

The background of the cover is a classical painting. On the left, a woman in a white dress stands in a stream, holding a basket. In the center and right, a group of figures, possibly in a ritual or dance, are gathered around a central point. The landscape is filled with tall, thin trees and a distant, hazy city or town. The overall tone is somber and historical.

THE GOLDEN BOUGH

JAMES GEORGE FRAZER

THE GOLDEN BOUGH

JAMES GEORGE FRAZER

The Golden Bough by James George Frazer.

First published in 1890.

This is the unabridged third edition, first published in 12 Volumes, 1906-1915.

This ebook edition was created and published by Global Grey in 2019,
and updated on the 11th April 2024.

The artwork used for the cover is '*The Golden Bough*'
painted by J. M. W. Turner.

This book can be found on the site here:

Contents

Part I. The Magic Art and the Evolution of the Kings

I. The King Of The Wood

II. Priestly Kings

III. Sympathetic Magic

IV. Magic And Religion

V. The Magical Control Of The Weather

VI. Magicians As Kings

VII. Incarnate Human Gods

Appendix. Hegel On Magic And Religion

VIII. Departmental Kings Of Nature

IX. The Worship Of Trees

X. Relics Of Tree-Worship In Modern Europe

XI. The Influence Of The Sexes On Vegetation

XII. The Sacred Marriage

XIII. The Kings Of Rome And Alba

XIV. The King's Fire

XV. The Fire-Drill

XVI. Father Jove And Mother Vesta

XVII. The Origin Of Perpetual Fires

XVIII. The Succession To The Kingdom In Ancient Latium

XIX. St. George And The Parilia

XX. The Worship Of The Oak

XXI. Dianus And Diana

Part II. Taboo and the Perils of the Soul

Preface

I. The Burden Of Royalty

II. The Perils Of The Soul

III. Tabooed Acts

IV. Tabooed Persons

V. Tabooed Things

VI. Tabooed Words

VII. Our Debt To The Savage

Part III. The Dying God

Preface

I. The Mortality Of The Gods

II. The Killing Of The Divine King

III. The Slaying Of The King In Legend

IV. The Supply Of Kings

V. Temporary Kings

VI. Sacrifice Of The King's Son

VII. Succession To The Soul

VIII. The Killing Of The Tree-Spirit

Note A. Chinese Indifference To Death

Note B. Swinging As A Magical Rite

Part IV. Adonis Attis Osiris

Book First. Adonis

I. The Myth of Adonis

II. Adonis in Syria

III. Adonis in Cyprus

IV. Sacred Men and Women

V. The Burning of Melcarth

VI. The Burning of Sandan

VII. Sardanapalus and Hercules

VIII. Volcanic Religion

IX. The Ritual of Adonis

X. The Gardens of Adonis

Book Second. Attis

I. The Myth and Ritual of Attis

II. Attis As a God of Vegetation

III. Attis As The Father God

IV. Human Representatives of Attis

V. The Hanged God

VI. Oriental Religions in the West

VII. Hyacinth

Book Third. Osiris

I. The Myth Of Osiris

II. The Official Egyptian Calendar

III. The Calendar of the Egyptian Farmer

IV. The Official Festivals of Osiris

V. The Nature of Osiris

VI. Isis

VII. Osiris and the Sun

VIII. Osiris and the Moon

IX. The Doctrine of Lunar Sympathy

X. The King As Osiris

XI. The Origin of Osiris

XII. Mother-Kin And Mother Goddesses

Notes

Part V. Spirits of the Corn and of the Wild

Preface

I. Dionysus

II. Demeter And Persephone

III. Magical Significance of Games in Primitive Agriculture

IV. Woman's Part in Primitive Agriculture

V. The Corn-Mother and the Corn-Maiden in Northern Europe

VI. The Corn-Mother in Many Lands

VII. Lityerses

VIII. The Corn-Spirit as an Animal

Note. The Pleiades in Primitive Calendars

IX. Ancient Deities of Vegetation as Animals

X. Eating The God

XI. The Sacrifice of First-Fruits

XII. Homoeopathic Magic of a Flesh Diet

XIII. Killing The Divine Animal

XIV. The Propitiation of Wild Animals by Hunters

XV. The Propitiation of Vermin by Farmers

XVI. The Transmigration of Human Souls Into Animals

XVII. Types of Animal Sacrament

Note: The Ceremony of the Horse at Rice-Harvest Among The Garos

Part VI. The Scapegoat

Preface

I. The Transference of Evil

II. The Omnipresence of Demons

III. The Public Expulsion of Evils

IV. Public Scapegoats

V. On Scapegoats in General

VI. Human Scapegoats in Classical Antiquity

VII. Killing the God in Mexico

VIII. The Saturnalia and Kindred Festivals

Note. The Crucifixion Of Christ

Part VII. Balder the Beautiful

Preface

I. Between Heaven And Earth

II. The Seclusion of Girls at Puberty

III. The Myth of Balder

IV. The Fire-Festivals of Europe

V. The Interpretation of the Fire-Festivals

VI. Fire-Festivals in Other Lands

VII. The Burning of Human Beings in the Fires

VIII. The Magic Flowers of Midsummer Eve

IX. Balder and the Mistletoe

X. The Eternal Soul in Folk-Tales

XI. The External Soul in Folk-Custom

XII. The Golden Bough

XIII. Farewell to Nemi

Notes

Part I. The Magic Art and the Evolution of the Kings

(Originally published in Volumes I and II)

I. The King Of The Wood

*“The still glassy lake that sleeps
Beneath Aricia’s trees—
Those trees in whose dim shadow
The ghastly priest doth reign,
The priest who slew the slayer,
And shall himself be slain.”*

MACAULAY.

§ 1. *Diana and Virbius*

WHO does not know Turner’s picture of the Golden Bough? The scene, suffused with the golden glow of imagination in which the divine mind of Turner steeped and transfigured even the fairest natural landscape, is a dream-like vision of the little woodland lake of Nemi—“Diana’s Mirror,” as it was called by the ancients. No one who has seen that calm water, lapped in a green hollow of the Alban hills, can ever forget it. The two characteristic Italian villages which slumber on its banks, and the equally Italian palace whose terraced gardens descend steeply to the lake, hardly break the stillness and even the solitariness of the scene. Dian herself might still linger by this lonely shore, still haunt these woodlands wild.

In antiquity this sylvan landscape was the scene of a strange and recurring tragedy. In order to understand it aright we must try to form in our minds an accurate picture of the place where it happened; for, as we shall see later on, a subtle link subsisted between the natural beauty of the spot and the dark crimes which under the mask of religion were often perpetrated there, crimes which after the lapse of so many ages still lend a touch of melancholy to these quiet woods and waters, like a chill breath of autumn on one of those bright September days “while not a leaf seems faded.”

The Alban hills are a fine bold group of volcanic mountains which rise abruptly from the Campagna in full view of Rome, forming the last spur sent out by the Apennines towards the sea. Two of the extinct craters are now filled by two beautiful waters, the Alban lake and its lesser sister the lake of Nemi. Both lie far below the monastery-crowned top of Monte Cavo, the summit of the range, but yet so high above the plain that standing on the rim of the larger crater at Castel Gandolfo, where the Popes had their summer palace, you look down on the one hand into the Alban lake, and on the other away across the Campagna to where, on the western horizon, the sea flashes like a broad sheet of burnished gold in the sun.

The lake of Nemi is still as of old embowered in woods, where in spring the wild flowers blow as fresh as no doubt they did two thousand springs ago. It lies so deep down in the old crater that the calm surface of its clear water is seldom ruffled by the wind. On all sides but one the banks, thickly mantled with luxuriant vegetation, descend steeply to the water’s edge. Only on the north a stretch of flat ground intervenes between the lake and the foot of the hills. This was the scene of the tragedy. Here, in the very heart of the wooded hills, under the abrupt declivity now crested by the village of Nemi, the sylvan goddess Diana had an old and famous sanctuary, the resort of pilgrims from all parts of Latium. It was known as the sacred grove of Diana Nemorensis, that is, Diana of the Wood, or, perhaps more exactly, Diana of the Woodland Glade. Sometimes the lake and grove were called, after the nearest town, the lake and grove of Aricia. But the town, the modern Ariccia, lay three miles away at the foot of the mountains, and separated from the lake by a long and steep descent. A spacious terrace

or platform contained the sanctuary. On the north and east it was bounded by great retaining walls which cut into the hillsides and served to support them. Semicircular niches sunk in the walls and faced with columns formed a series of chapels, which in modern times have yielded a rich harvest of votive offerings. On the side of the lake the terrace rested on a mighty wall, over seven hundred feet long by thirty feet high, built in triangular buttresses, like those which we see in front of the piers of bridges to break floating ice. At present this terrace-wall stands back some hundred yards from the lake; in other days its buttresses may have been lapped by the water. Compared with the extent of the sacred precinct, the temple itself was not large; but its remains prove it to have been neatly and solidly built of massive blocks of peperino, and adorned with Doric columns of the same material. Elaborate cornices of marble and friezes of terra-cotta contributed to the outward splendour of the edifice, which appears to have been further enhanced by tiles of gilt bronze.

The great wealth and popularity of the sanctuary in antiquity are attested by ancient writers as well as by the remains which have come to light in modern times. In the civil war its sacred treasures went to replenish the empty coffers of Octavian, who well understood the useful art of thus securing the divine assistance, if not the divine blessing, for the furtherance of his ends. But we are not told that he treated Diana on this occasion as civilly as his divine uncle Julius Caesar once treated Capitoline Jupiter himself, borrowing three thousand pounds' weight of solid gold from the god, and scrupulously paying him back with the same weight of gilt copper. However, the sanctuary at Nemi recovered from this drain on its resources, for two centuries later it was still reputed one of the richest in Italy. Ovid has described the walls hung with fillets and commemorative tablets; and the abundance of cheap votive offerings and copper coins, which the site has yielded in our own day, speaks volumes for the piety and numbers, if not for the opulence and liberality, of the worshippers. Swarms of beggars used to stream forth daily from the slums of Aricia and take their stand on the long slope up which the labouring horses dragged well-to-do pilgrims to the shrine; and according to the response which their whines and importunities met with they blew kisses or hissed curses after the carriages as they swept rapidly down hill again. Even peoples and potentates of the East did homage to the lady of the lake by setting up monuments in her sanctuary; and within the precinct stood shrines of the Egyptian goddesses Isis and Bubastis, with a store of gorgeous jewellery.

The retirement of the spot and the beauty of the landscape naturally tempted some of the luxurious Roman nobles to fix their summer residences by the lake. Here Lucius Caesar had a house to which, on a day in early summer, only two months after the murder of his illustrious namesake, he invited Cicero to meet the assassin Brutus. The emperors themselves appear to have been partial to a retreat where they could find repose from the cares of state and the bustle of the great city in the fresh air of the lake and the stillness of the woods. Here Julius Caesar built himself a costly villa, but pulled it down because it was not to his mind. Here Caligula had two magnificent barges, or rather floating palaces, launched for him on the lake; and it was while dallying in the woods of Nemi that the sluggard Vitellius received the tidings of revolt which woke him from his dream of pleasure and called him to arms.

Vespasian had a monument dedicated to his honour in the grove by the senate and people of Aricia: Trajan condescended to fill the chief magistracy of the town; and Hadrian indulged his taste for architecture by restoring a structure which had been erected in the precinct by a prince of the royal house of Parthia.

Such, then, was the sanctuary of Diana at Nemi, a fitting home for the "mistress of mountains, and forests green, and lonely glades, and sounding rivers," as Catullus calls her.

Multitudes of her statuettes, appropriately clad in the short tunic and high buskins of a huntress, with the quiver slung over her shoulder, have been found on the spot. Some of them

represent her with her bow in her hand or her hound at her side. Bronze and iron spears, and images of stags and hinds, discovered within the precinct, may have been offerings of huntsmen to the huntress goddess for success in the chase. Similarly the bronze tridents, which have also come to light at Nemi, were perhaps presented by fishermen who had speared fish in the lake, or maybe by hunters who had stabbed boars in the forest. The wild boar was still hunted in Italy down to the end of the first century of our era; for the younger Pliny tells us how, with his usual charming affectation, he sat meditating and reading by the nets, while three fine boars fell into them. Indeed, some fourteen-hundred years later boar-hunting was a favourite pastime of Pope Leo the Tenth. A frieze of painted reliefs in terracotta, which was found in the sanctuary at Nemi, and may have adorned Diana's temple, portrays the goddess in the character of what is called the Asiatic Artemis, with wings sprouting from her waist and a lion resting its paws on each of her shoulders. A few rude images of cows, oxen, horses, and pigs dug up on the site may perhaps indicate that Diana was here worshipped as the patroness of domestic animals as well as of the wild creatures of the wood. In like manner her Greek counterpart Artemis was a goddess not only of game but of herds. Thus her sanctuary in the highlands of north-western Arcadia, between Clitor and Cynaethae, owned sacred cattle which were driven off by Aetolian freebooters on one of their forays. When Xenophon returned from the wars and settled on his estate among the wooded hills and green meadows of the rich valley through which the Alpheus flows past Olympia, he dedicated to Artemis a little temple on the model of her great temple at Ephesus, surrounded it with a grove of all kinds of fruit-trees, and endowed it not only with a chase but also with a sacred pasture. The chase abounded in fish and game of all sorts, and the pasture sufficed to rear swine, goats, oxen, and horses; and on her yearly festival the pious soldier sacrificed to the goddess a tithe both of the cattle from the sacred pasture and of the game from the sacred chase. Again, the people of Hyampolis in Phocis worshipped Artemis and thought that no cattle thrived like those which they dedicated to her. Perhaps then the images of cattle found in Diana's precinct at Nemi were offered to her by herdsmen to ensure her blessing on their herds. In Catholic Germany at the present time the great patron of cattle, horses, and pigs is St. Leonhard, and models of cattle, horses, and pigs are dedicated to him, sometimes in order to ensure the health and increase of the flocks and herds through the coming year, sometimes in order to obtain the recovery of sick animals. And, curiously enough, like Diana of Aricia, St. Leonhard is also expected to help women in travail and to bless barren wives with offspring. Nor do these points exhaust the analogy between St. Leonard and Diana of Aricia; for like the goddess the saint heals the sick; he is the patron of prisoners, as she was of runaway slaves; and his shrines, like hers, enjoyed the right of asylum.

So to the last, in spite of a few villas peeping out here and there from among the trees, Nemi seems to have remained in some sense an image of what Italy had been in the far-off days when the land was still sparsely peopled with tribes of savage hunters or wandering herdsmen, when the beechwoods and oakwoods, with their deciduous foliage, reddening in autumn and bare in winter, had not yet begun, under the hand of man, to yield to the evergreens of the south, the laurel, the olive, the cypress, and the oleander, still less to those intruders of a later age, which nowadays we are apt to think of as characteristically Italian, the lemon and the orange.

However, it was not merely in its natural surroundings that this ancient shrine of the sylvan goddess continued to be a type or miniature of the past. Down to the decline of Rome a custom was observed there which seems to transport us at once from civilisation to savagery. In the sacred grove there grew a certain tree round which at any time of the day, and probably far into the night, a grim figure might be seen to prowl. In his hand he carried a drawn sword, and he kept peering warily about him as if at every instant he expected to be set upon by an

enemy. He was a priest and a murderer; and the man for whom he looked was sooner or later to murder him and hold the priesthood in his stead. Such was the rule of the sanctuary. A candidate for the priesthood could only succeed to office by slaying the priest, and having slain him, he retained office till he was himself slain by a stronger or a craftier.

The post which he held by this precarious tenure carried with it the title of king; but surely no crowned head ever lay uneasy, or was visited by more evil dreams, than his. For year in year out, in summer and winter, in fair weather and in foul, he had to keep his lonely watch, and whenever he snatched a troubled slumber it was at the peril of his life. The least relaxation of his vigilance, the smallest abatement of his strength of limb or skill of fence, put him in jeopardy; grey hairs might seal his death-warrant. His eyes probably acquired that restless, watchful look which, among the Esquimaux of Bering Strait, is said to betray infallibly the shedder of blood; for with that people revenge is a sacred duty, and the manslayer carries his life in his hand. To gentle and pious pilgrims at the shrine the sight of him might well seem to darken the fair landscape, as when a cloud suddenly blots the sun on a bright day. The dreamy blue of Italian skies, the dappled shade of summer woods, and the sparkle of waves in the sun, can have accorded but ill with that stern and sinister figure. Rather we picture to ourselves the scene as it may have been witnessed by a belated wayfarer on one of those wild autumn nights when the dead leaves are falling thick, and the winds seem to sing the dirge of the dying year. It is a sombre picture, set to melancholy music—the background of forest shewing black and jagged against a lowering and stormy sky, the sighing of the wind in the branches, the rustle of the withered leaves under foot, the lapping of the cold water on the shore, and in the foreground, pacing to and fro, now in twilight and now in gloom, a dark figure with a glitter of steel at the shoulder whenever the pale moon, riding clear of the cloud-rack, peers down at him through the matted boughs.

The strange rule of this priesthood has no parallel in classical antiquity, and cannot be explained from it. To find an explanation we must go farther afield. No one will probably deny that such a custom savours of a barbarous age, and, surviving into imperial times, stands out in striking isolation from the polished Italian society of the day, like a primaeval rock rising from a smooth-shaven lawn. It is the very rudeness and barbarity of the custom which allow us a hope of explaining it. For recent researches into the early history of man have revealed the essential similarity with which, under many superficial differences, the human mind has elaborated its first crude philosophy of life. Accordingly, if we can shew that a barbarous custom, like that of the priesthood of Nemi, has existed elsewhere; if we can detect the motives which led to its institution; if we can prove that these motives have operated widely, perhaps universally, in human society, producing in varied circumstances a variety of institutions specifically different but generically alike; if we can shew, lastly, that these very motives, with some of their derivative institutions, were actually at work in classical antiquity; then we may fairly infer that at a remoter age the same motives gave birth to the priesthood of Nemi. Such an inference, in default of direct evidence as to how the priesthood did actually arise, can never amount to demonstration. But it will be more or less probable according to the degree of completeness with which it fulfils the conditions I have indicated. The object of this book is, by meeting these conditions, to offer a fairly probable explanation of the priesthood of Nemi.

I begin by setting forth the few facts and legends which have come down to us on the subject. According to one story the worship of Diana at Nemi was instituted by Orestes, who, after killing Thoas, King of the Tauric Chersonese (the Crimea), fled with his sister to Italy, bringing with him the image of the Tauric Diana hidden in a faggot of sticks. After his death his bones were transported from Aricia to Rome and buried in front of the temple of Saturn, on the Capitoline slope, beside the temple of Concord. The bloody ritual which legend

ascribed to the Tauric Diana is familiar to classical readers; it is said that every stranger who landed on the shore was sacrificed on her altar. But transported to Italy, the rite assumed a milder form. Within the sanctuary at Nemi grew a certain tree of which no branch might be broken. Only a runaway slave was allowed to break off, if he could, one of its boughs. Success in the attempt entitled him to fight the priest in single combat, and if he slew him he reigned in his stead with the title of King of the Wood (*Rex Nemorensis*). According to the public opinion of the ancients the fateful branch was that Golden Bough which, at the Sibyl's bidding, Aeneas plucked before he essayed the perilous journey to the world of the dead. The flight of the slave represented, it was said, the flight of Orestes; his combat with the priest was a reminiscence of the human sacrifices once offered to the Tauric Diana. This rule of succession by the sword was observed down to imperial times; for amongst his other freaks Caligula, thinking that the priest of Nemi had held office too long, hired a more stalwart ruffian to slay him; and a Greek traveller, who visited Italy in the age of the Antonines, remarks that down to his time the priesthood was still the prize of victory in a single combat.

Of the worship of Diana at Nemi some leading features can still be made out. From the votive offerings which have been found on the site, it appears that she was conceived of especially as a huntress, and further as blessing men and women with offspring, and granting expectant mothers an easy delivery. Again, fire seems to have played a foremost part in her ritual. For during her annual festival, held on the thirteenth of August, at the hottest time of the year, her grove shone with a multitude of torches, whose ruddy glare was reflected by the lake; and throughout the length and breadth of Italy the day was kept with holy rites at every domestic hearth. Bronze statuettes found in her precinct represent the goddess herself holding a torch in her raised right hand; and women whose prayers had been heard by her came crowned with wreaths and bearing lighted torches to the sanctuary in fulfilment of their vows. Some one unknown dedicated a perpetually burning lamp in a little shrine at Nemi for the safety of the Emperor Claudius and his family. The terra-cotta lamps which have been discovered in the grove may perhaps have served a like purpose for humbler persons. If so, the analogy of the custom to the Catholic practice of dedicating holy candles in churches would be obvious.

Further, the title of Vesta borne by Diana at Nemi points clearly to the maintenance of a perpetual holy fire in her sanctuary. A large circular basement at the north-east corner of the temple, raised on three steps and bearing traces of a mosaic pavement, probably supported a round temple of Diana in her character of Vesta, like the round temple of Vesta in the Roman Forum. Here the sacred fire would seem to have been tended by Vestal Virgins, for the head of a Vestal in terra-cotta was found on the spot, and the worship of a perpetual fire, cared for by holy maidens, appears to have been common in Latium from the earliest to the latest times. Thus we know that among the ruins of Alba the Vestal fire was kept burning by Vestal Virgins, bound to strict chastity, until the end of the fourth century of our era. There were Vestals at Tibur and doubtless also at Lavinium, for the Roman consuls, praetors, and dictators had to sacrifice to Vesta at that ancient city when they entered on or laid down their office.

At her annual festival, which, as we have just seen, was celebrated all over Italy on the thirteenth of August, hunting dogs were crowned and wild beasts were not molested; young people went through a purificatory ceremony in her honour; wine was brought forth, and the feast consisted of a kid, cakes served piping hot on plates of leaves, and apples still hanging in clusters on the boughs. The Christian Church appears to have sanctified this great festival of the virgin goddess by adroitly converting it into the festival of the Assumption of the Blessed Virgin on the fifteenth of August. The discrepancy of two days between the dates of the festivals is not a fatal argument against their identity; for a similar displacement of two days occurs in the case of St. George's festival on the twenty-third of April, which is

probably identical with the ancient Roman festival of the Parilia on April twenty-first. On the reasons which prompted this conversion of the festival of the Virgin Diana into the festival of the Virgin Mary, some light is thrown by a passage in the Syriac text of *The Departure of My Lady Mary from this World*, which runs thus: "And the apostles also ordered that there should be a commemoration of the blessed one on the thirteenth of Ab [that is, August; another MS. reads the 15th of Ab], on account of the vines bearing bunches (of grapes), and on account of the trees bearing fruit, that clouds of hail, bearing stones of wrath, might not come, and the trees be broken, and their fruits, and the vines with their clusters." Here the festival of the Assumption of the Virgin is definitely said to have been fixed on the thirteenth or fifteenth of August for the sake of protecting the ripening grapes and other fruits. Similarly in the Arabic text of the apocryphal work *On the Passing of the Blessed Virgin Mary*, which is attributed to the Apostle John, there occurs the following passage: "Also a festival in her honour was instituted on the fifteenth day of the month Ab [that is, August], which is the day of her passing from this world, the day on which the miracles were performed, and the time when the fruits of trees are ripening." Further, in the calendars of the Syrian Church the fifteenth of August is repeatedly designated as the festival of the Mother of God "for the vines"; and to this day in Greece the ripening grapes and other fruits are brought to the churches to be blest by the priests on the fifteenth of August. Now we hear of vineyards and plantations dedicated to Artemis, fruits offered to her, and her temple standing in an orchard. Hence we may conjecture that her Italian sister Diana was also revered as a patroness of vines and fruit-trees, and that on the thirteenth of August the owners of vineyards and orchards paid their respects to her at Nemi along with other classes of the community. We have just seen that wine and apples still hanging on the boughs formed part of the festal cheer on that day; in an ancient fresco found at Ostia a statue of Diana is depicted in company with a procession of children, some of whom bear clusters of grapes; and in a series of gems the goddess is represented with a branch of fruit in one hand and a cup, which is sometimes full of fruit, in the other.

Catullus, too, tells us that Diana filled the husbandman's barns with a bounteous harvest. In some parts of Italy and Sicily the day of the Assumption of the Virgin is still celebrated, like Diana's day of old, with illuminations and bonfires; in many Sicilian parishes the corn is then brought in sacks to the churches to be blessed, and many persons, who have a favour to ask of the Virgin, vow to abstain from one or more kinds of fruit during the first fifteen days of August. Even in Scandinavia a relic of the worship of Diana survived in the custom of blessing the fruits of the earth of every sort, which in Catholic times was annually observed on the festival of the Assumption of the Virgin. There is no intrinsic improbability in the view that for the sake of edification the church may have converted a real heathen festival into a nominal Christian one. Similarly in the Armenian Church "according to the express evidence of the Armenian fathers of the year 700 and later, the day of the Virgin was placed on September the fifteenth, because that was the day of Anahite, the magnificence of whose feast the Christian doctors hoped thereby to transfer to Mary." This Anahite or Anaitis, as the Greeks called her, the Armenian predecessor of the Virgin Mary, was a great Oriental goddess, whose worship was exceedingly popular not only in Armenia but in the adjoining countries. The loose character of her rites is plainly indicated by Strabo, himself a native of these regions.

Among the ancient Celts of Gaul, who, to judge by their speech, were near kinsmen of the ancient Latins, the thirteenth of August appears to have been the day when the harvest was dedicated to the harvest-god Rivos. If that was so, we may conjecture that the choice of a day in mid-August for the solemn celebration of the harvest-home dates from the remote time when the ancestors of the Celtic and Italian peoples, having renounced the wandering life of the huntsman and herdsman, had settled down together in some land of fertile soil and

temperate climate, where harvest fell neither so late as after the cool rainy summers of the North nor so early as before the torrid and rainless summers of southern Europe.

But Diana did not reign alone in her grove at Nemi. Two lesser divinities shared her forest sanctuary. One was Egeria, the nymph of the clear water which, bubbling from the basaltic rocks, used to fall in graceful cascades into the lake at the place called Le Mole, because here were established the mills of the modern village of Nemi. The purling of the stream as it ran over the pebbles is mentioned by Ovid, who tells us that he had often drunk of its water.

Women with child used to sacrifice to Egeria, because she was believed, like Diana, to be able to grant them an easy delivery. Tradition ran that the nymph had been the wife or mistress of the wise king Numa, that he had consorted with her in the secrecy of the sacred grove, and that the laws which he gave the Romans had been inspired by communion with her divinity. Plutarch compares the legend with other tales of the loves of goddesses for mortal men, such as the love of Cybele and the Moon for the fair youths Attis and Endymion.

According to some, the trysting-place of the lovers was not in the woods of Nemi but in a grove outside the dripping Porta Capena at Rome, where another sacred spring of Egeria gushed from a dark cavern. Every day the Roman Vestals fetched water from this spring to wash the temple of Vesta, carrying it in earthenware pitchers on their heads. In Juvenal's time the natural rock had been encased in marble, and the hallowed spot was profaned by gangs of poor Jews, who were suffered to squat, like gypsies, in the grove. We may suppose that the spring which fell into the lake of Nemi was the true original Egeria, and that when the first settlers moved down from the Alban hills to the banks of the Tiber they brought the nymph with them and found a new home for her in a grove outside the gates. The remains of baths which have been discovered within the sacred precinct, together with many terra-cotta models of various parts of the human body, suggest that the waters of Egeria were used to heal the sick, who may have signified their hopes or testified their gratitude by dedicating likenesses of the diseased members to the goddess, in accordance with a custom which is still observed in many parts of Europe. To this day it would seem that the spring retains medicinal virtues.

The other of the minor deities at Nemi was Virbius. Legend had it that Virbius was the young Greek hero Hippolytus, chaste and fair, who learned the art of ventry from the centaur Chiron, and spent all his days in the greenwood chasing wild beasts with the virgin huntress Artemis (the Greek counterpart of Diana) for his only comrade. Proud of her divine society, he spurned the love of women, and this proved his bane. For Aphrodite, stung by his scorn, inspired his stepmother Phaedra with love of him; and when he disdained her wicked advances she falsely accused him to his father Theseus. The slander was believed, and Theseus prayed to his sire Poseidon to avenge the imagined wrong. So while Hippolytus drove in a chariot by the shore of the Saronic Gulf, the sea-god sent a fierce bull forth from the waves. The terrified horses bolted, threw Hippolytus from the chariot, and dragged him at their hoofs to death. But Diana, for the love she bore Hippolytus, persuaded the leech Aesculapius to bring her fair young hunter back to life by his simples. Jupiter, indignant that a mortal man should return from the gates of death, thrust down the meddling leech himself to Hades. But Diana hid her favourite from the angry god in a thick cloud, disguised his features by adding years to his life, and then bore him far away to the dells of Nemi, where she entrusted him to the nymph Egeria, to live there, unknown and solitary, under the name of Virbius, in the depth of the Italian forest. There he reigned a king, and there he dedicated a precinct to Diana. He had a comely son, Virbius, who, undaunted by his father's fate, drove a team of fiery steeds to join the Latins in the war against Aeneas and the Trojans. Virbius was worshipped as a god not only at Nemi but elsewhere; for in Campania we hear of a special priest devoted to his service. Horses were excluded from the Arician grove and sanctuary

because horses had killed Hippolytus. It was unlawful to touch his image. Some thought that he was the sun. "But the truth is," says Servius, "that he is a deity associated with Diana, as Attis is associated with the Mother of the Gods, and Erichthonius with Minerva, and Adonis with Venus." What the nature of that association was we shall enquire presently. Here it is worth observing that in his long and chequered career this mythical personage has displayed a remarkable tenacity of life. For we can hardly doubt that the Saint Hippolytus of the Roman calendar, who was dragged by horses to death on the thirteenth of August, Diana's own day, is no other than the Greek hero of the same name, who after dying twice over as a heathen sinner has been happily resuscitated as a Christian saint.

It needs no elaborate demonstration to convince us that the stories told to account for Diana's worship at Nemi are unhistorical. Clearly they belong to that large class of myths which are made up to explain the origin of a religious ritual and have no other foundation than the resemblance, real or imaginary, which may be traced between it and some foreign ritual. The incongruity of these Nemi myths is indeed transparent, since the foundation of the worship is traced now to Orestes and now to Hippolytus, according as this or that feature of the ritual has to be accounted for. The real value of such tales is that they serve to illustrate the nature of the worship by providing a standard with which to compare it; and further, that they bear witness indirectly to its venerable age by shewing that the true origin was lost in the mists of a fabulous antiquity. In the latter respect these Nemi legends are probably more to be trusted than the apparently historical tradition, vouched for by Cato the Elder, that the sacred grove was dedicated to Diana by a certain Egerius Baebius or Laevius of Tusculum, a Latin dictator, on behalf of the peoples of Tusculum, Aricia, Lanuvium, Laurentum, Cora, Tibur, Pometia, and Ardea. This tradition indeed speaks for the great age of the sanctuary, since it seems to date its foundation sometime before 495 B.C., the year in which Pometia was sacked by the Romans and disappears from history. But we cannot suppose that so barbarous a rule as that of the Arician priesthood was deliberately instituted by a league of civilised communities, such as the Latin cities undoubtedly were. It must have been handed down from a time beyond the memory of man, when Italy was still in a far ruder state than any known to us in the historical period. The credit of the tradition is rather shaken than confirmed by another story which ascribes the foundation of the sanctuary to a certain Manius Egerius, who gave rise to the saying, "There are many Manii at Aricia." This proverb some explained by alleging that Manius Egerius was the ancestor of a long and distinguished line, whereas others thought it meant that there were many ugly and deformed people at Aricia, and they derived the name Manius from *Mania*, a bogey or bugbear to frighten children. A Roman satirist uses the name Manius as typical of the beggars who lay in wait for pilgrims on the Arician slopes. These differences of opinion, together with the discrepancy between Manius Egerius of Aricia and Egerius Laevius of Tusculum, as well as the resemblance of both names to the mythical Egeria, excite our suspicion. Yet the tradition recorded by Cato seems too circumstantial, and its sponsor too respectable, to allow us to dismiss it as an idle fiction. Rather we may suppose that it refers to some ancient restoration or reconstruction of the sanctuary, which was actually carried out by the confederate states. At any rate it testifies to a belief that the grove had been from early times a common place of worship for many of the oldest cities of the country, if not for the whole Latin confederacy.

Another argument of antiquity may be drawn from some of the votive offerings found on the spot, such as a sacrificial ladle of bronze bearing Diana's name in archaic Greek letters, and pieces of the oldest kind of Italian money, being merely shapeless bits of copper, unstamped and valued by weight. But as the use of such old-fashioned money survived in offerings to the gods long after it vanished from daily life, no great stress can be laid on its occurrence at Nemi as evidence of the age of the shrine.

§ 2. *Artemis and Hippolytus*

I have said that the Arician legends of Orestes and Hippolytus, though worthless as history, have a certain value in so far as they may help us to understand the worship at Nemi better by comparing it with the ritual and myths of other sanctuaries. We must ask ourselves, Why did the authors of these legends pitch upon Orestes and Hippolytus in order to explain Virbius and the King of the Wood? In regard to Orestes, the answer is obvious. He and the image of the Tauric Diana, which could only be appeased with human blood, were dragged in to render intelligible the murderous rule of succession to the Arician priesthood. In regard to Hippolytus the case is not so plain. The manner of his death suggests readily enough a reason for the exclusion of horses from the grove; but this by itself seems hardly enough to account for the identification. We must try to probe deeper by examining the worship as well as the legend or myth of Hippolytus.

He had a famous sanctuary at his ancestral home of Troezen, situated on that beautiful, almost landlocked bay, where groves of oranges and lemons, with tall cypresses soaring like dark spires above the garden of the Hesperides, now clothe the strip of fertile shore at the foot of the rugged mountains. Across the blue water of the tranquil bay, which it shelters from the open sea, rises Poseidon's sacred island, its peaks veiled in the sombre green of the pines. On this fair coast Hippolytus was worshipped. Within his sanctuary stood a temple with an ancient image. His service was performed by a priest who held office for life: every year a sacrificial festival was held in his honour; and his untimely fate was yearly mourned, with weeping and doleful chants, by unwedded maids, who also dedicated locks of their hair in his temple before marriage. His grave existed at Troezen, though the people would not shew it. It has been suggested, with great plausibility, that in the handsome Hippolytus, beloved of Artemis, cut off in his youthful prime, and yearly mourned by damsels, we have one of those mortal lovers of a goddess who appear so often in ancient religion, and of whom Adonis is the most familiar type. The rivalry of Artemis and Phaedra for the affection of Hippolytus reproduces, it is said, under different names, the rivalry of Aphrodite and Proserpine for the love of Adonis, for Phaedra is merely a double of Aphrodite. Certainly in the *Hippolytus* of Euripides the tragedy of the hero's death is traced directly to the anger of Aphrodite at his contempt for her power, and Phaedra is nothing but a tool of the goddess. Moreover, within the precinct of Hippolytus at Troezen there stood a temple of Peeping Aphrodite, which was so named, we are told, because from this spot the amorous Phaedra used to watch Hippolytus at his manly sports. Clearly the name would be still more appropriate if it was Aphrodite herself who peeped. And beside this temple of Aphrodite grew a myrtle-tree with pierced leaves, which the hapless Phaedra, in the pangs of love, had pricked with her bodkin. Now the myrtle, with its glossy evergreen leaves, its red and white blossom, and its fragrant perfume, was Aphrodite's own tree, and legend associated it with the birth of Adonis. At Athens also Hippolytus was intimately associated with Aphrodite, for on the south side of the Acropolis, looking towards Troezen, a barrow or sepulchral mound in his memory was shewn, and beside it stood a temple of Aphrodite, said to have been founded by Phaedra, which bore the name of the temple of Aphrodite at Hippolytus. The conjunction, both in Troezen and in Athens, of his grave with a temple of the goddess of love is significant. Later on we shall meet with mounds in which the lovers of the great Asiatic goddess were said to lie buried.

If this view of the relation of Hippolytus to Artemis and Aphrodite is right, it is somewhat remarkable that both his divine mistresses appear to have been associated at Troezen with oaks. For Aphrodite was here worshipped under the title of Askraia, that is, she of the Fruitless Oak; and Hippolytus was said to have met his death not far from a sanctuary of

Saronian Artemis, that is, Artemis of the Hollow Oak, for here the wild olive-tree was shewn in which the reins of his chariot became entangled, and so brought him to the ground.

It may not be without significance that Orestes, the other mythical hero of Nemi, also appears in the legendary history of Troezen. For at Troezen there was a temple of Wolfish Artemis, said to have been dedicated by Hippolytus, and in front of the temple stood a sacred stone upon which nine men, according to the legend, had cleansed Orestes from the guilt of his mother's murder. In the solemn rite they made use of water drawn from the Horse's Fount; and as late as the second century of our era their descendants dined together on certain set days in a building called the Booth of Orestes. Before the building there grew a laurel-tree which was said to have sprung on the spot where the things used in purifying the matricide were buried. The old traveller Pausanias, to whom we owe so much of our knowledge of ancient Greece, could not learn why Hippolytus dedicated a temple to Wolfish Artemis; but he conjectured that it might have been because he extirpated the packs of wolves that used to scour the country.

Another point in the myth of Hippolytus which deserves attention is the frequent recurrence of horses in it. His name signifies either "horse-loosed" or "horse-looser"; he consecrated twenty horses to Aesculapius at Epidaurus; he was killed by horses; the Horse's Fount probably flowed not far from the temple which he built for Wolfish Artemis; and horses were sacred to his grandsire Poseidon, who had an ancient sanctuary in the wooded island across the bay, where the ruins of it may still be seen in the pine-forest. Lastly, Hippolytus's sanctuary at Troezen was said to have been founded by Diomedes, whose mythical connexion both with horses and wolves is attested. For the Veneti, at the head of the Adriatic, were famed for their breed of horses, and they had a sacred grove of Diomedes, at the spot where many springs burst forth from the foot of a lofty cliff, forming at once the broad and deep river Timavus (the modern Timao), which flows with a still and tranquil current into the neighbouring sea. Here the Veneti sacrificed a white horse to Diomedes; and associated with his grove were two others, sacred to Argive Hera and Aetolian Artemis. In these groves wild beasts were reported to lose their ferocity, and deer to herd with wolves. Moreover, the horses of the district, famed for their speed, were said to have been branded with the mark of a wolf. Thus Hippolytus was associated with the horse in many ways, and this association may have been used to explain more features of the Arician ritual than the mere exclusion of the animal from the sacred grove. To this point we shall return later on. Whether his relation to wolves was also invoked to account for any other aspect of the worship at Nemi we cannot say, since the wolf plays no part in the scanty notices of that worship which have come down to us. But doubtless, as one of the wild creatures of the wood, the beast would be under the special care of Diana.

The custom observed by Troezenian girls of offering tresses of their hair to Hippolytus before their wedding brings him into a relation with marriage, which at first sight seems out of keeping with his reputation as a confirmed bachelor. According to Lucian, youths as well as maidens at Troezen were forbidden to wed till they had shorn their hair in honour of Hippolytus, and we gather from the context that it was their first beard which the young men thus polled. However we may explain it, a custom of this sort appears to have prevailed widely both in Greece and the East. Plutarch tells us that formerly it was the wont of boys at puberty to go to Delphi and offer of their hair to Apollo; Theseus, the father of Hippolytus, complied with the custom, which lasted down into historical times. Argive maidens, grown to womanhood, dedicated their tresses to Athena before marriage. On the same occasion Megarian girls poured libations and laid clippings of their hair on the tomb of the maiden Iphinoe. At the entrance to the temple of Artemis in Delos the grave of two maidens was shewn under an olive-tree. It was said that long ago they had come as pilgrims from a far

northern land with offerings to Apollo, and dying in the sacred isle were buried there. The Delian virgins before marriage used to cut off a lock of their hair, wind it on a spindle, and lay it on the maidens' grave. The young men did the same, except that they twisted the down of their first beard round a wisp of grass or a green shoot. In some places it was Artemis who received the offering of a maiden's hair before marriage. At Panamara in Caria men dedicated locks of their hair in the temple of Zeus. The locks were enclosed in little stone boxes, some of them fitted with a marble lid or shutter, and the name of the dedicator was engraved on a square sinking in the stone, together with the name of the priest for the time being. Many of these inscribed boxes have been found of late years on the spot. None of them bear the names of women; some of them are inscribed with the names of a father and his sons. All the dedications are to Zeus alone, though Hera was also worshipped with him at Panamara. At Hierapolis, on the Euphrates, youths offered of their beards and girls of their tresses to the great Syrian goddess, and left the shorn hair in caskets of gold or silver, inscribed with their names, and nailed to the walls of the temple. The custom of dedicating the first beard seems to have been common at Rome under the Empire. Thus Nero consecrated his first beard in a golden box, studded with costly pearls, on the Capitol.

Some light is perhaps thrown on the meaning of these practices by two ancient Oriental customs, the one Egyptian, the other Phoenician. When Egyptian boys or girls had recovered from sickness, their parents used to shave the children's heads, weigh the hair against gold or silver, and give the precious metal to the keepers of the sacred beasts, who bought food with it for the animals according to their tastes. These tastes varied with the nature of the beast, and the beast varied with the district. Where hawks were worshipped, the keepers chopped up flesh, and calling the birds in a loud voice, flung the gobbets up into the air, till the hawks stooped and caught them. Where cats, or ichneumons, or fish were the local deities, the keepers crumbled bread in milk and set it before them, or threw it into the Nile. And similarly with the rest of the divine menagerie. Thus in Egypt the offerings of hair went to feed the worshipful animals.

In the sanctuary of the great Phoenician goddess Astarte at Byblus the practice was different. Here, at the annual mourning for the dead Adonis, the women had to shave their heads, and such of them as refused to do so were bound to prostitute themselves to strangers and to sacrifice to the goddess with the wages of their shame. Though Lucian, who mentions the custom, does not say so, there are some grounds for thinking that the women in question were generally maidens, of whom this act of devotion was required as a preliminary to marriage. In any case, it is clear that the goddess accepted the sacrifice of chastity as a substitute for the sacrifice of hair. Why? By many people, as we shall afterwards see, the hair is regarded as in a special sense the seat of strength; and at puberty it might well be thought to contain a double portion of vital energy, since at that season it is the outward sign and manifestation of the newly-acquired power of reproducing the species. For that reason, we may suppose, the beard rather than the hair of the head is offered by males on this occasion. Thus the substitution permitted at Byblus becomes intelligible: the women gave of their fecundity to the goddess, whether they offered their hair or their chastity. But why, it may be asked, should they make such an offering to Astarte, who was herself the great goddess of love and fertility? What need had she to receive fecundity from her worshippers? Was it not rather for her to bestow it on them? Thus put, the question overlooks an important side of polytheism, perhaps we may say of ancient religion in general. The gods stood as much in need of their worshippers as the worshippers in need of them. The benefits conferred were mutual. If the gods made the earth to bring forth abundantly, the flocks and herds to teem, and the human race to multiply, they expected that a portion of their bounty should be returned to them in the shape of tithe or tribute. On this tithe, indeed, they subsisted, and without it they would

starve. Their divine bellies had to be filled, and their divine reproductive energies to be recruited; hence men had to give of their meat and drink to them, and to sacrifice for their benefit what is most manly in man and womanly in woman. Sacrifices of the latter kind have too often been overlooked or misunderstood by the historians of religion. Other examples of them will meet us in the course of our enquiry. At the same time it may well be that the women who offered their hair to Astarte hoped to benefit through the sympathetic connexion which they thus established between themselves and the goddess; they may in fact have expected to fecundate themselves by contact with the divine source of fecundity. And it is probable that a similar motive underlay the sacrifice of chastity as well as the sacrifice of hair.

If the sacrifice of hair, especially of hair at puberty, is sometimes intended to strengthen the divine beings to whom it is offered by feeding or fertilising them, we can the better understand, not only the common practice of offering hair to the shadowy dead, but also the Greek usage of shearing it for rivers, as the Arcadian boys of Phigalia did for the stream that runs in the depths of the tremendous woody glen below the city. For next perhaps to rain and sunshine, nothing in nature so obviously contributes to fertilise a country as its rivers. Again, this view may set in a clearer light the custom of the Delian youths and maidens, who offered their hair on the maidens' tomb under the olive-tree. For at Delos, as at Delphi, one of Apollo's many functions was to make the crops grow and to fill the husbandman's barns; hence at the time of harvest tithe-offerings poured in to him from every side in the form of ripe sheaves, or, what was perhaps still more acceptable, golden models of them, which went by the name of the "golden summer." The festival at which these first-fruits were dedicated may have been the 6th and 7th of the harvest-month Thargelion, corresponding to the 24th and 25th of May, for these were the birthdays of Artemis and Apollo respectively. In Hesiod's day the corn-reaping began at the morning rising of the Pleiades, which then answered to our 9th of May, and in Greece the wheat is still ripe about that time. In return for these offerings the god sent out a sacred new fire from both his great sanctuaries at Delos and Delphi, thus radiating from them, as from central suns, the divine blessings of heat and light. A ship brought the new fire every year from Delos to Lemnos, the sacred island of the fire-god Hephaestus, where all fires were put out before its arrival, to be afterwards rekindled at the pure flame. The fetching of the new fire from Delphi to Athens appears to have been a ceremony of great solemnity and pomp. All the chief Athenian magistrates repaired to Delphi for the purpose. The holy fire blazed or smouldered in a sacred tripod borne on a chariot and tended by a woman who was called the Fire-bearer. Soldiers, both horse and foot, escorted it; magistrates, priests, and heralds accompanied it; and the procession moved to the music of trumpet and fife. We do not know on what occasion the fire was thus solemnly sent from Delphi to Athens, but we may conjecture that it was when the Pythaists at Athens, watching from the hearth of Lightning Zeus, saw lightning flash over Harma on Mount Parnes, for then they sent a sacrifice to Delphi and may have received the fire in return. After the great defeat of the Persians at Plataea, the people of that city extinguished all the fires in the country, deeming them defiled by the presence of the barbarians. Having done so they relit them at a pure new fire fetched by a runner from the altar of the common hearth at Delphi.

Now the maidens on whose grave the Delian youths and damsels laid their shorn locks before marriage, were said to have died in the island after bringing the harvest offering, wrapt in wheaten straw, from the land of the Hyperboreans in the far north. Thus they were in popular opinion the mythical representatives of those bands of worshippers who bore, year by year, the yellow sheaves with dance and song to Delos. But in fact they had once been much more than this. For an examination of their names, which are commonly given as Hekaerge and Opis, has led modern scholars to conclude, with every appearance of probability, that these

maidens were originally mere duplicates of Artemis herself. Perhaps indeed we may go a step farther. For sometimes one of this pair of Hyperboreans appears as a male, not a female, under the name of the Far-shooter (*Hekaergos*), which was a common epithet of Apollo. This suggests that the two were originally the heavenly twins themselves, Apollo and Artemis, and that the two graves which were shewn at Delos, one before and the other behind the sanctuary of Artemis, may have been at first the tombs of these great deities, who were thus laid to their rest on the spot where they had been born. As the one grave received offerings of hair, so the other received the ashes of the victims which were burned on the altar. Both sacrifices, if I am right, were designed to strengthen and fertilise the divine powers who made the earth to wave with the golden harvest, and whose mortal remains, like the miracle-working bones of saints in the Middle Ages, brought wealth to their fortunate possessors. Ancient piety was not shocked by the sight of the tomb of a dead god. The grave of Apollo himself was shewn at his other great sanctuary of Delphi, and this perhaps explains its disappearance at Delos. The priests of the rival shrines may have calculated that one tomb sufficed even for a god, and that two might prove a stumbling-block to any but the most robust faith. Acting on this prudent conviction, they may have adjusted their respective claims to the possession of the holy sepulchre by leaving Apollo to sleep undisturbed at Delphi, while his grave at Delos was dexterously converted into the tomb of a blessed virgin by the easy grammatical change of *Hekaergos* into *Hekaerge*.

But how, it may be asked, does all this apply to Hippolytus? Why attempt to fertilise the grave of a bachelor who paid all his devotions to a barren virgin? What seed could take root and spring up in so stony a soil? The question implies the popular modern notion of Diana or Artemis as the pattern of a straight-laced maiden lady with a taste for hunting. No notion could well be further from the truth. To the ancients, on the contrary, she was the ideal and embodiment of the wild life of nature—the life of plants, of animals, and of men—in all its exuberant fertility and profusion. As a recent German writer has admirably put it: “From of old a great goddess of nature was everywhere worshipped in Greece. She was revered on the mountain heights as in the swampy lowlands, in the rustling woods and by the murmuring spring. To the Greek her hand was everywhere apparent. He saw her gracious blessing in the sprouting meadow, in the ripening corn, in the healthful vigour of all living things on earth, whether the wild creatures of the wood and the fell, or the cattle which man has tamed to his service, or man’s own offspring from the cradle upward. Her destroying anger he perceived in the blight of vegetation, in the inroads of wild beasts on his fields and orchards, as well as in the last mysterious end of life, in death. No empty personification, like the earth conceived as a goddess, was this deity, for such abstractions are foreign to every primitive religion; she was an all-embracing power of nature, everywhere the object of a similar faith, however her names differed with the place in which she was believed to abide, with the emphasis laid on her gloomy or kindly aspect, or with the particular side of her energy which was specially revered. And as the Greek divided everything in animated nature into male and female, he could not imagine this female power of nature without her male counterpart. Hence in a number of her older worships we find Artemis associated with a nature-god of similar character, to whom tradition assigned different names in different places. In Laconia, for instance, she was mated with the old Peloponnesian god *Karneios*, in Arcadia more than once with *Poseidon*, elsewhere with *Zeus*, *Apollo*, *Dionysus*, and so on.” The truth is, that the word *parthenos* applied to Artemis, which we commonly translate virgin, means no more than an unmarried woman, and in early days the two things were by no means the same. With the growth of a purer morality among men a stricter code of ethics is imposed by them upon their gods; the stories of the cruelty, deceit, and lust of these divine beings are glossed lightly over or flatly rejected as blasphemies, and the old ruffians are set to guard the laws which before they broke. In regard to Artemis, even the ambiguous *parthenos* seems to have been

merely a popular epithet, not an official title. As Dr. Farnell has well pointed out, there was no public worship of Artemis the chaste; so far as her sacred titles bear on the relation of the sexes, they shew that, on the contrary, she was, like Diana in Italy, specially concerned with the loss of virginity and with child-bearing, and that she not only assisted but encouraged women to be fruitful and multiply; indeed, if we may take Euripides's word for it, in her capacity of midwife she would not even speak to childless women. Further, it is highly significant that while her titles and the allusions to her functions mark her out clearly as the patroness of childbirth, we find none that recognise her distinctly as a deity of marriage.

Nothing, however, sets the true character of Artemis as a goddess of fecundity, though not of wedlock, in a clearer light than her constant identification with the unmarried, but not chaste, Asiatic goddesses of love and fertility, who were worshipped with rites of notorious profligacy at their popular sanctuaries. At Ephesus, the most celebrated of all the seats of her worship, her universal motherhood was set forth unmistakably in her sacred image. Copies of it have come down to us which agree in their main features, though they differ from each other in some details. They represent the goddess with a multitude of protruding breasts; the heads of animals of many kinds, both wild and tame, spring from the front of her body in a series of bands that extend from the breasts to the feet; bees, roses, and sometimes butterflies, decorate her sides from the hips downward. The animals that thus appear to issue from her person vary in the different copies of the statue; they include lions, bulls, stags, horses, goats, and rams. Moreover, lions rest on her upper arms; in at least one copy, serpents twine round her lower arms; her bosom is festooned with a wreath of blossoms, and she wears a necklace of acorns. In one of the statues the breast of her robe is decorated with two winged male figures, who hold sheaves in both hands. It would be hard to devise a more expressive symbol of exuberant fertility, of prolific maternity, than these remarkable images. No doubt the Ephesian Artemis, with her eunuch priests and virgin priestesses, was an Oriental, whose worship the Greek colonists took over from the aborigines. But that they should have adopted it and identified the goddess with their own Artemis is proof enough that the Grecian divinity, like her Asiatic sister, was at bottom a personification of the teeming life of nature.

To return now to Troezen, we shall probably be doing no injustice either to Hippolytus or to Artemis if we suppose that the relation between them was once of a tenderer nature than appears in classical literature. We may conjecture that if he spurned the love of women, it was because he enjoyed the love of a goddess. On the principles of early religion, she who fertilises nature must herself be fertile, and to be that she must necessarily have a male consort. If I am right, Hippolytus was the consort of Artemis at Troezen, and the shorn tresses offered to him by the Troezenian youths and maidens before marriage were designed to strengthen his union with the goddess, and so to promote the fruitfulness of the earth, of cattle, and of mankind. It is some confirmation of this view that within the precinct of Hippolytus at Troezen there were worshipped two female powers named Damia and Auxesia, whose connexion with the fertility of the ground is unquestionable. When Epidaurus suffered from a dearth, the people, in obedience to an oracle, carved images of Damia and Auxesia out of sacred olive wood, and no sooner had they done so and set them up than the earth bore fruit again. Moreover, at Troezen itself, and apparently within the precinct of Hippolytus, a curious festival of stone-throwing was held in honour of these maidens, as the Troezenians called them; and it is easy to show that similar customs have been practised in many lands for the express purpose of ensuring good crops. In the story of the tragic death of the youthful Hippolytus we may discern an analogy with similar tales of other fair but mortal youths who paid with their lives for the brief rapture of the love of an immortal goddess. These hapless lovers were probably not always mere myths, and the legends which traced their spilt blood in the purple bloom of the violet, the scarlet stain of the anemone, or the crimson flush of the rose were no idle poetic emblems of youth and beauty fleeting as the summer flowers. Such

fables contain a deeper philosophy of the relation of the life of man to the life of nature—a sad philosophy which gave birth to a tragic practice. What that philosophy and that practice were we shall learn later on.

§ 3. *Recapitulation*

We can now perhaps understand why the ancients identified Hippolytus, the consort of Artemis, with Virbius, who, according to Servius, stood to Diana as Adonis to Venus, or Attis to the Mother of the Gods. For Diana, like Artemis, was a goddess of fertility in general, and of childbirth in particular. As such she, like her Greek counterpart, needed a male partner. That partner, if Servius is right, was Virbius. In his character of the founder of the sacred grove and first king of Nemi, Virbius is clearly the mythical predecessor or archetype of the line of priests who served Diana under the title of Kings of the Wood, and who came, like him, one after the other, to a violent end. It is natural, therefore, to conjecture that they stood to the goddess of the grove in the same relation in which Virbius stood to her; in short, that the mortal King of the Wood had for his queen the woodland Diana herself. If the sacred tree which he guarded with his life was supposed, as seems probable, to be her special embodiment, her priest may not only have worshipped it as his goddess but embraced it as his wife. There is at least nothing absurd in the supposition, since even in the time of Pliny a noble Roman used thus to treat a beautiful beech-tree in another sacred grove of Diana on the Alban hills. He embraced it, he kissed it, he lay under its shadow, he poured wine on its trunk. Apparently he took the tree for the goddess. The custom of physically marrying men and women to trees is still practised in India and other parts of the East. Why should it not have obtained in ancient Latium?

Reviewing the evidence as a whole, we may conclude that the worship of Diana in her sacred grove at Nemi was of great importance and immemorial antiquity; that she was revered as the goddess of woodlands and of wild creatures, probably also of domestic cattle and of the fruits of the earth; that she was believed to bless men and women with offspring and to aid mothers in childbed; that her holy fire, tended by chaste virgins, burned perpetually in a round temple within the precinct; that associated with her was a water-nymph Egeria who discharged one of Diana's own functions by succouring women in travail, and who was popularly supposed to have mated with an old Roman king in the sacred grove; further, that Diana of the Wood herself had a male companion, Virbius by name, who was to her what Adonis was to Venus, or Attis to Cybele; and, lastly, that this mythical Virbius was represented in historical times by a line of priests known as Kings of the Wood, who regularly perished by the swords of their successors, and whose lives were in a manner bound up with a certain tree in the grove, because so long as that tree was uninjured they were safe from attack.

A curious monument of the ill-fated dynasty appears to have come down to us in a double-headed bust which was found in the sanctuary at Nemi. It represents two men of heavy and somewhat coarse features and a grim expression. The type of face is similar in both heads, but there are marked differences between them; for while the one is young and beardless with shut lips and a steadfast gaze, the other is a man of middle life with a tossed and matted beard, wrinkled brows, a wild anxious look in the eyes, and an open grinning mouth. But perhaps the most singular thing about the two heads are the leaves with scalloped edges which are plastered, so to say, on the necks of both busts and apparently also under the eyes of the younger figure. The leaves have been interpreted as oak leaves, and this interpretation, which is not free from doubt, is confirmed by the resemblance to an oak leaf which the moustache of the older figure clearly presents when viewed in profile. Various explanations of this remarkable monument have been proposed; but the most probable theory appears to be that the older figure represents the priest of Nemi, the King of the Wood, in

possession, while the other face is that of his youthful adversary and possible successor. This theory would explain the coarse heavy type of both faces, which is neither Greek nor Roman but apparently barbarian; for as the priest of Nemi had always to be a runaway slave, he would commonly be a member of an alien and barbarous race. Further, it would explain the striking contrast between the set determined gaze of the younger man and the haggard, scared look of the older; on the one face we seem to read the resolution to kill, on the other the fear to die. Lastly, it would explain very simply the leaves that cling like cerements to the necks and breasts of both; for we shall see later on that the priest was probably regarded as an embodiment of the tree which he guarded, and human representatives of tree spirits are most naturally draped in the foliage of the tree which they personate. Hence if the leaves on the two heads are indeed oak leaves, as they have been thought to be, we should have to conclude that the tree which the King of the Wood guarded and personated was an oak. There are independent reasons for holding that this was so, but the consideration of them must be deferred for the present.

Clearly these conclusions do not of themselves suffice to explain the peculiar rule of succession to the priesthood. But perhaps the survey of a wider field may lead us to think that they contain in germ the solution of the problem. To that wider survey we must now address ourselves. It will be long and laborious, but may possess something of the interest and charm of a voyage of discovery, in which we shall visit many strange foreign lands, with strange foreign peoples, and still stranger customs. The wind is in the shrouds: we shake out our sails to it, and leave the coast of Italy behind us for a time.

II. Priestly Kings

The questions which we have set ourselves to answer are mainly two: first, why had Diana's priest at Nemi, the King of the Wood, to slay his predecessor? second, why before doing so had he to pluck the branch of a certain tree which the public opinion of the ancients identified with Virgil's Golden Bough? The two questions are to some extent distinct, and it will be convenient to consider them separately. We begin with the first, which, with the preliminary enquiries, will occupy this and several following volumes. In the last part of the book I shall suggest an answer to the second question.

The first point on which we fasten is the priest's title. Why was he called the King of the Wood? Why was his office spoken of as a kingdom?

The union of a royal title with priestly duties was common in ancient Italy and Greece. At Rome and in other cities of Latium there was a priest called the Sacrificial King or King of the Sacred Rites, and his wife bore the title of Queen of the Sacred Rites. In republican Athens the second annual magistrate of the state was called the King, and his wife the Queen; the functions of both were religious. For example, the king superintended the celebration of the Eleusinian mysteries, the Lenaeon festival of Dionysus, and the torch-races, which were held at several of the great Athenian festivals. Moreover, he presided at the curious trials of animals and inanimate objects, which had caused the death of a human being. To him in short were assigned, in the words of Plato, "the most solemn and most truly ancestral rites of the ancient sacrifices." Many other Greek democracies had titular kings, whose duties, so far as they are known, seem to have been priestly, and to have centred round the Common Hearth of the state. For example, in Cos the King sacrificed to Hestia, the goddess of the hearth, the equivalent of the Italian Vesta; and he received the hide and one leg of the victim as his perquisite. In Mytilene the kings, of whom there were several, invited to banquets at the Common Hearth those guests whom the state delighted to honour. In Chios, if any herdsman or shepherd drove his cows, his sheep, or his swine to pasture in a sacred grove, the first person who witnessed the transgression was bound to denounce the transgressor to the kings, under pain of incurring the wrath of the god and, what was perhaps even worse, of having to pay a fine to the offended deity. In the same island the king was charged with the duty of pronouncing the public curses, a spiritual weapon of which much use was made by the ancients. Every eighth year the King at Delphi took part in a quaint ceremony. He sat in public distributing barley-meal and pulse to all who chose to apply for the bounty, whether citizens or strangers. Then an image of a girl was brought to him, and he slapped it with his shoe. After that the president of the *Thyiads*, a college of women devoted to the orgiastic worship of Bacchus, carried away the image to a ravine and there buried it with a rope round its neck. The ceremony was said to be an expiation for the death of a girl who in a time of famine had been publicly buffeted by the king and, smarting under the insult, had hanged herself. In some cities, such as Megara, Aegosthena, and Pagae, the kingship was an annual office and the years were dated by the kings' names. The people of Priene appointed a young man king for the purpose of sacrificing a bull to Poseidon at the Panionian festival. Some Greek states had several of these titular kings, who held office simultaneously. At Rome the tradition was that the Sacrificial King had been appointed after the abolition of the monarchy in order to offer the sacrifices which before had been offered by the kings. A similar view as to the origin of the priestly kings appears to have prevailed in Greece. In itself the opinion is not improbable, and it is borne out by the example of Sparta, almost the only purely Greek state which retained the kingly form of government in historical times. For in Sparta all state

sacrifices were offered by the kings as descendants of the god. One of the two Spartan kings held the priesthood of Zeus Lacedaemon, the other the priesthood of Heavenly Zeus.

Sometimes the descendants of the old kings were allowed to retain this shadowy royalty after the real power had departed from them. Thus at Ephesus the descendants of the Ionian kings, who traced their pedigree to Codrus of Athens, kept the title of king and certain privileges, such as the right to occupy a seat of honour at the games, to wear a purple robe and carry a staff instead of a sceptre, and to preside at the rites of Eleusinian Demeter. So at Cyrene, when the monarchy was abolished, the deposed King Battus was assigned certain domains and allowed to retain some priestly functions. Thus the classical evidence points to the conclusion that in prehistoric ages, before the rise of the republican form of government, the various tribes or cities were ruled by kings, who discharged priestly duties and probably enjoyed a sacred character as reputed descendants of deities.

This combination of priestly functions with royal authority is familiar to every one. Asia Minor, for example, was the seat of various great religious capitals peopled by thousands of sacred slaves, and ruled by pontiffs who wielded at once temporal and spiritual authority, like the popes of mediaeval Rome. Such priest-ridden cities were Zela and Pessinus. Teutonic kings, again, in the old heathen days seem to have stood in the position, and to have exercised the powers, of high priests. The Emperors of China offer public sacrifices, the details of which are regulated by the ritual books. The King of Madagascar was high-priest of the realm. At the great festival of the new year, when a bullock was sacrificed for the good of the kingdom, the king stood over the sacrifice to offer prayer and thanksgiving, while his attendants slaughtered the animal. In the monarchical states which still maintain their independence among the Gallas of Eastern Africa, the king sacrifices on the mountain tops and regulates the immolation of human victims; and the dim light of tradition reveals a similar union of temporal and spiritual power, of royal and priestly duties, in the kings of that delightful region of Central America whose ancient capital, now buried under the rank growth of the tropical forest, is marked by the stately and mysterious ruins of Palenque.

Among the Matabeles the king is high-priest. Every year he offers sacrifices at the great and the little dance, and also at the festival of the new fruits, which ends the dances. On these occasions he prays to the spirits of his forefathers and likewise to his own spirit; for it is from these higher powers that he expects every blessing.

This last example is instructive because it shews that the king is something more than a priest. He prays not only to the spirits of his fathers but to his own spirit. He is clearly raised above the standard of mere humanity; there is something divine about him. Similarly we may suppose that the Spartan kings were thought not only to be descended from the great god Zeus but also to partake of his holy spirit. This is indeed indicated by a curious Spartan belief which has been recorded by Herodotus. The old historian tells us that formerly both of the Spartan kings went forth with the army to battle, but that in later times a rule was made that when one king marched out to fight the other should stay at home. "And accordingly," says Herodotus, "one of the kings remaining at home, one of the Tyndarids is left there too; for hitherto both of them were invoked and followed the kings." The Tyndarids are, of course, the heavenly twins Castor and Pollux, the sons of Zeus; and it should be remembered that the two Spartan kings themselves were believed to be descended from twins and hence may have been credited with the wondrous powers which superstition often associates with twins. The belief described by Herodotus plainly implies that one of the heavenly twins was supposed to be in constant attendance on each of their human kinsmen the two Spartan kings, staying with them where they stayed and going with them wherever they went; hence they were probably thought to aid the kings with their advice in time of need. Now Castor and Pollux are commonly represented as spearmen, and they were constantly associated or

identified, not only with stars, but also with those lurid lights which, in an atmosphere charged with electricity, are sometimes seen to play round the masts of ships under a murky sky. Moreover, similar lights were observed by the ancients to glitter in the darkness on the points of spears. Pliny tells us that he had seen such lambent flames on the spears of Roman sentinels as they paced their rounds by night in front of the camp; and it is said that Cossacks riding across the steppes on stormy nights perceive flickerings of the same sort at their lance-heads. Since, therefore, the divine brothers Castor and Pollux were believed to attend the Spartan kings, it seems not impossible that they may have been thought to accompany the march of a Spartan army in a visible form, appearing to the awe-stricken soldiers in the twilight or the darkness either as stars in the sky or as the sheen of spears on earth. Perhaps the stories of the appearance of the heavenly twins in battle, charging on their milk-white steeds at the head of the earthly chivalry, may have originated in similar lights seen to glitter in the gloaming on a point here and there in the long hedge of levelled or ported spears; for any two riders on white horses whose spearheads happened to be touched by the mystic light might easily be taken for Castor and Pollux in person. If there is any truth in this conjecture, we should conclude that the divine brothers were never seen in broad day, but only at dusk or in the darkness of night. Now their most famous appearance was at the battle of Lake Regillus, as to which we are expressly told that it was late in the evening of a summer day before the fighting was over. Such statements should not be lightly dismissed as late inventions of a rhetorical historian. The memories of great battles linger long among the peasantry of the neighbourhood.

But when we have said that the ancient kings were commonly priests also, we are far from having exhausted the religious aspect of their office. In those days the divinity that hedges a king was no empty form of speech, but the expression of a sober belief. Kings were revered, in many cases not merely as priests, that is, as intercessors between man and god, but as themselves gods, able to bestow upon their subjects and worshippers those blessings which are commonly supposed to be beyond the reach of mortals, and are sought, if at all, only by prayer and sacrifice offered to superhuman and invisible beings. Thus kings are often expected to give rain and sunshine in due season, to make the crops grow, and so on. Strange as this expectation appears to us, it is quite of a piece with early modes of thought. A savage hardly conceives the distinction commonly drawn by more advanced peoples between the natural and the supernatural. To him the world is to a great extent worked by supernatural agents, that is, by personal beings acting on impulses and motives like his own, liable like him to be moved by appeals to their pity, their hopes, and their fears. In a world so conceived he sees no limit to his power of influencing the course of nature to his own advantage. Prayers, promises, or threats may secure him fine weather and an abundant crop from the gods; and if a god should happen, as he sometimes believes, to become incarnate in his own person, then he need appeal to no higher being; he, the savage, possesses in himself all the powers necessary to further his own well-being and that of his fellow-men.

This is one way in which the idea of a man-god is reached. But there is another. Along with the view of the world as pervaded by spiritual forces, savage man has a different, and probably still older, conception in which we may detect a germ of the modern notion of natural law or the view of nature as a series of events occurring in an invariable order without the intervention of personal agency. The germ of which I speak is involved in that sympathetic magic, as it may be called, which plays a large part in most systems of superstition. In early society the king is frequently a magician as well as a priest; indeed he appears to have often attained to power by virtue of his supposed proficiency in the black or white art. Hence in order to understand the evolution of the kingship and the sacred character with which the office has commonly been invested in the eyes of savage or barbarous

peoples, it is essential to have some acquaintance with the principles of magic and to form some conception of the extraordinary hold which that ancient system of superstition has had on the human mind in all ages and all countries. Accordingly I propose to consider the subject in some detail.

III. Sympathetic Magic

§ 1. *The Principles of Magic*

If we analyse the principles of thought on which magic is based, they will probably be found to resolve themselves into two: first, that like produces like, or that an effect resembles its cause; and, second, that things which have once been in contact with each other continue to act on each other at a distance after the physical contact has been severed. The former principle may be called the Law of Similarity, the latter the Law of Contact or Contagion. From the first of these principles, namely the Law of Similarity, the magician infers that he can produce any effect he desires merely by imitating it: from the second he infers that whatever he does to a material object will affect equally the person with whom the object was once in contact, whether it formed part of his body or not. Charms based on the Law of Similarity may be called Homoeopathic or Imitative Magic. Charms based on the Law of Contact or Contagion may be called Contagious Magic. To denote the first of these branches of magic the term Homoeopathic is perhaps preferable, for the alternative term Imitative or Mimetic suggests, if it does not imply, a conscious agent who imitates, thereby limiting the scope of magic too narrowly. For the same principles which the magician applies in the practice of his art are implicitly believed by him to regulate the operations of inanimate nature; in other words, he tacitly assumes that the Laws of Similarity and Contact are of universal application and are not limited to human actions. In short, magic is a spurious system of natural law as well as a fallacious guide of conduct; it is a false science as well as an abortive art. Regarded as a system of natural law, that is, as a statement of the rules which determine the sequence of events throughout the world, it may be called Theoretical Magic: regarded as a set of precepts which human beings observe in order to compass their ends, it may be called Practical Magic. At the same time it is to be borne in mind that the primitive magician knows magic only on its practical side; he never analyses the mental processes on which his practice is based, never reflects on the abstract principles involved in his actions. With him, as with the vast majority of men, logic is implicit, not explicit: he reasons just as he digests his food in complete ignorance of the intellectual and physiological processes which are essential to the one operation and to the other. In short, to him magic is always an art, never a science; the very idea of science is lacking in his undeveloped mind. It is for the philosophic student to trace the train of thought which underlies the magician's practice; to draw out the few simple threads of which the tangled skein is composed; to disengage the abstract principles from their concrete applications; in short, to discern the spurious science behind the bastard art.

If my analysis of the magician's logic is correct, its two great principles turn out to be merely two different misapplications of the association of ideas. Homoeopathic magic is founded on the association of ideas by similarity: contagious magic is founded on the association of ideas by contiguity. Homoeopathic magic commits the mistake of assuming that things which resemble each other are the same: contagious magic commits the mistake of assuming that things which have once been in contact with each other are always in contact. But in practice the two branches are often combined; or, to be more exact, while homoeopathic or imitative magic may be practised by itself, contagious magic will generally be found to involve an application of the homoeopathic or imitative principle. Thus generally stated the two things may be a little difficult to grasp, but they will readily become intelligible when they are illustrated by particular examples. Both trains of thought are in fact extremely simple and elementary. It could hardly be otherwise, since they are familiar in the concrete, though

certainly not in the abstract, to the crude intelligence not only of the savage, but of ignorant and dull-witted people everywhere. Both branches of magic, the homoeopathic and the contagious, may conveniently be comprehended under the general name of Sympathetic Magic, since both assume that things act on each other at a distance through a secret sympathy, the impulse being transmitted from one to the other by means of what we may conceive as a kind of invisible ether, not unlike that which is postulated by modern science for a precisely similar purpose, namely, to explain how things can physically affect each other through a space which appears to be empty.

It may be convenient to tabulate as follows the branches of magic according to the laws of thought which underlie them:—

Sympathetic Magic (*Law of Sympathy*)

Homoeopathic Magic (*Law of Similarity*)

Contagious Magic (*Law of Contact*)

I will now illustrate these two great branches of sympathetic magic by examples, beginning with homoeopathic magic.

§ 2. *Homeopathic or Imitative Magic*

Perhaps the most familiar application of the principle that like produces like is the attempt which has been made by many peoples in many ages to injure or destroy an enemy by injuring or destroying an image of him, in the belief that, just as the image suffers, so does the man, and that when it perishes he must die. A few instances out of many may be given to prove at once the wide diffusion of the practice over the world and its remarkable persistence through the ages. For thousands of years ago it was known to the sorcerers of ancient India, Babylon, and Egypt, as well as of Greece and Rome, and at this day it is still resorted to by cunning and malignant savages in Australia, Africa, and Scotland. Thus the North American Indians, we are told, believe that by drawing the figure of a person in sand, ashes, or clay, or by considering any object as his body, and then pricking it with a sharp stick or doing it any other injury, they inflict a corresponding injury on the person represented. For example, when an Ojebway Indian desires to work evil on any one, he makes a little wooden image of his enemy and runs a needle into its head or heart, or he shoots an arrow into it, believing that wherever the needle pierces or the arrow strikes the image, his foe will the same instant be seized with a sharp pain in the corresponding part of his body; but if he intends to kill the person outright, he burns or buries the puppet, uttering certain magic words as he does so. So when a Cora Indian of Mexico wishes to kill a man, he makes a figure of him out of burnt clay, strips of cloth, and so forth, and then, muttering incantations, runs thorns through the head or stomach of the figure to make his victim suffer correspondingly. Sometimes the Cora Indian makes a more beneficent use of this sort of homoeopathic magic. When he wishes to multiply his flocks or herds, he models a figure of the animal he wants in wax or clay, or carves it from tuff, and deposits it in a cave of the mountains; for these Indians believe that the mountains are masters of all riches, including cattle and sheep. For every cow, deer, dog, or hen he wants, the Indian has to sacrifice a corresponding image of the creature. This may help us to understand the meaning of the figures of cattle, deer, horses, and pigs which were dedicated to Diana at Nemi. They may have been the offerings of farmers or huntsmen who hoped thereby to multiply the cattle or the game. Similarly when the Todas of Southern India desire to obtain more buffaloes, they offer silver images of these animals in the temples. The Peruvian Indians moulded images of fat mixed with grain to imitate the persons whom they disliked or feared, and then burned the effigy on the road where the intended victim was to pass. This they called burning his soul. But they drew a delicate distinction between the kinds

of materials to be used in the manufacture of these images, according as the victim was an Indian or a Viracocha, that is, a Spaniard. To kill an Indian they employed maize and the fat of a llama, to kill a Spaniard they used wheat and the fat of a pig, because Viracochas did not eat llamas and preferred wheat to maize.

A Malay charm of the same sort is as follows. Take parings of nails, hair, eyebrows, spittle, and so forth of your intended victim, enough to represent every part of his person, and then make them up into his likeness with wax from a deserted bees' comb. Scorch the figure slowly by holding it over a lamp every night for seven nights, and say:

*"It is not wax that I am scorching,
It is the liver, hearty and spleen of So-and-so that I scorch."*

After the seventh time burn the figure, and your victim will die. This charm obviously combines the principles of homoeopathic and contagious magic; since the image which is made in the likeness of an enemy contains things which once were in contact with him, namely, his nails, hair, and spittle. Another form of the Malay charm, which resembles the Ojebway practice still more closely, is to make a corpse of wax from an empty bees' comb and of the length of a footstep; then pierce the eye of the image, and your enemy is blind; pierce the stomach, and he is sick; pierce the head, and his head aches; pierce the breast, and his breast will suffer. If you would kill him outright, transfix the image from the head downwards; enshroud it as you would a corpse; pray over it as if you were praying over the dead; then bury it in the middle of a path where your victim will be sure to step over it. In order that his blood may not be on your head, you should say:

*"It is not I who am burying him,
It is Gabriel who is burying him."*

Thus the guilt of the murder will be laid on the shoulders of the archangel Gabriel, who is a great deal better able to bear it than you are. In eastern Java an enemy may be killed by means of a likeness of him drawn on a piece of paper, which is then incensed or buried in the ground. Among the Minangkabauers of Sumatra a man who is tormented by the passion of hate or of unrequited love will call in the help of a wizard in order to cause the object of his hate or love to suffer from a dangerous ulcer known as a *tinggam*. After giving the wizard the necessary instructions as to the name, bodily form, dwelling, and family of the person in question, he makes a puppet which is supposed to resemble his intended victim; and repairs with it to a wood, where he hangs the image on a tree that stands quite by itself. Muttering a spell, he then drives an instrument through the navel of the puppet into the tree, till the sap of the tree oozes through the hole thus made. The instrument which inflicts the wound bears the same name (*tinggam*) as the ulcer which is to be raised on the body of the victim, and the oozing sap is believed to be his or her life-spirit. Soon afterwards the person against whom the charm is directed begins to suffer from an ulcer, which grows worse and worse till he dies, unless a friend can procure a piece of the wood of the tree to which the image is attached.

The sorcerers of Mabuiag or Jervis Island, in Torres Straits, kept an assortment of effigies in stock ready to be operated on at the requirement of a customer. Some of the figures were of stone; these were employed when short work was to be made of a man or woman. Others were wooden; these gave the unhappy victim a little more rope, only, however, to terminate his prolonged sufferings by a painful death. The mode of operation in the latter case was to put poison, by means of a magical implement, into a wooden image, to which the name of the intended victim had been given. Next day the person aimed at would feel chilly, then waste away and die, unless the same wizard who had wrought the charm would consent to undo it.

If the sorcerer pulled off an arm or leg of the image, the human victim felt pain in the corresponding limb of his body; but if the sorcerer restored the severed arm or leg to the figure, the man recovered. Another mode of compassing a man's death in Torres Straits was to prick a wax effigy of him or her with the spine of a sting-ray; so when the man whose name had been given to the waxen image next went afishing on the reef a sting-ray would sting him in the exact part of his body where the waxen image had been pierced. Or the sorcerer might hang the effigy on the bough of a tree, and as it swayed to and fro in the wind the person represented by it would fall sick. However, he would get well again if a friend of his could induce the magician to steady the figure by sticking it firmly in the sandy bottom of the sea. When the Lerons of Borneo wish to be revenged on an enemy, they make a wooden image of him and leave it in the jungle. As it decays, he dies. More elaborate is the proceeding adopted by the Kenyahs of Borneo in similar circumstances. The operator retires with the image to a quiet spot on the river bank, and when a hawk appears in a certain part of the sky, he kills a fowl, smears its blood on the image, and puts a bit of fat in the mouth of the figure, saying, "Put fat in his mouth." By that he means, "May his head be cut off, hung up in an enemy's house, and fed with fat in the usual way." Then he strikes at the breast of the image with a small wooden spear, throws it into a pool of water reddened with red earth, and afterwards takes it out and buries it in the ground.

If an Aino of Japan desires to compass the destruction of an enemy, he will make a likeness of him out of mugwort or the guelder-rose and bury it in a hole upside down or under the trunk of a rotten tree, with a prayer to a demon to carry off the man's soul or to make his body rot away with the tree. Sometimes an Aino woman will attempt to get rid of her husband in this fashion by wrapping up his head-dress in the shape of a corpse and burying it deep in the ground, while she breathes a prayer that her husband may rot and die with the head-dress. The Japanese themselves are familiar with similar modes of enchantment. In one of their ancient books we read of a rebellious minister who made figures of the heir to the throne with intent, no doubt, to do him grievous bodily harm thereby; and sometimes a woman who has been deserted by her lover will make a straw effigy of the faithless gallant and nail it to a sacred tree, adjuring the gods to spare the tree and to visit the sacrilege on the traitor. At a shrine of Kompira there stood a pine-tree studded with nails which had been thus driven in for the purpose of doing people to death. The Chinese also are perfectly aware that you can harm a man by maltreating or cursing an image of him, especially if you have taken care to write on it his name and horoscope. This mode of venting spite on an enemy is said to be commonly practised in China. In Amoy such images, roughly made of bamboo splinters and paper, are called "substitutes of persons" and may be bought very cheap for a cash or so apiece at any shop which sells paper articles for the use of the dead or the gods; for the frugal Chinese are in the habit of palming off paper imitations of all kinds of valuables on the simple-minded ghosts and gods, who take them in all good faith for the genuine articles. As usual, the victim suffers a hurt corresponding to the hurt done to his image. Thus if you run a nail or a needle into the eyes of the puppet, your man will go more or less blind; if you stick a pin in its stomach, he will be doubled up with colic; a stab in the heart of the effigy may kill him outright; and in general the more you prick it and the louder you speak the spell, the more certain is the effect. To make assurance doubly sure it is desirable to impregnate the effigy, so to say, with the personal influence of the man by passing it clandestinely beforehand over him or hiding it, unbeknown to him, in his clothes or under his bed. If you do that, he is quite sure to die sooner or later. Naturally these nefarious practices are no new thing in the Chinese empire. There is a passage in the Chinese *Book of Rewards and Penalties* which illustrates their prevalence in days gone by. There, under the rubric "To hide an effigy of a man for the purpose of giving him the nightmare," we read as follows: "This means hiding the carved wooden effigy of a man somewhere with intent to give him the

nightmare. Kong-sun-tcho having died suddenly some time after he had succeeded to the post of treasurer, he appeared in a dream to the governor of his district and said unto him: 'I have been the victim of an odious crime, and I am come, my lord, to pray you to avenge me. My time to die had not yet come; but my servants gave me the nightmare, and I was choked in my sleep. If you will send secretly some dauntless soldiers, not one of the varlets will escape you. Under the seventh tile of the roof of my house will be found my image carved of wood. Fetch it and punish the criminals.' Next day the governor of the district had all the servants arrested, and sure enough, after some search, they found under the aforesaid tile the figure of a man in wood, a foot high, and bristling all over with nails. Bit by bit the wood changed into flesh and uttered inarticulate cries when it was struck. The governor of the district immediately reported to the prefect of the department, who condemned several of the servants to suffer the extreme rigour of the law."

When some of the aborigines of Victoria desired to destroy an enemy, they would occasionally retire to a lonely spot, and drawing on the ground a rude likeness of the victim would sit round it and devote him to destruction with cabalistic ceremonies. So dreaded was this incantation that men and women, who learned that it had been directed against them, have been known to pine away and die of fright. On the Bloomfield River in Queensland the natives think they can doom a man by making a rough wooden effigy of him and burying it in the ground, or by painting his likeness on a bull-roarer; and they believe that persons whose portraits are carved on a tree at Cape Bedford will waste away. When the wife of a Central Australian native has eloped from him and he cannot recover her, the disconsolate husband repairs with some sympathising friends to a secluded spot, where a man skilled in magic draws on the ground a rough figure supposed to represent the woman lying on her back. Beside the figure is laid a piece of green bark, which stands for her spirit or soul, and at it the men throw miniature spears which have been made for the purpose and charmed by singing over them. This barken effigy of the woman's spirit, with the little spears sticking in it, is then thrown as far as possible in the direction which she is supposed to have taken. During the whole of the operation the men chant in a low voice, the burden of their song being an invitation to the magic influence to go out and enter her body and dry up all her fat. Sooner or later—often a good deal later—her fat does dry up, she dies, and her spirit is seen in the sky in the form of a shooting star.

In Burma a rejected lover sometimes resorts to a sorcerer and engages him to make a small image of the scornful fair one, containing a piece of her clothes, or of something which she has been in the habit of wearing. Certain charms or medicines also enter into the composition of the doll, which is then hung up or thrown into the water. As a consequence the girl is supposed to go mad. In this last example, as in the first of the Malay charms noticed above, homoeopathic or imitative magic is blent with contagious magic in the strict sense of the word, since the likeness of the victim contains something which has been in contact with her person. A Matabele who wishes to avenge himself on an enemy makes a clay figure of him and pierces it with a needle; next time the man thus represented happens to engage in a fight he will be speared, just as his effigy was stabbed. The Ovambo of South-western Africa believe that some people have the power of bewitching an absent person by gazing into a vessel full of water till his image appears to them in the water; then they spit at the image and curse the man, and that seals his fate.

The ancient books of the Hindoos testify to the use of similar enchantments among their remote ancestors. To destroy his foe a man would fashion a figure of him in clay and transfix it with an arrow which had been barbed with a thorn and winged with an owl's feathers. Or he would mould the figure of wax and melt it in a fire. Sometimes effigies of the soldiers, horses, elephants, and chariots of a hostile army were modelled in dough, and then pulled in

pieces. Again, to destroy an enemy the magician might kill a red-headed lizard with the words, "I am killing So-and-so," smear it with blood, wrap it in a black cloth, and having pronounced an incantation burn it. Another way was to grind up mustard into meal, with which a figure was made of the person who was to be overcome or destroyed. Then having muttered certain spells to give efficacy to the rite, the enchanter chopped up the image, anointed it with melted butter, curds, or some such thing, and finally burnt it in a sacred pot.

In the so-called "sanguinary chapter" of the *Calica Puran* there occurs the following passage: "On the autumnal *Maha-Navami*, or when the month is in the lunar mansion *Scanda*, or *Bishácá*, let a figure be made, either of barley-meal or earth, representing the person with whom the sacrificer is at variance, and the head of the figure be struck off; after the usual texts have been used, the following text is to be used in invoking an axe on the occasion: 'Effuse, effuse blood; be terrific, be terrific; seize, destroy, for the love of *Ambica*, the head of this enemy.'"

In modern India the practices described in these old books are still carried on with mere variations of detail. The magician compounds the fatal image of earth taken from sixty-four filthy places, and mixed up with clippings of hair, parings of nails, bits of leather, and so on. Upon the breast of the image he writes the name of his enemy; then he pierces it through and through with an awl, or maims it in various ways, hoping thus to maim or kill the object of his vengeance. Among the Nambutiris of Malabar a figure representing the enemy to be destroyed is drawn on a small sheet of metal, gold by preference, on which some mystic diagrams are also inscribed. The sorcerer then declares that the bodily injury or death of the person shall take place at a certain time. After that he wraps up the little sheet in another sheet or leaf of metal (gold if possible), and buries it in a place where the victim is expected to pass. Sometimes instead of a small sheet of metal he buries a live frog or lizard enclosed in a coco-nut shell, after sticking nails into its eyes and stomach. At the same moment that the animal dies the person expires also. Among the Mohammedans of Northern India the proceeding is as follows. A doll is made of earth taken from a grave or from a place where bodies are cremated, and some sentences of the Coran are read backwards over twenty-one small wooden pegs. These pegs the operator next strikes into various parts of the body of the image, which is afterwards shrouded like a corpse, carried to a graveyard, and buried in the name of the enemy whom it is intended to injure. The man, it is believed, will die without fail after the ceremony. A slightly different form of the charm is observed by the Bâm-Margi, a very degraded sect of Hindoos in the North-West Provinces. To kill an enemy they make an image of flour or earth, and stick razors into the breast, navel, and throat, while pegs are thrust into the eyes, hands, and feet. As if this were not enough, they next construct an image of Bhairava or Durga holding a three-pronged fork in her hand; this they place so close to the effigy of the person to whom mischief is meant that the fork penetrates its breast. To injure a person a Singhalese sorcerer will procure a lock of his intended victim's hair, a paring of his nails, or a thread of his garment. Then he fashions an image of him and thrusts nails made of five metals into the joints. All these he buries where the unfortunate man is likely to pass. No sooner has he done so than the victim falls ill with swelling or stiffness of joints, or burning sensations in the body, or disfigurements of the mouth, legs, and arms.

Similar enchantments are wrought by the Moslem peoples of North Africa. Thus an Arabic treatise on magic directs that if you wish to deprive a man of the use of his limbs you should make a waxen image of him, and engrave his name and his mother's name on it with a knife of which the handle must be made of the same wax; then smite the limb of the image which answers to the particular limb of the man which you desire to disable; at the same moment the limb of flesh and blood will be paralysed. The following is another extract from the same treatise: "To injure the eyes of an enemy, take a taper and fashion it into the likeness of him

whom you would harm. Write on it the seven signs, along with the name of your enemy and the name of his mother and gouge out the two eyes of the figure with two points. Then put it in a pot with quicklime on which you must throw a little *chârib el h'amâm*, and bury the whole near the fire. The fire will make your victim to shriek and will hurt his eyes so that he will see nothing, and that the pain will cause him to utter cries of distress. But do not prolong the operation more than seven days, for he would die and you would have to answer for it at the day of the last judgment. If you wish to heal him, withdraw the figure and throw it into water. He will recover, with God's leave."

Nowhere, perhaps, were the magic arts more carefully cultivated, nowhere did they enjoy greater esteem or exercise a deeper influence on the national life than in the land of the Pharaohs. Little wonder, therefore, that the practice of enchantment by means of images was familiar to the wizards of Egypt. A drop of a man's blood, some clippings of his hair or parings of his nails, a rag of the garment which he had worn, sufficed to give a sorcerer complete power over him. These relics of his person the magician kneaded into a lump of wax, which he moulded into the likeness and dressed after the fashion of his intended victim, who was then at the mercy of his tormentor. If the image was exposed to the fire, the person whom it represented straightway fell into a burning fever; if it were stabbed with a knife, he felt the pain of the wound. Thus, for instance, a certain superintendent of the king's cattle was once prosecuted in an Egyptian court of law for having made figures of men and women in wax, thereby causing paralysis of their limbs and other grievous bodily harm. He had somehow obtained a book of magic which contained the spells and directions how to act in reciting them. Armed with this powerful instrument the rogue had shut himself up in a secret chamber, and there proceeded to cast spells over the people of his town. In ancient Babylonia also it was a common practice to make an image of clay, pitch, honey, fat, or other soft material in the likeness of an enemy, and to injure or kill him by burning, burying, or otherwise ill-treating it. Thus in a hymn to the fire-god Nusku we read:

*"Those who have made images of me, reproducing my features,
Who have taken away my breath, torn my hairs,
Who have rent my clothes, have hindered my feet from treading the dust,
May the fire-god, the strong one, break their charm."*

But both in Babylon and in Egypt this ancient tool of superstition, so baneful in the hands of the mischievous and malignant, was also pressed into the service of religion and turned to glorious account for the confusion and overthrow of demons. In a Babylonian incantation we meet with a long list of evil spirits whose effigies were burnt by the magician in the hope that, as their images melted in the fire, so the fiends themselves might melt away and disappear. Every night when the sun-god Ra sank down to his home in the glowing west he was assailed by hosts of demons under the leadership of the arch-fiend Apepi. All night long he fought them, and sometimes by day the powers of darkness sent up clouds even into the blue Egyptian sky to obscure his light and weaken his power. To aid the sun-god in this daily struggle, a ceremony was daily performed in his temple at Thebes. A figure of his foe Apepi, represented as a crocodile with a hideous face or a serpent with many coils, was made of wax, and on it the demon's name was written in green ink. Wrapt in a papyrus case, on which another likeness of Apepi had been drawn in green ink, the figure was then tied up with black hair, spat upon, hacked with a stone knife, and cast on the ground. There the priest trod on it with his left foot again and again, and then burned it in a fire made of a certain plant or grass. When Apepi himself had thus been effectually disposed of, waxen effigies of each of his principal demons, and of their fathers, mothers, and children, were made and burnt in the same way. The service, accompanied by the recitation of certain prescribed spells, was repeated not merely morning, noon, and night, but whenever a storm was raging, or heavy

rain had set in, or black clouds were stealing across the sky to hide the sun's bright disc. The fiends of darkness, clouds, and rain felt the injuries inflicted on their images as if they had been done to themselves; they passed away, at least for a time, and the beneficent sun-god shone out triumphant once more.

From the azure sky, the stately fanes, and the solemn ritual of ancient Egypt we have to travel far in space and time to the misty mountains and the humble cottages of the Scottish Highlands of to-day; but at our journey's end we shall find our ignorant countrymen seeking to attain the same end by the same means and, unhappily, with the same malignity as the Egyptian of old. To kill a person whom he hates, a modern Highlander will still make a rude clay image of him, called a *corp chre* or *corp chreadh* ("clay body"), stick it full of pins, nails, and broken bits of glass, and then place it in a running stream with its head to the current. As every pin is thrust into the figure an incantation is uttered, and the person represented feels a pain in the corresponding part of his body. If the intention is to make him die a lingering death, the operator is careful to stick no pins into the region of the heart, whereas he thrusts them into that region deliberately if he desires to rid himself of his enemy at once. And as the clay puppet crumbles away in the running water, so the victim's body is believed to waste away and turn to clay. In Islay the spell spoken over the *corp chre*, when it is ready to receive the pins, is as follows: "From behind you are like a ram with an old fleece." And as the pins are being thrust in, a long incantation is pronounced, beginning "As you waste away, may she waste away; as this wounds you, may it wound her." Sometimes, we are told, the effigy is set before a blazing fire on a door which has been taken off its hinges; there it is toasted and turned to make the human victim writhe in agony. The *corp chre* is reported to have been employed of late years in the counties of Inverness, Ross, and Sutherland. A specimen from Inverness-shire may be seen in the Pitt-Rivers Museum at Oxford. It is remarkable, however, that in the Highlands this form of magic has no power over a man who has lost any of his members. For example, though Ross-shire witches made a clay figure of "Donald of the Ear," they could not destroy him, because he had lost an ear in battle. A similar form of witchcraft, known as "burying the sheaf," seems still to linger in Ireland among the dwellers in the Bog of Ardee. The person who works the charm goes first to a chapel and says certain prayers with his back to the altar; then he takes a sheaf of wheat, which he fastens into the likeness of a human body, sticking pins in the joints of the stems and, according to one account, shaping a heart of plaited straw. This sheaf he buries in the devil's name near the house of his enemy, who will, it is supposed, gradually pine away as the sheaf decays, dying when it finally decomposes. If the enchanter desires his foe to perish speedily, he buries the sheaf in wet ground, where it will soon moulder away; but if on the other hand his wish is that his victim should linger in pain, he chooses a dry spot, where decomposition will be slow. However, in Scotland, as in Babylon and Egypt, the destruction of an image has also been employed for the discomfiture of fiends. When Shetland fishermen wish to disenchant their boat, they row it out to sea before sunrise, and as the day is dawning they burn a waxen figure in the boat, while the skipper exclaims, "Go hence, Satan."

If homoeopathic or imitative magic, working by means of images, has commonly been practised for the spiteful purpose of putting obnoxious people out of the world, it has also, though far more rarely, been employed with the benevolent intention of helping others into it. In other words, it has been used to facilitate childbirth and to procure offspring for barren women. Thus among the Esquimaux of Bering Strait a barren woman desirous of having a son will consult a shaman, who commonly makes, or causes her husband to make, a small doll-like image over which he performs certain secret rites, and the woman is directed to sleep with it under her pillow. Amongst the many ceremonies which a Thompson Indian girl of British Columbia had formerly to perform at puberty was the following. She had to run

four times in the morning, carrying two small stones which had been obtained from underneath the water. These were put in her bosom; and as she ran, they slipped down between her body and her clothes and fell to the ground. While she ran, she prayed to the Dawn that when she should be with child she might be delivered as easily as she had been delivered of these stones. Similarly among the Haida Indians of the Queen Charlotte Islands a pregnant woman would let round stones, eels, chips, or other small objects slip down over her abdomen for the sake of facilitating her delivery. Among the Nishinam Indians of California, when a woman is childless, her female friends sometimes make out of grass a rude image of a baby and tie it in a small basket after the Indian fashion. Some day, when the woman is from home, they lay this grass baby in her hut. On finding it she holds it to her breast, pretends to nurse it, and sings it lullabies. This is done as a charm to make her conceive. The Huichol Indians of Mexico believe in a certain Mother who is the goddess of conception and childbirth, and lives in a cave near Santa Catarina. A woman desirous of offspring deposits in this cave a doll made of cotton cloth to represent the baby on which her heart is set. After a while she goes back to the cave, puts the doll under her girdle, and soon afterwards is supposed to be pregnant. With a like intent Indian women in Peru used to wrap up stones like babies and leave them at the foot of a large stone, which they revered for this purpose.

Among the Makatisses, a Caffre tribe of South Africa, a traveller observed a woman carefully tending a doll made out of a gourd, adorned with necklaces of glass beads, and heavily weighted with iron ore. On enquiry he learned that she had been directed by the medicine-man to do this as a means of obtaining a child. Among the Basutos childless wives make rude effigies of clay, and give them the name of some tutelar deity. They treat these dolls as if they were real children, and beseech the divinity to whom they have dedicated them to grant them the power of conception. In Anno, a district of West Africa, women may often be seen carrying wooden dolls strapped, like babies, on their backs as a cure for sterility. In Japan, when a marriage is unfruitful, the old women of the neighbourhood come to the house and go through a pretence of delivering the wife of a child. The infant is represented by a doll. The Maoris had a household god whose image was in the form of an infant. The image was very carefully made, generally life-size, and adorned with the family jewels. Barren women nursed it and addressed it in the most endearing terms in order to become mothers.

Among the Battas of Sumatra a barren woman, who would become a mother, will make a wooden image of a child and hold it in her lap, believing that this will lead to the fulfilment of her wish. In the Babar Archipelago, when a woman desires to have a child, she invites a man who is himself the father of a large family to pray on her behalf to Upulero, the spirit of the sun. A doll is made of red cotton, which the woman clasps in her arms as if she would suckle it. Then the father of many children takes a fowl and holds it by the legs to the woman's head, saying, "O Upulero, make use of the fowl; let fall, let descend a child, I beseech you, I entreat you, let a child fall and descend into my hands and on my lap." Then he asks the woman, "Has the child come?" and she answers, "Yes, it is sucking already." After that the man holds the fowl on the husband's head, and mumbles some form of words. Lastly, the bird is killed and laid, together with some betel, on the domestic place of sacrifice. When the ceremony is over, word goes about in the village that the woman has been brought to bed, and her friends come and congratulate her. Here the pretence that a child has been born is a purely magical rite designed to secure, by means of imitation or mimicry, that a child really shall be born; but an attempt is made to add to the efficacy of the rite by means of prayer and sacrifice. To put it otherwise, magic is here blent with and reinforced by religion. In Saibai, one of the islands in Torres Straits, a similar custom of purely magical character is observed, without any religious alloy. Here, when a woman is pregnant, all the other women assemble. The husband's sister makes an image of a male child and places it before the

pregnant woman; afterwards the image is nursed until the birth of the child in order to ensure that the baby shall be a boy. To secure male offspring a woman will also press to her abdomen a fruit resembling the male organ of generation, which she then passes to another woman who has borne none but boys. This, it is clear, is imitative magic in a slightly different form. In the seventh month of a woman's pregnancy common people in Java observe a ceremony which is plainly designed to facilitate the real birth by mimicking it. Husband and wife repair to a well or to the bank of a neighbouring river. The upper part of the woman's body is bare, but young banana leaves are fastened under her arms, a small opening, or rather fold, being left in the leaves in front. Through this opening or fold in the leaves on his wife's body the husband lets fall from above a weaver's shuttle. An old woman receives the shuttle as it falls, takes it up in her arms and dandles it as if it were a baby, saying, "Oh, what a dear little child! Oh, what a beautiful little child!" Then the husband lets an egg slip through the fold, and when it lies on the ground as an emblem of the afterbirth, he takes his sword and cuts through the banana leaf at the place of the fold, obviously as if he were severing the navel-string. Persons of high rank in Java observe the ceremony after a fashion in which the real meaning of the rite is somewhat obscured. The pregnant woman is clothed in a long robe, which her husband, kneeling before her, severs with a stroke of his sword from bottom to top. Then he throws his sword on the ground and runs away as fast as he can. According to another account, the woman is wrapt round with white thread; her husband cuts it with his sword, throws away an oblong white gourd, dashes a fowl's egg to the ground, rolls along a young coco-nut on which the figures of a man and woman have been painted, and so departs in haste. Among some of the Dyaks of Borneo, when a woman is in hard labour, a wizard is called in, who essays to facilitate the delivery in a rational manner by manipulating the body of the sufferer. Meantime another wizard outside the room exerts himself to attain the same end by means which we should regard as wholly irrational. He, in fact, pretends to be the expectant mother; a large stone attached to his stomach by a cloth wrapt round his body represents the child in the womb, and, following the directions shouted to him by his colleague on the real scene of operations, he moves this make-believe baby about on his body in exact imitation of the movements of the real baby till the infant is born.

The same principle of make-believe, so dear to children, has led other peoples to employ a simulation of birth as a form of adoption, and even as a mode of restoring a supposed dead person to life. If you pretend to give birth to a boy, or even to a great bearded man who has not a drop of your blood in his veins, then, in the eyes of primitive law and philosophy, that boy or man is really your son to all intents and purposes. Thus Diodorus tells us that when Zeus persuaded his jealous wife Hera to adopt Hercules, the goddess got into bed, and clasping the burly hero to her bosom, pushed him through her robes and let him fall to the ground in imitation of a real birth; and the historian adds that in his own day the same mode of adopting children was practised by the barbarians. At the present time it is said to be still in use in Bulgaria and among the Bosnian Turks. A woman will take a boy whom she intends to adopt and push or pull him through her clothes; ever afterwards he is regarded as her very son, and inherits the whole property of his adoptive parents. Among the Berawans of Sarawak, when a woman desires to adopt a grown-up man or woman, a great many people assemble and have a feast. The adopting mother, seated in public on a raised and covered seat, allows the adopted person to crawl from behind between her legs. As soon as he appears in front he is stroked with the sweet-scented blossoms of the areca palm, and tied to the woman. Then the adopting mother and the adopted son or daughter, thus bound together, waddle to the end of the house and back again in front of all the spectators. The tie established between the two by this graphic imitation of childbirth is very strict; an offence committed against an adopted child is reckoned more heinous than one committed against a real child. In Central Africa "the Bahima practise adoption; the male relatives always take

charge of a brother's children. When a man dies his brother takes any children of the deceased and places them one by one in his wife's lap. Then he binds round her waist the thong used for tying the legs of restive cows during milking, just as is done after childbirth. The children are then brought up with his own family." In ancient Greece any man who had been supposed erroneously to be dead, and for whom in his absence funeral rites had been performed, was treated as dead to society till he had gone through the form of being born again. He was passed through a woman's lap, then washed, dressed in swaddling-clothes, and put out to nurse. Not until this ceremony had been punctually performed might he mix freely with living folk. In ancient India, under similar circumstances, the supposed dead man had to pass the first night after his return in a tub filled with a mixture of fat and water; there he sat with doubled-up fists and without uttering a syllable, like a child in the womb, while over him were performed all the sacraments that were wont to be celebrated over a pregnant woman. Next morning he got out of the tub and went through once more all the other sacraments he had formerly partaken of from his youth up; in particular, he married a wife or espoused his old one over again with due solemnity.

Amongst the Akikuyu of British East Africa every member of the tribe, whether male or female, has to go through a pretence of being born again. The age at which the ceremony is performed varies with the ability of the father to provide the goat or sheep which is required for the due observance of the rite; but it seems that the new birth generally takes place when a child is about ten years old or younger. If the child's father or mother is dead, a man or woman acts as proxy on the occasion, and in such a case the woman is thenceforth regarded by the child as its own mother. A goat or sheep is killed in the afternoon and the stomach and intestines are reserved. The ceremony takes place at evening in a hut; none but women are allowed to be present. A circular piece of the goat-skin or sheep-skin is passed over one shoulder and under the other arm of the child who is to be born again; and the animal's stomach is similarly passed over the child's other shoulder and under its other arm. The mother, or the woman who acts as mother, sits on a hide on the floor with the child between her knees. The sheep's or goat's gut is passed round her and brought in front of the child. She groans as if in labour, another woman cuts the gut as if it were the navel-string, and the child imitates the cry of a new-born infant. Until a lad has thus been born again in mimicry, he may not assist at the disposal of his father's body after death, nor help to carry him out into the wilds to breathe his last. Formerly the ceremony of the new birth was combined with the ceremony of circumcision; but the two are now kept separate. In origin we may suppose that this curious pretence of being born again regularly formed part of the initiatory rites through which every Kikuyu lad and every Kikuyu girl had to pass before he or she was recognised as a full-grown member of the tribe; for in many parts of the world a simulation of death and resurrection has been enacted by candidates on such occasions as well as on admission to the membership of certain secret societies. The intention of the mock birth or mock resurrection is not clear; but we may conjecture that it is designed, on the principles of homoeopathic or imitative magic, either to impart to the candidate the powers of a ghost or to enable him to be reborn again into the world whenever he shall have died in good earnest.

Magical images have often been employed for the amiable purpose of winning love. Thus to shoot an arrow into the heart of a clay image was an ancient Hindoo mode of securing a woman's affection; only the bow-string must be of hemp, the shaft of the arrow must be of black *ala* wood, its plume an owl's feather, and its barb a thorn. No doubt the wound inflicted on the heart of the clay image was supposed to make a corresponding impression on the woman's heart. Among the Chippeway Indians there used to be few young men or women who had not little images of the persons whose love they wished to win. They pricked the hearts of the images and inserted magical powders in the punctures, while they addressed the

effigies by the names of the persons whom they represented, bidding them requite their affection. Ancient witches and wizards melted wax in the fire in order to make the hearts of their sweethearts to melt of love. And as the wound of love may be inflicted by an image, so by an image it may be healed. How that can be done is told by Heine in a poem based on the experience of one of his own schoolfellows. It is called *The Pilgrimage to Kevlaar*, and describes how sick people offer waxen models of their ailing members to the Virgin Mary at Kevlaar in order that she may heal them of their infirmities. In the poem a lover, wasting away for love and sorrow at the death of his sweetheart, offers to the Virgin the waxen model of a heart with a prayer that she would heal his heart-ache. Such customs, still commonly observed in some parts of Catholic Europe, are interesting because they shew how in later times magic comes to be incorporated with religion. The moulding of wax images of ailing members is in its origin purely magical: the prayer to the Virgin or to a saint is purely religious: the combination of the two is a crude, if pathetic, attempt to turn both magic and religion to account for the benefit of the sufferer.

The natives of New Caledonia make use of effigies to maintain or restore harmony between husband and wife. Two spindle-shaped bundles, one representing the man and the other the woman, are tied firmly together to symbolise and ensure the amity of the couple. They are made up of various plants, together with some threads from the woman's girdle and a piece of the man's apron; a bone needle forms the axis of each. The talisman is meant to render the union of the spouses indissoluble, and is carefully treasured by them both. If, nevertheless, a domestic jar should unfortunately take place, the husband repairs to the family burying-ground with the precious packet. There he lights a fire with a wood of a particular kind, fumigates the talisman, sprinkles it with water from a prescribed source, waves it round his head, and then stirring the needle in the bundle which represents himself he says, "I change the heart of this woman, that she may love me." If the wife still remains obdurate, he ties a sugar-cane to the bundle, and presents it to her through a third person. If she eats of the sugar-cane, she feels her love for her husband revive. On her side she has the right to operate in like manner on the bundle which represents herself, always provided that she does not go to the burying-ground, which is strictly forbidden to women.

Another beneficent use of homoeopathic magic is to heal or prevent sickness. In ancient Greece, when a man died of dropsy, his children were made to sit with their feet in water until the body was burned. This was supposed to prevent the disease from attacking them.

Similarly, on the principle of water to water, among the natives of the hills near Rajamahall in India, the body of a person who has died of dropsy is thrown into a river; they think that if the corpse were buried, the disorder would return and carry off other people.

The ancient Hindoos performed an elaborate ceremony, based on homoeopathic magic, for the cure of jaundice. Its main drift was to banish the yellow colour to yellow creatures and yellow things, such as the sun, to which it properly belongs, and to procure for the patient a healthy red colour from a living, vigorous source, namely a red bull. With this intention, a priest recited the following spell: "Up to the sun shall go thy heart-ache and thy jaundice: in the colour of the red bull do we envelop thee! We envelop thee in red tints, unto long life. May this person go unscathed and be free of yellow colour! The cows whose divinity is Rohini, they who, moreover, are themselves red (*rohinih*)—in their every form and every strength we do envelop thee. Into the parrots, into the thrush, do we put thy jaundice, and, furthermore, into the yellow wagtail do we put thy jaundice." While he uttered these words, the priest, in order to infuse the rosy hue of health into the sallow patient, gave him water to sip which was mixed with the hair of a red bull; he poured water over the animal's back and made the sick man drink it; he seated him on the skin of a red bull and tied a piece of the skin to him. Then in order to improve his colour by thoroughly eradicating the yellow taint, he

proceeded thus. He first daubed him from head to foot with a yellow porridge made of turmeric or curcuma (a yellow plant), set him on a bed, tied three yellow birds, to wit a parrot, a thrush, and a yellow wagtail, by means of a yellow string to the foot of the bed; then pouring water over the patient, he washed off the yellow porridge, and with it no doubt the jaundice, from him to the birds. After that, by way of giving a final bloom to his complexion, he took some hairs of a red bull, wrapt them in gold leaf, and glued them to the patient's skin.

The ancients held that if a person suffering from jaundice looked sharply at a stone-curlew, and the bird looked steadily at him, he was cured of the disease. "Such is the nature," says Plutarch, "and such the temperament of the creature that it draws out and receives the malady which issues, like a stream, through the eyesight." So well recognised among bird-fanciers was this valuable property of the stone-curlew that when they had one of these birds for sale they kept it carefully covered, lest a jaundiced person should look at it and be cured for nothing. The virtue of the bird lay not in its colour but in its large golden eye, which, if it do not pass for a tuft of yellow lichen, is the first thing that strikes the searcher, as the bird cowers, to escape observation, on the sandy, flint-strewn surface of the ground which it loves to haunt, and with which its drab plumage blends so well that only a practised eye can easily detect it. Thus the yellow eye of the bird drew out the yellow jaundice. Pliny tells of another, or perhaps the same, bird, to which the Greeks gave their name for jaundice, because if a jaundiced man saw it, the disease left him and slew the bird. He mentions also a stone which was supposed to cure jaundice because its hue resembled that of a jaundiced skin. In modern Greece jaundice goes by the name of the Golden Disease, and very naturally it can be healed by gold. To effect a perfect cure all that you have to do is this. Take a piece of gold (best of all an English sovereign, since English gold is the purest) and put it in a measure of wine. Expose the wine with the gold to the stars for three nights; then drink three glasses of it daily till it is used up. By that time the jaundice will be quite washed out of your system. The cure is, in the strictest sense of the word, a sovereign one. A Wend cure for jaundice, like the modern Greek one, is to drink a glass of water in which a gold coin has been left overnight. A remedy based on the principle of contraries is to look steadily at pitch or other black substances. In South Russia a Jewish remedy for jaundice is to wear golden bracelets. Here the great homoeopathic principle is clearly the same as in the preceding cases, though its application is different. In Germany yellow turnips, gold coins, gold rings, saffron, and other yellow things are still esteemed remedies for jaundice, just as a stick of red sealing-wax carried on the person cures the red eruption popularly known as St. Anthony's fire, or the blood-stone with its blood-red spots allays bleeding. Another popular remedy in Germany for the red St. Anthony's fire and also for bleeding is supplied by the common crossbills. In this bird "after the first moult the difference between the sexes is shewn by the hens inclining to yellowish-green, while the cocks become diversified by orange-yellow and red, their plumage finally deepening into a rich crimson-red, varied in places by a flame-colour." The smallest reflection may convince us that these gorgeous hues must be endowed with very valuable medical properties. Accordingly in some parts of Bavaria, Saxony, and Bohemia people keep crossbills in cages in order that the red birds may draw the red St. Anthony's fire and the inflammation of fever to themselves and so relieve the human patient. Often in a peasant's cottage you may see the red bird in its cage hanging beside a sick-bed and drawing to itself the hectic flush from the cheeks of the hot and restless patient, who lies tossing under the blankets. And the dried body of a crossbill has only to be placed on a wound to stop the bleeding at once. It is not the colour only of the feathers which produces this salutary effect; the peculiar shape of the bill, which gives the bird its English and German name, is a contributory cause. For the horny sheaths of the bill cross each other obliquely, and this formation undoubtedly enables the bird to draw diseases to itself more readily than a beak of the common shape could possibly do. Curious observers have even remarked that when the

upper bill crosses the lower to the right, the bird will attract the diseases of men, whereas if the upper bill crosses the lower to the left, it will attract the diseases of women. But I cannot vouch for the accuracy of this particular observation. However that may be, certain it is that no fire will break out in a house where a crossbill is kept in a cage, neither will lightning strike the dwelling; and this immunity can only be ascribed to the protective colouring of the bird, the red hue of its plumage serving to ward off the red lightning and to nip a red conflagration in the bud. However, the poor bird seldom lives to old age; nor could this reasonably be expected of a creature which has to endure so much vicarious suffering. It generally falls a victim to one or other of the maladies of which it has relieved our ailing humanity. The causes which have given the crossbill its remarkable colour and the peculiar shape of its bill have escaped many naturalists, but they are familiar to children in Germany. The truth is that when Jesus Christ hung on the cross a flight of crossbills fluttered round him and tugged with their bills at the nails in his hands and feet to draw them out, till their feathers, which were grey before, were all bedabbled with blood, and their beaks, which had been straight, were twisted awry. So red have been their feathers and twisted their beaks from that day to this. Another cure prescribed in Germany for St. Anthony's fire is to rub the patient with ashes from a house that has been burned down; for it is easy to see that as the fire died out in that house, so St. Anthony's fire will die out in that man.

A curious application of homoeopathic magic to the cure of disease is founded on the old English superstition that if a shrew-mouse runs over a beast, be it horse, cow, or sheep, the animal suffers cruelly and may lose the use of its limb. Against this accident the farmer used to keep a shrew-ash at hand as a remedy. A shrew-ash was prepared thus. A deep hole was bored in the tree, and a shrew-mouse was thrust in alive and plugged in, probably with some incantations which have been forgotten. An ancient Indian cure for a scanty crop of hair was to pour a solution of certain plants over the head of the patient; this had to be done by a doctor who was dressed in black and had eaten black food, and the ceremony must be performed in the early morning, while the stars were fading in the sky, and before the black crows had risen cawing from their nests. The exact virtue of these plants has escaped our knowledge, but we can hardly doubt that they were dark and hairy; while the black clothes of the doctor, his black food, and the swarthy hue of the crows unquestionably combined to produce a crop of black hair on the patient's head. A more disagreeable means of attaining the same end is adopted by some of the tribes of Central Australia. To promote the growth of a boy's hair a man with flowing locks bites the youth's scalp as hard as he can, being urged thereto by his friends, who sit round watching him at his task, while the sufferer howls aloud with pain. Clearly, on the principle of capillary attraction, if I may say so, he thus imparts of his own mature abundance to the scarcity of his youthful friend.

One of the great merits of homoeopathic magic is that it enables the cure to be performed on the person of the doctor instead of on that of his victim, who is thus relieved of all trouble and inconvenience, while he sees his medical man writhe in anguish before him. For example, the peasants of Perche, in France, labour under the impression that a prolonged fit of vomiting is brought about by the patient's stomach becoming unhooked, as they call it, and so falling down. Accordingly, a practitioner is called in to restore the organ to its proper place. After hearing the symptoms he at once throws himself into the most horrible contortions, for the purpose of unhooking his own stomach. Having succeeded in the effort, he next hooks it up again in another series of contortions and grimaces, while the patient experiences a corresponding relief. Fee five francs. In like manner a Dyak medicine-man, who has been fetched in a case of illness, will lie down and pretend to be dead. He is accordingly treated like a corpse, is bound up in mats, taken out of the house, and deposited on the ground. After about an hour the other medicine-men loose the pretended dead man and bring him to life;

and as he recovers, the sick person is supposed to recover too. A cure for a tumour, based on the principle of homoeopathic magic, is prescribed by Marcellus of Bordeaux, court physician to Theodosius the First, in his curious work on medicine. It is as follows. Take a root of vervain, cut it across, and hang one end of it round the patient's neck, and the other in the smoke of the fire. As the vervain dries up in the smoke, so the tumour will also dry up and disappear. If the patient should afterwards prove ungrateful to the good physician, the man of skill can avenge himself very easily by throwing the vervain into water; for as the root absorbs the moisture once more, the tumour will return. The same sapient writer recommends you, if you are troubled with pimples, to watch for a falling star, and then instantly, while the star is still shooting from the sky, to wipe the pimples with a cloth or anything that comes to hand. Just as the star falls from the sky, so the pimples will fall from your body; only you must be very careful not to wipe them with your bare hand, or the pimples will be transferred to it.

Further, homoeopathic and in general sympathetic magic plays a great part in the measures taken by the rude hunter or fisherman to secure an abundant supply of food. On the principle that like produces like, many things are done by him and his friends in deliberate imitation of the result which he seeks to attain; and, on the other hand, many things are scrupulously avoided because they bear some more or less fanciful resemblance to others which would really be disastrous.

Nowhere is the theory of sympathetic magic more systematically carried into practice for the maintenance of the food supply than in the barren regions of Central Australia. Here the tribes are divided into a number of totem clans, each of which is charged with the duty of propagating and multiplying their totem for the good of the community by means of magical ceremonies and incantations. The great majority of the totems are edible animals and plants, and the general result supposed to be accomplished by these magical totemic ceremonies or *intichiuma*, as the Arunta call them, is that of supplying the tribe with food and other necessaries. Often the rites consist of an imitation of the effect which the people desire to produce; in other words, their magic is of the homoeopathic or imitative sort.

Thus among the Arunta the men of the witchetty grub totem perform a series of elaborate ceremonies for multiplying the grub which the other members of the tribe use as food. One of the ceremonies is a pantomime representing the fully-developed insect in the act of emerging from the chrysalis. A long narrow structure of branches is set up to imitate the chrysalis case of the grub. In this structure a number of men, who have the grub for their totem, sit and sing of the creature in its various stages. Then they shuffle out of it in a squatting posture, and as they do so they sing of the insect emerging from the chrysalis. This is supposed to multiply the numbers of the grubs. Again, in order to multiply emus, which are an important article of food, the men of the emu totem in the Arunta tribe proceed as follows. They clear a small spot of level ground, and opening veins in their arms they let the blood stream out until the surface of the ground, for a space of about three square yards, is soaked with it. When the blood has dried and caked, it forms a hard and fairly impermeable surface, on which they paint the sacred design of the emu totem, especially the parts of the bird which they like best to eat, namely, the fat and the eggs. Round this painting the men sit and sing. Afterwards performers, wearing head-dresses to represent the long neck and small head of the emu, mimic the appearance of the bird as it stands aimlessly peering about in all directions. Again, men of the hakea flower totem in the Arunta tribe perform a ceremony to make the hakea tree burst into blossom. The scene of the ceremony is a little hollow, by the side of which grows an ancient hakea tree. In the middle of the hollow is a small worn block of stone, supposed to represent a mass of hakea flowers. Before the ceremony begins, an old man of the totem carefully sweeps the ground clean, and then strokes the stone all over with his hands. After

that the men sit round the stone and chant invitations to the tree to flower much and to the blossoms to be filled with honey. Finally, at the request of the old leader, one of the young men opens a vein in his arm and lets the blood flow freely over the stone, while the rest continue to sing. The flow of blood is supposed to represent the preparation of the favourite drink of the natives, which is made by steeping the hakea flower in water. As soon as the stone is covered with blood the ceremony is complete. Again, the men of the kangaroo totem in the Arunta tribe perform ceremonies for the multiplication of kangaroos at a certain rocky ledge, which, in the opinion of the natives, is full of the spirits of kangaroos ready to go forth and inhabit kangaroo bodies. A little higher up on the hillside are two blocks of stone, which represent a male and female kangaroo respectively. At the ceremony these two blocks are rubbed with a stone by two men. Then the rocky ledge below is decorated with alternate vertical stripes of red and white, to indicate the red fur and white bones of the kangaroo. After that a number of young men sit on the ledge, open veins in their arms, and allow the blood to spurtle over the edge of the rock on which they are seated. This pouring out of the blood of the kangaroo men on the rock is thought to drive out the spirits of the kangaroos in all directions, and so to increase the number of the animals. While it is taking place, the other men sit below watching the performers and singing songs which refer to the expected increase of kangaroos. In the Kaitish tribe, when the headman of the grass seed totem wishes to make the grass grow, he takes two sacred sticks or stones (*churinga*) of the well-known bull-roarer pattern, smears them with red-ochre, and decorates them with lines and dots of down to represent grass seed. Then he rubs the sticks or stones together so that the down flies off in all directions. The down is supposed to carry with it some virtue from the sacred stick or stone whereby the grass seed is made to grow. For days afterwards the headman walks about by himself in the bush singing the grass seed and carrying one of the sacred bull-rovers (*churinga*) with him. At night he hides the implement in the bush and returns to camp, where he may have no intercourse with his wife. For during all this time he is believed to be so full of magic power, derived from the bull-roarer, that if he had intercourse with her the grass seed would not grow properly and his body would swell up when he tasted of it. When the seed begins to grow, he still goes on singing to make it grow more, but when it is fully grown he brings back the sacred implement to his camp hidden in bark; and having gathered a store of the seed he leaves it with the men of the other half of the tribe, saying, "You eat the grass seed in plenty, it is very good and grows in my country."

A somewhat similar ceremony is performed by men of the manna totem in the Arunta tribe for the increase of their totem. This manna is a product of the mulga tree (*Acacia aneura*), and resembles the better-known sugar-manna of gum trees. When the men of the totem wish to multiply the manna, they resort to a great boulder of grey rock, curiously streaked with black and white seams, which is thought to represent a mass of manna deposited there long ago by a man of the totem. The same significance is attributed to other smaller stones which rest on the top of the boulder. The headman of the totem begins the ceremony by digging up a sacred bull-roarer (*churinga*), which is buried in the earth at the foot of the boulder. It is supposed to represent a lump of manna and to have lain there ever since the remote *alcheringa* or dream time, the farthest past of which these savages have any conception. Next the headman climbs to the top of the boulder and rubs it with the bull-roarer, and after that he takes the smaller stones and with them rubs the same spot on the boulder. Meantime the other men, sitting round about, chant loudly an invitation to the dust produced by the rubbing of the stones to go out and generate a plentiful supply of manna on the mulga-trees. Finally, with twigs of the mulga the leader sweeps away the dust which has gathered on the surface of the stone; his intention is to cause the dust to settle on the mulga-trees and so produce manna.

Again, in a rocky gorge of the Murchison Range there are numbers of little heaps of rounded, water-worn stones, carefully arranged on beds of leaves and hidden away under piles of rougher quartzite blocks. In the opinion of the Warramunga tribe, these rounded stones represent euros, that is, a species of kangaroo. According to their size they stand for young or old, male or female euros. Any old man of the euro totem who happens to pass the spot may take the stones out, smear them with red ochre and rub them well. This is supposed to cause the spirits of euros to pass out from the stones and to be born as animals, thus increasing the food supply. Again, in the Warramunga tribe Messrs. Spencer and Gillen saw and heard a ceremony which was believed to multiply white cockatoos to a wonderful extent. From ten o'clock one evening until after sunrise next morning the headman of the white cockatoo totem held in his hand a rude effigy of the cockatoo and imitated the harsh cry of the bird, with exasperating monotony, all night long. When his voice failed him, his son took up the call and relieved the old man until such time as his father was rested enough to begin again.

In this last ceremony the homoeopathic or imitative character of the rite is particularly plain: the shape of the bird which is to be multiplied is mimicked by an effigy, its cry is imitated by the human voice. In others of the ceremonies just described the homoeopathic principle works by means of stones, which resemble in shape the edible animals or plants that the natives desire to increase. We shall see presently that the Melanesians similarly attribute fertilising virtues to stones of certain shapes. Meantime it deserves to be noticed that in some of these Australian rites for the multiplication of the totemic animals the blood of the men of the totem plays an important part. Similarly in a ceremony performed by men of the Dieri tribe for the multiplication of carpet-snakes and iguanas the performers wound themselves and the blood that drips from their wounds is poured on a sandhill in which a mythical ancestor is believed to be buried and from which carpet-snakes and iguanas are confidently expected to swarm forth. Again, when the headman of the fish totem in the Wonkgongaru tribe desires to make fish plentiful, he paints himself all over with red ochre, and, taking little pointed bones, goes into a pool. There he pierces his scrotum and the skin around the navel with the bones, and sits down in the water. The blood from the wounds, as it mingles with the water, is supposed to give rise to fish. In all these cases clearly a fertilising virtue is ascribed to human blood. The ascription is interesting and may possibly go some way to explain the widely-spread custom of voluntary wounds and mutilations in religious or magical rites. It may therefore be worth while, even at the cost of a digression, to enquire a little more closely into the custom as it is practised by the rude savages of Australia.

In the first place, then, the Dieri custom of pouring blood over the supposed remains of the ancestor in his sandhill closely resembles the custom observed by some of the Australian aborigines at the graves of their relatives. Thus among the tribes on the River Darling several men used to stand by the open grave and cut each other's heads with a boomerang, and then hold their bleeding heads over the grave so that the blood dripped on the corpse at the bottom of it. If the deceased was highly esteemed, the bleeding was repeated after some earth had been thrown on the corpse. Among the Arunta it is customary for the women kinsfolk to cut themselves at the grave so that blood flows upon it. Again, at the Vasse River, in Western Australia, before the body was lowered into the grave, the natives used to gash their thighs, and at the flowing of the blood they all said, "I have brought blood," and they stamped the foot forcibly on the ground, sprinkling the blood around them; then wiping the wounds with a wisp of leaves, they threw it, all bloody, on the dead man. After that they let the body down into the grave. Further, it is a common practice with the Central Australians to give human blood to the sick and aged for the purpose of strengthening them; and in order that the blood may have this effect it need not always be drunk by the infirm person, it is enough to sprinkle it on his body. For example, a young man will often open a vein in his arm and let the blood

trickle over the body of an older man in order to strengthen his aged friend; and sometimes the old man will drink a little of the blood. So in illness the blood is sometimes applied outwardly as well as inwardly, the patient both drinking it and having it rubbed over his body; sometimes apparently he only drinks it. The blood is drawn from a man or woman who is related to the sufferer either by blood or marriage, and the notion always is to convey to the sick person some of the strength of the blood-giver. In the Wiimbaio tribe, if a man had nearly killed his wife in a paroxysm of rage, the woman was laid out on the ground, and the husband's arms being tightly bound above the elbows, the medicine-man opened the veins in them and allowed the blood to flow on the prostrate body of the victim till the man grew faint. The intention of thus bleeding the man over the woman was apparently to restore her to life by means of the blood drawn from her assailant. Again, before an avenging party starts to take the life of a distant enemy, all the men stand up, open veins in their genital organs with sharp flints or pointed sticks, and allow the blood to spurtle over each other's thighs. This ceremony is supposed to strengthen the men mutually, and also to knit them so closely together that treachery henceforth becomes impossible. Sometimes for the same purpose blood is drawn from the arm and drunk by the men of the avenging party, and if one of them refuses thus to pledge himself the others will force his mouth open and pour the blood into it. After that, even if he wishes to play the traitor and to give the doomed man warning, he cannot do so; he is bound by a physical necessity to side with the avengers whose blood he has swallowed.

Further, it is worth while to notice some uses made of human blood in connexion with the ceremonies of circumcision and subincision, which all lads of the Central Australian tribes have to undergo before they are recognised as full-grown men. For example, the blood drawn from them at these operations is caught in a hollow shield and taken to certain kinsmen or kinswomen, who drink it or have it smeared on their breasts and foreheads. The motive of this practice is not mentioned, but on the analogy of the preceding customs we may conjecture that it is to strengthen the relatives who partake of the blood. This interpretation is confirmed by an analogous use in Queensland of the blood drawn from a woman at the operation which in the female sex corresponds to subincision in the male; for that blood, mixed with another ingredient, is kept and drunk as a medicine by any sick person who may be in the camp at the time. Moreover, it is corroborated by a similar use of the foreskin which has been removed at circumcision; for among the southern Arunta this piece of skin is given to the younger brother of the circumcised lad and he swallows it, in the belief that it will make him grow strong and tall. In the tribe at Fowler's Bay, who practise both circumcision and subincision, the severed foreskin is swallowed by the operator, perhaps in order to strengthen the lad sympathetically. In some tribes of North-West Australia it is the lad himself who swallows his own foreskin mixed with kangaroo flesh; while in other tribes of the same region the severed portion is taken by the relations and deposited under the bark of a large tree. The possible significance of this latter treatment of the foreskin will appear presently. Among the Kolkodoons of Cloniny, in Northern Queensland, the foreskin is strung on twine made of human hair, and is then tied round the mother's neck "to keep off the devil." In the Warramunga tribe the old men draw blood from their own subincised urethras in presence of the lads who a few days before have undergone the operation of subincision. The object of this custom, we are told, is to promote the healing of the young men's wounds and to strengthen them generally. It does not appear that the blood of the old men is drunk by or smeared upon the youths; seemingly it is supposed to benefit them sympathetically without direct contact. A similar action of blood at a distance may partly explain a very singular custom observed by the Arunta women at the moment when a lad is being subincised. The operation is performed at a distance from, but within hearing of, the women's camp. When the boy is seized in order to be operated on, the men of the party raise a loud shout of "Pirr-

rr.” At that sound the women immediately assemble in their camp, and the boy’s mother cuts gashes across the stomach and shoulders of the boy’s sisters, her own elder sisters, an old woman who furnished the boy with a sacred fire at circumcision, and all the women whose daughters he would be allowed to marry; and while she cuts she imitates the sound made by the men who are subincising her son. These cuts generally leave behind them a definite series of scars; they have a name of their own (*urpma*), and are often represented by definite lines on the bull-roarers. What the exact meaning of this extraordinary ceremony may be, I cannot say; but perhaps one of its supposed effects may be to relieve the boy’s pain by transferring it to his women-kind. In like manner, when the Warramunga men are fighting each other with blazing torches, the women burn themselves with lighted twigs in the belief that by so doing they prevent the men from inflicting serious injuries on each other. The theory further receives some support from certain practices formerly observed by the natives inhabiting the coast of New South Wales. Before lads had their noses bored, the medicine men threw themselves into contortions on the ground, and after pretending to suffer great pain were delivered of bones, which were to be used at the ceremony of nose-boring. The lads were told that the more the medicine men suffered, the less pain they themselves would feel. Again, among the same natives, when a woman was in labour, a female friend would tie one end of a cord round the sufferer’s neck and rub her own gums with the other end till they bled, probably in order to draw away the pain from the mother to herself. For a similar reason, perhaps, in Samoa, while blood was being drawn from a virgin bride, her friends, young and old, beat their heads with stones till they bled.

Lastly, in some tribes the blood shed at the circumcision and subincision of lads is collected in paper bark and buried in the bank of a pool where water-lilies grow; this is supposed to promote the growth of the lilies. Needless to say, this rude attempt at horticulture is not prompted by a simple delight in contemplating these beautiful bright blue flowers which bloom in the Australian wilderness, decking the surface of pools by countless thousands. The savages feed on the stems and roots of the lilies; that is why they desire to cultivate them. In this last practice a fertilising virtue is clearly attributed to the blood of circumcision and subincision. The Anula tribe, who among others observe the custom, obviously ascribe the same virtue to the severed foreskin, for they bury it also by the side of a pool. The Warramunga entertain the same opinion of this part of the person, for they place the foreskin in a hole made by a witchetty grub in a tree, believing that it will cause a plentiful supply of these edible grubs. Among the Unmatjera the custom is somewhat different, but taken in connexion with their traditions it is even more significant. The boy puts his severed foreskin on a shield, covers it up with a broad spear-thrower, and then carries it in the darkness of night, lest any woman should see what he is doing, to a hollow tree in which he deposits it. He tells no one where he has hidden it, except a man who stands to him in the relation of father’s sister’s son. Nowadays there is no special relation between the boy and the tree, but formerly the case seems to have been different. For according to tradition the early mythical ancestors of the tribe placed their foreskins in their *nanja* trees, that is, in their local totem centres, the trees from which their spirits came forth at birth and to which they would return after death. If, as seems highly probable, such a custom as that recorded by the tradition ever prevailed, its intention could hardly be any other than that of securing the future birth and reincarnation of the owner of the foreskin when he should have died and his spirit returned to its abode in the tree. For among all these Central tribes the belief is firmly rooted that the human soul undergoes an endless series of reincarnations, the living men and women of one generation being nothing but the spirits of their ancestors come to life again, and destined to be themselves reborn in the persons of their descendants. During the interval between two incarnations the souls live in their *nanja* spots or local totem centres, which are always natural objects such as trees or rocks. Each totem clan has a number of such totem centres

scattered over the country. There the souls of the dead men and women of the totem, but of no other, congregate during their disembodied state, and thence they issue and are born again in human form when a favourable opportunity presents itself. It might well be thought that a man's new birth would be facilitated if, in his lifetime, he could lay up a stock of vital energy for the use of his disembodied spirit after death. That he did, apparently, by detaching a portion of himself, namely the foreskin, and depositing it in his *nanja* tree, or rock, or whatever it might be.

Is it possible that in this belief and this practice we have the long lost key to the meaning of circumcision? In other words, can it be that circumcision was originally intended to ensure the rebirth at some future time of the circumcised man by disposing of the severed portion of his body in such a way as to provide him with a stock of energy on which his disembodied spirit could draw when the critical moment of reincarnation came round? The conjecture is confirmed by the observation that among the Akikuyu of British East Africa the ceremony of circumcision used to be regularly combined with a graphic pretence of rebirth enacted by the novice. If this should prove to be indeed the clue to the meaning of circumcision, it would be natural to look for an explanation of subincision along the same lines. Now we have seen that the blood of subincision is used both to strengthen relatives and to make water-lilies grow. Hence we may conjecture that the strengthening and fertilising virtue of the blood was applied, like the foreskin at circumcision, to lay up a store of energy in the *nanja* spot against the time when the man's feeble ghost would need it. The intention of both ceremonies would thus be to ensure the future reincarnation of the individual by quickening the local totem centre, the home of his disembodied spirit, with a vital portion of himself. That portion, whether the foreskin or the blood, was in a manner seed sown to grow up and provide his immortal spirit with a new body when his old body should have mouldered in the dust.

Perhaps the same theory may serve to explain another initiatory rite practised by some of the Australian aborigines, namely, the knocking out of teeth. This is the principal ceremony of initiation amongst the tribes of eastern and south-eastern Australia; and it is often practised, though not as an initiatory rite, by the Central tribes, with whom the essential rites of initiation are circumcision and subincision. On the hypothesis here suggested, we should expect to find the tooth regarded as a vital part of the man which was sacrificed to ensure another life for him after death. The durability of the teeth, compared to the corruptible nature of the greater part of the body, might be a sufficient reason with a savage philosopher for choosing this portion of the corporeal frame on which to pin his hope of immortality. The evidence at our disposal certainly does not suffice to establish this explanation of the rite; but there are some facts which seem to point in that direction. In the first place, the extracted tooth is supposed to remain in sympathetic connexion with the man from whom it has been removed; and if proper care is not taken of it, he may fall ill. With some Victorian tribes the practice was for the mother of the lad to choose a young gum-tree and to insert her son's teeth in the bark, at the fork of two of the topmost boughs. Ever afterwards the tree was held in a sense sacred. It was made known only to certain persons of the tribe, and the youth himself was never allowed to learn where his teeth had been deposited. When he died, the tree was killed by fire. Thus in a fashion the tree might be said to be bound up with the life of the man whose teeth it contained, since when he died it was destroyed. Further, among some of the Central tribes the extracted tooth is thrown away as far as possible in the direction of the spot where the man's mother is supposed to have had her camp in the far-off legendary time which is known as the *alcheringa*. May not this be done to secure the rebirth of the man's spirit in that place? In the Gnanji tribe the extracted tooth is buried by the man's or woman's mother beside a pool, for the purpose of stopping the rain and increasing the number of water-lilies that grow in the pool. Thus the same fertilising virtue is ascribed to the tooth

which is attributed to the foreskin severed at circumcision and to the blood drawn at subincision. Why the drawing of teeth should be supposed to stop rain, I cannot guess. Curiously enough, among the Central tribes generally, the extraction of teeth has a special association with rain and water. Thus among the Arunta it is practised chiefly by the members of the rain or water totem; and it is nearly if not quite obligatory on all the men and women of that totem, whereas it is merely optional with members of the other clans. Further, the ceremony is always performed among the Arunta immediately after the magical ceremony for the making of rain. In the Warramunga tribe the knocking out of the teeth generally takes place towards the end of the wet season, when the water-holes are full, and the natives do not wish any more rain to fall. Moreover, it is always performed on the banks of a water-hole. The persons to be operated on enter the pool, fill their mouths with water, spit it out in all directions, and splash the water over themselves, taking care to wet thoroughly the crown of the head. Immediately afterwards the tooth is knocked out. The Chingilli also knock out teeth towards the close of the wet season, when they think they have had enough of rain. The extracted tooth is thrown into a water-hole, in the belief that it will drive rain and clouds away. I merely note, without attempting to account for, this association between the extraction of teeth and the stopping of rain.

The natives of the Cape York Peninsula in Queensland use the extraction of the tooth to determine both a man's totem and the country to which he belongs. While the tooth is being knocked out, they mention the various districts owned or frequented by the lad's mother, her father, or other of her relatives. The one which happens to be mentioned at the moment when the tooth breaks away is the country to which the lad belongs in future, that is, the country where he will have the right to hunt and to gather roots and fruits. Further, the bloody spittle which he ejects after the extraction of the tooth is examined by the old men, who trace some likeness between it and a natural object, such as an animal, a plant, or a stone. Henceforth that object will be the young man's *ari* or totem. Some light is thrown on this ceremony by a parallel custom which the natives of the Pennefather River in Queensland observe at the birth of a child. They believe that every person's spirit undergoes a series of reincarnations, and that during the interval between two successive reincarnations the spirit stays in one or other of the haunts of Anjea, the being who causes conception in women by putting mud babies into their wombs. Hence, in order to determine where the new baby's spirit resided since it was last in the flesh, they mention Anjea's haunts one after the other while the grandmother is cutting the child's navel-string; and the place which happens to be mentioned when the navel-string breaks is the spot where the spirit lodged since its last incarnation. That is the country to which the child belongs; there he will have the right of hunting when he grows up. Hence, according to the home from which its spirit came to dwell among men, a child may be known as a baby obtained from a tree, a rock, or a pool of fresh water. Anjea, with whom the souls of the dead live till their time comes to be born again, is never seen; but you may hear him laughing in the depths of the woods, among the rocks, down in the lagoons, and along the mangrove swamps. Hence we may fairly infer that the country assigned to a man of the Cape York Peninsula at the extraction of his tooth is the one where his spirit tarried during the interval which elapsed since its last incarnation. His totem, which is determined at the same time, may possibly be the animal, plant, or other natural object in which his spirit resided since its last embodiment in human form, or perhaps rather in which a part of his spirit may be supposed to lodge outside of his body during life. The latter view is favoured by the belief of the tribe of the Pennefather River, whose practice at childbirth so closely resembles that of the Cape York natives at puberty; for the Pennefather people hold that during a man's life a portion of his spirit lodges outside of his body in his afterbirth. However that may be, it seems probable that among the Cape York natives the custom of knocking out the tooth is closely associated with a theory of reincarnation. Perhaps the same theory

explains a privilege enjoyed by the Kamilaroi tribe of New South Wales. They claimed a superiority over the surrounding tribes, and enforced their claim by exacting from them the teeth knocked out at puberty. The exaction of this tribute might have passed for a mere assertion of suzerainty, were it not that the Kamilaroi knocked out their own teeth also.

Perhaps the extracted teeth were believed to secure to their present possessors a magical control over their former owners, not only during life but after death, so that armed with them the Kamilaroi could help or hinder the rebirth of their departed friends or enemies.

Thus, if I am right, the essential feature in all the three great initiatory rites of the Australians is the removal of a vital part of the person which shall serve as a link between two successive incarnations by preparing for the novice a new body to house his spirit when its present tabernacle shall have been worn out. Now, if there is any truth in this suggestion, we should expect to find that measures to ensure reincarnation are also taken at death and burial. This seems in fact to be done. For, in the first place, the practice of pouring the blood of kinsmen and kinswomen into the grave is obviously susceptible of this explanation, since, in accordance with the Australian usages which I have cited, the blood might well be thought to strengthen the feeble ghost for a new birth. The same may be said of the Australian custom of depositing hair with the dead, for it is a common notion that the hair is the seat of strength.

Again, it has been a rule with some Australian tribes to bury their dead on the spot where they were born. This was very natural if they desired the dead man to be born again. Further, the common Australian practice of depositing the dead in trees may, in some cases at least, have been designed to facilitate rebirth; for trees are often the places in which the souls of the dead reside, and from which they come forth to be born again in human shape. Thus the Unmatjera and Kaitish tribes bury very aged women and decrepit old men in the ground; but the bodies of children, young women, and men in the prime of life are laid on platforms among the boughs of trees; and in regard to children we are definitely told that this is done in the hope that “before very long its spirit may come back again and enter the body of a woman—in all probability that of its former mother.” Further, the Arunta, who bury their dead, are careful to leave a low depression on one side of the mound, in order that the spirit may pass out and in; and this depression always faces towards the dead man’s or woman’s camping-ground in the *alcheringa* or remote past, that is, the spot which he or she inhabited in spirit form. Is not this done to let the spirit rid itself of its decaying tabernacle and repair to the place where in due time it will find a new and better body? In this connexion the final burial rites in the Binbinga, Anula, and Mara tribes are worthy of remark. Among these people the bones of the dead are, after a series of ceremonies, deposited in a hollow log, on which the dead man’s totem is painted. This log is then placed, with the bones, in the boughs of a tree beside a pool, so that if possible it overhangs the water. For about three wet seasons the father and son of the deceased, who placed the log there, are alone allowed to eat water-lilies out of that pool, and no woman is permitted to go near the spot. There the bones of the dead man remain till the log rots and they fall into the water or are carried away by a flood. When the burial rites are all over, the spirit of the deceased returns to its *mungai* spot, that is, to the place where it dwells in the interval between two successive incarnations. Sooner or later it will be born again. These rites seem, therefore, clearly to be a preparation for the new birth.

As the belief in reincarnation is shared by many peoples besides the Australians, it is natural to suppose that funeral rites intended to facilitate the rebirth of the deceased may be found in other parts of the world. Elsewhere I have cited examples of these rites: here I will add a few more. It is especially the bodies of dead infants which are the object of such ceremonies; for since their lives have been cut prematurely short, it seems reasonable to give their souls a chance of beginning again and lengthening out their existence on earth to its natural close.

But it is not always dead babies only whom the living seek thus to bring back to life. For example, we read that round about Mount Elgon in East Africa “the custom of throwing out the dead is universal among all the clans of Bagishu, except in the case of the youngest child or the old grandfather or grandmother, for whom, like the child, a prolonged life on earth is desired. . . . When it is desired to perpetuate on the earth the life of some old man or woman, or that of some young baby, the corpse is buried inside the house or just under the eaves, until another child is born to the nearest relation of the corpse. This child, male or female, takes the name of the corpse, and the Bagishu firmly believe that the spirit of the dead has passed into this new child and lives again on earth. The remains are then dug up and thrown out into the open.” Similarly among the tribes of the Lower Congo “a baby is always buried near the house of its mother, never in the bush. They think that, if the child is not buried near its mother’s house, she will be unlucky and never have any more children. It is believed that the only new thing about a child is its body. The spirit is old and formerly belonged to some deceased person, or it may have the spirit of some living person. They have two reasons for believing this. The child speaks early of strange things the mother has never taught it, so that they believe the old spirit is talking in the child. Again, if the child is like its mother, father, or uncle, they think it has the spirit of the person it resembles, and that that person will soon die. Hence a parent will resent it if you say that the baby is like him or her.” Thus it appears that the argument for the pre-existence of the human soul, which Plato and Wordsworth drew from reminiscence, is fully accepted by some negro tribes of West Africa. In the Bilaspore district of India “a still-born child, or one who has passed away before the *Chhatti* (the sixth day, the day of purification) is not taken out of the house for burial, but is placed in an earthen vessel (a *gharā*) and is buried in the doorway or in the yard of the house. Some say that this is done in order that the mother may bear another child.” It is said that among the Kondhs of India, on the day after a death, some boiled rice and a small fowl are taken to the place where the body was burned; there the fowl is split down the breast and placed on the spot, after which it is eaten and the soul of the departed is invited to enter a new-born child.

On the fifth day after a death the Gonds perform the ceremony of bringing back the soul. They go to the riverside and call aloud the name of the deceased. Then they enter the river, catch a fish or an insect, and taking it home place it among the sainted dead of the family, believing that the spirit of their lost one has thus been brought back to the house. Sometimes the fish or insect is eaten in order that the spirit which it contains may be born again as a child. When a baby died within a month or two of birth, the Hurons did not dispose of its little body like those of grown people by depositing it on a scaffold; they buried it beside the road in order, so they said, that the child might enter secretly into the womb of some woman passing by and be born again into the world. Some of the ancient rules observed with regard to funerals in the Greek island of Ceos have been ingeniously explained by Mr. F. B. Jevons as designed to secure the rebirth of the departed in one of the women of the family. The widespread custom of burying the dead in the house was perhaps instituted for the same purpose, and the ancient Greek practice of sacrificing to the dead man at the grave on his birthday may possibly have originated in the same train of thought. For example, sacrifices were annually offered on their birthdays to Hippocrates by the Coans, to Aratus by the Sicyonians, and to Epicurus by his disciples.

Now too we can fully understand the meaning of the bloody ritual in the ceremonies for the multiplication of the totem animals and plants. We have seen that a strengthening and fertilising virtue is attributed to human blood. What more natural than that it should be poured out by the men of the totem on the spot in which the disembodied spirits of the totem animals or plants are waiting for reincarnation? Clearly the rite seems intended to enable these spirits to take bodily shape and be born again, in order that they may again serve as food, if not to the men of the totem clan, at least to all the other numbers of the tribe. Later on

we shall find that the attempt to reincarnate the souls of dead animals, in order that their bodies may be eaten over again, is not peculiar to the Australian savages, but is practised with many curious rites by peoples in other parts of the world.

To sum up briefly the general theory to which the foregoing facts have thus far led us, I would say that just as the *intichiuma* rites of the Australians are, for the most part, magical ceremonies intended to secure the re-embodiment of the spirits of edible animals and plants, so their initiatory rites may perhaps be regarded as magical ceremonies designed mainly to ensure the reincarnation of human souls. Now the motive for procuring the rebirth of animals and plants is simply the desire to eat them. May not this have been one motive for attempting to resuscitate the human dead? It would seem so, for all the tribes on the Gulf of Carpentaria who have been examined by Spencer and Gillen eat their dead, and the ceremonies and traditions of the Arunta indicate that their ancestors also ate the bodies of their fellow tribesmen. In this respect the practice of the Binbinga tribe is particularly instructive. For among them the bodies of the dead are cut up and eaten, not by men of the same tribal subclass as the deceased, but by men belonging to the subclasses which compose the other intermarrying half of the tribe. This is exactly analogous to the practice which at present prevails as to the eating of the totem animal or plant among all these central and northern tribes. Among them each clan that has an edible animal or plant for its totem is supposed to provide that animal or plant for all the other clans to eat; and similarly among the Binbinga the men of any particular subclass do actually provide their own bodies for the members of the other intermarrying half of the tribe to devour. And just as in the far past the members of a totem clan appear to have subsisted regularly (though not exclusively, and perhaps not even mainly) on their totem animal or plant, so at a remote time they seem regularly to have eaten each other. Thus the Wild Dog clan of the Arunta has many traditions that their ancestors killed and ate Wild Dog men and women. Such traditions probably preserve a true reminiscence of a state of things still more savage than the present practice of the Binbinga. At that more or less remote time, if we may trust the scattered hints of custom and legend which are the only evidence we have to go upon, the men and women of a totem clan, in defiance of the customs of a later age, regularly cohabited with each other, ate their totems, and devoured each other's dead bodies. In such a state of things there was no sharp line of distinction drawn, either in theory or in practice, between a man and his totem; and this confusion is again confirmed by the legends, from which it is often difficult to make out whether the totemic ancestor spoken of is a man or an animal. And if measures were taken to resuscitate both, it may well have been primarily in order that both might be eaten again. The system was thoroughly practical in its aim; only the means it took to compass its ends were mistaken. It was in no sense a religion, unless we are prepared to bestow the name of religion on the business of the grazier and the market-gardener; for these savages certainly bred animals and plants, and perhaps bred men, for much the same reasons that a grazier and a market-gardener breed cattle and vegetables. But whereas the methods of the grazier and market-gardener rest upon the laws of nature, and therefore do really produce the effects they aim at, the methods of these savages are based on a mistaken conception of natural law, and therefore totally fail to bring about the intended result. Only they do not perceive their failure. Kindly nature, if we may personify her for a moment, draws a veil before their eyes, and herself works behind the veil those wonders of reproduction which the poor savage vainly fancies that he has wrought by his magical ceremonies and incantations. In short, totemism, as it exists at present among these tribes, appears to be mainly a crude, almost childlike attempt to satisfy the primary wants of man, especially under the hard conditions to which he is subject in the deserts of Central Australia, by magically creating everything that a savage stands in need of, and food first of all. But to say so is not to affirm that this has been the purpose, and the only purpose, of Australian totemism from the beginning. That beginning

lies far behind us in the past, and is therefore necessarily much more obscure and uncertain than the function of totemism as a fully developed system, to which alone the preceding remarks are applicable.

Our examination of the magical rites performed by the Australians for the maintenance of the food supply has led us into this digression. It is time to pass to ceremonies practised for the same purpose and on the same principles by peoples in other parts of the world.

The Indians of British Columbia live largely upon the fish which abound in their seas and rivers. If the fish do not come in due season, and the Indians are hungry, a Nootka wizard will make an image of a swimming fish and put it into the water in the direction from which the fish generally appear. This ceremony, accompanied by a prayer to the fish to come, will cause them to arrive at once. The islanders of Torres Straits use models of dugong and turtles to charm dugong and turtle to their destruction. The Toradjas of Central Celebes believe that things of the same sort attract each other by means of their indwelling spirits or vital ether. Hence they hang up the jawbones of deer and wild pigs in their houses, in order that the spirits which animate these bones may draw the living creatures of the same kind into the path of the hunter. In the island of Nias, when a wild pig has fallen into the pit prepared for it, the animal is taken out and its back is rubbed with nine fallen leaves, in the belief that this will make nine more wild pigs fall into the pit, just as the nine leaves fell from the tree. In the East Indian islands of Saparoea, Haroekoe, and Noessa Laut, when a fisherman is about to set a trap for fish in the sea, he looks out for a tree, of which the fruit has been much pecked at by birds. From such a tree he cuts a stout branch and makes of it the principal post in his fish-trap; for he believes that just as the tree lured many birds to its fruit, so the branch cut from that tree will lure many fish to the trap.

The western tribes of British New Guinea employ a charm to aid the hunter in spearing dugong or turtle. A small beetle, which haunts coco-nut trees, is placed in the hole of the spear-haft into which the spear-head fits. This is supposed to make the spear-head stick fast in the dugong or turtle, just as the beetle sticks fast to a man's skin when it bites him. When a Cambodian hunter has set his nets and taken nothing, he strips himself naked, goes some way off, then strolls up to the net as if he did not see it, lets himself be caught in it, and cries, "Hillo! what's this? I'm afraid I'm caught." After that the net is sure to catch game. A pantomime of the same sort has been acted within living memory in our Scottish Highlands. The Rev. James Macdonald, now of Reay in Caithness, tells us that in his boyhood when he was fishing with companions about Loch Aline and they had had no bites for a long time, they used to make a pretence of throwing one of their fellows overboard and hauling him out of the water, as if he were a fish; after that the trout or silloch would begin to nibble, according as the boat was on fresh or salt water. Before a Carrier Indian goes out to snare martens, he sleeps by himself for about ten nights beside the fire with a little stick pressed down on his neck. This naturally causes the fall-stick of his trap to drop down on the neck of the marten. Among the Galelareese, who inhabit a district in the northern part of Halmahera, a large island to the west of New Guinea, it is a maxim that when you are loading your gun to go out shooting, you should always put the bullet in your mouth before you insert it in the gun; for by so doing you practically eat the game that is to be hit by the bullet, which therefore cannot possibly miss the mark. A Malay who has baited a trap for crocodiles, and is awaiting results, is careful in eating his curry always to begin by swallowing three lumps of rice successively; for this helps the bait to slide more easily down the crocodile's throat. He is equally scrupulous not to take any bones out of his curry; for, if he did, it seems clear that the sharp-pointed stick on which the bait is skewered would similarly work itself loose, and the crocodile would get off with the bait. Hence in these circumstances it is prudent for the hunter, before he begins his meal, to get somebody else to take the bones out of his curry,

otherwise he may at any moment have to choose between swallowing a bone and losing the crocodile.

This last rule is an instance of the things which the hunter abstains from doing lest, on the principle that like produces like, they should spoil his luck. For it is to be observed that the system of sympathetic magic is not merely composed of positive precepts; it comprises a very large number of negative precepts, that is, prohibitions. It tells you not merely what to do, but also what to leave undone. The positive precepts are charms: the negative precepts are taboos. In fact the whole doctrine of taboo, or at all events a large part of it, would seem to be only a special application of sympathetic magic, with its two great laws of similarity and contact.

Though these laws are certainly not formulated in so many words nor even conceived in the abstract by the savage, they are nevertheless implicitly believed by him to regulate the course of nature quite independently of human will. He thinks that if he acts in a certain way, certain consequences will inevitably follow in virtue of one or other of these laws; and if the consequences of a particular act appear to him likely to prove disagreeable or dangerous, he is naturally careful not to act in that way lest he should incur them. In other words, he abstains from doing that which, in accordance with his mistaken notions of cause and effect, he falsely believes would injure him; in short, he subjects himself to a taboo. Thus taboo is so far a negative application of practical magic. Positive magic or sorcery says, "Do this in order that so and so may happen." Negative magic or taboo says, "Do not do this, lest so and so should happen." The aim of positive magic or sorcery is to produce a desired event; the aim of negative magic or taboo is to avoid an undesirable one. But both consequences, the desirable and the undesirable, are supposed to be brought about in accordance with the laws of similarity and contact. And just as the desired consequence is not really effected by the observance of a magical ceremony, so the dreaded consequence does not really result from the violation of a taboo. If the supposed evil necessarily followed a breach of taboo, the taboo would not be a taboo but a precept of morality or common sense. It is not a taboo to say, "Do not put your hand in the fire"; it is a rule of common sense, because the forbidden action entails a real, not an imaginary evil. In short, those negative precepts which we call taboo are just as vain and futile as those positive precepts which we call sorcery. The two things are merely opposite sides or poles of one great disastrous fallacy, a mistaken conception of the association of ideas. Of that fallacy, sorcery is the positive, and taboo the negative pole. If we give the general name of magic to the whole erroneous system, both theoretical and practical, then taboo may be defined as the negative side of practical magic. To put this in tabular form:—

- Magic
 - Theoretical (Magic as a pseudo-science)
 - Practical (Magic as a pseudo-art)
 - Positive Magic or Sorcery
 - Negative Magic or Taboo

I have made these remarks on taboo and its relations to magic because I am about to give some instances of taboos observed by hunters, fishermen, and others, and I wished to shew that they fall under the head of Sympathetic Magic, being only particular applications of that general theory. Thus, it is a rule with the Galelareese that when you have caught fish and strung them on a line, you may not cut the line through, or next time you go a-fishing your fishing-line will be sure to break. Among the Esquimaux of Baffin Land boys are forbidden to play cat's cradle, because if they did so their fingers might in later life become entangled in the harpoon-line. Here the taboo is obviously an application of the law of similarity, which is the basis of homoeopathic magic: as the child's fingers are entangled by the string in playing cat's cradle, so they will be entangled by the harpoon-line when he is a man and hunts

whales. Again, among the Huzuls, who inhabit the wooded north-eastern slopes of the Carpathian Mountains, the wife of a hunter may not spin while her husband is eating, or the game will turn and wind like the spindle, and the hunter will be unable to hit it. Here again the taboo is clearly derived from the law of similarity. So, too, in most parts of ancient Italy women were forbidden by law to spin on the highroads as they walked, or even to carry their spindles openly, because any such action was believed to injure the crops. Probably the notion was that the twirling of the spindle would twirl the corn-stalks and prevent them from growing straight. So, too, among the Ainos of Saghalien a pregnant woman may not spin nor twist ropes for two months before her delivery, because they think that if she did so the child's guts might be entangled like the thread. For a like reason in Bilaspore, a district of India, when the chief men of a village meet in council, no one present should twirl a spindle; for they think that if such a thing were to happen, the discussion, like the spindle, would move in a circle and never be wound up. In the East Indian islands of Saparoea, Haroekoe, and Noessa Laut, any one who comes to the house of a hunter must walk straight in; he may not loiter at the door, for were he to do so, the game would in like manner stop in front of the hunter's snares and then turn back, instead of being caught in the trap. For a similar reason it is a rule with the Toradjas of Central Celebes that no one may stand or loiter on the ladder of a house where there is a pregnant woman, for such delay would retard the birth of the child; and in various parts of Sumatra the woman herself in these circumstances is forbidden to stand at the door or on the top rung of the house-ladder under pain of suffering hard labour for her imprudence in neglecting so elementary a precaution. Malays engaged in the search for camphor eat their food dry and take care not to pound their salt fine. The reason is that the camphor occurs in the form of small grains deposited in the cracks of the trunk of the camphor-tree. Accordingly it seems plain to the Malay that if, while seeking for camphor, he were to eat his salt finely ground, the camphor would be found also in fine grains; whereas by eating his salt coarse he ensures that the grains of the camphor will also be large. Camphor hunters in Borneo use the leathery sheath of the leaf-stalk of the Penang palm as a plate for food, and during the whole of the expedition they will never wash the plate, for fear that the camphor might dissolve and disappear from the crevices of the tree. Apparently they think that to wash their plates would be to wash out the camphor crystals from the trees in which they are imbedded. In Laos, a province of Siam, a rhinoceros hunter will not wash himself for fear that as a consequence the wounds inflicted on the rhinoceros might not be mortal, and that the animal might disappear in one of the caves full of water in the mountains. The chief product of some parts of Laos is lac. This is a resinous gum exuded by a red insect on the young branches of trees, to which the little creatures have to be attached by hand. All who engage in the business of gathering the gum abstain from washing themselves and especially from cleansing their heads, lest by removing the parasites from their hair they should detach the other insects from the boughs. Some of the Brazilian Indians would never bring a slaughtered deer into their hut without first hamstringing it, believing that if they failed to do so, they and their children would never be able to run down their enemies. Apparently they thought that by hamstringing the animal they at the same stroke deprived their foemen of the use of their legs. No Arikara Indian would break a marrow bone in a hut; for they think that were he to do so their horses would break their legs in the prairie. Again, a Blackfoot Indian who has set a trap for eagles, and is watching it, would not eat rosebuds on any account; for he argues that if he did so, and an eagle alighted near the trap, the rosebuds in his own stomach would make the bird itch, with the result that instead of swallowing the bait the eagle would merely sit and scratch himself. Following this train of thought the eagle hunter also refrains from using an awl when he is looking after his snares; for surely if he were to scratch with an awl, the eagles would scratch him. The same disastrous consequence would follow if his wives and children at home used an awl while he is out after eagles, and

accordingly they are forbidden to handle the tool in his absence for fear of putting him in bodily danger.

All the foregoing taboos being based on the law of similarity may be called homoeopathic taboos. The Cholones, an Indian tribe of eastern Peru, make use of poisoned arrows in the chase, but there are some animals, such as armadillos, certain kinds of falcons, and a species of vulture, which they would on no account shoot at with these weapons. For they believe that between the poisoned arrows which they use and the supply of poison at home there exists a sympathetic relation of such a sort that if they shot at any of these creatures with poisoned shafts, all the poison at home would be spoilt, which would be a great loss to them.

Here the exact train of thought is not clear; but we may suppose that the animals in question are believed to possess a power of counteracting and annulling the effect of the poison, and that consequently if they are touched by it, all the poison, including the store of it at home, would be robbed of its virtue. However that may be, it is plain that the superstition rests on the law of contact, on the notion, namely, that things which have once been in contact remain sympathetically in contact with each other always. The poison with which the hunter wounds an animal has once been in contact with the store of poison at home; hence if the poison in the wound loses its venom, so necessarily will all the poison at home. These may be called contagious taboos.

Among the taboos observed by savages none perhaps are more numerous or important than the prohibitions to eat certain foods, and of such prohibitions many are demonstrably derived from the law of similarity and are accordingly examples of negative magic. Just as the savage eats many animals or plants in order to acquire certain desirable qualities with which he believes them to be endowed, so he avoids eating many other animals and plants lest he should acquire certain undesirable qualities with which he believes them to be infected. In eating the former he practises positive magic; in abstaining from the latter he practises negative magic. Many examples of such positive magic will meet us later on; here I will give a few instances of such negative magic or taboo. For example, in Madagascar soldiers are forbidden to eat a number of foods lest on the principle of homoeopathic magic they should be tainted by certain dangerous or undesirable properties which are supposed to inhere in these particular viands. Thus they may not taste hedgehog, "as it is feared that this animal, from its propensity of coiling up into a ball when alarmed, will impart a timid shrinking disposition to those who partake of it." Again, no soldier should eat an ox's knee, lest like an ox he should become weak in the knees and unable to march. Further, the warrior should be careful to avoid partaking of a cock that has died fighting or anything that has been speared to death; and no male animal may on any account be killed in his house while he is away at the wars. For it seems obvious that if he were to eat a cock that had died fighting, he would himself be slain on the field of battle; if he were to partake of an animal that had been speared, he would be speared himself; if a male animal were killed in his house during his absence, he would himself be killed in like manner and perhaps at the same instant. Further, the Malagasy soldier must eschew kidneys, because in the Malagasy language the word for kidney is the same as that for "shot"; so shot he would certainly be if he ate a kidney. Again, a Caffre has been known to refuse to eat two mice caught at the same time in one trap, alleging that were he to do so his wife would give birth to twins; yet the same man would eat freely of mice if they were caught singly. Clearly he imagined that if he ate the two mice he would be infected with the virus of doublets and would communicate the infection to his wife. Amongst the Zulus there are many foods which are similarly forbidden on homoeopathic principles. It may be well to give some specimens of these prohibitions as they have been described by the Zulus themselves. "There is among the black men," they say, "the custom of abstaining from certain foods. If a cow has the calf taken from her dead, and the

mother too dies before the calf is taken away, young people who have never had a child abstain from the flesh of that cow. I do not mean to speak of girls; there is not even a thought of whether they can eat it; for it is said that the cow will produce a similar evil among the women, so that one of them will be like the cow when she is in childbirth, be unable to give birth, like the cow, and die together with her child. On this account, therefore, the flesh of such a cow is abstained from. Further, pig's flesh is not eaten by girls on any account; for it is an ugly animal; its mouth is ugly, its snout is long; therefore girls do not eat it, thinking if they eat it, a resemblance to the pig will appear among their children. They abstain from it on that account. There are many things which are abstained from among black people through fear of bad resemblance; for it is said there was a person who once gave birth to an elephant, and a horse; but we do not know if that is true; but they are now abstained from on that account, through thinking that they will produce an evil resemblance if eaten; and the elephant is said to produce an evil resemblance, for when it is killed many parts of its body resemble those of a female; its breasts, for instance, are just like those of a woman. Young people, therefore, fear to eat it; it is only eaten on account of famine, when there is no food; and each of the young women say, 'It is no matter if I do give birth to an elephant and live; that is better than not to give birth to it, and die of famine.' So it is eaten from mere necessity. Another thing which is abstained from is the entrails of cattle. Men do not eat them, because they are afraid if they eat them, the enemy will stab them in the bowels. Young men do not eat them; they are eaten by old people. Another thing which is not eaten is the under lip of a bullock; for it is said, a young person must not eat it, for it will produce an evil resemblance in the child; the lip of the child will tremble continually, for the lower lip of a bullock moves constantly. They do not therefore eat it; for if a child of a young person is seen with its mouth trembling, it is said, 'It was injured by its father, who ate the lower lip of a bullock.' Also another thing which is abstained from is that portion of the paunch of a bullock which is called *umtala*; for the *umtala* has no *villi*, it has no pile; it is merely smooth and hard. It is therefore said, if it is eaten by young people, their children will be born without hair, and their heads will be bare like a man's knee. It is therefore abstained from."

The reader may have observed that in some of the foregoing examples of taboos the magical influence is supposed to operate at considerable distances; thus among the Blackfeet Indians the wives and children of an eagle hunter are forbidden to use an awl during his absence, lest the eagles should scratch the distant husband and father; and again no male animal may be killed in the house of a Malagasy soldier while he is away at the wars, lest the killing of the animal should entail the killing of the man. This belief in the sympathetic influence exerted on each other by persons or things at a distance is of the essence of magic. Whatever doubts science may entertain as to the possibility of action at a distance, magic has none; faith in telepathy is one of its first principles. A modern advocate of the influence of mind upon mind at a distance would have no difficulty in convincing a savage; the savage believed in it long ago, and what is more, he acted on his belief with a logical consistency such as his civilised brother in the faith has not yet, so far as I am aware, exhibited in his conduct. For the savage is convinced not only that magical ceremonies affect persons and things afar off, but that the simplest acts of daily life may do so too. Hence on important occasions the behaviour of friends and relations at a distance is often regulated by a more or less elaborate code of rules, the neglect of which by the one set of persons would, it is supposed, entail misfortune or even death on the absent ones. In particular when a party of men are out hunting or fighting, their kinsfolk at home are often expected to do certain things or to abstain from doing certain others, for the sake of ensuring the safety and success of the distant hunters or warriors. I will now give some instances of this magical telepathy both in its positive and in its negative aspect.

In Laos when an elephant hunter is starting for the chase, he warns his wife not to cut her hair or oil her body in his absence; for if she cut her hair the elephant would burst the toils, if she oiled herself it would slip through them. When a Dyak village has turned out to hunt wild pigs in the jungle, the people who stay at home may not touch oil or water with their hands during the absence of their friends; for if they did so, the hunters would all be “butter-fingered” and the prey would slip through their hands. In setting out to look for the rare and precious eagle-wood on the mountains, Cham peasants enjoin their wives, whom they leave at home, not to scold or quarrel in their absence, for such domestic brawls would lead to their husbands being rent in pieces by bears and tigers. A Hottentot woman whose husband is out hunting must do one of two things all the time he is away. Either she must light a fire and keep it burning till he comes back; or if she does not choose to do that, she must go to the water and continue to splash it about on the ground. When she is tired with throwing the water about, her place may be taken by her servant, but the exercise must in any case be kept up without cessation. To cease splashing the water or to let the fire out would be equally fatal to the husband’s prospect of a successful bag. In Yule Island, Torres Straits, when the men are gone to fetch sago, a fire is lit and carefully kept burning the whole time of their absence; for the people believe that if it went out the voyagers would fare ill. At the other end of the world the Lapps similarly object to extinguish a brand in water while any members of the family are out fishing, since to do so would spoil their luck.

Among the Koniags of Alaska a traveller once observed a young woman lying wrapt in a bearskin in the corner of a hut. On asking whether she were ill, he learned that her husband was out whale-fishing, and that until his return she had to lie fasting in order to ensure a good catch. Among the Esquimaux of Alaska similar notions prevail. The women during the whaling season remain in comparative idleness, as it is considered not good for them to sew while the men are out in the boats. If during this period any garments should need to be repaired, the women must take them far back out of sight of the sea and mend them there in little tents in which just one person can sit. And while the crews are at sea no work should be done at home which would necessitate pounding or hewing or any kind of noise; and in the huts of men who are away in the boats no work of any kind whatever should be carried on.

When the Esquimaux of Aivilik and Iglulik are away hunting on the ice, the bedding may not be raised up, because they think that to do so would cause the ice to crack and drift off, and so the men might be lost. And among these people in the winter, when the new moon appears, boys must run out of the snow-house, take a handful of snow, and put it into the kettle. It is believed that this helps the hunter to capture the seal and to bring it home. When the Maidu Indians of California were engaged in driving deer into the snares which they had prepared for them, and which consisted of fences stretched from tree to tree, the women and children who were left behind in the village had to observe a variety of regulations. The women had to keep quiet and spend much of the time indoors, and children might not romp, shout, jump over things, kick, run, fall down, or throw stones. If these rules were broken, it was believed that the deer would become unmanageable and would jump the fence, so that the whole drive would be unsuccessful.

While a Gilyak hunter is pursuing the game in the forest, his children at home are forbidden to make drawings on wood or on sand; for they fear that if the children did so, the paths in the forest would become as perplexed as the lines in the drawings, so that the hunter might lose his way and never return. A Russian political prisoner once taught some Gilyak children to read and write; but their parents forbade them to write when any of their fathers was away from home; for it seemed to them that writing was a peculiarly complicated form of drawing, and they stood aghast at the idea of the danger to which such a drawing would expose the hunters out in the wild woods. Among the Jukagirs of north-eastern Siberia, when a young

man is out hunting, his unmarried sister at home may not look at his footprints nor eat certain parts of the game killed by him. If she leaves the house while he is absent at the chase, she must keep her eyes fixed on the ground, and may not speak of the chase nor ask any questions about it. When a Nuba of north-eastern Africa goes to El Obeid for the first time, he tells his wife not to wash or oil herself and not to wear pearls round her neck during his absence, because by doing so she would draw down on him the most terrible misfortunes.

When Bushmen are out hunting, any bad shots they may make are set down to such causes as that the children at home are playing on the men's beds or the like, and the wives who allow such things to happen are blamed for their husbands' indifferent marksmanship.

Elephant-hunters in East Africa believe that, if their wives prove unfaithful in their absence, this gives the elephant power over his pursuer, who will accordingly be killed or severely wounded. Hence if a hunter hears of his wife's misconduct, he abandons the chase and returns home. If a Wagogo hunter is unsuccessful, or is attacked by a lion, he attributes it to his wife's misbehaviour at home, and returns to her in great wrath. While he is away hunting, she may not let any one pass behind her or stand in front of her as she sits; and she must lie on her face in bed. The Moxos Indians of eastern Bolivia thought that if a hunter's wife was unfaithful to him in his absence he would be bitten by a serpent or a jaguar. Accordingly, if such an accident happened to him, it was sure to entail the punishment, and often the death, of the woman, whether she was innocent or guilty. An Aleutian hunter of sea-otters thinks that he cannot kill a single animal if during his absence from home his wife should be unfaithful or his sister unchaste.

The Huichol Indians of Mexico treat as a demi-god a species of cactus which throws the eater into a state of ecstasy. The plant does not grow in their country, and has to be fetched every year by men who make a journey of forty-three days for the purpose. Meanwhile the wives at home contribute to the safety of their absent husbands by never walking fast, much less running, while the men are on the road. They also do their best to ensure the benefits which, in the shape of rain, good crops, and so forth, are expected to flow from the sacred mission. With this intention they subject themselves to severe restrictions like those imposed upon their husbands. During the whole of the time which elapses till the festival of the cactus is held, neither party washes except on certain occasions, and then only with water brought from the distant country where the holy plant grows. They also fast much, eat no salt, and are bound to strict continence. Any one who breaks this law is punished with illness, and, moreover, jeopardises the result which all are striving for. Health, luck, and life are to be gained by gathering the cactus, the gourd of the God of Fire; but inasmuch as the pure fire cannot benefit the impure, men and women must not only remain chaste for the time being, but must also purge themselves from the taint of past sin. Hence four days after the men have started the women gather and confess to Grandfather Fire with what men they have been in love from childhood till now. They may not omit a single one, for if they did so the men would not find a single cactus. So to refresh their memories each one prepares a string with as many knots as she has had lovers. This she brings to the temple, and, standing before the fire, she mentions aloud all the men she has scored on her string, name after name. Having ended her confession, she throws the string into the fire, and when the god has consumed it in his pure flame, her sins are forgiven her and she departs in peace. From now on the women are averse even to letting men pass near them. The cactus-seekers themselves make in like manner a clean breast of all their frailties. For every peccadillo they tie a knot on a string, and after they have "talked to all the five winds" they deliver the rosary of their sins to the leader, who burns it in the fire.

Many of the indigenous tribes of Sarawak are firmly persuaded that were the wives to commit adultery while their husbands are searching for camphor in the jungle, the camphor

obtained by the men would evaporate. Husbands can discover, by certain knots in the tree, when their wives are unfaithful; and it is said that in former days many women were killed by jealous husbands on no better evidence than that of these knots. Further, the wives dare not touch a comb while their husbands are away collecting the camphor; for if they did so, the interstices between the fibres of the tree, instead of being filled with the precious crystals, would be empty like the spaces between the teeth of a comb. While men of the Toaripi or Motumotu tribe of eastern New Guinea are away hunting, fishing, fighting, or on any long journey, the people who remain at home must observe strict chastity, and may not let the fire go out. Those of them who stay in the men's club-houses must further abstain from eating certain foods and from touching anything that belongs to others. A breach of these rules might, it is believed, entail the failure of the expedition. Among the tribes of Geelvink Bay, in north-western New Guinea, when the men are gone on a long journey, as to Ceram or Tidore, the wives and sisters left at home sing to the moon, accompanying the lay with the booming music of gongs. The singing takes place in the afternoons, beginning two or three days before the new moon, and lasting for the same time after it. If the silver sickle of the moon is seen in the sky, they raise a loud cry of joy. Asked why they do so, they answer, "Now we see the moon, and so do our husbands, and now we know that they are well; if we did not sing, they would be sick or some other misfortune would befall them." On nights when the moon is at the full the natives of Doreh, in north-western New Guinea, go out fishing on the lagoons. Their mode of proceeding is to poison the water with the pounded roots of a certain plant which has a powerful narcotic effect; the fish are stunned by it, and so easily caught. While the men are at work on the moonlit water, the people on the shore must keep as still as death with their eyes fixed on the fishermen; but no woman with child may be among them, for if she were there and looked at the water, the poison would at once lose its effect and the fish would escape. In the Kei Islands, to the south-west of New Guinea, as soon as a vessel that is about to sail for a distant port has been launched, the part of the beach on which it lay is covered as speedily as possible with palm branches, and becomes sacred. No one may thenceforth cross that spot till the ship comes home. To cross it sooner would cause the vessel to perish. Moreover, all the time that the voyage lasts three or four young girls, specially chosen for the duty, are supposed to remain in sympathetic connexion with the mariners and to contribute by their behaviour to the safety and success of the voyage. On no account, except for the most necessary purpose, may they quit the room that has been assigned to them. More than that, so long as the vessel is believed to be at sea they must remain absolutely motionless, crouched on their mats with their hands clasped between their knees. They may not turn their heads to the left or to the right or make any other movement whatsoever. If they did, it would cause the boat to pitch and toss; and they may not eat any sticky stuff, such as rice boiled in coco-nut milk, for the stickiness of the food would clog the passage of the boat through the water. When the sailors are supposed to have reached their destination, the strictness of these rules is somewhat relaxed; but during the whole time that the voyage lasts the girls are forbidden to eat fish which have sharp bones or stings, such as the sting-ray, lest their friends at sea should be involved in sharp, stinging trouble.

Where beliefs like these prevail as to the sympathetic connexion between friends at a distance, we need not wonder that above everything else war, with its stern yet stirring appeal to some of the deepest and tenderest of human emotions, should quicken in the anxious relations left behind a desire to turn the sympathetic bond to the utmost account for the benefit of the dear ones who may at any moment be fighting and dying far away. Hence, to secure an end so natural and laudable, friends at home are apt to resort to devices which will strike us as pathetic or ludicrous, according as we consider their object or the means adopted to effect it. Thus in some districts of Borneo, when a Dyak is out head-hunting, his wife or, if he is unmarried, his sister must wear a sword day and night in order that he may always be

thinking of his weapons; and she may not sleep during the day nor go to bed before two in the morning, lest her husband or brother should thereby be surprised in his sleep by an enemy. In other parts of Borneo, when the men are away on a warlike expedition, their mats are spread in their houses just as if they were at home, and the fires are kept up till late in the evening and lighted again before dawn, in order that the men may not be cold. Further, the roofing of the house is opened before daylight to prevent the distant husbands, brothers, and sons from sleeping too late, and so being surprised by the enemy. While a Malay of the Peninsula is away at the wars, his pillows and sleeping-mat at home must be kept rolled up. If any one else were to use them, the absent warrior's courage would fail and disaster would befall him. His wife and children may not have their hair cut in his absence, nor may he himself have his hair shorn.

Among the Sea Dyaks of Banting in Sarawak the women strictly observe an elaborate code of rules while the men are away fighting. Some of the rules are negative and some are positive, but all alike are based on the principles of magical homoeopathy and telepathy. Amongst them are the following. The women must wake very early in the morning and open the windows as soon as it is light; otherwise their absent husbands will oversleep themselves. The women may not oil their hair, or the men will slip. The women may neither sleep nor doze by day, or the men will be drowsy on the march. The women must cook and scatter popcorn on the verandah every morning; so will the men be agile in their movements. The rooms must be kept very tidy, all boxes being placed near the walls; for if any one were to stumble over them, the absent husbands would fall and be at the mercy of the foe. At every meal a little rice must be left in the pot and put aside; so will the men far away always have something to eat and need never go hungry. On no account may the women sit at the loom till their legs grow cramped, otherwise their husbands will likewise be stiff in their joints and unable to rise up quickly or to run away from the foe. So in order to keep their husband's joints supple the women often vary their labours at the loom by walking up and down the verandah. Further, they may not cover up their faces, or the men would not be able to find their way through the tall grass or jungle. Again, the women may not sew with a needle, or the men will tread on the sharp spikes set by the enemy in the path. Should a wife prove unfaithful while her husband is away, he will lose his life in the enemy's country. Some years ago all these rules and more were observed by the women of Banting, while their husbands were fighting for the English against rebels. But alas! these tender precautions availed them little; for many a man, whose faithful wife was keeping watch and ward for him at home, found a soldier's grave.

Among the Shans of Burma the wife of an absent warrior has to observe certain rules. Every fifth day she rests and does no work. She fills an earthen goblet with water to the brim and puts flowers into it every day. If the water sinks or the flowers fade, it is an omen of death. Moreover, she may not sleep on her husband's bed during his absence, but she sweeps the bedding clean and lays it out every night. In the island of Timor, while war is being waged, the high-priest never quits the temple; his food is brought to him or cooked inside; day and night he must keep the fire burning, for if he were to let it die out, disaster would befall the warriors and would continue so long as the hearth was cold. Moreover, he must drink only hot water during the time the army is absent; for every draught of cold water would damp the spirits of the people, so that they could not vanquish the enemy. Among the Toradjas of Central Celebes, when a party of men is out hunting for heads, the villagers who stay at home, and especially the wives of the head-hunters, have to observe certain rules in order not to hinder the absent men at their task. In the first place, the entrance to the *lobo* or spirit-house is shut. For the spirits of their fathers, who live in that house, are now away with the warriors, watching over and guarding them; and if any one entered their house in their

absence they would hear the noise and return and be very angry at being thus called back from the campaign. Moreover, the people at home have to keep the house tidy: the sleeping-mats of the absent men must be hung on beams, not rolled up as if they were to be away a long time: their wives and next-of-kin may not quit the house at night: every night a light burns in the house, and a fire must be kept up constantly at the foot of the house-ladder: garments, turbans, and head-dresses may not be laid aside at night, for if the turban or head-dress were put off the warrior's turban might drop from his head in the battle; and the wives may sew no garments. When the spirit of the head-hunter returns home in his sleep (which is the Toradja expression for a soldier's dream) he must find everything there in good order and nothing that could vex him. By the observance of these rules, say the Toradjas, the souls of the head-hunters are "covered" or protected. And in order to make them strong, that they may not soon grow weary, rice is strewed morning and evening on the floor of the house. The women too go about constantly with a certain plant of which the pods are so light and feathery that they are easily wafted by the wind, for that helps to make the men nimble-footed.

When Galelareese men are going away to war, they are accompanied down to the boats by the women. But after the leave-taking is over, the women, in returning to their houses, must be careful not to stumble or fall, and in the house they may neither be angry nor lift up weapons against each other; otherwise the men will fall and be killed in battle. Similarly, we saw that among the Chams domestic brawls at home are supposed to cause the searcher for eagle-wood to fall a prey to wild beasts on the mountains. Further, Galelareese women may not lay down the chopping knives in the house while their husbands are at the wars; the knives must always be hung up on hooks. The reason for the rule is not given; we may conjecture that it is a fear lest, if the chopping knives were laid down by the women at home, the men would be apt to lay down their weapons in the battle or at other inopportune moments. In the Kei Islands, when the warriors have departed, the women return indoors and bring out certain baskets containing fruits and stones. These fruits and stones they anoint and place on a board, murmuring as they do so, "O lord sun, moon, let the bullets rebound from our husbands, brothers, betrothed, and other relations, just as raindrops rebound from these objects which are smeared with oil." As soon as the first shot is heard, the baskets are put aside, and the women, seizing their fans, rush out of the houses. Then, waving their fans in the direction of the enemy, they run through the village, while they sing, "O golden fans! let our bullets hit, and those of the enemy miss." In this custom the ceremony of anointing stones, in order that the bullets may recoil from the men like raindrops from the stones, is a piece of pure homoeopathic or imitative magic; but the prayer to the sun, that he will be pleased to give effect to the charm, is a religious and perhaps later addition. The waving of the fans seems to be a charm to direct the bullets towards or away from their mark, according as they are discharged from the guns of friends or foes.

An old historian of Madagascar informs us that "while the men are at the wars, and until their return, the women and girls cease not day and night to dance, and neither lie down nor take food in their own houses. And although they are very voluptuously inclined, they would not for anything in the world have an intrigue with another man while their husband is at the war, believing firmly that if that happened, their husband would be either killed or wounded. They believe that by dancing they impart strength, courage, and good fortune to their husbands; accordingly during such times they give themselves no rest, and this custom they observe very religiously." Similarly a traveller of the seventeenth century writes that in Madagascar "when the man is in battle or under march, the wife continually dances and sings, and will not sleep or eat in her own house, nor admit of the use of any other man, unless she be desirous to be rid of her own; for they entertain this opinion among them, that if they suffer themselves

to be overcome in an *intestin war* at home, their husbands must suffer for it, being engaged in a *forreign expedition*; but, on the contrary, if they behave themselves chastely, and dance lustily, that then their husbands, by some certain sympathetic operation, will be able to vanquish all their combatants." We have seen that among hunters in various parts of the world the infidelity of the wife at home is believed to have a disastrous effect on her absent husband. In the Babar Archipelago, and among the Wagogo of East Africa, when the men are at the wars the women at home are bound to chastity, and in the Babar Archipelago they must fast besides. Under similar circumstances in the islands of Leti, Moa, and Lakor the women and children are forbidden to remain inside of the houses and to twine thread or weave.

Among the Tshi-speaking peoples of the Gold Coast the wives of men who are away with the army paint themselves white, and adorn their persons with beads and charms. On the day when a battle is expected to take place, they run about armed with guns, or sticks carved to look like guns, and taking green paw-paws (fruits shaped somewhat like a melon), they hack them with knives, as if they were chopping off the heads of the foe. The pantomime is no doubt merely an imitative charm, to enable the men to do to the enemy as the women do to the paw-paws. In the West African town of Framin, while the Ashantee war was raging some years ago, Mr. Fitzgerald Marriott saw a dance performed by women whose husbands had gone as carriers to the war. They were painted white and wore nothing but a short petticoat. At their head was a shrivelled old sorceress in a very short white petticoat, her black hair arranged in a sort of long projecting horn, and her black face, breasts, arms, and legs profusely adorned with white circles and crescents. All carried long white brushes made of buffalo or horse tails, and as they danced they sang, "Our husbands have gone to Ashanteeland; may they sweep their enemies off the face of the earth!" Among the Thompson Indians of British Columbia, when the men were on the war-path, the women performed dances at frequent intervals. These dances were believed to ensure the success of the expedition. The dancers flourished their knives, threw long sharp-pointed sticks forward, or drew sticks with hooked ends repeatedly backward and forward. Throwing the sticks forward was symbolic of piercing or warding off the enemy, and drawing them back was symbolic of drawing their own men from danger. The hook at the end of the stick was particularly well adapted to serve the purpose of a life-saving apparatus. The women always pointed their weapons towards the enemy's country. They painted their faces red and sang as they danced, and they prayed to the weapons to preserve their husbands and help them to kill many foes. Some had eagle-down stuck on the points of their sticks. When the dance was over, these weapons were hidden. If a woman whose husband was at the war thought she saw hair or a piece of a scalp on the weapon when she took it out, she knew that her husband had killed an enemy. But if she saw a stain of blood on it, she knew he was wounded or dead.

When the men of the Yuki tribe of Indians in California were away fighting, the women at home did not sleep; they danced continually in a circle, chanting and waving leafy wands. For they said that if they danced all the time, their husbands would not grow tired. Among the Haida Indians of the Queen Charlotte Islands, when the men had gone to war, the women at home would get up very early in the morning and pretend to make war by falling upon their children and feigning to take them for slaves. This was supposed to help their husbands to go and do likewise. If a wife were unfaithful to her husband while he was away on the war-path, he would probably be killed. For ten nights all the women at home lay with their heads towards the point of the compass to which the war-canoes had paddled away. Then they changed about, for the warriors were supposed to be coming home across the sea. At Masset the Haida women danced and sang war-songs all the time their husbands were away at the wars, and they had to keep everything about them in a certain order. It was thought that a wife might kill her husband by not observing these customs. In the Kafir district of the Hindoo Koosh, while the men are out raiding, the women abandon their work in the fields

and assemble in the villages to dance day and night. The dances are kept up most of each day and the whole of each night. Sir George Robertson, who reports the custom, more than once watched the dancers dancing at midnight and in the early morning, and could see by the fitful glow of the woodfire how haggard and tired they looked, yet how gravely and earnestly they persisted in what they regarded as a serious duty. The dances of these Kafirs are said to be performed in honour of certain of the national gods, but when we consider the custom in connexion with the others which have just been passed in review, we may reasonably surmise that it is or was originally in its essence a sympathetic charm intended to keep the absent warriors wakeful, lest they should be surprised in their sleep by the enemy. When a band of Carib Indians of the Orinoco had gone on the war-path, their friends left in the village used to calculate as nearly as they could the exact moment when the absent warriors would be advancing to attack the enemy. Then they took two lads, laid them down on a bench, and inflicted a most severe scourging on their bare backs. This the youths submitted to without a murmur, supported in their sufferings by the firm conviction, in which they had been bred from childhood, that on the constancy and fortitude with which they bore the cruel ordeal depended the valour and success of their comrades in the battle.

So much for the savage theory of telepathy in war and the chase. We pass now to other cases of homoeopathic or imitative magic. While marriageable boys of the Mekeo district in British New Guinea are making their drums, they have to live alone in the forest and to observe a number of rules which are based on the principle of homoeopathic magic. The drums will be used in the dances, and in order that they may give out a resonant sonorous note, great care must be taken in their construction. The boys may spend from two days to a week at the task. Having chosen a suitable piece of wood, they scrape the outside into shape with a shell, and hollow out the inside by burning it with a hot coal till the sides are very thin. The skin of an iguana, made supple by being steeped in coco-nut milk, is then stretched over the hollow and tightened with string and glue. All the time a boy is at work on his drum, he must carefully avoid women; for if a woman or a girl were to see him, the drum would split and sound like an old cracked pot. If he ate fish, a bone would prick him and the skin of the drum would burst. If he ate a red banana it would choke him, and the drum would give a dull stifled note; if he tasted grated coco-nut, the white ants, like the white particles of the nut, would gnaw the body of the drum; if he cooked his food in the ordinary round-bellied pot, he would grow fat and would not be able to dance, and the girls would despise him and say, "Your belly is big; it is a pot!" Moreover, he must strictly shun water; for if he accidentally touched it with his feet, his hands, or his lips before the drum was quite hollowed out, he would throw the instrument away, saying: "I have touched water; my hot coal will be put out, and I shall never be able to hollow out my drum." A Highland witch can sink a ship by homoeopathic or imitative magic. She has only to set a small round dish floating in a milk-pan full of water, and then to croon her spell. When the dish upsets in the pan, the ship will go down in the sea. They say that once three witches from Harris left home at night after placing the milk-pan thus on the floor, and strictly charging a serving-maid to let nothing come near it. But while the girl was not looking a duck came in and squattered about in the water on the floor. Next morning the witches returned and asked if anything had come near the pan. The girl said "No," whereupon one of the witches said to the others, "What a heavy sea we had last night coming round Cabag head!" If a wolf has carried off a sheep or a pig, the Esthonians have a very simple mode of making him drop it. They let fall anything that they happen to have at hand, such as a cap or a glove, or, what is perhaps still better, they lift a heavy stone and then let it go. By that act, on the principle of homoeopathic magic, they compel the wolf to let go his booty.

Among the many beneficent uses to which a mistaken ingenuity has applied the principle of homoeopathic or imitative magic, is that of causing trees and plants to bear fruit in due season. In Thuringen the man who sows flax carries the seed in a long bag which reaches from his shoulders to his knees, and he walks with long strides, so that the bag sways to and fro on his back. It is believed that this will cause the flax to wave in the wind. In the interior of Sumatra rice is sown by women who, in sowing, let their hair hang loose down their back, in order that the rice may grow luxuriantly and have long stalks. Similarly, in ancient Mexico a festival was held in honour of the goddess of maize, or "the long-haired mother," as she was called. It began at the time "when the plant had attained its full growth, and fibres shooting forth from the top of the green ear indicated that the grain was fully formed. During this festival the women wore their long hair unbound, shaking and tossing it in the dances which were the chief feature in the ceremonial, in order that the tassel of the maize might grow in like profusion, that the grain might be correspondingly large and flat, and that the people might have abundance." It is a Malay maxim to plant maize when your stomach is full, and to see to it that your dibble is thick; for this will swell the ear of the maize. And they say that you should sow rice also with a full stomach, for then the ears will be full. The eminent novelist, Mr. Thomas Hardy, was once told that the reason why certain trees in front of his house, near Weymouth, did not thrive, was that he looked at them before breakfast on an empty stomach. More elaborate still are the measures taken by an Esthonian peasant woman to make her cabbages thrive. On the day when they are sown she bakes great pancakes, in order that the cabbages may have great broad leaves; and she wears a dazzling white hood in the belief that this will cause the cabbages to have fine white heads. Moreover, as soon as the cabbages are transplanted, a small round stone is wrapt up tightly in a white linen rag and set at the end of the cabbage bed, because in this way the cabbage heads will grow very white and firm. Among the Huzuls of the Carpathians, when a woman is planting cabbages, she winds many cloths about her head, in order that the heads of the cabbages may also be thick. And as soon as she has sown parsley, she grasps the calf of her leg with both hands, saying, "May it be as thick as that!" Among the Kurs of East Prussia, who inhabit the long sandy tongue of land known as the Nehrung which parts the Baltic from a lagoon, when a farmer sows his fields in spring, he carries an axe and chops the earth with it, in order that the cornstalks may be so sturdy that an axe will be needed to hew them down. For much the same reason a Bavarian sower in sowing wheat will sometimes wear a golden ring, in order that the corn may have a fine yellow colour. The Malagasy think that only people with a good even set of teeth should plant maize, for otherwise there will be empty spaces in the maize cob corresponding to the empty spaces in the planter's teeth.

In many parts of Europe dancing or leaping high in the air are approved homoeopathic modes of making the crops grow high. Thus in Franche-Comté they say that you should dance at the Carnival in order to make the hemp grow tall. In the Vosges mountains the sower of hemp pulls his nether garments up as far as he can, because he imagines that the hemp he is sowing will attain the precise height to which he has succeeded in hitching up his breeches; and in the same region another way of ensuring a good crop of hemp is to dance on the roof of the house on Twelfth Day. In Swabia and among the Transylvanian Saxons it is a common custom for a man who has sown hemp to leap high on the field, in the belief that this will make the hemp grow tall. All over Baden till recently it was the custom for the farmer's wife to give the sower a dish of eggs or a cake baked with eggs either before or after sowing, in order that he might leap as high as possible. This was deemed the best way of making the hemp grow high. For the same purpose some people who had sown hemp used to dance the hemp dance, as it was called, on Shrove Tuesday, and in this dance also the dancers jumped as high as they could. In some parts of Baden the hemp seed is thrown in the air as high as possible, and in Katzenthal the urchins leap over fires in order that the hemp may grow tall.

Similarly in many other parts of Germany and Austria the peasant imagines that he makes the flax grow tall by dancing or leaping high, or by jumping backwards from a table; the higher the leap the taller will the flax be that year. The special season for thus promoting the growth of flax is Shrove Tuesday, but in some places it is Candlemas or Walpurgis Night (the eve of May Day). The scene of the performance is the flax field, the farmhouse, or the village tavern. In some parts of Eastern Prussia the girls dance one by one in a large hoop at midnight on Shrove Tuesday. The hoop is adorned with leaves, flowers, and ribbons, and attached to it are a small bell and some flax. Strictly speaking, the hoop should be wrapt in white linen handkerchiefs, but the place of these is often taken by many-coloured bits of cloth, wool, and so forth. While dancing within the hoop each girl has to wave her arms vigorously and cry "Flax grow!" or words to that effect. When she has done, she leaps out of the hoop, or is lifted out of it by her partner. In Anhalt, when the sower had sown the flax, he leaped up and flung the seed-bag high in the air, saying, "Grow and turn green! You have nothing else to do." He hoped that the flax would grow as high as he flung the seed-bag in the air. At Quellendorff, in Anhalt, the first bushel of seed-corn had to be heaped up high in order that the corn-stalks should grow tall and bear plenty of grain. When Macedonian farmers have done digging their fields, they throw their spades up into the air, and catching them again, exclaim, "May the crop grow as high as the spade has gone!"

The notion that a person can influence a plant homoeopathically by his act or condition comes out clearly in a remark made by a Malay woman. Being asked why she stripped the upper part of her body naked in reaping the rice, she explained that she did it to make the rice-husks thinner, as she was tired of pounding thick-husked rice. Clearly, she thought that the less clothing she wore the less husk there would be on the rice. Among the Minangkabauers of Sumatra, when a rice barn has been built a feast is held, of which a woman far advanced in pregnancy must partake. Her condition will obviously help the rice to be fruitful and multiply. Among the Zulus a pregnant woman sometimes grinds corn, which is afterwards burnt among the half-grown crops in order to fertilise them. For a similar reason in Syria when a fruit-tree does not bear, the gardener gets a pregnant woman to fasten a stone to one of its branches; then the tree will be sure to bear fruit, but the woman will run a risk of miscarriage, having transferred her fertility, or part of it, to the tree. The practice of loading with stones a tree which casts its fruit is mentioned by Maimonides, though the Rabbis apparently did not understand it. The proceeding was most probably a homoeopathic charm designed to load the tree with fruit. In Swabia they say that if a fruit-tree does not bear, you should keep it loaded with a heavy stone all summer, and next year it will be sure to bear.

The custom of tying stones to fruit-trees in order to ensure a crop of fruit is followed also in Sicily. The magic virtue of a pregnant woman to communicate fertility is known to Bavarian and Austrian peasants, who think that if you give the first fruit of a tree to a woman with child to eat, the tree will bring forth abundantly next year. In Bohemia for a similar purpose the first apple of a young tree is sometimes plucked and eaten by a woman who has borne many children, for then the tree will be sure to bear many apples. In the Zürcher Oberland, Switzerland, they think that a cherry-tree will bear abundantly if its first fruit is eaten by a woman who has just given birth to her first child. In Macedonia the first fruit of a tree should not be eaten by a barren woman but by one who has many children. The Nicobar Islanders think it lucky to get a pregnant woman and her husband to plant seed in gardens. The Greeks and Romans sacrificed pregnant victims to the goddesses of the corn and of the earth, doubtless in order that the earth might teem and the corn swell in the ear. When a Catholic priest remonstrated with the Indians of the Orinoco on allowing their women to sow the fields in the blazing sun, with infants at their breasts, the men answered, "Father, you don't understand these things, and that is why they vex you. You know that women are accustomed to bear children, and that we men are not. When the women sow, the stalk of the maize bears

two or three ears, the root of the yucca yields two or three basketfuls, and everything multiplies in proportion. Now why is that? Simply because the women know how to bring forth, and know how to make the seed which they sow bring forth also. Let them sow, then; we men don't know as much about it as they do." For the same reason, probably, the Tupinambas of Brazil thought that if a certain earth-almond were planted by the men, it would not grow. Among the Ilocans of Luzon the men sow bananas, but the sower must have a young child on his shoulder, or the bananas will bear no fruit. When a tree bears no fruit, the Galelareese think it is a male; and their remedy is simple. They put a woman's petticoat on the tree, which, being thus converted into a female, will naturally prove prolific. On the other hand the Baganda believe that a barren wife infects her husband's garden with her own sterility and prevents the trees from bearing fruit; hence a childless woman is generally divorced. For a like reason, probably, the Wajagga of East Africa throw away the corpse of a childless woman, with all her belongings, in the forest or in any other place where the land is never cultivated; moreover her body is not carried out of the door of the hut, but a special passage is broken for it through the wall, no doubt to prevent her dangerous ghost from finding its way back.

Thus on the theory of homoeopathic magic a person can influence vegetation either for good or for evil according to the good or the bad character of his acts or states: for example, a fruitful woman makes plants fruitful, a barren woman makes them barren. Hence this belief in the noxious and infectious nature of certain personal qualities or accidents has given rise to a number of prohibitions or rules of avoidance: people abstain from doing certain things lest they should homoeopathically infect the fruits of the earth with their own undesirable state or condition. All such customs of abstention or rules of avoidance are examples of negative magic or taboo. Thus, for example, arguing from what may be called the infectiousness of personal acts or states, the Galelareese say that you ought not to shoot with a bow and arrows under a fruit-tree, or the tree will cast its fruit even as the arrows fall to the ground; and that when you are eating water-melon you ought not to mix the pips which you spit out of your mouth with the pips which you have put aside to serve as seed; for if you do, though the pips you spat out may certainly spring up and blossom, yet the blossoms will keep falling off just as the pips fell from your mouth, and thus these pips will never bear fruit. Precisely the same train of thought leads the Bavarian peasant to believe that if he allows the graft of a fruit-tree to fall on the ground, the tree that springs from that graft will let its fruit fall untimely. The Indians of Santiago Tepehuacan suppose that if a single grain of the maize which they are about to sow were eaten by an animal, the birds and the wild boars would come and devour all the rest, and nothing would grow. And if any of these Indians has ever in his life buried a corpse, he will never be allowed to plant a fruit-tree, for they say that the tree would wither. And they will not let such a man go fishing with them, for the fish would flee from him.

Clearly these Indians imagine that anybody who has buried a corpse is thereby tainted, so to say, with an infection of death, which might prove fatal to fruits and fish. In Nias, the day after a man has made preparations for planting rice he may not use fire, or the crop would be parched; he may not spread his mats on the ground, or the young plants would droop towards the earth. When the Chams of Cochinchina are sowing their dry rice-fields and desire that no rain should fall, they eat their rice dry instead of moistening it, as they usually do, with the water in which vegetables and fish have been boiled. That prevents rain from spoiling the rice.

In the foregoing cases a person is supposed to influence vegetation homoeopathically. He infects trees or plants with qualities or accidents, good or bad, resembling and derived from his own. But on the principle of homoeopathic magic the influence is mutual: the plant can infect the man just as much as the man can infect the plant. In magic, as I believe in physics,

action and reaction are equal and opposite. The Cherokee Indians are adepts in practical botany of the homoeopathic sort. Thus wiry roots of the catgut plant or devil's shoestring (*Tephrosia*) are so tough that they can almost stop a ploughshare in the furrow. Hence Cherokee women wash their heads with a decoction of the roots to make the hair strong, and Cherokee ball-players wash themselves with it to toughen their muscles. To help them to spring quickly to their feet when they are thrown to the ground, these Indian ball-players also bathe their limbs with a decoction of the small rush (*Juncus tenuis*), which, they say, always recovers its erect position, no matter how often it is trampled down. To improve a child's memory the Cherokees beat up burs in water which has been fetched from a roaring waterfall. The virtue of the potion is threefold. The voice of the Long Man or river-god is heard in the roar of the cataract; the stream seizes and holds things cast upon its surface; and there is nothing that sticks like a bur. Hence it seems clear that with the potion the child will drink in the lessons taught by the voice of the waters, will seize them like the stream, and stick fast to them like a bur. For a like reason the Cherokee fisherman ties the plant called Venus' flytrap (*Dionaea*) to his fishtrap, and he chews the plant and spits it on the bait. That will be sure to make the trap and the bait catch fish, just as Venus' flytrap catches and digests the insects which alight on it. The Kei islanders think that certain creepers which adhere firmly to the trunks of trees prevent voyagers at sea from being wafted hither and thither at the mercy of the wind and the waves; the adhesive power of the plants enables the mariners to go straight to their destination. It is a Galelareese belief that if you eat a fruit which has fallen to the ground, you will yourself contract a disposition to stumble and fall; and that if you partake of something which has been forgotten (such as a sweet potato left in the pot or a banana in the fire), you will become forgetful. The Galelareese are also of opinion that if a woman were to consume two bananas growing from a single head she would give birth to twins. The Guarani Indians of South America thought that a woman would become a mother of twins if she ate a double grain of millet. In Vedic times a curious application of this principle supplied a charm by which a banished prince might be restored to his kingdom. He had to eat food cooked on a fire which was fed with wood which had grown out of the stump of a tree which had been cut down. The recuperative power manifested by such a tree would in due course be communicated through the fire to the food, and so to the prince, who ate the food which was cooked on the fire which was fed with the wood which grew out of the tree. Among the Lkuñgen Indians of Vancouver Island an infallible means of making your hair grow long is to rub it with fish oil and the pulverised fruit of a particular kind of poplar (*Populus trichocarpa*). As the fruit grows a long way up the tree, it cannot fail to make your hair grow long too. At Allumba, in Central Australia, there is a tree to which the sun, in the shape of a woman, is said to have travelled from the east. The natives believe that if the tree were destroyed, they would all be burned up; and that were any man to kill and eat an opossum from this tree, the food would burn up all his inward parts so that he would die. The Sundanese of the Indian Archipelago regard certain kinds of wood as unsuitable for use in house-building, especially such trees as have prickles or thorns on their trunks. They think that the life of people who lived in a house made of such timber would be thorny and full of trouble. Again, if a house is built of trees that have fallen, or lost their leaves through age, the inmates would die soon or would be hard put to it to earn their bread. Again, wood from a house that has been burnt down should never be used in building, for it would cause a fire to break out in the new house. In Java some people would not build a house with the wood of a tree that has been uprooted by a storm, lest the house should fall down in like manner; and they take care not to construct the upright and the horizontal parts (the standing and lying parts, as they call them) of the edifice out of the same tree. The reason for this precaution is a belief that if the standing and lying woodwork was made out of the same tree, the inmates of the house would constantly suffer from ill health; no sooner had one of them got up from a

bed of sickness than another would have to lie down on it; and so it would go on, one up and another down, perpetually. Before Cherokee braves went forth to war the medicine-man used to give each man a small charmed root which made him absolutely invulnerable. On the eve of battle the warrior bathed in a running stream, chewed a portion of the root and spat the juice on his body in order that the bullets might slide from his skin like the drops of water. Some of my readers perhaps doubt whether this really made the men bomb-proof. There is a barren and paralysing spirit of scepticism abroad at the present day which is most deplorable. However, the efficacy of this particular charm was proved in the Civil War, for three hundred Cherokees served in the army of the South; and they were never, or hardly ever, wounded in action. Near Charlotte Waters, in Central Australia, there is a tree which sprang up to mark the spot where a blind man died. It is called the Blind Tree by the natives, who think that if it were cut down all the people of the neighbourhood would become blind. A man who wishes to deprive his enemy of sight need only go to the tree by himself and rub it, muttering his wish and exhorting the magic virtue to go forth and do its baleful work.

In this last example the infectious quality, though it emanates directly from a tree, is derived originally from a man—namely, the blind man—who was buried at the place where the tree grew. Similarly, the Central Australians believe that a certain group of stones at Undiara are the petrified boils of an old man who long ago plucked them from his body and left them there; hence any man who wishes to infect his enemy with boils will go to these stones and throw miniature spears at them, taking care that the points of the spears strike the stones. Then the spears are picked up, and thrown one by one in the direction of the person whom it is intended to injure. The spears carry with them the magic virtue from the stones, and the result is an eruption of painful boils on the body of the victim. Sometimes a whole group of people can be afflicted in this way by a skilful magician. These examples introduce us to a fruitful branch of homoeopathic magic, namely to that department of it which works by means of the dead; for just as the dead can neither see nor hear nor speak, so you may on homoeopathic principles render people blind, deaf, and dumb by the use of dead men's bones or anything else that is tainted by the infection of death. Thus among the Galelareese, when a young man goes a-wooing at night, he takes a little earth from a grave and strews it on the roof of his sweetheart's house just above the place where her parents sleep. This, he fancies, will prevent them from waking while he converses with his beloved, since the earth from the grave will make them sleep as sound as the dead. Burglars in all ages and many lands have been patrons of this species of magic, which is very useful to them in the exercise of their profession. Thus a South Slavonian housebreaker sometimes begins operations by throwing a dead man's bone over the house, saying, with pungent sarcasm, "As this bone may waken, so may these people waken"; after that not a soul in the house can keep his or her eyes open. Similarly, in Java the burglar takes earth from a grave and sprinkles it round the house which he intends to rob; this throws the inmates into a deep sleep. With the same intention a Hindoo will strew ashes from a pyre at the door of the house; Indians of Peru scatter the dust of dead men's bones; and Ruthenian burglars remove the marrow from a human shin-bone, pour tallow into it, and having kindled the tallow, march thrice round the house with this candle burning, which causes the inmates to sleep a death-like sleep. Or the Ruthenian will make a flute out of a human leg-bone and play upon it; whereupon all persons within hearing are overcome with drowsiness. The Indians of Mexico employed for this maleficent purpose the left fore-arm of a woman who had died in giving birth to her first child; but the arm had to be stolen. With it they beat the ground before they entered the house which they designed to plunder; this caused every one in the house to lose all power of speech and motion; they were as dead, hearing and seeing everything, but perfectly powerless; some of them, however, really slept and even snored. In Europe similar properties were ascribed to the Hand of Glory, which was the dried and pickled hand of a man who had

been hanged. If a candle made of the fat of a malefactor who had also died on the gallows was lighted and placed in the Hand of Glory as in a candlestick, it rendered motionless all persons to whom it was presented; they could not stir a finger any more than if they were dead. Sometimes the dead man's hand is itself the candle, or rather bunch of candles, all its withered fingers being set on fire; but should any member of the household be awake, one of the fingers will not kindle. Such nefarious lights can only be extinguished with milk. Often it is prescribed that the thief's candle should be made of the finger of a new-born or, still better, unborn child; sometimes it is thought needful that the thief should have one such candle for every person in the house, for if he has one candle too little somebody in the house will wake and catch him. Once these tapers begin to burn, there is nothing but milk that will put them out. In the seventeenth century robbers used to murder pregnant women in order thus to extract candles from their wombs. An ancient Greek robber or burglar thought he could silence and put to flight the fiercest watchdogs by carrying with him a brand plucked from a funeral pyre.

Again, Servian and Bulgarian women who chafe at the restraints of domestic life will take the copper coins from the eyes of a corpse, wash them in wine or water, and give the liquid to their husbands to drink. After swallowing it, the husband will be as blind to his wife's peccadilloes as the dead man was on whose eyes the coins were laid. When a Blackfoot Indian went out eagle-hunting, he used to take a skull with him, because he believed that the skull would make him invisible, like the dead person to whom it had belonged, and so the eagles would not be able to see and attack him. The Tarahumares of Mexico are great runners, and parties of them engage in races with each other. They believe that human bones induce fatigue; hence before a race the friends of one side will bury dead men's bones in the track, hoping that the runners of the other side will pass over them and so be weakened. Naturally they warn their own men to shun the spot where the bones are buried. The Belep of New Caledonia think that they can disable an enemy from flight by means of the leg-bone of a dead foe. They stick certain plants into the bone, and then smash it between stones before the skulls of their ancestors. It is easy to see that this breaks the leg of the living enemy and so hinders him from running away. Hence in time of war men fortify themselves with amulets of this sort. The ancient Greeks seem to have thought that to set a young male child on a tomb would be to rob him of his manhood by infecting him with the impotence of the dead. And as there is no memory in the grave the Arabs think that earth from a grave can make a man forget his griefs and sorrows, especially the sorrow of an unhappy love.

Again, animals are often conceived to possess qualities or properties which might be useful to man, and homoeopathic or imitative magic seeks to communicate these properties to human beings in various ways. Thus some Bechuanas wear a ferret as a charm, because, being very tenacious of life, it will make them difficult to kill. Others wear a certain insect, mutilated, but living, for a similar purpose. Yet other Bechuana warriors wear the hair of a hornless ox among their own hair, and the skin of a frog on their mantle, because a frog is slippery, and the ox, having no horns, is hard to catch; so the man who is provided with these charms believes that he will be as hard to hold as the ox and the frog. Again, it seems plain that a South African warrior who twists tufts of rats' hair among his own curly black locks will have just as many chances of avoiding the enemy's spear as the nimble rat has of avoiding things thrown at it; hence in these regions rats' hair is in great demand when war is expected.

In Morocco a fowl or a pigeon may sometimes be seen with a little red bundle tied to its foot; the bundle contains a charm, and it is believed that as the charm is kept in constant motion by the bird, a corresponding restlessness is kept up in the mind of him or her against whom the charm is directed. When a Galla sees a tortoise, he will take off his sandals and step on it, believing that the soles of his feet are thereby made hard and strong like the shell of the

animal. The Wajaggas of Eastern Africa think that if they wear a piece of the wing-bone of a vulture tied round their leg they will be able to run and not grow weary, just as the vulture flies unwearied through the sky. The Esquimaux of Baffin Land fancy that if part of the intestines of a fox is placed under the feet of a baby boy, he will become active and skilful in walking over thin ice, like a fox. One of the ancient books of India prescribes that when a sacrifice is offered for victory, the earth out of which the altar is to be made should be taken from a place where a boar has been wallowing, since the strength of the boar will be in that earth. When you are playing the one-stringed lute, and your fingers are stiff, the thing to do is to catch some long-legged field spiders and roast them, and then rub your fingers with the ashes; that will make your fingers as lithe and nimble as the spiders' legs—at least so think the Galelareese. As the sea-eagle is very expert at seizing fish in its talons, the Kei islanders use its claws as a charm to enable them to make great gain on their trading voyages. The children of the Baronga on Delagoa Bay are much troubled by a small worm which burrows under their skin, where its meanderings are visible to the eye. To guard her little one against this insect pest a Baronga mother will attach to its wrist the skin of a mole which burrows just under the surface of the ground, exactly as the worm burrows under the infant's skin. To bring back a runaway slave an Arab of North Africa will trace a magic circle on the ground, stick a nail in the middle of it, and attach a beetle by a thread to the nail, taking care that the sex of the beetle is that of the fugitive. As the beetle crawls round and round it will coil the thread about the nail, thus shortening its tether and drawing nearer to the centre at every circuit. So by virtue of homoeopathic magic the runaway slave will be drawn back to his master. The Patagonian Indians kill a mare and put a new-born boy in its body, believing that this will make him a good horseman. The Lkuñgen Indians of Vancouver's Island believe that the ashes of wasps rubbed on the faces of warriors going to battle will render the men as pugnacious as wasps, and that a decoction of wasps' nests or of flies administered internally to barren women will make them prolific like the insects.

Among the western tribes of British New Guinea, a man who has killed a snake will burn it and smear his legs with the ashes when he goes into the forest; for no snake will bite him for some days afterwards. The Baronga of Delagoa Bay carry the powdered ashes of a serpent in a little bag as a talisman which guards them from snake-bites. Among the Arabs of Moab a woman will give her infant daughter the ashes of a scorpion mixed with milk to drink in order to protect her against the stings of scorpions. The Cholones of eastern Peru think that to carry the poison tooth of a serpent is a protection against the bite of a serpent, and that to rub the cheek with the tooth of an ounce is an infallible remedy for toothache and face-ache. In order to strengthen her teeth some Brazilian Indians used to hang round a girl's neck at puberty the teeth of an animal which they called *capugouare*, that is "grass-eating." When a thoroughbred mare has drunk at a trough, an Arab woman will hasten to drink any water that remains in order that she may give birth to strong children. If a South Slavonian has a mind to pilfer and steal at market, he has nothing to do but to burn a blind cat, and then throw a pinch of its ashes over the person with whom he is higgling; after that he can take what he likes from the booth, and the owner will not be a bit the wiser, having become as blind as the deceased cat with whose ashes he has been sprinkled. The thief may even ask boldly "Did I pay for it?" and the deluded huckster will reply, "Why, certainly." Equally simple and effectual is the expedient adopted by natives of Central Australia who desire to cultivate their beards. They prick the chin all over with a pointed bone, and then stroke it carefully with a magic stick or stone, which represents a kind of rat that has very long whiskers. The virtue of these whiskers naturally passes into the representative stick or stone, and thence by an easy transition to the chin, which, consequently, is soon adorned with a rich growth of beard.

When a party of these same natives has returned from killing a foe, and they fear to be attacked by the ghost of the dead man in their sleep, every one of them takes care to wear the

tip of the tail of a rabbit-kangaroo in his hair. Why? Because the rabbit-kangaroo, being a nocturnal animal, does not sleep of nights; and therefore a man who wears a tip of its tail in his hair will clearly be wakeful during the hours of darkness. The Unmatjera tribe of Central Australia use the tip of the tail of the same animal for the same purpose, but they draw out the sympathetic chain one link farther. For among them, when a boy has undergone subincision and is leading a solitary life in the bush, it is not he but his mother who wears the tip of the nocturnal creature's tail in order that he may be watchful at nights, lest harm should befall him from snakes and so forth. The ancient Greeks thought that to eat the flesh of the wakeful nightingale would prevent a man from sleeping; that to smear the eyes of a blear-sighted person with the gall of an eagle would give him the eagle's vision; and that a raven's eggs would restore the blackness of the raven to silvery hair. Only the person who adopted this last mode of concealing the ravages of time had to be most careful to keep his mouth full of oil all the time he applied the eggs to his venerable locks, else his teeth as well as his hair would be dyed raven black, and no amount of scrubbing and scouring would avail to whiten them again. The hair-restorer was in fact a shade too powerful, and in applying it you might get more than you bargained for.

The Huichol Indians of Mexico admire the beautiful markings on the backs of serpents. Hence when a Huichol woman is about to weave or embroider, her husband catches a large serpent and holds it in a cleft stick, while the woman strokes the reptile with one hand down the whole length of its back; then she passes the same hand over her forehead and eyes, that she may be able to work as beautiful patterns in the web as the markings on the back of the serpent. Among the Tarahumares of Mexico men who run races tie deer-hoofs to their backs in the belief that this will make them swift-footed like the deer. Cherokee ball-players rub their bodies with eel-skins in order to make themselves as slippery and hard to hold as eels; and they also apply land-tortoises to their legs in the hope of making them as thick and strong as the legs of these animals. But they are careful not to eat frogs, lest the brittleness of the frog's bones should infect their own bones. Moreover, they will not eat the flesh of the sluggish hog-sucker, lest they should lose their speed, nor the flesh of rabbits, lest, like the rabbit, they should become confused in running. On the other hand, their friends sprinkle a soup made of rabbit hamstrings along the path to be taken by their rivals, in order to make these rivals timorous in action. Moreover, the ball-players will not wear the feathers of the bald-headed buzzard, for fear of themselves becoming bald, nor turkey feathers, lest they should suffer from a goitrous growth on the throat like the red appendage on the throat of a turkey. The flesh of the common grey squirrel is forbidden to Cherokees who suffer from rheumatism, because the squirrel eats in a cramped position, which would clearly aggravate the pangs of the rheumatic patient. And a Cherokee woman who is with child may not eat the flesh of the ruffed grouse, because that bird hatches a large brood, but loses most of them before maturity. Strict people, indeed, will not allow a woman to taste of the bird till she is past child-bearing. When a Cherokee is starting on a journey on a cold winter morning he rubs his feet in the ashes of the fire and sings four verses by means of which he can set the cold at defiance, like the wolf, the deer, the fox, and the opossum, whose feet, so the Indians think, are never frost-bitten. After each verse he imitates the cry and action of the animal, thus homoeopathically identifying himself with the creature. The song he sings may be rendered, "I become a real wolf, a real deer, a real fox, and a real opossum." After stating that he has become a real wolf, the songster utters a prolonged howl and paws the ground like a wolf with his feet. After giving notice that he has become a real deer, he imitates the call and jumping of a deer. And after announcing his identification, for all practical purposes, with a fox and an opossum, he mimicks the barking and scratching of a fox and the cry of an opossum when it is driven to bay, also throwing his head back just as an opossum does when it feigns death. Some Cherokees are said to drink tea made of crickets in order to become

good singers like the insects. If the eyes of a Cherokee child be bathed with water in which a feather of an owl has been soaked, the child will be able, like the owl, to keep awake all night. The mole-cricket has claws with which it burrows in the earth, and among the Cherokees it is reputed to be an excellent singer. Hence when children are long of learning to speak, their tongues are scratched with the claw of a live mole-cricket in order that they may soon talk as distinctly as the insect. Grown persons also, who are slow of speech, may acquire a ready flow of eloquence, if only the inside of their throat be scratched on four successive mornings with a mole-cricket. The negroes of the Maroni river in Guiana have a somewhat similar cure for stammering. Day and night the shrieks of a certain species of ape resound through the forest. Hence when the negroes kill one of these pests, they remove its larynx and make a cup out of it. If a stammering child drinks out of such a cup for a few months, it ceases to stammer. Cherokee parents scratch the hands of their children with the pincers of a live red crawfish, resembling a lobster, in order to give the infants a strong grip, like that of the crawfish. This may help us to understand why on the fifth day after birth a Greek child used to receive presents of octopuses and cuttle-fish from its friends and relations. For the numerous arms, legs, and tentacles of these creatures seem well calculated to strengthen the grip of a baby's hands and to impart the power of toddling to its little toes.

On the principle of homoeopathic magic, inanimate things, as well as plants and animals, may diffuse blessing or bane around them, according to their own intrinsic nature and the skill of the wizard to tap or dam, as the case may be, the stream of weal or woe. Thus, for example, the Galelareese think that when your teeth are being filed you should keep spitting on a pebble, for this establishes a homoeopathic connexion between you and the pebble, by virtue of which your teeth will henceforth be as hard and durable as a stone. On the other hand, you ought not to comb a child before it has teethed, for if you do, its teeth will afterwards be separated from each other like the teeth of a comb. Nor should children look at a sieve, otherwise they will suffer from a skin disease, and will have as many sores on their bodies as there are holes in the sieve. In Samaracand women give a baby sugar candy to suck and put glue in the palm of its hand, in order that, when the child grows up, his words may be sweet and precious things may stick to his hands as if they were glued. The Greeks thought that a garment made from the fleece of a sheep that had been torn by a wolf would hurt the wearer, setting up an itch or irritation in his skin. They were also of opinion that if a stone which had been bitten by a dog were dropped in wine, it would make all who drank of that wine to fall out among themselves. Among the Arabs of Moab a childless woman often borrows the robe of a woman who has had many children, hoping with the robe to acquire the fruitfulness of its owner. The Caffres of Sofala, in East Africa, had a great dread of being struck with anything hollow, such as a reed or a straw, and greatly preferred being thrashed with a good thick cudgel or an iron bar, even though it hurt very much. For they thought that if a man were beaten with anything hollow, his inside would waste away till he died. In eastern seas there is a large shell which the Buginese of Celebes call the "old man" (*kadjâwo*). On Fridays they turn these "old men" upside down and place them on the thresholds of their houses, believing that whoever then steps over the threshold of the house will live to be old. Again, the Galelareese think that, if you are imprudent enough to eat while somebody is sharpening a knife, your throat will be cut that same evening, or next morning at latest. The disastrous influence thus attributed, under certain circumstances, to a knife in the East Indies, finds its counterpart in a curious old Greek story. A certain king had no child, and he asked a wise man how he could get one. The wise man himself did not know, but he thought that the birds of the air might, and he undertook to enquire of them. For you must know that the sage understood the language of birds, having learned it through some serpents whose life he had saved, and who, out of gratitude, had cleansed his ears as he slept. So he sacrificed two bulls, and cut them up, and prayed the fowls to come and feast on the flesh;

only the vulture he did not invite. When the birds came, the wise man asked them what the king must do to get a son; but none of them knew. At last up came the vulture, and he knew all about it. He said that once when the king was a child his royal father was gelding rams in the field, and laid down the bloody knife beside his little son; nay, he threatened the boy with it. The child was afraid and ran away, and the father stuck the knife in a tree, either a sacred oak or a wild pear-tree. Meanwhile, the bark of the tree had grown round the knife and hidden it. The vulture said that if they found the knife, scraped the rust off it, and gave the rust, mixed with wine, to the king to drink for ten days, he would beget a son. They did so, and it fell out exactly as the vulture had said. In this story a knife which had gelded rams is supposed to have deprived a boy of his virility merely by being brought near his person. Through simple proximity it infected him, so to say, with the same disability which it had already inflicted on the rams; and the loss he thus sustained was afterwards repaired by administering to him in a potion the rust which, having been left on the blade by the blood of the animals, might be supposed to be still imbued with their generative faculty.

The strengthening virtue of iron is highly appreciated by the Toradjas of Central Celebes, only they apply it externally, not internally, as we do in Europe. For this purpose the people of a village assemble once a year in the smithy. The master of the ceremonies opens the proceedings by carrying a little pig and a white fowl round the smithy, after which he kills them and smears a little of their blood on the forehead of every person present. Next he takes a doit, a chopping-knife, and a bunch of leaves in his hand, and strikes with them the palm of the right hand of every man, woman, and child, and ties a leaf of the *Dracaena terminalis* to every wrist. Then a little fire is made in the furnace and blown up with the bellows. Every one who feels sick or unwell now steps up to the anvil, and the master of the ceremonies sprinkles a mixture of pigs' blood, water, and herbs on the joints of his body, and finally on his head, wishing him a long life. Lastly, the patient takes the chopping-knife, heats it in the furnace, lays it on the anvil, and strikes it seven times with the hammer. After that he has only to cool the knife in water and the iron cure is complete. Again, on the seventh day after a birth the Toradjas hold a little feast, at which the child is carried down the house ladder and its feet set on a piece of iron, in order to strengthen its feeble soul with the strong soul of the iron. At critical times the Mahakam Dyaks of Central Borneo seek to strengthen their souls by biting on an old sword or setting their feet upon it. At initiation a Brahman boy is made to tread with his right foot on a stone, while the words are repeated, "Tread on this stone; like a stone be firm"; and the same ceremony is performed, with the same words, by a Brahman bride at her marriage. In Madagascar a mode of counteracting the levity of fortune is to bury a stone at the foot of the heavy house-post. The common custom of swearing upon a stone may be based partly on a belief that the strength and stability of the stone lend confirmation to an oath. Thus the old Danish historian Saxo Grammaticus tells us that "the ancients, when they were to choose a king, were wont to stand on stones planted in the ground, and to proclaim their votes, in order to foreshadow from the steadfastness of the stones that the deed would be lasting." There was a stone at Athens on which the nine archons stood when they swore to rule justly and according to the laws. A little to the west of St. Columba's tomb in Iona "lie the black stones, which are so called, not from their colour, for that is grey, but from the effects that tradition says ensued upon perjury, if any one became guilty of it after swearing on these stones in the usual manner; for an oath made on them was decisive in all controversies. Mac-Donald, king of the isles, delivered the rights of their lands to his vassals in the isles and continent, with uplifted hands and bended knees, on the black stones; and in this posture, before many witnesses, he solemnly swore that he would never recall those rights which he then granted: and this was instead of his great seal. Hence it is that when one was certain of what he affirmed, he said positively, I have freedom to swear this matter upon the black stones." Again, in the island of Arran there was a green

globular stone, about the size of a goose's egg, on which oaths were taken. It was also endowed with healing virtue, for it cured stitches in the sides of sick people if only it was laid on the affected part. They say that Macdonald, the Lord of the Isles, carried this stone about with him, and that victory was always on his side when he threw it among the enemy. Once more, in the island of Fladda there was a round blue stone, on which people swore decisive oaths, and it too healed stitches in the side like the green stone of Arran. When two Bogos of eastern Africa have a dispute, they will sometimes settle it at a certain stone, which one of them mounts. His adversary calls down the most dreadful curses on him if he forswears himself, and to every curse the man on the stone answers "Amen!" In Laconia an unwrought stone was shewn which, according to the legend, relieved the matricide Orestes of his madness as soon as he had sat down on it; and Zeus is said to have often cured himself of his love for Hera by sitting down on a certain rock in the island of Leucadia. In these cases it may have been thought that the wayward and flighty impulses of love and madness were counteracted by the steadying influence of a heavy stone.

But while a general magical efficacy may be supposed to reside in all stones by reason of their common properties of weight and solidity, special magical virtues are attributed to particular stones, or kinds of stone, in accordance with their individual or specific qualities of shape and colour. For example, a pot-hole in a rocky gorge of Central Australia contains many rounded boulders which, in the opinion of the Warramunga tribe, represent the kidneys, heart, tail, intestines, and so forth of an old euro, a species of kangaroo. Hence the natives jump into the pool, and after splashing the water all over their bodies rub one another with the stones, believing that this will enable them to catch euros. Again, not very far from Alice Springs, in Central Australia, there is a heap of stones supposed to be the vomit of two men of the eagle-hawk totem who had dined too copiously on eagle-hawk men, women, and children. The natives think that if any person caught sight of these stones he would be taken very sick on the spot; hence the heap is covered with sticks, to which every passer-by adds one in order to prevent the evil magic from coming out and turning his stomach. The Indians of Peru employed certain stones for the increase of maize, others for the increase of potatoes, and others again for the increase of cattle. The stones used to make maize grow were fashioned in the likeness of cobs of maize, and the stones destined to multiply cattle had the shape of sheep.

No people perhaps employ stones more freely for the purposes of homoeopathic magic than the natives of New Caledonia. They have stones of the most diverse shapes and colours to serve the most diverse ends—stones for sunshine, rain, famine, war, madness, death, fishing, sailing, and so forth. Thus in order to make a plantation of taro thrive they bury in the field certain stones resembling taros, praying to their ancestors at the same time. A stone marked with black lines like the leaves of the coco-nut palm helps to produce a good crop of coco-nuts. To make bread-fruit grow they use two stones of different sizes representing the unripe and the ripe fruit respectively. As soon as the fruit begins to form, they bury the small stone at the foot of the tree; and later on, when the fruit approaches maturity, they replace the small stone by the large one. The yam is the chief crop of the New Caledonians; hence the number of stones used to foster its growth is correspondingly great. Different families have different kinds of stones which, according to their diverse shapes and colours, are supposed to promote the cultivation of the various species of yams. Before the stones are buried in the yam field they are deposited beside the ancestral skulls, wetted with water, and wiped with the leaves of certain trees. Sacrifices, too, of yams and fish are offered to the dead, with the words, "Here are your offerings, in order that the crop of yams may be good." Again, a stone carved in the shape of a canoe can make a voyage prosperous or the reverse according as it is placed before the ancestral skulls with the opening upwards or downwards, the ceremony being

accompanied with prayers and offerings to the dead. Again, fish is a very important article of diet with the New Caledonians, and every kind of fish has its sacred stone, which is enclosed in a large shell and kept in the graveyard. In performing the rite to secure a good catch, the wizard swathes the stone in bandages of various colours, spits some chewed leaves on it, and, setting it up before the skulls, says, "Help us to be lucky at the fishing." In these and many similar practices of the New Caledonians the magical efficacy of the stones appears to be deemed insufficient of itself to accomplish the end in view; it has to be reinforced by the spirits of the dead, whose help is sought by prayer and sacrifice. Moreover, the stones are regularly kept in the burial-grounds, as if to saturate them with the powerful influence of the ancestors; they are brought from the cemetery to be buried in the fields or at the foot of trees for the sake of quickening the fruits of the earth, and they are restored to the cemetery when they have discharged this duty. Thus in New Caledonia magic is blent with the worship of the dead.

In other parts of Melanesia a like belief prevails that certain sacred stones are endowed with miraculous powers which correspond in their nature to the shape of the stone. Thus a piece of water-worn coral on the beach often bears a surprising likeness to a bread-fruit. Hence in the Banks Islands a man who finds such a coral will lay it at the root of one of his bread-fruit trees in the expectation that it will make the tree bear well. If the result answers his expectation, he will then, for a proper remuneration, take stones of less-marked character from other men and let them lie near his, in order to imbue them with the magic virtue which resides in it. Similarly, a stone with little discs upon it is good to bring in money; and if a man found a large stone with a number of small ones under it, like a sow among her litter, he was sure that to offer money upon it would bring him pigs. In these and similar cases the Melanesians ascribe the marvellous power, not to the stone itself, but to its indwelling spirit; and sometimes, as we have just seen, a man endeavours to propitiate the spirit by laying down offerings on the stone. But the conception of spirits that must be propitiated lies outside the sphere of magic, and within that of religion. Where such a conception is found, as here, in conjunction with purely magical ideas and practices, the latter may generally be assumed to be the original stock on which the religious conception has been at some later time engrafted. For there are strong grounds for thinking that, in the evolution of thought, magic has preceded religion. But to this point we shall return presently.

The ancients set great store on the magical qualities of precious stones; indeed it has been maintained, with great show of reason, that such stones were used as amulets long before they were worn as mere ornaments. Thus the Greeks gave the name of tree-agate to a stone which exhibits tree-like markings, and they thought that if two of these gems were tied to the horns or neck of oxen at the plough, the crop would be sure to be plentiful. Again, they recognised a milk-stone which produced an abundant supply of milk in women if only they drank it dissolved in honey-mead. Milk-stones are used for the same purpose by Greek women in Crete and Melos at the present day; in Albania nursing mothers wear the stones in order to ensure an abundant flow of milk. In Lechrain down to modern times German women have attempted to increase their milk by stroking their breasts with a kind of alum which they call a milk-stone. Again, the Greeks believed in a stone which cured snake-bites, and hence was named the snake-stone; to test its efficacy you had only to grind the stone to powder and sprinkle the powder on the wound. The wine-coloured amethyst received its name, which means "not drunken," because it was supposed to keep the wearer of it sober; and two brothers who desired to live at unity were advised to carry magnets about with them, which, by drawing the twain together, would clearly prevent them from falling out. In Albania people think that if the blood-stone is laid on a wound it will stop the flow of blood.

Amongst the things which homoeopathic magic seeks to turn to account are the great powers of nature, such as the waxing and the waning moon, the rising and the setting sun, the stars, and the sea. Elsewhere I have illustrated the homoeopathic virtues ascribed to the waxing and the waning moon: here I will give an Arab charm of the setting sun. When a husband is far away and his wife would bring him home to her, she procures pepper and coriander seed from a shop that faces the east, and throws them on a lighted brasier at sunset. Then turning to the east she waves a napkin with which she has wiped herself and says: "Let the setting sun return having found such and such an one, son of such and such a woman, in grief and pain. May the grief that my absence causes him make him weep, may the grief that my absence causes him make him lament, may the grief that my absence causes him make him break the obstacles that part us and bring him back to me." If the charm is unsuccessful, she repeats it one day at sunrise, burning the same perfumes. Clearly she imagines that as the sun goes away in the west and comes back in the east, it should at its return bring the absent one home. The ancient books of the Hindoos lay down a rule that after sunset on his marriage night a man should sit silent with his wife till the stars begin to twinkle in the sky. When the pole-star appears, he should point it out to her, and, addressing the star, say, "Firm art thou; I see thee, the firm one. Firm be thou with me, O thriving one!" Then, turning to his wife, he should say, "To me Brihaspati has given thee; obtaining offspring through me, thy husband, live with me a hundred autumns." The intention of the ceremony is plainly to guard against the fickleness of fortune and the instability of earthly bliss by the steadfast influence of the constant star. It is the wish expressed in Keats's last sonnet:—

*Bright star! would I were steadfast as thou art—
Not in lone splendour hung aloft the night.*

Dwellers by the sea cannot fail to be impressed by the sight of its ceaseless ebb and flow, and are apt, on the principles of that rude philosophy of sympathy and resemblance which here engages our attention, to trace a subtle relation, a secret harmony, between its tides and the life of man, of animals, and of plants. In the flowing tide they see not merely a symbol, but a cause of exuberance, of prosperity, and of life, while in the ebbing tide they discern a real agent as well as a melancholy emblem of failure, of weakness, and of death. The Breton peasant fancies that clover sown when the tide is coming in will grow well, but that if the plant be sown at low water or when the tide is going out, it will never reach maturity, and that the cows which feed on it will burst. His wife believes that the best butter is made when the tide has just turned and is beginning to flow, that milk which foams in the churn will go on foaming till the hour of high water is past, and that water drawn from the well or milk extracted from the cow while the tide is rising will boil up in the pot or saucepan and overflow into the fire. The Galelareese say that if you wish to make oil, you should do it when the tide is high, for then you will get plenty of oil. According to some of the ancients, the skins of seals, even after they had been parted from their bodies, remained in secret sympathy with the sea, and were observed to ruffle when the tide was on the ebb. Another ancient belief, attributed to Aristotle, was that no creature can die except at ebb tide. The belief, if we can trust Pliny, was confirmed by experience, so far as regards human beings, on the coast of France. Philostratus also assures us that at Cadiz dying people never yielded up the ghost while the water was high. A like fancy still lingers in some parts of Europe. On the Cantabrian coast of Spain they think that persons who die of chronic or acute disease expire at the moment when the tide begins to recede. In Portugal, all along the coast of Wales, and on some parts of the coast of Brittany, a belief is said to prevail that people are born when the tide comes in, and die when it goes out. Dickens attests the existence of the same superstition in England. "People can't die, along the coast," said Mr. Peggotty, "except when the tide's pretty nigh out. They can't be born, unless it's pretty nigh in—not properly born till flood."

The belief that most deaths happen at ebb tide is said to be held along the east coast of England from Northumberland to Kent. Shakespeare must have been familiar with it, for he makes Falstaff die “even just between twelve and one, e’en at the turning o’ the tide.” We meet the belief again on the Pacific coast of North America among the Haidas of the Queen Charlotte Islands. Whenever a good Haida is about to die he sees a canoe manned by some of his dead friends, who come with the tide to bid him welcome to the spirit land. “Come with us now,” they say, “for the tide is about to ebb and we must depart.” At the other extremity of America the same fancy has been noted among the Indians of Southern Chili. A Chilote Indian in the last stage of consumption, after preparing to die like a good Catholic, was heard to ask how the tide was running. When his sister told him that it was still coming in, he smiled and said that he had yet a little while to live. It was his firm conviction that with the ebbing tide his soul would pass to the ocean of eternity. At Port Stephens, in New South Wales, the natives always buried their dead at flood tide, never at ebb, lest the retiring water should bear the soul of the departed to some distant country.

To ensure a long life the Chinese have recourse to certain complicated charms, which concentrate in themselves the magical essence emanating, on homoeopathic principles, from times and seasons, from persons and from things. The vehicles employed to transmit these happy influences are no other than grave-clothes. These are provided by many Chinese in their lifetime, and most people have them cut out and sewn by an unmarried girl or a very young woman, wisely calculating that, since such a person is likely to live a great many years to come, a part of her capacity to live long must surely pass into the clothes, and thus stave off for many years the time when they shall be put to their proper use. Further, the garments are made by preference in a year which has an intercalary month; for to the Chinese mind it seems plain that grave-clothes made in a year which is unusually long will possess the capacity of prolonging life in an unusually high degree. Amongst the clothes there is one robe in particular on which special pains have been lavished to imbue it with this priceless quality. It is a long silken gown of the deepest blue colour, with the word “longevity” embroidered all over it in thread of gold. To present an aged parent with one of these costly and splendid mantles, known as “longevity garments,” is esteemed by the Chinese an act of filial piety and a delicate mark of attention. As the garment purports to prolong the life of its owner, he often wears it, especially on festive occasions, in order to allow the influence of longevity, created by the many golden letters with which it is bespangled, to work their full effect upon his person. On his birthday, above all, he hardly ever fails to don it, for in China common sense bids a man lay in a large stock of vital energy on his birthday, to be expended in the form of health and vigour during the rest of the year. Attired in the gorgeous pall, and absorbing its blessed influence at every pore, the happy owner receives complacently the congratulations of friends and relations, who warmly express their admiration of these magnificent ceremonies, and of the filial piety which prompted the children to bestow so beautiful and useful a present on the author of their being.

Another application of the maxim that like produces like is seen in the Chinese belief that the fortunes of a town are deeply affected by its shape, and that they must vary according to the character of the thing which that shape most nearly resembles. Thus it is related that long ago the town of Tsuen-cheu-fu, the outlines of which are like those of a carp, frequently fell a prey to the depredations of the neighbouring city of Yung-chun, which is shaped like a fishing-net, until the inhabitants of the former town conceived the plan of erecting two tall pagodas in their midst. These pagodas, which still tower above the city of Tsuen-cheu-fu, have ever since exercised the happiest influence over its destiny by intercepting the imaginary net before it could descend and entangle in its meshes the imaginary carp. Some thirty years ago the wise men of Shanghai were much exercised to discover the cause of a

local rebellion. On careful enquiry they ascertained that the rebellion was due to the shape of a large new temple which had most unfortunately been built in the shape of a tortoise, an animal of the very worst character. The difficulty was serious, the danger was pressing; for to pull down the temple would have been impious, and to let it stand as it was would be to court a succession of similar or worse disasters. However, the genius of the local professors of geomancy, rising to the occasion, triumphantly surmounted the difficulty and obviated the danger. By filling up two wells, which represented the eyes of the tortoise, they at once blinded that disreputable animal and rendered him incapable of doing further mischief.

Sometimes homoeopathic or imitative magic is called in to annul an evil omen by accomplishing it in mimicry. The effect is to circumvent destiny by substituting a mock calamity for a real one. At Kampot, a small seaport of Cambodia, a French official saw one morning a troop of armed guards escorting a man who was loaded with chains. They passed his house and went away towards the country, preceded by a man who drew lugubrious sounds from a gong, and followed by a score of idlers. The official thought it must be an execution and was surprised to have heard nothing about it. Afterwards he received from his interpreter the following lucid explanation of the affair. "In our country it sometimes happens that a man walking in the fields has nothing but the upper part of his body visible to people at a distance. Such an appearance is a sign that he will certainly die soon, and that is what happened last evening to the man you saw. Going homewards across the plain he carried over his shoulder a bundle of palms with long slender stems ending in fan-like tufts of leaves. His family, returning from their work, followed him at a distance, and soon they saw his head, shoulders, and arms moving along the road and carrying the branches, while his body and legs were invisible. Struck with consternation at the sight, his mother and wife repaired in all haste to the magistrate and implored him to proceed against the man after the fashion customary in such cases. The magistrate replied that the custom was ridiculous, and that he would be still more ridiculous if he complied with it. However, the two women insisted on it so vehemently, saying it was the only way to avert the omen, that he decided to do as they wished, and gave them his word that he would have the man arrested next morning at sunrise. So this morning the guards came to seize the poor man, telling him that he was accused of rebellion against the king, and without listening to his protestations of innocence they dragged him off to court. His family pretended to be surprised and followed him weeping. The judges had him clapped into irons and ordered him to instant execution. His own entreaties and the prayers of his family being all in vain, he begged that the priests of the pagoda might come and bear witness to his innocence and join their supplications to those of his friends. They came in haste, but receiving a hint how the wind lay they advised the condemned man to submit to his fate and departed to pray for his soul at the temple. Then the man was led away to a rice-field, in the middle of which a banana-tree, stripped of its leaves, had been set up as a stake. To this he was tied, and while his friends took their last leave of him, the sword of the executioner flashed through the air and at a single stroke swept off the top of the banana-tree above the head of the pretended victim. The man had given himself up for dead. His friends, while they knocked off his irons, explained to him the meaning of it all and led him away to thank the magistrates and priests for what they had done to save him from the threatened catastrophe." The writer who reports the case adds that if the magistrates had not good-naturedly lent themselves to the pious fraud, the man's family would have contrived in some other way to impress him with the terror of death in order to save his life.

Again, two missionaries were journeying not long ago through Central Celebes, accompanied by some Toradjas. Unfortunately the note of a certain bird called *teka-teka* was heard to the left. This boded ill, and the natives insisted that they must either turn back or pass the night on the spot. When the missionaries refused to do either, an expedient was hit upon which

allowed them to continue the journey in safety. A miniature hut was made out of a leafy branch, and in it were deposited a leaf moistened with spittle and a hair from the head of one of the party. Then one of the Toradjas said, "We shall pass the night here," and addressing the hair he spoke thus: "If any misfortune should happen through the cry of that bird, may it fall on you." In this way the evil omen was diverted from the real men and directed against their substitute the hair, and perhaps also the spittle, in the tiny hut. When a Cherokee has dreamed of being stung by a snake, he is treated just in the same way as if he had really been stung; otherwise the place would swell and ulcerate in the usual manner, though perhaps years might pass before it did so. It is the ghost of a snake that has bitten him in sleep. One night a Huron Indian dreamed that he had been taken and burned alive by his hereditary foes the Iroquois. Next morning a council was held on the affair, and the following measures were adopted to save the man's life. Twelve or thirteen fires were kindled in the large hut where they usually burned their prisoners to death. Every man seized a flaming brand and applied it to the naked body of the dreamer, who shrieked with pain. Thrice he ran round the hut, escaping from one fire only to fall into another. As each man thrust his blazing torch at the sufferer he said, "Courage, my brother, it is thus that we have pity on you." At last he was allowed to escape. Passing out of the hut he caught up a dog which was held ready for the purpose, and throwing it over his shoulder carried it through the wigwams as a sacred offering to the war-god, praying him to accept the animal instead of himself. Afterwards the dog was killed, roasted, and eaten, exactly as the Indians were wont to roast and eat their captives.

In Madagascar this mode of cheating the fates is reduced to a regular system. Here every man's fortune is determined by the day or hour of his birth, and if that happens to be an unlucky one his fate is sealed, unless the mischief can be extracted, as the phrase goes, by means of a substitute. The ways of extracting the mischief are various. For example, if a man is born on the first day of the second month (February), his house will be burnt down when he comes of age. To take time by the forelock and avoid this catastrophe, the friends of the infant will set up a shed in a field or in the cattle-fold and burn it. If the ceremony is to be really effective, the child and his mother should be placed in the shed and only plucked, like brands, from the burning hut before it is too late. Again, dripping November is the month of tears, and he who is born in it is born to sorrow. But in order to disperse the clouds that thus gather over his future, he has nothing to do but to take the lid off a boiling pot and wave it about. The drops that fall from it will accomplish his destiny and so prevent the tears from trickling from his eyes. Again, if fate has decreed that a young girl, still unwed, should see her children, still unborn, descend before her with sorrow to the grave, she can avert the calamity as follows. She kills a grasshopper, wraps it in a rag to represent a shroud, and mourns over it like Rachel weeping for her children and refusing to be comforted. Moreover, she takes a dozen or more other grasshoppers, and having removed some of their superfluous legs and wings she lays them about their dead and shrouded fellow. The buzz of the tortured insects and the agitated motions of their mutilated limbs represent the shrieks and contortions of the mourners at a funeral. After burying the deceased grasshopper she leaves the rest to continue their mourning till death releases them from their pain; and having bound up her dishevelled hair she retires from the grave with the step and carriage of a person plunged in grief. Thenceforth she looks cheerfully forward to seeing her children survive her; for it cannot be that she should mourn and bury them twice over. Once more, if fortune has frowned on a man at his birth and penury has marked him for her own, he can easily erase the mark in question by purchasing a couple of cheap pearls, price three halfpence, and burying them. For who but the rich of this world can thus afford to fling pearls away?

§ 3. *Contagious Magic*

Thus far we have been considering chiefly that branch of sympathetic magic which may be called homoeopathic or imitative. Its leading principle, as we have seen, is that like produces like, or, in other words, that an effect resembles its cause. The other great branch of sympathetic magic, which I have called Contagious Magic, proceeds upon the notion that things which have once been conjoined must remain ever afterwards, even when quite dissevered from each other, in such a sympathetic relation that whatever is done to the one must similarly affect the other. Thus the logical basis of Contagious Magic, like that of Homoeopathic Magic, is a mistaken association of ideas; its physical basis, if we may speak of such a thing, like the physical basis of Homoeopathic Magic, is a material medium of some sort which, like the ether of modern physics, is assumed to unite distant objects and to convey impressions from one to the other. The most familiar example of Contagious Magic is the magical sympathy which is supposed to exist between a man and any severed portion of his person, as his hair or nails; so that whoever gets possession of human hair or nails may work his will, at any distance, upon the person from whom they were cut. This superstition is world-wide; instances of it in regard to hair and nails will be noticed later on in this work.

While like other superstitions it has had its absurd and mischievous consequences, it has nevertheless indirectly done much good by furnishing savages with strong, though irrational, motives for observing rules of cleanliness which they might never have adopted on rational grounds. How the superstition has produced this salutary effect will appear from a single instance, which I will give in the words of an experienced observer. Amongst the natives of the Gazelle Peninsula in New Britain "it is as a rule necessary for the efficiency of a charm that it should contain a part of the person who is to be enchanted (for example, his hair), or a piece of his clothing, or something that stands in some relation to him, such as his excrements, the refuse of his food, his spittle, his footprints, etc. All such objects can be employed as *panait*, that is, as a medium for a *papait* or charm, consisting of an incantation or murmuring of a certain formula, together with the blowing into the air of some burnt lime which is held in the hand. It need hardly, therefore, be said that the native removes all such objects as well as he can. Thus the cleanliness which is usual in the houses and consists in sweeping the floor carefully every day, is by no means based on a desire for cleanliness and neatness in themselves, but purely on the effort to put out of the way anything that might serve an ill-wisher as a charm." I will now illustrate the principles of Contagious Magic by examples, beginning with its application to various parts of the human body.

Among the Australian tribes it was a common practice to knock out one or more of a boy's front teeth at those ceremonies of initiation to which every male member had to submit before he could enjoy the rights and privileges of a full-grown man. The reason of the practice is obscure; a conjecture on this subject has been hazarded above. All that concerns us here is the evidence of a belief that a sympathetic relation continued to exist between the lad and his teeth after the latter had been extracted from his gums. Thus among some of the tribes about the river Darling, in New South Wales, the extracted tooth was placed under the bark of a tree near a river or water-hole; if the bark grew over the tooth, or if the tooth fell into the water, all was well; but if it were exposed and the ants ran over it, the natives believed that the boy would suffer from a disease of the mouth. Among the Murring and other tribes of New South Wales the extracted tooth was at first taken care of by an old man, and then passed from one headman to another, until it had gone all round the community, when it came back to the lad's father, and finally to the lad himself. But however it was thus conveyed from hand to hand, it might on no account be placed in a bag containing magical substances, for to do so would, they believed, put the owner of the tooth in great danger. The late Dr. Howitt once acted as custodian of the teeth which had been extracted from some novices at a ceremony of initiation, and the old men earnestly besought him not to carry them in a bag in which they knew that he had some quartz crystals. They declared that if he did so

the magic of the crystals would pass into the teeth, and so injure the boys. Nearly a year after Dr. Howitt's return from the ceremony he was visited by one of the principal men of the Murring tribe, who had travelled some two hundred and fifty miles from his home to fetch back the teeth. This man explained that he had been sent for them because one of the boys had fallen into ill health, and it was believed that the teeth had received some injury which had affected him. He was assured that the teeth had been kept in a box apart from any substances, like quartz crystals, which could influence them; and he returned home bearing the teeth with him carefully wrapt up and concealed. In the Dieri tribe of South Australia the teeth knocked out at initiation were bound up in emu feathers, and kept by the boy's father or his next-of-kin until the mouth had healed, and even for long afterwards. Then the father, accompanied by a few old men, performed a ceremony for the purpose of taking all the supposed life out of the teeth. He made a low rumbling noise without uttering any words, blew two or three times with his mouth, and jerked the teeth through his hand to some little distance. After that he buried them about eighteen inches under ground. The jerking movement was meant to shew that he thereby took all the life out of the teeth. Had he failed to do so, the boy would, in the opinion of the natives, have been liable to an ulcerated and wry mouth, impediment in speech, and ultimately a distorted face. This ceremony is interesting as a rare instance of an attempt to break the sympathetic link between a man and a severed part of himself by rendering the part insensitive.

The Basutos are careful to conceal their extracted teeth, lest these should fall into the hands of certain mythical beings called *baloi*, who haunt graves, and could harm the owner of the tooth by working magic on it. In Sussex some forty years ago a maid-servant remonstrated strongly against the throwing away of children's cast teeth, affirming that should they be found and gnawed by any animal, the child's new tooth would be, for all the world, like the teeth of the animal that had bitten the old one. In proof of this she named old Master Simmons, who had a very large pig's tooth in his upper jaw, a personal defect that he always averred was caused by his mother, who threw away one of his cast teeth by accident into the hog's trough. A similar belief has led to practices intended, on the principles of homoeopathic magic, to replace old teeth by new and better ones. Thus in many parts of the world it is customary to put extracted teeth in some place where they will be found by a mouse or a rat, in the hope that, through the sympathy which continues to subsist between them and their former owner, his other teeth may acquire the same firmness and excellence as the teeth of these rodents. Thus in Germany it is said to be an almost universal maxim among the people that when you have had a tooth taken out you should insert it in a mouse's hole. To do so with a child's milk-tooth which has fallen out will prevent the child from having toothache. Or you should go behind the stove and throw your tooth backwards over your head, saying, "Mouse, give me your iron tooth; I will give you my bone tooth." After that your other teeth will remain good. German children say, "Mouse, mouse, come out and bring me out a new tooth"; or "Mouse, I give you a little bone; give me a little stone"; or "Mouse, there is an old tooth for you; make me a new one." In Bavaria they say that if this ceremony be observed the child's second teeth will be as white as the teeth of mice. Amongst the South Slavonians, too, the child is taught to throw his tooth into a dark corner and say, "Mouse, mouse, there is a bone tooth; give me an iron tooth instead." Jewish children in South Russia throw their cast teeth on the roof with the same request to the mouse to give them an iron tooth for a tooth of bone. Far away from Europe, at Raratonga, in the Pacific, when a child's tooth was extracted, the following prayer used to be recited:—

*"Big rat! little rat!
Here is my old tooth.
Pray give me a new one."*

Then the tooth was thrown on the thatch of the house, because rats make their nests in the decayed thatch. The reason assigned for invoking the rats on these occasions was that rats' teeth were the strongest known to the natives. In the Seranglao and Gorong archipelagoes, between New Guinea and Celebes, when a child loses his first tooth, he must throw it on the roof, saying, "Mouse, I give you my tooth; give me yours instead." In Amboyna the custom is the same, and the form of words is, "Take this tooth, thrown on the roof, as the mouse's share, and give me a better one instead." In the Kei Islands, to the south-west of New Guinea, when a child begins to get his second teeth, he is lifted up to the top of the roof in order that he may there deposit, as an offering to the rats, the tooth which has fallen out. At the same time some one cries aloud, "O rats, here you have his tooth; give him a golden one instead."

Among the Ilocans of Luzon, in the Philippines, when children's teeth are loose, they are pulled out with a string and put in a place where rats will be likely to find and drag them away. In ancient Mexico, when a child was getting a new tooth, the father or mother used to put the old one in a mouse's hole, believing that if this precaution were not taken the new tooth would not issue from the gums. A different and more barbarous application of the same principle is the Swabian superstition that when a child is teething you should bite off the head of a living mouse, and hang the head round the child's neck by a string, taking care, however, to make no knot in the string; then the child will teethe easily. In Bohemia the treatment prescribed is similar, though there they recommend you to use a red thread and to string three heads of mice on it instead of one.

But it is not always a mouse or a rat that brings the child a new and stronger tooth.

Apparently any strong-toothed animal will serve the purpose. Thus when his or her tooth drops out, a Singhalese will throw it on the roof, saying, "Squirrel, dear squirrel, take this tooth and give me a dainty tooth." In Bohemia a child will sometimes throw its cast tooth behind the stove, asking the fox to give him an iron tooth instead of the bone one. In Berlin the teeth of a fox worn as an amulet round a child's neck make teething easy for him, and ensure that his teeth will be good and lasting. Similarly, in order to help a child to cut its teeth, the aborigines of Victoria fastened to its wrist the front tooth of a kangaroo, which the child used as a coral to rub its gums with. Again, the beaver can gnaw through the hardest wood. Hence among the Cherokee Indians, when the loosened milk tooth of a child has been pulled out or has dropped out of itself, the child runs round the house with it, repeating four times, "Beaver, put a new tooth into my jaw," after which he throws the tooth on the roof of the house. In Macedonia, a child carefully keeps for a time its first drawn tooth, and then throws it on the roof with the following invocation to the crow:—

*"O dear crow, here is a tooth of bone,
Take it and give me a tooth of iron instead,
That I may be able to chew beans
And to crunch dry biscuits."*

We can now understand a custom of the Thompson Indians of British Columbia, which the writer who records it is unable to explain. When a child lost its teeth, the father used to take each one as it fell out and to hide it in a piece of raw venison, which he gave to a dog to eat. The animal swallowed the venison and the tooth with it. Doubtless the custom was intended to ensure that the child's new teeth should be as strong as those of a dog. In Silesia mothers sometimes swallow their children's cast teeth in order to save their offspring from toothache. The intention is perhaps to strengthen the weak teeth of the child by the strong teeth of the grown woman. Amongst the Warramunga of Central Australia, when a girl's tooth has been knocked out as a solemn ceremony, it is pounded up and the fragments placed in a piece of flesh, which has to be eaten by the girl's mother. When the same rite has been performed on a man, his pounded tooth must be eaten in a piece of meat by his mother-in-law. Among the

heathen Arabs, when a boy's tooth fell out, he used to take it between his finger and thumb and throw it towards the sun, saying, "Give me a better for it." After that his teeth were sure to grow straight, and close, and strong. "The sun," says Tharafah, "gave the lad from his own nursery-ground a tooth like a hailstone, white and polished." Thus the reason for throwing the old teeth towards the sun would seem to have been a notion that the sun sends hail, from which it naturally follows that he can send you a tooth as smooth and white and hard as a hailstone. Among the peasants of the Lebanon, when a child loses a milk tooth, he throws it towards the sun, saying, "Sun, sun, take the ass's tooth and give me the deer's tooth." They sometimes say jestingly that the child's tooth has been carried off by a mouse. An Armenian generally buries his extracted teeth at the edge of the hearth with the prayer: "Grandfather, take a dog's tooth and give me a golden tooth." In the light of the preceding examples, we may conjecture that the grandfather here invoked is not so much the soul of a dead ancestor as a mouse or a rat.

Other parts which are commonly believed to remain in a sympathetic union with the body, after the physical connexion has been severed, are the navel-string and the afterbirth, including the placenta. So intimate, indeed, is the union conceived to be, that the fortunes of the individual for good or evil throughout life are often supposed to be bound up with one or other of these portions of his person, so that if his navel-string or afterbirth is preserved and properly treated, he will be prosperous; whereas if it be injured or lost, he will suffer accordingly. Thus among the Maoris, when the navel-string dropped off, the child was carried to a priest to be solemnly named by him. But before the ceremony of naming began, the navel-string was buried in a sacred place and a young sapling was planted over it. Ever afterwards that tree, as it grew, was a *tohu oranga* or sign of life for the child. In the Upper Whakatane valley, in the North Island of New Zealand, there is a famous *hinau* tree, to which the Maoris used to attach the navel-strings of their children; and barren women were in the habit of embracing the tree in the hope of thereby obtaining offspring. Again, among the Maoris, "the placenta is named *fenua*, which word signifies land. It is applied by the natives to the placenta, from their supposing it to be the residence of the child: on being discharged it is immediately buried with great care, as they have the superstitious idea that the priests, if offended, would procure it; and, by praying over it, occasion the death of both mother and child, by 'praying them to death,' to use their own expression." Again, some of the natives of South Australia regarded the placenta as sacred and carefully put it away out of reach of the dogs, doubtless because they thought that harm would come to the child if this part of himself were eaten by the animals. Certain tribes of Western Australia believe that a man swims well or ill, according as his mother at his birth threw the navel-string into water or not. Among the Arunta of Central Australia the navel-string is swathed in fur-string and made into a necklace, which is placed round the child's neck. The necklace is supposed to facilitate the growth of the child, to keep it quiet and contented, and to avert illness generally. In the Kaitish tribe of Central Australia the practice and belief are similar. In the Warramunga tribe, after the string has hung round the child's neck for a time, it is given to the wife's brother, who wears it in his armband, and who may not see the child till it can walk. In return for the navel-string, the man makes a present of weapons to the infant's father. When the child can walk, the father gives fur-string to the man, who now comes to the camp, sees the child, and makes another present to the father. After that he keeps the navel-string for some time longer, and finally places it in a hollow tree known only to himself. Among the natives on the Pennefather river in Queensland it is believed that a part of the child's spirit (*cho-i*) stays in the afterbirth. Hence the grandmother takes the afterbirth away and buries it in the sand. She marks the spot by a number of twigs which she sticks in the ground in a circle, tying their tops together so that the structure resembles a cone. When Anjea, the being who causes conception in women by putting mud babies into their wombs, comes along and sees the place, he takes out the

spirit and carries it away to one of his haunts, such as a tree, a hole in a rock, or a lagoon, where it may remain for years. But sometime or other he will put the spirit again into a baby, and it will be born once more into the world.

In the Yabim tribe of German New Guinea the mother ties the navel-string to the net in which she carries the child, lest any one should use the string to the child's hurt. "In some parts of Fiji the navel-string of a male infant is planted together with a cocoanut, or slip of a bread-fruit tree, and the child's life is supposed to be intimately connected with that of the tree. Moreover, the planting is supposed to have the effect of making the boy a good climber. If the child be a girl, the mother or her sister will take the navel-string to the sea-water when she goes out fishing for the first time after the childbirth, and she will throw it into the sea when the nets are stretched in line. Thus the girl will grow up into a skilful fisherwoman. But the queerest use I ever saw the string put to was at Rotuma. There it has become almost obligatory for a young man, who wants the girls to respect him, to make a voyage in a white man's vessel; and mothers come alongside ships anchored in the roadstead and fasten their boy's navel-string to the vessel's chain-plates. This will make sure of a voyage for the child when it has grown up. This, of course, must be a modern development, but it has all the strength of an ancient custom." In Ponape, one of the Caroline Islands, the navel-string is placed in a shell and then disposed of in such a way as shall best adapt the child for the career which the parents have chosen for him. Thus if they wish to make him a good climber, they will hang the navel-string on a tree. In the Gilbert Islands the navel-string is wrapt by the child's father or adoptive father in a pandanus leaf, and then worn by him as a bracelet for several months. After that he keeps it most carefully in the hut, generally hanging under the ridge-beam. The islanders believe that if the navel-string is thus preserved, the child will become a great warrior if it is a boy, or will make a good match if it is a girl. But should the bracelet be lost before the child is grown up, they expect that the boy will prove a coward in war, and that the girl will make an unfortunate marriage. Hence the most anxious search is made for the missing talisman, and if it is not to be found, weeks will pass before the relations resign themselves to its loss. When the boy has grown to be a youth and has distinguished himself for the first time in war, the bracelet containing the navel-string is taken by the villagers, on a day fixed for the purpose, far out to sea; the adoptive father of the lad throws the bracelet overboard, and all the canoes begin to catch as many fish as they can. The first fish caught, whether large or small, is carefully preserved apart from the rest. Meantime the old women at home have been busy preparing a copious banquet for the fishermen. When the little fleet comes to shore, the old woman who helped at the lad's birth goes to meet it; the first fish caught is handed to her, and she carries it to the hut. The fish is laid on a new mat, the youth and his mother take their places beside it, and they and it are covered up with another mat. Then the old woman goes round the mat, striking the ground with a short club and murmuring a prayer to the lad's god to help him henceforth in war, that he may be brave and invulnerable, and that he may turn out a skilful fisherman. The navel-string of a girl, as soon as she is grown up, is thrown into the sea with similar ceremonies; and the ceremony on land is the same except that the old woman's prayer is naturally different; she asks the girl's god to grant that she may have a happy marriage and many children. After the mat has been removed, the fish is cooked and eaten by the two; if it is too large to be eaten by them alone, the remainder is consumed by friends and relations. These ceremonies are only observed for the children of wealthy parents, who can defray the cost. In the case of a child of poorer parents the bracelet containing the navel-string simply hangs up till it disappears in one way or another.

Among the Galelareese, to the west of New Guinea, the mother sometimes keeps the navel-string till the child is old enough to begin to play. Then she gives it as a plaything to the little

one, who may take it away; otherwise the child would be idiotic. But others plant the navel-string with a banana-bush or a coco-nut. The Kei islanders, to the south-west of New Guinea, regard the navel-string as the brother or sister of the child, according as the infant is a boy or a girl. They put it in a pot with ashes, and set it in the branches of a tree, that it may keep a watchful eye on the fortunes of its comrade. In the Babar Archipelago, between New Guinea and Celebes, the placenta is mixed with ashes and put in a small basket, which seven women, each of them armed with a sword, hang up on a tree of a particular kind (*Citrus hystrix*). The women carry swords for the purpose of frightening the evil spirits; otherwise these mischievous beings might get hold of the placenta and make the child sick. The navel-string is kept in a little box in the house. In the Tenimber and Timorlaut islands the placenta is buried in a basket under a sago or coco-nut palm, which then becomes the property of the child. But sometimes it is hidden in the forest, or deposited in a hole under the house with an offering of betel. In the Watubela islands the placenta is buried under a coco-nut, *mangga*, or great fig-tree along with the shell of the coco-nut, of which the pulp had been used to smear the newborn child. In many of the islands between New Guinea and Celebes the placenta is put in the branches of a tree, often in the top of one of the highest trees in the neighbourhood. Sometimes the navel-string is deposited along with the placenta in the tree, but often it is kept to be used as medicine or an amulet by the child. Thus in Ceram the child sometimes wears the navel-string round its neck as a charm to avert sickness; and in the islands of Leti, Moa, and Lakor he carries it as an amulet in war or on a far journey. We cannot doubt that the intention of putting the placenta in the top of a tall tree is to keep it, and with it the child, out of harm's way. In the islands of Saparoea, Haroekoe, and Noessa Laut, to the east of Amboyna, the midwife buries the afterbirth and strews flowers over it. Moreover, resin or a lamp is kept burning for seven or three nights over the buried afterbirth, in order that no harm may come to the child. Some people, however, in these islands solemnly cast the afterbirth into the sea. Being placed in a pot and closely covered up with a piece of white cotton, it is taken out to sea in a boat. A hole is knocked in the pot to allow it to sink in the water. The midwife, who is charged with the duty of heaving the pot and its contents overboard, must look straight ahead; if she were to glance to the right or left the child whose afterbirth is in the pot would squint. And the man who rows or steers the boat must make her keep a straight course, otherwise the child would grow up a gad-about. Before the pot is flung into the sea, the midwife disengages the piece of white cotton in which it is wrapt, and this cloth she takes straight back to the house and covers the baby with it. In these islands it is thought that a child born with a caul will enjoy in later years the gift of second sight—that is, that he will be able to see things which are hidden from common eyes, such as devils and evil spirits. But if his parents desire to prevent him from exercising this uncanny power, they can do so. In that case the midwife must dry the caul in the sun, steep it in water, and then wash the child with the water thrice; further, when the child is a little older, she must grind the caul to powder, and give the child the powder to eat with its pap. Some people keep the caul; and if the child falls ill, it is given water to drink in which the caul has been steeped. Similarly in the Luang-Sermata islands a child born with a caul is counted lucky, and can perceive and recognise the spirits of his ancestors. A caul, it may be said, is merely the foetal membrane which usually forms part of the afterbirth; occasionally a child is born with it wrapt like a hood round its head.

In Parigi, a kingdom on the coast of Central Celebes, the placenta is laid in a cooking-pot, and one of the mother's female relations carries the pot wrapt in white cotton and hidden under a petticoat (*sarong*) to a spot beneath the house or elsewhere, and there she buries it. A coco-nut is planted near the place. Going and coming the woman is led by another, and must keep her eyes fast shut, for if she looked right or left the child would squint, "because she is at this time closely united with a part of the child, to wit its older brother, in other words the

placenta." On her return to the house she lies down on her sleeping-mat, still with closed eyes, and draws a petticoat over her head, and another woman sprinkles her with water. After that she may get up and open her eyes. The sprinkling with water is intended to sever her sympathetic connexion with the child and so prevent her from exercising any influence on it.

Among the Tolalaki of Central Celebes turmeric and other spices are put on the placenta, which is then enclosed in two coco-nut shells that fit one on the other. These are wrapt in bark-cloth and kept in the house. If the child falls ill, the coco-nut shells are opened and the placenta examined. Should there be worms in it, they are removed and fresh spices added. When the child has grown big and strong, the placenta is thrown away. Among the Toboingkoo of Central Celebes the afterbirth is placed in a rice-pot with various plants, which are intended to preserve it from decay as long as possible; it is then carefully tied up in bark-cloth. A man and a woman of the family carry the placenta away; in doing so they go out and in the house four times, and each time they enter they kiss the child, but they take care not to look to the right or the left, for otherwise the child would squint. Some bury the placenta, others hang it on a tree. If the child is unwell, they dig up the placenta or take it down from the tree, and lay bananas, rice of four sorts, and a lighted taper beside it. Having done so, they hang it up on a tree if it was previously buried; but they bury it if it was formerly hung up. The Tomori of Central Celebes wash the afterbirth, put it in a rice-pot, and bury it under the house. Great care is taken that no water or spittle falls on the place. For a few days the afterbirth is sometimes fed with rice and eggs, which are laid on the spot where it is buried. Afterwards the people cease to trouble themselves about it. In southern Celebes they call the navel-string and afterbirth the two brothers or sisters of the child. When the infant happens to be a prince or princess, the navel-string and afterbirth are placed with salt and tamarind in a new rice-pot, which is then enveloped in a fine robe and tightly corded up to prevent the evil spirits from making off with the pair of brothers or sisters. For the same reason a light is kept burning all night, and twice a day rice is rubbed on the edge of the pot, for the purpose, as the people say, of giving the child's little brothers or sisters something to eat. After a while this feeding, as it is called, takes place at rarer intervals, and when the mother has been again brought to bed it is discontinued altogether. On the ninth day after the birth a number of coco-nuts are planted, with much ceremony, in a square enclosure, and the water which was used in cleansing the afterbirth and navel-string is poured upon them. These coco-nuts are called the contemporaries of the child and grow up with him. When the planting is done, the rice-pot with the navel-string and afterbirth is carried back and set beside the bed of the young prince or princess, and when his royal highness is carried out to take the air the rice-pot with his two "brothers" goes out with him, swathed in a robe of state and screened from the sun by an umbrella. If the prince or princess should die, the afterbirth and navel-string are buried. Among common people in South Celebes these parts of the infant are generally buried immediately after the birth, or they are sunk in the deep sea, or hung in a rice-pot on a tree.

In the island of Timor the placenta is called the child's companion and treated accordingly. The midwife puts it in an earthen pot and covers it with ashes from the hearth. After standing thus three days it is taken away and buried by a person who must observe silence in discharging this duty. In Savou, a small island to the south-west of Timor, the afterbirth is filled with native herbs, and having been deposited in a new pot, which has never before been used, is buried under the house to keep off evil spirits. Or it is put in a new basket and hung in a high toddy palm to fertilise it, or thrown into the sea to secure a good catch of fish. The person who thus disposes of the afterbirth may not look to the right or the left; he must be joyous and, if possible, go singing on his way. If it is to be hung on a tree, he must climb nimbly up, in order that the child may always be lucky. These islanders ascribe a similar fertilising virtue to a caul. It is dried and carefully kept in a box. When rice-stalks turn black

and the ears refuse to set, a man will take the box containing the caul and run several times round the rice-field, in order that the wind may waft the genial influence of the caul over the rice. In Rotti, an island to the south of Timor, the navel-string is put in a small satchel made of leaves, and if the father of the child is not himself going on a voyage, he entrusts the bag to one of his seafaring friends and charges him to throw it away in the open sea with the express wish that, when the child grows up and has to sail to other islands, he may escape the perils of the deep. But the business of girls in these islands does not lie in the great waters, and hence their navel-strings receive a different treatment. It is their task to go afishing daily, when the tide is out, on the coral reefs which ring the islands. So when the mother is herself again, she repairs with the little satchel to the reef where she is wont to fish. Acting the part of a priestess she there eats one or two small bagfuls of boiled rice on the spot where she intends to deposit the dried navel-string of her baby daughter, taking care to leave a few grains of rice in the bags. Then she ties the precious satchel and the nearly empty rice-bags to a stick and fastens it among the stones of the reef, generally on its outer edge, within sight and sound of the breaking waves. In doing so she utters a wish that this ceremony may guard her daughter from the perils and dangers that beset her on the reef—for example, that no crocodile may issue from the lagoon and eat her up, and that the sharp corals and broken shells may not wound her feet.

In the island of Flores the placenta is put in an earthen pot, along with some rice and betel, and buried by the father in the neighbourhood of the house, or else preserved in one of the highest trees. The natives of Bali, an island to the east of Java, believe firmly that the afterbirth is the child's brother or sister, and they bury it in the courtyard in the half of a coconut from which the kernel has not been removed. For forty days afterwards a light is burned, and food, water, and betel deposited on the spot, doubtless in order to feed the baby's little brother or sister, and to guard him or her from evil spirits. In Java the afterbirth is also called the brother or sister of the infant; it is wrapt in white cotton, put in a new pot or a coconut shell, and buried by the father beside the door, outside the house if the child is a boy, but inside the house if the child is a girl. Every evening until the child's navel has healed a lamp is lit over the spot where the afterbirth is buried. If the afterbirth hangs in a rice-pot in the house, as the practice is with some people, the lamp burns under the place where the rice-pot is suspended. The purpose of the light is to ward off demons, to whose machinations the child and its supposed brother or sister are at this season especially exposed. If the child is a boy, a piece of paper inscribed with the alphabet is deposited in the pot with his placenta, in order that he may be smart at his learning; if the child is a girl, a needle and thread are deposited in the pot, that she may be a good sempstress, and water with flowers in it is poured on the spot where the placenta is buried, in order that the child may always be healthy; for many Javanese think that if the placenta is not properly honoured, the child will never be well.

Sometimes, however, women in the interior of Java allow the placenta, surrounded with fruits and flowers and illuminated by little lamps, to float down the river in the dusk of the evening as an offering to the crocodiles, or rather to the ancestors whose souls are believed to lodge in these animals.

In Mandeling, a district on the west coast of Sumatra, the afterbirth is washed and buried under the house or put in an earthenware pot, which is carefully shut up and thrown into the river. This is done to avert the supposed unfavourable influence of the afterbirth on the child, whose hands or feet, for example, might be chilled by it. When the navel-string drops off, it is preserved to be used as a medicine when its former owner is ill. In Mandeling, too, the midwife prefers to cut the navel-string with a piece of a flute on which she has first blown, for then the child will be sure to have a fine voice. Among the Minangkabau people of Sumatra the placenta is put in a new earthenware pot, which is then carefully closed with a

banana leaf to prevent the ants and other insects from coming at it; for if they did, the child would be sickly and given to squalling. In Central Sumatra the placenta is wrapt in white cotton, deposited in a basket or a calabash, and buried in the courtyard before the house or under a rice-barn. The hole is dug by a kinsman or kinswoman according as the baby is a boy or a girl. Over the hole is placed a stone from the hearth, and beside it a wooden spoon is stuck in the ground. Both stone and spoon are sprinkled with the juice of a citron. During the ceremony *koemajen* is burned and a shot fired. For three evenings afterwards candles are lighted at the spot, doubtless to keep off demons. Among the Battas of Sumatra, as among so many other peoples of the Indian Archipelago, the placenta passes for the child's younger brother or sister, the sex being determined by the sex of the child, and it is buried under the house. According to the Battas it is bound up with the child's welfare, and seems, in fact, to be the seat of the transferable soul, of whose wanderings outside of the body we shall hear something later on. The Karo Battas even affirm that of a man's two souls it is the true soul that lives with the placenta under the house; that is the soul, they say, which begets children.

In Pasir, a district of eastern Borneo, the afterbirth is carefully treated and kept in an earthen pot or basket in the house until the remains of the navel-string have fallen off. All the time it is in the house candles are burned and a little food is placed beside the pot. When the navel-string has fallen off, it is placed with the placenta in the pot, and the two are buried in the ground near the house. The reason why the people take this care of the afterbirth is that they believe it able to cause the child all kinds of sickness and mishaps. The Malas, a low Telugu caste of Southern India, bury the placenta in a pot with leaves in some convenient place, generally in the back yard, lest dogs or other animals should carry it off; for if that were to happen they fancy that the child would be of a wandering disposition. The Khasis of Assam keep the placenta in a pot in the house until the child has been formally named. When that ceremony is over, the father waves the pot containing the placenta thrice over the child's head, and then hangs it to a tree outside of the village. In some Malayo-Siamese families of the Patani States it is customary to bury the afterbirth under a banana-tree, the condition of which is thenceforth regarded as ominous of the child's fate for good or ill. A Chinese medical work prescribes that "the placenta should be stored away in a felicitous spot under the salutary influences of the sky or the moon, deep in the ground, and with earth piled up over it carefully, in order that the child may be ensured a long life. If it is devoured by a swine or dog, the child loses its intellect; if insects or ants eat it, the child becomes scrofulous; if crows or magpies swallow it, the child will have an abrupt or violent death; if it is cast into the fire, the child incurs running sores." The Japanese preserve the navel-string most carefully and bury it with the dead in the grave.

Among the Gallas of East Africa the navel-string is carefully kept, sewn up in leather, and serves as an amulet for female camels, which then become the child's property, together with all the young they give birth to. The Baganda believe that every person is born with a double, and this double they identify with the afterbirth, which they regard as a second child. Further, they think that the afterbirth has a ghost, and that the ghost is in that portion of the navel-string which remains attached to the child after birth. This ghost must be preserved if the child is to be healthy. Hence when the navel-string drops off, it is rubbed with butter, swathed in bark-cloth, and kept through life under the name of "the twin" (*mulongo*). The afterbirth is wrapt up in plantain leaves and buried by the child's mother at the root of a plantain tree, where it is protected against wild beasts. If the child be a boy, the tree chosen is of the kind whose fruit is made into beer; if the child be a girl, the tree is of the kind whose fruit is eaten. The plantain tree at whose root the afterbirth is buried becomes sacred until the fruit has ripened and been used. Only the father's mother may come near it and dig about it; all other people are kept from it by a rope of plantain fibre which is tied from tree to tree in a circle

round about the sacred plantain. All the child's secretions are thrown by the mother at the root of the tree; when the fruit is ripe, the father's mother cuts it and makes it into beer or cooks it, according to the sex of the child, and the relatives of the father's clan then come and partake of the sacred feast. After the meal the father must go in to his own wife, for should he neglect to do so, and should some other member of the clan have sexual relations with his wife first, the child's spirit would leave it and go into the other woman. Further, the navel-string plays a part at the ceremony of naming a child, the object of which among the Baganda is to determine whether the child is legitimate or not. For this purpose the navel-string (the so-called "twin") is dropped into a bowl containing a mixture of beer, milk, and water; if it floats, the child is legitimate and the clan accepts it as a member; if it sinks, the child is disowned by the clan and the mother is punished for adultery. Afterwards the navel-string or "twin" (*mulongo*) is either kept by the clan or buried along with the afterbirth at the root of the plantain tree. Such are the customs observed with regard to the afterbirth and navel-string of Baganda commoners. The king's navel-string or "twin," wrapt in bark-cloths and decorated with beads, is treated like a person and confided to the care of the Kimbugwe, the second officer of the country, who has a special house built for it within his enclosure. Every month, when the new moon first appears in the sky, the Kimbugwe carries the bundle containing the "twin" in procession, with fife and drums playing, to the king, while the royal drum is beating in the royal enclosure. The king examines it and hands it back to him. After that, the minister returns the precious bundle to its own house in his enclosure and places it in the doorway, where it remains all night. Next morning it is taken from its wrappings, smeared with butter, and again set in the doorway until the evening, when it is swathed once more in its bark-cloths and restored to its proper resting-place. After the king's death his "twin" is deposited, along with his jawbone, in the huge hut which forms his temple. The spirit of the dead king is supposed to dwell in these two relics; they are placed on the dais when he wishes to hold his court and when he is oracularly consulted on special occasions.

The Incas of Peru preserved the navel-string with the greatest care, and gave it to the child to suck whenever it fell ill. In ancient Mexico they used to give a boy's navel-string to soldiers, to be buried by them on a field of battle, in order that the boy might thus acquire a passion for war. But the navel-string of a girl was buried beside the domestic hearth, because this was believed to inspire her with a love of home and a taste for cooking and baking. Algonquin women hung the navel-string round the child's neck; if he lost it, they thought the child would be stupid and spiritless. Among the Thompson Indians of British Columbia the navel-string was sewed up by the mother in a piece of buckskin embroidered with hair, quills, or beads. It was then tied to the broad buckskin band which extended round the head of the cradle on the outside. Many thongs hung from it, each carrying fawn's hoofs and beads that jingled when the cradle was moved. If the navel-string were lost, they looked on it as a calamity, for they believed that in after years the child would become foolish or would be lost in the chase or on a journey. Among the Kwakiutl Indians of British Columbia the afterbirth of girls is buried at high-water mark, in the belief that this will render them expert at digging for clam. The afterbirth of boys is sometimes exposed at places where ravens will eat it, because the boys will thus acquire the raven's prophetic vision. The same Indians are persuaded that the navel-string may be the means of imparting a variety of accomplishments to its original owner. Thus, if it is fastened to a dancing mask, which is then worn by a skilful dancer, the child will dance well. If it is attached to a knife, which is thereafter used by a cunning carver, the child will carve well. Again, if the parents wish their son to sing beautifully, they tie his navel-string to the baton of a singing-master. Then the boy calls on the singing-master every morning while the artist is eating his breakfast. The votary of the Muses thereupon takes his baton and moves it twice down the right side and twice down the left side of the boy's body, after which he gives the lad some of his food to eat. That is an

infallible way of making the boy a beautiful singer. Among the Cherokees the navel-string of an infant girl is buried under the corn mortar, in order that the girl may grow up to be a good baker; but the navel-string of a boy is hung up on a tree in the woods, in order that he may be a hunter. Among the Kiowas the navel-string of a girl is sewn up in a small beaded pouch and worn by her at her belt as she grows to womanhood. If the girl's mother ever sells the belt and pouch, she is careful to extract the navel-string from the pouch before the bargain is struck. Should the child die, the pouch containing her navel-string would be fastened to a stick and set up over her grave.

Even in Europe many people still believe that a person's destiny is more or less bound up with that of his navel-string or afterbirth. Thus in Rhenish Bavaria the navel-string is kept for a while wrapt up in a piece of old linen, and then cut or pricked to pieces according as the child is a boy or a girl, in order that he or she may grow up to be a skilful workman or a good sempstress. In Berlin the midwife commonly delivers the dried navel-string to the father with a strict injunction to preserve it carefully, for so long as it is kept the child will live and thrive and be free from sickness. In Beauce and Perche the people are careful to throw the navel-string neither into water nor into fire, believing that if that were done the child would be drowned or burned. Among the Ruthenians of Bukowina and Galicia, the owner of a cow sometimes endeavours to increase its milk by throwing its afterbirth into a spring, "in order that, just as the water flows from the spring, so milk may flow in abundance from the udders of the cow." Some German peasants think that the afterbirth of a cow must be hung up in an apple-tree, otherwise the cow would not have a calf next year. Similarly at Cleveland in Yorkshire, when a mare foals, it is the custom to hang up the placenta in a tree, particularly in a thorn-tree, in order to secure luck with the foal. "Should the birth take place in the fields, this suspension is most carefully attended to, while as for the requirements of such events at the homestead, in not a few instances there is a certain tree not far from the farm-buildings still specially marked out for the reception of these peculiar pendants. In one instance lately, I heard of a larch tree so devoted, but admittedly in default of the thorn; the old thorn-tree long employed for the purpose having died out." Again, in Europe children born with a caul are considered lucky; in Holland, as in the East Indies, they can see ghosts. The Icelanders also hold that a child born with a caul will afterwards possess the gift of second sight, that he will never be harmed by sorcery, and will be victorious in every contest he undertakes, provided he has the caul dried and carries it with him. This latter belief explains why both in ancient and modern times advocates have bought cauls with the hope of winning their cases by means of them. Probably they thought that the spirit in the caul would prove an invincible ally to the person who had purchased its services. In like manner the aborigines of Central Australia believe that their sacred sticks or stones (*churinga*) are intimately associated with the spirits of the dead men to whom they belonged, and that in a fight a man who carries one of these sticks or stones will certainly vanquish an adversary who has no such talisman.

Further, it is an ancient belief in Iceland that the child's guardian spirit or a part of its soul has its seat in the chorion or foetal membrane, which usually forms part of the afterbirth, but is known as the caul when the child happens to be born with it. Hence the chorion was itself known as the *fylgia* or guardian spirit. It might not be thrown away under the open sky, lest demons should get hold of it and work the child harm thereby, or lest wild beasts should eat it up. It might not be burned, for if it were burned the child would have no *fylgia*, which would be as bad as to have no shadow. Formerly it was customary to bury the chorion under the threshold, where the mother stepped over it daily when she rose from bed. If the chorion was thus treated, the man had in after life a guardian spirit in the shape of a bear, an eagle, a wolf, an ox, or a boar. The guardian spirits of cunning men and wizards had the shape of a fox, while those of beautiful women appeared as swans. In all these forms the guardian spirits

formerly announced their coming and presented themselves to the persons to whom they belonged; but nowadays both the belief and the custom have changed in many respects.

Thus in many parts of the world the navel-string, or more commonly the afterbirth, is regarded as a living being, the brother or sister of the infant, or as the material object in which the guardian spirit of the child or part of its soul resides. This latter belief we have found among the aborigines of Queensland, the Battas of Sumatra, and the Norsemen of Iceland. In accordance with such beliefs it has been customary to preserve these parts of the body, at least for a time, with the utmost care, lest the character, the fate, or even the life of the person to whom they belong should be endangered by their injury or loss. Further, the sympathetic connexion supposed to exist between a person and his afterbirth or navel-string comes out very clearly in the widespread custom of treating the afterbirth or navel-string in ways which are supposed to influence for life the character and career of the person, making him, if it is a man, a swift runner, a nimble climber, a strong swimmer, a skilful hunter, or a brave soldier, and making her, if it is a woman, an expert fisher, a cunning sempstress, a good cook or baker, and so forth. Thus the beliefs and usages concerned with the afterbirth or placenta, and to a less extent with the navel-string, present a remarkable parallel to the widespread doctrine of the transferable or external soul and the customs founded on it. Hence it is hardly rash to conjecture that the resemblance is no mere chance coincidence, but that in the afterbirth or placenta we have a physical basis (not necessarily the only one) for the theory and practice of the external soul. The consideration of that subject is reserved for a later part of this work.

A curious application of the doctrine of contagious magic is the relation commonly believed to exist between a wounded man and the agent of the wound, so that whatever is subsequently done by or to the agent must correspondingly affect the patient either for good or evil. Thus Pliny tells us that if you have wounded a man and are sorry for it, you have only to spit on the hand that gave the wound, and the pain of the sufferer will be instantly alleviated. In Melanesia, if a man's friends get possession of the arrow which wounded him, they keep it in a damp place or in cool leaves, for then the inflammation will be trifling and will soon subside. Meantime the enemy who shot the arrow is hard at work to aggravate the wound by all the means in his power. For this purpose he and his friends drink hot and burning juices and chew irritating leaves, for this will clearly inflame and irritate the wound. Further, they keep the bow near the fire to make the wound which it has inflicted hot; and for the same reason they put the arrow-head, if it has been recovered, into the fire. Moreover, they are careful to keep the bow-string taut and to twang it occasionally, for this will cause the wounded man to suffer from tension of the nerves and spasms of tetanus. Similarly when a Kwakiutl Indian of British Columbia had bitten a piece out of an enemy's arm, he used to drink hot water afterwards for the purpose of thereby inflaming the wound in his foe's body.

Among the Lkuñgen Indians of the same region it is a rule that an arrow, or any other weapon that has wounded a man, must be hidden by his friends, who have to be careful not to bring it near the fire till the wound is healed. If a knife or an arrow which is still covered with a man's blood were thrown into the fire, the wounded man would suffer very much. In the Yerkla-mining tribe of south-eastern Australia it is thought that if any one but the medicine-man touches the flint knife with which a boy has been subincised, the boy will thereby be made very ill. So seriously is this belief held that if the lad chanced thereafter to fall sick and die, the man who had touched the knife would be killed. "It is constantly received and avouched," says Bacon, "that the anointing of the weapon that maketh the wound will heal the wound itself. In this experiment, upon the relation of men of credit (though myself, as yet, am not fully inclined to believe it), you shall note the points following: first, the ointment wherewith this is done is made of divers ingredients, whereof the strangest and hardest to come by are the moss upon the skull of a dead man unburied, and the fats of a boar and a bear

killed in the act of generation.” The precious ointment compounded out of these and other ingredients was applied, as the philosopher explains, not to the wound but to the weapon, and that even though the injured man was at a great distance and knew nothing about it. The experiment, he tells us, had been tried of wiping the ointment off the weapon without the knowledge of the person hurt, with the result that he was presently in a great rage of pain until the weapon was anointed again. Moreover, “it is affirmed that if you cannot get the weapon, yet if you put an instrument of iron or wood resembling the weapon into the wound, whereby it bleedeth, the anointing of that instrument will serve and work the effect.”

Remedies of the sort which Bacon deemed worthy of his attention are still in vogue in the eastern counties of England. Thus in Suffolk if a man cuts himself with a bill-hook or a scythe he always takes care to keep the weapon bright, and oils it to prevent the wound from festering. If he runs a thorn or, as he calls it, a bush into his hand, he oils or greases the extracted thorn. A man came to a doctor with an inflamed hand, having run a thorn into it while he was hedging. On being told that the hand was festering, he remarked, “That didn’t ought to, for I greased the bush well arter I pulled it out.” If a horse wounds its foot by treading on a nail, a Suffolk groom will invariably preserve the nail, clean it, and grease it every day, to prevent the foot from festering. Arguing in the same way, a Suffolk woman, whose sister had burnt her face with a flat-iron, observed that “the face would never heal till the iron had been put out of the way; and even if it did heal, it would be sure to break out again every time the iron was heated.” At Norwich in June 1902 a woman named Matilda Henry accidentally ran a nail into her foot. Without examining the wound, or even removing her stocking, she caused her daughter to grease the nail, saying that if this were done no harm would come of the hurt. A few days afterwards she died of lockjaw. Similarly Cambridgeshire labourers think that if a horse has run a nail into its foot, it is necessary to grease the nail with lard or oil and put it away in some safe place, or the horse will not recover. A few years ago a veterinary surgeon was sent for to attend a horse which had ripped its side open on the hinge of a farm gatepost. On arriving at the farm he found that nothing had been done to the wounded horse, but that a man was busy trying to pry the hinge out of the gatepost in order that it might be greased and put away, which, in the opinion of the Cambridge wiseacres, would conduce to the recovery of the animal. Similarly Essex rustics opine that, if a man has been stabbed with a knife, it is essential to his recovery that the knife should be greased and laid across the bed on which the sufferer is lying. So in Bavaria you are directed to anoint a linen rag with grease and tie it on the edge of the axe that cut you, taking care to keep the sharp edge upwards. As the grease on the axe dries, your wound heals. Similarly in the Harz mountains they say that if you cut yourself, you ought to smear the knife or the scissors with fat and put the instrument away in a dry place in the name of the Father, of the Son, and of the Holy Ghost. As the knife dries, the wound heals. Other people, however, in Germany say that you should stick the knife in some damp place in the ground, and that your hurt will heal as the knife rusts. Others again, in Bavaria, recommend you to smear the axe or whatever it is with blood and put it under the eaves.

The train of reasoning which thus commends itself to English and German rustics, in common with the savages of Melanesia and America, is carried a step further by the aborigines of Central Australia, who conceive that under certain circumstances the near relations of a wounded man must grease themselves, restrict their diet, and regulate their behaviour in other ways in order to ensure his recovery. Thus when a lad has been circumcised and the wound is not yet healed, his mother may not eat opossum, or a certain kind of lizard, or carpet snake, or any kind of fat, for otherwise she would retard the healing of the boy’s wound. Every day she greases her digging-sticks and never lets them out of her sight; at night she sleeps with them close to her head. No one is allowed to touch them. Every day also she rubs her body all over with grease, as in some way this is believed to help her

son's recovery. Another refinement of the same principle is due to the ingenuity of the German peasant. It is said that when one of his pigs or sheep breaks its leg, a farmer of Rhenish Bavaria or Hesse will bind up the leg of a chair with bandages and splints in due form. For some days thereafter no one may sit on that chair, move it, or knock up against it; for to do so would pain the injured pig or sheep and hinder the cure. In this last case it is clear that we have passed wholly out of the region of contagious magic and into the region of homoeopathic or imitative magic; the chair-leg, which is treated instead of the beast's leg, in no sense belongs to the animal, and the application of bandages to it is a mere simulation of the treatment which a more rational surgery would bestow on the real patient.

The sympathetic connexion supposed to exist between a man and the weapon which has wounded him is probably founded on the notion that the blood on the weapon continues to feel with the blood in his body. For a like reason the Papuans of Tumleo, an island off German New Guinea, are careful to throw into the sea the bloody bandages with which their wounds have been dressed, for they fear that if these rags fell into the hands of an enemy he might injure them magically thereby. Once when a man with a wound in his mouth, which bled constantly, came to the missionaries to be treated, his faithful wife took great pains to collect all the blood and cast it into the sea. Strained and unnatural as this idea may seem to us, it is perhaps less so than the belief that magic sympathy is maintained between a person and his clothes, so that whatever is done to the clothes will be felt by the man himself, even though he may be far away at the time. That is why these same Papuans of Tumleo search most anxiously for the smallest scrap which they may have lost of their scanty garments, and why other Papuans, travelling through the thick forest, will stop and carefully scrape from a bough any clot of red pomade which may have adhered to it from their greasy heads. In the Wotjobaluk tribe of Victoria a wizard would sometimes get hold of a man's opossum rug and tie it up with some small spindle-shaped pieces of casuarina wood, on which he had made certain marks, such as likenesses of his victim and of a poisonous snake. This bundle he would then roast slowly in the fire, and as he did so the man who had owned the opossum rug would fall sick. Should the patient suspect what was happening, he would send to the wizard and beg him to let him have the rug back. If the wizard consented, "he would give the thing back, telling the sick man's friends to put it in water, so as to wash the fire out." In such cases, we are told, the sick man would feel cooled and would most likely recover. In Tanna, one of the New Hebrides, a man who had a grudge at another and desired his death would try to get possession of a cloth which had touched the sweat of his enemy's body. If he succeeded, he rubbed the cloth carefully over with the leaves and twigs of a certain tree, rolled and bound cloth, twigs, and leaves into a long sausage-shaped bundle, and burned it slowly in the fire. As the bundle was consumed, the victim fell ill, and when it was reduced to ashes, he died. In this last form of enchantment, however, the magical sympathy may be supposed to exist not so much between the man and the cloth as between the man and the sweat which issued from his body. But in other cases of the same sort it seems that the garment by itself is enough to give the sorcerer a hold upon his victim. The witch in Theocritus, while she melted an image or lump of wax in order that her faithless lover might melt with love of her, did not forget to throw into the fire a shred of his cloak which he had dropped in her house. In Prussia they say that if you cannot catch a thief, the next best thing you can do is to get hold of a garment which he may have shed in his flight; for if you beat it soundly, the thief will fall sick. This belief is firmly rooted in the popular mind. Some seventy or eighty years ago, in the neighbourhood of Berend, a man was detected trying to steal honey, and fled, leaving his coat behind him. When he heard that the enraged owner of the honey was mauling his lost coat, he was so alarmed that he took to his bed and died. But in Germany it is not every stick that is good enough to beat an absent man with. It should be a hazel rod cut before sunrise on Good Friday. Some say it should be a one-year-old hazel-

sapling, and that you should cut it with three strokes, looking to the east, in the name of the Father, the Son, and the Holy Ghost. Others think the best time for cutting the rod is at the new moon on a Tuesday morning before sunrise. Once you have got this valuable instrument, you have only to spread a garment on a mole-hill or on the threshold, and to lay on with hearty goodwill, mentioning the name of the person whom you desire to injure. Though he may be miles off, he will feel every whack as if it descended on his body.

Again, magic may be wrought on a man sympathetically, not only through his clothes and severed parts of himself, but also through the impressions left by his body in sand or earth. In particular, it is a world-wide superstition that by injuring footprints you injure the feet that made them. Thus the natives of south-eastern Australia think that they can lame a man by placing sharp pieces of quartz, glass, bone, or charcoal in his footprints. Rheumatic pains are often attributed by them to this cause. Seeing a Tatungolung man very lame, Mr. Howitt asked him what was the matter. He said, "Some fellow has put *bottle* in my foot." He was suffering from rheumatism, but believed that an enemy had found his foot-track and had buried in it a piece of broken bottle, the magical influence of which had entered his foot. On another occasion Mr. Howitt's party was followed by a number of strange natives who looked with great interest at the footprints of the horses and camels. A black fellow with Mr. Howitt was much alarmed, and declared that the strangers were putting poison in his footsteps. The Wyingurri, a tribe on the border of western Australia, have a magical instrument made of resin and rats' teeth which they call a sun, because it is supposed to contain the solar heat. By placing it on a man's tracks they think they can throw him into a violent fever, which will soon burn him up. In the Unmatjera tribe of Central Australia, when a boy has been circumcised he must hide in the bush, and if he should see a woman's tracks he must be very careful to jump over them. For if his foot were to touch them, the spirit of the louse which lives in the woman's hair would go to him, and his head would be full of lice. In New Britain it is thought that you can cause the sickness or death of a man by pricking his footprints with the sting of a sting-ray. The Maoris imagine that they can work grievous harm to an enemy by taking up earth from his footprints, depositing it in a sacred place, and performing a ceremony over it. In Savage Island a common form of witchcraft was to take up the soil on which an enemy had set his foot, and to carry it to a sacred place, where it was solemnly cursed, in order that the man might be afflicted with lameness. The Galelareese think that if anybody sticks something sharp into your footprints while you are walking, you will be wounded in your feet. In Japan, if a house has been robbed by night and the burglar's footprints are visible in the morning, the householder will burn mugwort on them, hoping thereby to hurt the robber's feet so that he cannot run far, and the police may easily overtake him. Among the Karens of Burma some people are said to keep poison fangs for the purpose of killing their enemies. These they thrust into the footprints of the person whom they wish to destroy, and soon he finds himself with a sore foot, as if a dog had bitten it. The sore rapidly grows worse till death follows. Peasants of northern India commonly attribute all sorts of pains and sores to the machinations of a witch or sorcerer who has meddled with their footprints. For example, with the Chero, a Dravidian race of labourers in the hill country of Mirzapur, a favourite mode of harming an enemy is to measure his footprints in the dust with a straw and then mutter a spell over them; that brings on wounds and sores in his feet. Such magical operations have been familiar to the Hindoos from of old. In the *Kausika Sutra*, a book of sorcery, it is directed that, while your foe is walking southward, you should make cuts in his footprint with the leaf of a certain tree or with the blade of an axe (it is not quite clear which is to be used); then you must tie dust from the footprint in the leaf of a certain tree (*Butea frondosa*) and throw it into a frying-pan; if it crackles in the pan, your enemy is undone. Another old Hindoo charm was to obtain earth from the footprint of a beleaguered king and scatter it in the wind. The Herero of South Africa take earth from the footprints of a

lion and throw it on the track of an enemy, with the wish, "May the lion kill you." The Ovambo of the same region believe that they can be bewitched by an enemy through the dust or sand of their footprints. Hence a man who has special reason to dread the spite of a foe will carefully efface his footprints with a branch as fast as he makes them. The Ewe-speaking people of West Africa fancy they can drive an enemy mad by throwing a magic powder on his footprints. Among the Shuswap and Carrier Indians of North-west America shamans used to bewitch a man by taking earth from the spot on which he had stood and placing it in their medicine-bags; then their victim fell sick or died. In North Africa the magic of the footprints is sometimes used for more amiable purposes. A woman who wishes to attach her husband or lover to herself will take earth from the print of his right foot, tie it up with some of his hairs in a packet, and wear the packet next her skin.

Similar practices prevail in various parts of Europe. Thus in Mecklenburg it is thought that if you drive a nail into a man's footprint he will fall lame; sometimes it is required that the nail should be taken from a coffin. A like mode of injuring an enemy is resorted to in some parts of France. It is said that there was an old woman who used to frequent Stow in Suffolk, and she was a witch. If, while she walked, any one went after her and stuck a nail or a knife into her footprint in the dust, the dame could not stir a step till it was withdrawn. More commonly, it would seem, in Germany earth from the footprint is tied up in a cloth and hung in the chimney smoke; as it dries up, so the man withers away or his foot shrivels up. The same practice and the same belief are said to be common in Matogrosso, a province of Brazil. A Bohemian variation of the charm is to put the earth from the footprint in a pot with nails, needles, broken glass, and so forth, then set the pot on the fire and let it boil till it bursts.

After that the man whose footprint has been boiled will have a lame leg for the rest of his life.

Among the Lithuanians the proceeding is somewhat different. They dig up the earth from the person's footprint and bury it, with various incantations, in a graveyard. That causes the person to sicken and die. A similar practice is reported from Mecklenburg. The Esthonians of the island of Oesel measure the footprint with a stick and bury the stick, thereby undermining the health of the man or woman whose foot made the mark. Among the South Slavs a girl will dig up the earth from the footprints of the man she loves and put it in a flower-pot. Then she plants in the pot a marigold, a flower that is thought to be fadeless. And as its golden blossom grows and blooms and never fades, so shall her sweetheart's love grow and bloom, and never, never fade. Thus the love-spell acts on the man through the earth he trod on. An old Danish mode of concluding a treaty was based on the same idea of the sympathetic connexion between a man and his footprints: the covenanting parties sprinkled each other's footprints with their own blood, thus giving a pledge of fidelity. In ancient Greece superstitions of the same sort seem to have been current, for it was thought that if a horse stepped on the track of a wolf he was seized with numbness; and a maxim ascribed to Pythagoras forbade people to pierce a man's footprints with a nail or a knife.

The same superstition is turned to account by hunters in many parts of the world for the purpose of running down the game. Thus a German huntsman will stick a nail taken from a coffin into the fresh spoor of the quarry, believing that this will hinder the animal from escaping. The aborigines of Victoria put hot embers in the tracks of the animals they were pursuing. Hottentot hunters throw into the air a handful of sand taken from the footprints of the game, believing that this will bring the animal down. Thompson Indians used to lay charms on the tracks of wounded deer; after that they deemed it superfluous to pursue the animal any further that day, for being thus charmed it could not travel far and would soon die.

Similarly, Ojebway Indians placed "medicine" on the track of the first deer or bear they met with, supposing that this would soon bring the animal into sight, even if it were two or three days' journey off; for this charm had power to compress a journey of several days into a few

hours. Ewe hunters of West Africa stab the footprints of game with a sharp-pointed stick in order to maim the quarry and allow them to come up with it. If Esthonian peasants find a wolf's dung on a beast's tracks, they burn it and scatter the ashes to the wind. This gives the wolf a pain in his stomach and makes him lose his way. The Aino think that hares bewitch people. Hence if one of them sees the track of a hare in the snow near his hut, he should carefully scoop it up with a water-ladle and then turn it upside down, saying as he does so that he buries the soul of the hare under the snow, and expressing a wish that the animal may sicken and die. In order to recover strayed cattle, the Zulus take the animals' dung and earth from their footprints and place both in the chief's vessel, round which a magic circle is drawn. Then the chief says: "I have now conquered them. Those cattle are now here; I am now sitting upon them. I do not know in what way they will escape."

But though the footprint is the most obvious it is not the only impression made by the body through which magic may be wrought on a man. The aborigines of south-eastern Australia believe that a man may be injured by burying sharp fragments of quartz, glass, and so forth in the mark made by his reclining body; the magical virtue of these sharp things enters his body and causes those acute pains which the ignorant European puts down to rheumatism.

Sometimes they beat the place where the man sat with a pointed stick of the he-oak (*Casuarina leptoclada*), chanting an appropriate song at the same time; the stick will enter his person and kill him, provided the place operated on is still warm with the heat of his body. At Delena, in British New Guinea, a man will sometimes revenge himself on a girl who has rejected his love by thrusting the spine of a sting-ray into the spot where she has been sitting; afterwards he puts it in the sun for a day or two and finally heats it over a fire. In a couple of days the girl dies. The natives of Tumleo, an island off German New Guinea, efface the marks they have left on the ground where they sat, lest magic should be wrought on them thereby. Before they leave a camping-place some of the natives of German New Guinea are careful to stab the ground thoroughly with spears, in order to prevent a sorcerer from making any use of a drop of sweat or any other personal remains which they may chance to leave behind. We can now understand why it was a maxim with the Pythagoreans that in rising from bed you should smooth away the impression left by your body on the bed-clothes. The rule was simply an old precaution against magic, forming part of a whole code of superstitious maxims which antiquity fathered on Pythagoras, though doubtless they were familiar to the barbarous forefathers of the Greeks long before the time of that philosopher.

To ensure the good behaviour of an ally with whom they have just had a conference, the Basutos will cut and preserve the grass on which the ally sat during the interview. Probably they regard the grass as a hostage for the observance of the treaty, since through it they could punish the man who sat on the grass if he should break faith. Moors who write on the sand are superstitiously careful to obliterate all the marks they made, never leaving a stroke or a dot in the sand when they have done writing. Another of the so-called maxims of Pythagoras bade people in lifting a pot always to smooth away the imprint it left on the ashes. So in Cambodia they say that when you lift a pot from the fire you should not set it down on the ashes; but that, if you must do so, you should be careful, in lifting the pot from the ashes, to efface the impression it has made. Otherwise they think that want will knock at your door.

But this seems to be an afterthought, devised to explain a rule of which the original meaning was forgotten. The old notion probably was that a magician could sympathetically injure any person who ate out of a pot by means of the impression which the pot had left on the ashes; or, to be more explicit, contagious magic was supposed to work through the impression of the pot to the pot itself, through the pot to the meat contained in it, and finally through the meat to the eater.

§ 4. *The Magician's Progress*

We have now concluded our examination of the general principles of sympathetic magic. The examples by which I have illustrated them have been drawn for the most part from what may be called private magic, that is from magical rites and incantations practised for the benefit or the injury of individuals. But in savage society there is commonly to be found in addition what we may call public magic, that is, sorcery practised for the benefit of the whole community. Wherever ceremonies of this sort are observed for the common good, it is obvious that the magician ceases to be merely a private practitioner and becomes to some extent a public functionary. The development of such a class of functionaries is of great importance for the political as well as the religious evolution of society. For when the welfare of the tribe is supposed to depend on the performance of these magical rites, the magician rises into a position of much influence and repute, and may readily acquire the rank and authority of a chief or king. The profession accordingly draws into its ranks some of the ablest and most ambitious men of the tribe, because it holds out to them a prospect of honour, wealth, and power such as hardly any other career could offer. The acuter minds perceive how easy it is to dupe their weaker brother and to play on his superstition for their own advantage. Not that the sorcerer is always a knave and impostor; he is often sincerely convinced that he really possesses those wonderful powers which the credulity of his fellows ascribes to him. But the more sagacious he is, the more likely he is to see through the fallacies which impose on duller wits. Thus the ablest members of the profession must tend to be more or less conscious deceivers; and it is just these men who in virtue of their superior ability will generally come to the top and win for themselves positions of the highest dignity and the most commanding authority. The pitfalls which beset the path of the professional sorcerer are many, and as a rule only the man of coolest head and sharpest wit will be able to steer his way through them safely. For it must always be remembered that every single profession and claim put forward by the magician as such is false; not one of them can be maintained without deception, conscious or unconscious. Accordingly the sorcerer who sincerely believes in his own extravagant pretensions is in far greater peril and is much more likely to be cut short in his career than the deliberate impostor. The honest wizard always expects that his charms and incantations will produce their supposed effect; and when they fail, not only really, as they always do, but conspicuously and disastrously, as they often do, he is taken aback: he is not, like his knavish colleague, ready with a plausible excuse to account for the failure, and before he can find one he may be knocked on the head by his disappointed and angry employers.

The general result is that at this stage of social evolution the supreme power tends to fall into the hands of men of the keenest intelligence and the most unscrupulous character. If we could balance the harm they do by their knavery against the benefits they confer by their superior sagacity, it might well be found that the good greatly outweighed the evil. For more mischief has probably been wrought in the world by honest fools in high places than by intelligent rascals. Once your shrewd rogue has attained the height of his ambition, and has no longer any selfish end to further, he may, and often does, turn his talents, his experience, his resources, to the service of the public. Many men who have been least scrupulous in the acquisition of power have been most beneficent in the use of it, whether the power they aimed at and won was that of wealth, political authority, or what not. In the field of politics the wily intriguer, the ruthless victor, may end by being a wise and magnanimous ruler, blessed in his lifetime, lamented at his death, admired and applauded by posterity. Such men, to take two of the most conspicuous instances, were Julius Caesar and Augustus. But once a fool always a fool, and the greater the power in his hands the more disastrous is likely to be the use he makes of it. The heaviest calamity in English history, the breach with America, might never have occurred if George the Third had not been an honest dullard.

Thus, so far as the public profession of magic affected the constitution of savage society, it tended to place the control of affairs in the hands of the ablest man: it shifted the balance of power from the many to the one: it substituted a monarchy for a democracy, or rather for an oligarchy of old men; for in general the savage community is ruled, not by the whole body of adult males, but by a council of elders. The change, by whatever causes produced, and whatever the character of the early rulers, was on the whole very beneficial. For the rise of monarchy appears to be an essential condition of the emergence of mankind from savagery. No human being is so hidebound by custom and tradition as your democratic savage; in no state of society consequently is progress so slow and difficult. The old notion that the savage is the freest of mankind is the reverse of the truth. He is a slave, not indeed to a visible master, but to the past, to the spirits of his dead forefathers, who haunt his steps from birth to death, and rule him with a rod of iron. What they did is the pattern of right, the unwritten law to which he yields a blind unquestioning obedience. The least possible scope is thus afforded to superior talent to change old customs for the better. The ablest man is dragged down by the weakest and dullest, who necessarily sets the standard, since he cannot rise, while the other can fall. The surface of such a society presents a uniform dead level, so far as it is humanly possible to reduce the natural inequalities, the immeasurable real differences of inborn capacity and temper, to a false superficial appearance of equality. From this low and stagnant condition of affairs, which demagogues and dreamers in later times have lauded as the ideal state, the Golden Age, of humanity, everything that helps to raise society by opening a career to talent and proportioning the degrees of authority to men's natural abilities, deserves to be welcomed by all who have the real good of their fellows at heart. Once these elevating influences have begun to operate—and they cannot be for ever suppressed—the progress of civilisation becomes comparatively rapid. The rise of one man to supreme power enables him to carry through changes in a single lifetime which previously many generations might not have sufficed to effect; and if, as will often happen, he is a man of intellect and energy above the common, he will readily avail himself of the opportunity. Even the whims and caprices of a tyrant may be of service in breaking the chain of custom which lies so heavy on the savage. And as soon as the tribe ceases to be swayed by the timid and divided counsels of the elders, and yields to the direction of a single strong and resolute mind, it becomes formidable to its neighbours and enters on a career of aggrandisement, which at an early stage of history is often highly favourable to social, industrial, and intellectual progress. For extending its sway, partly by force of arms, partly by the voluntary submission of weaker tribes, the community soon acquires wealth and slaves, both of which, by relieving some classes from the perpetual struggle for a bare subsistence, afford them an opportunity of devoting themselves to that disinterested pursuit of knowledge which is the noblest and most powerful instrument to ameliorate the lot of man.

Intellectual progress, which reveals itself in the growth of art and science and the spread of more liberal views, cannot be dissociated from industrial or economic progress, and that in its turn receives an immense impulse from conquest and empire. It is no mere accident that the most vehement outbursts of activity of the human mind have followed close on the heels of victory, and that the great conquering races of the world have commonly done most to advance and spread civilisation, thus healing in peace the wounds they inflicted in war. The Babylonians, the Greeks, the Romans, the Arabs are our witnesses in the past: we may yet live to see a similar outburst in Japan. Nor, to remount the stream of history to its sources, is it an accident that all the first great strides towards civilisation have been made under despotic and theocratic governments, like those of Egypt, Babylon, and Peru, where the supreme ruler claimed and received the servile allegiance of his subjects in the double character of a king and a god. It is hardly too much to say that at this early epoch despotism is the best friend of humanity and, paradoxical as it may sound, of liberty. For after all there is

more liberty in the best sense—liberty to think our own thoughts and to fashion our own destinies—under the most absolute despotism, the most grinding tyranny, than under the apparent freedom of savage life, where the individual's lot is cast from the cradle to the grave in the iron mould of hereditary custom.

So far, therefore, as the public profession of magic has been one of the roads by which the ablest men have passed to supreme power, it has contributed to emancipate mankind from the thralldom of tradition and to elevate them into a larger, freer life, with a broader outlook on the world. This is no small service rendered to humanity. And when we remember further that in another direction magic has paved the way for science, we are forced to admit that if the black art has done much evil, it has also been the source of much good; that if it is the child of error, it has yet been the mother of freedom and truth.

IV. Magic And Religion

The examples collected in the last chapter may suffice to illustrate the general principles of sympathetic magic in its two branches, to which we have given the names of Homoeopathic and Contagious respectively. In some cases of magic which have come before us we have seen that the operation of spirits is assumed, and that an attempt is made to win their favour by prayer and sacrifice. But these cases are on the whole exceptional; they exhibit magic tinged and alloyed with religion. Wherever sympathetic magic occurs in its pure unadulterated form, it assumes that in nature one event follows another necessarily and invariably without the intervention of any spiritual or personal agency. Thus its fundamental conception is identical with that of modern science; underlying the whole system is a faith, implicit but real and firm, in the order and uniformity of nature. The magician does not doubt that the same causes will always produce the same effects, that the performance of the proper ceremony, accompanied by the appropriate spell, will inevitably be attended by the desired results, unless, indeed, his incantations should chance to be thwarted and foiled by the more potent charms of another sorcerer. He supplicates no higher power: he sues the favour of no fickle and wayward being: he abases himself before no awful deity. Yet his power, great as he believes it to be, is by no means arbitrary and unlimited. He can wield it only so long as he strictly conforms to the rules of his art, or to what may be called the laws of nature as conceived by him. To neglect these rules, to break these laws in the smallest particular is to incur failure, and may even expose the unskilful practitioner himself to the utmost peril. If he claims a sovereignty over nature, it is a constitutional sovereignty rigorously limited in its scope and exercised in exact conformity with ancient usage. Thus the analogy between the magical and the scientific conceptions of the world is close. In both of them the succession of events is perfectly regular and certain, being determined by immutable laws, the operation of which can be foreseen and calculated precisely; the elements of caprice, of chance, and of accident are banished from the course of nature. Both of them open up a seemingly boundless vista of possibilities to him who knows the causes of things and can touch the secret springs that set in motion the vast and intricate mechanism of the world. Hence the strong attraction which magic and science alike have exercised on the human mind; hence the powerful stimulus that both have given to the pursuit of knowledge. They lure the weary enquirer, the footsore seeker, on through the wilderness of disappointment in the present by their endless promises of the future: they take him up to the top of an exceeding high mountain and shew him, beyond the dark clouds and rolling mists at his feet, a vision of the celestial city, far off, it may be, but radiant with unearthly splendour, bathed in the light of dreams.

The fatal flaw of magic lies not in its general assumption of a sequence of events determined by law, but in its total misconception of the nature of the particular laws which govern that sequence. If we analyse the various cases of sympathetic magic which have been passed in review in the preceding pages, and which may be taken as fair samples of the bulk, we shall find, as I have already indicated, that they are all mistaken applications of one or other of two great fundamental laws of thought, namely, the association of ideas by similarity and the association of ideas by contiguity in space or time. A mistaken association of similar ideas produces homoeopathic or imitative magic: a mistaken association of contiguous ideas produces contagious magic. The principles of association are excellent in themselves, and indeed absolutely essential to the working of the human mind. Legitimately applied they yield science; illegitimately applied they yield magic, the bastard sister of science. It is therefore a truism, almost a tautology, to say that all magic is necessarily false and barren; for were it ever to become true and fruitful, it would no longer be magic but science. From the

earliest times man has been engaged in a search for general rules whereby to turn the order of natural phenomena to his own advantage, and in the long search he has scraped together a great hoard of such maxims, some of them golden and some of them mere dross. The true or golden rules constitute the body of applied science which we call the arts; the false are magic.

If magic is thus next of kin to science, we have still to enquire how it stands related to religion. But the view we take of that relation will necessarily be coloured by the idea which we have formed of the nature of religion itself; hence a writer may reasonably be expected to define his conception of religion before he proceeds to investigate its relation to magic. There is probably no subject in the world about which opinions differ so much as the nature of religion, and to frame a definition of it which would satisfy every one must obviously be impossible. All that a writer can do is, first, to say clearly what he means by religion, and afterwards to employ the word consistently in that sense throughout his work. By religion, then, I understand a propitiation or conciliation of powers superior to man which are believed to direct and control the course of nature and of human life. Thus defined, religion consists of two elements, a theoretical and a practical, namely, a belief in powers higher than man and an attempt to propitiate or please them. Of the two, belief clearly comes first, since we must believe in the existence of a divine being before we can attempt to please him. But unless the belief leads to a corresponding practice, it is not a religion but merely a theology; in the language of St. James, "faith, if it hath not works, is dead, being alone." In other words, no man is religious who does not govern his conduct in some measure by the fear or love of God. On the other hand, mere practice, divested of all religious belief, is also not religion. Two men may behave in exactly the same way, and yet one of them may be religious and the other not. If the one acts from the love or fear of God, he is religious; if the other acts from the love or fear of man, he is moral or immoral according as his behaviour comports or conflicts with the general good. Hence belief and practice or, in theological language, faith and works are equally essential to religion, which cannot exist without both of them. But it is not necessary that religious practice should always take the form of a ritual; that is, it need not consist in the offering of sacrifice, the recitation of prayers, and other outward ceremonies. Its aim is to please the deity, and if the deity is one who delights in charity and mercy and purity more than in oblations of blood, the chanting of hymns, and the fumes of incense, his worshippers will best please him, not by prostrating themselves before him, by intoning his praises, and by filling his temples with costly gifts, but by being pure and merciful and charitable towards men, for in so doing they will imitate, so far as human infirmity allows, the perfections of the divine nature. It was this ethical side of religion which the Hebrew prophets, inspired with a noble ideal of God's goodness and holiness, were never weary of inculcating. Thus Micah says: "He hath shewed thee, O man, what is good; and what doth the Lord require of thee, but to do justly, and to love mercy, and to walk humbly with thy God?" And at a later time much of the force by which Christianity conquered the world was drawn from the same high conception of God's moral nature and the duty laid on men of conforming themselves to it. "Pure religion and undefiled," says St. James, "before God and the Father is this, To visit the fatherless and widows in their affliction, and to keep himself unspotted from the world."

But if religion involves, first, a belief in superhuman beings who rule the world, and, second, an attempt to win their favour, it clearly assumes that the course of nature is to some extent elastic or variable, and that we can persuade or induce the mighty beings who control it to deflect, for our benefit, the current of events from the channel in which they would otherwise flow. Now this implied elasticity or variability of nature is directly opposed to the principles of magic as well as of science, both of which assume that the processes of nature are rigid and invariable in their operation, and that they can as little be turned from their course by

persuasion and entreaty as by threats and intimidation. The distinction between the two conflicting views of the universe turns on their answer to the crucial question, Are the forces which govern the world conscious and personal, or unconscious and impersonal? Religion, as a conciliation of the superhuman powers, assumes the former member of the alternative. For all conciliation implies that the being conciliated is a conscious or personal agent, that his conduct is in some measure uncertain, and that he can be prevailed upon to vary it in the desired direction by a judicious appeal to his interests, his appetites, or his emotions. Conciliation is never employed towards things which are regarded as inanimate, nor towards persons whose behaviour in the particular circumstances is known to be determined with absolute certainty. Thus in so far as religion assumes the world to be directed by conscious agents who may be turned from their purpose by persuasion, it stands in fundamental antagonism to magic as well as to science, both of which take for granted that the course of nature is determined, not by the passions or caprice of personal beings, but by the operation of immutable laws acting mechanically. In magic, indeed, the assumption is only implicit, but in science it is explicit. It is true that magic often deals with spirits, which are personal agents of the kind assumed by religion; but whenever it does so in its proper form, it treats them exactly in the same fashion as it treats inanimate agents, that is, it constrains or coerces instead of conciliating or propitiating them as religion would do. Thus it assumes that all personal beings, whether human or divine, are in the last resort subject to those impersonal forces which control all things, but which nevertheless can be turned to account by any one who knows how to manipulate them by the appropriate ceremonies and spells. In ancient Egypt, for example, the magicians claimed the power of compelling even the highest gods to do their bidding, and actually threatened them with destruction in case of disobedience.

Sometimes, without going quite so far as that, the wizard declared that he would scatter the bones of Osiris or reveal his sacred legend, if the god proved contumacious. Similarly in India at the present day the great Hindoo trinity itself of Brahma, Vishnu, and Siva is subject to the sorcerers, who, by means of their spells, exercise such an ascendancy over the mightiest deities, that these are bound submissively to execute on earth below, or in heaven above, whatever commands their masters the magicians may please to issue. There is a saying everywhere current in India: "The whole universe is subject to the gods; the gods are subject to the spells (*mantras*); the spells to the Brahmans; therefore the Brahmans are our gods."

This radical conflict of principle between magic and religion sufficiently explains the relentless hostility with which in history the priest has often pursued the magician. The haughty self-sufficiency of the magician, his arrogant demeanour towards the higher powers, and his unabashed claim to exercise a sway like theirs could not but revolt the priest, to whom, with his awful sense of the divine majesty, and his humble prostration in presence of it, such claims and such a demeanour must have appeared an impious and blasphemous usurpation of prerogatives that belong to God alone. And sometimes, we may suspect, lower motives concurred to whet the edge of the priest's hostility. He professed to be the proper medium, the true intercessor between God and man, and no doubt his interests as well as his feelings were often injured by a rival practitioner, who preached a surer and smoother road to fortune than the rugged and slippery path of divine favour.

Yet this antagonism, familiar as it is to us, seems to have made its appearance comparatively late in the history of religion. At an earlier stage the functions of priest and sorcerer were often combined or, to speak perhaps more correctly, were not yet differentiated from each other. To serve his purpose man wooed the good-will of gods or spirits by prayer and sacrifice, while at the same time he had recourse to ceremonies and forms of words which he hoped would of themselves bring about the desired result without the help of god or devil. In short, he performed religious and magical rites simultaneously; he uttered prayers and

incantations almost in the same breath, knowing or recking little of the theoretical inconsistency of his behaviour, so long as by hook or crook he contrived to get what he wanted. Instances of this fusion or confusion of magic with religion have already met us in the practices of Melanesians and of other peoples. So far as the Melanesians are concerned, the general confusion cannot be better described than in the words of Dr. R. H. Codrington:—“That invisible power which is believed by the natives to cause all such effects as transcend their conception of the regular course of nature, and to reside in spiritual beings, whether in the spiritual part of living men or in the ghosts of the dead, being imparted by them to their names and to various things that belong to them, such as stones, snakes, and indeed objects of all sorts, is that generally known as *mana*. Without some understanding of this it is impossible to understand the religious beliefs and practices of the Melanesians; and this again is the active force in all they do and believe to be done in magic, white or black. By means of this men are able to control or direct the forces of nature, to make rain or sunshine, wind or calm, to cause sickness or remove it, to know what is far off in time and space, to bring good luck and prosperity, or to blast and curse.” “By whatever name it is called, it is the belief in this supernatural power, and in the efficacy of the various means by which spirits and ghosts can be induced to exercise it for the benefit of men, that is the foundation of the rites and practices which can be called religious; and it is from the same belief that everything which may be called Magic and Witchcraft draws its origin. Wizards, doctors, weather-mongers, prophets, diviners, dreamers, all alike, everywhere in the islands, work by this power. There are many of these who may be said to exercise their art as a profession; they get their property and influence in this way. Every considerable village or settlement is sure to have some one who can control the weather and the waves, some one who knows how to treat sickness, some one who can work mischief with various charms. There may be one whose skill extends to all these branches; but generally one man knows how to do one thing and one another. This various knowledge is handed down from father to son, from uncle to sister’s son, in the same way as is the knowledge of the rites and methods of sacrifice and prayer; and very often the same man who knows the sacrifice knows also the making of the weather, and of charms for many purposes besides. But as there is no order of priests, there is also no order of magicians or medicine-men. Almost every man of consideration knows how to approach some ghost or spirit, and has some secret of occult practices.”

The same confusion of magic and religion has survived among peoples that have risen to higher levels of culture. It was rife in ancient India and ancient Egypt; it is by no means extinct among European peasantry at the present day. With regard to ancient India we are told by an eminent Sanscrit scholar that “the sacrificial ritual at the earliest period of which we have detailed information is pervaded with practices that breathe the spirit of the most primitive magic.” Again, the same writer observes that “the ritual of the very sacrifices for which the metrical prayers were composed is described in the other Vedic texts as saturated from beginning to end with magical practices which were to be carried out by the sacrificial priests.” In particular he tells us that the rites celebrated on special occasions, such as marriage, initiation, and the anointment of a king, “are complete models of magic of every kind, and in every case the forms of magic employed bear the stamp of the highest antiquity.”

Speaking of the sacrifices prescribed in the *Brâhmanas*, Professor Sylvain Lévi says: “The sacrifice has thus all the characteristics of a magical operation, independent of the divinities, effective by its own energy, and capable of producing evil as well as good. It is hardly distinguished from magic strictly so called, except by being regular and obligatory; it can easily be adapted to different objects, but it exists of necessity, independently of circumstances. That is the sole fairly clear line of distinction which can be drawn between the two domains; in point of fact they are so intimately interfused with each other that the same class of works treats of both matters. The *Sâma-vidhâna Brâhmana* is a real handbook of

incantations and sorcery; the *Adbhuta Brâhmana*, which forms a section of the *Sadvimça Brâhmana*, has the same character.” Similarly Professor M. Bloomfield writes: “Even witchcraft is part of the religion; it has penetrated and has become intimately blended with the holiest Vedic rites; the broad current of popular religion and superstition has infiltrated itself through numberless channels into the higher religion that is presented by the Brahman priests, and it may be presumed that the priests were neither able to cleanse their own religious beliefs from the mass of folk-belief with which it was surrounded, nor is it at all likely that they found it in their interest to do so.” Again, in the introduction to his translation of the *Kausika Sūtra*, Dr. W. Caland observes: “He who has been wont to regard the ancient Hindoos as a highly civilised people, famed for their philosophical systems, their dramatic poetry, their epic lays, will be surprised when he makes the acquaintance of their magical ritual, and will perceive that hitherto he has known the old Hindoo people from one side only. He will find that he here stumbles on the lowest strata of Vedic culture, and will be astonished at the agreement between the magic ritual of the old Vedas and the shamanism of the so-called savage. If we drop the peculiar Hindoo expressions and technical terms, and imagine a shaman instead of a Brahman, we could almost fancy that we have before us a magical book belonging to one of the tribes of North American red-skins.” Some good authorities hold that the very name of Brahman is derived from *brahman*, “a magical spell”; so that, if they are right, the Brahman would seem to have been a magician before he was a priest.

Speaking of the importance of magic in the East, and especially in Egypt, Professor Maspero remarks that “we ought not to attach to the word magic the degrading idea which it almost inevitably calls up in the mind of a modern. Ancient magic was the very foundation of religion. The faithful who desired to obtain some favour from a god had no chance of succeeding except by laying hands on the deity, and this arrest could only be effected by means of a certain number of rites, sacrifices, prayers, and chants, which the god himself had revealed, and which obliged him to do what was demanded of him.” According to another distinguished Egyptologist “the belief that there are words and actions by which man can influence all the powers of nature and all living things, from animals up to gods, was inextricably interwoven with everything the Egyptians did and everything they left undone. Above all, the whole system of burial and of the worship of the dead is completely dominated by it. The wooden puppets which relieved the dead man from toil, the figures of the maid-servants who baked bread for him, the sacrificial formulas by the recitation of which food was procured for him, what are these and all the similar practices but magic? And as men cannot help themselves without magic, so neither can the gods; the gods also wear amulets to protect themselves, and use magic spells to constrain each other.” “The whole doctrine of magic,” says Professor Wiedemann, “formed in the valley of the Nile, not a part of superstition, but an essential constituent of religious faith, which to a great extent rested directly on magic, and always remained most closely bound up with it.” But though we can perceive the union of discrepant elements in the faith and practice of the ancient Egyptians, it would be rash to assume that the people themselves did so. “Egyptian religion,” says the same scholar, “was not one and homogeneous; it was compounded of the most heterogeneous elements, which seemed to the Egyptian to be all equally justified. He did not care whether a doctrine or a myth belonged to what, in modern scholastic phraseology, we should call faith or superstition; it was indifferent to him whether we should rank it as religion or magic, as worship or sorcery. All such classifications were foreign to the Egyptian. To him no one doctrine seemed more or less justified than another. Nay, he went so far as to allow the most flagrant contradictions to stand peaceably side by side.”

Among the ignorant classes of modern Europe the same confusion of ideas, the same mixture of religion and magic, crops up in various forms. Thus we are told that in France “the majority of the peasants still believe that the priest possesses a secret and irresistible power over the elements. By reciting certain prayers which he alone knows and has the right to utter, yet for the utterance of which he must afterwards demand absolution, he can, on an occasion of pressing danger, arrest or reverse for a moment the action of the eternal laws of the physical world. The winds, the storms, the hail, and the rain are at his command and obey his will. The fire also is subject to him, and the flames of a conflagration are extinguished at his word.” For example, French peasants used to be, perhaps are still, persuaded that the priests could celebrate, with certain special rites, a “Mass of the Holy Spirit,” of which the efficacy was so miraculous that it never met with any opposition from the divine will; God was forced to grant whatever was asked of Him in this form, however rash and importunate might be the petition. No idea of impiety or irreverence attached to the rite in the minds of those who, in some of the great extremities of life, sought by this singular means to take the kingdom of heaven by storm. The secular priests generally refused to say the “Mass of the Holy Spirit”; but the monks, especially the Capuchin friars, had the reputation of yielding with less scruple to the entreaties of the anxious and distressed. In the constraint thus supposed by Catholic peasantry to be laid by the priest upon the deity we seem to have an exact counterpart of the power which, as we saw, the ancient Egyptians ascribed to their magicians. Again, to take another example, in many villages of Provence the priest is still reputed to possess the faculty of averting storms. It is not every priest who enjoys this reputation; and in some villages, when a change of pastors takes place, the parishioners are eager to learn whether the new incumbent has the power (*pouder*), as they call it. At the first sign of a heavy storm they put him to the proof by inviting him to exorcise the threatening clouds; and if the result answers to their hopes, the new shepherd is assured of the sympathy and respect of his flock. In some parishes, where the reputation of the curate in this respect stood higher than that of his rector, the relations between the two have been so strained in consequence that the bishop has had to translate the rector to another benefice. Again, Gascon peasants believe that to revenge themselves on their enemies bad men will sometimes induce a priest to say a mass called the Mass of Saint Sécaire. Very few priests know this mass, and three-fourths of those who do know it would not say it for love or money. None but wicked priests dare to perform the gruesome ceremony, and you may be quite sure that they will have a very heavy account to render for it at the last day. No curate or bishop, not even the archbishop of Auch, can pardon them; that right belongs to the pope of Rome alone. The Mass of Saint Sécaire may be said only in a ruined or deserted church, where owls mope and hoot, where bats flit in the gloaming, where gypsies lodge of nights, and where toads squat under the desecrated altar. Thither the bad priest comes by night with his light o’ love, and at the first stroke of eleven he begins to mumble the mass backwards, and ends just as the clocks are knelling the midnight hour. His leman acts as clerk. The host he blesses is black and has three points; he consecrates no wine, but instead he drinks the water of a well into which the body of an unbaptized infant has been flung. He makes the sign of the cross, but it is on the ground and with his left foot. And many other things he does which no good Christian could look upon without being struck blind and deaf and dumb for the rest of his life. But the man for whom the mass is said withers away little by little, and nobody can say what is the matter with him; even the doctors can make nothing of it. They do not know that he is slowly dying of the Mass of Saint Sécaire.

Yet though magic is thus found to fuse and amalgamate with religion in many ages and in many lands, there are some grounds for thinking that this fusion is not primitive, and that there was a time when man trusted to magic alone for the satisfaction of such wants as transcended his immediate animal cravings. In the first place a consideration of the

fundamental notions of magic and religion may incline us to surmise that magic is older than religion in the history of humanity. We have seen that on the one hand magic is nothing but a mistaken application of the very simplest and most elementary processes of the mind, namely the association of ideas by virtue of resemblance or contiguity; and that on the other hand religion assumes the operation of conscious or personal agents, superior to man, behind the visible screen of nature. Obviously the conception of personal agents is more complex than a simple recognition of the similarity or contiguity of ideas; and a theory which assumes that the course of nature is determined by conscious agents is more abstruse and recondite, and requires for its apprehension a far higher degree of intelligence and reflection, than the view that things succeed each other simply by reason of their contiguity or resemblance. The very beasts associate the ideas of things that are like each other or that have been found together in their experience; and they could hardly survive for a day if they ceased to do so. But who attributes to the animals a belief that the phenomena of nature are worked by a multitude of invisible animals or by one enormous and prodigiously strong animal behind the scenes? It is probably no injustice to the brutes to assume that the honour of devising a theory of this latter sort must be reserved for human reason. Thus, if magic be deduced immediately from elementary processes of reasoning, and be, in fact, an error into which the mind falls almost spontaneously, while religion rests on conceptions which the merely animal intelligence can hardly be supposed to have yet attained to, it becomes probable that magic arose before religion in the evolution of our race, and that man essayed to bend nature to his wishes by the sheer force of spells and enchantments before he strove to coax and mollify a coy, capricious, or irascible deity by the soft insinuation of prayer and sacrifice.

The conclusion which we have thus reached deductively from a consideration of the fundamental ideas of religion and magic is confirmed inductively by the observation that among the aborigines of Australia, the rudest savages as to whom we possess accurate information, magic is universally practised, whereas religion in the sense of a propitiation or conciliation of the higher powers seems to be nearly unknown. Roughly speaking, all men in Australia are magicians, but not one is a priest; everybody fancies he can influence his fellows or the course of nature by sympathetic magic, but nobody dreams of propitiating gods by prayer and sacrifice.

But if in the most backward state of human society now known to us we find magic thus conspicuously present and religion conspicuously absent, may we not reasonably conjecture that the civilised races of the world have also at some period of their history passed through a similar intellectual phase, that they attempted to force the great powers of nature to do their pleasure before they thought of courting their favour by offerings and prayer—in short that, just as on the material side of human culture there has everywhere been an Age of Stone, so on the intellectual side there has everywhere been an Age of Magic? There are reasons for answering this question in the affirmative. When we survey the existing races of mankind from Greenland to Tierra del Fuego, or from Scotland to Singapore, we observe that they are distinguished one from the other by a great variety of religions, and that these distinctions are not, so to speak, merely coterminous with the broad distinctions of race, but descend into the minuter subdivisions of states and commonwealths, nay, that they honeycomb the town, the village, and even the family, so that the surface of society all over the world is cracked and seamed, sapped and mined with rents and fissures and yawning crevasses opened up by the disintegrating influence of religious dissension. Yet when we have penetrated through these differences, which affect mainly the intelligent and thoughtful part of the community, we shall find underlying them all a solid stratum of intellectual agreement among the dull, the weak, the ignorant, and the superstitious, who constitute, unfortunately, the vast majority of mankind. One of the great achievements of the nineteenth century was to run shafts down

into this low mental stratum in many parts of the world, and thus to discover its substantial identity everywhere. It is beneath our feet—and not very far beneath them—here in Europe at the present day, and it crops up on the surface in the heart of the Australian wilderness and wherever the advent of a higher civilisation has not crushed it under ground. This universal faith, this truly Catholic creed, is a belief in the efficacy of magic. While religious systems differ not only in different countries, but in the same country in different ages, the system of sympathetic magic remains everywhere and at all times substantially alike in its principles and practice. Among the ignorant and superstitious classes of modern Europe it is very much what it was thousands of years ago in Egypt and India, and what it now is among the lowest savages surviving in the remotest corners of the world. If the test of truth lay in a show of hands or a counting of heads, the system of magic might appeal, with far more reason than the Catholic Church, to the proud motto, "*Quod semper, quod ubique, quod ab omnibus,*" as the sure and certain credential of its own infallibility.

It is not our business here to consider what bearing the permanent existence of such a solid layer of savagery beneath the surface of society, and unaffected by the superficial changes of religion and culture, has upon the future of humanity. The dispassionate observer, whose studies have led him to plumb its depths, can hardly regard it otherwise than as a standing menace to civilisation. We seem to move on a thin crust which may at any moment be rent by the subterranean forces slumbering below. From time to time a hollow murmur underground or a sudden spurt of flame into the air tells of what is going on beneath our feet. Now and then the polite world is startled by a paragraph in a newspaper which tells how in Scotland an image has been found stuck full of pins for the purpose of killing an obnoxious laird or minister, how a woman has been slowly roasted to death as a witch in Ireland, or how a girl has been murdered and chopped up in Russia to make those candles of human tallow by whose light thieves hope to pursue their midnight trade unseen. But whether the influences that make for further progress, or those that threaten to undo what has already been accomplished, will ultimately prevail; whether the impulsive energy of the minority or the dead weight of the majority of mankind will prove the stronger force to carry us up to higher heights or to sink us into lower depths, are questions rather for the sage, the moralist, and the statesman, whose eagle vision scans the future, than for the humble student of the present and the past. Here we are only concerned to ask how far the uniformity, the universality, and the permanence of a belief in magic, compared with the endless variety and the shifting character of religious creeds, raises a presumption that the former represents a ruder and earlier phase of the human mind, through which all the races of mankind have passed or are passing on their way to religion and science.

If an Age of Religion has thus everywhere, as I venture to surmise, been preceded by an Age of Magic, it is natural that we should enquire what causes have led mankind, or rather a portion of them, to abandon magic as a principle of faith and practice and to betake themselves to religion instead. When we reflect upon the multitude, the variety and the complexity of the facts to be explained, and the scantiness of our information regarding them, we shall be ready to acknowledge that a full and satisfactory solution of so profound a problem is hardly to be hoped for, and that the most we can do in the present state of our knowledge is to hazard a more or less plausible conjecture. With all due diffidence, then, I would suggest that a tardy recognition of the inherent falsehood and barrenness of magic set the more thoughtful part of mankind to cast about for a truer theory of nature and a more fruitful method of turning her resources to account. The shrewder intelligences must in time have come to perceive that magical ceremonies and incantations did not really effect the results which they were designed to produce, and which the majority of their simpler fellows still believed that they did actually produce. This great discovery of the inefficacy of magic

must have wrought a radical though probably slow revolution in the minds of those who had the sagacity to make it. The discovery amounted to this, that men for the first time recognised their inability to manipulate at pleasure certain natural forces which hitherto they had believed to be completely within their control. It was a confession of human ignorance and weakness. Man saw that he had taken for causes what were no causes, and that all his efforts to work by means of these imaginary causes had been vain. His painful toil had been wasted, his curious ingenuity had been squandered to no purpose. He had been pulling at strings to which nothing was attached; he had been marching, as he thought, straight to the goal, while in reality he had only been treading in a narrow circle. Not that the effects which he had striven so hard to produce did not continue to manifest themselves. They were still produced, but not by him. The rain still fell on the thirsty ground: the sun still pursued his daily, and the moon her nightly journey across the sky: the silent procession of the seasons still moved in light and shadow, in cloud and sunshine across the earth: men were still born to labour and sorrow, and still, after a brief sojourn here, were gathered to their fathers in the long home hereafter. All things indeed went on as before, yet all seemed different to him from whose eyes the old scales had fallen. For he could no longer cherish the pleasing illusion that it was he who guided the earth and the heaven in their courses, and that they would cease to perform their great revolutions were he to take his feeble hand from the wheel. In the death of his enemies and his friends he no longer saw a proof of the resistless potency of his own or of hostile enchantments; he now knew that friends and foes alike had succumbed to a force stronger than any that he could wield, and in obedience to a destiny which he was powerless to control.

Thus cut adrift from his ancient moorings and left to toss on a troubled sea of doubt and uncertainty, his old happy confidence in himself and his powers rudely shaken, our primitive philosopher must have been sadly perplexed and agitated till he came to rest, as in a quiet haven after a tempestuous voyage, in a new system of faith and practice, which seemed to offer a solution of his harassing doubts and a substitute, however precarious, for that sovereignty over nature which he had reluctantly abdicated. If the great world went on its way without the help of him or his fellows, it must surely be because there were other beings, like himself, but far stronger, who, unseen themselves, directed its course and brought about all the varied series of events which he had hitherto believed to be dependent on his own magic. It was they, as he now believed, and not he himself, who made the stormy wind to blow, the lightning to flash, and the thunder to roll; who had laid the foundations of the solid earth and set bounds to the restless sea that it might not pass; who caused all the glorious lights of heaven to shine; who gave the fowls of the air their meat and the wild beasts of the desert their prey; who bade the fruitful land to bring forth in abundance, the high hills to be clothed with forests, the bubbling springs to rise under the rocks in the valleys, and green pastures to grow by still waters; who breathed into man's nostrils and made him live, or turned him to destruction by famine and pestilence and war. To these mighty beings, whose handiwork he traced in all the gorgeous and varied pageantry of nature, man now addressed himself, humbly confessing his dependence on their invisible power, and beseeching them of their mercy to furnish him with all good things, to defend him from the perils and dangers by which our mortal life is compassed about on every hand, and finally to bring his immortal spirit, freed from the burden of the body, to some happier world, beyond the reach of pain and sorrow, where he might rest with them and with the spirits of good men in joy and felicity for ever.

In this, or some such way as this, the deeper minds may be conceived to have made the great transition from magic to religion. But even in them the change can hardly ever have been sudden; probably it proceeded very slowly, and required long ages for its more or less perfect

accomplishment. For the recognition of man's powerlessness to influence the course of nature on a grand scale must have been gradual; he cannot have been shorn of the whole of his fancied dominion at a blow. Step by step he must have been driven back from his proud position; foot by foot he must have yielded, with a sigh, the ground which he had once viewed as his own. Now it would be the wind, now the rain, now the sunshine, now the thunder, that he confessed himself unable to wield at will; and as province after province of nature thus fell from his grasp, till what had once seemed a kingdom threatened to shrink into a prison, man must have been more and more profoundly impressed with a sense of his own helplessness and the might of the invisible beings by whom he believed himself to be surrounded. Thus religion, beginning as a slight and partial acknowledgment of powers superior to man, tends with the growth of knowledge to deepen into a confession of man's entire and absolute dependence on the divine; his old free bearing is exchanged for an attitude of lowliest prostration before the mysterious powers of the unseen, and his highest virtue is to submit his will to theirs: *In la sua voluntade è nostra pace*. But this deepening sense of religion, this more perfect submission to the divine will in all things, affects only those higher intelligences who have breadth of view enough to comprehend the vastness of the universe and the littleness of man. Small minds cannot grasp great ideas; to their narrow comprehension, their purblind vision, nothing seems really great and important but themselves. Such minds hardly rise into religion at all. They are, indeed, drilled by their betters into an outward conformity with its precepts and a verbal profession of its tenets; but at heart they cling to their old magical superstitions, which may be discountenanced and forbidden, but cannot be eradicated by religion, so long as they have their roots deep down in the mental framework and constitution of the great majority of mankind.

A vestige of the transition from magic to religion may perhaps be discerned in the belief, shared by many peoples, that the gods themselves are adepts in magic, guarding their persons by talismans and working their will by spells and incantations. Thus the Egyptian gods, we are told, could as little dispense with the help of magic as could men; like men they wore amulets to protect themselves, and used spells to overcome each other. Above all the rest Isis was skilled in sorcery and famous for her incantations. In Babylonia the great god Ea was reputed to be the inventor of magic, and his son Marduk, the chief deity of Babylon, inherited the art from his father. Marduk is described as "the master of exorcism, the magician of the gods." Another text declares that "the incantation is the incantation of Marduk, the exorcist is the image of Marduk." In the legend of the creation it is related that when Marduk was preparing to fight the monster Tiamat he gave a proof of his magical powers to the assembled gods by causing a garment to disappear and reappear again at the word of his mouth. And the other Babylonian deities had in like manner recourse to magic, especially to magical words or spells. "The word is above all the instrument of the gods; it seems to suit the high conception of their power better than mere muscular effort; the hymns celebrate the irresistible might of their word; it is by their word that they compel both animate and inanimate beings to answer their purposes; in short, they employ almost exclusively the oral rites of magic." And like men they made use of amulets and talismans. In the Vedic religion the gods are often represented as attaining their ends by magical means; in particular the god Bṛhaspati, "the creator of all prayers," is regarded as "the heavenly embodiment of the priesthood, in so far as the priesthood is invested with the power, and charged with the task, of influencing the course of things by prayers and spells"; in short, he is "the possessor of the magical power of the holy word." So too in Norse mythology Odin is said to have owed his supremacy and his dominion over nature to his knowledge of the runes or magical names of all things in earth and heaven. This mystical lore he acquired as follows. The runic names of all things were scratched on the things themselves, then scraped off and mixed in a magical potion, which was compounded of honey and the blood of the slain Kvasir, the wisest of beings. A draught

of this wonderful mead imparted to Odin not only the wisdom of Kvasir, but also a knowledge of all things, since he had swallowed their runic or mystical names along with the blood of the sage. Hence by the utterance of his spells he could heal sickness, deaden the swords of his enemies, loose himself from bonds, stop the flight of an arrow in mid-air, stay the raging of the flames, still the winds and lull the sea; and by graving and painting certain runes he could make the corpse of a hanged man come down from the gallows-tree and talk with him. It is easy to conceive how this ascription of magical powers to the gods may have originated. When a savage sorcerer fails to effect his purpose, he generally explains his want of success by saying that he has been foiled by the spells of some more potent magician. Now if it began to be perceived that certain natural effects, such as the making of rain or wind or sunshine, were beyond the power of any human magician to accomplish, the first thought would naturally be that they were wrought by the more powerful magic of some great invisible beings, and these superhuman magicians might readily develop into gods of the type of Odin, Isis, and Marduk. In short, many gods may at first have been merely deified sorcerers.

The reader may well be tempted to ask. How was it that intelligent men did not sooner detect the fallacy of magic? How could they continue to cherish expectations that were invariably doomed to disappointment? With what heart persist in playing venerable antics that led to nothing, and mumbling solemn balderdash that remained without effect? Why cling to beliefs which were so flatly contradicted by experience? How dare to repeat experiments that had failed so often? The answer seems to be that the fallacy was far from easy to detect, the failure by no means obvious, since in many, perhaps in most cases, the desired event did actually follow, at a longer or shorter interval, the performance of the rite which was designed to bring it about; and a mind of more than common acuteness was needed to perceive that, even in these cases, the rite was not necessarily the cause of the event. A ceremony intended to make the wind blow or the rain fall, or to work the death of an enemy, will always be followed, sooner or later, by the occurrence it is meant to bring to pass; and primitive man may be excused for regarding the occurrence as a direct result of the ceremony, and the best possible proof of its efficacy. Similarly, rites observed in the morning to help the sun to rise, and in spring to wake the dreaming earth from her winter sleep, will invariably appear to be crowned with success, at least within the temperate zones; for in these regions the sun lights his golden lamp in the east every morning, and year by year the vernal earth decks herself afresh with a rich mantle of green. Hence the practical savage, with his conservative instincts, might well turn a deaf ear to the subtleties of the theoretical doubter, the philosophic radical, who presumed to hint that sunrise and spring might not, after all, be direct consequences of the punctual performance of certain daily or yearly ceremonies, and that the sun might perhaps continue to rise and trees to blossom though the ceremonies were occasionally intermitted, or even discontinued altogether. These sceptical doubts would naturally be repelled by the other with scorn and indignation as airy reveries subversive of the faith and manifestly contradicted by experience. "Can anything be plainer," he might say, "than that I light my twopenny candle on earth and that the sun then kindles his great fire in heaven? I should be glad to know whether, when I have put on my green robe in spring, the trees do not afterwards do the same? These are facts patent to everybody, and on them I take my stand. I am a plain practical man, not one of your theorists and splitters of hairs and choppers of logic. Theories and speculation and all that may be very well in their way, and I have not the least objection to your indulging in them, provided, of course, you do not put them in practice. But give me leave to stick to facts; then I know where I am." The fallacy of this reasoning is obvious to us, because it happens to deal with facts about which we have long made up our minds. But let an argument of precisely the same calibre be applied to matters which are still under debate, and it may be questioned whether a British audience

would not applaud it as sound, and esteem the speaker who used it a safe man—not brilliant or showy, perhaps, but thoroughly sensible and hard-headed. If such reasonings could pass muster among ourselves, need we wonder that they long escaped detection by the savage?

V. The Magical Control Of The Weather

§ 1. *The Public Magician*

The patient reader may remember that we were led to plunge into the labyrinth of magic, in which we have wandered for so many pages, by a consideration of two different types of man-god. This is the clue which has guided our devious steps through the maze, and brought us out at last on higher ground, whence, resting a little by the way, we can look back over the path we have already traversed and forward to the longer and steeper road we have still to climb.

As a result of the foregoing discussion, the two types of human gods may conveniently be distinguished as the religious and the magical man-god respectively. In the former, a being of an order different from and superior to man is supposed to become incarnate, for a longer or a shorter time, in a human body, manifesting his superhuman power and knowledge by miracles wrought and prophecies uttered through the medium of the fleshly tabernacle in which he has deigned to take up his abode. This may also appropriately be called the inspired or incarnate type of man-god. In it the human body is merely a frail earthly vessel filled with a divine and immortal spirit. On the other hand, a man-god of the magical sort is nothing but a man who possesses in an unusually high degree powers which most of his fellows arrogate to themselves on a smaller scale; for in rude society there is hardly a person who does not dabble in magic. Thus, whereas a man-god of the former or inspired type derives his divinity from a deity who has stooped to hide his heavenly radiance behind a dull mask of earthly mould, a man-god of the latter type draws his extraordinary power from a certain physical sympathy with nature. He is not merely the receptacle of a divine spirit. His whole being, body and soul, is so delicately attuned to the harmony of the world that a touch of his hand or a turn of his head may send a thrill vibrating through the universal framework of things; and conversely his divine organism is acutely sensitive to such slight changes of environment as would leave ordinary mortals wholly unaffected. But the line between these two types of man-god, however sharply we may draw it in theory, is seldom to be traced with precision in practice, and in what follows I shall not insist on it.

We have seen that in practice the magic art may be employed for the benefit either of individuals or of the whole community, and that according as it is directed to one or other of these two objects it may be called private or public magic. Further, I pointed out that the public magician occupies a position of great influence, from which, if he is a prudent and able man, he may advance step by step to the rank of a chief or king. Thus an examination of public magic conduces to an understanding of the early kingship, since in savage and barbarous society many chiefs and kings appear to owe their authority in great measure to their reputation as magicians.

Among the objects of public utility which magic may be employed to secure, the most essential is an adequate supply of food. The examples cited in preceding pages prove that the purveyors of food—the hunter, the fisher, the farmer—all resort to magical practices in the pursuit of their various callings; but they do so as private individuals for the benefit of themselves and their families, rather than as public functionaries acting in the interest of the whole people. It is otherwise when the rites are performed, not by the hunters, the fishers, the farmers themselves, but by professional magicians on their behalf. In primitive society, where uniformity of occupation is the rule, and the distribution of the community into various classes of workers has hardly begun, every man is more or less his own magician; he

practises charms and incantations for his own good and the injury of his enemies. But a great step in advance has been taken when a special class of magicians has been instituted; when, in other words, a number of men have been set apart for the express purpose of benefiting the whole community by their skill, whether that skill be directed to the healing of diseases, the forecasting of the future, the regulation of the weather, or any other object of general utility. The impotence of the means adopted by most of these practitioners to accomplish their ends ought not to blind us to the immense importance of the institution itself. Here is a body of men relieved, at least in the higher stages of savagery, from the need of earning their livelihood by hard manual toil, and allowed, nay, expected and encouraged, to prosecute researches into the secret ways of nature. It was at once their duty and their interest to know more than their fellows, to acquaint themselves with everything that could aid man in his arduous struggle with nature, everything that could mitigate his sufferings and prolong his life. The properties of drugs and minerals, the causes of rain and drought, of thunder and lightning, the changes of the seasons, the phases of the moon, the daily and yearly journeys of the sun, the motions of the stars, the mystery of life, and the mystery of death, all these things must have excited the wonder of these early philosophers, and stimulated them to find solutions of problems that were doubtless often thrust on their attention in the most practical form by the importunate demands of their clients, who expected them not merely to understand but to regulate the great processes of nature for the good of man. That their first shots fell very far wide of the mark could hardly be helped. The slow, the never-ending approach to truth consists in perpetually forming and testing hypotheses, accepting those which at the time seem to fit the facts and rejecting the others. The views of natural causation embraced by the savage magician no doubt appear to us manifestly false and absurd; yet in their day they were legitimate hypotheses, though they have not stood the test of experience. Ridicule and blame are the just meed, not of those who devised these crude theories, but of those who obstinately adhered to them after better had been propounded. Certainly no men ever had stronger incentives in the pursuit of truth than these savage sorcerers. To maintain at least a show of knowledge was absolutely necessary; a single mistake detected might cost them their life. This no doubt led them to practise imposture for the purpose of concealing their ignorance; but it also supplied them with the most powerful motive for substituting a real for a sham knowledge, since, if you would appear to know anything, by far the best way is actually to know it. Thus, however justly we may reject the extravagant pretensions of magicians and condemn the deceptions which they have practised on mankind, the original institution of this class of men has, take it all in all, been productive of incalculable good to humanity. They were the direct predecessors, not merely of our physicians and surgeons, but of our investigators and discoverers in every branch of natural science. They began the work which has since been carried to such glorious and beneficent issues by their successors in after ages; and if the beginning was poor and feeble, this is to be imputed to the inevitable difficulties which beset the path of knowledge rather than to the natural incapacity or wilful fraud of the men themselves.

§ 2. *The Magical Control of Rain*

Of the things which the public magician sets himself to do for the good of the tribe, one of the chief is to control the weather and especially to ensure an adequate fall of rain. Water is the first essential of life, and in most countries the supply of it depends upon showers. Without rain vegetation withers, animals and men languish and die. Hence in savage communities the rain-maker is a very important personage; and often a special class of magicians exists for the purpose of regulating the heavenly water-supply. The methods by which they attempt to discharge the duties of their office are commonly, though not always, based on the principle of homoeopathic or imitative magic. If they wish to make rain they simulate it by sprinkling

water or mimicking clouds: if their object is to stop rain and cause drought, they avoid water and resort to warmth and fire for the sake of drying up the too abundant moisture. Such attempts are by no means confined, as the cultivated reader might imagine, to the naked inhabitants of those sultry lands like Central Australia and some parts of Eastern and Southern Africa, where often for months together the pitiless sun beats down out of a blue and cloudless sky on the parched and gaping earth. They are, or used to be, common enough among outwardly civilised folk in the moister climate of Europe. I will now illustrate them by instances drawn from the practice both of public and private magic.

Thus, for example, in a village near Dorpat, in Russia, when rain was much wanted, three men used to climb up the fir-trees of an old sacred grove. One of them drummed with a hammer on a kettle or small cask to imitate thunder; the second knocked two fire-brands together and made the sparks fly, to imitate lightning; and the third, who was called "the rain-maker," had a bunch of twigs with which he sprinkled water from a vessel on all sides. To put an end to drought and bring down rain, women and girls of the village of Ploska are wont to go naked by night to the boundaries of the village and there pour water on the ground. In Halmahera, or Gilolo, a large island to the west of New Guinea, a wizard makes rain by dipping a branch of a particular kind of tree in water and then scattering the moisture from the dripping bough over the ground. In Ceram it is enough to dedicate the bark of a certain tree to the spirits, and lay it in water. A Javanese mode of making rain is to imitate the pattering sound of rain-drops by brushing a coco-nut leaf over the sheath of a betel-nut in a mortar. In New Britain the rain-maker wraps some leaves of a red and green striped creeper in a banana-leaf, moistens the bundle with water, and buries it in the ground; then he imitates with his mouth the plashing of rain. Amongst the Omaha Indians of North America, when the corn is withering for want of rain, the members of the sacred Buffalo Society fill a large vessel with water and dance four times round it. One of them drinks some of the water and spirts it into the air, making a fine spray in imitation of a mist or drizzling rain. Then he upsets the vessel, spilling the water on the ground; whereupon the dancers fall down and drink up the water, getting mud all over their faces. Lastly, they squirt the water into the air, making a fine mist. This saves the corn. In spring-time the Natchez of North America used to club together to purchase favourable weather for their crops from the wizards. If rain was needed, the wizards fasted and danced with pipes full of water in their mouths. The pipes were perforated like the nozzle of a watering-can, and through the holes the rain-maker blew the water towards that part of the sky where the clouds hung heaviest. But if fine weather was wanted, he mounted the roof of his hut, and with extended arms, blowing with all his might, he beckoned to the clouds to pass by. In time of drought the Tarahumares Indians of Mexico will sometimes throw water towards the sky in order that God may replenish his supply. And in the month of May they always burn the grass, so that the whole country is then wrapt in smoke and travelling becomes very difficult. They think that this is necessary to produce rain, clouds of smoke being, in their opinion, equivalent to rain-clouds. Among the Swazies and Hlubies of South-Eastern Africa the rain-doctor draws water from a river with various mystic ceremonies, and carries it into a cultivated field. Here he throws it in jets from his vessel high into the air, and the falling spray is believed to draw down the clouds and to make rain by sympathy. To squirt water from the mouth is a West African mode of making rain, and it is practised also by the Wajaggas of Kilimanjaro. Among the Wahuma, on the Albert Nyanza Lake, the rain-maker pours water into a vessel in which he has first placed a dark stone as large as the hand. Pounded plants and the blood of a black goat are added to the water, and with a bunch of magic herbs the sorcerer sprinkles the mixture towards the sky. In this charm special efficacy is no doubt attributed to the dark stone and the black goat, their colour being chosen from its resemblance to that of the rain-clouds, as we shall see presently. When the rains do not come in due season the people of Central Angoniland repair to what is called the

rain-temple. Here they clear away the grass, and the leader pours beer into a pot which is buried in the ground, while he says, "Master *Chauta*, you have hardened your heart towards us, what would you have us do? We must perish indeed. Give your children the rains, there is the beer we have given you." Then they all partake of the beer that is left over, even the children being made to sip it. Next they take branches of trees and dance and sing for rain. When they return to the village they find a vessel of water set at the doorway by an old woman; so they dip their branches in it and wave them aloft, so as to scatter the drops. After that the rain is sure to come driving up in heavy clouds. In these practices we see a combination of religion with magic; for while the scattering of the water-drops by means of branches is a purely magical ceremony, the prayer for rain and the offering of beer are purely religious rites. At Takitount in Algeria, when the drought is severe, the people prepare a sacrificial banquet (*zerda*), in the course of which they dance, and filling their mouths with water spirt it into the air crying, "The rain and abundance!" Elsewhere in the course of these banquets it is customary for the same purpose to sprinkle water on children. At Tlemcen in time of drought water is thrown from terraces and windows on small girls, who pass singing.

During the summer months frequent droughts occur among the Japanese alps. To procure rain a party of hunters armed with guns climb to the top of Mount Jonendake, one of the most imposing peaks in the range. By kindling a bonfire, discharging their guns, and rolling great masses of rocks down the cliffs, they represent the wished-for storm; and rain is supposed always to follow within a few days. To make rain a party of Ainos will scatter water by means of sieves, while others will take a porringer, fit it up with sails and oars as if it were a boat, and then push or draw it about the village and gardens. In Laos the festival of the New Year takes place about the middle of April and lasts three days. The people assemble in the pagodas, which are decorated with flowers and illuminated. The Buddhist monks perform the ceremonies, and when they come to the prayers for the fertility of the earth the worshippers pour water into little holes in the floor of the pagoda as a symbol of the rain which they hope Buddha will send down on the rice-fields in due time. In the Mara tribe of Northern Australia the rain-maker goes to a pool and sings over it his magic song. Then he takes some of the water in his hands, drinks it, and spits it out in various directions. After that he throws water all over himself, scatters it about, and returns quietly to the camp. Rain is supposed to follow.

In the Wotjobaluk tribe of Victoria the rain-maker dipped a bunch of his own hair in water, sucked out the water and squirted it westward, or he twirled the ball round his head, making a spray like rain. Other Australian tribes employ human hair as a rain-charm in other ways. In Western Australia the natives pluck hair from their arm-pits and thighs and blow them in the direction from which they wish the rain to come. But if they wish to prevent rain, they light a piece of sandal wood, and beat the ground with the burning brand. When the rivers were low and water scarce in Victoria, the wizard used to place human hair in the stream, accompanying the act with chants and gesticulation. But if he wished to make rain, he dropped some human hair in the fire. Hair was never burnt at other times for fear of causing a great fall of rain. The Arab historian Makrizi describes a method of stopping rain which is said to have been resorted to by a tribe of nomads called Alqamar in Hadramaut. They cut a branch from a certain tree in the desert, set it on fire, and then sprinkled the burning brand with water. After that the vehemence of the rain abated, just as the water vanished when it fell on the glowing brand. Some of the Eastern Angamis of Manipur are said to perform a somewhat similar ceremony for the opposite purpose, in order, namely, to produce rain. The head of the village puts a burning brand on the grave of a man who has died of burns, and quenches the brand with water, while he prays that rain may fall. Here the putting out the fire with water, which is an imitation of rain, is reinforced by the influence of the dead man, who, having been burnt to death, will naturally be anxious for the descent of rain to cool his scorched body and assuage his pangs.

Other people besides the Arabs have used fire as a means of stopping rain. Thus the Sulka of New Britain heat stones red hot in the fire and then put them out in the rain, or they throw hot ashes in the air. They think that the rain will soon cease to fall, for it does not like to be burned by the hot stones or ashes. The Telugus send a little girl out naked into the rain with a burning piece of wood in her hand, which she has to shew to the rain. That is supposed to stop the downpour. At Port Stevens in New South Wales the medicine-men used to drive away rain by throwing fire-sticks into the air, while at the same time they puffed and shouted. Any man of the Anula tribe in Northern Australia can stop rain by simply warming a green stick in the fire, and then striking it against the wind. When a Thompson Indian of British Columbia wished to put an end to a spell of heavy rain, he held a stick in the fire, then described a circle with it, beginning at the east and following the sun's course till it reached the east again, towards which quarter he held the stick and addressed the rain as follows: "Now then, you must stop raining; the people are miserable. Ye mountains, become clear." The ceremony was repeated for all the other quarters of the sky. To bring on rain the Ainos of Japan wash their tobacco-boxes and pipes in a stream, and the Toradjas of Central Celebes dip rice-spoons in water. On the contrary, during heavy rain the Indians of Guiana are careful not to wash the inside of their pots, lest by so doing they should cause the rain to fall still more heavily. In Bilaspore it is believed that the grain-dealer, who has stored large quantities of grain and wishes to sell it dear, resorts to nefarious means of preventing the rain from falling, lest the abundance of rice which would follow a copious rainfall should cheapen his wares. To do this he collects rain-drops from the eaves of his house in an earthen vessel and buries the vessel under the grinding-mill. After that you shall hear thunder rumbling in the distance like the humming sound of the mill at work, but no rain will fall, for the wicked dealer has shut it up and it cannot get out.

In the torrid climate of Queensland the ceremonies necessary for wringing showers from the cloudless heaven are naturally somewhat elaborate. A prominent part in them is played by a "rain-stick." This is a thin piece of wood about twenty inches long, to which three "rain-stones" and hair cut from the beard have been fastened. The "rain-stones" are pieces of white quartz-crystal. Three or four such sticks may be used in the ceremony. About noon the men who are to take part in it repair to a lonely pool, into which one of them dives and fixes a hollow log vertically in the mud. Then they all go into the water, and, forming a rough circle round the man in the middle, who holds the rain-stick aloft, they begin stamping with their feet as well as they can, and splashing the water with their hands from all sides on the rain-stick. The stamping, which is accompanied by singing, is sometimes a matter of difficulty, since the water may be four feet deep or more. When the singing is over, the man in the middle dives out of sight and attaches the rain-stick to the hollow log under water. Then coming to the surface, he quickly climbs on to the bank and spits out on dry land the water which he imbibed in diving. Should more than one of these rain-sticks have been prepared, the ceremony is repeated with each in turn. While the men are returning to camp they scratch the tops of their heads and the inside of their shins from time to time with twigs; if they were to scratch themselves with their fingers alone, they believe that the whole effect of the ceremony would be spoiled. On reaching the camp they paint their faces, arms, and chests with broad bands of gypsum. During the rest of the day the process of scratching, accompanied by the song, is repeated at intervals, and thus the performance comes to a close. No woman may set eyes on the rain-stick or witness the ceremony of its submergence; but the wife of the chief rain-maker is privileged to take part in the subsequent rite of scratching herself with a twig. When the rain does come, the rain-stick is taken out of the water: it has done its work. At Roxburgh, in Queensland, the ceremony is somewhat different. A white quartz-crystal which is to serve as the rain-stone is obtained in the mountains and crushed to powder. Next a tree is chosen of which the stem runs up straight for a long way without any

branches. Against its trunk saplings from fifteen to twenty feet long are then propped in a circle, so as to form a sort of shed like a bell-tent, and in front of the shed an artificial pond is made in the ground. The men, who have collected within the shed, now come forth and, dancing and singing round the pond, mimic the cries and antics of various aquatic birds and animals, such as ducks and frogs. Meanwhile the women are stationed some twenty yards or so away. When the men have done pretending to be ducks, frogs, and so forth, they march round the women in single file, throwing the pulverised quartz-crystals over them. On their side the women hold up wooden troughs, shields, pieces of bark, and so on over their heads, making believe that they are sheltering themselves from a heavy shower of rain. Both these ceremonies are cases of mimetic magic; the splashing of the water over the rain-stick is as clearly an imitation of a shower as the throwing of the powdered quartz-crystal over the women.

The Dieri of Central Australia enact a somewhat similar pantomime for the same purpose. In a dry season their lot is a hard one. No fresh herbs or roots are to be had, and as the parched earth yields no grass, the emus, reptiles, and other creatures which generally furnish the natives with food grow so lean and wizened as to be hardly worth eating. At such a time of severe drought the Dieri, loudly lamenting the impoverished state of the country and their own half-starved condition, call upon the spirits of their remote predecessors, whom they call Mura-muras, to grant them power to make a heavy rainfall. For they believe that the clouds are bodies in which rain is generated by their own ceremonies or those of neighbouring tribes, through the influence of the Mura-muras. The way in which they set about drawing rain from the clouds is this. A hole is dug about twelve feet long and eight or ten broad, and over this hole a conical hut of logs and branches is made. Two wizards, supposed to have received a special inspiration from the Mura-muras, are bled by an old and influential man with a sharp flint; and the blood, drawn from their arms below the elbow, is made to flow on the other men of the tribe, who sit huddled together in the hut. At the same time the two bleeding men throw handfuls of down about, some of which adheres to the blood-stained bodies of their comrades, while the rest floats in the air. The blood is thought to represent the rain, and the down the clouds. During the ceremony two large stones are placed in the middle of the hut; they stand for gathering clouds and presage rain. Then the wizards who were bled carry away the two stones for about ten or fifteen miles, and place them as high as they can in the tallest tree. Meanwhile the other men gather gypsum, pound it fine, and throw it into a water-hole. This the Mura-muras see, and at once they cause clouds to appear in the sky. Lastly, the men, young and old, surround the hut, and, stooping down, butt at it with their heads, like so many rams. Thus they force their way through it and reappear on the other side, repeating the process till the hut is wrecked. In doing this they are forbidden to use their hands or arms; but when the heavy logs alone remain, they are allowed to pull them out with their hands. "The piercing of the hut with their heads symbolises the piercing of the clouds; the fall of the hut, the fall of the rain." Obviously, too, the act of placing high up in trees the two stones, which stand for clouds, is a way of making the real clouds to mount up in the sky. The Dieri also imagine that the foreskins taken from lads at circumcision have a great power of producing rain. Hence the Great Council of the tribe always keeps a small stock of foreskins ready for use. They are carefully concealed, being wrapt up in feathers with the fat of the wild dog and of the carpet snake. A woman may not see such a parcel opened on any account. When the ceremony is over, the foreskin is buried, its virtue being exhausted. After the rains have fallen, some of the tribe always undergo a surgical operation, which consists in cutting the skin of their chest and arms with a sharp flint. The wound is then tapped with a flat stick to increase the flow of blood, and red ochre is rubbed into it. Raised scars are thus produced. The reason alleged by the natives for this practice is that they are pleased with the rain, and that there is a connexion between the rain and the scars. Apparently the operation is not very

painful, for the patient laughs and jokes while it is going on. Indeed, little children have been seen to crowd round the operator and patiently take their turn; then after being operated on, they ran away, expanding their little chests and singing for the rain to beat upon them.

However, they were not so well pleased next day, when they felt their wounds stiff and sore.

The tribes of the Karamundi nation, on the River Darling, universally believe that rain can be produced as follows. A vein in the arm of one of the men is opened, and the blood allowed to flow into a piece of hollow bark till it forms a little pool. Powdered gypsum and hair from the man's beard are then added to the blood, and the whole is stirred into a thick paste.

Afterwards the mixture is placed between two pieces of bark and put under water in a river or lagoon, pointed stakes being driven into the ground to keep it down. When it has all dissolved away, the natives think that a great cloud will come bringing rain. From the time the ceremony is performed until rain falls, the men must abstain from intercourse with their wives, or the charm would be spoiled. In this custom the bloody paste seems to be an imitation of a rain-cloud. In Java, when rain is wanted, two men will sometimes thrash each other with supple rods till the blood flows down their backs; the streaming blood represents the rain, and no doubt is supposed to make it fall on the ground. The people of Egghiou, a district of Abyssinia, used to engage in sanguinary conflicts with each other, village against village, for a week together every January for the purpose of procuring rain. A few years ago the emperor Menelik forbade the custom. However, the following year the rain was deficient, and the popular outcry so great that the emperor yielded to it, and allowed the murderous fights to be resumed, but for two days a year only. The writer who mentions the custom regards the blood shed on these occasions as a propitiatory sacrifice offered to spirits who control the showers; but perhaps, as in the Australian and Javanese ceremonies, it is an imitation of rain. The prophets of Baal, who sought to procure rain by cutting themselves with knives till the blood gushed out, may have acted on the same principle.

The Kaitish tribe of Central Australia believe that the rainbow is the son of the rain, and with filial regard is always anxious to prevent his father from falling down. Hence if it appears in the sky at a time when rain is wanted, they "sing" or enchant it in order to send it away. When the head man of the rain totem in this tribe desires to make rain he goes to the sacred storehouse of his local group. There he paints the holy stones with red ochre and sings over them, and as he sings he pours water from a vessel on them and on himself. Moreover, he paints three rainbows in red ochre, one on the ground, one on his own body, and one on a shield, which he also decorates with zigzag lines of white clay to represent lightning. This shield may only be seen by men of the same exogamous half of the tribe as himself; if men of the other half of the tribe were to see it, the charm would be spoilt. Hence after bringing the shield away from the sacred place, he hides it in his own camp until the rain has fallen, after which he destroys the rainbow drawings. The intention seems to be to keep the rainbow in custody, and prevent it from appearing in the sky until the clouds have burst and moistened the thirsty ground. To ensure that event the rain-maker, on his return from the sacred storehouse, keeps a vessel of water by his side in camp, and from time to time scatters white down about, which is thought to hasten the rain. Meantime the men who accompanied him to the holy place go away and camp by themselves, for neither they nor he may have any intercourse with the women. The leader may not even speak to his wife, who absents herself from the camp at the time of his return to it. When later on she comes back, he imitates the call of the plover, a bird whose cry is always associated with the rainy season in these parts. Early next morning he returns to the sacred storehouse and covers the stones with bushes. After another night passed in silence, he and the other men and women go out in separate directions to search for food. When they meet on their return to camp, they all mimic the cry of the plover. Then the leader's mouth is touched with some of the food that has been brought in, and thus the ban of silence is removed. If rain follows, they attribute it to the magical

virtue of the ceremony; if it does not, they fall back on their standing excuse, that some one else has kept off the rain by stronger magic.

Among the Arunta tribe of Central Australia a celebrated rain-maker resides at the present day in what is called by the natives the Rain Country (*Kartwia quatcha*), a district about fifty miles to the east of Alice Springs. He is the head of a group of people who have water for their totem, and when he is about to engage in a ceremony for the making of rain he summons other men of the water totem from neighbouring groups to come and help him. When all are assembled, they march into camp, painted with red and yellow ochre and pipeclay, and wearing bunches of eagle-hawk feathers on the crown and sides of the head. At a signal from the rain-maker they all sit down in a line and, folding their arms across their breasts, chant certain words for a time. Then at another signal from the master of the ceremonies they jump up and march in single file to a spot some miles off, where they camp for the night. At break of day they scatter in all directions to look for game, which is then cooked and eaten; but on no account may any water be drunk, or the ceremony would fail. When they have eaten, they adorn themselves again in a different style, broad bands of white bird's down being glued by means of human blood to their stomach, legs, arms, and forehead. Meanwhile a special hut of boughs has been made by some older men not far from the main camp. Its floor is strewn with a thick layer of gum leaves to make it soft, for a good deal of time has to be spent lying down here. Close to the entrance of the hut a shallow trench, some thirty yards long, is excavated in the ground. At sunset the performers, arrayed in all the finery of white down, march to the hut. On reaching it the young men go in first and lie face downwards at the inner end, where they have to stay till the ceremony is over; none of them is allowed to quit it on any pretext. Meanwhile, outside the hut the older men are busy decorating the rain-maker. Hair girdles, covered with white down, are placed all over his head, while his cheeks and forehead are painted with pipeclay; and two broad bands of white down pass across the face, one over the eyebrows and the other over the nose. The front of his body is adorned with a broad band of pipeclay fringed with white down, and rings of white down encircle his arms. Thus decorated, with patches of bird's down adhering by means of human blood to his hair and the whole of his body, the disguised man is said to present a spectacle which, once seen, can never be forgotten. He now takes up a position close to the opening of the hut. Then the old men sing a song, and when it is finished, the rain-maker comes out of the hut and stalks slowly twice up and down the shallow trench, quivering his body and legs in a most extraordinary way, every nerve and fibre seeming to tremble. While he is thus engaged the young men, who had been lying flat on their faces, get up and join the old men in chanting a song with which the movements of the rain-maker seem to accord. But as soon as he re-enters the hut, the young men at once prostrate themselves again; for they must always be lying down when he is in the hut. The performance is repeated at intervals during the night, and the singing goes on with little intermission until, just when the day is breaking, the rain-maker executes a final quiver, which lasts longer than any of the others, and seems to exhaust his remaining strength completely. Then he declares the ceremony to be over, and at once the young men jump to their feet and rush out of the hut, screaming in imitation of the spur-winged plover. The cry is heard by the men and women who have been left at the main camp, and they take it up with weird effect.

Although we cannot, perhaps, divine the meaning of all the details of this curious ceremony, the analogy of the Queensland and the Dieri ceremonies, described above, suggests that we have here a rude attempt to represent the gathering of rain-clouds and the other accompaniments of a rising storm. The hut of branches, like the structure of logs among the Dieri, and perhaps the conical shed in Queensland, may possibly stand for the vault of heaven, from which the rain-clouds, represented by the chief actor in his quaint costume of

white down, come forth to move in ever-shifting shapes across the sky, just as he struts quivering up and down the trench. The other performers, also adorned with bird's down, who burst from the tent with the cries of plovers, probably imitate birds that are supposed to harbingers or accompany rain. This interpretation is confirmed by other ceremonies in which the performers definitely assimilate themselves to the celestial or atmospheric phenomena which they seek to produce. Thus in Mabuiag, a small island in Torres Straits, when a wizard desired to make rain, he took some bush or plant and painted himself black and white, "All along same as clouds, black behind, white he go first." He further put on a large woman's petticoat to signify raining clouds. On the other hand, when he wished to stop the rain, he put red paint on the crown of his head, "to represent the shining sun," and he inserted a small ball of red paint in another part of his person. By and by he expelled this ball, "Like breaking a cloud so that sun he may shine." He then took some bushes and leaves of the pandanus, mixed them together, and placed the compound in the sea. Afterwards he removed them from the water, dried them, and burnt them so that the smoke went up, thereby typifying, as Dr. Haddon was informed, the evaporation and dispersal of the clouds. Again, it is said that if a Malay woman puts upon her head an inverted earthenware pan, and then, setting it upon the ground, fills it with water and washes the cat in it till the animal is nearly drowned, heavy rain will certainly follow. In this performance the inverted pan is intended, as Mr. Skeat was told, to symbolise the vault of heaven.

There is a widespread belief that twin children possess magical powers over nature, especially over rain and the weather. This curious superstition prevails among some of the Indian tribes of British Columbia, and has led them often to impose certain singular restrictions or taboos on the parents of twins, though the exact meaning of these restrictions is generally obscure. Thus the Tsimshian Indians of British Columbia believe that twins control the weather; therefore they pray to wind and rain, "Calm down, breath of the twins." Further, they think that the wishes of twins are always fulfilled; hence twins are feared, because they can harm the man they hate. They can also call the salmon and the olachen or candle-fish, and so they are known by a name which means "making plentiful." In the opinion of the Kwakiutl Indians of British Columbia twins are transformed salmon; hence they may not go near water, lest they should be changed back again into the fish. In their childhood they can summon any wind by motions of their hands, and they can make fair or foul weather, and also cure diseases by swinging a large wooden rattle. Their parents must live secluded in the woods for sixteen months after the birth, doing no work, borrowing nobody's canoes, paddles, or dishes, and keeping their faces painted red all the time. If the father were to catch salmon, or the mother were to dig clams, the salmon and the clams would disappear. Moreover the parents separate from each other, and must pretend to be married to a log, with which they lie down every night. They are forbidden to touch each other, and even their own hair. A year after the birth they drive wedges into a tree in the woods, asking it to let them work again when four more months have passed. The Nootka Indians of British Columbia also believe that twins are somehow related to salmon. Hence among them twins may not catch salmon, and they may not eat or even handle the fresh fish. They can make fair or foul weather, and can cause rain to fall by painting their faces black and then washing them, which may represent the rain dripping from the dark clouds. Conversely, among the Angoni of Central Africa there is a woman who stops rain by tying a strip of white calico round her black head, probably in imitation of the sky clearing after a heavy storm. The parents of twins among the Nootkas must build a small hut in the woods on the bank of a river, far from the village, and there they must live for two years, avoiding other people; they may not eat or even touch fresh food, particularly salmon. Wooden images and masks of birds and fish are placed round the hut, and others, representing fish, are set near the river for the purpose of inviting all birds and fish to come and see the twins, and be friendly to them. Moreover the

father sings a special song praising the salmon, and asking them to come. And the fish do come in great numbers to see the twins. Therefore the birth of twins is believed to prognosticate a good year for salmon. But though a Nootka father of twins has thus to live in seclusion for two years, abstaining from fresh meat, and attending none of the ordinary feasts, he is, by a singular exception, invited to banquets which consist wholly of dried provisions, and at them he is treated with great respect and seated among the chiefs, even though he be himself a mere commoner. The birth of twins among the Nootkas is said to be very rare, but one occurred while Jewitt lived with the tribe. He reports that the father always appeared very thoughtful and gloomy, and never associated with other people. "His dress was very plain, and he wore around his head the red fillet of bark, the symbol of mourning and devotion. It was his daily practice to repair to the mountain, with a chief's rattle in his hand, to sing and pray, as Maquina informed me, for the fish to come into their waters. When not thus employed, he kept continually at home, except when sent for to sing and perform his ceremonies over the sick, being considered as a sacred character, and one much in favour with their gods." Among the Thompson Indians of British Columbia twins were called "grizzly-bear children" or "hairy feet," because they were thought to be under the protection of the grizzly bear, and to be endowed by him with special powers, such as that of making fair or foul weather. After their birth the parents moved away from other people, and lived in a lodge made of fir-boughs and bark till the children were about four years old. During all this time great care was taken of the twins. They might not come into contact with other people, and were washed with fir-twigs dipped in water. While they were being washed, the father described circles round them with fir-boughs, singing the song of the grizzly bear.

With these American beliefs we may compare an African one. The negroes of Porto Novo, on the Bight of Benin, hold that twins have for their companions certain spirits or genii like those which animate a kind of small ape, which abounds in the forests of Guinea. When the twins grow up, they will not be allowed to eat the flesh of apes, and meantime the mother carries offerings of bananas and other dainties to the apes in the forest. Precisely similar beliefs and customs as to twins prevail in the Ho tribe of German Togoland. There the twins are called "children of apes"; neither they nor their parents may eat the flesh of the particular species of apes with which they are associated; and if a hunter kills one of these animals, the parents must beat him with a stick. But to return to America. The Shuswap Indians of British Columbia, like the Thompson Indians, associate twins with the grizzly bear, for they call them "young grizzly bears." According to them, twins remain throughout life endowed with supernatural powers. In particular they can make good or bad weather. They produce rain by spilling water from a basket in the air; they make fine weather by shaking a small flat piece of wood attached to a stick by a string; they raise storms by strewing down on the ends of spruce branches.

The Indians of Peru entertained similar notions as to the special relation in which twins stand to the rain and the weather. For they said that one of each pair of twins was a son of the lightning; and they called the lightning the lord and creator of rain, and prayed to him to send showers. The parents of twins had to fast for many days after the birth, abstaining from salt and pepper, and they might not have intercourse with each other. In some parts of Peru this period of fasting and abstinence lasted six months. In other parts both the father and mother had to lie down on one side, with one leg drawn up, and a bean placed in the hollow of the ham. In this position they had to lie without moving for five days, till with the heat and sweat of their bodies the beans began to sprout. Then they changed over to the other side, and lay on it in like manner for other five days, fasting in the way described. When the ten days were up, their relations went out to hunt, and having killed and skinned a deer they made a robe of its hide, under which they caused the parents of the twins to pass, with cords about their necks which they afterwards wore for many days. If the twins died young, their bodies,

enclosed in pots, were kept in the house as sacred things. But if they lived, and it happened that a frost set in, the priests sent for them, together with all persons who had hare-lips or had been born feet foremost, and rated them soundly for being the cause of the frost, in that they had not fasted from salt and pepper. Wherefore they were ordered to fast for ten days in the usual manner, and to abstain from their wives, and to wash themselves, and to acknowledge and confess their sins. After their nominal conversion to Christianity, the Peruvian Indians retained their belief that one of twins was always the son of the lightning, and oddly enough they regularly gave him the name of St. James (Santiago). The Spanish Jesuit, who reports the custom, was at a loss to account for it. It could not, he thought, have originated in the name of Boanerges, or "sons of thunder," which Christ applied to the two brothers James and John. He suggests two explanations. The Indians may have adopted the name because they had heard a phrase used by Spanish children when it thunders, "The horse of Santiago is running." Or it may have been because they saw that the Spanish infantry in battle, before they fired their arquebuses, always cried out "Santiago! Santiago!" For the Indians called an arquebuse *illapa*, that is, "lightning," and they might easily imagine that the name which they heard shouted just before the flash and roar of the guns was that of the Spanish god of thunder and lightning. However they came by the name, they made such frequent and superstitious use of it that the church forbade any Indian to bear the name of Santiago.

The same power of influencing the weather is attributed to twins by the Baronga, a tribe of Bantu negroes who inhabit the shores of Delagoa Bay in south-eastern Africa. They bestow the name of *Tilo*—that is, the sky—on a woman who has given birth to twins, and the infants themselves are called the children of the sky. Now when the storms which generally burst in the months of September and October have been looked for in vain, when a drought with its prospect of famine is threatening, and all nature, scorched and burnt up by a sun that has shone for six months from a cloudless sky, is panting for the beneficent showers of the South African spring, the women perform ceremonies to bring down the longed-for rain on the parched earth. Stripping themselves of all their garments, they assume in their stead girdles and head-dresses of grass, or short petticoats made of the leaves of a particular sort of creeper. Thus attired, uttering peculiar cries and singing ribald songs, they go about from well to well, cleansing them of the mud and impurities which have accumulated in them. The wells, it may be said, are merely holes in the sand where a little turbid unwholesome water stagnates. Further, the women must repair to the house of one of their gossips who has given birth to twins, and must drench her with water, which they carry in little pitchers. Having done so they go on their way, shrieking out their loose songs and dancing immodest dances. No man may see these leaf-clad women going their rounds. If they meet a man, they maul him and thrust him aside. When they have cleansed the wells, they must go and pour water on the graves of their ancestors in the sacred grove. It often happens, too, that at the bidding of the wizard they go and pour water on the graves of twins. For they think that the grave of a twin ought always to be moist, for which reason twins are regularly buried near a lake. If all their efforts to procure rain prove abortive, they will remember that such and such a twin was buried in a dry place on the side of a hill. "No wonder," says the wizard in such a case, "that the sky is fiery. Take up his body and dig him a grave on the shore of the lake." His orders are at once obeyed, for this is supposed to be the only means of bringing down the rain. The Swiss missionary who reports this strange superstition has also suggested what appears to be its true explanation. He points out that as the mother of twins is called by the Baronga "the sky," they probably think that to pour water on her is equivalent to pouring water on the sky itself; and if water be poured on the sky, it will of course drip through it, as through the nozzle of a gigantic watering-pot, and fall on the earth beneath. A slight extension of the same train of reasoning explains why the desired result is believed to be expedited by drenching the graves of twins, who are the Children of the Sky. Among the Zulus twins are

supposed to be able to foretell the weather, and people who want rain will go to a twin and say, "Tell me, do you feel ill to-day?" If he says he feels quite well, they know it will not rain. The Wanyamwesi, a large tribe of Central Africa, to the south of the Victoria Nyanza, also believe in the special association of twins with water. For amongst them, when a twin is about to cross a river, stream, or lake, he must fill his mouth full of water and spirt it out over the surface of the river or lake, adding, "I am a twin" (*nānā mpassa*). And he must do the same if a storm arises on a lake over which he is sailing. Were he to omit the ceremony, some harm might befall him or his companions. In this tribe the birth of twins is comparatively common and is attended by a number of ceremonies. Old women march about the village collecting gifts for the infants, while they drum with a hoe on a piece of ox-hide and sing an obscene song in praise of the father. Further, two little fetish huts are built for the twins before their mother's house, and here people sacrifice for them in season and out of season, especially when somebody is sick or about to go on a journey or to the wars. If one or both twins die, two aloes are planted beside the little fetish hut. Lastly, the Hindoos of the Central Provinces in India believe that a twin can save the crops from the ravages of hail and heavy rain if he will only paint his right buttock black and his left buttock some other colour, and thus adorned go and stand in the direction of the wind.

Many of the foregoing facts strongly support an interpretation which Professor Oldenberg has given of the rules to be observed by a Brahman who would learn a particular hymn of the ancient Indian collection known as the Samaveda. The hymn, which bears the name of the Sakvarī song, was believed to embody the might of Indra's weapon, the thunderbolt; and hence, on account of the dreadful and dangerous potency with which it was thus charged, the bold student who essayed to master it had to be isolated from his fellow-men, and to retire from the village into the forest. Here for a space of time, which might vary, according to different doctors of the law, from one to twelve years, he had to observe certain rules of life, among which were the following. Thrice a day he had to touch water; he must wear black garments and eat black food; when it rained, he might not seek the shelter of a roof, but had to sit in the rain and say, "Water is the Sakvarī song"; when the lightning flashed he said, "That is like the Sakvarī song"; when the thunder pealed he said, "The Great One is making a great noise." He might never cross a running stream without touching water; he might never set foot on a ship unless his life were in danger, and even then he must be sure to touch water when he went on board; "for in water," so ran the saying, "lies the virtue of the Sakvarī song." When at last he was allowed to learn the song itself, he had to dip his hands in a vessel of water in which plants of all sorts had been placed. If a man walked in the way of all these precepts, the rain-god Parjanya, it was said, would send rain at the wish of that man. It is clear, as Professor Oldenberg well points out, that "all these rules are intended to bring the Brahman into union with water, to make him, as it were, an ally of the water powers, and to guard him against their hostility. The black garments and the black food have the same significance; no one will doubt that they refer to the rain-clouds when he remembers that a black victim is sacrificed to procure rain; 'it is black, for such is the nature of rain.' In respect of another rain-charm it is said plainly, 'He puts on a black garment edged with black, for such is the nature of rain.' We may therefore assume that here in the circle of ideas and ordinances of the Vedic schools there have been preserved magical practices of the most remote antiquity, which were intended to prepare the rain-maker for his office and dedicate him to it."

It is interesting to observe that where an opposite result is desired, primitive logic enjoins the weather-doctor to observe precisely opposite rules of conduct. In the tropical island of Java, where the rich vegetation attests the abundance of the rainfall, ceremonies for the making of rain are rare, but ceremonies for the prevention of it are not uncommon. When a man is about

to give a great feast in the rainy season and has invited many people, he goes to a weather-doctor and asks him to “prop up the clouds that may be lowering.” If the doctor consents to exert his professional powers, he begins to regulate his behaviour by certain rules as soon as his customer has departed. He must observe a fast, and may neither drink nor bathe; what little he eats must be eaten dry, and in no case may he touch water. The host, on his side, and his servants, both male and female, must neither wash clothes nor bathe so long as the feast lasts, and they have all during its continuance to observe strict chastity. The doctor seats himself on a new mat in his bedroom, and before a small oil-lamp he murmurs, shortly before the feast takes place, the following prayer or incantation: “Grandfather and Grandmother Sroekoel” (the name seems to be taken at random; others are sometimes used), “return to your country. Akkemat is your country. Put down your water-cask, close it properly, that not a drop may fall out.” While he utters this prayer the sorcerer looks upwards, burning incense the while. So among the Toradjas of Central Celebes the rain-doctor (*sando*), whose special business it is to drive away rain, takes care not to touch water before, during, or after the discharge of his professional duties. He does not bathe, he eats with unwashed hands, he drinks nothing but palm wine, and if he has to cross a stream he is careful not to step in the water. Having thus prepared himself for his task he has a small hut built for himself outside of the village in a rice-field, and in this hut he keeps up a little fire, which on no account may be suffered to go out. In the fire he burns various kinds of wood, which are supposed to possess the property of driving off rain; and he puffs in the direction from which the rain threatens to come, holding in his hand a packet of leaves and bark which derive a similar cloud-compelling virtue, not from their chemical composition, but from their names, which happen to signify something dry or volatile. If clouds should appear in the sky while he is at work, he takes lime in the hollow of his hand and blows it towards them. The lime, being so very dry, is obviously well adapted to disperse the damp clouds. Should rain afterwards be wanted, he has only to pour water on his fire, and immediately the rain will descend in sheets. So in Santa Cruz and Reef islands, when the man who has power over rain wishes to prevent it from falling, he will abstain from washing his face for a long time and will do no work, lest he should sweat and his body be wet; “for they think that if his body be wet it will rain.” On the other hand when he desires to bring on rain, he goes into the house where the spirit or ghost of the rain is believed to reside, and there he sprinkles water at the head of the ghost-post (*duka*) in order that showers may fall.

The reader will observe how exactly the Javanese and Toradja observances, which are intended to prevent rain, form the antithesis of the Indian observances, which aim at producing it. The Indian sage is commanded to touch water thrice a day regularly as well as on various special occasions; the Javanese and Toradja wizards may not touch it at all. The Indian lives out in the forest, and even when it rains he may not take shelter; the Javanese and the Toradja sit in a house or a hut. The one signifies his sympathy with water by receiving the rain on his person and speaking of it respectfully; the others light a lamp or a fire and do their best to drive the rain away. Yet the principle on which all three act is the same; each of them, by a sort of childish make-believe, identifies himself with the phenomenon which he desires to produce. It is the old fallacy that the effect resembles its cause: if you would make wet weather, you must be wet; if you would make dry weather, you must be dry.

In south-eastern Europe at the present day ceremonies are observed for the purpose of making rain which not only rest on the same general train of thought as the preceding, but even in their details resemble the ceremonies practised with the same intention by the Baronga of Delagoa Bay. Among the Greeks of Thessaly and Macedonia, when a drought has lasted a long time, it is customary to send a procession of children round to all the wells and springs of the neighbourhood. At the head of the procession walks a girl adorned with flowers, whom

her companions drench with water at every halting-place, while they sing an invocation, of which the following is part:—

*Perperia, all fresh bedewed,
Freshen all the neighbourhood;
By the woods, on the highway,
As thou goest, to God now pray:
O my God, upon the plain,
Send thou us a still, small rain;
That the fields may fruitful be,
And vines in blossom we may see;
That the grain be full and sound,
And wealthy grow the folks around.*

In time of drought the Servians strip a girl to her skin and clothe her from head to foot in grass, herbs, and flowers, even her face being hidden behind a veil of living green. Thus disguised she is called the Dodola, and goes through the village with a troop of girls. They stop before every house; the Dodola keeps turning herself round and dancing, while the other girls form a ring about her singing one of the Dodola songs, and the housewife pours a pail of water over her. One of the songs they sing runs thus:—

*We go through the village;
The clouds go in the sky;
We go faster,
Faster go the clouds;
They have overtaken us,
And wetted the corn and the vine.*

A similar custom is observed in Greece and Roumania. In Roumania the rain-maker is called Paparuda or Babaruda. She is a gypsy girl, who goes naked except for a short skirt of dwarf elder (*Sambucus ebulus*) or of corn and vines. Thus scantily attired the girls go in procession from house to house, singing for rain, and are drenched by the people with buckets of water. The ceremony regularly takes place all over Roumania on the third Tuesday after Easter, but it may be repeated at any time of drought during the summer. But the Roumanians have another way of procuring rain. They make a clay figure to represent Drought, cover it with a pall, and place it in an open coffin. Girls crouch round the coffin and lament, saying, "Drought (*Scaloi*) is dead! Lord, give us rain!" Then the coffin is carried by children in funeral procession, with a burning wax candle before it, while lamentations fill the air. Finally, they throw the coffin and the candle into a stream or a well. When rain is wanted in Bulgaria the people dress up a girl in branches of nut-trees, flowers, and the green stuff of beans, potatoes, and onions. She carries a nosegay of flowers in her hand, and is called Djuldjul or Peperuga. Attended by a train of followers she goes from house to house, and is received by the goodman with a kettleful of water, on which flowers are swimming. With this water he drenches her, while a song is sung:—

*The Peperuga flew;
God give rain,
That the corn, the millet, and the wheat may thrive.*

Sometimes the girl is dressed in flax to the girdle. At Melenik, a Greek town in Macedonia, a poor orphan boy parades the streets in time of drought, decked with ferns and flowers, and attended by other boys of about the same age. The women shower water and money on him from the windows. He is called Dudulé, and as they march along the boys sing a song, which

begins: "Hail, hail, Dudulé, (bring us) both maize and wheat." In Dalmatia also the custom is observed. The performer is a young unmarried man, who is dressed up, dances, and has water poured over him. He goes by the name of Prpats, and is attended by companions called Prporushe, who are young bachelors like himself. In such customs the leaf-clad person appears to personify vegetation, and the drenching of him or her with water is certainly an imitation of rain. The words of the Servian song, however, taken in connexion with the constant movement which the chief actress in the performance seems expected to keep up, points to some comparison of the girl or her companions to clouds moving through the sky. This again reminds us of the odd quivering movement kept up by the Australian rain-maker, who, in his disguise of white down, may perhaps represent a cloud. At Poona in India, when rain is needed, the boys dress up one of their number in nothing but leaves and call him King of Rain (*Mriij raja*). Then they go round to every house in the village, where the householder or his wife sprinkles the Rain King with water, and gives the party food of various kinds. When they have thus visited all the houses, they strip the Rain King of his leafy robes and feast upon what they have gathered.

Similar rain-charms are practised in Armenia, except that there the representative of vegetation is an effigy or doll, not a person. The children dress up a broomstick as a girl and carry it from house to house. Before every house they sing a song, of which the following is one version:—

*Nurin, Nurin is come,
The wondrous maiden is come.
A shirt of red stuff has she put on,
With a red girdle is she girded,
Bring water to pour on her head,
Bring butter to smear on her hair.
Let the blessed rain fall,
Let the fields of your fathers grow green.
Give our Nurin her share,
And we will eat and drink and be merry.*

The children are asked, "Will you have it from the door or from the garret-window?" If they choose the door, the water is poured on Nurin from the window; and if they choose the window, it is poured on her from the door. At each house they receive presents of butter, eggs, rice, and so forth. Afterwards they take Nurin to a river and throw her into the water. Sometimes the figure has the head of a pig or a goat, and is covered with boughs. At Egin in Armenia, when rain is wanted, boys carry about an effigy which they call Chi-chi Mama or "the drenched Mother," as they interpret the phrase. As they go about they ask, "What does Chi-chi Mother want?" The answer is, "She wants wheat in her bins, she wants bread on her bread-hooks, and she wants rain from God!" The people pour water on her from the roofs, and rich people make presents to the children. At Ourfa in Armenia the children in time of drought make a rain-bride, which they call Chimché-gelin. They say this means in Turkish "shovel-bride." While they carry it about they say, "What does Chimché-gelin want? She wishes mercy from God: she wants offerings of lambs and rams." And the crowd responds, "Give, my God, give rain, give a flood." The rain-bride is then thrown into the water. At Kerak in Palestine, whenever there is a drought, the Greek Christians dress up a winnowing-fork in women's clothes. They call it "the bride of God." The girls and women carry it from house to house, singing doggerel songs. We are not told that "the bride of God" is drenched with water or thrown into a stream, but the charm would hardly be complete without this feature. Similarly, when rain is much wanted, the Arabs of Moab attire a dummy in the robes

and ornaments of a woman and call it “the Mother of the Rain.” A woman carries it in procession past the houses of the village or the tents of the camp, singing:—

O Mother of the Rain, O Immortal, moisten our sleeping seeds.

Moisten the sleeping seeds of the sheikh, who is ever generous.

She is gone, the Mother of the Rain, to bring the storm; when she comes back, the crops are as high as the walls.

She is gone, the Mother of the Rain, to bring the winds; when she comes back, the plantations have attained the height of lances.

She is gone, the Mother of the Rain, to bring the thunders; when she comes back, the crops are as high as camels.

And so on.

Bathing is practised as a rain-charm in some parts of southern and western Russia.

Sometimes after service in church the priest in his robes has been thrown down on the ground and drenched with water by his parishioners. Sometimes it is the women who, without stripping off their clothes, bathe in crowds on the day of St. John the Baptist, while they dip in the water a figure made of branches, grass, and herbs, which is supposed to represent the saint. In Kursk, a province of southern Russia, when rain is much wanted, the women seize a passing stranger and throw him into the river, or souse him from head to foot. Later on we shall see that a passing stranger is often taken for a deity or the personification of some natural power. It is recorded in official documents that during a drought in 1790 the peasants of Scheroutz and Werboutz collected all the women and compelled them to bathe, in order that rain might fall. An Armenian rain-charm is to throw the wife of a priest into the water and drench her. The Arabs of North Africa fling a holy man, willy-nilly, into a spring as a remedy for drought. In Minahassa, a province of North Celebes, the priest bathes as a rain-charm. In Central Celebes when there has been no rain for a long time and the rice-stalks begin to shrivel up, many of the villagers, especially the young folk, go to a neighbouring brook and splash each other with water, shouting noisily, or squirt water on one another through bamboo tubes. Sometimes they imitate the plump of rain by smacking the surface of the water with their hands, or by placing an inverted gourd on it and drumming on the gourd with their fingers. The Karo-Bataks of Sumatra have a rain-making ceremony which lasts a week. The men go about with bamboo squirts and the women with bowls of water, and they drench each other or throw the water into the air and cry, “The rain has come,” when it drips down on them. In Kumaon, a district of north-west India, when rain fails they sink a Brahman up to his lips in a tank or pond, where he repeats the name of a god of rain for a day or two. When this rite is duly performed, rain is sure to fall. For the same purpose village girls in the Punjab will pour a solution of cow-dung in water upon an old woman who happens to pass; or they will make her sit down under the roof-spout of a house and get a wetting when it rains. In the Solok district of Sumatra, when a drought has lasted a long time, a number of half-naked women take a half-witted man to a river; and there besprinkle him with water as a means of compelling the rain to fall. In some parts of Bengal, when drought threatens the country, troops of children of all ages go from house to house and roll and tumble in puddles which have been prepared for the purpose by pouring water into the courtyards. This is supposed to bring down rain. Again, in Dubrajpur, a village in the Birbhum district of Bengal, when rain has been looked for in vain, people will throw dirt or filth on the houses of their neighbours, who abuse them for doing so. Or they drench the lame, the halt, the blind, and other infirm persons, and are reviled for their pains by the victims. This vituperation is believed to bring about the desired result by drawing down showers on the parched earth.

Similarly, in the Shahpur district of the Punjab it is said to be customary in time of drought

to spill a pot of filth on the threshold of a notorious old shrew, in order that the fluent stream of foul language in which she vents her feelings may accelerate the lingering rain.

In these latter customs the means adopted for bringing about the desired result appear to be not so much imitative magic as the beneficent effect which, curiously enough, is often attributed to curses and maledictions. Thus in the Indian district of Behar much virtue is ascribed to abuse, which is supposed in some cases to bring good luck. People, for example, who accompany a marriage procession to the bride's house are often foully abused by the women of the bride's family in the belief that this contributes to the good fortune of the newly-married pair. So in Behar on Jamadwitiya Day, which falls on the second day of the bright period of the moon next to that during which the Dussera festival takes place, brothers are reviled by sisters to their heart's content because it is thought that this will prolong the lives of the brothers and bring them good luck. Further, in Behar and Bengal it is deemed very unlucky to look at the new moon of Bhadon (August); whoever does so is sure to meet with some mishap, or to be falsely accused of something. To avert these evils people are commonly advised to throw stones or brickbats into their neighbours' houses; for if they do so, and are reviled for their pains, they will escape the threatened evils, and their neighbours who abused them will suffer in their stead. Hence the day of the new moon in this month is called the Day of Stones. At Benares a regular festival is held for this purpose on the fourth day of Bhadon, which is known as "the clod festival of the fourth." On the Khurda estate in Orissa gardens and fruit-trees are conspicuously absent. The peasants explain their absence by saying that from time immemorial they have held it lucky to be annoyed and abused by their neighbours at a certain festival, which answers to the Nashti-Chandra in Bengal. Hence in order to give ample ground of offence they mutilate the fruit-trees and trample down the gardens of their neighbours, and so court fortune by drawing down on themselves the wrath of the injured owners. At Cranganore, in the Native State of Cochin, there is a shrine of the goddess Bhagavati, which is much frequented by pilgrims in the month of Minam (March-April). From all parts of Cochin, Malabar, and Travancore crowds flock to attend the festival and the highroads ring with their shouts of *Nada nada*, "March! march!" They desecrate the shrine of the goddess in every conceivable way, discharge volleys of stones and filth, and level the most opprobrious language at the goddess herself. These proceedings are supposed to be acceptable to her. The intention of the pilgrimage is to secure immunity from disease during the succeeding year. In some cases a curse may, like rags and dirt, be supposed to benefit a man by making him appear vile and contemptible, and thus diverting from him the evil eye and other malignant influences, which are attracted by beauty and prosperity but repelled by their opposites. Among the Huzuls of the Carpathians, if a herdsman or cattle-owner suspects himself of having the evil eye, he will charge one of his household to call him a devil or a robber every time he goes near the cattle; for he thinks that this will undo the effect of the evil eye. Among the Chams of Cambodia and Annam, while a corpse is being burned on the pyre, a man who bears the title of the Master of Sorrows remains in the house of the deceased and loads it with curses, after which he beseeches the ghost not to come back and torment his family. These last curses are clearly intended to make his old home unattractive to the spirit of the dead. Esthonian fishermen believe that they never have such good luck as when some one is angry with them and curses them. Hence before a fisherman goes out to fish, he will play a rough practical joke on a comrade in order to be abused and execrated by him. The more his friend storms and curses, the better he is pleased; every curse brings at least three fish into his net. There is a popular belief in Berlin and the neighbourhood that if you wish a huntsman good luck when he is going out to shoot deer he will be certain never to get a shot at all. To avert the ill luck caused by such a wish the hunter must throw a broomstick at the head of his well-wisher. If he is really to have luck, you must wish that he may break his neck, or both his neck and his legs. The wish is expressed with

pregnant brevity in the phrase, "Now then, neck and leg!" The intention of such curses may be to put the fish or the deer off their guard; for, as we shall see later on, animals are commonly supposed to understand human speech, and even to overhear what is said of them many miles off. Accordingly if they hear a fisherman or a hunter flouted and vituperated, they will think too meanly of him to go out of his way, and so will fall an easy prey to his net or his gun. When a Greek sower sowed cummin he had to curse and swear, or the crop would not turn out well. Roman writers mention a similar custom observed by the sowers of rue and basil; and hedge doctors in ancient Greece laid it down as a rule that in cutting black hellebore you should face eastward and curse. Perhaps the bitter language was supposed to strengthen the bitter taste, and hence the medicinal virtue, of these plants. At Lindus in the island of Rhodes it was customary to sacrifice one or two plough oxen to Hercules with curses and imprecations; indeed we are told that the sacrifice was deemed invalid if a good word fell from any one's lips during the rite. The custom was explained by a legend that Hercules had laid hands on the oxen of a ploughman and cooked and devoured them, while their owner, unable to defend his beasts, stood afar off and vented his anger in a torrent of abuse and execration. Hercules received his maledictions with a roar of laughter, appointed him his priest, and bade him always sacrifice with the very same execrations, for he had never dined better in his life. The legend is plainly a fiction devised to explain the ritual. We may conjecture that the curses were intended to palliate the slaughter of a sacred animal. The subject will be touched on in a later part of this work. Here we must return to rain-making.

Women are sometimes supposed to be able to make rain by ploughing, or pretending to plough. Thus the Pshaws and Chewsurs of the Caucasus have a ceremony called "ploughing the rain," which they observe in time of drought. Girls yoke themselves to a plough and drag it into a river, wading in the water up to their girdles. In the same circumstances Armenian girls and women do the same. The oldest woman, or the priest's wife, wears the priest's dress, while the others, dressed as men, drag the plough through the water against the stream. In the Caucasian province of Georgia, when a drought has lasted long, marriageable girls are yoked in couples with an ox-yoke on their shoulders, a priest holds the reins, and thus harnessed they wade through rivers, puddles, and marshes, praying, screaming, weeping, and laughing. In a district of Transylvania, when the ground is parched with drought, some girls strip themselves naked, and, led by an older woman, who is also naked, they steal a harrow and carry it across the fields to a brook, where they set it afloat. Next they sit on the harrow and keep a tiny flame burning on each corner of it for an hour. Then they leave the harrow in the water and go home. A similar rain-charm is resorted to in some parts of India; naked women drag a plough across a field by night, while the men keep carefully out of the way, for their presence would break the spell. As performed at Chunar in Bengal on the twenty-fourth of July 1891 the ceremony was this. Between nine and ten in the evening a barber's wife went from door to door and invited the women to engage in ploughing. They all assembled in a field from which men were excluded. Three women of a husbandman's family then stripped themselves naked; two of them were yoked like oxen to the plough, while the third held the handle. They next began to imitate the operation of ploughing. The one who held the plough cried out, "O mother earth! bring parched grain, water, and chaff. Our stomachs are breaking to pieces from hunger and thirst." Then the landlord and accountant approached them and laid down some grain, water, and chaff in the field. After that the women dressed and returned home. "By the grace of God," adds the gentleman who reports the ceremony, "the weather changed almost immediately, and we had a good shower." Sometimes as they draw the plough the women sing a hymn to Vishnu, in which they seek to enlist his sympathy by enumerating the ills which the people are suffering from the want of rain. In some cases they discharge volleys of abuse at the village officials, and even at the landlord, whom they compel to drag the plough. These ceremonies are all the more remarkable because in ordinary

circumstances Hindoo women never engage in agricultural operations like ploughing and harrowing. Yet in drought it seems to be women of the highest or Brahman caste who are chosen to perform what at other times would be regarded as a menial and degrading task. Occasionally, when hesitation is felt at subjecting Brahman ladies to this indignity, they are allowed to get off by merely touching the plough early in the morning, before people are astir; the real work is afterwards done by the ploughmen. In Manipur the prosperity of all classes depends on the abundance and regularity of the rainfall; hence the people have many rites and ceremonies for the making of rain. Thus in time of drought one hundred and eight girls milk one hundred and eight cows in the temple of Govindji, the most popular incarnation of Krishna in the country. If this fails, the women throw their *dhan*-pounders into the nearest pool, and at the dead of night strip themselves naked and plough. There is a Burmese superstition that if a harrow has a flaw in it no rain will fall till the faulty harrow has been decked with flowers, broken, and thrown into the river. Further, the owner should have his hair cropped, and being adorned with flowers should dance and carry the harrow to the water. Otherwise the country is sure to suffer from drought. The Tarahumare Indians of Mexico dip the plough in water before they use it, that it may draw rain.

Sometimes the rain-charm operates through the dead. Thus in New Caledonia the rain-makers blackened themselves all over, dug up a dead body, took the bones to a cave, jointed them, and hung the skeleton over some taro leaves. Water was poured over the skeleton to run down on the leaves. They believed that the soul of the deceased took up the water, converted it into rain, and showered it down again. In some parts of New Caledonia the ceremony is somewhat different. A great quantity of provisions is offered to the ancestors, being laid down before their skulls in the sacred place. In front of the skulls a number of pots full of water are set in a row, and in each pot there is deposited a sacred stone which has more or less the shape of a skull. The rain-maker then prays to the ancestors to send rain. After that he climbs a tree with a branch in his hand, which he waves about to hasten the approach of the rain-clouds. The ceremony is a mixture of magic and religion; the prayers and offerings to the ancestors are purely religious, while the placing of the skull-like stones in water and the waving of the branch are magical. In Russia, if common report may be believed, it is not long since the peasants of any district that chanced to be afflicted with drought used to dig up the corpse of some one who had drunk himself to death and sink it in the nearest swamp or lake, fully persuaded that this would ensure the fall of the needed rain. In 1868 the prospect of a bad harvest, caused by a prolonged drought, induced the inhabitants of a village in the Tarashchansk district to dig up the body of a Raskolnik, or Dissenter, who had died in the preceding December. Some of the party beat the corpse, or what was left of it, about the head, exclaiming, "Give us rain!" while others poured water on it through a sieve. Here the pouring of water through a sieve seems plainly an imitation of a shower, and reminds us of the manner in which Strepsiadés in Aristophanes imagined that rain was made by Zeus. An Armenian rain-charm is to dig up a skull and throw it into running water. At Ourfa for this purpose they prefer the skull of a Jew, which they cast into the Pool of Abraham. In Mysore people think that if a leper is buried, instead of being burnt, as he ought to be, rain will not fall. Hence they have been known to disinter buried lepers in time of drought. In Halmahera there is a practice of throwing stones on a grave, in order that the ghost may fall into a passion and avenge the disturbance, as he imagines, by sending heavy rain. This may explain a rain-charm which seems to have been practised by the Mauretians in antiquity. A mound in the shape of a man lying on his back was pointed out as the grave of the giant Antaeus; and if any earth were dug up and removed from it, rain fell till the soil was replaced. Perhaps the rain was the revenge the surly giant took for being wakened from his long sleep. Sometimes, in order to procure rain, the Toradjas of Central Celebes make an appeal to the pity of the dead. Thus, in the village of Kalingooa, in Kadombookoo, there is the grave of a famous

chief, the grandfather of the present ruler. When the land suffers from unseasonable drought, the people go to this grave, pour water on it, and say, "O grandfather, have pity on us; if it is your will that this year we should eat, then give rain." After that they hang a bamboo full of water over the grave; there is a small hole in the lower end of the bamboo, so that the water drips from it continually. The bamboo is always refilled with water until rain drenches the ground. Here, as in New Caledonia, we find religion blent with magic, for the prayer to the dead chief, which is purely religious, is eked out with a magical imitation of rain at his grave. We have seen that the Baronga of Delagoa Bay drench the tombs of their ancestors, especially the tombs of twins, as a rain-charm. In Zululand the native girls form a procession and carry large pots of water to a certain tree which chances to be on a mission station. When the girls were asked why they did this, they said that an old ancestor of theirs had been buried under the tree, and as he was a great rain-maker in his life, they always came and poured water on his grave in time of drought, in order that he might send them rain. This ceremony partakes of the nature of religion, since it implies an appeal for help to a deceased ancestor. Purely religious, on the other hand, are some means adopted by the Herero of south-western Africa to procure rain. If a drought has lasted long, the whole tribe goes with its cattle to the grave of some eminent man; it may be the father or grandfather of the chief. They lay offerings of milk and flesh on the grave and utter their plaint: "Look, O Father, upon your beloved cattle and children; they suffer distress, they are so lean, they are dying of hunger. Give us rain." The ears of the spectator are deafened by the lowing and bleating of herds and flocks, the shouts of herdsmen, the barking of dogs, and the screams of women. Among some of the Indian tribes in the region of the Orinoco it was customary for the relations of a deceased person to disinter his bones a year after burial, burn them, and scatter the ashes to the winds, because they believed that the ashes were changed into rain, which the dead man sent in return for his obsequies. The Chinese are convinced that when human bodies remain unburied, the souls of their late owners feel the discomfort of rain, just as living men would do if they were exposed without shelter to the inclemency of the weather. These wretched souls, therefore, do all in their power to prevent the rain from falling, and often their efforts are only too successful. Then drought ensues, the most dreaded of all calamities in China, because bad harvests, dearth, and famine follow in its train. Hence it has been a common practice of the Chinese authorities in time of drought to inter the dry bones of the unburied dead for the purpose of putting an end to the scourge and conjuring down the rain.

Animals, again, often play an important part in these weather-charms. The Anula tribe of northern Australia associate the dollar-bird with rain, and call it the rain-bird. A man who has the bird for his totem can make rain at a certain pool. He catches a snake, puts it alive into the pool, and after holding it under water for a time takes it out, kills it, and lays it down by the side of the creek. Then he makes an arched bundle of grass stalks in imitation of a rainbow, and sets it up over the snake. After that all he does is to sing over the snake and the mimic rainbow; sooner or later the rain will fall. They explain this procedure by saying that long ago the dollar-bird had as a mate at this spot a snake, who lived in the pool and used to make rain by spitting up into the sky till a rainbow and clouds appeared and rain fell. The Tjingilli of northern Australia make rain in an odd way. One of them will catch a fat bandicoot and carry it about, singing over it till the animal grows very thin and weak. Then he lets it go, and rain will follow. When some of the Blackfoot Indians were at war in summer and wished to bring on a tempest, they would take a kit-fox skin and rub it with dirt and water, which never failed to be followed by a storm of rain. The Thompson Indians of British Columbia think that when the loon calls loud and often, it will soon rain, and that to mimic the cry of the bird may bring the rain down. The fish called the small sculpin, which abounds along the rocky shore of Norton Sound, is called by the Esquimaux the rain-maker; they say that if a person takes one of these fish in his hand heavy rain will follow. If Aino fishermen desire to bring on rain

and wind, they pray to the skulls of racoons and then throw water over each other. Should they wish the storm to increase they put on gloves and caps of racoon-skin and dance. Then it blows great guns. In Ma-hlaing, a district of Upper Burma, when rain is scarce, the people pray to a certain fish called *nga-yan* to send it. They also catch some fish and put them in a tub, while offerings of plantains and other food are made to the monks in the name of the fish. After that the fish are let loose in a stream or pond, with gold-leaf stuck on their heads. If live fish are not to be had, wooden ones are used and answer the purpose just as well.

When the Chirus of Manipur wish to make rain they catch a crab and put it in a pot of water. Then the headman goes to the gate of the village and keeps lifting the crab out of the water and putting it back into it till he is tired. An ancient Indian mode of making rain was to throw an otter into the water. If the sky refuses rain and the cattle are perishing, an Arab sheikh will sometimes stand in the middle of the camp and cry, "Redeem yourselves, O people, redeem yourselves!" At these words every family sacrifices a sheep, divides it in two, and hanging the pieces on two poles passes between them. Children too young to walk are carried by their mother. But this custom has rather the appearance of a sacrifice than of a charm. In southern Celebes people try to make rain by carrying a cat tied in a sedan chair thrice round the parched fields, while they drench it with water from bamboo squirts. When the cat begins to miaul, they say, "O lord, let rain fall on us." A common way of making rain in many parts of Java is to bathe a cat or two cats, a male and a female; sometimes the animals are carried in procession with music. Even in Batavia you may from time to time see children going about with a cat for this purpose; when they have ducked it in a pool, they let it go.

Often in order to give effect to the rain-charm the animal must be black. Thus an ancient Indian way of bringing on rain was to set a black horse with his face to the west and rub him with a black cloth till he neighed. In the Beni-Chougran tribe of North Africa women lead a black cow in procession, while other women sprinkle the whole group with water as a means of wringing a shower from the sky. To procure rain the Peruvian Indians used to set a black sheep in a field, poured *chica* over it, and gave the animal nothing to eat until rain fell. Once when a drought lasting five months had burnt up their pastures and withered the corn, the Caffres of Natal had recourse to a famous witch, who promised to procure rain without delay. A black sheep having been produced, an incision was made in the animal near the shoulder and the gall taken out. Part of this the witch rubbed over her own person, part she drank, part was mixed with medicine. Some of the medicine was then rubbed on her body; the rest of it, attached to a stick, was fixed in the fence of a calves' pen. The woman next harangued the clouds. When the sheep was to be cooked, a new fire was procured by the friction of fire-sticks; in ordinary circumstances a brand would have been taken from one of the huts.

Among the Wambugwe, a Bantu people of eastern Africa, when the sorcerer desires to make rain he takes a black sheep and a black calf in bright sunshine, and has them placed upon the roof of the large common hut in which the people live together. Then he slits open the stomachs of the animals and scatters their contents in all directions. After that he pours water and medicine into a vessel; if the charm has succeeded, the water boils up and rain follows. On the other hand, if the sorcerer wishes to prevent rain from falling, he withdraws into the interior of the hut, and there heats a rock-crystal in a calabash. In order to procure rain the Wagogo of German East Africa sacrifice black fowls, black sheep, and black cattle at the graves of dead ancestors, and the rain-maker wears black clothes during the rainy season.

Among the Matabele the rain-charm employed by sorcerers was made from the blood and gall of a black ox. In a district of Sumatra, in order to procure rain, all the women of the village, scantily clad, go to the river, wade into it, and splash each other with the water. A black cat is thrown into the stream and made to swim about for a while, then allowed to escape to the bank, pursued by the splashing of the women. The Garos of Assam offer a black goat on the top of a very high mountain in time of drought. In all these cases the colour of the

animal is part of the charm; being black, it will darken the sky with rain-clouds. So the Bechuanas burn the stomach of an ox at evening, because they say, "The black smoke will gather the clouds and cause the rain to come." The Timorese sacrifice a black pig to the Earth-goddess for rain, a white or red one to the Sun-god for sunshine. The Angoni, a tribe of Zulu descent to the north of the Zambesi, sacrifice a black ox for rain and a white one for fine weather. Among the high mountains of Japan there is a district in which, if rain has not fallen for a long time, a party of villagers goes in procession to the bed of a mountain torrent, headed by a priest, who leads a black dog. At the chosen spot they tether the beast to a stone, and make it a target for their bullets and arrows. When its life-blood bespatters the rocks, the peasants throw down their weapons and lift up their voices in supplication to the dragon divinity of the stream, exhorting him to send down forthwith a shower to cleanse the spot from its defilement. Custom has prescribed that on these occasions the colour of the victim shall be black, as an emblem of the wished-for rain-clouds. But if fine weather is wanted, the victim must be white, without a spot.

The intimate association of frogs and toads with water has earned for these creatures a widespread reputation as custodians of rain; and hence they often play a part in charms designed to draw needed showers from the sky. Some of the Indians of the Orinoco held the toad to be the god or lord of the waters, and for that reason feared to kill the creature, even when they were ordered to do so. They have been known to keep frogs under a pot and to beat them with rods when there was a drought. It is said that the Aymara Indians of Peru and Bolivia often make little images of frogs and other aquatic animals and place them on the tops of the hills as a means of bringing down rain. In some parts of south-eastern Australia, where the rainfall is apt to be excessive, the natives feared to injure Tidelek, the frog, or Bluk, the bull-frog, because they were said to be full of water instead of intestines, and great rains would follow if one of them were killed. The frog family was often referred to as Bunjil Willung or Mr. Rain. A tradition ran that once upon a time long ago the frog drank up all the water in the lakes and rivers, and then sat in the dry reed beds swollen to an enormous size, saying, "Bluk! bluk!" in a deep gurgling voice. All the other animals wandered about gaping and gasping for a drop of moisture, but finding none, they agreed that they must all die of thirst unless they could contrive to make the frog laugh. So they tried one after the other, but for a long time in vain. At last the conger eel and his relations, hung round with lake grass and gay sea-weed, reared themselves on their tails and pranced round the fire. This was too much for the frog. He opened his mouth and laughed till the water ran out and the lakes and streams were full once more. We have seen that some of the Queensland aborigines imitate the movements and cries of frogs as part of a rain-charm. The Thompson River Indians of British Columbia and some people in Europe think that to kill a frog brings on rain. In order to procure rain people of low caste in the Central Provinces of India will tie a frog to a rod covered with green leaves and branches of the *nîm* tree (*Azadirachta Indica*) and carry it from door to door singing—

*Send soon, O frog, the jewel of water!
And ripen the wheat and millet in the field.*

In Kumaon, a district of north-western India, one way of bringing on rain when it is needed is to hang a frog with its mouth up on a tall bamboo or on a tree for a day or two. The notion is that the god of rain, seeing the creature in trouble, will take pity on it and send the rain. In the district of Muzaffarpur in India the vulgar believe that the cry of a frog is most readily heard by the God of Rain. Hence in a year of drought the low-caste females of a village assemble at evening and put a frog in a small earthen pot together with water taken from five different houses. The pot with the frog is then placed in the hollow wooden cup into which the lever used for pounding rice falls. Being raised with the foot and then allowed to drop, the lever

crushes the frog to death; and while the creature emits his dying croak the women sing songs in a loud voice about the dearth of water. The Kapus or Reddis are a large and prosperous caste of cultivators and landowners in the Madras Presidency. When rain fails, women of the caste will catch a frog and tie it alive to a new winnowing fan made of bamboo. On this fan they spread a few margosa leaves and go from door to door singing, "Lady frog must have her bath. Oh! rain-god, give a little water for her at least." While the Kapu women sing this song, the woman of the house pours water over the frog and gives an alms, convinced that by so doing she will soon bring rain down in torrents. Again, in order to procure rain the Malas, who are the pariahs of the Telugu country in Southern India, tie a live frog to a mortar and put a mud figure of Gontiyamma over it. Then they carry the mortar, frog, and all in procession, singing, "Mother frog, playing in water, pour rain by pots full," while the villagers of other castes pour water over them. Beliefs like these might easily develop into a worship of frogs regarded as personifying the powers of water and rain. In the Rig Veda there is a hymn about frogs which appears to be substantially a rain-charm. The Newars, the aboriginal inhabitants of Nepaul, worship the frog as a creature associated with the demi-god Nagas in the production and control of rain and the water-supply, on which the welfare of the crops depends. A sacred character is attributed to the little animal, and every care is taken not to molest or injure it. The worship of the frog is performed on the seventh day of the month Kartik (October), usually at a pool which is known to be frequented by frogs, although it is not essential to the efficacy of the rite that a frog should be actually seen at the time. After carefully washing his face and hands, the priest takes five brazen bowls and places in them five separate offerings, namely, rice, flowers, milk and vermilion, ghee and incense, and water. Lighting the pile of ghee and incense, the priest says, "Hail, Paremêsvara Bhûmînâtha! I pray you receive these offerings and send us timely rain, and bless our crops!"

Some of these customs and beliefs may be, at least in part, based on the frog's habit of storing up water in its body against seasons of drought; when it is caught at such times, it squirts the water out in a jet. On seeing a frog emit a gush of water when all around was dry and parched, savages might easily infer that the creature had caused the drought by swallowing all the water, and that in order to restore its moisture to the thirsty ground they had only to make the frog disgorge its secret store of the precious liquid.

Among some tribes of South Africa, when too much rain falls, the wizard, accompanied by a large crowd, repairs to the house of a family where there has been no death for a very long time, and there he burns the skin of a coney. As it burns he shouts, "The rabbit is burning," and the cry is taken up by the whole crowd, who continue shouting till they are exhausted.

This no doubt is supposed to stop the rain. Equally effective is a method adopted by gypsies in Austria. When the rain has continued to pour steadily for a long time, to the great discomfort of these homeless vagrants, the men of the band assemble at a river and divide themselves into two parties. Some of them cut branches with which to make a raft, while the others collect hazel leaves and cover the raft with them. A witch thereupon lays a dried serpent, wrapt in white rags, on the raft, which is then carried by several men to the river. Women are not allowed to be present at this part of the ceremony. While the procession moves towards the river, the witch marches behind the raft singing a song, of which the burden is a statement that gypsies do not like water, and have no urgent need of serpents' milk, coupled with the expression of a hope that the serpent may see his way to swallow the water, that he may run to his mother and drink milk from her breasts, and that the sun may shine out, bringing back mirth and jollity to gypsy hearts. Transylvanian gypsies will sometimes expose the dried carcass of a serpent to the pouring rain, "in order that the serpent may convince himself of the inclemency of the weather, and so grant the people's wish."

This last custom is an example of an entirely different mode of procuring rain, to which people sometimes have recourse in extreme cases, when the drought is long and their temper short. At such times they will drop the usual hocus-pocus of imitative magic altogether, and being far too angry to waste their breath in prayer they seek by threats and curses or even downright physical force to extort the waters of heaven from the supernatural being who has, so to say, cut them off at the main. Thus, in Muzaffarnagar, a town of the Punjaub, when the rains are excessive, the people draw a figure of a certain Muni or Rishi Agastya on a loin-cloth and put it out in the rain, or they paint his figure on the outside of the house and let the rain wash it off. This Muni or Rishi Agastya is a great personage in the native folklore, and enjoys the reputation of being able to stop the rain. It is supposed that he will exercise his power as soon as he is thus made to feel in effigy the misery of wet weather. On the other hand, when rain is wanted at Chhatarpur, a native state in Bundelcund, they paint two figures with their legs up and their heads down on a wall that faces east; one of the figures represents Indra, the other Megha Raja, the lord of rain. They think that in this uncomfortable position these powerful beings will soon be glad to send the much-needed showers. In a Japanese village, when the guardian divinity had long been deaf to the peasants' prayers for rain, they at last threw down his image and, with curses loud and long, hurled it head foremost into a stinking rice-field. "There," they said, "you may stay yourself for a while, to see how *you* will feel after a few days' scorching in this broiling sun that is burning the life from our cracking fields." In the like circumstances the Feloupes of Senegambia cast down their fetishes and drag them about the fields, cursing them till rain falls. In Okunomura, a Japanese village not far from Tokio, when rain is wanted, an artificial dragon is made out of straw, reeds, bamboos, and magnolia leaves. Preceded by a Shinto priest, attended by men carrying paper flags, and followed by others beating a big drum, the dragon is carried in procession from the Buddhist temple and finally thrown into a waterfall. When the spirits withhold rain or sunshine, the Comanches whip a slave; if the gods prove obstinate, the victim is almost flayed alive.

The Chinese are adepts in the art of taking the kingdom of heaven by storm. Thus, when rain is wanted they make a huge dragon of paper or wood to represent the rain-god, and carry it about in procession; but if no rain follows, the mock-dragon is execrated and torn to pieces.

At other times they threaten and beat the god if he does not give rain; sometimes they publicly depose him from the rank of deity. On the other hand, if the wished-for rain falls, the god is promoted to a higher rank by an imperial decree. It is said that in the reign of Kia-King, fifth emperor of the Manchu dynasty, a long drought desolated several provinces of northern China. Processions were of no avail; the rain-dragon hardened his heart and would not let a drop fall. At last the emperor lost patience and condemned the recalcitrant deity to perpetual exile on the banks of the river Illi in the province of Torgot. The decree was in process of execution; the divine criminal, with a touching resignation, was already traversing the deserts of Tartary to work out his sentence on the borders of Turkestan, when the judges of the High Court of Peking, moved with compassion, flung themselves at the feet of the emperor and implored his pardon for the poor devil. The emperor consented to revoke his doom, and a messenger set off at full gallop to bear the tidings to the executors of the imperial justice. The dragon was reinstated in his office on condition of performing his duties a little better in future. About the year 1710 the island of Tsong-ming, which belongs to the province of Nanking, was afflicted with a drought. The viceroy of the province, after the usual attempts to soften the heart of the local deity by burning incense-sticks had been made in vain, sent word to the idol that if rain did not fall by such and such a day, he would have him turned out of the city and his temple razed to the ground. The threat had no effect on the obdurate divinity; the day of grace came and went, and yet no rain fell. Then the indignant viceroy forbade the people to make any more offerings at the shrine of this unfeeling deity,

and commanded that the temple should be shut up and seals placed on the doors. This soon produced the desired effect. Cut off from his base of supplies, the idol had no choice but to surrender at discretion. Rain fell in a few days, and thus the god was restored to the affections of the faithful. In some parts of China the mandarins procure rain or fine weather by shutting the southern or the northern gates of the city. For the south wind brings drought and the north wind brings showers. Hence by closing the southern and opening the northern gates you clearly exclude drought and admit rain; whereas contrariwise by shutting the northern and opening the southern gates you bar out the clouds and the wet and let in sunshine and genial warmth. In April 1888 the mandarins of Canton prayed to the god Lung-wong to stop the incessant downpour of rain; and when he turned a deaf ear to their petitions they put him in a lock-up for five days. This had a salutary effect. The rain ceased and the god was restored to liberty. Some years before, in time of drought, the same deity had been chained and exposed to the sun for days in the courtyard of his temple in order that he might feel for himself the urgent need of rain. So when the Siamese need rain, they set out their idols in the blazing sun; but if they want dry weather, they unroof the temples and let the rain pour down on the idols. They think that the inconvenience to which the gods are thus subjected will induce them to grant the wishes of their worshippers. When the rice-crop is endangered by long drought, the governor of Battambang, a province of Siam, goes in great state to a certain pagoda and prays to Buddha for rain. Then, accompanied by his suite and followed by an enormous crowd, he adjourns to a plain behind the pagoda. Here a dummy figure has been made up, dressed in bright colours, and placed in the middle of the plain. A wild music begins to play; maddened by the din of drums and cymbals and crackers, and goaded on by their drivers, the elephants charge down on the dummy and trample it to pieces. After this, Buddha will soon give rain.

The reader may smile at the meteorology of the Far East; but precisely similar modes of procuring rain have been resorted to in Christian Europe within our own lifetime. By the end of April 1893 there was great distress in Sicily for lack of water. The drought had lasted six months. Every day the sun rose and set in a sky of cloudless blue. The gardens of the Conca d'Oro, which surround Palermo with a magnificent belt of verdure, were withering. Food was becoming scarce. The people were in great alarm. All the most approved methods of procuring rain had been tried without effect. Processions had traversed the streets and the fields. Men, women, and children, telling their beads, had lain whole nights before the holy images. Consecrated candles had burned day and night in the churches. Palm branches, blessed on Palm Sunday, had been hung on the trees. At Solaparuta, in accordance with a very old custom, the dust swept from the churches on Palm Sunday had been spread on the fields. In ordinary years these holy sweepings preserve the crops; but that year, if you will believe me, they had no effect whatever. At Nicosia the inhabitants, bare-headed and bare-foot, carried the crucifixes through all the wards of the town and scourged each other with iron whips. It was all in vain. Even the great St. Francis of Paola himself, who annually performs the miracle of rain and is carried every spring through the market-gardens, either could not or would not help. Masses, vespers, concerts, illuminations, fire-works—nothing could move him. At last the peasants began to lose patience. Most of the saints were banished. At Palermo they dumped St. Joseph in a garden to see the state of things for himself, and they swore to leave him there in the sun till rain fell. Other saints were turned, like naughty children, with their faces to the wall. Others again, stripped of their beautiful robes, were exiled far from their parishes, threatened, grossly insulted, ducked in horse-ponds. At Caltanissetta the golden wings of St. Michael the Archangel were torn from his shoulders and replaced with wings of pasteboard; his purple mantle was taken away and a clout wrapt about him instead. At Licata the patron saint, St. Angelo, fared even worse, for he was left without any garments at all; he was reviled, he was put in irons, he was threatened

with drowning or hanging. "Rain or the rope!" roared the angry people at him, as they shook their fists in his face.

Another way of constraining the rain-god is to disturb him in his haunts. This seems to be the reason why rain is supposed to follow the troubling of a sacred spring. The Dards believe that if a cow-skin or anything impure is placed in certain springs, storms will follow. In the mountains of Farghana there was a place where rain began to fall as soon as anything dirty was thrown into a certain famous well. Again, in Tabaristan there was said to be a cave in the mountain of Tak which had only to be defiled by filth or milk for the rain to begin to fall, and to continue falling till the cave was cleansed. Gervasius mentions a spring, into which if a stone or a stick were thrown, rain would at once issue from it and drench the thrower. There was a fountain in Munster such that if it were touched or even looked at by a human being, it would at once flood the whole province with rain. In Normandy a wizard will sometimes repair to a spring, sprinkle flour on it, and strike the water with a hazel rod, while he chants his spell. A mist then rises from the spring and condenses in the shape of heavy clouds, which discharge volleys of hail on the orchards and corn-fields. When rain was long of coming in the Canary Islands, the priestesses used to beat the sea with rods to punish the water-spirit for his niggardliness. Among the natural curiosities of Annam are the caves of Chua-hang or Troc. You may sail into them in a boat underground for a distance of half a mile, and a little way further in you come to the remains of an ancient altar among magnificent stalactite columns. The Annamites worship the spirit of the cave and offer sacrifices at its mouth in time of drought. From all the villages in the neighbourhood come boats, the boatmen singing, "Let it rain! let it rain!" in time to the measured dip of their oars in the water. Arrived at the mouth of the cave, they offer rice and wine to the spirit, prostrating themselves four times before him. Then the master of the ceremonies recites a prayer, ties a written copy of it to the neck of a dog, and flings the animal into the stream which flows from the grotto. This is done in order to provoke the spirit of the cave to anger by defiling his pure water; for he will then send abundant rains to sweep far away the carcass of the dead dog which pollutes the sacred grotto.

Two hundred miles to the east of the land of the Huichol Indians in Mexico there is a sacred spring, and away to the west of their country stretches the Pacific Ocean. To ensure the fall of rain these Indians carry water from the spring to the sea, and an equal quantity of sea-water from the sea to the spring. The two waters thus transferred will, they think, feel strange in their new surroundings and will seek to return to their old homes. Hence they will pass in the shape of clouds across the Huichol country and meeting there will descend as rain.

Sometimes an appeal is made to the pity of the gods. When their corn is being burnt up by the sun, the Zulus look out for a "heaven bird," kill it, and throw it into a pool. Then the heaven melts with tenderness for the death of the bird; "it wails for it by raining, wailing a funeral wail." In Zululand women sometimes bury their children up to the neck in the ground, and then retiring to a distance keep up a dismal howl for a long time. The sky is supposed to melt with pity at the sight. Then the women dig the children out and feel sure that rain will soon follow. They say that they call to "the lord above" and ask him to send rain. If it comes they declare that "Usondo rains." In times of drought the Guanches of Teneriffe led their sheep to sacred ground, and there they separated the lambs from their dams, that their plaintive bleating might touch the heart of the god. In Kumaon a way of stopping rain is to pour hot oil in the left ear of a dog. The animal howls with pain, his howls are heard by Indra, and out of pity for the beast's sufferings the god stops the rain. Sometimes the Toradjas of Central Celebes attempt to procure rain as follows. They place the stalks of certain plants in water, saying, "Go and ask for rain, and so long as no rain falls I will not plant you again, but there shall you die." Also they string some fresh-water snails on a cord, and hang the cord on

a tree, and say to the snails, "Go and ask for rain, and so long as no rain comes, I will not take you back to the water." Then the snails go and weep and the gods take pity and send rain.

However, the foregoing ceremonies are religious rather than magical, since they involve an appeal to the compassion of higher powers. A peculiar mode of making rain was adopted by some of the heathen Arabs. They tied two sorts of bushes to the tails and hind legs of their cattle, and, setting fire to the bushes, drove the cattle to the top of a mountain, praying for rain. This may be, as Wellhausen suggests, an imitation of lightning on the horizon; but it may also be a way of threatening the sky, as some West African rain-makers put a pot of inflammable materials on the fire and blow up the flames, threatening that if heaven does not soon give rain they will send up a blaze which will set the sky on fire. In time of drought the priests of the Muyscas in New Granada ascended a mountain and there burned billets of wood smeared with resin. The ashes they scattered in the air, thinking thus to condense the clouds and bring rain.

Stones are often supposed to possess the property of bringing on rain, provided they be dipped in water or sprinkled with it, or treated in some other appropriate manner. In a Samoan village a certain stone was carefully housed as the representative of the rain-making god, and in time of drought his priests carried the stone in procession and dipped it in a stream. Among the Ta-ta-thi tribe of New South Wales, the rain-maker breaks off a piece of quartz-crystal and spits it towards the sky; the rest of the crystal he wraps in emu feathers, soaks both crystal and feathers in water, and carefully hides them. In the Keramin tribe of New South Wales the wizard retires to the bed of a creek, drops water on a round flat stone, then covers up and conceals it. Among some tribes of north-western Australia the rain-maker repairs to a piece of ground which is set apart for the purpose of rain-making. There he builds a heap of stones or sand, places on the top of it his magic stone, and walks or dances round the pile chanting his incantations for hours, till sheer exhaustion obliges him to desist, when his place is taken by his assistant. Water is sprinkled on the stone and huge fires are kindled. No layman may approach the sacred spot while the mystic ceremony is being performed.

When the Sulka of New Britain wish to procure rain they blacken stones with the ashes of certain fruits and set them out, along with certain other plants and buds, in the sun. Then a handful of twigs is dipped in water and weighted with stones, while a spell is chanted. After that rain should follow. In Manipur, on a lofty hill to the east of the capital, there is a stone which the popular imagination likens to an umbrella. When rain is wanted, the rajah fetches water from a spring below and sprinkles it on the stone. At Sagami in Japan there is a stone which draws down rain whenever water is poured on it. When the Wakondyo, a tribe of Central Africa, desire rain, they send to the Wawamba, who dwell at the foot of snowy mountains, and are the happy possessors of a "rain-stone." In consideration of a proper payment, the Wawamba wash the precious stone, anoint it with oil, and put it in a pot full of water. After that the rain cannot fail to come. In Behar people think to put an end to drought by keeping a holy stone named Náráyan-chakra in a vessel of water. The Turks of Armenia make rain by throwing pebbles into the water. At Egin the pebbles are hung in two bags in the Euphrates; there should be seventy thousand and one of them. At Myndus in Asia Minor the number of the stones used for this purpose is seventy-seven thousand, and each of them should be licked before it is cast into the sea. In some parts of Mongolia, when the people desire rain, they fasten a bezoar stone to a willow twig, and place it in pure water, uttering incantations or prayers at the same time. At Yakutsk all classes used firmly to believe they could make rain by means of one of these bezoar stones, provided it had really been found in the stomach of an animal, and the fiercer the beast the more powerful the charm. The rain-maker had to dip the stone in spring water just as the sun rose, and then holding it between the thumb and fore-finger of the right hand to present it to the luminary, after which he made three turns contrary to the direction of the sun. The virtue of a bezoar stone lasted only nine

days. Conversely, when Dr. Radloff's Mongolian guide wished to stop the rain, he tied a rock-crystal by a short string to a stick, held the stone over the fire, and then swung the stick about in all directions, while he chanted an incantation. Water is scarce with the fierce Apaches, who roam the arid wastes of Arizona and New Mexico; for springs are few and far between in these torrid wildernesses, where the intense heat would be unendurable were it not for the great dryness of the air. The stony beds of the streams are waterless in the plains; but if you ascend for some miles the profound cañons that worm their way into the heart of the wild and rugged mountains, you come in time to a current trickling over the sand, and a mile or two more will bring you to a stream of a tolerable size flowing over boulders and screened from the fierce sun by walls of rock that tower on either hand a thousand feet into the air, their parched sides matted with the fantastic forms of the prickly cactus, and their summits crested far overhead with pine woods, like a black fringe against the burning blue of the sky. In such a land we need not wonder that the thirsty Indians seek to procure rain by magic. They take water from a certain spring and throw it on a particular point high up on a rock; the welcome clouds then soon gather, and rain begins to fall. In the district of Varanda, in Armenia, there is a rock with a hole in it near a sacred place. Women light candles on the rock and pour water into the hole in order to bring on rain. And in the same district there is another rock on which water is poured and milk boiled as an offering in time of drought.

But customs of this sort are not confined to the wilds of Africa and Asia or the torrid deserts of Australia and the New World. They have been practised in the cool air and under the grey skies of Europe. There is a fountain called Barenton, of romantic fame, in those "wild woods of Broceliande," where, if legend be true, the wizard Merlin still sleeps his magic slumber in the hawthorn shade. Thither the Breton peasants used to resort when they needed rain. They caught some of the water in a tankard and threw it on a slab near the spring. On Snowdon there is a lonely tarn called Dulyn, or the Black Lake, lying "in a dismal dingle surrounded by high and dangerous rocks." A row of stepping-stones runs out into the lake, and if any one steps on the stones and throws water so as to wet the farthest stone, which is called the Red Altar, "it is but a chance that you do not get rain before night, even when it is hot weather."

In these cases it appears probable that, as in Samoa, the stone is regarded as more or less divine. This appears from the custom sometimes observed of dipping the cross in the Fountain of Barenton to procure rain, for this is plainly a Christian substitute for the old pagan way of throwing water on the stone. At various places in France it is, or used till lately to be, the practice to dip the image of a saint in water as a means of procuring rain. Thus, beside the old priory of Commagny, a mile or two to the south-west of Moulins-Engilbert, there is a spring of St. Gervais, whither the inhabitants go in procession to obtain rain or fine weather according to the needs of the crops. In times of great drought they throw into the basin of the fountain an ancient stone image of the saint that stands in a sort of niche from which the fountain flows. At Collobrières and Carpentras, both in Provence, a similar practice was observed with the images of St. Pons and St. Gens respectively. In several villages of Navarre prayers for rain used to be offered to St. Peter, and by way of enforcing them the villagers carried the image of the saint in procession to the river, where they thrice invited him to reconsider his resolution and to grant their prayers; then, if he was still obstinate, they plunged him in the water, despite the remonstrances of the clergy, who pleaded with as much truth as piety that a simple caution or admonition administered to the image would produce an equally good effect. After this the rain was sure to fall within twenty-four hours. Catholic countries do not enjoy a monopoly of making rain by ducking holy images in water. In Mingrelia, when the crops are suffering from want of rain, they take a particularly holy image and dip it in water every day till a shower falls; and in the Far East the Shans drench the images of Buddha with water when the rice is perishing of drought. In all such cases the

practice is probably at bottom a sympathetic charm, however it may be disguised under the appearance of a punishment or a threat.

The application of water to a miraculous stone is not the only way of securing its good offices in the making of rain. In the island of Uist, one of the Outer Hebrides, there is a stone cross opposite to St. Mary's church, which the natives used to call the Water-cross. When they needed rain, they set the cross up; and when enough rain had fallen, they laid it flat on the ground. In Aurora, one of the New Hebrides islands, the rain-maker puts a tuft of leaves of a certain plant in the hollow of a stone; over it he lays some branches of a pepper-tree pounded and crushed, and to these he adds a stone which is believed to possess the property of drawing down showers from the sky. All this he accompanies with incantations, and finally covers the whole mass up. In time it ferments, and steam, charged with magical virtue, goes up and makes clouds and rain. The wizard must be careful, however, not to pound the pepper too hard, as otherwise the wind might blow too strong. Sometimes the stone derives its magical virtue from its likeness to a real or imaginary animal. Thus, at Kota Gadang in Sumatra, there is a stone which, with the help of a powerful imagination, may perhaps be conceived to bear a faint and distant resemblance to a cat. Naturally, therefore, it possesses the property of eliciting showers from the sky, since in Sumatra, as we have seen, a real black cat plays a part in ceremonies for the production of rain. Hence the stone is sometimes smeared with the blood of fowls, rubbed, and incensed, while a charm is uttered over it. At Eneti, in Washington State, there is an irregular basaltic rock on which a face, said to be that of the thunder-bird, has been hammered. The Indians of the neighbourhood long believed that to shake the rock would cause rain by exciting the wrath of the thunder-bird.

Like other peoples, the Greeks and Romans sought to obtain rain by magic, when prayers and processions had proved ineffectual. For example, in Arcadia, when the corn and trees were parched with drought, the priest of Zeus dipped an oak branch into a certain spring on Mount Lycaeus. Thus troubled, the water sent up a misty cloud, from which rain soon fell upon the land. A similar mode of making rain is still practised, as we have seen, in Halmahera near New Guinea. The people of Crannon in Thessaly had a bronze chariot which they kept in a temple. When they desired a shower they shook the chariot and the shower fell. Probably the rattling of the chariot was meant to imitate thunder; we have already seen that mock thunder and lightning form part of a rain-charm in Russia and Japan. The legendary Salmoneus, King of Elis, made mock thunder by dragging bronze kettles behind his chariot, or by driving over a bronze bridge, while he hurled blazing torches in imitation of lightning. It was his impious wish to mimic the thundering car of Zeus as it rolled across the vault of heaven. Indeed he declared that he was actually Zeus, and caused sacrifices to be offered to himself as such.

Near a temple of Mars, outside the walls of Rome, there was kept a certain stone known as the *lapis manalis*. In time of drought the stone was dragged into Rome, and this was supposed to bring down rain immediately. There were Etruscan wizards who made rain or discovered springs of water, it is not certain which. They were thought to bring the rain or the water out of their bellies. The legendary Telchines in Rhodes are described as magicians who could change their shape and bring clouds, rain, and snow. The Athenians sacrificed boiled, not roast meat to the Seasons, begging them to avert drought and dry heat and to send due warmth and timely rain. This is an interesting example of the admixture of religion with sorcery, of sacrifice with magic. The Athenians dimly conceived that in some way the water in the pot would be transmitted through the boiled meat to the deities, and then sent down again by them in the form of rain. In a similar spirit the prudent Greeks made it a rule always to pour honey, but never wine, on the altars of the sun-god, pointing out, with great show of reason, how expedient it was that a god on whom so much depended should keep strictly sober.

§ 3. *The Magical Control of the Sun*

The rule of total abstinence which Greek prudence and piety imposed on the sun-god introduces us to a second class of natural phenomena which primitive man commonly supposes to be in some degree under his control and dependent on his exertions. As the magician thinks he can make rain, so he fancies he can cause the sun to shine, and can hasten or stay its going down. At an eclipse the Ojebways used to imagine that the sun was being extinguished. So they shot fire-tipped arrows in the air, hoping thus to rekindle his expiring light. The Sencis of eastern Peru also shot burning arrows at the sun during an eclipse, but apparently they did this not so much to relight his lamp as to drive away a savage beast with which they supposed him to be struggling. Conversely during an eclipse of the moon some Indian tribes of the Orinoco used to bury lighted brands in the ground; because, said they, if the moon were to be extinguished, all fire on earth would be extinguished with her, except such as was hidden from her sight. During an eclipse of the sun the Kamtchatkans were wont to bring out fire from their huts and pray the great luminary to shine as before. But the prayer addressed to the sun shews that this ceremony was religious rather than magical. Purely magical, on the other hand, was the ceremony observed on similar occasions by the Chilcotin Indians of north-western America. Men and women tucked up their robes, as they do in travelling, and then leaning on staves, as if they were heavy laden, they continued to walk in a circle till the eclipse was over. Apparently they thought thus to support the failing steps of the sun as he trod his weary round in the sky. Similarly in ancient Egypt the king, as the representative of the sun, walked solemnly round the walls of a temple in order to ensure that the sun should perform his daily journey round the sky without the interruption of an eclipse or other mishap. And after the autumnal equinox the ancient Egyptians held a festival called "the nativity of the sun's walking-stick," because, as the luminary declined daily in the sky, and his light and heat diminished, he was supposed to need a staff on which to lean. In New Caledonia when a wizard desires to make sunshine, he takes some plants and corals to the burial-ground, and fashions them into a bundle, adding two locks of hair cut from a living child of his family, also two teeth or an entire jawbone from the skeleton of an ancestor. He then climbs a mountain whose top catches the first rays of the morning sun. Here he deposits three sorts of plants on a flat stone, places a branch of dry coral beside them, and hangs the bundle of charms over the stone. Next morning he returns to the spot and sets fire to the bundle at the moment when the sun rises from the sea. As the smoke curls up, he rubs the stone with the dry coral, invokes his ancestors and says: "Sun! I do this that you may be burning hot, and eat up all the clouds in the sky." The same ceremony is repeated at sunset.

The New Caledonians also make a drought by means of a disc-shaped stone with a hole in it. At the moment when the sun rises, the wizard holds the stone in his hand and passes a burning brand repeatedly into the hole, while he says: "I kindle the sun, in order that he may eat up the clouds and dry up our land, so that it may produce nothing." When the sun rises behind clouds—a rare event in the bright sky of southern Africa—the Sun clan of the Bechuanas say that he is grieving their heart. All work stands still, and all the food of the previous day is given to matrons or old women. They may eat it and may share it with the children they are nursing, but no one else may taste it. The people go down to the river and wash themselves all over. Each man throws into the river a stone taken from his domestic hearth, and replaces it with one picked up in the bed of the river. On their return to the village the chief kindles a fire in his hut, and all his subjects come and get a light from it. A general dance follows. In these cases it seems that the lighting of the flame on earth is supposed to rekindle the solar fire. Such a belief comes naturally to people who, like the Sun clan of the Bechuanas, deem themselves the veritable kinsmen of the sun. When the sun is obscured by clouds, the Lengua Indians of the Gran Chaco hold burning sticks towards him to encourage the luminary, or rather perhaps to rekindle his seemingly expiring light. The Banks Islanders

make sunshine by means of a mock sun. They take a very round stone, called a *vat loa* or sunstone, wind red braid about it, and stick it with owls' feathers to represent rays, singing the proper spell in a low voice. Then they hang it on some high tree, such as a banyan or a casuarina, in a sacred place. Or the stone is laid on the ground with white rods radiating from it to imitate sunbeams. Sometimes the mode of making sunshine is the converse of that of making rain. Thus we have seen that a white or red victim is sacrificed for sunshine, while a black one is sacrificed for rain. Some of the New Caledonians drench a skeleton to make rain, but burn it to make sunshine.

When the mists lay thick on the Sierras of Peru, the Indian women used to rattle the silver and copper ornaments which they wore on their breasts, and they blew against the fog, hoping thus to disperse it and make the sun shine through. Another way of producing the same effect was to burn salt or scatter ashes in the air. The Guarayo Indians also threw ashes in the air for the sake of clearing up the clouded evening sky. In Car Nicobar, when it has rained for several days without stopping, the natives roll long bamboos in leaves of various kinds and set them up in the middle of the village. They call these bamboos "rods inviting the sun to shine." The offering made by the Brahman in the morning is supposed to produce the sun, and we are told that "assuredly it would not rise, were he not to make that offering." The ancient Mexicans conceived the sun as the source of all vital force; hence they named him *Ipalnemohuani*, "He by whom men live." But if he bestowed life on the world, he needed also to receive life from it. And as the heart is the seat and symbol of life, bleeding hearts of men and animals were presented to the sun to maintain him in vigour and enable him to run his course across the sky. Thus the Mexican sacrifices to the sun were magical rather than religious, being designed, not so much to please and propitiate him, as physically to renew his energies of heat, light, and motion. The constant demand for human victims to feed the solar fire was met by waging war every year on the neighbouring tribes and bringing back troops of captives to be sacrificed on the altar. Thus the ceaseless wars of the Mexicans and their cruel system of human sacrifices, the most monstrous on record, sprang in great measure from a mistaken theory of the solar system. No more striking illustration could be given of the disastrous consequences that may flow in practice from a purely speculative error. The ancient Greeks believed that the sun drove in a chariot across the sky; hence the Rhodians, who worshipped the sun as their chief deity, annually dedicated a chariot and four horses to him, and flung them into the sea for his use. Doubtless they thought that after a year's work his old horses and chariot would be worn out. From a like motive, probably, the idolatrous kings of Judah dedicated chariots and horses to the sun, and the Spartans, Persians, and Massagetae sacrificed horses to him. The Spartans performed the sacrifice on the top of Mount Taygetus, the beautiful range behind which they saw the great luminary set every night. It was as natural for the inhabitants of the valley of Sparta to do this as it was for the islanders of Rhodes to throw the chariot and horses into the sea, into which the sun seemed to them to sink at evening. For thus, whether on the mountain or in the sea, the fresh horses stood ready for the weary god where they would be most welcome, at the end of his day's journey.

As some people think they can light up the sun or speed him on his way, so others fancy they can retard or stop him. In a pass of the Peruvian Andes stand two ruined towers on opposite hills. Iron hooks are clamped into their walls for the purpose of stretching a net from one tower to the other. The net is intended to catch the sun. On a small hill in Fiji grew a patch of reeds, and travellers who feared to be belated used to tie the tops of a handful of reeds together to prevent the sun from going down. As to this my late friend the Rev. Lorimer Fison wrote to me: "I have often seen the reeds tied together to keep the sun from going down. The place is on a hill in Lakomba, one of the eastern islands of the Fijian group. It is

on the side—not on the top—of the hill. The reeds grow on the right side of the path. I asked an old man the meaning of the practice, and he said, ‘We used to think the sun would see us, and know we wanted him not to go down till we got past on our way home again.’” But perhaps the original intention was to entangle the sun in the reeds, just as the Peruvians try to catch him in the net. Stories of men who have caught the sun in a noose are widely spread.

When the sun is going southward in the autumn, and sinking lower and lower in the Arctic sky, the Esquimaux of Iglulik play the game of cat’s cradle in order to catch him in the meshes of the string and so prevent his disappearance. On the contrary, when the sun is moving northward in the spring, they play the game of cup-and-ball to hasten his return.

Means like those which the Esquimaux take to stop the departing sun are adopted by the Ewe negroes of the Slave Coast to catch a runaway slave. They take two sticks, unite them by a string, and then wind the string round one of them, while at the same time they pronounce the name of the fugitive. When the string is quite wound about the stick, the runaway will be bound fast and unable to stir. In New Guinea, when a Motu man is hunting or travelling late in the afternoon and fears to be overtaken by darkness, he will sometimes take a piece of twine, loop it, and look through the loop at the sun. Then he pulls the loop into a knot and says, “Wait until we get home, and we will give you the fat of a pig.” After that he passes the string to the man behind him, and then it is thrown away. In a similar case a Motumotu man of New Guinea says, “Sun, do not be in a hurry; just wait until I get to the end.” And the sun waits. The Motumotu do not like to eat in the dark; so if the food is not yet ready, and the sun is sinking, they say, “Sun, stop; my food is not ready, and I want to eat by you.” Here the looking at the sinking sun through a loop and then drawing the loop into a knot appears to be a purely magical ceremony designed to catch the sun in the mesh; but the request that the luminary would kindly stand still till home is reached or the dinner cooked, coupled with the offer of a slice of fat bacon as an inducement to him to comply with the request, is thoroughly religious. Jerome of Prague, travelling among the heathen Lithuanians early in the fifteenth century, found a tribe who worshipped the sun and venerated a large iron hammer. The priests told him that once the sun had been invisible for several months, because a powerful king had shut it up in a strong tower; but the signs of the zodiac had broken open the tower with this very hammer and released the sun. Therefore they adored the hammer. When an Australian blackfellow wishes to stay the sun from going down till he gets home, he puts a sod in the fork of a tree, exactly facing the setting sun. For the same purpose an Indian of Yucatan, journeying westward, places a stone in a tree or pulls out some of his eyelashes and blows them towards the sun. When the Golos, a tribe of the Bahr-el-Ghazal, are on the march, they will sometimes take a stone or a small ant-heap, about the size of a man’s head, and place it in the fork of a tree in order to retard the sunset. South African natives, in travelling, will put a stone in a fork of a tree or place some grass on the path with a stone over it, believing that this will cause their friends to keep the meal waiting till their arrival. In this, as in previous examples, the purpose apparently is to retard the sun. But why should the act of putting a stone or a sod in a tree be supposed to effect this? A partial explanation is suggested by another Australian custom. In their journeys the natives are accustomed to place stones in trees at different heights from the ground in order to indicate the height of the sun in the sky at the moment when they passed the particular tree. Those who follow are thus made aware of the time of day when their friends in advance passed the spot. Possibly the natives, thus accustomed to mark the sun’s progress, may have slipped into the confusion of imagining that to mark the sun’s progress was to arrest it at the point marked. On the other hand, to make it go down faster, the Australians throw sand into the air and blow with their mouths towards the sun, perhaps to waft the lingering orb westward and bury it under the sands into which it appears to sink at night.

As some people imagine they can hasten the sun, so others fancy they can jog the tardy moon. The natives of German New Guinea reckon months by the moon, and some of them have been known to throw stones and spears at the moon, in order to accelerate its progress and so to hasten the return of their friends, who were away from home for twelve months working on a tobacco plantation. The Malays think that a bright glow at sunset may throw a weak person into a fever. Hence they attempt to extinguish the glow by spitting out water and throwing ashes at it. The Shuswap Indians of British Columbia believe that they can bring on cold weather by burning the wood of a tree that has been struck by lightning. The belief may be based on the observation that in their country cold follows a thunder-storm. Hence in spring, when these Indians are travelling over the snow on high ground, they burn splinters of such wood in the fire in order that the crust of the snow may not melt.

§ 4. *The Magical Control of the Wind*

Once more, the savage thinks he can make the wind to blow or to be still. When the day is hot and a Yakut has a long way to go, he takes a stone which he has chanced to find in an animal or fish, winds a horse-hair several times round it, and ties it to a stick. He then waves the stick about, uttering a spell. Soon a cool breeze begins to blow. In order to procure a cool wind for nine days the stone should first be dipped in the blood of a bird or beast and then presented to the sun, while the sorcerer makes three turns contrary to the course of the luminary. The Wind clan of the Omahas flap their blankets to start a breeze which will drive away the mosquitoes. When a Haida Indian wishes to obtain a fair wind, he fasts, shoots a raven, sings it in the fire, and then going to the edge of the sea sweeps it over the surface of the water four times in the direction in which he wishes the wind to blow. He then throws the raven behind him, but afterwards picks it up and sets it in a sitting posture at the foot of a spruce-tree, facing towards the required wind. Propping its beak open with a stick, he requests a fair wind for a certain number of days; then going away he lies covered up in his mantle till another Indian asks him for how many days he has desired the wind, which question he answers. When a sorcerer in New Britain wishes to make a wind blow in a certain direction, he throws burnt lime in the air, chanting a song all the time. Then he waves sprigs of ginger and other plants about, throws them up and catches them. Next he makes a small fire with these sprigs on the spot where the lime has fallen thickest, and walks round the fire chanting. Lastly, he takes the ashes and throws them on the water. If a Hottentot desires the wind to drop, he takes one of his fattest skins and hangs it on the end of a pole, in the belief that by blowing the skin down the wind will lose all its force and must itself fall. Fuegian wizards throw shells against the wind to make it drop. On the other hand, when a Persian peasant desires a strong wind to winnow his corn, he rubs a kind of bastard saffron and throws it up into the air; after that the breeze soon begins to blow. Some of the Indians of Canada believed that the winds were caused by a fish like a lizard. When one of these fish had been caught, the Indians advised the Jesuit missionaries to put it back into the river as fast as possible in order to calm the wind, which was contrary. If a Cherokee wizard desires to turn aside an approaching storm, he faces it and recites a spell with outstretched hand. Then he gently blows towards the quarter to which he wishes it to go, waving his hand in the same direction as if he were pushing away the storm. The Ottawa Indians fancied they could calm a tempest by relating the dreams they had dreamed during their fast, or by throwing tobacco on the troubled water. When the Kei Islanders wish to obtain a favourable wind for their friends at sea, they dance in a ring, both men and women, swaying their bodies to and fro, while the men hold handkerchiefs in their hands. In Melanesia there are everywhere weather-doctors who can control the powers of the air and are willing to supply wind or calm in return for a proper remuneration. For instance, in Santa Cruz the wizard makes wind by waving the branch of a tree and chanting the appropriate charm. In another Melanesian island

a missionary observed a large shell filled with earth, in which an oblong stone, covered with red ochre, was set up, while the whole was surrounded by a fence of sticks strengthened by a creeper which was twined in and out the uprights. On asking a native what these things meant, he learned that the wind was here fenced or bound round, lest it should blow hard; the imprisoned wind would not be able to blow again until the fence that kept it in should have rotted away. In South Africa, when the Caffres wish to stop a high wind, they call in a “wind-doctor,” who takes a pot with a spout and points the spout towards the quarter from which the wind is blowing. He then places medicines and some of the dust blown by the wind in the vessel, and seals up every opening of the pot with damp clay. Thereupon the doctor declares, “The head of the wind is now in my pot, and the wind will cease to blow.” The natives of the island of Bibili, off German New Guinea, are reputed to make wind by blowing with their mouths. In stormy weather the Bogadjim people say, “The Bibili folk are at it again, blowing away.” Another way of making wind which is practised in New Guinea is to strike a “wind-stone” lightly with a stick; to strike it hard would bring on a hurricane. So in Scotland witches used to raise the wind by dipping a rag in water and beating it thrice on a stone, saying:

*“I knok this rag upone this stane
To raise the wind in the divellis name,
It sall not lye till I please againe.”*

At Victoria, the capital of Vancouver’s Island, there are a number of large stones not far from what is called the Battery. Each of them represents a certain wind. When an Indian wants any particular wind, he goes and moves the corresponding stone a little; were he to move it too much, the wind would blow very hard. The natives of Murray Island in Torres Straits used to make a great wind blow from the south-east by pointing coco-nut leaves and other plants at two granitic boulders on the shore. So long as the leaves remained there the wind sat in that quarter. But, significantly enough, the ceremony was only performed during the prevalence of the south-east monsoon. The natives knew better than to try to raise a south-east wind while the north-west monsoon was blowing. On the altar of Fladda’s chapel, in the island of Fladdahuan (one of the Hebrides), lay a round bluish stone which was always moist. Windbound fishermen walked sunwise round the chapel and then poured water on the stone, whereupon a favourable breeze was sure to spring up. In Gigha, an island off the western coast of Argyleshire, there is a well named Tobar-rath Bhuathaig or “The lucky well of Beathag,” which used to be famous for its power of raising the wind. It lies at the foot of a hill facing north-east near an isthmus called Tarbat. Six feet above where the water gushes out there is a heap of stones which forms a cover to the sacred spring. When a person wished for a fair wind, either to leave the island or to bring home his absent friends, this part was opened with great solemnity, the stones were carefully removed, and the well cleaned with a wooden dish or a clam shell. This being done, the water was thrown several times in the direction from which the wished-for wind was to blow, and this action was accompanied by a certain form of words which the person repeated every time he threw the water. When the ceremony was over, the well was again carefully shut up to prevent fatal consequences, it being firmly believed that, were the place left open, a storm would arise which would overwhelm the whole island. The Esthonians have various odd ways of raising a wind. They scratch their finger, or hang up a serpent, or strike an axe into a house-beam in the direction from which they wish the wind to blow, while at the same time they whistle. The notion is that the gentle wind will not let an innocent being or even a beam suffer without coming and breathing softly to assuage the pain.

In Mabuiag, an island between New Guinea and Australia, there were men whose business was to make wind for such as wanted it. When engaged in his professional duties the wizard painted himself black behind and red on his face and chest. The red in front typified the red

cloud of morning, the black represented the dark blue sky of night. Thus arrayed he took some bushes, and, when the tide was low, fastened them at the edge of the reef so that the flowing tide made them sway backwards and forwards. But if only a gentle breeze was needed, he fastened them nearer to the shore. To stop the wind he again painted himself red and black, the latter in imitation of the clear blue sky, and then removing the bushes from the reef he dried and burnt them. The smoke as it curled up was believed to stop the wind: "Smoke he go up and him clear up on top." In some islands of Torres Straits the wizard made wind by whirling a bull-roarer; the booming sound of the instrument probably seemed to him like the roar or the whistling of the wind. Amongst the Kurnai tribe of Gippsland in Victoria there used to be a noted raiser of storms who went by the name of Bunjil Kraura or "Great West Wind." This wind makes the tall slender trees of the Gippsland forests to rock and sway so that the natives could not climb them in search of opossums. Hence the people were forced to propitiate Bunjil Kraura by liberal offerings of weapons and rugs whenever the tree-tops bent before a gale. Having received their gifts, Bunjil Kraura would bind his head with swathes of stringy bark, and lull the storm to rest with a song which consisted of the words "Wear—string—Westwind," repeated again and again. Apparently the wizard identified himself with the wind, and fancied that he could bind it by tying string round his own head. The Kwakiutl Indians of British Columbia, as we have seen, believe that twins can summon any wind by merely moving their hands. In Greenland a woman in child-bed and for some time after delivery is supposed to possess the power of laying a storm. She has only to go out of doors, fill her mouth with air, and coming back into the house blow it out again. In antiquity there was a family at Corinth which enjoyed the reputation of being able to still the raging wind; but we do not know in what manner its members exercised a useful function, which probably earned for them a more solid recompense than mere repute among the seafaring population of the isthmus. Even in Christian times, under the reign of Constantine, a certain Sopater suffered death at Constantinople on a charge of binding the winds by magic, because it happened that the corn-ships of Egypt and Syria were detained afar off by calms or head-winds, to the rage and disappointment of the hungry Byzantine rabble. An ancient charm to keep storms from damaging the crops was to bury a toad in a new earthen vessel in the middle of the field. Finnish wizards used to sell wind to storm-stayed mariners. The wind was enclosed in three knots; if they undid the first knot, a moderate wind sprang up; if the second, it blew half a gale; if the third, a hurricane. Indeed the Esthonians, whose country is divided from Finland only by an arm of the sea, still believe in the magical powers of their northern neighbours. The bitter winds that blow in spring from the north and north-east, bringing ague and rheumatic inflammations in their train, are set down by the simple Esthonian peasantry to the machinations of the Finnish wizards and witches. In particular they regard with special dread three days in spring to which they give the name of Days of the Cross; one of them falls on the Eve of Ascension Day. The people in the neighbourhood of Fellin fear to go out on these days lest the cruel winds from Lappland should smite them dead. A popular Esthonian song runs:

*"Wind of the Cross! rushing and mighty!
Heavy the blow of thy wings sweeping past!
Wild wailing wind of misfortune and sorrow,
Wizards of Finland ride by on the blast."*

It is said, too, that sailors, beating up against the wind in the Gulf of Finland, sometimes see a strange sail heave in sight astern and overhaul them hand over hand. On she comes with a cloud of canvas—all her studding-sails out—right in the teeth of the wind, forging her way through the foaming billows, dashing back the spray in sheets from her cutwater, every sail

swollen to bursting, every rope strained to cracking. Then the sailors know that she hails from Finland.

The art of tying up the wind in three knots, so that the more knots are loosed the stronger will blow the wind, has been attributed to wizards in Lappland and to witches in Shetland, Lewis, and the Isle of Man. Shetland seamen still buy winds in the shape of knotted handkerchiefs or threads from old women who claim to rule the storms. There are said to be ancient crones in Lerwick now who live by selling wind. In the early part of the nineteenth century Sir Walter Scott visited one of these witches at Stromness in the Orkneys. He says: "We clomb, by steep and dirty lanes, an eminence rising above the town, and commanding a fine view. An old hag lives in a wretched cabin on this height, and subsists by selling winds. Each captain of a merchantman, between jest and earnest, gives the old woman sixpence, and she boils her kettle to procure a favourable gale. She was a miserable figure; upwards of ninety, she told us, and dried up like a mummy. A sort of clay-coloured cloak, folded over her head, corresponded in colour to her corpse-like complexion. Fine light-blue eyes, and nose and chin that almost met, and a ghastly expression of cunning, gave her quite the effect of Hecate." A Norwegian witch has boasted of sinking a ship by opening a bag in which she had shut up a wind. Ulysses received the winds in a leathern bag from Aeolus, King of the Winds.

The Motumotu in New Guinea think that storms are sent by an Oiabu sorcerer; for each wind he has a bamboo which he opens at pleasure. On the top of Mount Agu in Togo, a district of German West Africa, resides a fetish called Bagba, who is supposed to control the wind and the rain. His priest is said to keep the winds shut up in great pots.

Often the stormy wind is regarded as an evil being who may be intimidated, driven away, or killed. When the darkening of the sky indicates the approach of a tornado, a South African magician will repair to a height whither he collects as many people as can be hastily summoned to his assistance. Directed by him, they shout and bellow in imitation of the gust as it swirls roaring about the huts and among the trees of the forest. Then at a signal they mimic the crash of the thunder, after which there is a dead silence for a few seconds; then follows a screech more piercing and prolonged than any that preceded, dying away in a tremulous wail. The magician fills his mouth with a foul liquid which he squirts in defiant jets against the approaching storm as a kind of menace or challenge to the spirit of the wind; and the shouting and wailing of his assistants are meant to frighten the spirit away. The performance lasts until the tornado either bursts or passes away in another direction. If it bursts, the reason is that the magician who sent the storm was more powerful than he who endeavoured to avert it. When storms and bad weather have lasted long and food is scarce with the Central Esquimaux, they endeavour to conjure the tempest by making a long whip of seaweed, armed with which they go down to the beach and strike out in the direction of the wind, crying, "*Taba* (it is enough)!" Once when north-westerly winds had kept the ice long on the coast and food was becoming scarce, the Esquimaux performed a ceremony to make a calm. A fire was kindled on the shore, and the men gathered round it and chanted. An old man then stepped up to the fire and in a coaxing voice invited the demon of the wind to come under the fire and warm himself. When he was supposed to have arrived, a vessel of water, to which each man present had contributed, was thrown on the flames by an old man, and immediately a flight of arrows sped towards the spot where the fire had been. They thought that the demon would not stay where he had been so badly treated. To complete the effect, guns were discharged in various directions, and the captain of a European vessel was invited to fire on the wind with cannon. On the twenty-first of February 1883 a similar ceremony was performed by the Esquimaux of Point Barrow, Alaska, with the intention of killing the spirit of the wind. Women drove the demon from their houses with clubs and knives, with which they made passes in the air; and the men, gathering round a fire, shot him with their rifles and

crushed him under a heavy stone the moment that steam rose in a cloud from the smouldering embers, on which a tub of water had just been thrown.

In ancient India the priest was directed to confront a storm, armed to the teeth with a bludgeon, a sword, and a firebrand, while he chanted a magical lay. During a tremendous hurricane the drums of Kadouma, near the Victoria Nyanza, were heard to beat all night. When next morning a missionary enquired the cause, he was told that the sound of the drums is a charm against storms. The Sea Dyaks and Kayans of Borneo beat gongs when a tempest is raging; but the Dyaks, and perhaps the Kayans also, do this, not so much to frighten away the spirit of the storm, as to apprise him of their whereabouts, lest he should inadvertently knock their houses down. Heard at night above the howling of the storm, the distant boom of the gongs has a weird effect; and sometimes, before the notes can be distinguished for the wind and rain, they strike fear into a neighbouring village; lights are extinguished, the women are put in a place of safety, and the men stand to their arms to resist an attack. Then with a lull in the wind the true nature of the gong-beating is recognised, and the alarm subsides.

On calm summer days in the Highlands of Scotland eddies of wind sometimes go past, whirling about dust and straws, though not another breath of air is stirring. The Highlanders think that the fairies are in these eddies carrying away men, women, children, or animals, and they will fling their left shoe, or their bonnet, or a knife, or earth from a mole-hill at the eddy to make the fairies drop their booty. When a gust lifts the hay in the meadow, the Breton peasant throws a knife or a fork at it to prevent the devil from carrying off the hay. Similarly in the Esthonian island of Oesel, when the reapers are busy among the corn and the wind blows about the ears that have not yet been tied into sheaves, the reapers slash at it with their sickles. The custom of flinging a knife or a hat at a whirlwind is observed alike by German, Slavonian, and Esthonian rustics; they think that a witch or wizard is riding on the blast, and that the knife, if it hits the witch, will be reddened by her blood or will disappear altogether, sticking in the wound it has inflicted. Sometimes Esthonian peasants run shrieking and shouting behind a whirlwind, hurling sticks and stones into the flying dust. The Lengua Indians of the Gran Chaco ascribe the rush of a whirlwind to the passage of a spirit and they fling sticks at it to frighten it away. When the wind blows down their huts, the Payaguas of South America snatch up firebrands and run against the wind, menacing it with the blazing brands, while others beat the air with their fists to frighten the storm. When the Guaycurus are threatened by a severe storm, the men go out armed, and the women and children scream their loudest to intimidate the demon. During a tempest the inhabitants of a Batta village in Sumatra have been seen to rush from their houses armed with sword and lance. The rajah placed himself at their head, and with shouts and yells they hewed and hacked at the invisible foe. An old woman was observed to be specially active in the defence of her house, slashing the air right and left with a long sabre. In a violent thunderstorm, the peals sounding very near, the Kayans of Borneo have been seen to draw their swords threateningly half out of their scabbards, as if to frighten away the demons of the storm. In Australia the huge columns of red sand that move rapidly across a desert tract are thought by the natives to be spirits passing along. Once an athletic young black ran after one of these moving columns to kill it with boomerangs. He was away two or three hours, and came back very weary, saying he had killed Koochee (the demon), but that Koochee had growled at him and he must die. Of the Bedouins of eastern Africa it is said that "no whirlwind ever sweeps across the path without being pursued by a dozen savages with drawn creeses, who stab into the centre of the dusty column in order to drive away the evil spirit that is believed to be riding on the blast."

In the light of these examples a story told by Herodotus, which his modern critics have treated as a fable, is perfectly credible. He says, without however vouching for the truth of the tale, that once in the land of the Psylli, the modern Tripoli, the wind blowing from the

Sahara had dried up all the water-tanks. So the people took counsel and marched in a body to make war on the south wind. But when they entered the desert the simoom swept down on them and buried them to a man. The story may well have been told by one who watched them disappearing, in battle array, with drums and cymbals beating, into the red cloud of whirling sand.

VI. Magicians As Kings

The foregoing evidence may satisfy us that in many lands and many races magic has claimed to control the great forces of nature for the good of man. If that has been so, the practitioners of the art must necessarily be personages of importance and influence in any society which puts faith in their extravagant pretensions, and it would be no matter for surprise if, by virtue of the reputation which they enjoy and of the awe which they inspire, some of them should attain to the highest position of authority over their credulous fellows. In point of fact magicians appear to have often developed into chiefs and kings. Not that magic is the only or perhaps even the main road by which men have travelled to a throne. The lust of power, the desire to domineer over our fellows, is among the commonest and the strongest of human passions, and no doubt men of a masterful character have sought to satisfy it in many different ways and have attained by many different means to the goal of their ambition. The sword, for example, in a strong hand has unquestionably done for many what the magician's wand in a deft hand appears to have done for some. He who investigates the history of institutions should constantly bear in mind the extreme complexity of the causes which have built up the fabric of human society, and should be on his guard against a subtle danger incidental to all science, the tendency to simplify unduly the infinite variety of the phenomena by fixing our attention on a few of them to the exclusion of the rest. The propensity to excessive simplification is indeed natural to the mind of man, since it is only by abstraction and generalisation, which necessarily imply the neglect of a multitude of particulars, that he can stretch his puny faculties so as to embrace a minute portion of the illimitable vastness of the universe. But if the propensity is natural and even inevitable, it is nevertheless fraught with peril, since it is apt to narrow and falsify our conception of any subject under investigation. To correct it partially—for to correct it wholly would require an infinite intelligence—we must endeavour to broaden our views by taking account of a wide range of facts and possibilities; and when we have done so to the utmost of our power, we must still remember that from the very nature of things our ideas fall immeasurably short of the reality.

In no branch of learning, perhaps, has this proneness to an attractive but fallacious simplicity wrought more havoc than in the investigation of the early history of mankind; in particular, the excesses to which it has been carried have done much to discredit the study of primitive mythology and religion. Students of these subjects have been far too ready to pounce on any theory which adequately explains some of the facts, and forthwith to stretch it so as to cover them all; and when the theory, thus unduly strained, has broken, as was to be expected, in their unskilful hands, they have pettishly thrown it aside in disgust instead of restricting it, as they should have done from the outset, to the particular class of facts to which it is really applicable. So it fared in our youth with the solar myth theory, which after being unreasonably exaggerated by its friends has long been quite as unreasonably rejected altogether by its adversaries; and in more recent times the theories of totemism, magic, and taboo, to take only a few conspicuous examples, have similarly suffered from the excessive zeal of injudicious advocates. This instability of judgment, this tendency of anthropological opinion to swing to and fro from one extreme to another with every breath of new discovery, is perhaps the principal reason why the whole study is still viewed askance by men of sober and cautious temper, who naturally look with suspicion on idols that are set up and worshipped one day only to be knocked down and trampled under foot the next. To these cool observers Max Müller and the rosy Dawn in the nineteenth century stand on the same dusty shelf with Jacob Bryant and Noah's ark in the eighteenth, and they expect with a

sarcastic smile the time when the fashionable anthropological topics of the present day will in their turn be consigned to the same peaceful limbo of forgotten absurdities. It is not for the anthropologist himself to anticipate the verdict of posterity on his labours; still it is his humble hope that the facts which he has patiently amassed will be found sufficiently numerous and solid to bear the weight of some at least of the conclusions which he rests upon them, so that these can never again be lightly tossed aside as the fantastic dreams of a mere bookish student. At the same time, if he is wise, he will be forward to acknowledge and proclaim that our hypotheses at best are but partial, not universal, solutions of the manifold problems which confront us, and that in science as in daily life it is vain to look for one key to open all locks.

Therefore, to revert to our immediate subject, in putting forward the practice of magic as an explanation of the rise of monarchy in some communities, I am far from thinking or suggesting that it can explain the rise of it in all, or, in other words, that kings are universally the descendants or successors of magicians; and if any one should hereafter, as is likely enough, either enunciate such a theory or attribute it to me, I desire to enter my caveat against it in advance. To enumerate and describe all the modes in which men have pushed, or fought, or wormed their way by force or by fraud, by their own courage and wisdom or by the cowardice and folly of others, to supreme power, might furnish the theme of a political treatise such as I have no pretension to write; for my present purpose it suffices if I can trace the magician's progress in some savage and barbarous tribes from the rank of a sorcerer to the dignity of a king. The facts which I am about to lay before the reader seem to exhibit various steps of this development from simple conjuring up to conjuring compounded with despotism.

Let us begin by looking at the lowest race of men as to whom we possess comparatively full and accurate information, the aborigines of Australia. These savages are ruled neither by chiefs nor kings. So far as their tribes can be said to have a political constitution, it is a democracy or rather an oligarchy of old and influential men, who meet in council and decide on all measures of importance to the practical exclusion of the younger men. Their deliberative assembly answers to the senate of later times: if we had to coin a word for such a government of elders we might call it a *gerontocracy*. The elders who in aboriginal Australia thus meet and direct the affairs of their tribe appear to be for the most part the headmen of their respective totem clans. Now in Central Australia, where the desert nature of the country and the almost complete isolation from foreign influences have retarded progress and preserved the natives on the whole in their most primitive state, the headmen of the various totem clans are charged with the important task of performing magical ceremonies for the multiplication of the totems, and as the great majority of the totems are edible animals or plants, it follows that these men are commonly expected to provide the people with food by means of magic. Others have to make the rain to fall or to render other services to the community. In short, among the tribes of Central Australia the headmen are public magicians. Further, their most important function is to take charge of the sacred storehouse, usually a cleft in the rocks or a hole in the ground, where are kept the holy stones and sticks (*churinga*) with which the souls of all the people, both living and dead, are apparently supposed to be in a manner bound up. Thus while the headmen have certainly to perform what we should call civil duties, such as to inflict punishment for breaches of tribal custom, their principal functions are sacred or magical.

Again, in the tribes of South-Eastern Australia the headman was often, sometimes invariably, a magician. Thus in the southern Wiradjuri tribe the headman was always a wizard or a medicine-man. There was one for each local division. He called the people together for the initiation ceremonies or to discuss matters of public importance. In the Yerkla-mining tribe

the medicine-men are the headmen; they are called *Mobung-bai*, from *mobung*, "magic." They decide disputes, arrange marriages, conduct the ceremonies of initiation, and in certain circumstances settle the formalities to be observed in ordeals of battle. "In fact, they wield authority in the tribe, and give orders where others only make requests." Again, in the Yuin tribe there was a headman for each local division, and in order to be fitted for his office he had, among other qualifications, to be a medicine-man; above all he must be able to perform magical feats at the initiation ceremonies. The greatest headman of all was he who on these occasions could bring up the largest number of things out of his inside. In fact the budding statesman and king must be first and foremost a conjuror in the most literal sense of the word. Some forty or fifty years ago the principal headman of the Dieri tribe was a certain Jalina piramurana, who was known among the colonists as the Frenchman on account of his polished manners. He was not only a brave and skilful warrior, but also a powerful medicine-man, greatly feared by the neighbouring tribes, who sent him presents even from a distance of a hundred miles. He boasted of being the "tree of life," for he was the head of a totem consisting of a particular sort of seed which forms at certain times the chief vegetable food of these tribes. His people spoke of him as the plant itself (*manyura*) which yields the edible seed. Again, an early writer on the tribes of South-Western Australia, near King George's Sound, tells us that "the individuals who possess most influence are the *mulgarradocks*, or doctors. . . . A *mulgarraddock* is considered to possess the power of driving away wind or rain, as well as bringing down lightning or disease upon any object of their or others' hatred," and they also attempted to heal the sick. On the whole, then, it is highly significant that in the most primitive society about which we are accurately informed it is especially the magicians or medicine-men who appear to have been in process of developing into chiefs.

When we pass from Australia to New Guinea we find that, though the natives stand at a far higher level of culture than the Australian aborigines, the constitution of society among them is still essentially democratic or oligarchic, and chieftainship exists only in embryo. Thus Sir William MacGregor tells us that in British New Guinea no one has ever arisen wise enough, bold enough, and strong enough to become the despot even of a single district. "The nearest approach to this has been the very distant one of some person becoming a renowned wizard; but that has only resulted in levying a certain amount of blackmail." To the same effect a Catholic missionary observes that in New Guinea the *nepu* or sorcerers "are everywhere. They boast of their misdeeds; everybody fears them, everybody accuses them, and, after all, nothing positive is known of their secret practices. This cursed brood is as it were the soul of the Papuan life. Nothing happens without the sorcerer's intervention: wars, marriages, diseases, deaths, expeditions, fishing, hunting, always and everywhere the sorcerer. . . . One thing is certain for them, and they do not regard it as an article of faith, but as a fact patent and indisputable, and that is the extraordinary power of the *nepu*; he is the master of life and of death. Hence it is only natural that they should fear him and obey him in everything and give him all that he asks for. The *nepu* is not a chief, but he domineers over the chiefs, and we may say that the true authority, the only effective influence in New Guinea, is that of the *nepu*. Nothing can resist him." We are told that in the Toaripi or Motumotu tribe of British New Guinea chiefs have not necessarily supernatural powers, but that a sorcerer is looked upon as a chief. Some years ago, for example, one man of the tribe was a chief because he was supposed to rule the sea, calming it or rousing it to fury at his pleasure. Another owed his power to his skill in making the rain to fall, the sun to shine, and the plantations to bear fruit. It is believed that the chief of Mowat in British New Guinea, can affect the growth of crops for good or ill, and coax the turtle and dugong to come from all parts of the sea and allow themselves to be caught. At Bartle Bay in British New Guinea there are magicians (*taniwaga*) who are expected to manage certain departments of nature for the good of the community by means of charms (*pari*) which are known only to them. One of

these men, for example, works magic for rain, another for taro, another for wallaby, and another for fish. A magician who is believed to control an important department of nature may be the chief of his community. Thus the present chief of Wedau is a sorcerer who can make rain and raise or calm the winds. He is greatly respected by all and receives many presents. A chief of Kolem, on Finsch Harbour, in German New Guinea, enjoyed a great reputation as a magician; it was supposed that he could make wind and storm, rain and sunshine, and visit his enemies with sickness and death.

Turning now to the natives of the Melanesian islands, which stretch in an immense quadrant of a circle round New Guinea and Australia on the east, we are told by Dr. Codrington that among these savages “as a matter of fact the power of chiefs has hitherto rested upon the belief in their supernatural power derived from the spirits or ghosts with which they had intercourse. As this belief has failed, in the Banks’ Islands for example some time ago, the position of a chief has tended to become obscure; and as this belief is now being generally undermined a new kind of chief must needs arise, unless a time of anarchy is to begin.”

According to a native Melanesian account, the origin of the power of chiefs lies entirely in the belief that they have communication with mighty ghosts (*tindalo*), and wield that supernatural power (*mana*) whereby they can bring the influence of the ghosts to bear. If a chief imposed a fine, it was paid because the people universally dreaded his ghostly power, and firmly believed that he could inflict calamity and sickness upon such as resisted him. As soon as any considerable number of his people began to disbelieve in his influence with the ghosts, his power to levy fines was shaken. In Malo, one of the New Hebrides, the highest nobility consists of those persons who have sacrificed a thousand little pigs to the souls of their ancestors. No one ever resists a man of that exalted rank, because in him are supposed to dwell all the souls of the ancient chiefs and all the spirits who preside over the tribe. In the Northern New Hebrides the son does not inherit the chieftainship, but he inherits, if his father can manage it, what gives him the chieftainship, namely, his father’s supernatural power, his charms, magical songs, stones and apparatus, and his knowledge of the way to approach spiritual beings. A chief in the island of Paramatta informed a European that he had the power of making rain, wind, storm, thunder and lightning, and dry weather. He exhibited as his magical instrument a piece of bamboo with some parti-coloured rags attached to it. In this bamboo, he said, were kept the devils of rain and wind, and when he commanded them to discharge their office or to lie still, they were obliged to obey, being his subjects and prisoners. When he had given his orders to these captive devils, the bamboo had to be fastened to the highest point of his house. In the Marshall Bennet Islands to the east of New Guinea it was the duty of each chief of a clan to charm the gardens of his clan so as to make them productive. The charm consisted of turning up part of the soil with a long stick and muttering an appropriate spell. Each special crop, such as yams, bananas, sugar-cane, and coco-nuts, had its special kind of stick and its special spell.

With regard to government among the Melanesians of New Britain or the Bismarck Archipelago, I may cite the evidence of an experienced missionary, the Rev. Dr. George Brown, who settled in the islands at a time when no other white man was living in the group, and who resided among the savage islanders for some five or six years. He says: “There was no government so called in New Britain except that form of jurisdiction or power represented by the secret societies and that exercised by chiefs, who were supposed to possess exceptional powers of sorcery and witchcraft. These powers were very real, owing, I think, principally to two reasons—one of which was that the men themselves thoroughly believed that they were the possessors of the powers which they claimed, and the other was that the people themselves believed that the men really possessed them. There was indeed the title of chief (*todaru*) claimed and also given to them by the people; but this was not the result of any

election or necessarily by inheritance, it was simply that a certain man claimed to be the possessor of these powers and succeeded in convincing the people that he really possessed them.” Again, Dr. Brown tells us that in New Britain “a ruling chief was always supposed to exercise priestly functions, that is, he professed to be in constant communication with the *tebarans* (spirits), and through their influence he was enabled to bring rain or sunshine, fair winds or foul ones, sickness or health, success or disaster in war, and generally to procure any blessing or curse for which the applicant was willing to pay a sufficient price. If his spells did not produce the desired effect he always had a plausible explanation ready, which was generally accepted as a sufficient excuse. I think much of the success which these men undoubtedly had was due to their keen observations of natural phenomena, and to the effects of fear upon the people.”

According to Dr. Turner, “The real gods at Tana may be said to be the disease-makers. It is surprising how these men are dreaded, and how firm the belief is that they have in their hands the power of life and death. There are rain-makers and thunder-makers, and fly and mosquito-makers, and a host of other ‘sacred men,’ but the disease-makers are the most dreaded. It is believed that these men can create disease and death by burning what is called *nahak*. *Nahak*, means rubbish, but principally refuse of food. Everything of the kind they bury or throw into the sea, lest the disease-makers should get hold of it. These fellows are always about, and consider it their special business to pick up and burn, with certain formalities, anything in the *nahak* line which comes in their way. If a disease-maker sees the skin of a banana, for instance, he picks it up, wraps it in a leaf, and wears it all day hanging round his neck. The people stare as they see him go along, and say to each other, ‘He has got something; he will do for somebody by-and-by at night.’ In the evening he scrapes some bark off a tree, mixes it up with the banana skin, rolls all up tightly in a leaf in the form of a cigar, and then puts the one end close enough to the fire to cause it to singe, and smoulder, and burn away very gradually. Presently he hears a shell blowing. ‘There,’ he says to his friends, ‘there it is; that is the man whose rubbish I am now burning, he is ill; let us stop burning, and see what they bring in the morning.’ When a person is taken ill he believes that it is occasioned by some one burning his rubbish. Instead of thinking about medicine, he calls some one to blow a shell, a large conch or other shell, which, when perforated and blown, can be heard two or three miles off. The meaning of it is to implore the person who is supposed to be burning the sick man’s rubbish and causing all the pain to stop burning; and it is a promise as well that a present will be taken in the morning. The greater the pain the more they blow the shell, and when the pain abates they cease, supposing that the disease-maker has been kind enough to stop burning.” Night after night the silence is broken by the dismal too-too-tooing of these shells; and in the morning the friends of the sufferer repair to the disease-maker with presents of pigs, mats, hatchets, beads, whales’ teeth, or suchh like things. Thus these sorcerers attain to a position of immense power and influence and acquire wealth by purely maleficent magic; it is not by the imaginary benefits which they confer on the community, but by the imaginary evils which they inflict on individuals, that they climb the steps of a throne or the ladder that leads to heaven; for according to Dr. Turner these rascals are on the highroad to divinity. The process which they employ to accomplish their ends is a simple application of the principles of contagious magic: whatever has once been in contact with a person remains in sympathetic connexion with him always, and harm done to it is therefore harm done to him. Side by side with the evil which this superstition produces, on the one hand by inspiring men with baseless terrors, and on the other by leading them to neglect effectual remedies for real evils, we must recognise the benefit which it incidentally confers on society by causing people to clear away and destroy the refuse of their food and other rubbish, which if suffered to accumulate about their dwellings might, by polluting the atmosphere, prove a real, not an imaginary source of disease. In practice, cleanliness based on motives of superstition may be just as effective for

the preservation of health as if it were founded on the best-ascertained principles of sanitary science.

Still rising in the scale of culture we come to Africa, where both the chieftainship and the kingship are fully developed; and here the evidence for the evolution of the chief out of the magician, and especially out of the rain-maker, is comparatively plentiful. Thus among the Wambugwe, a Bantu people of East Africa, the original form of government was a family republic, but the enormous power of the sorcerers, transmitted by inheritance, soon raised them to the rank of petty lords or chiefs. Of the three chiefs living in the country in 1894 two were much dreaded as magicians, and the wealth of cattle they possessed came to them almost wholly in the shape of presents bestowed for their services in that capacity. Their principal art was that of rain-making. The chiefs of the Wataturu, another people of East Africa, are said to be nothing but sorcerers destitute of any direct political influence. Again, among the Wagogo of German East Africa the main power of the chiefs, we are told, is derived from their art of rain-making. If a chief cannot make rain himself, he must procure it from some one who can. Again, in the powerful Masai nation of the same region the medicine-men are not uncommonly the chiefs, and the supreme chief of the race is almost invariably a powerful medicine-man. These *Laibon*, as they are called, are priests as well as doctors, skilled in interpreting omens and dreams, in averting ill-luck, and in making rain.

The head chief or medicine-man, who has been called the Masai pope, is expected not only to make rain, but to repel and destroy the enemies of the Masai in war by his magic art. The following is Captain Merker's account of the Masai pope: "The most prominent clan of the whole Masai people is the *En gidon*, because to it belong not only the family of the chief (*ol oiboni*), but also the family of the magicians. The designation chief is, strictly speaking, not quite correct, since the chief (*ol oiboni*) does not govern directly and exercises no real administrative function. He rules only indirectly; the firm belief of his subjects in his prophetic gifts and in his supernatural power of sorcery gives him an influence on the destinies of the people. Despotism and cruelty, such as we find among all negro rulers, are alien to him. He is not so much a ruler as a national saint or patriarch. The people speak of his sacred person with shy awe, and no man dares to appear before this mighty personage without being summoned. The aim of his policy is to unite and strengthen the Masai. While he allows free play to the predatory instincts of the warriors in raids on other tribes, he guards his own people from the scourge of civil war, to which the ceaseless quarrels of the various districts with each other would otherwise continually give occasion. This influence of his is rendered possible by the belief that victory can only be achieved through the secret power of the war-medicine which none but he can compound, and that defeat would infallibly follow if he were to predict it. Neither he nor his nearest relatives march with the army to war. He supplies remedies, generally in the shape of magical medicines, for plagues and sicknesses, and he appoints festivals of prayer in honour of the Masai god *'Ng ai*. He delivers his predictions by means of an oracular game like the telling of beads." And just as Samson's miraculous strength went from him when his hair was shorn, so it is believed that the head chief of the Masai would lose his supernatural powers if his chin were shaved. According to one writer, the Masai pope has never more than one eye: the father knocks out his son's eye in order to qualify him for the holy office.

Among the Nandi of British East Africa "the *Orkoiyot*, or principal medicine man, holds precisely the same position as the Masai *Ol-oiboni*, that is to say, he is supreme chief of the whole race." He is a diviner, and foretells the future by casting stones, inspecting entrails, interpreting dreams, and prophesying when he is drunk. The Nandi believe implicitly in his powers. He tells them when to begin planting their crops: in time of drought he procures rain for them either directly or by means of the rainmakers: he makes women and cattle fruitful;

and no war-party can expect to be successful if he has not approved of the foray. His office is hereditary and his person is usually regarded as absolutely sacred. Nobody may approach him with weapons in his hand or speak in his presence unless the great man addresses him; and it is most important that nobody should touch his head, else it is feared that his powers of divination and so forth would depart from him. However, one of these sacred pontiffs was clubbed to death, being held responsible for several public calamities, to wit, famine, sickness, and defeat in war. The Suk and Turkana, two other peoples of British East Africa, distinguish between their chiefs and their medicine-men, who wield great power; but very often the medicine-man is a chief by virtue of his skill in medicine or the occult arts.

Again, among the tribes of the Upper Nile the medicine-men are generally the chiefs. Their authority rests above all upon their supposed power of making rain, for "rain is the one thing which matters to the people in those districts, as if it does not come down at the right time it means untold hardships for the community. It is therefore small wonder that men more cunning than their fellows should arrogate to themselves the power of producing it, or that having gained such a reputation, they should trade on the credulity of their simpler neighbours." Hence "most of the chiefs of these tribes are rainmakers, and enjoy a popularity in proportion to their powers to give rain to their people at the proper season. . . . Rain-making chiefs always build their villages on the slopes of a fairly high hill, as they no doubt know that the hills attract the clouds, and that they are, therefore, fairly safe in their weather forecasts." Each of these rain-makers has a number of rain-stones, such as rock-crystal, aventurine, and amethyst, which he keeps in a pot. When he wishes to produce rain he plunges the stones in water, and taking in his hand a peeled cane, which is split at the top, he beckons with it to the clouds to come or waves them away in the way they should go, muttering an incantation the while. Or he pours water and the entrails of a sheep or goat into a hollow in a stone and then sprinkles the water towards the sky. Though the chief acquires wealth by the exercise of his supposed magical powers, he often, perhaps generally, comes to a violent end; for in time of drought the angry people assemble and kill him, believing that it is he who prevents the rain from falling. Yet the office is usually hereditary and passes from father to son. Among the tribes which cherish these beliefs and observe these customs are the Latuka, Bari, Laluba, and Lokoïya. Thus, for example, with regard to the Latuka we are told that "amongst the most important but also the most dangerous occupations of the greater chiefs is the procuring of rain for their country. Almost all the greater chiefs enjoy the reputation of being rainmakers, and the requisite knowledge usually passes by inheritance from father to son. However, there are also here and there among the natives persons who, without being chiefs, busy themselves with rain-making. If there has been no rain in a district for a long time and the people wish to attract it for the sake of the sowing, they apply to their chief, bringing him a present of sheep, goats, or, in urgent cases, cattle or a girl, and if the present seems to him sufficient he promises to furnish rain; but if it appears to him too little he asks for more. If some days pass without rain, it gives the magician an opportunity for claiming fresh presents, on the ground that the smallness of the offered gifts hinders the coming of the rain." When the cupidity of the rain-maker is satisfied, he goes to work in the usual way, pouring water over two flat stones, one called the male and the other the female, till they are covered to a depth of three inches. The "male" stone is a common white quartz; the "female" is brownish. If still no rain falls, he makes a smoky fire in the open with certain herbs, and if the smoke mounts straight up, rain is near. Although an unsuccessful rain-maker is often banished or killed, his son always succeeds him in the dignity. Amongst the Bari the procedure of the rain-making chief to draw down the water of heaven is somewhat elaborate. He has many rain-stones, consisting of rock crystal and pink and green granite. These are deposited in the hollows of some twenty slabs of gneiss, and across the hollows are laid numerous iron rods of various shapes and sizes. When rain is to be made, these iron rods are

set up in a perpendicular position, and water is poured on the crystals and stones. Then the rain-maker takes up the stones one by one and oils them, praying to his dead father to send the rain. One of the iron rods is provided with a hook, and another is a two-headed spear. With the hook the rain-maker hooks and attracts the rain-clouds; with the two-headed spear he attacks and drives them away. In this procedure the prayer to the dead ancestor is religious, while the rest of the ceremony is magical. Thus, as so often happens, the savage seeks to compass his object by combining magic with religion. The logical inconsistency does not trouble him, provided he attains his end. Further, the rain-maker chief of the Bari is supposed to be able to make women fruitful. For this purpose he takes an iron rod with a hollow bulb at each end, in which are small stones. Grasping the rod by the middle he shakes it over the would-be mother, rattling the stones and muttering an incantation.

Again, among the Bongo, a tribe of the same region, the influence of the chiefs is said to rest in great part on a belief in their magical powers; for the chief is credited with the knowledge of certain roots, which are the only means of communicating with the dangerous spirits of whose mischievous pranks the Bongo stand in great fear. In the Dinka or Denka nation, to the north-east of the Bongo, men who are supposed to be in close communication with spirits pass for omnipotent; it is believed that they make rain, conjure away all calamities, foresee the future, exorcise evil spirits, know all that goes on even at a distance, have the wild beasts in their service, and can call down every kind of disaster on their enemies. One of these men became the richest and most esteemed chief of the Kic tribe through his skill in ventriloquism. He kept a cage from which the roars of imaginary lions and the howls of imaginary hyaenas were heard to proceed; and he gave out that these beasts guarded his house and were ready at his bidding to rush forth on his enemies. The dread which he infused into the tribe and its neighbours was incredible; from all sides oxen were sent to him as presents, so that his herds were the most numerous in the country. Another of these conjurers in the Tuic tribe had a real tame lion and four real fat snakes, which slept in front of his door, to the great awe of the natives, who could only attribute the pacific demeanour of these ferocious animals to sorcery. But it does not appear that the real lion inspired nearly so much terror as the imaginary one; from which we may perhaps infer that among these people ventriloquism is a more solid basis of political power even than lion-taming.

In Central Africa, again, the Lendu tribe, to the west of Lake Albert, firmly believe that certain people possess the power of making rain. Among them the rain-maker either is a chief or almost invariably becomes one. The Banyoro also have a great respect for the dispensers of rain, whom they load with a profusion of gifts. The great dispenser, he who has absolute and uncontrollable power over the rain, is the king; but he can depute his power to other persons, so that the benefit may be distributed and the heavenly water laid on over the various parts of the kingdom. A Catholic missionary observes that "a superstition common to the different peoples of equatorial Africa attributes to the petty kings of the country the exclusive power of making the rain to fall; in extreme cases the power is ascribed to certain kings more privileged than the rest, such as those of Huilla, Humbé, Varé, Libebé, and others. These kings profit by the superstition in order to draw to themselves many presents of cattle; for the rain must fall after the sacrifice of an ox, and if it tarries, the king, who is never at a loss for excuses to extricate himself from the scrape, will ascribe the failure to the defects of the victim, and will seize the pretext to claim more cattle." Among the Ba-Yaka, a tribe of the Kasai district in the Congo Free State, magicians are exempt from justice, and the chief is the principal magician; and among the Ba-Yanzi, another tribe of the same district, there is, or was a few years ago, a chief who passed for the greatest magician in the country.

In Western as well as in Eastern and Central Africa we meet with the same union of chiefly with magical functions. Thus in the Fan tribe the strict distinction between chief and

medicine-man does not exist. The chief is also a medicine-man and a smith to boot; for the Fans esteem the smith's craft sacred, and none but chiefs may meddle with it. The chiefs of the Ossidinge district in the Cameroons have as such very little influence over their subjects; but if the chief happens to be also the fetish-priest, as he generally is among the Ekois, he has not only powerful influence in all fetish matters (and most of the vital interests of the people are bound up with fetish worship), but he also enjoys great authority in general. A few years ago the head chief of Etatin on the Cross River, in Southern Nigeria, was an old man whom the people had compelled to take office in order that he should look after the fetishes or jujus and work magic for the benefit of the community. In accordance with an old custom, which is binding on the head chief, he was never allowed to leave his compound, that is, the enclosure in which his house stands. He gave the following account of himself to an English official, who paid him a visit: "I have been shut up ten years, but, being an old man, I don't miss my freedom. I am the oldest man of the town, and they keep me here to look after the jujus, and to conduct the rites celebrated when women are about to give birth to children, and other ceremonies of the same kind. By the observance and performance of these ceremonies, I bring game to the hunter, cause the yam crop to be good, bring fish to the fisherman, and make rain to fall. So they bring me meat, yams, fish, etc. To make rain, I drink water, and squirt it out, and pray to our big deities. If I were to go outside this compound, I should fall down dead on returning to this hut. My wives cut my hair and nails, and take great care of the parings."

As to the relation between the offices of chief and rain-maker in South Africa a well-informed writer observes: "In very old days the chief was the great Rain-maker of the tribe. Some chiefs allowed no one else to compete with them, lest a successful Rain-maker should be chosen as chief. There was also another reason: the Rain-maker was sure to become a rich man if he gained a great reputation, and it would manifestly never do for the chief to allow any one to be too rich. The Rain-maker exerts tremendous control over the people, and so it would be most important to keep this function connected with royalty. Tradition always places the power of making rain as the fundamental glory of ancient chiefs and heroes, and it seems probable that it may have been the origin of chieftainship. The man who made the rain would naturally become the chief. In the same way Chaka [the famous Zulu despot] used to declare that he was the only diviner in the country, for if he allowed rivals his life would be insecure." These South African rain-makers smear themselves with mud and sacrifice oxen as an essential part of the charm; almost everything is thought to turn on the colour of the beasts. Thus Umbandine, the old king of the Swazies, had huge herds of cattle of a peculiar colour, which was particularly well adapted for the production of rain. Hence deputations came to him from distant tribes praying and bribing him to make rain by the sacrifice of his cattle; and he used to threaten to "bind up the sky" if they did not satisfy his demands. The power which by this means he wielded was enormous. Similarly Mablaan, a chief of the Bawenda, in the north-eastern corner of the Transvaal, enjoyed a wide reputation and was revered beyond the limits of his own tribe because he was credited with the power of rain-making, "a greater power in the eyes of natives than that of the assegai." Hence he was constantly importuned by other chiefs to exercise his power and received valuable presents of girls, oxen, and red and green beads as inducements to turn on the heavenly water-tap.

Among the Matabeles of South Africa the witch-doctors are supposed to be on speaking terms with spirits, and their influence is described as tremendous; in the time of King Lo Bengula some years ago "their power was as great as, if not greater than, the king's."

Similarly speaking of the South African tribes in general, Dr. Moffat says that "the rain-maker is in the estimation of the people no mean personage, possessing an influence over the minds of the people superior even to that of the king, who is likewise compelled to yield to

the dictates of this arch-official." In Matabeleland the rainy season falls in November, December, January, and February. For several weeks before the rain sets in, the clouds gather in heavy banks, dark and lowering. Then the king is busy with his magicians compounding potions of wondrous strength to make the labouring clouds discharge their pent-up burden on the thirsty earth. He may be seen gazing at every black cloud, for his people flock from all parts to beg rain from him, "their rain-maker," for their parched fields; and they thank and praise him when a heavy rain has fallen. A letter dated from Bulawayo, the twentieth of November 1880, records that Lo Bengula, king of the Matabeles, "arrived yesterday evening at his kraal of 'the White Rocks.' He brought with him the rain to his people. For according to the ideas of the Matabeles, it is the king who ought to 'make the rain and the good season' in all senses of the word. Now Lo Bengula had chosen well the day and the hour, for it was in the midst of a tremendous storm that the king made his solemn entrance into his capital." "You must know that the arrival of the king and of the rain gives rise every year to a little festival. For the rain is the great benefit conferred by the king, the pledge of future harvests and of plenty, after eight months of desolating drought." To bring down the needed showers the king of the Matabeles boils a magic hell-broth in a cauldron, which sends up volumes of steam to the blue sky. But to make assurance doubly sure, he has recourse to religion as well as to magic; for he sacrifices twelve black oxen to the spirits of his fathers, and prays to them: "O great spirits of my father and grandfather, I thank you for having granted last year to my people more wheat than to our enemies the Mashonas. This year also, in gratitude for the twelve black oxen which I am about to dedicate to you, make us to be the best-fed and the strongest people in the world!" Thus the king of the Matabeles acts not only as a magician but as a priest, for he prays and sacrifices to the spirits of his forefathers.

The foregoing evidence renders it probable that in Africa the king has often been developed out of the public magician, and especially out of the rain-maker. The unbounded fear which the magician inspires and the wealth which he amasses in the exercise of his profession may both be supposed to have contributed to his promotion. But if the career of a magician and especially of a rain-maker offers great rewards to the successful practitioner of the art, it is beset with many pitfalls into which the unskilful or unlucky artist may fall. The position of the public sorcerer is indeed a very precarious one; for where the people firmly believe that he has it in his power to make the rain to fall, the sun to shine, and the fruits of the earth to grow, they naturally impute drought and dearth to his culpable negligence or wilful obstinacy, and they punish him accordingly. We have seen that in Africa the chief who fails to procure rain is often exiled or killed. Examples of such punishments could be multiplied. Thus, in some parts of West Africa, when prayers and offerings presented to the king have failed to procure rain, his subjects bind him with ropes and take him by force to the grave of his forefathers that he may obtain from them the needed rain. The Banjars in West Africa ascribe to their king the power of causing rain or fine weather. So long as the weather is fine they load him with presents of grain and cattle. But if long drought or rain threatens to spoil the crops, they insult and beat him till the weather changes. When the harvest fails or the surf on the coast is too heavy to allow of fishing, the people of Loango accuse their king of a "bad heart" and depose him. On the Grain Coast the high priest or fetish king, who bears the title of Bodio, is responsible for the health of the community, the fertility of the earth, and the abundance of fish in the sea and rivers; and if the country suffers in any of these respects the Bodio is deposed from his office. In Ussukuma, a great district on the southern bank of the Victoria Nyanza, "the rain and locust question is part and parcel of the Sultan's government. He, too, must know how to make rain and drive away the locusts. If he and his medicine-men are unable to accomplish this, his whole existence is at stake in times of distress. On a certain occasion, when the rain so greatly desired by the people did not come, the Sultan was simply driven out (in Ututwa, near Nassa). The people, in fact, hold that rulers

must have power over Nature and her phenomena.” Again, we are told of the natives of the Nyanza region generally that “they are persuaded that rain only falls as a result of magic, and the important duty of causing it to descend devolves on the chief of the tribe. If rain does not come at the proper time, everybody complains. More than one petty king has been banished his country because of drought.” Similarly among the Antimores of Madagascar the chiefs are held responsible for the operation of the laws of nature. Hence if the land is smitten with a blight or devastated by clouds of locusts, if the cows yield little milk, or fatal epidemics rage among the people, the chief is not only deposed but stripped of his property and banished, because they say that under a good chief such things ought not to happen. So, too, of the Antaimorona we read that “although the chiefs of this tribe are chosen by the people, during their tenure of power they enjoy a respect which borders on adoration; but if a crop of rice fails or any other calamity happens, they are immediately deposed, sometimes even killed; and yet their successor is always chosen from the family.” Among the Latukas of the Upper Nile, when the crops are withering in the fields and all the efforts of the chief to bring down rain have proved fruitless, the people commonly attack him by night, rob him of all he possesses, and drive him away. But often they kill him.

In many other parts of the world kings have been expected to regulate the course of nature for the good of their people and have been punished if they failed to do so. It appears that the Scythians, when food was scarce, used to put their king in bonds. In ancient Egypt the sacred kings were blamed for the failure of the crops, but the sacred beasts were also held responsible for the course of nature. When pestilence and other calamities had fallen on the land, in consequence of a long and severe drought, the priests took the animals by night and threatened them, but if the evil did not abate they slew the beasts. On the coral island of Niue or Savage Island, in the South Pacific, there formerly reigned a line of kings. But as the kings were also high priests, and were supposed to make the food grow, the people became angry with them in times of scarcity and killed them; till at last, as one after another was killed, no one would be king, and the monarchy came to an end. Ancient Chinese writers inform us that in Corea the blame was laid on the king whenever too much or too little rain fell and the crops did not ripen. Some said that he must be deposed, others that he must be slain. The Chinese emperor himself is deemed responsible if the drought is at all severe, and many are the self-condemnatory edicts on this subject published in the pages of the venerable *Peking Gazette*. In extreme cases the emperor, clad in humble vestments, sacrifices to heaven and implores its protection. So, too, the kings of Tonquin used to take blame to themselves when the country was visited by such calamities as scanty harvests, dearth, floods, destructive hurricanes and cholera. On these occasions the monarch would sometimes publicly confess his guilt and impose on himself a penance as a means of appeasing the wrath of Heaven. In former days it sometimes happened that when the country suffered from drought and dearth the king of Tonquin was obliged to change his name in the hope that this would turn the weather to rain. But if the drought continued even after the change of name the people would sometimes resort to stronger measures and transfer the title of king from the legitimate monarch to his brother, son, or other near relation.

Among the American Indians the furthest advance towards civilisation was made under the monarchical and theocratic governments of Mexico and Peru; but we know too little of the early history of these countries to say whether the predecessors of their deified kings were medicine-men or not. Perhaps a trace of such a succession may be detected in the oath which the Mexican kings took when they mounted the throne: they swore that they would make the sun to shine, the clouds to give rain, the rivers to flow, and the earth to bring forth fruits in abundance. Certainly, in aboriginal America the sorcerer or medicine-man, surrounded by a halo of mystery and an atmosphere of awe, was a personage of great influence and

importance, and he may well have developed into a chief or king in many tribes, though positive evidence of such a development appears to be lacking. Thus Catlin tells us that in North America the medicine-men “are valued as dignitaries in the tribe, and the greatest respect is paid to them by the whole community; not only for their skill in their *materia medica*, but more especially for their tact in magic and mysteries, in which they all deal to a very great extent. . . . In all tribes their doctors are conjurors—are magicians—are soothsayers, and I had like to have said high-priests, inasmuch as they superintend and conduct all their religious ceremonies; they are looked upon by all as oracles of the nation. In all councils of war and peace, they have a seat with the chiefs, are regularly consulted before any public step is taken, and the greatest deference and respect is paid to their opinions.” Among the Loucheux of North-West America each band is “headed by a chief and one or more medicine-men. The latter, however, do not possess any secular power as chiefs, but they acquire an authority by shamanism to which even the chiefs themselves are subject.” “The Loucheux are very superstitious, and place implicit faith in the pretended incantations of their medicine-men, for whom they entertain great fear. . . . The power of the medicine-men is very great, and they use every means they can to increase it by working on the fears and credulity of the people. Their influence exceeds even that of the chiefs. The power of the latter consists in the quantity of beads they possess, their wealth and the means it affords them to work ill to those to whom they may be evil-disposed; while the power of the medicine-man consists in the harm they believe he is able to do by shamanism, should they happen to displease him in any way. It is when sickness prevails that the conjuror rules supreme; it is then that he fills his bead bags and increases his riches.” Amongst the Tinneh Indians of the same region “the social standing of a medicine-man is, on the whole, a desirable one; but it has also its drawbacks and its dark side. The medicine-man is decidedly influential among his fellow savages. He is consulted and listened to, on account of the superior knowledge imparted to him by the spirits. He is feared, on account of his power to do evil, viz. to cause the death of a person, to ruin his undertakings, to render him unsuccessful in the hunt by driving away the game from his path, to cause the loss of his property, of his strength, of his health, of his faculties, etc. The medicine-man is rich, because his services, when summoned, or even when accepted though uncalled for, are generously remunerated. He is respected on account of his continual intercourse with the supernatural world. His words, when said in a peculiar low tone, with a momentary glow in the eyes, which [he] seems able to control at will, or when uttered during his sleep (real or feigned) are taken as oracles, as the very words of the spirit. In short, for these tribes who have no chiefs, no religion, no medical knowledge, he is the nearest approach to a chief, a priest, and a physician.” Similarly in California “the shaman was, and still is, perhaps the most important individual among the Maidu. In the absence of any definite system of government, the word of a shaman has great weight: as a class they are regarded with much awe, and as a rule are obeyed much more than the chief.” As leader of the local branch of a secret society the most noted Maidu shaman of each district was supposed to make rain when it was needed, to ensure a good crop of edible acorns and a plentiful supply of salmon, and to drive away evil spirits, disease, and epidemics from the village. Further, it was his business to inflict disease and death on hostile villages, which he did by burning certain roots and blowing the smoke towards the doomed village, while he said, “Over there, over there, not here! To the other place! Do not come back this way. We are good. Make those people sick. Kill them, they are bad people.” Among the Yokuts, another tribe of Californian Indians, the rain-makers exercised great influence. One of them by his insinuating address, eloquence, and jugglery spread his fame to a distance of two hundred miles, and cunningly availed himself of two years of drought to levy contributions far and wide from the trembling Indians, who attributed to his magic the fall of the rain. In the same tribe the wizards drew large profits

from the rattlesnake dance which they danced every spring, capering about with rattlesnakes twined round their arms; for after this exhibition many simpletons paid them for complete immunity from snake-bites, which the wizards were believed able to grant for a year.

In South America also the magicians or medicine-men seem to have been on the highroad to chieftainship or kingship. One of the earliest settlers on the coast of Brazil, the Frenchman Thevet, reports that the Indians “hold these *pages* (or medicine-men) in such honour and reverence that they adore, or rather idolise them. You may see the common folk go to meet them, prostrate themselves, and pray to them, saying, ‘Grant that I be not ill, that I do not die, neither I nor my children,’ or some such request. And he answers, ‘You shall not die, you shall not be ill,’ and such like replies. But sometimes if it happens that these *pages* do not tell the truth, and things turn out otherwise than they predicted, the people make no scruple of killing them as unworthy of the title and dignity of *pages*.” The Indians of Brazil, says a modern writer who knew them well, “have no priests but only magicians, who at the same time use medical help and exorcism in order to exert influence over the superstition and the dread of spirits felt by the rude multitude. We may perfectly compare them with the shamans of the north-eastern Asiatic peoples. But like the shamans they are not mere magicians, fetish-men, soothsayers, interpreters of dreams, visionaries, and casters-out of devils; their activity has also a political character in so far as they influence the decisions of the leaders and of the community in public business, and exert a certain authority, more than anybody else, as judges, sureties, and witnesses in private affairs.” Among the Lengua Indians of the Gran Chaco every clan has its *cazique* or chief, but he possesses little authority. In virtue of his office he has to make many presents, so he seldom grows rich and is generally more shabbily clad than any of his subjects. “As a matter of fact the magician is the man who has most power in his hands, and he is accustomed to receive presents instead of to give them.” It is the magician’s duty to bring down misfortune and plagues on the enemies of his tribe, and to guard his own people against hostile magic. For these services he is well paid and by them he acquires a position of great influence and authority. Among the Indians of Guiana also the magician or medicine-man (*piai*, *peaiman*) is a personage of great importance. By his magic art he alone, it is believed, can counteract the machinations of the great host of evil spirits, to which these savages attribute all the ills of life. It is almost impossible, we are told, to overestimate the dreadful sense of constant and unavoidable danger in which the Indian would live were it not for his trust in the protecting power of the magician. Every village has one such spiritual guardian, who is physician, priest, and magician in one. His influence is immense. No Indian dare refuse him anything he takes a fancy to, from a trifle of food up to a man’s wife. Hence these cunning fellows live in idleness on the fat of the land and acquire a large harem; their houses are commonly full of women who serve them in the capacity of beasts of burden as well as of wives, plodding wearily along under the weight of the baggage on long journeys, while their lord and master, fantastically tricked out in feathers and paint, strolls ahead, burdened only with his magic rattle and perhaps his bow and arrows.

Among the wild pagan tribes of the Malay peninsula the connexion between the offices of magician and chief is very close; indeed the two offices are often united in the same person. Among these savages, “as among the Malays, the accredited intermediary between gods and men is in all cases the medicine-man or sorcerer. In the Semang tribes the office of chief medicine-man appears to be generally combined with that of chief, but amongst the Sakai and Jakun these offices are sometimes separated, and although the chief is almost invariably a medicine-man of some repute, he is not necessarily the chief medicine-man, any more than the chief medicine-man is necessarily the administrative head of the tribe. In both cases there is an unflinching supply of aspirants to the office, though it may be taken for granted that, all else being equal, a successful medicine-man would have much the best prospect of being

elected chief, and that in the vast majority of cases his priestly duties form an important part of a chief's work. The medicine-man is, as might be expected, duly credited with supernatural powers. His tasks are to preside as chief medium at all the ceremonies, to instruct the youth of the tribe, to ward off as well as to heal all forms of sickness and trouble, to foretell the future (as affecting the results of any given act), to avert when necessary the wrath of heaven, and even when re-embodied after death in the shape of a wild beast, to extend a benign protection to his devoted descendants. Among the Sakai and the Jakun he is provided with a distinctive form of dress and body-painting, and carries an emblematic wand or staff by virtue of his office."

Throughout the Malay region the rajah or king is commonly regarded with superstitious veneration as the possessor of supernatural powers, and there are grounds for thinking that he too, like apparently so many African chiefs, has been developed out of a simple magician. At the present day the Malays firmly believe that the king possesses a personal influence over the works of nature, such as the growth of the crops and the bearing of fruit-trees. The same prolific virtue is supposed to reside, though in a lesser degree, in his delegates, and even in the persons of Europeans who chance to have charge of districts. Thus in Selangor, one of the native states of the Malay Peninsula, the success or failure of the rice crops is often attributed to a change of district officers. The Toorateyas of southern Celebes hold that the prosperity of the rice depends on the behaviour of their princes, and that bad government, by which they mean a government which does not conform to ancient custom, will result in a failure of the crops.

The Dyaks of Sarawak believed that their famous English ruler, Rajah Brooke, was endowed with a certain magical virtue which, if properly applied, could render the rice-crops abundant. Hence when he visited a tribe, they used to bring him the seed which they intended to sow next year, and he fertilised it by shaking over it the women's necklaces, which had been previously dipped in a special mixture. And when he entered a village, the women would wash and bathe his feet, first with water, and then with the milk of a young coco-nut, and lastly with water again, and all this water which had touched his person they preserved for the purpose of distributing it on their farms, believing that it ensured an abundant harvest. Tribes which were too far off for him to visit used to send him a small piece of white cloth and a little gold or silver, and when these things had been impregnated by his generative virtue they buried them in their fields, and confidently expected a heavy crop. Once when a European remarked that the rice-crops of the Samban tribe were thin, the chief immediately replied that they could not be otherwise, since Rajah Brooke had never visited them, and he begged that Mr. Brooke might be induced to visit his tribe and remove the sterility of their land.

Among the Malays the links which unite the king or rajah with the magician happen to be unusually plain and conspicuous. Thus the magician shares with the king the privilege of using cloth dyed yellow, the royal colour; he has considerable political influence, and he can compel people to address him in ceremonial language, of which indeed the phraseology is even more copious in its application to a magician than to a king. Moreover, and this is a fact of great significance, the Malay magician owns certain insignia which are said to be exactly analogous to the regalia of the king, and even bear the very same name (*kabésaran*). Now the regalia of a Malay king are not mere jewelled baubles designed to impress the multitude with the pomp and splendour of royalty; they are regarded as wonder-working talismans, the possession of which carries with it the right to the throne; if the king loses them, he thereby forfeits the allegiance of his subjects. It seems, therefore, to be a probable inference that in the Malay region the regalia of the kings are only the conjuring apparatus of their predecessors the magicians, and that in this part of the world accordingly the magician is the

humble grub or chrysalis which in due time bursts and discloses that gorgeous butterfly the rajah or king.

Nowhere apparently in the Indian Archipelago is this view of the regalia as the true fount of regal dignity carried to such lengths as in southern Celebes. Here the royal authority is supposed to be in some mysterious fashion embodied in the regalia, while the princes owe all the power they exercise, and all the respect they enjoy, to their possession of these precious objects. In short, the regalia reign, and the princes are merely their representatives. Hence whoever happens to possess the regalia is regarded by the people as their lawful king. For example, if a deposed monarch contrives to keep the regalia, his former subjects remain loyal to him in their hearts, and look upon his successor as a usurper who is to be obeyed only in so far as he can exact obedience by force. And on the other hand, in an insurrection the first aim of the rebels is to seize the regalia, for if they can only make themselves masters of them, the authority of the sovereign is gone. In short, the regalia are here fetishes, which confer a title to the throne and control the fate of the kingdom. Houses are built for them to dwell in, as if they were living creatures; furniture, weapons, and even lands are assigned to them. Like the ark of God, they are carried with the army to battle, and on various occasions the people propitiate them, as if they were gods, by prayer and sacrifice and by smearing them with blood. Some of them serve as instruments of divination, or are brought forth in times of public disaster for the purpose of staying the evil, whatever it may be. For example, when plague is rife among men or beasts, or when there is a prospect of dearth, the Boogineese bring out the regalia, smear them with buffalo's blood, and carry them about. For the most part these fetishes are heirlooms of which the origin is forgotten; some of them are said to have fallen from heaven. Popular tradition traces the foundation of the oldest states to the discovery or acquisition of one of these miraculous objects—it may be a stone, a piece of wood, a fruit, a weapon, or what not, of a peculiar shape or colour. Often the original regalia have disappeared in course of time, but their place is taken by the various articles of property which were bestowed on them, and to which the people have transferred their pious allegiance. The oldest dynasties have the most regalia, and the holiest regalia consist of relics of the bodies of former princes, which are kept in golden caskets wrapt in silk. At Paloppo, the capital of Loowoo, a kingdom on the coast of Celebes, two toy cannons, with barrels like thin gas-pipes, are regalia; their possession is supposed to render the town impregnable. Other regalia of this kingdom are veiled from vulgar eyes in bark-cloth. When a missionary requested to see them, the official replied that it was strictly forbidden to open the bundle; were he to do so, the earth would yawn and swallow them up. In Bima the principal part of the regalia or public talismans consists of a sacred brown horse, which no man may ride. It is always stabled in the royal palace. When the animal passes the government fort on high days and holidays, it is saluted with the fire of five guns; when it is led to the river to bathe, the royal spear is carried before it, and any man who does not give way to the beast, or crosses the road in front of it, has to pay a fine. But the horse is mortal, and when it goes the way of all horse-flesh, another steed chosen from the same stud reigns in its place.

But if in the Malay region the regalia are essentially wonder-working talismans or fetishes which the kings appear to have derived from their predecessors the magicians, we may conjecture that in other parts of the world the emblems of royalty may at some time have been viewed in a similar light and have had a similar origin. In ancient Egypt the two royal crowns, the white and the red, were supposed to be endowed with magical virtues, indeed to be themselves divinities, embodiments of the sun god. One text declares: "The white crown is the eye of Horus; the red crown is the eye of Horus." Another text speaks of a crown as a "great magician." And applied to the image of a god, the crown was supposed to confirm the deity in the possession of his soul and of his form. Among the Yorubas of West Africa at the

present time the king's crown is sacred and is supposed to be the shrine of a spirit which has to be propitiated. When the king (*Oni*) of Ife visited Lagos some years ago, he had to sacrifice five sheep to his crown between Ibadan and Ife, a two days' journey on foot. Among the Ashantees "the throne or chair of the king or chief is believed to be inhabited by a spirit to which it is consecrated, and to which human sacrifices were formerly offered: at present the victims are sheep. It is the personification of power; hence a king is not a king and a chief is not a chief until he has been solemnly installed on the throne." Among the Hos, a Ewe tribe of Togoland in German West Africa, the king's proper throne is small and the king does not sit on it. Usually it is bound round with magic cords and wrapt up in a sheep's skin; but from time to time it is taken out of the wrappings, washed in a stream, and smeared all over with the blood of a sheep which has been sacrificed for the purpose. The flesh of the sheep is boiled and a portion of it eaten by every man who has been present at the ceremony. In Cambodia the regalia are regarded as a palladium on which the existence of the kingdom depends; they are committed to Brahmans for safe keeping. In antiquity the Scythian kings treasured as sacred a plough, a yoke, a battle-axe, and a cup, all of gold, which were said to have fallen from heaven; they offered great sacrifices to these sacred things at an annual festival; and if the man in charge of them fell asleep under the open sky, it was believed that he would die within the year. The sceptre of king Agamemnon, or what passed for such, was worshipped as a god at Chaeronea; a man acted as priest of the sceptre for a year at a time, and sacrifices were offered to it daily. The golden lamb of Mycenae, on the possession of which, according to legend, the two rivals Atreus and Thyestes based their claim to the throne, may have been a royal talisman of this sort.

The belief that kings possess magical or supernatural powers by virtue of which they can fertilise the earth and confer other benefits on their subjects would seem to have been shared by the ancestors of all the Aryan races from India to Ireland, and it has left clear traces of itself in our own country down to modern times. Thus the ancient Hindoo law-book called *The Laws of Manu* describes as follows the effects of a good king's reign: "In that country where the king avoids taking the property of mortal sinners, men are born in due time and are long-lived. And the crops of the husbandmen spring up, each as it was sown, and the children die not, and no misshaped offspring is born." In Homeric Greece kings and chiefs were spoken of as sacred or divine; their houses, too, were divine and their chariots sacred; and it was thought that the reign of a good king caused the black earth to bring forth wheat and barley, the trees to be loaded with fruit, the flocks to multiply, and the sea to yield fish. A Greek historian of a much later age tells us that in the reign of a very bad king of Lydia the country suffered from drought, for which he would seem to have held the king responsible. There is a tradition that once when the land of the Edonians in Thrace bore no fruit, the god Dionysus intimated to the people that its fertility could be restored by putting their king Lycurgus to death. So they took him to Mount Pangaeum and there caused him to be torn in pieces by horses. When the crops failed, the Burgundians used to blame their kings and depose them. In the time of the Swedish king Domalde a mighty famine broke out, which lasted several years, and could be stayed by the blood neither of beasts nor of men. Therefore, in a great popular assembly held at Upsala, the chiefs decided that King Domalde himself was the cause of the scarcity and must be sacrificed for good seasons. So they slew him and smeared with his blood the altars of the gods. Again, we are told that the Swedes always attributed good or bad crops to their kings as the cause. Now, in the reign of King Olaf, there came dear times and famine, and the people thought that the fault was the king's, because he was sparing in his sacrifices. So, mustering an army, they marched against him, surrounded his dwelling, and burned him in it, "giving him to Odin as a sacrifice for good crops." In the Middle Ages, when Waldemar I., King of Denmark, travelled in Germany, mothers brought their infants and husbandmen their seed for him to lay his hands on, thinking that children

would both thrive the better for the royal touch, and for a like reason farmers asked him to throw the seed for them. It was the belief of the ancient Irish that when their kings observed the customs of their ancestors, the seasons were mild, the crops plentiful, the cattle fruitful, the waters abounded with fish, and the fruit trees had to be propped up on account of the weight of their produce. A canon attributed to St. Patrick enumerates among the blessings that attend the reign of a just king “fine weather, calm seas, crops abundant, and trees laden with fruit.” On the other hand, dearth, dryness of cows, blight of fruit, and scarcity of corn were regarded as infallible proofs that the reigning king was bad. For example, in the reign of the usurper king Carbery Kinncat, “evil was the state of Ireland: fruitless her corn, for there used to be only one grain on the stalk; fruitless her rivers; milkless her cattle; plentiful her fruit, for there used to be but one acorn on the stalk.” Superstitions of the same sort seem to have lingered in the Highlands of Scotland down to the eighteenth century; for when Dr. Johnson travelled in Skye it was still held that the return of the laird to Dunvegan, after any considerable absence, produced a plentiful capture of herring. The laird of Dunvegan is chief of the clan of the Macleods, and his family still owns a banner which is called “Macleods Fairy Banner,” on account of the supernatural powers ascribed to it. When it is unfurled, victory in war attends it, and it relieves its followers from imminent danger. But these virtues it can exert only thrice, and already it has been twice unfurled. When the potato crop failed, many of the common people desired that the magical banner should be displayed, apparently in the belief that the mere sight of it would produce a fine crop of potatoes. Every woman with child who sees it is taken with premature labour, and every cow casts her calf.

Perhaps the last relic of such superstitions which lingered about our English kings was the notion that they could heal scrofula by their touch. The disease was accordingly known as the King’s Evil. Queen Elizabeth often exercised this miraculous gift of healing. On Midsummer Day 1633, Charles the First cured a hundred patients at one swoop in the chapel royal at Holyrood. But it was under his son Charles the Second that the practice seems to have attained its highest vogue. In this respect the Merry Monarch did not let the grass grow under his feet. It was the twenty-ninth of May 1660 when he was brought home in triumph from exile amid a shouting multitude and a forest of brandished swords, over roads strewed with flowers and through streets hung with tapestry, while the fountains ran wine and all the bells of London rang for joy. And it was on the sixth of July that he began to touch for the King’s Evil. The ceremony is thus described by Evelyn, who may have witnessed it. “His Majestie began first to *touch for y^e evil*, according to custome, thus: His Ma^{tie} sitting under his state in the Banqueting House, the chirurgeons cause the sick to be brought or led up to the throne, where they kneeling, y^e King strokes their faces or cheekes with both his hands at once, at which instant a chaplaine in his formalities says, ‘He put his hands upon them and he healed them.’ This is sayd to everyone in particular. When they have been all touch’d they come up again in the same order, and the other chaplaine kneeling, and having angel gold strung on white ribbon on his arme, delivers them one by one to his Ma^{tie}, who puts them about the necks of the touched as they pass, whilst the first chaplaine repeats, ‘That is y^e true light who came into y^e world.’ Then follows an Epistle (as at first a Gospell) with the liturgy, prayers for the sick, with some alteration, lastly y^e blessing; and then the Lo. Chamberlaine and the Comptroller of the Household bring a basin, ewer and towell, for his Majesty to wash.” Pepys witnessed the same ceremony at the same place on the thirteenth of April in the following year and he has recorded his opinion that it was “an ugly office and a simple.” It is said that in the course of his reign Charles the Second touched near a hundred thousand persons for scrofula. The press to get near him was sometimes terrific. On one occasion six or seven of those who came to be healed were trampled to death. While the hope of a miraculous cure attracted the pious and sanguine, the certainty of receiving angel gold attracted the needy and avaricious, and it was not always easy for the royal surgeons to

distinguish between the motives of the applicants. This solemn mummerly cost the state little less than ten thousand pounds a year. The cool-headed William the Third contemptuously refused to lend himself to the hocus-pocus; and when his palace was besieged by the usual unsavoury crowd, he ordered them to be turned away with a dole. On the only occasion when he was importuned into laying his hand on a patient, he said to him, "God give you better health and more sense." However, the practice was continued, as might have been expected, by the dull bigot James the Second and his dull daughter Queen Anne. In his childhood Dr. Johnson was touched for scrofula by the queen, and he always retained a faint but solemn recollection of her as of a lady in diamonds with a long black hood. To judge by the too faithful picture which his biographer has drawn of the doctor's appearance in later life we may conclude that the touch of the queen's hand was not a perfect remedy for the disorder; perhaps the stream of divine grace which had flowed so copiously in the veins of Charles the Second had been dried up by the interposition of the sceptical William.

The kings of France also claimed to possess the same gift of healing by touch, which they are said to have derived from Clovis or from St. Louis, while our English kings inherited it from Edward the Confessor. We may suspect that these estimates of the antiquity of the gift were far too modest, and that the barbarous, nay savage, predecessors both of the Saxon and of the Merovingian kings had with the same justice claimed the same powers many ages before. Down to the nineteenth century the West African tribe of the Walos, in Senegal, ascribed to their royal family a like power of healing by touch. Mothers have been seen to bring their sick children to the queen, who touched them solemnly with her foot on the back, the stomach, the head, and the legs, after which the women departed in peace, convinced that their children had been made whole. Similarly the savage chiefs of Tonga were believed to heal scrofula and cases of indurated liver by the touch of their feet; and the cure was strictly homoeopathic, for the disease as well as the cure was thought to be caused by contact with the royal person or with anything that belonged to it. In fact royal personages in the Pacific and elsewhere have been supposed to live in a sort of atmosphere highly charged with what we may call spiritual electricity, which, if it blasts all who intrude into its charmed circle, has happily also the gift of making them whole again by a touch. We may conjecture that similar views prevailed in ancient times as to the predecessors of our English monarchs, and that accordingly scrofula received its name of the King's Evil from the belief that it was caused as well as cured by contact with a king. In Loango palsy is called the king's disease, because the negroes imagine it to be heaven's punishment for treason meditated against the king.

On the whole, then, we seem to be justified in inferring that in many parts of the world the king is the lineal successor of the old magician or medicine-man. When once a special class of sorcerers has been segregated from the community and entrusted by it with the discharge of duties on which the public safety and welfare are believed to depend, these men gradually rise to wealth and power, till their leaders blossom out into sacred kings. But the great social revolution which thus begins with democracy and ends in despotism is attended by an intellectual revolution which affects both the conception and the functions of royalty. For as time goes on, the fallacy of magic becomes more and more apparent to the acuter minds and is slowly displaced by religion; in other words, the magician gives way to the priest, who renouncing the attempt to control directly the processes of nature for the good of man, seeks to attain the same end indirectly by appealing to the gods to do for him what he no longer fancies he can do for himself. Hence the king, starting as a magician, tends gradually to exchange the practice of magic for the priestly functions of prayer and sacrifice. And while the distinction between the human and the divine is still imperfectly drawn, it is often imagined that men may themselves attain to godhead, not merely after their death, but in their

lifetime, through the temporary or permanent possession of their whole nature by a great and powerful spirit. No class of the community has benefited so much as kings by this belief in the possible incarnation of a god in human form. The doctrine of that incarnation, and with it the theory of the divinity of kings in the strict sense of the word, will form the subject of the following chapter.

VII. Incarnate Human Gods

The instances which in the preceding chapters I have drawn from the beliefs and practices of rude peoples all over the world, may suffice to prove that the savage fails to recognise those limitations to his power over nature which seem so obvious to us. In a society where every man is supposed to be endowed more or less with powers which we should call supernatural, it is plain that the distinction between gods and men is somewhat blurred, or rather has scarcely emerged. The conception of gods as superhuman beings endowed with powers to which man possesses nothing comparable in degree and hardly even in kind, has been slowly evolved in the course of history. By primitive peoples the supernatural agents are not regarded as greatly, if at all, superior to man; for they may be frightened and coerced by him into doing his will. At this stage of thought the world is viewed as a great democracy; all beings in it, whether natural or supernatural, are supposed to stand on a footing of tolerable equality. But with the growth of his knowledge man learns to realise more clearly the vastness of nature and his own littleness and feebleness in presence of it. The recognition of his helplessness does not, however, carry with it a corresponding belief in the impotence of those supernatural beings with which his imagination peoples the universe. On the contrary, it enhances his conception of their power. For the idea of the world as a system of impersonal forces acting in accordance with fixed and invariable laws has not yet fully dawned or darkened upon him. The germ of the idea he certainly has, and he acts upon it, not only in magic art, but in much of the business of daily life. But the idea remains undeveloped, and so far as he attempts to explain the world he lives in, he pictures it as the manifestation of conscious will and personal agency. If then he feels himself to be so frail and slight, how vast and powerful must he deem the beings who control the gigantic machinery of nature! Thus as his old sense of equality with the gods slowly vanishes, he resigns at the same time the hope of directing the course of nature by his own unaided resources, that is, by magic, and looks more and more to the gods as the sole repositories of those supernatural powers which he once claimed to share with them. With the advance of knowledge, therefore, prayer and sacrifice assume the leading place in religious ritual; and magic, which once ranked with them as a legitimate equal, is gradually relegated to the background and sinks to the level of a black art. It is now regarded as an encroachment, at once vain and impious, on the domain of the gods, and as such encounters the steady opposition of the priests, whose reputation and influence rise or fall with those of their gods. Hence, when at a late period the distinction between religion and superstition has emerged, we find that sacrifice and prayer are the resource of the pious and enlightened portion of the community, while magic is the refuge of the superstitious and ignorant. But when, still later, the conception of the elemental forces as personal agents is giving way to the recognition of natural law; then magic, based as it implicitly is on the idea of a necessary and invariable sequence of cause and effect, independent of personal will, reappears from the obscurity and discredit into which it had fallen, and by investigating the causal sequences in nature, directly prepares the way for science. Alchemy leads up to chemistry.

The notion of a man-god, or of a human being endowed with divine or supernatural powers, belongs essentially to that earlier period of religious history in which gods and men are still viewed as beings of much the same order, and before they are divided by the impassable gulf which, to later thought, opens out between them. Strange, therefore, as may seem to us the idea of a god incarnate in human form, it has nothing very startling for early man, who sees in a man-god or a god-man only a higher degree of the same supernatural powers which he arrogates in perfect good faith to himself. Nor does he draw any very sharp distinction

between a god and a powerful sorcerer. His gods, as we have seen, are often merely invisible magicians who behind the veil of nature work the same sort of charms and incantations which the human magician works in a visible and bodily form among his fellows. And as the gods are commonly believed to exhibit themselves in the likeness of men to their worshippers, it is easy for the magician, with his supposed miraculous powers, to acquire the reputation of being an incarnate deity. Thus beginning as little more than a simple conjurer, the medicine-man or magician tends to blossom out into a full-blown god and king in one. Only in speaking of him as a god we must beware of importing into the savage conception of deity those very abstract and complex ideas which we attach to the term. Our ideas on this profound subject are the fruit of a long intellectual and moral evolution, and they are so far from being shared by the savage that he cannot even understand them when they are explained to him. Much of the controversy which has raged as to the religion of the lower races has sprung merely from a mutual misunderstanding. The savage does not understand the thoughts of the civilised man, and few civilised men understand the thoughts of the savage. When the savage uses his word for god, he has in his mind a being of a certain sort: when the civilised man uses his word for god, he has in his mind a being of a very different sort; and if, as commonly happens, the two men are equally unable to place themselves at the other's point of view, nothing but confusion and mistakes can result from their discussions. If we civilised men insist on limiting the name of God to that particular conception of the divine nature which we ourselves have formed, then we must confess that the savage has no god at all. But we shall adhere more closely to the facts of history if we allow most of the higher savages at least to possess a rudimentary notion of certain supernatural beings who may fittingly be called gods, though not in the full sense in which we use the word. That rudimentary notion represents in all probability the germ out of which the civilised peoples have gradually evolved their own high conceptions of deity; and if we could trace the whole course of religious development, we might find that the chain which links our idea of the Godhead with that of the savage is one and unbroken.

With these explanations and cautions I will now adduce some examples of gods who have been believed by their worshippers to be incarnate in living human beings, whether men or women. The persons in whom a deity is thought to reveal himself are by no means always kings or descendants of kings; the supposed incarnation may take place even in men of the humblest rank. In India, for example, one human god started in life as a cotton-bleacher and another as the son of a carpenter. I shall therefore not draw my examples exclusively from royal personages, as I wish to illustrate the general principle of the deification of living men, in other words, the incarnation of a deity in human form. Such incarnate gods are common in rude society. The incarnation may be temporary or permanent. In the former case, the incarnation—commonly known as inspiration or possession—reveals itself in supernatural knowledge rather than in supernatural power. In other words, its usual manifestations are divination and prophecy rather than miracles. On the other hand, when the incarnation is not merely temporary, when the divine spirit has permanently taken up its abode in a human body, the god-man is usually expected to vindicate his character by working miracles. Only we have to remember that by men at this stage of thought miracles are not considered as breaches of natural law. Not conceiving the existence of natural law, primitive man cannot conceive a breach of it. A miracle is to him merely an unusually striking manifestation of a common power.

The belief in temporary incarnation or inspiration is world-wide. Certain persons are supposed to be possessed from time to time by a spirit or deity; while the possession lasts, their own personality lies in abeyance, the presence of the spirit is revealed by convulsive shiverings and shakings of the man's whole body, by wild gestures and excited looks, all of

which are referred, not to the man himself, but to the spirit which has entered into him; and in this abnormal state all his utterances are accepted as the voice of the god or spirit dwelling in him and speaking through him. Thus, for example, in the Sandwich Islands, the king personating the god, uttered the responses of the oracle from his concealment in a frame of wicker-work. But in the southern islands of the Pacific the god “frequently entered the priest, who, inflated as it were with the divinity, ceased to act or speak as a voluntary agent, but moved and spoke as entirely under supernatural influence. In this respect there was a striking resemblance between the rude oracles of the Polynesians, and those of the celebrated nations of ancient Greece. As soon as the god was supposed to have entered the priest, the latter became violently agitated, and worked himself up to the highest pitch of apparent frenzy, the muscles of the limbs seemed convulsed, the body swelled, the countenance became terrific, the features distorted, and the eyes wild and strained. In this state he often rolled on the earth, foaming at the mouth, as if labouring under the influence of the divinity by whom he was possessed, and, in shrill cries, and violent and often indistinct sounds, revealed the will of the god. The priests, who were attending, and versed in the mysteries, received, and reported to the people, the declarations which had been thus received. When the priest had uttered the response of the oracle, the violent paroxysm gradually subsided, and comparative composure ensued. The god did not, however, always leave him as soon as the communication had been made. Sometimes the same *taura*, or priest, continued for two or three days possessed by the spirit or deity; a piece of a native cloth, of a peculiar kind, worn round one arm, was an indication of inspiration, or of the indwelling of the god with the individual who wore it. The acts of the man during this period were considered as those of the god, and hence the greatest attention was paid to his expressions, and the whole of his deportment. . . . When *uruhia*, (under the inspiration of the spirit,) the priest was always considered as sacred as the god, and was called, during this period, *atua*, god, though at other times only denominated *taura* or priest.”

In Mangaia, an island of the South Pacific, the priests in whom the gods took up their abode from time to time were called “god-boxes” or, for shortness, “gods.” Before giving oracles as gods, they drank an intoxicating liquor, and in the frenzy thus produced their wild whirling words were received as the voice of the deity. In Fiji there is in every tribe a certain family who alone are liable to be thus temporarily inspired or possessed by a divine spirit. “Their qualification is hereditary, and any one of the ancestral gods may choose his vehicle from among them. I have seen this possession, and a horrible sight it is. In one case, after the fit was over, for some time the man’s muscles and nerves twitched and quivered in an extraordinary way. He was naked except for his breech-clout, and on his naked breast little snakes seemed to be wriggling for a moment or two beneath his skin, disappearing and then suddenly reappearing in another part of his chest. When the *mbete* (which we may translate ‘priest’ for want of a better word) is seized by the possession, the god within him calls out his own name in a stridulous tone, ‘It is I! Katouivere!’ or some other name. At the next possession some other ancestor may declare himself.” In Bali there are certain persons called *pěrmās*, who are predestined or fitted by nature to become the temporary abode of the invisible deities. When a god is to be consulted, the villagers go and compel some of these mediums to lend their services. Sometimes the medium leaves his consciousness at home, and is then conducted with marks of honour to the temple, ready to receive the godhead into his person. Generally, however, some time passes before he can be brought into the requisite frame of body and mind; but the desired result may be hastened by making him inhale the smoke of incense or surrounding him with a band of singing men or women. The soul of the medium quits for a time his body, which is thus placed at the disposal of the deity, and up to the moment when his consciousness returns all his words and acts are regarded as proceeding not from himself but from the god. So long as the possession lasts he is a *dewa kapiragan*,

that is, a god who has become man, and in that character he answers the questions put to him. During this time his body is believed to be immaterial and hence invulnerable. A dance with swords and pikes follows the consultation of the oracle; but these weapons could make no impression on the ethereal body of the inspired medium. In Poso, a district of Central Celebes, sickness is often supposed to be caused by an alien substance, such as a piece of tobacco, a stick, or even a chopping-knife, which has been introduced unseen into the body of the sufferer by the magic art of an insidious foe. To discover and eject this foreign matter is a task for a god, who for this purpose enters into the body of a priestess, speaks through her mouth, and performs the necessary surgical operation with her hands. An eye-witness of the ceremony has told how, when the priestess sat beside the sick man, with her head covered by a cloth, she began to quiver and shake and to sing in a strident tone, at which some one observed to the writer, "Now her own spirit is leaving her body and a god is taking its place." On removing the cloth from her head she was no longer a woman but a heavenly spirit, and gazed about her with an astonished air as if to ask how she came from her own celestial region to this humble abode. Yet the divine spirit condescended to chew betel and to drink palm-wine like any poor mortal of earthly mould. After she had pretended to extract the cause of the disease by laying the cloth from her head on the patient's stomach and pinching it, she veiled her face once more, sobbed, quivered, and shook violently, at which the people said, "The human spirit is returning into her."

A Brahman householder who performs the regular half-monthly sacrifices is supposed thereby to become himself a deity for a time. In the words of the *Satapatha-Brâhmana*, "He who is consecrated draws nigh to the gods and becomes one of the deities." "All formulas of the consecration are *audgrabhana* (elevatory), since he who is consecrated elevates himself (*ud-grabh*) from this world to the world of the gods. He elevates himself by means of these same formulas." "He who is consecrated indeed becomes both Vishnu and a sacrificer; for when he is consecrated, he is Vishnu, and when he sacrifices, he is the sacrificer." After he has completed the sacrifice he becomes man again, divesting himself of his sacred character with the words, "Now I am he who I really am," which are thus explained in the *Satapatha-Brâhmana*: "In entering upon the vow, he becomes, as it were, non-human; and as it would not be becoming for him to say, 'I enter from truth into untruth'; and as, in fact, he now again becomes man, let him therefore divest himself (of the vow) with the text: 'Now I am he who I really am.'" The means by which the sacrificer passed from untruth to truth, from the human to the divine, was a simulation of a new birth. He was sprinkled with water as a symbol of seed. He feigned to be an embryo, and shut himself up in a special hut, which represented the womb. Under his robe he wore a belt, and over it the skin of a black antelope; the belt stood for the navel-string, and the robe and the black antelope skin represented the inner and outer membranes (the amnion and the chorion) in which an embryo is wrapt. He might not scratch himself with his nails or a stick because he was an embryo, and were an embryo scratched with nails or a stick it would die. If he moved about in the hut, it was because the child moves about in the womb. If he kept his fists doubled up, it was because an unborn babe does the same. If in bathing he put off the black antelope skin but retained his robe, it was because the child is born with the amnion but not with the chorion. By these practices he acquired, in addition to his old natural and mortal body, a new body that was sacramental and immortal, invested with superhuman powers, encircled with an aureole of fire. Thus, by a new birth, a regeneration of his carnal nature, the man became a god. At his natural birth, the Brahmans said, man is born but in part; it is by sacrifice that he is truly born into the world. The funeral rites, which ensured the final passage from earth to heaven, might be considered as a phase of the new birth. "In truth," they said, "man is born thrice. At first he is born of his father and mother; then when he sacrifices he is born again; and lastly, when he dies and is laid on the

fire, he is born again from it, and that is his third birth. That is why they say that man is born thrice.”

But examples of such temporary inspiration are so common in every part of the world and are now so familiar through books on ethnology that it is needless to multiply illustrations of the general principle. It may be well, however, to refer to two particular modes of producing temporary inspiration, because they are perhaps less known than some others, and because we shall have occasion to refer to them later on. One of these modes of producing inspiration is by sucking the fresh blood of a sacrificed victim. In the temple of Apollo Diradiotes at Argos, a lamb was sacrificed by night once a month; a woman, who had to observe a rule of chastity, tasted the blood of the lamb, and thus being inspired by the god she prophesied or divined. At Aegira in Achaia the priestess of Earth drank the fresh blood of a bull before she descended into the cave to prophesy. In southern India a devil-dancer “cuts and lacerates his flesh till the blood flows, lashes himself with a huge whip, presses a burning torch to his breast, drinks the blood which flows from his own wounds, or drinks the blood of the sacrifice, putting the throat of the decapitated goat to his mouth. Then, as if he had acquired new life, he begins to brandish his staff of bells, and to dance with a quick but wild unsteady step. Suddenly the afflatus descends. There is no mistaking that glare, or those frantic leaps. He snorts, he stares, he gyrates. The demon has now taken bodily possession of him; and, though he retains the power of utterance and of motion, both are under the demon’s control, and his separate consciousness is in abeyance. The bystanders signalize the event by raising a long shout, attended with a peculiar vibratory noise, which is caused by the motion of the hand and tongue, or of the tongue alone. The devil-dancer is now worshipped as a present deity, and every bystander consults him respecting his disease, his wants, the welfare of his absent relatives, the offerings to be made for the accomplishment of his wishes, and, in short, respecting everything for which superhuman knowledge is supposed to be available.”

Similarly among the Kuruvikkarans, a class of bird-catchers and beggars in Southern India, the goddess Kali is believed to descend upon the priest, and he gives oracular replies after sucking the blood which streams from the cut throat of a goat. At a festival of the Alfoors of Minahassa, in northern Celebes, after a pig has been killed, the priest rushes furiously at it, thrusts his head into the carcase, and drinks of the blood. Then he is dragged away from it by force and set on a chair, whereupon he begins to prophesy how the rice-crop will turn out that year. A second time he runs at the carcase and drinks of the blood; a second time he is forced into the chair and continues his predictions. It is thought that there is a spirit in him which possesses the power of prophecy. At Rhetra, a great religious capital of the Western Slavs, the priest tasted the blood of the sacrificed oxen and sheep in order the better to prophesy.

The true test of a Dainyal or diviner among some of the Hindoo Koosh tribes is to suck the blood from the neck of a decapitated goat. The Takhas on the border of Cashmeer have prophets who act as inspired mediums between the deity and his worshippers. At the sacrifices the prophet inhales the smoke of the sacred cedar in order to keep off evil spirits, and sometimes he drinks the warm blood as it spouts from the neck of the decapitated victim before he utters his oracle. The heathen of Harran regarded blood as unclean, but nevertheless drank it because they believed it to be the food of demons, and thought that by imbibing it they entered into communion with the demons, who would thus visit them and lift the veil that hides the future from mortal vision.

The other mode of producing temporary inspiration, to which I shall here refer, consists in the use of a sacred tree or plant. Thus in the Hindoo Koosh a fire is kindled with twigs of the sacred cedar; and the Dainyal or sibyl, with a cloth over her head, inhales the thick pungent smoke till she is seized with convulsions and falls senseless to the ground. Soon she rises and raises a shrill chant, which is caught up and loudly repeated by her audience. So Apollo’s

prophetess ate the sacred laurel and was fumigated with it before she prophesied. The Bacchanals ate ivy, and their inspired fury was by some believed to be due to the exciting and intoxicating properties of the plant. In Uganda the priest, in order to be inspired by his god, smokes a pipe of tobacco fiercely till he works himself into a frenzy; the loud excited tones in which he then talks are recognised as the voice of the god speaking through him. In Madura, an island off the north coast of Java, each spirit has its regular medium, who is oftener a woman than a man. To prepare herself for the reception of the spirit she inhales the fumes of incense, sitting with her head over a smoking censer. Gradually she falls into a sort of trance accompanied by shrieks, grimaces, and violent spasms. The spirit is now supposed to have entered into her, and when she grows calmer her words are regarded as oracular, being the utterances of the indwelling spirit, while her own soul is temporarily absent.

It is worth observing that many peoples expect the victim as well as the priest or prophet to give signs of inspiration by convulsive movements of the body; and if the animal remains obstinately steady, they esteem it unfit for sacrifice. Thus when the Yakuts sacrifice to an evil spirit, the beast must bellow and roll about, which is considered a token that the evil spirit has entered into it. Apollo's prophetess could give no oracles unless the sacrificial victim trembled in every limb when the wine was poured on its head. But for ordinary Greek sacrifices it was enough that the victim should shake its head; to make it do so, water was poured on it. Many other peoples (Tonquinese, Hindoos, Chuwash, and so forth) have adopted the same test of a suitable victim; they pour water or wine on its head; if the animal shakes its head it is accepted for sacrifice; if it does not, it is rejected. Among the Kafirs of the Hindoo Koosh the priest or his substitute pours water into the ear and all down the spine of the intended victim, whether it be a sheep or a goat. It is not enough that the animal should merely shake its head to get the water out of its ear; it must shake its whole body as a wet dog shakes himself. When it does so, a kissing sound is made by all present, and the victim is forthwith slaughtered.

The person temporarily inspired is believed to acquire, not merely divine knowledge, but also, at least occasionally, divine power. In Cambodia, when an epidemic breaks out, the inhabitants of several villages unite and go with a band of music at their head to look for the man whom the local god is supposed to have chosen for his temporary incarnation. When found, the man is conducted to the altar of the god where the mystery of incarnation takes place. Then the man becomes an object of veneration to his fellows, who implore him to protect the village against the plague. A certain image of Apollo, which stood in a sacred cave at Hylae near Magnesia, was thought to impart superhuman strength. Sacred men, inspired by it, leaped down precipices, tore up huge trees by the roots, and carried them on their backs along the narrowest defiles. The feats performed by inspired dervishes belong to the same class.

Thus far we have seen that the savage, failing to discern the limits of his ability to control nature, ascribes to himself and to all men certain powers which we should now call supernatural. Further, we have seen that, over and above this general supernaturalism, some persons are supposed to be inspired for short periods by a divine spirit, and thus temporarily to enjoy the knowledge and power of the indwelling deity. From beliefs like these it is an easy step to the conviction that certain men are permanently possessed by a deity, or in some other undefined way are endued with so high a degree of supernatural power as to be ranked as gods and to receive the homage of prayer and sacrifice. Sometimes these human gods are restricted to purely supernatural or spiritual functions. Sometimes they exercise supreme political power in addition. In the latter case they are kings as well as gods, and the government is a theocracy. Thus in the Marquesas or Washington Islands there was a class of men who were deified in their lifetime. They were supposed to wield a supernatural power

over the elements; they could give abundant harvests or smite the ground with barrenness; and they could inflict disease or death. Human sacrifices were offered to them to avert their wrath. There were not many of them, at the most one or two in each island. They lived in mystic seclusion. Their powers were sometimes, but not always, hereditary. A missionary has described one of these human gods from personal observation. The god was a very old man who lived in a large house within an enclosure. In the house was a kind of altar, and on the beams of the house and on the trees round it were hung human skeletons, head down. No one entered the enclosure except the persons dedicated to the service of the god; only on days when human victims were sacrificed might ordinary people penetrate into the precinct. This human god received more sacrifices than all the other gods; often he would sit on a sort of scaffold in front of his house and call for two or three human victims at a time. They were always brought, for the terror he inspired was extreme. He was invoked all over the island, and offerings were sent to him from every side. Again, of the South Sea Islands in general we are told that each island had a man who represented or personified the divinity. Such men were called gods, and their substance was confounded with that of the deity. The man-god was sometimes the king himself; oftener he was a priest or subordinate chief. Tanatoa, king of Raiatea, was deified by a certain ceremony performed at the chief temple. "As one of the divinities of his subjects, therefore, the king was worshipped, consulted as an oracle and had sacrifices and prayers offered to him." This was not an exceptional case. The kings of the island regularly enjoyed divine honours, being deified at the time of their accession. At his inauguration the king of Tahiti received a sacred girdle of red and yellow feathers, "which not only raised him to the highest earthly station, but identified him with their gods." A new piece, about eighteen inches long, was added to the belt at the inauguration of every king, and three human victims were sacrificed in the process. The king's houses were called the clouds of heaven; the rainbow was the name of the canoe in which he voyaged; his voice was spoken of as thunder, and the glare of the torches in his dwelling as lightning; and when the people saw them in the evening, as they passed near his house, instead of saying the torches were burning in the palace, they would remark that the lightning was flashing in the clouds of heaven. When he moved from one district to another on the shoulders of his bearers, he was said to be flying. The natives of Futuna, an island in the South Pacific, "are not content with deifying the evils that afflict them; they place gods everywhere, and even go so far as to suppose that the greatest of all the spirits resides in the person of their prince as in a living sanctuary. From this belief springs a strange mode of regarding their king, and of behaving under his authority. In their eyes the sovereign is not responsible for his acts; they deem him inspired by the divine spirit whose tabernacle he is; hence his will is sacred; even his whims and rages are revered; and if it pleases him to play the tyrant, his subjects submit from conscientious motives to the vexations he inflicts on them." The gods of Samoa generally appeared in animal form, but sometimes they were permanently incarnate in men, who gave oracles, received offerings (occasionally of human flesh), healed the sick, answered prayers, and so on. In regard to the old religion of the Fijians, and especially of the inhabitants of Somosomo, it is said that "there appears to be no certain line of demarcation between departed spirits and gods, nor between gods and living men, for many of the priests and old chiefs are considered as sacred persons, and not a few of them will also claim to themselves the right of divinity. 'I am a god,' Tuikilakila would say; and he believed it too." In the Pelew Islands it is thought that every god can take possession of a man and speak through him. The possession may be either temporary or permanent; in the latter case the chosen person is called a *korong*. The god is free in his choice, so the position of *korong* is not hereditary. After the death of a *korong* the god is for some time unrepresented, until he suddenly makes his appearance in a new Avatar. The person thus chosen gives signs of the divine presence by behaving in a strange way; he gapes, runs about, and performs a number of senseless acts. At

first people laugh at him, but his sacred mission is in time recognised, and he is invited to assume his proper position in the state. Generally this position is a distinguished one and confers on him a powerful influence over the whole community. In some of the islands the god is political sovereign of the land; and hence his new incarnation, however humble his origin, is raised to the same high rank, and rules, as god and king, over all the other chiefs.

The ancient Egyptians, far from restricting their adoration to cats and dogs and such small deer, very liberally extended it to men. One of these human deities resided at the village of Anabis, and burnt sacrifices were offered to him on the altars; after which, says Porphyry, he would eat his dinner just as if he were an ordinary mortal. In classical antiquity the Sicilian philosopher Empedocles gave himself out to be not merely a wizard but a god. Addressing his fellow-citizens in verse he said:—

*“O friends, in this great city that climbs the yellow slope
Of Agrigentum’s citadel, who make good works your scope,
Who offer to the stranger a haven quiet and fair,
All hail! Among you honoured I walk with lofty air.
With garlands, blooming garlands you crown my noble brow,
A mortal man no longer, a deathless godhead now.
Where e’er I go, the people crowd round and worship pay,
And thousands follow seeking to learn the better way.
Some crave prophetic visions, some smit with anguish sore
Would fain hear words of comfort and suffer pain no more.”*

He asserted that he could teach his disciples how to make the wind to blow or be still, the rain to fall and the sun to shine, how to banish sickness and old age and to raise the dead. When Demetrius Poliorcetes restored the Athenian democracy in 307 B.C., the Athenians decreed divine honours to him and his father Antigonus, both of them being then alive, under the title of the Saviour Gods. Altars were set up to the Saviours, and a priest appointed to attend to their worship. The people went forth to meet their deliverer with hymns and dances, with garlands and incense and libations; they lined the streets and sang that he was the only true god, for the other gods slept, or dwelt far away, or were not. In the words of a contemporary poet, which were chanted in public and sung in private:—

*“Of all the gods the greatest and the dearest
To the city are come.
For Demeter and Demetrius
Together time has brought.
She comes to hold the Maiden’s awful rites,
And he joyous and fair and laughing,
As befits a god.
A glorious sight, with all his friends about him,
He in their midst,
They like to stars, and he the sun.
Son of Poseidon the mighty, Aphrodite’s son,
All hail!
The other gods dwell far away,
Or have no ears,
Or are not, or pay us no heed.
But thee we present see,
No god of wood or stone, but godhead true.
Therefore to thee we pray.”*

The ancient Germans believed that there was something holy in women, and accordingly consulted them as oracles. Their sacred women, we are told, looked on the eddying rivers and listened to the murmur or the roar of the water, and from the sight and sound foretold what would come to pass. But often the veneration of the men went further, and they worshipped women as true and living goddesses. For example, in the reign of Vespasian a certain Veleda, of the tribe of the Bructeri, was commonly held to be a deity, and in that character reigned over her people, her sway being acknowledged far and wide. She lived in a tower on the river Lippe, a tributary of the Rhine. When the people of Cologne sent to make a treaty with her, the ambassadors were not admitted to her presence; the negotiations were conducted through a minister, who acted as the mouthpiece of her divinity and reported her oracular utterances.

The example shews how easily among our rude forefathers the ideas of divinity and royalty coalesced. It is said that among the Getae down to the beginning of our era there was always a man who personified a god and was called God by the people. He dwelt on a sacred mountain and acted as adviser to the king.

An early Portuguese historian informs us that the Quiteve or king of Sofala, in south-eastern Africa, “is a woolly-haired Kaffir, a heathen who adores nothing whatever, and has no knowledge of God; on the contrary he esteems himself the god of all his lands, and is so looked upon and revered by his subjects.” “When they suffer necessity or scarcity they have recourse to the king, firmly believing that he can give them all that they desire or have need of, and can obtain anything from his dead predecessors, with whom they believe that he holds converse. For this reason they ask the king to give them rain when it is required, and other favourable weather for their harvest, and in coming to ask for any of these things they bring him valuable presents, which the king accepts, bidding them return to their homes and he will be careful to grant their petitions. They are such barbarians that though they see how often the king does not give them what they ask for, they are not undeceived, but make him still greater offerings, and many days are spent in these comings and goings, until the weather turns to rain, and the Kaffirs are satisfied, believing that the king did not grant their request until he had been well bribed and importuned, as he himself affirms, in order to maintain them in their error.” The Zimbabwes, or Muzimbabwes, another people of south-eastern Africa, “do not adore idols or recognise any god, but instead they venerate and honour their king, whom they regard as a divinity, and they say he is the greatest and best in the world. And the said king says of himself that he alone is god of the earth, for which reason if it rains when he does not wish it to do so, or is too hot, he shoots arrows at the sky for not obeying him.”

Amongst the Barotse, a tribe on the upper Zambesi, “there is an old but waning belief that a chief is a demigod, and in heavy thunderstorms the Barotse flock to the chief’s yard for protection from the lightning. I have been greatly distressed at seeing them fall on their knees before the chief, entreating him to open the water-pots of heaven and send rain upon their gardens.” “The king’s servants declare themselves to be invincible, because they are the servants of God (meaning *the king*).”

The Maraves of South Africa “have a spiritual head to whom they ascribe supernatural powers, revering him as a prophet and designating him by the name of Chissumpe. Besides a considerable territory, which he owns and rules, he receives tribute from all, even from the king (*unde*). They believe that this being is invisible and immortal, and they consult him as an oracle, in which case he makes himself heard. He is personified by a *Fumo-a-Chissumpe*, that is, by an intimate of the Chissumpe, whose dignity is hereditary and who is revered exactly like the supposed Chissumpe, with whom he is naturally identical. As he names his own successor, disputes as to the succession do not arise. His oracles are as unintelligible and ambiguous as can well be imagined. He derives great profit from impostors of both sexes, who purchase the gift of soothsaying from him. In the settlement (*Muzinda*) of the Chissumpe

there are women whom the people regard as his wives, but who, according to the universal belief, cannot bear children. If these women are convicted of an offence with a man, they are burnt along with the partner of their guilt." The Mashona of southern Africa informed their bishop that they had once had a god, but that the Matabeles had driven him away. "This last was in reference to a curious custom in some villages of keeping a man they called their god. He seemed to be consulted by the people and had presents given to him. There was one at a village belonging to a chief Magondi, in the old days. We were asked not to fire off any guns near the village, or we should frighten him away." This Mashona god was formerly bound to render an annual tribute to the king of the Matabeles in the shape of four black oxen and one dance. A missionary has seen and described the deity discharging the latter part of his duty in front of the royal hut. For three mortal hours, without a break, to the banging of a tambourine, the click of castanettes, and the drone of a monotonous song, the swarthy god engaged in a frenzied dance, crouching on his hams like a tailor, sweating like a pig, and bounding about with an agility which testified to the strength and elasticity of his divine legs.

"In the Makalaka hills, to the west of Matabeleland, the natives all acknowledge there dwells a god whom they name Ngwali, much worshipped by the bushmen and Makalakas, and feared even by the Matabele: even Lo Bengula paid tribute and sent presents to him often. This individual has only been seen by a few of those who live close by, and who doubtless profit by the numberless offerings made to this strange being; but the god never dies; and the position is supposed to be hereditary in the one family who are the intermediaries for and connexion between Ngwali and the outer world." This Makalaka god "resides in the depth of a cave, in the midst of a labyrinth. Nobody has ever seen him, but he has sons and daughters, who are priests and priestesses and dwell in the neighbourhood of the grotto. It is rather odd that not long ago three sons of this god were put to death like common mortals for having stolen wheat from the king. Lo Bengula probably thought that they should practise justice even more strictly than other folk. . . . In the middle of the cavern, they say, there is a shaft, very deep and very black. From this gulf there issue from time to time terrible noises like the crash of thunder. On the edge of the abyss the worshippers tremblingly lay flesh and wheat, fowls, cakes, and other presents to appease the hunger of the dreadful god and secure his favour. After making this offering the poor suppliants declare aloud their wishes and the object of their application. They ask to know hidden things, future events, the names of those who have cast a spell on them, the issue of such and such an enterprise. After some moments of profound silence there are heard, amid the crash of subterranean thunder, inarticulate sounds, strange broken words, of which it is hard to make out the sense, and which the medicine-men (*amazizis*), who are hand in glove with the makers of thunder, explain to these credulous devotees."

The Baganda of Central Africa believed in a god of Lake Nyanza, who sometimes took up his abode in a man or woman. The incarnate god was much feared by all the people, including the king and the chiefs. When the mystery of incarnation had taken place, the man, or rather the god, removed about a mile and a half from the margin of the lake, and there awaited the appearance of the new moon before he engaged in his sacred duties. From the moment that the crescent moon appeared faintly in the sky, the king and all his subjects were at the command of the divine man, or *Lubare* (god), as he was called, who reigned supreme not only in matters of faith and ritual, but also in questions of war and state policy. He was consulted as an oracle; by his word he could inflict or heal sickness, withhold rain, and cause famine. Large presents were made him when his advice was sought. The chief of Urua, a large region to the west of Lake Tanganyika, "arrogates to himself divine honours and power and pretends to abstain from food for days without feeling its necessity; and, indeed, declares that as a god he is altogether above requiring food and only eats, drinks, and smokes for the

pleasure it affords him.” Among the Gallas, when a woman grows tired of the cares of housekeeping, she begins to talk incoherently and to demean herself extravagantly. This is a sign of the descent of the holy spirit Callo upon her. Immediately her husband prostrates himself and adores her; she ceases to bear the humble title of wife and is called “Lord”; domestic duties have no further claim on her, and her will is a divine law.

The king of Loango is honoured by his people “as though he were a god; and he is called Sambee and Pango, which mean god. They believe that he can let them have rain when he likes; and once a year, in December, which is the time they want rain, the people come to beg of him to grant it to them.” On this occasion the king, standing on his throne, shoots an arrow into the air, which is supposed to bring on rain. Much the same is said of the king of Mombasa. Down to a few years ago, when his spiritual reign on earth was brought to an abrupt end by the carnal weapons of English marines and bluejackets, the king of Benin was the chief object of worship in his dominions. “He occupies a higher post here than the Pope does in Catholic Europe; for he is not only God’s vicegerent upon earth, but a god himself, whose subjects both obey and adore him as such, although I believe their adoration to arise rather from fear than love.” The king of Iddah told the English officers of the Niger Expedition, “God made me after his own image; I am all the same as God; and he appointed me a king.” In the language of the Hos, a Ewe tribe of Togoland, the word for god is *Mawu* and the Great God is *Mawu gã*. They personify the blessing of god and say that the Great God dwells with a rich man. “From the personification of the divine blessing to the deification of the man himself the step is not a long one, and as a matter of fact it is taken. The Hos know men in whose life are to be seen so many resemblances to the Great God that they call them simply *Mawu*. In the neighbourhood of Ho there lived a good many years ago a man who enjoyed an extraordinary reputation in the whole of the neighbourhood, and who accordingly named himself *Wuwo*, that is, ‘more than the others.’ The people actually paid him divine honours, not indeed in the sense that they sacrificed to him, but in the sense that they followed his words absolutely. They worked on his fields and brought him rich presents. On the coast there lived a respected old chief, who called himself *Mawu*. He was richer than all the other chiefs, and the inhabitants of twenty-seven towns rendered him unconditional obedience. In the circumstance that he was richer and more honoured than all the other chiefs he saw his resemblance to the deity.”

Among the Hovas and other tribes of Madagascar there is said to be a deep sense of the divinity of kings; and down to the acceptance of Christianity by the late queen, the Hova sovereigns were regularly termed “the visible God” (*Andriamánitra híta mào*) and other terms of similar import were also applied to them. The chiefs of the Betsileo in Madagascar “are considered as far above the common people and are looked upon almost as if they were gods.” “For the chiefs are supposed to have power as regards the words they utter, not, however, merely the power which a king possesses, but power like that of God; a power which works of itself on account of its inherent virtue, and not power exerted through soldiers and strong servants.” “The *Ampandzaka-mandzaka* or sovereign whom the Sakkalava of the north often call also *Zanahari antani*, God on earth, is surrounded by them with a veneration which resembles idolatry, and the vulgar are simple enough to attribute the creation of the world to his ancestors. The different parts of his body and his least actions are described by nouns and verbs which are foreign to the ordinary language, forming a separate vocabulary called *Voûla fâli*, sacred words, or *Voûla n’ ampandzâka*, princely words. The person and the goods of the *Ampandzaka-mandzaka* are *fali*, sacred.”

The theory of the real divinity of a king is said to be held strongly in the Malay region. Not only is the king’s person considered sacred, but the sanctity of his body is supposed to communicate itself to his regalia and to slay those who break the royal taboos. Thus it is

firmly believed that any one who seriously offends the royal person, who imitates or touches even for a moment the chief objects of the regalia, or who wrongfully makes use of the insignia or privileges of royalty, will be *kěna daulat*, that is, struck dead by a sort of electric discharge of that divine power which the Malays suppose to reside in the king's person and to which they give the name of *daulat* or sanctity. The regalia of every petty Malay state are believed to be endowed with supernatural powers; and we are told that "the extraordinary strength of the Malay belief in the supernatural powers of the regalia of their sovereigns can only be thoroughly realised after a study of their romances, in which their kings are credited with all the attributes of inferior gods, whose birth, as indeed every subsequent act of their after-life, is attended by the most amazing prodigies."

Among the Battas of Central Sumatra there is a prince who bears the hereditary title of Singa Mangaradja and is worshipped as a deity. He reigns over Bakara, a village on the south-western shore of Lake Toba; but his worship is diffused among the tribes both near and far. All sorts of strange stories are told of him. It is said that he was seven years in his mother's womb, and thus came into the world a seven-year-old child; that he has a black hairy tongue, the sight of which is fatal, so that in speaking he keeps his mouth as nearly shut as possible and gives all his orders in writing. Sometimes he remains seven months without eating, or sleeps for three months together. He can make the sun to shine or the rain to fall at his pleasure; hence the people pray to him for a good harvest, and worshippers hasten to Bakara from all sides with offerings in the hope of thereby securing his miraculous aid. Wherever he goes, the gongs are solemnly beaten and the public peace may not be broken. He is said to eat neither pork nor dog's flesh. The Battas used to cherish a superstitious veneration for the Sultan of Minangkabau, and shewed a blind submission to his relations and emissaries, real or pretended, when these persons appeared among them for the purpose of levying contributions. Even when insulted and put in fear of their lives they made no attempt at resistance; for they believed that their affairs would never prosper, that their rice would be blighted and their buffaloes die, and that they would remain under a sort of spell if they offended these sacred messengers. In the kingdom of Loowoo the great majority of the people have never seen the king, and they believe that were they to see him their belly would swell up and they would die on the spot. The farther you go from the capital, the more firmly rooted is this belief. In time of public calamity, as during war or pestilence, some of the Molucca Islanders used to celebrate a festival of heaven. If no good result followed, they bought a slave, took him at the next festival to the place of sacrifice, and set him on a raised place under a certain bamboo-tree. This tree represented heaven, and had been honoured as its image at former festivals. The portion of the sacrifice which had previously been offered to heaven was now given to the slave, who ate and drank it in the name and stead of heaven. Henceforth he was well treated, kept for the festivals of heaven, and employed to represent heaven and receive the offerings in its name. Every Alfoor village of northern Ceram has usually six priests, of whom the most intelligent discharges the duties of high priest. This man is the most powerful person in the village; all the inhabitants, even the regent, are subject to him and must do his bidding. The common herd regard him as a higher being, a sort of demi-god. He aims at surrounding himself with an atmosphere of mystery, and for this purpose lives in great seclusion, generally in the council-house of the village, where he conceals himself from vulgar eyes behind a screen or partition. However, in this case the god seems to be in process of incubation rather than full-fledged.

A peculiarly bloodthirsty monarch of Burma, by name Badonsachen, whose very countenance reflected the inbred ferocity of his nature, and under whose reign more victims perished by the executioner than by the common enemy, conceived the notion that he was something more than mortal, and that this high distinction had been granted him as a reward

for his numerous good works. Accordingly he laid aside the title of king and aimed at making himself a god. With this view, and in imitation of Buddha, who, before being advanced to the rank of a divinity, had quitted his royal palace and seraglio and retired from the world, Badonsachen withdrew from his palace to an immense pagoda, the largest in the empire, which he had been engaged in constructing for many years. Here he held conferences with the most learned monks, in which he sought to persuade them that the five thousand years assigned for the observance of the law of Buddha were now elapsed, and that he himself was the god who was destined to appear after that period, and to abolish the old law by substituting his own. But to his great mortification many of the monks undertook to demonstrate the contrary; and this disappointment, combined with his love of power and his impatience under the restraints of an ascetic life, quickly disabused him of his imaginary godhead, and drove him back to his palace and his harem. The king of Siam "is venerated equally with a divinity. His subjects ought not to look him in the face; they prostrate themselves before him when he passes, and appear before him on their knees, their elbows resting on the ground." There is a special language devoted to his sacred person and attributes, and it must be used by all who speak to or of him. Even the natives have difficulty in mastering this peculiar vocabulary. The hairs of the monarch's head, the soles of his feet, the breath of his body, indeed every single detail of his person, both outward and inward, have particular names. When he eats or drinks, sleeps or walks, a special word indicates that these acts are being performed by the sovereign, and such words cannot possibly be applied to the acts of any other person whatever. There is no word in the Siamese language by which any creature of higher rank or greater dignity than a monarch can be described; and the missionaries, when they speak of God, are forced to use the native word for king. In Tonquin every village chooses its guardian spirit, often in the form of an animal, as a dog, tiger, cat, or serpent. Sometimes a living person is selected as patron-divinity. Thus a beggar persuaded the people of a village that he was their guardian spirit; so they loaded him with honours and entertained him with their best. At the present day the head of the great Persian sect of the Babites, Abbas Effendi by name, resides at Acre in Syria, and is held by Frenchmen, Russians, and Americans, especially by rich American ladies, to be an incarnation of God himself. The late Professor S. I. Curtiss of Chicago had the honour of dining with "the master," as he is invariably called by his followers, when the incarnation expressed a kindly hope that he might have the pleasure of drinking tea with the professor in the kingdom of heaven.

But perhaps no country in the world has been so prolific of human gods as India; nowhere has the divine grace been poured out in a more liberal measure on all classes of society from kings down to milkmen. Thus amongst the Todas, a pastoral people of the Neilgherry Hills of southern India, the dairy is a sanctuary, and the milkman who attends to it has been described as a god. On being asked whether the Todas salute the sun, one of these divine milkmen replied, "Those poor fellows do so, but I," tapping his chest, "I, a god! why should I salute the sun?" Every one, even his own father, prostrates himself before the milkman, and no one would dare to refuse him anything. No human being, except another milkman, may touch him; and he gives oracles to all who consult him, speaking with the voice of a god.

Further, in India "every king is regarded as little short of a present god." The Hindoo law-book of Manu goes farther and says that "even an infant king must not be despised from an idea that he is a mere mortal; for he is a great deity in human form." As to the Brahmans it is laid down in the same treatise that a Brahman, "be he ignorant or learned, is a great divinity, just as the fire, whether carried forth (for the performance of a burnt-oblation) or not carried forth, is a great divinity." Further, it is said that though Brahmans "employ themselves in all sorts of mean occupations, they must be honoured in every way; for each of them is a very

great deity.” In another ancient Hindoo book we read that “verily, there are two kinds of gods; for, indeed, the gods are the gods; and the Brahmans who have studied and teach sacred lore are the human gods. The sacrifice of these is divided into two kinds: oblations constitute the sacrifice to the gods; and gifts to the priests that to the human gods, the Brahmans who have studied and teach sacred lore.” The spiritual power of a Brahman priest is described as unbounded. “His anger is as terrible as that of the gods. His blessing makes rich, his curse withers. Nay, more, he is himself actually worshipped as a god. No marvel, no prodigy in nature is believed to be beyond the limits of his power to accomplish. If the priest were to threaten to bring down the sun from the sky or arrest it in its daily course in the heavens, no villager would for a moment doubt his ability to do so.” As to the *mantras*, or sacred texts by means of which the Brahmans exercise their miraculous powers, there is a saying everywhere current in India: “The whole universe is subject to the gods; the gods are subject to the Mantras; the Mantras to the Brahmans; therefore the Brahmans are our gods.” There is said to have been a sect in Orissa some years ago who worshipped the late Queen Victoria in her lifetime as their chief divinity. And to this day in India all living persons remarkable for great strength or valour or for supposed miraculous powers run the risk of being worshipped as gods. Thus, a sect in the Punjab worshipped a deity whom they called Nikkal Sen. This Nikkal Sen was no other than the redoubted General Nicholson, and nothing that the general could do or say damped the ardour of his adorers. The more he punished them, the greater grew the religious awe with which they worshipped him. At Benares a few years ago a celebrated deity was incarnate in the person of a Hindoo gentleman who rejoiced in the euphonious name of Swami Bhaskaranandaji Saraswati, and looked uncommonly like the late Cardinal Manning, only more ingenuous. His eyes beamed with kindly human interest, and he took what is described as an innocent pleasure in the divine honours paid him by his confiding worshippers.

The Lingayats are the Unitarians of Hindooism, for they believe in only one god, Siva, rejecting the other two persons of the Hindoo Trinity. Yet “they esteem the *Jangam* or priest as superior even to the deity. They pay homage to the *Jangam* first and to Siva afterwards. The *Jangam* is regarded as an incarnation of the deity. . . . In practice the *Jangam* is placed first and, as stated above, is worshipped as god upon earth.” In 1900 a hill-man in Vizagapatam gave out that he was an incarnate god, and his claims to divinity were accepted by a following of five thousand people, who, when a sceptical government sent an armed force to suppress the movement, which threatened political trouble, testified to the faith that was in them by resisting even to the shedding of their blood. Two policemen who refused to bow the knee to the new god were knocked on the head. However, in the scuffle the deity himself was arrested and laid by the heels in gaol, where he died just like a common mortal.

At Chinchvad, a small town about ten miles from Poona in western India, there lives a family of whom one in each generation is believed by a large proportion of the Mahrattas to be an incarnation of the elephant-headed god Gunputty. That celebrated deity was first made flesh about the year 1640 in the person of a Brahman of Poona, by name Mooraba Gosseyn, who sought to work out his salvation by abstinence, mortification, and prayer. His piety had its reward. The god himself appeared to him in a vision of the night and promised that a portion of his, that is, of Gunputty’s holy spirit should abide with him and with his seed after him even to the seventh generation. The divine promise was fulfilled. Seven successive incarnations, transmitted from father to son, manifested the light of Gunputty to a dark world. The last of the direct line, a heavy-looking god with very weak eyes, died in the year 1810. But the cause of truth was too sacred, and the value of the church property too considerable, to allow the Brahmans to contemplate with equanimity the unspeakable loss that would be sustained by a world which knew not Gunputty. Accordingly they sought and found a holy vessel in whom the divine spirit of the master had revealed itself anew, and the revelation has

been happily continued in an unbroken succession of vessels from that time to this. But a mysterious law of spiritual economy, whose operation in the history of religion we may deplore though we cannot alter, has decreed that the miracles wrought by the god-man in these degenerate days cannot compare with those which were wrought by his predecessors in days gone by; and it is even reported that the only sign vouchsafed by him to the present generation of vipers is the miracle of feeding the multitude whom he annually entertains to dinner at Chinchvad.

A Hindoo sect, which has many representatives in Bombay and Central India, holds that its spiritual chiefs or Maharajas, as they are called, are representatives or even actual incarnations on earth of the god Krishna. Hence in the temples where the Maharajas do homage to the idols, men and women do homage to the Maharajas, prostrating themselves at their feet, offering them incense, fruits, and flowers, and waving lights before them, as the Maharajas themselves do before the images of the gods. One mode of worshipping Krishna is by swinging his images in swings. Hence, in every district presided over by a Maharaja, the women are wont to worship not Krishna but the Maharaja by swinging him in pendulous seats. The leavings of his food, the dust on which he treads, the water in which his dirty linen is washed, are all eagerly swallowed by his devotees, who worship his wooden shoes, and prostrate themselves before his seat and his painted portraits. And as Krishna looks down from heaven with most favour on such as minister to the wants of his successors and vicars on earth, a peculiar rite called Self-devotion has been instituted, whereby his faithful worshippers make over their bodies, their souls, and, what is perhaps still more important, their worldly substance to his adorable incarnations; and women are taught to believe that the highest bliss for themselves and their families is to be attained by yielding themselves to the embraces of those beings in whom the divine nature mysteriously coexists with the form and even the appetites of true humanity.

Christianity itself has not uniformly escaped the taint of these unhappy delusions; indeed it has often been sullied by the extravagances of vain pretenders to a divinity equal to or even surpassing that of its great Founder. In the second century Montanus the Phrygian claimed to be the incarnate Trinity, uniting in his single person God the Father, God the Son, and God the Holy Ghost. Nor is this an isolated case, the exorbitant pretension of a single ill-balanced mind. From the earliest times down to the present day many sects have believed that Christ, nay God himself, is incarnate in every fully initiated Christian, and they have carried this belief to its logical conclusion by adoring each other. Tertullian records that this was done by his fellow-Christians at Carthage in the second century; the disciples of St. Columba worshipped him as an embodiment of Christ; and in the eighth century Elipandus of Toledo spoke of Christ as “a god among gods,” meaning that all believers were gods just as truly as Jesus himself. The adoration of each other was customary among the Albigenses, and is noticed hundreds of times in the records of the Inquisition at Toulouse in the early part of the fourteenth century. It is still practised by the Paulicians of Armenia and the Bogomiles about Moscow. The Paulicians, indeed, presume to justify their faith, if not their practice, by the authority of St. Paul, who said, “It is not I that speak, but Christ that dwelleth in me.” Hence the members of this Russian sect are known as the Christs. “Among them men and women alike take upon themselves the calling of teachers and prophets, and in this character they lead a strict, ascetic life, refrain from the most ordinary and innocent pleasures, exhaust themselves by long fasting and wild ecstatic religious exercises, and abhor marriage. Under the excitement caused by their supposed holiness and inspiration, they call themselves not only teachers and prophets, but also ‘Saviours,’ ‘Redeemers,’ ‘Christs,’ ‘Mothers of God.’ Generally speaking, they call themselves simply Gods, and pray to each other as to real gods and living Christs or Madonnas.”

In the thirteenth century there arose a sect called the Brethren and Sisters of the Free Spirit, who held that by long and assiduous contemplation any man might be united to the deity in an ineffable manner and become one with the source and parent of all things, and that he who had thus ascended to God and been absorbed in his beatific essence, actually formed part of the Godhead, was the Son of God in the same sense and manner with Christ himself, and enjoyed thereby a glorious immunity from the trammels of all laws human and divine. Inwardly transported by this blissful persuasion, though outwardly presenting in their aspect and manners a shocking air of lunacy and distraction, the sectaries roamed from place to place, attired in the most fantastic apparel and begging their bread with wild shouts and clamour, spurning indignantly every kind of honest labour and industry as an obstacle to divine contemplation and to the ascent of the soul towards the Father of spirits. In all their excursions they were followed by women with whom they lived on terms of the closest familiarity. Those of them who conceived they had made the greatest proficiency in the higher spiritual life dispensed with the use of clothes altogether in their assemblies, looking upon decency and modesty as marks of inward corruption, characteristics of a soul that still grovelled under the dominion of the flesh and had not yet been elevated into communion with the divine spirit, its centre and source. Sometimes their progress towards this mystic communion was accelerated by the Inquisition, and they expired in the flames, not merely with unclouded serenity, but with the most triumphant feelings of cheerfulness and joy. In the same century a Bohemian woman named Wilhelmina, whose head had been turned by brooding over some crazy predictions about a coming age of the Holy Ghost, persuaded herself and many people besides that the Holy Ghost had actually become incarnate in her person for the salvation of a great part of mankind. She died at Milan in the year 1281 in the most fragrant odour of sanctity, and her memory was held in the highest veneration by a numerous following, and even honoured with religious worship both public and private.

About the year 1830 there appeared, in one of the states of the American Union bordering on Kentucky, an impostor who declared that he was the Son of God, the Saviour of mankind, and that he had reappeared on earth to recall the impious, the unbelieving, and sinners to their duty. He protested that if they did not mend their ways within a certain time, he would give the signal, and in a moment the world would crumble to ruins. These extravagant pretensions were received with favour even by persons of wealth and position in society. At last a German humbly besought the new Messiah to announce the dreadful catastrophe to his fellow-countrymen in the German language, as they did not understand English, and it seemed a pity that they should be damned merely on that account. The would-be Saviour in reply confessed with great candour that he did not know German. "What!" retorted the German, "you the Son of God, and don't speak all languages, and don't even know German? Come, come, you are a knave, a hypocrite, and a madman. Bedlam is the place for you." The spectators laughed, and went away ashamed of their credulity. About thirty years ago a new sect was founded at Patiala in the Punjaub by a wretched creature named Hakim Singh, who lived in extreme poverty and filth, gave himself out to be a reincarnation of Jesus Christ, and offered to baptize the missionaries who attempted to argue with him. He proposed shortly to destroy the British Government, and to convert and conquer the world. His gospel was accepted by four thousand believers in his immediate neighbourhood. Cases like these verge on, if they do not cross, the wavering and uncertain line which divides the raptures of religion from insanity.

Sometimes, at the death of the human incarnation, the divine spirit transmigrates into another man. In the kingdom of Kaffa, in eastern Africa, the heathen part of the people worship a spirit called *Deòce*, to whom they offer prayer and sacrifice, and whom they invoke on all important occasions. This spirit is incarnate in the grand magician or pope, a person of great

wealth and influence, ranking almost with the king, and wielding the spiritual, as the king wields the temporal power. It happened that, shortly before the arrival of a Christian missionary in the kingdom, this African pope died, and the priests, fearing lest the missionary might assume the position vacated by the deceased prelate, declared that the *Deòce* had passed into the king, who henceforth, uniting the spiritual with the temporal power, reigned as god and king. Before beginning to work at the salt-pans in a Laosian village, the workmen offer sacrifice to the divinity of the salt-pans. This divinity is incarnate in a woman and transmigrates at her death into another woman. In Bhotan the spiritual head of the government is a dignitary called the Dhurma Rajah, who is supposed to be a perpetual incarnation of the deity. At his death the new incarnate god shews himself in an infant by the refusal of his mother's milk and a preference for that of a cow.

The Buddhist Tartars believe in a great number of living Buddhas, who officiate as Grand Lamas at the head of the most important monasteries. When one of these Grand Lamas dies his disciples do not sorrow, for they know that he will soon reappear, being born in the form of an infant. Their only anxiety is to discover the place of his birth. If at this time they see a rainbow they take it as a sign sent them by the departed Lama to guide them to his cradle. Sometimes the divine infant himself reveals his identity. "I am the Grand Lama," he says, "the living Buddha of such and such a temple. Take me to my old monastery. I am its immortal head." In whatever way the birthplace of the Buddha is revealed, whether by the Buddha's own avowal or by the sign in the sky, tents are struck, and the joyful pilgrims, often headed by the king or one of the most illustrious of the royal family, set forth to find and bring home the infant god. Generally he is born in Tibet, the holy land, and to reach him the caravan has often to traverse the most frightful deserts. When at last they find the child they fall down and worship him. Before, however, he is acknowledged as the Grand Lama whom they seek he must satisfy them of his identity. He is asked the name of the monastery of which he claims to be the head, how far off it is, and how many monks live in it; he must also describe the habits of the deceased Grand Lama and the manner of his death. Then various articles, as prayer-books, tea-pots, and cups, are placed before him, and he has to point out those used by himself in his previous life. If he does so without a mistake his claims are admitted, and he is conducted in triumph to the monastery. At the head of all the Lamas is the Dalai Lama of Lhasa, the Rome of Tibet. He is regarded as a living god, and at death his divine and immortal spirit is born again in a child. According to some accounts the mode of discovering the Dalai Lama is similar to the method, already described, of discovering an ordinary Grand Lama. Other accounts speak of an election by drawing lots from a golden jar. Wherever he is born, the trees and plants put forth green leaves; at his bidding flowers bloom and springs of water rise; and his presence diffuses heavenly blessings. His palace stands on a commanding height; its gilded cupolas are seen sparkling in the sunlight for miles. In 1661 or 1662 Fathers Grueber and d'Orville, on their return from Peking to Europe, spent two months at Lhasa waiting for a caravan, and they report that the Grand Lama was worshipped as a true and living god, that he received the title of the Eternal and Heavenly Father, and that he was believed to have risen from the dead no less than seven times. He lived withdrawn from the business of this passing world in the recesses of his palace, where, seated aloft on a cushion and precious carpets, he received the homage of his adorers in a chamber screened from the garish eye of day, but glittering with gold and silver, and lit up by the blaze of a multitude of torches. His worshippers, with heads bowed to the earth, attested their veneration by kissing his feet, and even bribed the attendant Lamas with great sums to give them a little of the natural secretions of his divine person, which they either swallowed with their food or wore about their necks as an amulet that fortified them against the assaults of every ailment.

But he is by no means the only man who poses as a god in these regions. A register of all the incarnate gods in the Chinese empire is kept in the *Li fan yüan* or Colonial Office at Peking. The number of gods who have thus taken out a license is one hundred and sixty. Tibet is blessed with thirty of them, northern Mongolia rejoices in nineteen, and southern Mongolia basks in the sunshine of no less than fifty-seven. The Chinese government, with a paternal solicitude for the welfare of its subjects, forbids the gods on the register to be reborn anywhere but in Tibet. They fear lest the birth of a god in Mongolia should have serious political consequences by stirring the dormant patriotism and warlike spirit of the Mongols, who might rally round an ambitious native deity of royal lineage and seek to win for him, at the point of the sword, a temporal as well as a spiritual kingdom. But besides these public or licensed gods there are a great many little private gods, or unlicensed practitioners of divinity, who work miracles and bless their people in holes and corners; and of late years the Chinese government has winked at the rebirth of these pettifogging deities outside of Tibet. However, once they are born, the government keeps its eye on them as well as on the regular practitioners, and if any of them misbehaves he is promptly degraded, banished to a distant monastery, and strictly forbidden ever to be born again in the flesh.

At the head of Taoism, the most numerous religious sect of China, is a pope who goes by the name of the Heavenly Master and is believed to be an incarnation and representative on earth of the god of heaven. His official title is *Chên-yen*, or "the True Man." When one of these pontiffs or incarnate deities departs this life, his soul passes into a male member of his family, the ancient house of Chang. In order to determine the chosen vessel, all the male members of the clan assemble at the palace, their names are engraved on tablets of lead, the tablets are thrown into a vase full of water, and the one which bears the name of the new incarnation floats on the surface. The reputation and power of the pope are very great. He lives in princely style at his palace on the Dragon and Tiger mountains in the province of Kiang-si, about twenty-five miles to the south-west of Kuei-Ki. The road, which is kept in good repair, partly flagged, and provided at regular intervals with stone halls for the repose of weary pilgrims, leads gradually upward through a bleak and barren district, treeless and thinly peopled, to the summit of a pass, from which a beautiful prospect suddenly opens up of a wide and fertile valley watered by a little stream. The scene charms the traveller all the more by contrast with the desert country which he has just traversed. This is the beginning of the pope's patrimony, which he holds from the emperor free of taxes. The palace stands in the middle of a little town. It is new and of no special interest, having been rebuilt after the Taiping rebellion. For in their march northward the rebels devastated the papal domains with great fury. About a mile to the east of the palace lie the ruins of stately temples, which also perished in the great rising and have only in part been rebuilt. However, the principal temple is well preserved. It is dedicated to the god of heaven and contains a colossal image of that deity. The papal residence naturally swarms with monks and priests of all ranks. But the courts and gardens of the monasteries, littered with heaps of broken bricks and stones and mouldering wood, present a melancholy spectacle of decay. And the ruinous state of the religious capital reflects the decline of the papacy. The number of pilgrims has fallen off and with them the revenues of the holy see. Of old the pope ranked with viceroys and the highest dignitaries of the empire; now he is reduced to the level of a mandarin of the third class, and wears a blue button instead of a red. Formerly he repaired every year to the imperial court at Peking or elsewhere in order to procure peace and prosperity for the whole kingdom by means of his ceremonies; and on his journey the gods and spirits were bound to come from every quarter to pay him homage, unless he considerately hung out on his palanquin a board with the notice, "You need not trouble to salute." The people, too, gathered up the dust or mud from under his feet to preserve it as a priceless talisman. Nowadays, if he goes to court at all, it seems to be not oftener than once in three years; and his services are seldom wanted

except to ban the demons of plague. But he still exercises the right of elevating deceased mandarins to the rank of local deities, and as he receives a fee for every deification, the ranks of the celestial hierarchy naturally receive many recruits. He also draws a considerable revenue from the manufacture and sale of red and green papers inscribed with cabalistic characters, which are infallible safeguards against demons, disease, and calamities of every sort.

From our survey of the religious position occupied by the king in rude societies we may infer that the claim to divine and supernatural powers put forward by the monarchs of great historical empires like those of Egypt, China, Mexico, and Peru, was not the simple outcome of inflated vanity or the empty expression of a grovelling adulation; it was merely a survival and extension of the old savage apotheosis of living kings. Thus, for example, as children of the Sun the Incas of Peru were revered like gods; they could do no wrong, and no one dreamed of offending against the person, honour, or property of the monarch or of any of the royal race. Hence, too, the Incas did not, like most people, look on sickness as an evil. They considered it a messenger sent from their father the Sun to call them to come and rest with him in heaven. Therefore the usual words in which an Inca announced his approaching end were these: "My father calls me to come and rest with him." They would not oppose their father's will by offering sacrifice for recovery, but openly declared that he had called them to his rest. Issuing from the sultry valleys upon the lofty table-land of the Colombian Andes, the Spanish conquerors were astonished to find, in contrast to the savage hordes they had left in the sweltering jungles below, a people enjoying a fair degree of civilisation, practising agriculture, and living under a government which Humboldt has compared to the theocracies of Tibet and Japan. These were the Chibchas, Muyscas, or Mozcas, divided into two kingdoms, with capitals at Bogota and Tunja, but united apparently in spiritual allegiance to the high pontiff of Sogamozo or Iraca. By a long and ascetic novitiate, this ghostly ruler was reputed to have acquired such sanctity that the waters and the rain obeyed him, and the weather depended on his will. The Mexican kings at their accession, as we have seen, took an oath that they would make the sun to shine, the clouds to give rain, the rivers to flow, and the earth to bring forth fruits in abundance. We are told that Montezuma, the last king of Mexico, was worshipped by his people as a god.

In China, if the emperor is not himself worshipped as a deity, he is supposed by his subjects to be the lord and master of all the gods. On this subject a leading authority on Chinese religion observes: "To no son of China would it ever occur to question the supreme authority wielded by the emperor and his proxies, the mandarins, not only over mankind, but also over the gods. For the gods or *shen* are souls of intrinsically the same nature as those existing in human beings; why then, simply because they have no human bodies, should they be placed above the emperor, who is no less than a son of Heaven, that is to say, a magnitude second to none but Heaven or the Power above whom there is none—who governs the universe and all that moves and exists therein? Such absurdity could not possibly be entertained by Chinese reason. So it is a first article of China's political creed that the emperor, as well as Heaven, is lord and master of all the gods, and delegates this dignity to his mandarins, each in his jurisdiction. With them then rests the decision which of the gods are entitled to receive the people's worship, and which are not. It is the imperial government which deifies disembodied souls of men, and also divests them of their divine rank. Their worship, if established against its will or without its consent, can be exterminated at its pleasure, without revenge having to be feared from the side of the god for any such radical measure; for the power of even the mightiest and strongest god is as naught compared with that of the august Celestial Being with whose will and under whose protection the Son reigns supreme over everything existing below the empyrean, unless he forfeits this omnipotent support through neglect of his

imperial duties.” As the emperor of China is believed to be a Son of Heaven, so the Emperor of Japan, the Mikado, is supposed to be an incarnation of the sun goddess, the deity who rules the universe, gods and men included. Once a year all the gods wait upon him, and spend a month at his court. During that month, the name of which means “without gods,” no one frequents the temples, for they are believed to be deserted.

The early Babylonian kings, from the time of Sargon I. till the fourth dynasty of Ur or later, claimed to be gods in their lifetime. The monarchs of the fourth dynasty of Ur in particular had temples built in their honour; they set up their statues in various sanctuaries and commanded the people to sacrifice to them; the eighth month was especially dedicated to the kings, and sacrifices were offered to them at the new moon and on the fifteenth of each month. Again, the Parthian monarchs of the Arsacid house styled themselves brothers of the sun and moon and were worshipped as deities. It was esteemed sacrilege to strike even a private member of the Arsacid family in a brawl.

The kings of Egypt were deified in their lifetime, sacrifices were offered to them, and their worship was celebrated in special temples and by special priests. Indeed the worship of the kings sometimes cast that of the gods into the shade. Thus in the reign of Merenra a high official declared that he had built many holy places in order that the spirits of the king, the ever-living Merenra, might be invoked “more than all the gods.” “It has never been doubted that the king claimed actual divinity; he was the ‘great god,’ the ‘golden Horus,’ and son of Ra. He claimed authority not only over Egypt, but over ‘all lands and nations,’ ‘the whole world in its length and its breadth, the east and the west,’ ‘the entire compass of the great circuit of the sun,’ ‘the sky and what is in it, the earth and all that is upon it,’ ‘every creature that walks upon two or upon four legs, all that fly or flutter, the whole world offers her productions to him.’ Whatever in fact might be asserted of the Sun-god, was dogmatically predicable of the king of Egypt. His titles were directly derived from those of the sun-god.” “In the course of his existence,” we are told, “the king of Egypt exhausted all the possible conceptions of divinity which the Egyptians had framed for themselves. A superhuman god by his birth and by his royal office, he became the deified man after his death. Thus all that was known of the divine was summed up in him.” “The divinity of the king was recognised in all the circumstances of the public life of the sovereign. It was not enough to worship Pharaoh in the temple; beyond the limits of the sanctuary he remained the ‘good god’ to whom all men owed a perpetual adoration. The very name of the sovereign was sacred like his person; people swore by his name as by that of the gods, and he who took the oath in vain was punished.” In particular the king of Egypt was identified with the great sun-god Ra. “Son of the sun, decked with the solar crowns, armed with the solar weapons, gods and men adored him as Ra, defended him as Ra from the attacks which menaced in him the divine being who, in his human existence, knew the glory and the dangers of being ‘an incarnate sun’ and ‘the living image on earth of his father Tum of Heliopolis.’” Even the life of the gods depended on the divine life of the king. Gods and men, it is said, “live by the words of his mouth.” “O gods,” said the king before celebrating divine worship, “you are safe, if I am safe. Your doubles are safe if my double is safe at the head of all living doubles. All live, if I live.” The king was addressed as “Lord of heaven, lord of earth, sun, life of the whole world, lord of time, measurer of the sun’s course, Tum for men, lord of well-being, creator of the harvest, maker and fashioner of mortals, bestower of breath upon all men, giver of life to all the host of gods, pillar of heaven, threshold of the earth, weigher of the equipoise of both worlds, lord of rich gifts, increaser of the corn,” and so forth. Yet, as we should expect, the exalted powers thus ascribed to the king differ in degree rather than in kind from those which every Egyptian claimed for himself. Professor Tiele observes that “as every good man at his death became Osiris, as every one in danger or need could by the use of magic sentences assume the form

of a deity, it is quite comprehensible how the king, not only after death, but already during his life, was placed on a level with the deity.”

We have now completed our sketch, for it is no more than a sketch, of the evolution of that sacred kingship which attained its highest form, its most absolute expression, in the monarchies of Peru and Egypt, of China and Japan. Historically, the institution appears to have originated in the order of public magicians or medicine-men; logically it rests on a mistaken deduction from the association of ideas. Men mistook the order of their ideas for the order of nature, and hence imagined that the control which they have, or seem to have, over their thoughts, permitted them to exercise a corresponding control over things. The men who for one reason or another, because of the strength or the weakness of their natural parts, were supposed to possess these magical powers in the highest degree, were gradually marked off from their fellows and became a separate class, who were destined to exercise a most far-reaching influence on the political, religious, and intellectual evolution of mankind. Social progress, as we know, consists mainly in a successive differentiation of functions, or, in simpler language, a division of labour. The work which in primitive society is done by all alike and by all equally ill, or nearly so, is gradually distributed among different classes of workers and executed more and more perfectly; and so far as the products, material or immaterial, of this specialised labour are shared by all, the whole community benefits by the increasing specialisation. Now magicians or medicine-men appear to constitute the oldest artificial or professional class in the evolution of society. For sorcerers are found in every savage tribe known to us; and among the lowest savages, such as the Australian aborigines, they are the only professional class that exists. As time goes on, and the process of differentiation continues, the order of medicine-men is itself subdivided into such classes as the healers of disease, the makers of rain, and so forth; while the most powerful member of the order wins for himself a position as chief and gradually develops into a sacred king, his old magical functions falling more and more into the background and being exchanged for priestly or even divine duties, in proportion as magic is slowly ousted by religion. Still later, a partition is effected between the civil and the religious aspect of the kingship, the temporal power being committed to one man and the spiritual to another. Meanwhile the magicians, who may be repressed but cannot be extirpated by the predominance of religion, still addict themselves to their old occult arts in preference to the newer ritual of sacrifice and prayer; and in time the more sagacious of their number perceive the fallacy of magic and hit upon a more effectual mode of manipulating the forces of nature for the good of man; in short, they abandon sorcery for science. I am far from affirming that the course of development has everywhere rigidly followed these lines: it has doubtless varied greatly in different societies. I merely mean to indicate in the broadest outline what I conceive to have been its general trend. Regarded from the industrial point of view the evolution has been from uniformity to diversity of function: regarded from the political point of view, it has been from democracy to despotism. With the later history of monarchy, especially with the decay of despotism and its displacement by forms of government better adapted to the higher needs of humanity, we are not concerned in this enquiry: our theme is the growth, not the decay, of a great and, in its time, beneficent institution.

Appendix. Hegel On Magic And Religion

My friend Professor James Ward has pointed out to me that the view which I have taken of the nature and historical relations of magic and religion was anticipated by Hegel in his *Lectures on the Philosophy of Religion*. So far as I understand the philosopher's exposition, the agreement between us amounts to this: we both hold that in the mental evolution of humanity an age of magic preceded an age of religion, and that the characteristic difference between magic and religion is that, whereas magic aims at controlling nature directly, religion aims at controlling it indirectly through the mediation of a powerful supernatural being or beings to whom man appeals for help and protection. That I take to be the substance of Hegel's meaning in the following passages which I extract from his lectures on the philosophy of religion.

Speaking of what he calls the religion of nature he observes: "Fear of the powers of nature, of the sun, of thunder-storms, etc., is here not as yet fear which might be called religious fear, for this has its seat in freedom. The fear of God is a different fear from the fear of natural forces. It is said that 'fear is the beginning of wisdom'; this fear cannot present itself in immediate religion. It first appears in man when he knows himself to be powerless in his particularity, when his particularity trembles within him. . . . It is not, however, fear in this higher sense only that is not present here, but even the fear of the powers of nature, so far as it enters at all at this first stage of the religion of nature, changes round into its opposite, and becomes magic.

"The absolutely primary form of religion, to which we give the name of magic, consists in this, that the Spiritual is the ruling power over nature. This spiritual element does not yet exist, however, as Spirit; it is not yet found in its universality, but is merely the particular, contingent, empirical self-consciousness of man, which, although it is only mere passion, knows itself to be higher in its self-consciousness than nature—knows that it is a power ruling over nature. . . . This power is a direct power over nature in general, and is not to be likened to the indirect power, which we exercise by means of implements over natural objects in their separate forms. . . . Here the power over nature acts in a direct way. It thus is magic or sorcery.

"As regards the external mode in which this idea actually appears, it is found in a form which implies that this magic is what is highest in the self-consciousness of those peoples. But in a subordinate way magic steals up to higher standpoints too, and insinuates itself into higher religions, and thus into the popular conception of witches, although in that form it is recognised as something which is partly impotent, and partly improper and godless.

"There has been an inclination on the part of some (as, for example, in the Kantian philosophy) to consider prayer too as magic, because man seeks to make it effectual, not through mediation, but by starting direct from Spirit. The distinction here, however, is that man appeals to an absolute will, for which even the individual or unit is an object of care, and which can either grant the prayer or not, and which in so acting is determined by general purposes of good. Magic, however, in the general sense, simply amounts to this,—that man has the mastery as he is in his natural state, as possessed of passions and desires.

"Such is the general character of this primal and wholly immediate standpoint, namely, that the human consciousness, any definite human being, is recognised as the ruling power over nature in virtue of his own will. The natural has, however, by no means that wide range which it has in our idea of it. For here the greater part of nature still remains indifferent to

man, or is just as he is accustomed to see it. Everything is stable. Earthquakes, thunderstorms, floods, animals, which threaten him with death, enemies, and the like, are another matter. To defend himself against these recourse is had to magic. Such is the oldest mode of religion, the wildest, most barbarous form. . . .

“By recent travellers, such as Captain Parry, and before him Captain Ross, this religion has been found among the Esquimaux, wholly without the element of mediation and as the crudest consciousness. Among other peoples a mediation is already present.

“Captain Parry says of them: ‘. . . They have not the slightest idea of Spirit, of a higher existence, of an essential substance as contrasted with their empirical mode of existence. . . . On the other hand, they have amongst them individuals whom they call *Angekoks*, magicians, conjurers. Those assert that they have it in their power to raise a storm, to create a calm, to bring whales near, etc., and say that they learnt these arts from old *Angekoks*. The people regard them with fear; in every family, however, there is at least one. A young *Angekok* wished to make the wind rise, and he proceeded to do it by dint of phrases and gestures. These phrases had no meaning and were directed toward no Supreme Being as a medium, but were addressed in an immediate way to the natural object over which the *Angekok* wished to exercise power; he required no aid from any one whatever.’ . . .

“This religion of magic is very prevalent in Africa, as well as among the Mongols and Chinese; here, however, it is no longer found in the absolute crudeness of its first form, but mediations already come in, which owe their origin to the fact that the Spiritual has begun to assume an objective form for self-consciousness.

“In its first form this religion is more magic than religion; it is in Africa among the negroes that it prevails most extensively. . . . In this sphere of magic the main principle is the direct domination of nature by means of the will, of self-consciousness—in other words that Spirit is something of a higher kind than nature. However bad this magic may look regarded in one aspect, still in another it is higher than a condition of dependence upon nature and fear of it. . . .

“Such, then, is the very first form of religion, which cannot indeed as yet be properly called religion. To religion essentially pertains the moment of objectivity, and this means that spiritual power shows itself as a mode of the Universal relatively to self-consciousness, for the individual, for the particular empirical consciousness. This objectivity is an essential characteristic, on which all depends. Not until it is present does religion begin, does a God exist, and even in the lowest condition there is at least a beginning of it. The mountain, the river, is not in its character as this particular mass of earth, as this particular water, the Divine, but as a mode of the existence of the Divine, of an essential, universal Being. But we do not yet find this in magic as such. It is the individual consciousness as this particular consciousness, and consequently the very negation of the Universal, which is what has the power here; not a god in the magician, but the magician himself is the conjurer and conqueror of nature. . . . Out of magic the religion of magic is developed.”

VIII. Departmental Kings Of Nature

The preceding investigation has proved that the same union of sacred functions with a royal title which meets us in the King of the Wood at Nemi, the Sacrificial King at Rome, and the magistrate called the King at Athens, occurs frequently outside the limits of classical antiquity and is a common feature of societies at all stages from barbarism to civilisation. Further, it appears that the royal priest is often a king, not only in name but in fact, swaying the sceptre as well as the crosier. All this confirms the traditional view of the origin of the titular and priestly kings in the republics of ancient Greece and Italy. At least by shewing that the combination of spiritual and temporal power, of which Graeco-Italian tradition preserved the memory, has actually existed in many places, we have obviated any suspicion of improbability that might have attached to the tradition. Therefore we may now fairly ask, May not the King of the Wood have had an origin like that which a probable tradition assigns to the Sacrificial King of Rome and the titular King of Athens? In other words, may not his predecessors in office have been a line of kings whom a republican revolution stripped of their political power, leaving them only their religious functions and the shadow of a crown? There are at least two reasons for answering this question in the negative. One reason is drawn from the abode of the priest of Nemi; the other from his title, the King of the Wood. If his predecessors had been kings in the ordinary sense, he would surely have been found residing, like the fallen kings of Rome and Athens, in the city of which the sceptre had passed from him. This city must have been Aricia, for there was none nearer. But Aricia was three miles off from his forest sanctuary by the lake shore. If he reigned, it was not in the city, but in the greenwood. Again his title, King of the Wood, hardly allows us to suppose that he had ever been a king in the common sense of the word. More likely he was a king of nature, and of a special side of nature, namely, the woods from which he took his title. If we could find instances of what we may call departmental kings of nature, that is of persons supposed to rule over particular elements or aspects of nature, they would probably present a closer analogy to the King of the Wood than the divine kings we have been hitherto considering, whose control of nature is general rather than special. Instances of such departmental kings are not wanting.

On a hill at Bomma near the mouth of the Congo dwells Namvulu Vumu, King of the Rain and Storm. Of some of the tribes on the Upper Nile we are told that they have no kings in the common sense; the only persons whom they acknowledge as such are the Kings of the Rain, *Mata Kodou*, who are credited with the power of giving rain at the proper time, that is in the rainy season. Before the rains begin to fall at the end of March the country is a parched and arid desert; and the cattle, which form the people's chief wealth, perish for lack of grass. So, when the end of March draws on, each householder betakes himself to the King of the Rain and offers him a cow that he may make the blessed waters of heaven to drip on the brown and withered pastures. If no shower falls, the people assemble and demand that the king shall give them rain; and if the sky still continues cloudless, they rip up his belly, in which he is believed to keep the storms. Amongst the Bari tribe one of these Rain Kings made rain by sprinkling water on the ground out of a handbell.

Among tribes on the outskirts of Abyssinia a similar office exists and has been thus described by an observer. "The priesthood of the Alfai, as he is called by the Barea and Kunama, is a remarkable one; he is believed to be able to make rain. This office formerly existed among the Algeds and appears to be still common to the Nuba negroes. The Alfai of the Barea, who is also consulted by the northern Kunama, lives near Tembadere on a mountain alone with his

family. The people bring him tribute in the form of clothes and fruits, and cultivate for him a large field of his own. He is a kind of king, and his office passes by inheritance to his brother or sister's son. He is supposed to conjure down rain and to drive away the locusts. But if he disappoints the people's expectation and a great drought arises in the land, the Alfai is stoned to death, and his nearest relations are obliged to cast the first stone at him. When we passed through the country, the office of Alfai was still held by an old man; but I heard that rain-making had proved too dangerous for him and that he had renounced his office."

In the backwoods of Cambodia live two mysterious sovereigns known as the King of the Fire and the King of the Water. Their fame is spread all over the south of the great Indo-Chinese peninsula; but only a faint echo of it has reached the West. Down to a few years ago no European, so far as is known, had ever seen either of them; and their very existence might have passed for a fable, were it not that till lately communications were regularly maintained between them and the King of Cambodia, who year by year exchanged presents with them. The Cambodian gifts were passed from tribe to tribe till they reached their destination; for no Cambodian would essay the long and perilous journey. The tribe amongst whom the Kings of Fire and Water reside is the Chréais or Jaray, a race with European features but a sallow complexion, inhabiting the forest-clad mountains and high tablelands which separate Cambodia from Annam. Their royal functions are of a purely mystic or spiritual order; they have no political authority; they are simple peasants, living by the sweat of their brow and the offerings of the faithful. According to one account they live in absolute solitude, never meeting each other and never seeing a human face. They inhabit successively seven towers perched upon seven mountains, and every year they pass from one tower to another. People come furtively and cast within their reach what is needful for their subsistence. The kingship lasts seven years, the time necessary to inhabit all the towers successively; but many die before their time is out. The offices are hereditary in one or (according to others) two royal families, who enjoy high consideration, have revenues assigned to them, and are exempt from the necessity of tilling the ground. But naturally the dignity is not coveted, and when a vacancy occurs, all eligible men (they must be strong and have children) flee and hide themselves. Another account, admitting the reluctance of the hereditary candidates to accept the crown, does not countenance the report of their hermit-like seclusion in the seven towers. For it represents the people as prostrating themselves before the mystic kings whenever they appear in public, it being thought that a terrible hurricane would burst over the country if this mark of homage were omitted. Probably, however, these are mere fables such as commonly shed a glamour of romance over the distant and unknown. A French officer, who had an interview with the redoubtable Fire King in February 1891, found him stretched on a bamboo couch, diligently smoking a long copper pipe, and surrounded by people who paid him no great deference. In spite of his mystic vocation the sorcerer had no charm or talisman about him, and was in no way distinguishable from his fellows except by his tall stature. Another writer reports that the two kings are much feared, because they are supposed to possess the evil eye; hence every one avoids them, and the potentates considerably cough to announce their approach and to allow people to get out of their way. They enjoy extraordinary privileges and immunities, but their authority does not extend beyond the few villages of their neighbourhood. Like many other sacred kings, of whom we shall read in the sequel, the Kings of Fire and Water are not allowed to die a natural death, for that would lower their reputation. Accordingly when one of them is seriously ill, the elders hold a consultation and if they think he cannot recover they stab him to death. His body is burned and the ashes are piously collected and publicly honoured for five years. Part of them is given to the widow, and she keeps them in an urn, which she must carry on her back when she goes to weep on her husband's grave.

We are told that the Fire King, the more important of the two, whose supernatural powers have never been questioned, officiates at marriages, festivals, and sacrifices in honour of the *Yan* or spirit. On these occasions a special place is set apart for him; and the path by which he approaches is spread with white cotton cloths. A reason for confining the royal dignity to the same family is that this family is in possession of certain famous talismans which would lose their virtue or disappear if they passed out of the family. These talismans are three: the fruit of a creeper called *Cui*, gathered ages ago at the time of the last deluge, but still fresh and green; a rattan, also very old but bearing flowers that never fade; and lastly, a sword containing a *Yan* or spirit, who guards it constantly and works miracles with it. The spirit is said to be that of a slave, whose blood chanced to fall upon the blade while it was being forged, and who died a voluntary death to expiate his involuntary offence. By means of the two former talismans the Water King can raise a flood that would drown the whole earth. If the Fire King draws the magic sword a few inches from its sheath, the sun is hidden and men and beasts fall into a profound sleep; were he to draw it quite out of the scabbard, the world would come to an end. To this wondrous brand sacrifices of buffaloes, pigs, fowls, and ducks are offered for rain. It is kept swathed in cotton and silk; and amongst the annual presents sent by the King of Cambodia were rich stuffs to wrap the sacred sword.

In return the Kings of Fire and Water sent him a huge wax candle and two calabashes, one full of rice and the other of sesame. The candle bore the impress of the Fire King's middle finger, and was probably thought to contain the seed of fire, which the Cambodian monarch thus received once a year fresh from the Fire King himself. This holy candle was kept for sacred uses. On reaching the capital of Cambodia it was entrusted to the Brahmans, who laid it up beside the regalia, and with the wax made tapers which were burned on the altars on solemn days. As the candle was the special gift of the Fire King, we may conjecture that the rice and sesame were the special gift of the Water King. The latter was doubtless king of rain as well as of water, and the fruits of the earth were boons conferred by him on men. In times of calamity, as during plague, floods, and war, a little of this sacred rice and sesame was scattered on the ground "to appease the wrath of the maleficent spirits." Contrary to the common usage of the country, which is to bury the dead, the bodies of both these mystic monarchs are burnt, but their nails and some of their teeth and bones are religiously preserved as amulets. It is while the corpse is being consumed on the pyre that the kinsmen of the deceased magician flee to the forest and hide themselves for fear of being elevated to the invidious dignity which he has just vacated. The people go and search for them, and the first whose lurking place they discover is made King of Fire or Water.

These, then, are examples of what I have called departmental kings of nature. But it is a far cry to Italy from the forests of Cambodia and the sources of the Nile. And though Kings of Rain, Water, and Fire have been found, we have still to discover a King of the Wood to match the African priest who bore that title. Perhaps we shall find him nearer home.

IX. The Worship Of Trees

§ 1. Tree-spirits

In the religious history of the Aryan race in Europe the worship of trees has played an important part. Nothing could be more natural. For at the dawn of history Europe was covered with immense primæval forests, in which the scattered clearings must have appeared like islets in an ocean of green. Down to the first century before our era the Hercynian forest stretched eastward from the Rhine for a distance at once vast and unknown; Germans whom Caesar questioned had travelled for two months through it without reaching the end. Four centuries later it was visited by the Emperor Julian, and the solitude, the gloom, the silence of the forest appear to have made a deep impression on his sensitive nature. He declared that he knew nothing like it in the Roman empire. In our own country the wealds of Kent, Surrey, and Sussex are remnants of the great forest of Anderida, which once clothed the whole of the south-eastern portion of the island. Westward it seems to have stretched till it joined another forest that extended from Hampshire to Devon. In the reign of Henry II. the citizens of London still hunted the wild bull and the boar in the woods of Hampstead. Even under the later Plantagenets the royal forests were sixty-eight in number. In the forest of Arden it was said that down to modern times a squirrel might leap from tree to tree for nearly the whole length of Warwickshire. The excavation of ancient pile-villages in the valley of the Po has shewn that long before the rise and probably the foundation of Rome the north of Italy was covered with dense woods of elms, chestnuts, and especially of oaks. Archaeology is here confirmed by history; for classical writers contain many references to Italian forests which have now disappeared. As late as the fourth century before our era Rome was divided from central Etruria by the dreaded Ciminian forest, which Livy compares to the woods of Germany. No merchant, if we may trust the Roman historian, had ever penetrated its pathless solitudes: and it was deemed a most daring feat when a Roman general, after sending two scouts to explore its intricacies, led his army into the forest and, making his way to a ridge of the wooded mountains, looked down on the rich Etrurian fields spread out below. In Greece beautiful woods of pine, oak, and other trees still linger on the slopes of the high Arcadian mountains, still adorn with their verdure the deep gorge through which the Ladon hurries to join the sacred Alpheus; and were still, down to a few years ago, mirrored in the dark blue waters of the lonely lake of Pheneus; but they are mere fragments of the forests which clothed great tracts in antiquity, and which at a more remote epoch may have spanned the Greek peninsula from sea to sea.

From an examination of the Teutonic words for "temple" Grimm has made it probable that amongst the Germans the oldest sanctuaries were natural woods. However this may be, tree-worship is well attested for all the great European families of the Aryan stock. Amongst the Celts the oak-worship of the Druids is familiar to every one, and their old word for a sanctuary seems to be identical in origin and meaning with the Latin *némus*, a grove or woodland glade, which still survives in the name of Nemi. Sacred groves were common among the ancient Germans, and tree-worship is hardly extinct amongst their descendants at the present day. How serious that worship was in former times may be gathered from the ferocious penalty appointed by the old German laws for such as dared to peel the bark of a standing tree. The culprit's navel was to be cut out and nailed to the part of the tree which he had peeled, and he was to be driven round and round the tree till all his guts were wound about its trunk. The intention of the punishment clearly was to replace the dead bark by a living substitute taken from the culprit; it was a life for a life, the life of a man for the life of a

tree. At Upsala, the old religious capital of Sweden, there was a sacred grove in which every tree was regarded as divine. The heathen Slavs worshipped trees and groves. The Lithuanians were not converted to Christianity till towards the close of the fourteenth century, and amongst them at the date of their conversion the worship of trees was prominent. Some of them revered remarkable oaks and other great shady trees, from which they received oracular responses. Some maintained holy groves about their villages or houses, where even to break a twig would have been a sin. They thought that he who cut a bough in such a grove either died suddenly or was crippled in one of his limbs. Proofs of the prevalence of tree-worship in ancient Greece and Italy are abundant. In the sanctuary of Aesculapius at Cos, for example, it was forbidden to cut down the cypress-trees under a penalty of a thousand drachms. But nowhere, perhaps, in the ancient world was this antique form of religion better preserved than in the heart of the great metropolis itself. In the Forum, the busy centre of Roman life, the sacred fig-tree of Romulus was worshipped down to the days of the empire, and the withering of its trunk was enough to spread consternation through the city. Again, on the slope of the Palatine Hill grew a cornel-tree which was esteemed one of the most sacred objects in Rome. Whenever the tree appeared to a passer-by to be drooping, he set up a hue and cry which was echoed by the people in the street, and soon a crowd might be seen running helter-skelter from all sides with buckets of water, as if (says Plutarch) they were hastening to put out a fire.

Among the tribes of the Finnish-Ugrian stock in Europe the heathen worship was performed for the most part in sacred groves, which were always enclosed with a fence. Such a grove often consisted merely of a glade or clearing with a few trees dotted about, upon which in former times the skins of the sacrificial victims were hung. The central point of the grove, at least among the tribes of the Volga, was the sacred tree, beside which everything else sank into insignificance. Before it the worshippers assembled and the priest offered his prayers, at its roots the victim was sacrificed, and its boughs sometimes served as a pulpit. No wood might be hewn and no branch broken in the grove, and women were generally forbidden to enter it. The Ostyaks and Woguls, two peoples of the Finnish-Ugrian stock in Siberia, had also sacred groves in which nothing might be touched, and where the skins of the sacrificed animals were suspended; but these groves were not enclosed with fences. Near Kuopio, in Finland, there was a famous grove of ancient moss-grown firs, where the people offered sacrifices and practised superstitious customs down to about 1650, when a sturdy veteran of the Thirty Years' War dared to cut it down at the bidding of the pastor. Sacred groves now hardly exist in Finland, but sacred trees to which offerings are brought are still not very uncommon. On some firs the skulls of bears are nailed, apparently that the hunter may have good luck in the chase. The Ostyaks are said never to have passed a sacred tree without shooting an arrow at it as a mark of respect. In many places they hung furs and skins on the holy trees in the forest; but having observed that these furs were often appropriated and carried off by unscrupulous travellers, they adopted the practice of hewing the trunks into great blocks, which they decked with their offerings and preserved in safe places. The custom marks a transition from the worship of trees to the worship of idols carved out of the sacred wood. Within their sacred groves no grass or wood might be cut, no game hunted, no fish caught, not even a draught of water drunk. When they passed them in their canoes, they were careful not to touch the land with the oar, and if the journey through the hallowed ground was long, they laid in a store of water before entering on it, for they would rather suffer extreme thirst than slake it by drinking of the sacred stream. The Ostyaks also regarded as holy any tree on which an eagle had built its nest for several years, and they spared the bird as well as the tree. No greater injury could be done them than to shoot such an eagle or destroy its nest.

But it is necessary to examine in some detail the notions on which the worship of trees and plants is based. To the savage the world in general is animate, and trees and plants are no exception to the rule. He thinks that they have souls like his own, and he treats them accordingly. "They say," writes the ancient vegetarian Porphyry, "that primitive men led an unhappy life, for their superstition did not stop at animals but extended even to plants. For why should the slaughter of an ox or a sheep be a greater wrong than the felling of a fir or an oak, seeing that a soul is implanted in these trees also?" Similarly, the Hidatsa Indians of North America believe that every natural object has its spirit, or to speak more properly, its shade. To these shades some consideration or respect is due, but not equally to all. For example, the shade of the cottonwood, the greatest tree in the valley of the Upper Missouri, is supposed to possess an intelligence which, if properly approached, may help the Indians in certain undertakings; but the shades of shrubs and grasses are of little account. When the Missouri, swollen by a freshet in spring, carries away part of its banks and sweeps some tall tree into its current, it is said that the spirit of the tree cries while the roots still cling to the land and until the trunk falls with a splash into the stream. Formerly the Indians considered it wrong to fell one of these giants, and when large logs were needed they made use only of trees which had fallen of themselves. Till lately some of the more credulous old men declared that many of the misfortunes of their people were caused by this modern disregard for the rights of the living cottonwood. The Iroquois believed that each species of tree, shrub, plant, and herb had its own spirit, and to these spirits it was their custom to return thanks. The Wanika of Eastern Africa fancy that every tree, and especially every coco-nut tree, has its spirit; "the destruction of a cocoa-nut tree is regarded as equivalent to matricide, because that tree gives them life and nourishment, as a mother does her child." In the Yasawu islands of Fiji a man will never eat a coco-nut without first asking its leave—"May I eat you, my chief?" Among the Thompson Indians of British Columbia young people addressed the following prayer to the sunflower root before they ate the first roots of the season: "I inform thee that I intend to eat thee. Mayest thou always help me to ascend, so that I may always be able to reach the tops of mountains, and may I never be clumsy! I ask this from thee, Sunflower-Root. Thou art the greatest of all in mystery." To omit this prayer would have made the eater of the root lazy, and caused him to sleep long in the morning. We are not told, but may conjecture, that these Indians ascribed to the sunflower the sun's power of climbing above the mountain-tops and of rising betimes in the morning; hence whoever ate of the plant, with all the due formalities, would naturally acquire the same useful properties. It is not so easy to say why women had to observe continence in cooking and digging the root, and why, when they were cooking it, no man might come near the oven. The Dyaks ascribe souls to trees, and do not dare to cut down an old tree. In some places, when an old tree has been blown down, they set it up, smear it with blood, and deck it with flags "to appease the soul of the tree." Siamese monks, believing that there are souls everywhere, and that to destroy anything whatever is forcibly to dispossess a soul, will not break a branch of a tree, "as they will not break the arm of an innocent person." These monks, of course, are Buddhists. But Buddhist animism is not a philosophical theory. It is simply a common savage dogma incorporated in the system of an historical religion. To suppose with Benfey and others that the theories of animism and transmigration current among rude peoples of Asia are derived from Buddhism, is to reverse the facts. Buddhism in this respect borrowed from savagery, not savagery from Buddhism. According to Chinese belief, the spirits of plants are never shaped like plants but have commonly the form either of human beings or of animals, for example bulls and serpents. Occasionally at the felling of a tree the tree-spirit has been seen to rush out in the shape of a blue bull. In China "to this day the belief in tree-spirits dangerous to man is obviously strong. In southern Fuhkien it deters people from felling any large trees or chopping off heavy branches, for fear the indwelling spirit may become irritated and visit the

aggressor or his neighbours with disease and calamity. Especially respected are the green banyan or *ch'ing*, the biggest trees to be found in that part of China. In Amoy some people even show a strong aversion from planting trees, the planters, as soon as the stems have become as thick as their necks, being sure to be throttled by the indwelling spirits. No explanation of this curious superstition was ever given us. It may account to some extent for the almost total neglect of forestry in that part of China, so that hardly any except spontaneous trees grow there.”

Sometimes it is only particular sorts of trees that are supposed to be tenanted by spirits. At Grbalj in Dalmatia it is said that among great beeches, oaks, and other trees there are some that are endowed with shades or souls, and whoever fells one of them must die on the spot, or at least live an invalid for the rest of his days. If a woodman fears that a tree which he has felled is one of this sort, he must cut off the head of a live hen on the stump of the tree with the very same axe with which he cut down the tree. This will protect him from all harm, even if the tree be one of the animated kind. The silk-cotton trees, which rear their enormous trunks to a stupendous height, far out-topping all the other trees of the forest, are regarded with reverence throughout West Africa, from the Senegal to the Niger, and are believed to be the abode of a god or spirit. Among the Ewe-speaking peoples of the Slave Coast the indwelling god of this giant of the forest goes by the name of Huntin. Trees in which he specially dwells—for it is not every silk-cotton tree that he thus honours—are surrounded by a girdle of palm-leaves; and sacrifices of fowls, and occasionally of human beings, are fastened to the trunk or laid against the foot of the tree. A tree distinguished by a girdle of palm-leaves may not be cut down or injured in any way; and even silk-cotton trees which are not supposed to be animated by Huntin may not be felled unless the woodman first offers a sacrifice of fowls and palm-oil to purge himself of the proposed sacrilege. To omit the sacrifice is an offence which may be punished with death. Everywhere in Egypt on the borders of the cultivated land, and even at some distance from the valley of the Nile, you meet with fine sycamores standing solitary and thriving as by a miracle in the sandy soil; their living green contrasts strongly with the tawny hue of the surrounding landscape, and their thick impenetrable foliage bids defiance even in summer to the noonday sun. The secret of their verdure is that their roots strike down into rills of water that trickle by unseen sluices from the great river. Of old the Egyptians of every rank esteemed these trees divine, and paid them regular homage. They gave them figs, raisins, cucumbers, vegetables, and water in earthenware pitchers, which charitable folk filled afresh every day. Passers-by slaked their thirst at these pitchers in the sultry hours, and paid for the welcome draught by a short prayer. The spirit that animated these beautiful trees generally lurked unseen, but sometimes he would shew his head or even his whole body outside the trunk, but only to retire into it again. People in Congo set calabashes of palm-wine at the foot of certain trees for the trees to drink when they are thirsty. The Wanika of Eastern Africa pay special honour to the spirits of coco-nut palms in return for the many benefits conferred on them by the trees. To cut down a coco-nut palm is an inexpiable offence, equivalent to matricide. They sacrifice to the tree on many occasions. When a man in gathering the coco-nuts has fallen from the palm, they attribute it to the wrath of the tree-spirit, and resort to the oddest means of appeasing him. The Masai particularly reverence the *subugo* tree, the bark of which has medical properties, and a species of parasitic fig which they call *retete*. The green figs are eaten by boys and girls, and older people propitiate the tree by pouring the blood of a goat at the foot of the trunk and strewing grass on the branches. The natives of the Bissagos Islands, off the west coast of Africa, sacrifice dogs, cocks, and oxen to their sacred trees, but they eat the flesh of the victims and leave only the horns, fastened to the trees, for the spirits. In a Turkish village of Northern Syria there is a very old oak-tree which the people worship, burning incense to it and bringing offerings as they would to a shrine. In Patagonia, between the Rio

Negro and the Rio Colorado, there stands solitary an ancient acacia-tree with a gnarled and hollow trunk. The Indians revere it as the abode of a spirit, and hang offerings of blankets, ponchos, ribbons, and coloured threads on it, so that the tree presents the aspect of an old clothes' shop, the tattered, weather-worn garments drooping sadly from the boughs. No Indian passes it without leaving something, if it be only a little horse-hair which he ties to a branch. The hollow trunk contains offerings of tobacco, beads, and sometimes coins. But the best evidence of the sanctity of the tree are the bleached skeletons of many horses which have been killed in honour of the spirit; for the horse is the most precious sacrifice that these Indians can offer. They slaughter the animal also to propitiate the spirits of the deep and rapid rivers which they have often to ford or swim. The Kayans of Central Borneo ascribe souls to the trees which yield the poison they use to envenom their arrows. They think that the spirit of the *tasem* tree (*Antiaris toxicaria*) is particularly hard to please; but if the wood has a strong and agreeable scent, they know that the man who felled the tree must have contrived by his offerings to mollify the peevish spirit. In some of the Louisiade Islands there are certain large trees under which the natives hold their feasts. These trees seem to be regarded as endowed with souls; for a portion of the feast is set aside for them, and the bones of pigs and of human beings are everywhere deeply imbedded in their branches. Among the Kangra mountains of the Punjab a girl used to be annually sacrificed to an old cedar-tree, the families of the village taking it in turn to supply the victim. The tree was cut down not very many years ago. On Christmas Eve it is still customary in some parts of Germany to gird fruit-trees with ropes of straw on which the sausages prepared for the festival have lain. This is supposed to make the trees bear fruit. In the Mark of Brandenburg the person who ties the straw round the trees says, "Little tree, I make you a present, and you will make me one." The people say that if the trees receive gifts, they will bestow gifts in return. The custom, which is clearly a relic of tree-worship, is often observed on New Year's night or at any time between Christmas and Twelfth Night.

If trees are animate, they are necessarily sensitive and the cutting of them down becomes a delicate surgical operation, which must be performed with as tender a regard as possible for the feelings of the sufferers, who otherwise may turn and rend the careless or bungling operator. When an oak is being felled "it gives a kind of shriekes or groanes, that may be heard a mile off, as if it were the genius of the oake lamenting. E. Wyld, Esq., hath heard it severall times." The Ojebways "very seldom cut down green or living trees, from the idea that it puts them to pain, and some of their medicine-men profess to have heard the wailing of the trees under the axe." Trees that bleed and utter cries of pain or indignation when they are hacked or burned occur very often in Chinese books, even in Standard Histories. Old peasants in some parts of Austria still believe that forest-trees are animate, and will not allow an incision to be made in the bark without special cause; they have heard from their fathers that the tree feels the cut not less than a wounded man his hurt. In felling a tree they beg its pardon. It is said that in the Upper Palatinate also old woodmen still secretly ask a fine, sound tree to forgive them before they cut it down. So in Jarkino the woodman craves pardon of the tree he fells. Before the Ilocanes of Luzon cut down trees in the virgin forest or on the mountains, they recite some verses to the following effect: "Be not uneasy, my friend, though we fell what we have been ordered to fell." This they do in order not to draw down on themselves the hatred of the spirits who live in the trees, and who are apt to avenge themselves by visiting with grievous sickness such as injure them wantonly. When the Tagalogs of the Philippines wish to pluck a flower, they ask leave of the genius (*nono*) of the flower to do so; when they are obliged to cut down a tree they beg pardon of the genius of the tree and excuse themselves by saying that it was the priest who bade them fell it. Among the Tigre-speaking tribes in the north of Abyssinia people are afraid to fell a green and fruit-bearing tree lest they incur the curse of God, which is heard in the groaning of the tree as it

sinks to the ground. But if a man is bold enough to cut down such a tree, he will say to it, "Thy curse abide in thee," or he will allege that it was not he but an elephant or a rhinoceros that knocked it down. Amongst the Hos of Togoland, in West Africa, when a man wishes to make palm-wine he hires woodmen to fell the trees. They go into the palm-wood, set some meal on the ground and say to the wood, "That is your food. The old man at home sent us to cut you down. We are still children who know nothing at all. The old man at home has sent us." They say this because they think that the wood is a spirit and that it is angry with them. Before a Karo Batak cuts down a tree, he will offer it betel and apologies; and if in passing the place afterwards he should see the tree weeping or, as we should say, exuding sap, he hastens to console it by sprinkling the blood of a fowl on the stump. The Basoga of Central Africa think that when a tree is cut down the angry spirit which inhabits it may cause the death of the chief and his family. To prevent this disaster they consult a medicine-man before they fell a tree. If the man of skill gives leave to proceed, the woodman first offers a fowl and a goat to the tree; then as soon as he has given the first blow with the axe, he applies his mouth to the cut and sucks some of the sap. In this way he forms a brotherhood with the tree, just as two men become blood-brothers by sucking each other's blood. After that he can cut down his tree-brother with impunity. An ancient Indian ritual directs that in preparing to fell a tree the woodman should lay a stalk of grass on the spot where the blow is to fall, with the words, "O plant, shield it!" and that he should say to the axe, "O axe, hurt it not!" When the tree had fallen, he poured melted butter on the stump, saying, "Grow thou out of this, O lord of the forest, grow with a hundred shoots! May we grow with a thousand shoots!" Then he anointed the severed stem and wound a rope of grass round it.

Again, when a tree or plant is cut it is sometimes thought to bleed. Some Indians dare not cut a certain plant, because there comes out a red juice which they take for the blood of the plant. In Samoa there was a grove of trees which no one dared hew down. Once some strangers tried to do so, but blood flowed from the tree, and the sacrilegious strangers fell ill and died. Down to 1859 there stood a sacred larch-tree at Nauders in the Tyrol which was thought to bleed whenever it was cut; moreover people fancied that the steel pierced the woodman's body to the same depth that it pierced the tree, and that the wound on his body would not heal until the bark closed over the scar on the trunk. So sacred was the tree that no one would gather fuel or cut timber near it; and to curse, scold, or quarrel in its neighbourhood was regarded as a crying sin which would be supernaturally punished on the spot. Angry disputants were often hushed with the warning whisper, "Don't, the sacred tree is here."

But the spirits of vegetation are not always treated with deference and respect. If fair words and kind treatment do not move them, stronger measures are sometimes resorted to. The durian-tree of the East Indies, whose smooth stem often shoots up to a height of eighty or ninety feet without sending out a branch, bears a fruit of the most delicious flavour and the most disgusting stench. The Malays cultivate the tree for the sake of its fruit, and have been known to resort to a peculiar ceremony for the purpose of stimulating its fertility. Near Jugra in Selangor there is a small grove of durian-trees, and on a specially chosen day the villagers used to assemble in it. Thereupon one of the local sorcerers would take a hatchet and deliver several shrewd blows on the trunk of the most barren of the trees, saying, "Will you now bear fruit or not? If you do not, I shall fell you." To this the tree replied through the mouth of another man who had climbed a mangostin-tree hard by (the durian-tree being unclimbable), "Yes, I will now bear fruit; I beg you not to fell me." So in Japan to make trees bear fruit two men go into an orchard. One of them climbs up a tree and the other stands at the foot with an axe. The man with the axe asks the tree whether it will yield a good crop next year and threatens to cut it down if it does not. To this the man among the branches replies on behalf

of the tree that it will bear abundantly. Odd as this mode of horticulture may seem to us, it has its exact parallels in Europe. On Christmas Eve many a South Slavonian and Bulgarian peasant swings an axe threateningly against a barren fruit-tree, while another man standing by intercedes for the menaced tree, saying, "Do not cut it down; it will soon bear fruit." Thrice the axe is swung, and thrice the impending blow is arrested at the entreaty of the intercessor. After that the frightened tree will certainly bear fruit next year. So at the village of Ucria in Sicily, if a tree obstinately refuses to bear fruit, the owner pretends to hew it down. Just as the axe is about to fall, a friend intercedes for the tree, begging him to have patience for one year more, and promising not to interfere again if the culprit has not mended his ways by then. The owner grants his request, and the Sicilians say that a tree seldom remains deaf to such a menace. The ceremony is performed on Easter Saturday. In Armenia the same pantomime is sometimes performed by two men for the same purpose on Good Friday. In the Abruzzi the ceremony takes place before sunrise on the morning of St. John's Day (Midsummer Day). The owner threatens the trees which are slow to bear fruit. Thrice he walks round each sluggard repeating his threat and striking the trunk with the head of an axe. In Lesbos, when an orange-tree or a lemon-tree does not bear fruit, the owner will sometimes set a looking-glass before the tree; then standing with an axe in his hand over against the tree and gazing at its reflection in the glass he will feign to fall into a passion and will say aloud, "Bear fruit, or I'll cut you down." When cabbages merely curl their leaves instead of forming heads as they ought to do, an Esthonian peasant will go out into the garden before sunrise, clad only in his shirt, and armed with a scythe, which he sweeps over the refractory vegetables as if he meant to cut them down. This intimidates the cabbages and brings them to a sense of their duty.

If European peasants thus know how to work on the fears of cabbages and fruit-trees, the subtle Malay has learned how to overreach the simple souls of the plants and trees that grow in his native land. Thus, when a bunch of fruit hangs from an *aren* palm-tree, and in reaching after it you tread on some of the fallen fruit, the Galelareese say that you ought to grunt like a wild boar in order that your feet may not itch. The chain of reasoning seems weak to a European mind, but the natives find no flaw in it. They have observed that wild boars are fond of the fruit, and run freely about among it as it lies on the ground. From this they infer that the animal's feet are proof against the itch which men suffer through treading on the fruit; and hence they conclude that if, by grunting in a natural and life-like manner, you can impress the fruit with the belief that you are a pig, it will treat your feet as tenderly as the feet of his friends the real pigs. Again, pregnant women in Java sometimes take a fancy to eat the wild species of a particular plant (*Colocasia antiquorum*), which, on account of its exceedingly pungent taste, is not commonly used as food by human beings, though it is relished by pigs. In such a case it becomes the husband's duty to go and look for the plant, but before he gathers it he takes care to grunt loudly, in order that the plant may take him for a pig, and so mitigate the pungency of its flavour. Again, in the Madiun district of Java there grows a plant of which the fruit is believed to be injurious for men, but not for apes. The urchins who herd buffaloes, and to whom nothing edible comes amiss, eat this fruit also; but before plucking it they take the precaution of mimicking the voices of apes, in order to persuade the plant that its fruit is destined for the maw of these creatures. Once more, the Javanese scrape the rind of a certain plant (*Sarcolobus narcoticus*) into a powder, with which they poison such dangerous beasts as tigers and wild boars. But the rind is believed not to be a poison for men. Hence the person who gathers the plant has to observe certain precautions in order that its baneful quality may not be lost in passing through his hands. He approaches it naked and creeping on all fours to make the plant think that he is a ravenous beast and not a man, and to strengthen the illusion he bites the stalk. After that the deadly property of the rind is assured. But even when the plant has been gathered and the powder made from it in strict accordance with certain superstitious rules, care is still needed in handling the powder, which

is regarded as alive and intelligent. It may not be brought near a corpse, nor may a corpse be carried past the house in which the powder is kept. For if either of these things were to happen, the powder, seeing the corpse, would hastily conclude that it had already done its work, and so all its noxious quality would be gone. The Indians of the Upper Orinoco extract a favourite beverage from certain palm-trees which grow in their forests. In order to make the trees bear abundance of fruit the medicine-men blow sacred trumpets under them; but how this is supposed to produce the desired effect does not appear. The trumpets (*botutos*) are objects of religious veneration; no woman may look on them under pain of death. Candidates for initiation into the mystery of the trumpets must be men of good character and celibate. The initiated members scourge each other, fast, and practise other austerities.

The conception of trees and plants as animated beings naturally results in treating them as male and female, who can be married to each other in a real, and not merely a figurative or poetical sense of the word. The notion is not purely fanciful, for plants like animals have their sexes and reproduce their kind by the union of the male and female elements. But whereas in all the higher animals the organs of the two sexes are regularly separated between different individuals, in most plants they exist together in every individual of the species. This rule, however, is by no means universal, and in many species the male plant is distinct from the female. The distinction appears to have been observed by some savages, for we are told that the Maoris "are acquainted with the sex of trees, etc., and have distinct names for the male and female of some trees." The ancients knew the difference between the male and the female date-palm, and fertilised them artificially by shaking the pollen of the male tree over the flowers of the female. The fertilisation took place in spring. Among the heathen of Harran the month during which the palms were fertilised bore the name of the Date Month, and at this time they celebrated the marriage festival of all the gods and goddesses. Different from this true and fruitful marriage of the palm are the false and barren marriages of plants which play a part in Hindoo superstition. For example, if a Hindoo has planted a grove of mangos, neither he nor his wife may taste of the fruit until he has formally married one of the trees, as a bridegroom, to a tree of a different sort, commonly a tamarind-tree, which grows near it in the grove. If there is no tamarind to act as bride, a jasmine will serve the turn. The expenses of such a marriage are often considerable, for the more Brahmans are feasted at it, the greater the glory of the owner of the grove. A family has been known to sell its golden and silver trinkets, and to borrow all the money they could in order to marry a mango-tree to a jasmine with due pomp and ceremony. According to another account of the ceremony, a branch of a *bar* tree is brought and fixed near one of the mango trees in the grove to represent the *bar* or bridegroom, and both are wrapt round with the same piece of cloth by the owner of the grove and his wife. To complete the ceremony a bamboo basket containing the bride's belongings and dowry on a miniature scale is provided; and after the Brahman priest has done his part, vermilion, the emblem of a completed marriage, is applied to the mango as to a bride. Another plant which figures as a bride in Hindoo rites is the *tulasi* or Holy Basil (*Ocimum sanctum*). It is a small shrub, not too big to be grown in a large flower-pot, and is often placed in rooms; indeed there is hardly a respectable Hindoo family that does not possess one. In spite of its humble appearance, the shrub is pervaded by the essence of Vishnu and his wife Lakshmi, and is itself worshipped daily as a deity. The following prayer is often addressed to it: "I adore that *tulasi* in whose roots are all the sacred places of pilgrimage, in whose centre are all the deities, and in whose upper branches are all the Vedas." The plant is especially a woman's divinity, being regarded as an embodiment of Vishnu's wife Lakshmi, or of Rama's wife Sita, or of Krishna's wife Rukmini. Women worship it by walking round it and praying or offering flowers and rice to it. Now this sacred plant, as the embodiment of a goddess, is annually married to the god Krishna in every Hindoo family. The ceremony takes place in the month *Karttika* or November. In Western

India they often bring an idol of the youthful Krishna in a gorgeous palanquin, followed by a long train of attendants, to the house of a rich man to be wedded to the basil; and the festivities are celebrated with great pomp. Again, as the wife of Vishnu, the holy basil is married to the *Salagrama*, a black fossil ammonite which is regarded as an embodiment of Vishnu. In North-Western India this marriage of the plant to the fossil has to be performed before it is lawful to taste of the fruit of a new orchard. A man holding the fossil personates the bridegroom, and another holding the basil represents the bride. After burning a sacrificial fire, the officiating Brahman puts the usual questions to the couple about to be united. Bride and bridegroom walk six times round a small spot marked out in the centre of the orchard. Further, no well is considered lucky until the *Salagrama* has been solemnly wedded to the holy basil, which stands for the garden that the well is intended to water. The relations assemble; the owner of the garden represents the bridegroom, while a kinsman of his wife personates the bride. Gifts are given to the Brahmans, a feast is held in the garden, and after that both garden and well may be used without danger. The same marriage of the sacred fossil to the sacred plant is celebrated annually by the Rajah of Orchha at Ludhaura. A former Rajah used to spend a sum equal to about thirty thousand pounds, being one-fourth of his revenue, upon the ceremony. On one occasion over a hundred thousand people are said to have been present at the rite, and to have been feasted at the expense of the Rajah. The procession consisted of eight elephants, twelve hundred camels, and four thousand horses, all mounted and elegantly caparisoned. The most sumptuously decorated of the elephants carried the fossil god to pay his bridal visit to the little shrub goddess. On such an occasion all the rites of a regular marriage are performed, and afterwards the newly-wedded couple are left to repose together in the temple till the next year. On Christmas Eve German peasants used to tie fruit-trees together with straw ropes to make them bear fruit, saying that the trees were thus married.

In the Moluccas, when the clove-trees are in blossom, they are treated like pregnant women. No noise may be made near them; no light or fire may be carried past them at night; no one may approach them with his hat on, all must uncover in their presence. These precautions are observed lest the tree should be alarmed and bear no fruit, or should drop its fruit too soon, like the untimely delivery of a woman who has been frightened in her pregnancy. So in the East the growing rice-crop is often treated with the same considerate regard as a breeding woman. Thus in Amboyna, when the rice is in bloom, the people say that it is pregnant and fire no guns and make no other noises near the field, for fear lest, if the rice were thus disturbed, it would miscarry, and the crop would be all straw and no grain. The Javanese also regard the bloom on the rice as a sign that the plant is pregnant; and they treat it accordingly, by mingling in the water that irrigates the fields a certain astringent food prepared from sour fruit, which is believed to be wholesome for women with child. In some districts of Western Borneo there must be no talk of corpses or demons in the fields, else the spirit of the growing rice would be frightened and flee away to Java. The Toboongkoos of Central Celebes will not fire a gun in a ricefield, lest the rice should be frightened away. The Chams of Binh-Thuan, in Cochin-China, do not dare to touch the rice in the granary at mid-day, because the rice is then asleep, and it would be both rude and dangerous to disturb its noonday slumber. In Orissa growing rice is "considered as a pregnant woman, and the same ceremonies are observed with regard to it as in the case of human females." In Poso, a district of Central Celebes, when the rice-ears are beginning to form, women go through the field feeding the young ears with soft-boiled rice to make them grow fast. They carry the food in calabashes, and grasping the ears in their hands bend them over into the vessels that they may partake of the strengthening pap. The reason for boiling the rice soft is that the ears are regarded as young children who could not digest rice cooked in the usual way. The Tomori of Central Celebes feed the ripening rice by touching it with the contents of a broken egg. When the grain begins

to form, the people of Gayo, a district of northern Sumatra, regard the rice as pregnant and feed it with a pap composed of rice-meal, coco-nut, and treacle, which they deposit on leaves in the middle and at the corners of the field. And when the crop is plentiful and the rice has been threshed, they give it water to drink in a pitcher, which they bury to the neck in the heap of grain.

Sometimes it is the souls of the dead which are believed to animate trees. The Dieri tribe of South Australia regard as very sacred certain trees which are supposed to be their fathers transformed; hence they speak with reverence of these trees, and are careful that they shall not be cut down or burned. If the settlers require them to hew down the trees, they earnestly protest against it, asserting that were they to do so they would have no luck, and might be punished for not protecting their ancestors. Some of the Philippine Islanders believe that the souls of their ancestors are in certain trees, which they therefore spare. If they are obliged to fell one of these trees, they excuse themselves to it by saying that it was the priest who made them do it. The spirits take up their abode, by preference, in tall and stately trees with great spreading branches. When the wind rustles the leaves, the natives fancy it is the voice of the spirit; and they never pass near one of these trees without bowing respectfully, and asking pardon of the spirit for disturbing his repose. Among the Ignorrotos, in the district of Lepanto, every village has its sacred tree, in which the souls of the dead forefathers of the hamlet reside. Offerings are made to the tree, and any injury done to it is believed to entail some misfortune on the village. Were the tree cut down, the village and all its inhabitants would inevitably perish. The natives of Bontoc, a province in the north of Luzon, cut down the woods near their villages, but leave a few fine trees standing as the abode of the spirits of their ancestors (*anitos*); and they honour the spirits by depositing food under the trees. The Dyaks believe that when a man dies by accident, as by drowning, it is a sign that the gods mean to exclude him from the realms of bliss. Accordingly his body is not buried, but carried into the forest and there laid down. The souls of such unfortunates pass into trees or animals or fish, and are much dreaded by the Dyaks, who abstain from using certain kinds of wood, or eating certain sorts of fish, because they are supposed to contain the souls of the dead. Once, while walking with a Dyak through the jungle, Sir Hugh Low observed that his companion, after raising his sword to strike a great snake, suddenly arrested his arm and suffered the reptile to escape. On asking the reason, he was told by the Dyak that the bush in front of which they were standing had been a man, a kinsman of his own, who, dying some ten years before, had appeared in a dream to his widow and told her that he had become that particular bamboo-tree. Hence the ground and everything on it was sacred, and the serpent might not be interfered with. The Dyak further related that in spite of the warning given to the woman in the vision, a man had been hardy enough to cut a branch of the tree, but that the fool had paid for his temerity with his life, for he died soon afterwards. A little bamboo altar stood in front of the bush, on which the remnants of offerings presented to the spirit of the tree were still visible when Sir Hugh Low passed that way.

In Corea the souls of people who die of the plague or by the roadside, and of women who expire in childbed, invariably take up their abode in trees. To such spirits offerings of cake, wine, and pork are made on heaps of stones piled under the trees. In China it has been customary from time immemorial to plant trees on graves in order thereby to strengthen the soul of the deceased and thus to save his body from corruption; and as the evergreen cypress and pine are deemed to be fuller of vitality than other trees, they have been chosen by preference for this purpose. Hence the trees that grow on graves are sometimes identified with the souls of the departed. Among the Miao-Kia, an aboriginal race of Southern and Western China, a sacred tree stands at the entrance of every village, and the inhabitants believe that it is tenanted by the soul of their first ancestor and that it rules their destiny.

Sometimes there is a sacred grove near a village, where the trees are suffered to rot and die on the spot. Their fallen branches cumber the ground, and no one may remove them unless he has first asked leave of the spirit of the tree and offered him a sacrifice. Among the Maraves of Southern Africa the burial-ground is always regarded as a holy place where neither a tree may be felled nor a beast killed, because everything there is supposed to be tenanted by the souls of the dead. Trees supposed to be inhabited by spirits of the dead are reported to be common in Southern Nigeria. Thus in the Indem tribe on the Cross River every village has a big tree into which the souls of the villagers are believed to pass at death. Hence they will not allow these trees to be cut, and they sacrifice to them when people are ill. Other natives of the Cross River say that the big tree of the village is "their Life," and that anybody who breaks a bough of it will fall sick or die unless he pays a fine to the chief. Some of the mountaineers on the north-west coast of New Guinea think that the spirits of their ancestors live on the branches of trees, on which accordingly they hang rags of red or white cotton, always in the number of seven or a multiple of seven; also, they place food on the trees or hang it in baskets from the boughs. Among the Buryats of Siberia the bones of a deceased shaman are deposited in a hole hewn in the trunk of a great fir, which is then carefully closed up. Thenceforth the tree goes by the name of the shaman's fir, and is looked upon as his abode. Whoever cuts down such a tree will perish with all his household. Every tribe has its sacred grove of firs in which the bones of the dead shamans are buried. In treeless regions these firs often form isolated clumps on the hills, and are visible from afar. The Lkungen Indians of British Columbia fancy that trees are transformed men, and that the creaking of the branches in the wind is their voice. In Croatia, they say that witches used to be buried under old trees in the forest, and that their souls passed into the trees and left the villagers in peace. A tree that grows on a grave is regarded by the South Slavonian peasant as a sort of fetish. Whoever breaks a twig from it hurts the soul of the dead, but gains thereby a magic wand, since the soul embodied in the twig will be at his service. This reminds us of the story of Polydorus in Virgil, and of the bleeding pomegranate that grew on the grave of the fratricides Eteocles and Polynices at Thebes. Similar stories are told far away from the classic lands of Italy and Greece. In an Annamite tale an old fisherman makes an incision in the trunk of a tree which has drifted ashore; but blood flows from the cut, and it appears that an empress with her three daughters, who had been cast into the sea, are embodied in the tree. On the Slave Coast of West Africa the negroes tell how from the mouldering bones of a little boy, who had been murdered by his brother in the forest, there sprang up an edible fungus, which spoke and revealed the crime to the child's mother when she attempted to pluck it.

In most, if not all, of these cases the spirit is viewed as incorporate in the tree; it animates the tree and must suffer and die with it. But, according to another and probably later opinion, the tree is not the body, but merely the abode of the tree-spirit, which can quit it and return to it at pleasure. The inhabitants of Siao, an island of the Sangi group in the East Indies, believe in certain sylvan spirits who dwell in forests or in great solitary trees. At full moon the spirit comes forth from his lurking-place and roams about. He has a big head, very long arms and legs, and a ponderous body. In order to propitiate the wood-spirits people bring offerings of food, fowls, goats, and so forth to the places which they are supposed to haunt. The people of Nias think that, when a tree dies, its liberated spirit becomes a demon, which can kill a coconut palm by merely lighting on its branches, and can cause the death of all the children in a house by perching on one of the posts that support it. Further, they are of opinion that certain trees are at all times inhabited by roving demons who, if the trees were damaged, would be set free to go about on errands of mischief. Hence the people respect these trees, and are careful not to cut them down. On the Tanga coast of East Africa mischievous sprites reside in great trees, especially in the fantastically shaped baobabs. Sometimes they appear in the shape of ugly black beings, but as a rule they enter unseen into people's bodies, from

which, after causing much sickness and misery, they have to be cast out by the sorcerer. The Warramunga tribe of Central Australia believe that certain trees are the abode of disembodied human spirits waiting to be born again. No woman will strike one of these trees with an axe, lest the blow might disturb one of the spirits, who might come forth from the tree and enter her body. In the Galla region of East Africa, where the vegetation is magnificent, there are many sacred trees, the haunts of jinn. Most of them belong to the sycamore and maple family, but they do not all exhale an equal odour of sanctity. The *watêsa*, with its edible fruit, is least revered; people climb it to get the fruit, and this disturbs the jinn, who naturally do not care to linger among its boughs. The *gute tubi*, which has no edible fruit, is more sacred. Every Galla tribe has its sacred tree, which is always one individual of a particular species called *lafto*. When a tree has been consecrated by a priest it becomes holy, and no branch of it may be broken. Such trees are loaded with long threads, woollen bands, and bracelets; the blood of animals is poured on their roots and sometimes smeared on their trunks, and pots full of butter, milk, and flesh are placed among the branches or on the ground under them. In many Galla tribes women may not tread on the shadow of sacred trees or even approach the trees.

Not a few ceremonies observed at cutting down haunted trees are based on the belief that the spirits have it in their power to quit the trees at pleasure or in case of need. Thus when the Pelew Islanders are felling a tree, they conjure the spirit of the tree to leave it and settle on another. The wily negro of the Slave Coast, who wishes to fell an *ashorin* tree, but knows that he cannot do it so long as the spirit remains in the tree, places a little palm-oil on the ground as a bait, and then, when the unsuspecting spirit has quitted the tree to partake of this dainty, hastens to cut down its late abode. The Alfoors of Poso, in Central Celebes, believe that great trees are inhabited by demons in human form, and the taller the tree the more powerful the demon. Accordingly they are careful not to fell such trees, and they leave offerings at the foot of them for the spirits. But sometimes, when they are clearing land for cultivation, it becomes necessary to cut down the trees which cumber it. In that case the Alfoor will call to the demon of the tree and beseech him to leave his abode and go elsewhere, and he deposits food under the tree as provision for the spirit on his journey. Then, and not till then, he may fell the tree. Woe to the luckless wight who should turn a tree-spirit out of his house without giving him due notice! When the Toboongkoos of Central Celebes are about to clear a piece of forest in order to plant rice, they build a tiny house and furnish it with tiny clothes and some food and gold. Then they call together all the spirits of the wood, offer them the little house with its contents, and beseech them to quit the spot. After that they may safely cut down the wood without fearing to wound themselves in so doing. Before the Tomori of Central Celebes fell a tall tree they lay a quid of betel at its foot, and invite the spirit who dwells in the tree to change his lodging; moreover, they set a little ladder against the trunk to enable him to descend with safety and comfort. The Sundanese of the Eastern Archipelago drive golden or silver nails into the trunk of a sacred tree for the sake of expelling the tree-spirit before they hew down his abode. They seem to think that, though the nails will hurt him, his vanity will be soothed by the reflection that they are of gold or silver. In Rotti, an island to the south of Timor, when they fell a tree to make a coffin, they sacrifice a dog as compensation to the tree-spirit whose property they are thus making free with. Before the Gayos of Northern Sumatra clear a piece of forest for the purpose of planting tobacco or sugar-cane, they offer a quid of betel to the spirit whom they call the Lord of the Wood, and beg his leave to quarter themselves on his domain. The Mandelings of Sumatra endeavour to lay the blame of all such misdeeds at the door of the Dutch authorities. Thus when a man is cutting a road through a forest and has to fell a tall tree which blocks the way, he will not begin to ply his axe until he has said: "Spirit who lodgest in this tree, take it not ill that I cut down thy dwelling, for it is done at no wish of mine but by order of the Controller." And when he wishes to clear a piece of forest-land for cultivation, it is necessary that he should

come to a satisfactory understanding with the woodland spirits who live there before he lays low their leafy dwellings. For this purpose he goes to the middle of the plot of ground, stoops down, and pretends to pick up a letter. Then unfolding a bit of paper he reads aloud an imaginary letter from the Dutch Government, in which he is strictly enjoined to set about clearing the land without delay. Having done so, he says: "You hear that, spirits. I must begin clearing at once, or I shall be hanged." When the Tagales of the Philippines are about to fell a tree which they believe to be inhabited by a spirit, they excuse themselves to the spirit, saying: "The priest has ordered us to do it; the fault is not ours, nor the will either." There is a certain tree called *rara* which the Dyaks believe to be inhabited by a spirit. Before they cut down one of these trees they strike an axe into the trunk, leave it there, and call upon the spirit either to quit his dwelling or to give them a sign that he does not wish it to be meddled with. Then they go home. Next day they visit the tree, and if they find the axe still sticking in the trunk, they can fell the tree without danger; there is no spirit in it, or he would certainly have ejected the axe from his abode. But if they find the axe lying on the ground, they know that the tree is inhabited and they will not fell it; for it must surely have been the spirit of the tree in person who expelled the intrusive axe. Some sceptical Europeans, however, argue that what casts out the axe is strychnine in the sap rather than the tree-spirit. They say that if the sap is running, the axe must necessarily be forced out by the action of heat and the expansion of the exuding gutta; whereas if the axe remains in the trunk, this only shews that the tree is not vigorous but ready to die.

Before they cut down a great tree, the Indians in the neighbourhood of Santiago Tepehuacan hold a festival in order to appease the tree and so prevent it from hurting anybody in its fall. In the Greek island of Siphnos, if woodmen have to fell a tree which they regard as possessed by a spirit, they are most careful, when it falls, to prostrate themselves humbly and in silence lest the spirit should chastise them as it escapes. Sometimes they put a stone on the stump of the tree to prevent the egress of the spirit. In some parts of Sumatra, so soon as a tree is felled, a young tree is planted on the stump, and some betel and a few small coins are also placed on it. The purpose of the ceremony seems plain. The spirit of the tree is offered a new home in the young tree planted on the stump of the old one, and the offering of betel and money is meant to compensate him for the disturbance he has suffered. Similarly, when the Maghs of Bengal were obliged by Europeans to cut down trees which the natives believed to be tenanted by spirits, one of them was always ready with a green sprig, which he ran and placed in the middle of the stump when the tree fell, "as a propitiation to the spirit which had been displaced so roughly, pleading at the same time the orders of the strangers for the work." In Halmahera, however, the motive for placing a sprig on the stump is said to be to deceive the spirit into thinking that the fallen stem is still growing in its old place. The Gilyaks insert a stick with curled shavings on the stump of the tree which they have felled, believing that in this way they give back to the dispossessed tree-spirit his life and soul. German woodmen make a cross upon the stump while the tree is falling, in the belief that this enables the spirit of the tree to live upon the stump. Before the Katodis fell a forest tree, they choose a tree of the same kind and worship it by presenting a coco-nut, burning incense, applying a red pigment, and begging it to bless the undertaking. The intention, perhaps, is to induce the spirit of the former tree to shift its quarters to the latter. In clearing a wood, a Galelareese must not cut down the last tree till the spirit in it has been induced to go away. When the Dyaks fell the jungle on the hills, they often leave a few trees standing on the hill-tops as a refuge for the dispossessed tree-spirits. Sailing up the Baram river in Sarawak you pass from time to time a clearing in the forest where manioc is cultivated. In the middle of every one of these clearings a solitary tree is always left standing as a home for the ejected spirits of the wood. Its boughs are stripped off, all but the topmost, and just under its leafy crown two cross-pieces are fastened from which rags dangle. Similarly in India, the Gonds

allow a grove of typical trees to remain as a home or reserve for the woodland spirits when they are clearing away a jungle. The Mundaris have sacred groves which were left standing when the land was cleared, lest the sylvan gods, disquieted at the felling of the trees, should abandon the place. The Miris in Assam are unwilling to break up new land for cultivation so long as there is fallow land available; for they fear to offend the spirits of the woods by hewing down trees needlessly. On the other hand, when a child has been lost, the Padams of Assam think that it has been stolen by the spirits of the wood; so they retaliate on the spirits by felling trees till they find the child. The spirits, fearing to be left without a tree in which to lodge, give up the child, and it is found in the fork of a tree.

Even when a tree has been felled, sawn into planks, and used to build a house, it is possible that the woodland spirit may still be lurking in the timber, and accordingly some people seek to propitiate him before or after they occupy the new house. Hence, when a new dwelling is ready the Toradjas of Central Celebes kill a goat, a pig, or a buffalo, and smear all the woodwork with its blood. If the building is a *lobo* or spirit-house, a fowl or a dog is killed on the ridge of the roof, and its blood allowed to flow down on both sides. The ruder Tonapoo in such a case sacrifice a human being on the roof. This sacrifice on the roof of a *lobo* or temple serves the same purpose as the smearing of blood on the woodwork of an ordinary house. The intention is to propitiate the forest-spirits who may still be in the timber; they are thus put in good humour and will do the inmates of the house no harm. For a like reason people in Celebes and the Moluccas are much afraid of planting a post upside down at the building of a house; for the forest-spirit, who might still be in the timber, would very naturally resent the indignity and visit the inmates with sickness. The Bahaus or Kayans of central Borneo are of opinion that tree-spirits stand very stiffly on the point of honour and visit men with their displeasure for any injury done to them. Hence after building a house, whereby they have been forced to illtreat many trees, these people observe a period of penance for a year, during which they must abstain from many things, such as the killing of bears, tiger-cats, and serpents. The period of taboo is brought to an end by a ceremony at which head-hunting, or the pretence of it, plays a part. The Ooloo-Ayar Dyaks on the Mandai river are still more punctilious in their observance of taboos after building a house. The length of the penance depends chiefly on the kind of timber used in the construction of the dwelling. If the timber was the valuable ironwood, the inmates of the house must deny themselves various dainties for three years. But the spirits of humbler trees are less exacting. When the Kayans have felled an ironwood tree in order to cut it up into planks for a roof, they will offer a pig to the spirits of the tree, hoping thus to prevent the spirits from molesting the souls of persons assembled under the roof.

Thus the tree is regarded, sometimes as the body, sometimes as merely the house of the tree-spirit; and when we read of sacred trees which may not be cut down because they are the seat of spirits, it is not always possible to say with certainty in which way the presence of the spirit in the tree is conceived. In the following cases, perhaps, the trees are regarded as the dwelling-place of the spirits rather than as their bodies. The Sea Dyaks point to many a tree as sacred because it is the abode of a spirit or spirits, and to cut one of these down would provoke the spirit's anger, who might avenge himself by visiting the sacrilegious woodman with sickness. The Battas of Sumatra have been known to refuse to cut down certain trees because they were the abode of mighty spirits who would resent the injury. One of the largest and stateliest of the forest trees in Perak is known as *toallong*; it has a very poisonous sap which produces great irritation when it comes into contact with the skin. Many trees of this species have large hollow knobs on their trunks where branches have been broken off. These knobs are looked upon by the Malays as houses of spirits, and they object strongly to cut down trees that are thus disfigured, believing that the man who fells one of them will die

within the year. When clearings are made in the forest these trees are generally left standing to the annoyance and expense of planters. The Siamese fear to cut down any very fine trees lest they should incur the anger of the powerful spirits who inhabit them. The En, a tribe of Upper Burma, worship the spirits of hills and forests, and over great tracts of country they will not lay out fields for fear of offending the spirits. They say that if a tree is felled a man dies. In every Khond village a large grove, generally of *sâl* trees (*Shorea robusta*), is dedicated to the forest god, whose favour is sought by the sacrifice of birds, hogs, and sheep, together with an offering of rice and an addled egg. This sacred grove is religiously preserved. The young trees are occasionally pruned, but not a twig may be cut for use without the formal consent of the village and the ceremonial propitiation of the god. In some parts of Berar the holy groves are so carefully preserved, that during the annual festivals held in them it is customary to gather and burn solemnly all dead and fallen branches and trees. The Larka Kols of India believe that the tops of trees are the abode of spirits who are disturbed by the felling of the trees and will take vengeance. The Parahiya, a Dravidian tribe of Mirzapur, think that evil spirits live in the *sâl*, *pîpal*, and *mahua* trees; they make offerings to such trees and will not climb into their branches. In Travancore demons are supposed to reside in certain large old trees, which it would be sacrilegious and dangerous to hew down. A rough stone is generally placed at the foot of one of these trees as an image or emblem, and turmeric powder is rubbed on it. Some of the Western tribes of British New Guinea dread certain female devils who inhabit large trees and are very dangerous. Trees supposed to be the abode of these demons are treated with much respect and never cut down. Near Old Calabar there is a ravine full of the densest and richest vegetation, whence a stream of limpid water flows purling to the river. The spot was considered by a late king to be hallowed ground, the residence of Anansa, the tutelary god of Old Calabar. The people had strict orders to revere the grove, and no branch of it might be cut. Among the Bambaras of the Upper Niger every village has its sacred tree, generally a tamarind, which is supposed to be the abode of the fetish and is carefully preserved. The fetish is consulted on every important occasion, and sacrifices of sheep, dogs, and fowls, accompanied with offerings of millet and fruits, are made under the sacred tree. In the deserts of Arabia a modern traveller found a great solitary acacia-tree which the Bedouins believed to be possessed by a jinnee. Shreds of cotton and horns of goats hung among the boughs and nails were knocked into the trunk. An Arab strongly dissuaded the traveller from cutting a branch of the tree, assuring him that it was death to do so. The Yourouks, who inhabit the southern coasts of Asia Minor and the heights of Mount Taurus, have sacred trees which they never cut down from fear of driving away the spirits that own them. The old Prussians believed that gods inhabited tall trees, such as oaks, from which they gave audible answers to enquirers; hence these trees were not felled, but worshipped as the homes of divinities. Amongst the trees thus venerated by them was the elder-tree. The Samagitians thought that if any one ventured to injure certain groves, or the birds or beasts in them, the spirits would make his hands or feet crooked. Down to the nineteenth century the Esthonians stood in such awe of many trees, which they considered as the seat of mighty spirits, that they would not even pluck a flower or a berry on the ground where the shadow of the trees fell, much less would they dare to break a branch from the tree itself.

Even where no mention is made of wood-spirits, we may generally assume that when trees or groves are sacred and inviolable, it is because they are believed to be either inhabited or animated by sylvan deities. In Central India the *bar* tree (*Ficus Indica*) and the *pipal* (*Ficus religiosa*) are sacred, and every child learns the saying that "it is better to die a leper than pluck a leaf of a *pipal*, and he who can wound a *bar* will kick his little sister." In Livonia there is a sacred grove in which, if any man fells a tree or breaks a branch, he will die within the year. The Wotyaks have sacred groves. A Russian who ventured to hew a tree in one of them fell sick and died next day. The heathen Cheremiss of South-Eastern Russia have sacred

groves, and woe to him who dares to fell one of the holy trees. If the author of the sacrilege is unknown, they take a cock or a goose, torture it to death and then throw it on the fire, while they pray to the gods to punish the sinner and cause him to perish like the bird. Near a chapel of St. Ninian, in the parish of Belly, there stood more than a century and a half ago a row of trees, "all of equal size, thick planted for about the length of a butt," which were "looked upon by the superstitious papists as sacred trees, from which they reckon it sacrilege to take so much as a branch or any of the fruit." So in the island of Skye some two hundred and fifty years ago there was a holy lake, "surrounded by a fair wood, which none presumes to cut"; and those who ventured to infringe its sanctity by breaking even a twig either sickened on the spot or were visited afterwards by "some signal inconvenience." Sacrifices offered at cutting down trees are doubtless meant to appease the wood-spirits. In Gilgit it is usual to sprinkle goat's blood on a tree of any kind before felling it. The Akikuyu of British East Africa hold the *mugumu* or *mugomo* tree, a species of fig, sacred on account of its size and fine appearance; hence they do not ruthlessly cut it down like all other trees which cumber a patch of ground that is to be cleared for tillage. Groves of this tree are sacred. In them no axe may be laid to any tree, no branch broken, no firewood gathered, no grass burnt; and wild animals which have taken refuge there may not be molested. In these sacred groves sheep and goats are sacrificed and prayers are offered for rain or fine weather or in behalf of sick children. The whole meat of the sacrifices is left in the grove for God (*Ngai*) to eat; the fat is placed in a cleft of the trunk or in the branches as a tit-bit for him. He lives up in the boughs but comes down to partake of the food.

§ 2. Beneficent Powers of Tree-Spirits

When a tree comes to be viewed, no longer as the body of the tree-spirit, but simply as its abode which it can quit at pleasure, an important advance has been made in religious thought. Animism is passing into polytheism. In other words, instead of regarding each tree as a living and conscious being, man now sees in it merely a lifeless, inert mass, tenanted for a longer or shorter time by a supernatural being who, as he can pass freely from tree to tree, thereby enjoys a certain right of possession or lordship over the trees, and, ceasing to be a tree-soul, becomes a forest god. As soon as the tree-spirit is thus in a measure disengaged from each particular tree, he begins to change his shape and assume the body of a man, in virtue of a general tendency of early thought to clothe all abstract spiritual beings in concrete human form. Hence in classical art the sylvan deities are depicted in human shape, their woodland character being denoted by a branch or some equally obvious symbol. But this change of shape does not affect the essential character of the tree-spirit. The powers which he exercised as a tree-soul incorporate in a tree, he still continues to wield as a god of trees. This I shall now attempt to prove in detail. I shall shew, first, that trees considered as animate beings are credited with the power of making the rain to fall, the sun to shine, flocks and herds to multiply, and women to bring forth easily; and, second, that the very same powers are attributed to tree-gods conceived as anthropomorphic beings or as actually incarnate in living men.

First, then, trees or tree-spirits are believed to give rain and sunshine. When the missionary Jerome of Prague was persuading the heathen Lithuanians to fell their sacred groves, a multitude of women besought the Prince of Lithuania to stop him, saying that with the woods he was destroying the house of god from which they had been wont to get rain and sunshine. The Mundaris in Assam think that if a tree in the sacred grove is felled the sylvan gods evince their displeasure by withholding rain. In order to procure rain the inhabitants of Monyo, a village in the Sagaing district of Upper Burma, chose the largest tamarind-tree near the village and named it the haunt of the spirit (*nat*) who controls the rain. Then they offered bread, coco-nuts, plantains, and fowls to the guardian spirit of the village and to the spirit

who gives rain, and they prayed, "O Lord *nat* have pity on us poor mortals, and stay not the rain. Inasmuch as our offering is given ungrudgingly, let the rain fall day and night." Afterwards libations were made in honour of the spirit of the tamarind-tree; and still later three elderly women, dressed in fine clothes and wearing necklaces and earrings, sang the Rain Song. In Cambodia each village or province has its sacred tree, the abode of a spirit. If the rains are late the people sacrifice to the tree. In time of drought the elders of the Wakamba in East Africa assemble and take a calabash of cider and a goat to a baobab-tree, where they kill the goat but do not eat it. When Ovambo women go out to sow corn they take with them in the basket of seed two green branches of a particular kind of tree (*Peltophorum africanum Sond.*), one of which they plant in the field along with the first seed sown. The branch is believed to have the power of attracting rain; hence in one of the native dialects the tree goes by the name of the "rain-bush." To extort rain from the tree-spirit a branch is sometimes dipped in water, as we have seen above. In such cases the spirit is doubtless supposed to be immanent in the branch, and the water thus applied to the spirit produces rain by a sort of sympathetic magic, exactly as we saw that in New Caledonia the rain-makers pour water on a skeleton, believing that the soul of the deceased will convert the water into rain. There is hardly room to doubt that Mannhardt is right in explaining as a rain-charm the European custom of drenching with water the trees which are cut at certain popular festivals, as midsummer, Whitsuntide, and harvest.

Again, tree-spirits make the crops to grow. Amongst the Mundaris every village has its sacred grove, and "the grove deities are held responsible for the crops, and are especially honoured at all the great agricultural festivals." The negroes of the Gold Coast are in the habit of sacrificing at the foot of certain tall trees, and they think that if one of these were felled all the fruits of the earth would perish. Before harvest the Wabondëi of East Africa sacrifice a goat to the spirit that lives in baobab-trees; the blood is poured into a hole at the foot of one of the trees. If the sacrifice were omitted the spirit would send disease and death among the people. The Gallas dance in couples round sacred trees, praying for a good harvest. Every couple consists of a man and woman, who are linked together by a stick, of which each holds one end. Under their arms they carry green corn or grass. Swedish peasants stick a leafy branch in each furrow of their corn-fields, believing that this will ensure an abundant crop. The same idea comes out in the German and French custom of the Harvest-May. This is a large branch or a whole tree, which is decked with ears of corn, brought home on the last waggon from the harvest-field, and fastened on the roof of the farmhouse or of the barn, where it remains for a year. Mannhardt has proved that this branch or tree embodies the tree-spirit conceived as the spirit of vegetation in general, whose vivifying and fructifying influence is thus brought to bear upon the corn in particular. Hence in Swabia the Harvest-May is fastened amongst the last stalks of corn left standing on the field; in other places it is planted on the corn-field and the last sheaf cut is attached to its trunk. The Harvest-May of Germany has its counterpart in the *eiresione* of ancient Greece. The *eiresione* was a branch of olive or laurel, bound about with ribbons and hung with a variety of fruits. This branch was carried in procession at a harvest festival and was fastened over the door of the house, where it remained for a year. The object of preserving the Harvest-May or the *eiresione* for a year is that the life-giving virtue of the bough may foster the growth of the crops throughout the year. By the end of the year the virtue of the bough is supposed to be exhausted and it is replaced by a new one. Following a similar train of thought some of the Dyaks of Sarawak are careful at the rice harvest to take up the roots of a certain bulbous plant, which bears a beautiful crown of white and fragrant flowers. These roots are preserved with the rice in the granary and are planted again with the seed-rice in the following season; for the Dyaks say that the rice will not grow unless a plant of this sort be in the field.

Customs like that of the Harvest-May appear to exist in India and Africa. At a harvest festival of the Lhoosai of South-Eastern India the chief goes with his people into the forest and fells a large tree, which is then carried into the village and set up in the midst. Sacrifice is offered, and spirits and rice are poured over the tree. The ceremony closes with a feast and a dance, at which the unmarried men and girls are the only performers. Among the Bechuanas the hack-thorn is very sacred, and it would be a serious offence to cut a bough from it and carry it into the village during the rainy season. But when the corn is ripe in the ear the people go with axes, and each man brings home a branch of the sacred hack-thorn, with which they repair the village cattle-yard. According to another authority, it is a rule with the Bechuanas that "neither the hook-thorn nor the milk-tree must be cut down while the corn is on the ground, for this, they think, would prevent rain. When I was at Lattakoo, though Mr. Hamilton stood in much need of some milk-tree timber, he durst not supply himself till all the corn was gathered in." Many tribes of South-Eastern Africa will not cut down timber while the corn is green, fearing that if they did so, the crops would be destroyed by blight, hail, or early frost. The heathen Cheremiss, in the Russian Government of Kasan, will not fell trees, mow grass, or dig the ground while the corn is in bloom. Again, the fructifying power of the tree is put forth at seed-time as well as at harvest. Among the Aryan tribes of Gilgit, on the north-western frontier of India, the sacred tree is the *Chili*, a species of cedar (*Juniperus excelsa*). At the beginning of wheat-sowing the people receive from the rajah's granary a quantity of wheat, which is placed in a skin mixed with sprigs of the sacred cedar. A large bonfire of the cedar wood is lighted, and the wheat which is to be sown is held over the smoke. The rest is ground and made into a large cake, which is baked on the same fire and given to the ploughman. Here the intention of fertilising the seed by means of the sacred cedar is unmistakable.

In all these cases the power of fostering the growth of crops, and, in general, of cultivated plants, is ascribed to trees. The ascription is not unnatural. For the tree is the largest and most powerful member of the vegetable kingdom, and man is familiar with it before he takes to cultivating corn. Hence he naturally places the feebler and, to him, newer plant under the dominion of the older and more powerful.

Again, the tree-spirit makes the herds to multiply and blesses women with offspring. The sacred *Chili* or cedar of Gilgit was supposed to possess this virtue in addition to that of fertilising the corn. At the commencement of wheat-sowing three chosen unmarried youths, after undergoing daily washing and purification for three days, used to start for the mountain where the cedars grew, taking with them wine, oil, bread, and fruit of every kind. Having found a suitable tree they sprinkled the wine and oil on it, while they ate the bread and fruit as a sacrificial feast. Then they cut off the branch and brought it to the village, where, amid general rejoicing, it was placed on a large stone beside running water. "A goat was then sacrificed, its blood poured over the cedar branch, and a wild dance took place, in which weapons were brandished about, and the head of the slaughtered goat was borne aloft, after which it was set up as a mark for arrows and bullet-practice. Every good shot was rewarded with a gourd full of wine and some of the flesh of the goat. When the flesh was finished the bones were thrown into the stream and a general ablution took place, after which every man went to his house taking with him a spray of the cedar. On arrival at his house he found the door shut in his face, and on his knocking for admission, his wife asked, 'What have you brought?' To which he answered, 'If you want children, I have brought them to you; if you want food, I have brought it; if you want cattle, I have brought them; whatever you want, I have it.' The door was then opened and he entered with his cedar spray. The wife then took some of the leaves, and pouring wine and water on them placed them on the fire, and the rest were sprinkled with flour and suspended from the ceiling. She then sprinkled flour on her

husband's head and shoulders, and addressed him thus, 'Ai Shiri Bagerthum, son of the fairies, you have come from far!' *Shiri Bagerthum*, 'the dreadful king,' being the form of address to the cedar when praying for wants to be fulfilled. The next day the wife baked a number of cakes, and taking them with her, drove the family goats to the Chili stone. When they were collected round the stone, she began to pelt them with pebbles, invoking the Chili at the same time. According to the direction in which the goats ran off, omens were drawn as to the number and sex of the kids expected during the ensuing year. Walnuts and pomegranates were then placed on the Chili stone, the cakes were distributed and eaten, and the goats followed to pasture in whatever direction they showed a disposition to go. For five days afterwards this song was sung in all the houses:—

*'Dread Fairy King, I sacrifice before you,
How nobly do you stand! you have filled up my house,
You have brought me a wife when I had not one,
Instead of daughters you have given me sons.
You have shown me the ways of right,
You have given me many children.'*

Here the driving of the goats to the stone on which the cedar had been placed is clearly meant to impart to them the fertilising influence of the cedar. In Northern India the *Emblica officinalis* is a sacred tree. On the eleventh of the month Phalgun (February) libations are poured at the foot of the tree, a red or yellow string is bound about the trunk, and prayers are offered to it for the fruitfulness of women, animals, and crops. Again, in Northern India the coco-nut is esteemed one of the most sacred fruits, and is called Sripkala, or the fruit of Sri, the goddess of prosperity. It is the symbol of fertility, and all through Upper India is kept in shrines and presented by the priests to women who desire to become mothers. In the town of Qua, near Old Calabar, there used to grow a palm-tree which ensured conception to any barren woman who ate a nut from its branches. In Europe the May-tree or May-pole is apparently supposed to possess similar powers over both women and cattle. Thus in some parts of Germany on the first of May the peasants set up May-trees or May-bushes at the doors of stables and byres, one for each horse and cow; this is thought to make the cows yield much milk. Of the Irish we are told that "they fancy a green bough of a tree, fastened on May-day against the house, will produce plenty of milk that summer." In Suffolk there was an old custom, observed in most farm-houses, that any servant who could bring in a branch of hawthorn in blossom on the first of May was entitled to a dish of cream for breakfast. Similarly, "in parts of Cornwall, till certainly ten years ago, any child who brought to a dairy on May morning a piece of hawthorn in bloom, or a piece of fresh bracken, long enough to surround the earthenware bowl in which cream is kept, was given a bowl of cream." On May Day English milkmaids used to dance with garlands on their pails. One May morning long ago Pepys on his way to Westminster saw many of them dancing thus to the music of a fiddle while pretty Nel Gwynne, in her smock sleeves and bodice, watched them from the door of her lodgings in Drury-lane.

However in these and similar European customs it seems that the influence of the tree, bush, or bough is really protective rather than generative; it does not so much fill the udders of the cows as prevent them from being drained dry by witches, who ride on broomsticks or pitchforks through the air on the Eve of May Day (the famous Walpurgis Night) and make great efforts to steal the milk from the cattle. Hence the many precautions which the prudent herdsman must take to guard his beasts at this season from the raids of these baleful creatures. For example, on May morning the Irish scatter primroses on the threshold, keep a piece of red-hot iron on the hearth, or twine branches of whitethorn and mountain-ash or rowan about the door. To save the milk they cut and peel boughs of mountain-ash (rowan),

and bind the twigs round the milk-pails and the churn. According to a writer of the sixteenth century, whose description is quoted by Camden, the Irish “account every woman who fetches fire on May-day a witch, nor will they give it to any but sick persons, and that with an imprecation, believing she will steal all the butter the next summer. On May day they kill all the hares they find among their cattle, supposing them the old women who have designs on the butter. They imagine the butter so stolen may be recovered if they take some of the thatch hanging over the door and burn it.” In the north-east of Scotland pieces of rowan-tree and woodbine, or of rowan alone, used to be placed over the doors of the cow-houses on May Day to keep the witches from the kine; and a still better way of attaining the same object was to tie a cross of rowan-tree wood with a scarlet thread to each animal’s tail. The Highlanders of Scotland believe that on Beltane eve, that is the night before May Day, the witches go about in the shape of hares and suck the milk from the cows. To guard against their depredations tar was put behind the ears of the cattle and at the root of the tail, and the house was hung with rowan-tree. For the same reason the Highlanders say that the peg of the cow-shackle and the handle and cross of the churn-staff should always be made of rowan, because that is the most potent charm against witchcraft. In the Isle of Man on May Day, old style, people carried crosses of rowan in their hats and fastened May-flowers over their doors as a protection against elves and witches, and for the same purpose they tied crosses of rowan to the tails of the cattle. Also women washed their faces in the dew early on May morning in order to secure good luck, a fine complexion, and immunity from witches. Further, the break of day on that morning was the signal for setting the ling or gorse on fire, which was done for the sake of burning out the witches, who are wont to take the shape of hares. In some places, indeed, as in the Lezayre parish, the practice was to burn gorse in the hedge of every field to drive away the witches, who are still feared in the Isle of Man. In Norway and Denmark branches of rowan are similarly used to protect houses and cattle-stalls against witches on Walpurgis Night, and there, too, it is thought that the churn-staff should be made of rowan. In Germany a common way of keeping witches from the cattle on Walpurgis Night is to chalk up three crosses on the door of the cowhouse. Branches of buckthorn stuck in the muck-heaps on the eve of May Day answer the same purpose. In Silesia the precautions taken at this season against witches are many and various; for example, pieces of buckthorn are nailed crosswise over the door of the cowhouse; pitchforks and harrows, turned upside down, with the prongs pointing outwards, are placed at the doors; and a sod of fresh turf from a meadow is laid before the threshold and strewed with marsh-marigolds. Before the witches can pass the threshold, they must count every blade of grass in the turf and every petal of the marigolds; and while they are still counting the day breaks and their power is gone. For the same reason little birch-trees are set up at the house-door, because the witches cannot enter the house till they have counted all the leaves; and before they have done the sum it is broad daylight, and they must flee away with the shadows. On Walpurgis Night the Germans of Moravia put knives under the threshold of the cowhouse and twigs of birch at the door and in the muck-heap to keep the witches from the cows. For the same purpose the Bohemians at this season lay branches of gooseberry bushes, hawthorn, and wild rose-trees on the thresholds of the cowhouses, because the witches are caught by the thorns and can get no farther. We now see why thorny trees and bushes, whether hawthorn, buckthorn, or what not, afford protection against witchcraft: they serve as prickly hedges through which the witches cannot force their way. But this explanation clearly does not apply to the mountain-ash and the birch.

On the second of July some of the Wends used to set up an oak-tree in the middle of the village with an iron cock fastened to its top; then they danced round it, and drove the cattle round it to make them thrive. Some of the Esthonians believe in a mischievous spirit called Metsik, who lives in the forest and has the weal of the cattle in his hands. Every year a new

image of him is prepared. On an appointed day all the villagers assemble and make a straw man, dress him in clothes, and take him to the common pasture-land of the village. Here the figure is fastened to a high tree, round which the people dance noisily. On almost every day of the year prayer and sacrifice are offered to him that he may protect the cattle. Sometimes the image of Metsik is made of a corn-sheaf and fastened to a tall tree in the wood. The people perform strange antics before it to induce Metsik to guard the corn and the cattle. The Circassians regard the pear-tree as the protector of cattle. So they cut down a young pear-tree in the forest, branch it, and carry it home, where it is adored as a divinity. Almost every house has one such pear-tree. In autumn, on the day of the festival, the tree is carried into the house with great ceremony to the sound of music and amid the joyous cries of all the inmates, who compliment it on its fortunate arrival. It is covered with candles, and a cheese is fastened to its top. Round about it they eat, drink, and sing. Then they bid the tree good-bye and take it back to the courtyard, where it remains for the rest of the year, set up against the wall, without receiving any mark of respect.

In the Tuhoe tribe of Maoris "the power of making women fruitful is ascribed to trees. These trees are associated with the navel-strings of definite mythical ancestors, as indeed the navel-strings of all children used to be hung upon them down to quite recent times. A barren woman had to embrace such a tree with her arms, and she received a male or a female child according as she embraced the east or the west side." The common European custom of placing a green bush on May Day before or on the house of a beloved maiden probably originated in the belief of the fertilising power of the tree-spirit. In some parts of Bavaria such bushes are set up also at the houses of newly-married pairs, and the practice is only omitted if the wife is near her confinement; for in that case they say that the husband has "set up a May-bush for himself." Among the South Slavonians a barren woman, who desires to have a child, places a new chemise upon a fruitful tree on the eve of St. George's Day. Next morning before sunrise she examines the garment, and if she finds that some living creature has crept on it, she hopes that her wish will be fulfilled within the year. Then she puts on the chemise, confident that she will be as fruitful as the tree on which the garment has passed the night. Among the Kara-Kirghiz barren women roll themselves on the ground under a solitary apple-tree, in order to obtain offspring. Some of the hill-tribes of India have a custom of marrying the bride and bridegroom to two trees before they are married to each other. For example, among the Mundas the bride touches with red lead a *mahwá*-tree, clasps it in her arms, and is tied to it; and the bridegroom goes through a like ceremony with a mango-tree. The intention of the custom may perhaps be to communicate to the newly-wedded pair the vigorous reproductive power of the trees. Lastly, the power of granting to women an easy delivery at child-birth is ascribed to trees both in Sweden and Africa. In some districts of Sweden there was formerly a *bårdträd* or guardian-tree (lime, ash, or elm) in the neighbourhood of every farm. No one would pluck a single leaf of the sacred tree, any injury to which was punished by ill-luck or sickness. Pregnant women used to clasp the tree in their arms in order to ensure an easy delivery. In some negro tribes of the Congo region pregnant women make themselves garments out of the bark of a certain sacred tree, because they believe that this tree delivers them from the dangers that attend child-bearing. The story that Leto clasped a palm-tree and an olive-tree or two laurel-trees, when she was about to give birth to the divine twins Apollo and Artemis, perhaps points to a similar Greek belief in the efficacy of certain trees to facilitate delivery.

X. Relics Of Tree-Worship In Modern Europe

From the foregoing review of the beneficent qualities commonly ascribed to tree-spirits, it is easy to understand why customs like the May-tree or May-pole have prevailed so widely and figured so prominently in the popular festivals of European peasants. In spring or early summer or even on Midsummer Day, it was and still is in many parts of Europe the custom to go out to the woods, cut down a tree and bring it into the village, where it is set up amid general rejoicings; or the people cut branches in the woods, and fasten them on every house. The intention of these customs is to bring home to the village, and to each house, the blessings which the tree-spirit has in its power to bestow. Hence the custom in some places of planting a May-tree before every house, or of carrying the village May-tree from door to door, that every household may receive its share of the blessing. Out of the mass of evidence on this subject a few examples may be selected.

Sir Henry Piers, in his *Description of Westmeath*, writing in 1682 says: "On May-eve, every family sets up before their door a green bush, strewed over with yellow flowers, which the meadows yield plentifully. In countries where timber is plentiful, they erect tall slender trees, which stand high, and they continue almost the whole year; so as a stranger would go nigh to imagine that they were all signs of ale-sellers, and that all houses were ale-houses." In Northamptonshire a young tree ten or twelve feet high used to be planted before each house on May Day so as to appear growing; flowers were thrown over it and strewn about the door. "Among ancient customs still retained by the Cornish, may be reckoned that of decking their doors and porches on the first of May with green boughs of sycamore and hawthorn, and of planting trees, or rather stumps of trees, before their houses." In the north of England it was formerly the custom for young people to rise a little after midnight on the morning of the first of May, and go out with music and the blowing of horns into the woods, where they broke branches and adorned them with nosegays and crowns of flowers. This done, they returned about sunrise and fastened the flower-decked branches over the doors and windows of their houses. At Abingdon in Berkshire young people formerly went about in groups on May morning, singing a carol of which the following are two of the verses:—

*"We've been rambling all the night,
And sometime of this day;
And now returning back again,
We bring a garland gay.*

*A garland gay we bring you here;
And at your door we stand;
It is a sprout well budded out,
The work of our Lord's hand."*

At the towns of Saffron Walden and Debden in Essex on the first of May little girls go about in parties from door to door singing a song almost identical with the above and carrying garlands; a doll dressed in white is usually placed in the middle of each garland. Similar customs have been and indeed are still observed in various parts of England. The garlands are generally in the form of hoops intersecting each other at right angles. Thus on May morning the girls of the neighbouring villages used to flock into Northampton bringing their garlands, which they exhibited from house to house. The skeleton of the garland was formed of two hoops of osier or hazel crossing each other at right angles, and so twined with flowers and ribbons that no part of them could be seen. In the centre of the garlands were placed gaily

dressed dolls, one, two, or three in number according to the size of the garland. The whole was fixed to a staff about five feet long, by which it was carried. In shewing their garlands the children chanted some simple ditties and received in return pennies, which furnished forth a feast on their return to their homes. A merry dance round the garland concluded the festivity. At Uttoxeter groups of children carry garlands of flowers about the town on May Day. "The garlands consist of two hoops, one passing through the other, which give the appearance of four half-circles, and they are decorated with flowers and evergreens, and surmounted with a bunch of flowers as a sort of crown, and in the centre of the hoops is a pendant orange and flowers." One or more of the children carry a little pole or stick upright with a bunch of flowers fastened to the top. They are themselves decorated with flowers and ribbons, and receive pence from the houses which they visit. At Watford in Hertfordshire, groups of children, almost entirely girls, go about the streets from door to door on May Day singing some verses, of which two agree almost verbally with those which, as we have seen, are sung at Abingdon in Berkshire. They are dressed in white, and adorned with gay ribbons and sashes of many hues. "Two of the girls carry between them on a stick what they call 'the garland,' which in its simplest form, is made of two circular hoops, intersecting each other at right angles; a more elaborate form has, in addition, smaller semicircles inserted in the four angles formed by the meeting of the hoops at the top of 'the garland.' These hoops are covered with any wild-flowers in season, and are further ornamented with ribbons. The 'garland' in shape reminds me of the 'Christmas' which used to form the centre of the Christmas decorations in Yorkshire some few years ago, except that the latter had a bunch of mistletoe inside the hoops." A similar custom was observed at Bampton-in-the-Bush in Oxfordshire down to about the middle of the nineteenth century. The garland consisted of two crossed hoops covered with moss, flowers, and ribbons. Two girls, known as the Lady and her Maid, bore the garland between them on a stick; and a boy called the Lord, who carried a stick dressed with ribbons and flowers, collected contributions from the spectators. From time to time the Lady sang a few lines and was then kissed by the Lord. At Sevenoaks in Kent the children carry boughs and garlands from door to door on May Day. The boughs consist of sticks carried upright with bunches of leaves and wild-flowers fastened to the top. The garlands are formed of two hoops interlaced cross-wise and covered with blue and yellow flowers from the woods and hedges. Sometimes the garlands are fastened to the end of a stick carried perpendicularly, sometimes they hang from the middle of a stick borne horizontally by two children. In the streets of Cambridge little girls regularly make their appearance every May Day with female dolls enclosed in hoops, which are covered with ribbons and flowers. These they shew to passers-by, inviting them to remember the May Lady by paying a small sum to her bearers. At Salisbury girls go through the streets on May Day in pairs, carrying between them on a stick a circular garland or hoop adorned with flowers and bows; they visit the shops asking for money. A similar custom is observed at Wilton a few miles from Salisbury. At Cawthorne in Yorkshire "on the first of May the school-children came with hoops to beg for artificial flowers; these my mother's maid used to sew on to the hoops, which with ribbons and other decorations, were used in decking out a tall May-pole planted in the village." It appears that a hoop wreathed with rowan and marsh marigold, and bearing suspended within it two balls, is still carried on May Day by villagers in some parts of Ireland. The balls, which are sometimes covered with gold and silver paper, are said to have originally represented the sun and moon.

In some villages of the Vosges Mountains on the first Sunday of May young girls go in bands from house to house, singing a song in praise of May, in which mention is made of the "bread and meal that come in May." If money is given them, they fasten a green bough to the door; if it is refused, they wish the family many children and no bread to feed them. In the French department of Mayenne, boys who bore the name of *Maillotins* used to go about from farm to

farm on the first of May singing carols, for which they received money or a drink; they planted a small tree or a branch of a tree. Among the Germans of Moravia on the third Sunday before Easter, which goes by the name of *Laetare* Sunday, it is customary in some places for young girls to carry a small fir-tree about from door to door, while they sing songs, for which they receive presents. The tree is tricked out with many-coloured ribbons, and sometimes with flowers and dyed egg-shells, and its branches are twined together so as to form what is called a crown. In Corfu the children go about singing May songs on the first of May. The boys carry small cypresses adorned with ribbons, flowers, and the fruits of the season. They receive a glass of wine at each house. The girls carry nosegays. One of them is dressed up like an angel, with gilt wings, and scatters flowers.

On the Thursday before Whitsunday the Russian villagers “go out into the woods, sing songs, weave garlands, and cut down a young birch-tree, which they dress up in woman’s clothes, or adorn with many-coloured shreds and ribbons. After that comes a feast, at the end of which they take the dressed-up birch-tree, carry it home to their village with joyful dance and song, and set it up in one of the houses, where it remains as an honoured guest till Whitsunday. On the two intervening days they pay visits to the house where their ‘guest’ is; but on the third day, Whitsunday, they take her to a stream and fling her into its waters,” throwing their garlands after her. “All over Russia every village and every town is turned, a little before Whitsunday, into a sort of garden. Everywhere along the streets the young birch-trees stand in rows, every house and every room is adorned with boughs, even the engines upon the railway are for the time decked with green leaves.” In this Russian custom the dressing of the birch in woman’s clothes shews how clearly the tree is personified; and the throwing it into a stream is most probably a rain-charm. In some villages of Altmark it was formerly the custom for serving-men, grooms, and cowherds to go from farm to farm at Whitsuntide distributing crowns made of birch branches and flowers to the farmers; these crowns were hung up in the houses and left till the following year.

In the neighbourhood of Zabern in Alsace bands of people go about carrying May-trees. Amongst them is a man dressed in a white shirt, with his face blackened; in front of him is carried a large May-tree, but each member of the band also carries a smaller one. One of the company bears a huge basket in which he collects eggs, bacon, and so forth. In some parts of Sweden on the eve of May Day lads go about carrying each a bunch of fresh-gathered birch twigs, wholly or partially in leaf. With the village fiddler at their head, they make the round of the houses singing May songs; the burden of their songs is a prayer for fine weather, a plentiful harvest, and worldly and spiritual blessings. One of them carries a basket in which he collects gifts of eggs and the like. If they are well received they stick a leafy twig in the roof over the cottage door.

But in Sweden midsummer is the season when these ceremonies are chiefly observed. On the Eve of St. John (the twenty-third of June) the houses are thoroughly cleansed and garnished with green boughs and flowers. Young fir-trees are raised at the doorway and elsewhere about the homestead; and very often small umbrageous arbours are constructed in the garden. In Stockholm on this day a leaf-market is held at which thousands of May-poles (*Maj Stänger*), from six inches to twelve feet high, decorated with leaves, flowers, slips of coloured paper, gilt egg-shells strung on reeds, and so on, are exposed for sale. Bonfires are lit on the hills, and the people dance round them and jump over them. But the chief event of the day is setting up the May-pole. This consists of a straight and tall spruce-pine tree, stripped of its branches. “At times hoops and at others pieces of wood, placed cross-wise, are attached to it at intervals; whilst at others it is provided with bows, representing, so to say, a man with his arms akimbo. From top to bottom not only the ‘Maj Stäng’ (May-pole) itself, but the hoops, bows, etc., are ornamented with leaves, flowers, slips of various cloth, gilt egg-

shells, etc.; and on the top of it is a large vane, or it may be a flag.” The raising of the May-pole, the decoration of which is done by the village maidens, is an affair of much ceremony; the people flock to it from all quarters, and dance round it in a great ring. Midsummer customs of the same sort used to be observed in some parts of Germany. Thus in the towns of the Upper Harz Mountains tall fir-trees, with the bark peeled off their lower trunks, were set up in open places and decked with flowers and eggs, which were painted yellow and red. Round these trees the young folk danced by day and the old folk in the evening. Many people disguised themselves, and dramatic representations were given, amongst others mock executions, at which the sufferer’s hat was knocked off instead of his head. At the village of Lerbach in these fir-clad mountains children would gather together on Midsummer Day, each with a tiny fir-tree, which they made to revolve from left to right in the direction of the sun, while they sang “The maiden turned herself about,” or “Oh, thou dear Summertime! Oh, thou dear Summertime!” In some parts of Bohemia also a May-pole or midsummer-tree is erected on St. John’s Eve. The lads fetch a tall fir or pine from the wood and set it up on a height, where the girls deck it with nosegays, garlands, and red ribbons. It is afterwards burned.

It would be needless to illustrate at length the custom, which has prevailed in various parts of Europe, such as England, France, and Germany, of setting up a village May-tree or May-pole on May Day. A few examples will suffice. The puritanical writer Phillip Stubbes in his *Anatomie of Abuses*, first published at London in 1583, has described with manifest disgust how they used to bring in the May-pole in the days of good Queen Bess. His description affords us a vivid glimpse of merry England in the olden time. “Against May, Whitsonday, or other time, all the yung men and maides, olde men and wives, run gadding over night to the woods, groves, hils, and mountains, where they spend all the night in pleasant pastimes; and in the morning they return, bringing with them birch and branches of trees, to deck their assemblies withall. And no mervaile, for there is a great Lord present amongst them, as superintendent and Lord over their pastimes and sportes, namely, Sathan, prince of hel. But the chiefest jewel they bring from thence is their May-pole, which they bring home with great veneration, as thus. They have twentie or fortie yoke of oxen, every oxe having a sweet nose-gay of flouers placed on the tip of his hornes, and these oxen drawe home this May-pole (this stinkyng ydol, rather), which is covered all over with floures and hearbs, bound round about with strings, from the top to the bottome, and sometime painted with variable colours, with two or three hundred men, women and children following it with great devotion. And thus beeing reared up, with handkercheefs and flags hovering on the top, they straw the ground rounde about, binde green boughes about it, set up sommer haules, bowers, and arbors hard by it. And then fall they to daunce about it, like as the heathen people did at the dedication of the Idols, whereof this is a perfect pattern, or rather the thing itself. I have heard it credibly reported (and that *viva voce*) by men of great gravitie and reputation, that of fortie, threescore, or a hundred maides going to the wood over night, there have scaresly the third part of them returned home againe undefiled.” Of the Cornish people their historian Borlase says: “From towns they make excursions, on May eve, into the country, cut down a tall elm, bring it into town with rejoicings, and having fitted a straight taper pole to the end of it, and painted it, erect it in the most publick part, and upon holidays and festivals dress it with garlands of flowers, or ensignes and streamers.” In Northumberland, down apparently to near the end of the eighteenth century, young people of both sexes used to go out early on May morning to gather the flowering thorn and the dew off the grass, which they brought home with music and acclamations; then, having dressed a pole on the green with garlands, they danced about it. The dew was considered as a great cosmetic, and preserved the face from wrinkles, blotches, and the traces of old age. A syllabub made of warm milk from the cow, sweet cakes, and wine was prepared for the feast; and a kind of divination, to discover who should be wedded first, was practised by dropping a marriage-

ring into the syllabub and fishing for it with a ladle. At Padstow in Cornwall, when shipbuilding was a thriving industry of the port, the shipwrights used to erect a tall May-pole at the top of Cross Street in the middle of a cross inlaid with stone. The pole was gaily decorated with spring flowers and so forth. But the custom has long been abandoned. A great feature of the celebration of May Day at Padstow used to be the Hobby Horse, that is, a man wearing a ferocious mask, who went dancing and singing before the chief houses, accompanied by a great flower-bedecked crowd of men and women, while the men fired pistols loaded with powder in all directions.

In Swabia on the first of May a tall fir-tree used to be fetched into the village, where it was decked with ribbons and set up; then the people danced round it merrily to music. The tree stood on the village green the whole year through, until a fresh tree was brought in next May Day. In Saxony "people were not content with bringing the summer symbolically (as king or queen) into the village; they brought the fresh green itself from the woods even into the houses: that is the May or Whitsuntide trees, which are mentioned in documents from the thirteenth century onwards. The fetching in of the May-tree was also a festival. The people went out into the woods to seek the May (*majum quaerere*), brought young trees, especially firs and birches, to the village and set them up before the doors of the houses or of the cattle-stalls or in the rooms. Young fellows erected such May-trees, as we have already said, before the chambers of their sweethearts. Besides these household Mays, a great May-tree or May-pole, which had also been brought in solemn procession to the village, was set up in the middle of the village or in the market-place of the town. It had been chosen by the whole community, who watched over it most carefully. Generally the tree was stripped of its branches and leaves, nothing but the crown being left, on which were displayed, in addition to many-coloured ribbons and cloths, a variety of victuals such as sausages, cakes, and eggs. The young folk exerted themselves to obtain these prizes. In the greasy poles which are still to be seen at our fairs we have a relic of these old May-poles. Not uncommonly there was a race on foot or on horseback to the May-tree—a Whitsuntide pastime which in course of time has been divested of its goal and survives as a popular custom to this day in many parts of Germany. In the great towns of our land the custom has developed into sport, for our spring races are in their origin nothing but the old German horse-races, in which the victor received a prize (generally a red cloth) from the hand of a maiden, while the last rider was greeted with jeers and gibes by the assembled community." The custom of the May-tree is observed by the Wends of Saxony, as well as by the Germans. The young men of the village choose the slimmest and tallest tree in the wood, peel it and set it up on the village green. Its leafy top is decked with cloths and ribbons presented by the girls. Here it stands, towering high above the roofs, till Ascension Day, or in many places till Whitsuntide. When it is being taken down, the young folk dance round it, and the youth who catches and breaks off the leafy crown of the falling tree is the hero of the day. Holding the green boughs aloft he is carried shoulder-high, with music and joyous shouts, to the ale-house, where the dance is resumed. At Bordeaux on the first of May the boys of each street used to erect in it a May-pole, which they adorned with garlands and a great crown; and every evening during the whole of the month the young people of both sexes danced singing about the pole. Down to the present day May-trees decked with flowers and ribbons are set up on May Day in every village and hamlet of gay Provence. Under them the young folk make merry and the old folk rest. The Red Karens of Upper Burma hold a festival in April, at which the chief ceremony is the erection of a post on ground set apart for the purpose in or near each village. A new post is set up every year; the old ones are left standing, but are not renewed if they fall or decay. Omens are first drawn from chicken bones as to which tree will be the best to fell for the post, which day will be the luckiest, and so on. A pole some twenty or thirty feet long is then hewn from the tree and ornamented with a rudely carved capital. On the lucky day all the villagers

assemble and drag the pole to the chosen spot. When it has been set up, the people dance “a rude sort of May-pole dance” to the music of drums and gongs. Much pork is eaten and much liquor drunk on this festive occasion.

In all these cases, apparently, the custom is or was to bring in a new May-tree each year. However, in England the village May-pole seems as a rule, at least in later times, to have been permanent, not renewed annually. Villages of Upper Bavaria renew their May-pole once every three, four, or five years. It is a fir-tree fetched from the forest, and amid all the wreaths, flags, and inscriptions with which it is bedecked, an essential part is the bunch of dark green foliage left at the top “as a memento that in it we have to do, not with a dead pole, but with a living tree from the greenwood.” We can hardly doubt that originally the practice everywhere was to set up a new May-tree every year. As the object of the custom was to bring in the fructifying spirit of vegetation, newly awakened in spring, the end would have been defeated if, instead of a living tree, green and sappy, an old withered one had been erected year after year or allowed to stand permanently. When, however, the meaning of the custom had been forgotten, and the May-tree was regarded simply as a centre for holiday merry-making, people saw no reason for felling a fresh tree every year, and preferred to let the same tree stand permanently, only decking it with fresh flowers on May Day. But even when the May-pole had thus become a fixture, the need of giving it the appearance of being a green tree, not a dead pole, was sometimes felt. Thus at Weverham in Cheshire “are two May-poles, which are decorated on this day (May Day) with all due attention to the ancient solemnity; the sides are hung with garlands, and the top terminated by a birch or other tall slender tree with its leaves on; the bark being peeled, and the stem spliced to the pole, so as to give the appearance of one tree from the summit.” Thus the renewal of the May-tree is like the renewal of the Harvest-May; each is intended to secure a fresh portion of the fertilising spirit of vegetation, and to preserve it throughout the year. But whereas the efficacy of the Harvest-May is restricted to promoting the growth of the crops, that of the May-tree or May-branch extends also, as we have seen, to women and cattle. Lastly, it is worth noting that the old May-tree is sometimes burned at the end of the year. Thus in the district of Prague young people break pieces of the public May-tree and place them behind the holy pictures in their rooms, where they remain till next May Day, and are then burned on the hearth. In Würtemberg the bushes which are set up on the houses on Palm Sunday are sometimes left there for a year and then burnt. The *eiresione* (the Harvest-May of Greece) was perhaps burnt at the end of the year.

So much for the tree-spirit conceived as incorporate or immanent in the tree. We have now to shew that the tree-spirit is often conceived and represented as detached from the tree and clothed in human form, and even as embodied in living men or women. The evidence for this anthropomorphic representation of the tree-spirit is largely to be found in the popular customs of European peasantry. These will be described presently, but before examining them we may notice an Esthonian folk-tale which illustrates the same train of thought very clearly. Once upon a time, so runs the tale, a young peasant was busy raking the hay in a meadow, when on the rim of the horizon a heavy thunder-cloud loomed black and angry, warning him to make haste with his work before the storm should break. He finished in time, and was wending his way homeward, when under a tree he espied a stranger fast asleep. “He will be drenched to the skin,” thought the good-natured young fellow to himself, “if I allow him to sleep on.” So he stepped up to the sleeper and shaking him forcibly roused him from his slumber. The stranger started up, and at sight of the thunder-cloud, which now darkened the sky, he blanched, fumbled in his pockets, and finding nothing in them wherewith to reward the friendly swain, he said, “This time I am your debtor. But the time will come when I shall be able to repay your kindness. Remember what I tell you. You will enlist. You will be parted

from your friends for years, and one day a feeling of homesickness will come over you in a foreign land. Then look up, and you will see a crooked birch-tree a few steps from you. Go to it, knock thrice on the trunk, and ask, 'Is the Crooked One at home?' The rest will follow." With these words the stranger hastened away and was out of sight in a moment. The peasant also went his way, and soon forgot all about the matter. Well, time went by and part of the stranger's prophecy came true. For the peasant turned soldier and served in a cavalry regiment for years. One day, when he was quartered with his regiment in the north of Finland, it fell to his turn to tend the horses while his comrades were roistering in the tavern. Suddenly a great yearning for home, such as he had never known before, came over the lonely trooper; tears started to his eyes, and dear visions of his native land crowded on his soul. Then he bethought him of the sleeping stranger in the wood, and the whole scene came back to him as fresh as if it had happened yesterday. He looked up, and there, strange to tell, he was aware of a crooked birch-tree right in front of him. More in jest than in earnest he went up to it and did as the stranger had bidden him. Hardly had the words, "Is the Crooked One at home?" passed his lips when the stranger himself stood before him and said, "I am glad you have come. I feared you had forgotten me. You wish to be at home, do you not?" The trooper said yes, he did. Then the Crooked One cried into the tree, "Young folks, which of you is the fleetest?" A voice from the birch replied, "Father, I can run as fast as a moorhen flies." "Well, I need a fleeter messenger to-day." A second voice answered, "I can run like the wind." "I need a swifter envoy," said the father. Then a third voice cried, "I can run like the thought of man." "You are after my own heart. Fill a bag full of gold and take it with my friend and benefactor to his home." Then he caught the soldier by the hat, crying, "The hat to the man, and the man to the house!" The same moment the soldier felt his hat fly from his head. When he looked about for it, lo! he was at home in the old familiar parlour wearing his old peasant clothes, and the great sack of money stood beside him. Yet on parade and at the roll-call he was never missed. When the man who told this story was asked, "Who could the stranger be?" he answered, "Who but a tree-elf?"

There is an instructive class of cases in which the tree-spirit is represented simultaneously in vegetable form and in human form, which are set side by side as if for the express purpose of explaining each other. In these cases the human representative of the tree-spirit is sometimes a doll or puppet, sometimes a living person; but whether a puppet or a person, it is placed beside a tree or bough; so that together the person or puppet, and the tree or bough, form a sort of bilingual inscription, the one being, so to speak, a translation of the other. Here, therefore, there is no room left for doubt that the spirit of the tree is actually represented in human form. Thus in Bohemia, on the fourth Sunday in Lent, young people throw a puppet called Death into the water; then the girls go into the wood, cut down a young tree, and fasten to it a puppet dressed in white clothes to look like a woman; with this tree and puppet they go from house to house collecting gratuities and singing songs with the refrain:—

*"We carry Death out of the village,
We bring Summer into the village."*

Here, as we shall see later on, the "Summer" is the spirit of vegetation returning or reviving in spring. In some parts of our own country children go about asking for pence with some small imitations of May-poles, and with a finely-dressed doll which they call the Lady of the May. In these cases the tree and the puppet are obviously regarded as equivalent.

At Thann, in Alsace, a girl called the Little May Rose, dressed in white, carries a small May-tree, which is gay with garlands and ribbons. Her companions collect gifts from door to door, singing a song:—

*“Little May Rose turn round three times,
Let us look at you round and round!
Rose of the May, come to the greenwood away,
We will be merry all.
So we go from the May to the roses.”*

In the course of the song a wish is expressed that those who give nothing may lose their fowls by the marten, that their vine may bear no clusters, their tree no nuts, their field no corn; the produce of the year is supposed to depend on the gifts offered to these May singers. Here and in the cases mentioned above, where children go about with green boughs or garlands on May Day singing and collecting money, the meaning is that with the spirit of vegetation they bring plenty and good luck to the house, and they expect to be paid for the service. In Russian Lithuania, on the first of May, they used to set up a green tree before the village. Then the rustic swains chose the prettiest girl, crowned her, swathed her in birch branches and set her beside the May-tree, where they danced, sang, and shouted “O May! O May!” In Brie (Isle de France) a May-tree is set up in the midst of the village; its top is crowned with flowers; lower down it is twined with leaves and twigs, still lower with huge green branches. The girls dance round it, and at the same time a lad wrapt in leaves and called Father May is led about. In the small towns of the Franken Wald mountains in Northern Bavaria, on the second of May, a *Walber* tree is erected before a tavern, and a man dances round it, enveloped in straw from head to foot in such a way that the ears of corn unite above his head to form a crown. He is called the *Walber*, and used to be led in procession through the streets, which were adorned with sprigs of birch.

Amongst the Slavs of Carinthia, on St. George’s Day (the twenty-third of April), the young people deck with flowers and garlands a tree which has been felled on the eve of the festival. The tree is then carried in procession, accompanied with music and joyful acclamations, the chief figure in the procession being the Green George, a young fellow clad from head to foot in green birch branches. At the close of the ceremonies the Green George, that is an effigy of him, is thrown into the water. It is the aim of the lad who acts Green George to step out of his leafy envelope and substitute the effigy so adroitly that no one shall perceive the change. In many places, however, the lad himself who plays the part of Green George is ducked in a river or pond, with the express intention of thus ensuring rain to make the fields and meadows green in summer. In some places the cattle are crowned and driven from their stalls to the accompaniment of a song:—

*“Green George we bring,
Green George we accompany,
May he feed our herds well.
If not, to the water with him.”*

Here we see that the same powers of making rain and fostering the cattle, which are ascribed to the tree-spirit regarded as incorporate in the tree, are also attributed to the tree-spirit represented by a living man.

Among the gypsies of Transylvania and Roumania the festival of Green George is the chief celebration of spring. Some of them keep it on Easter Monday, others on St. George’s Day (the twenty-third of April). On the eve of the festival a young willow tree is cut down, adorned with garlands and leaves, and set up in the ground. Women with child place one of their garments under the tree, and leave it there over night; if next morning they find a leaf of the tree lying on the garment, they know that their delivery will be easy. Sick and old people go to the tree in the evening, spit on it thrice, and say, “You will soon die, but let us live.” Next morning the gypsies gather about the willow. The chief figure of the festival is Green

George, a lad who is concealed from top to toe in green leaves and blossoms. He throws a few handfuls of grass to the beasts of the tribe, in order that they may have no lack of fodder throughout the year. Then he takes three iron nails, which have lain for three days and nights in water, and knocks them into the willow; after which he pulls them out and flings them into a running stream to propitiate the water-spirits. Finally, a pretence is made of throwing Green George into the water, but in fact it is only a puppet made of branches and leaves which is ducked in the stream. In this version of the custom the powers of granting an easy delivery to women and of communicating vital energy to the sick and old are clearly ascribed to the willow; while Green George, the human double of the tree, bestows food on the cattle, and further ensures the favour of the water-spirits by putting them in indirect communication with the tree.

An example of the double representation of the spirit of vegetation by a tree and a living man is reported from Bengal. The Oraons have a festival in spring while the *sál*-trees are in blossom, because they think that at this time the marriage of earth is celebrated and the *sál* flowers are necessary for the ceremony. On an appointed day the villagers go with their priest to the Sarna, the sacred grove, a remnant of the old *sál* forest in which a goddess Sarna Burhi, or woman of the grove, is supposed to dwell. She is thought to have great influence on the rain; and the priest arriving with his party at the grove sacrifices to her five fowls, of which a morsel is given to each person present. Then they gather the *sál* flowers and return laden with them to the village. Next day the priest visits every house, carrying the flowers in a wide open basket. The women of each house bring out water to wash his feet as he approaches, and kneeling make him an obeisance. Then he dances with them and places some of the *sál* flowers over the door of the house and in the women's hair. No sooner is this done than the women empty their water-jugs over him, drenching him to the skin. A feast follows, and the young people, with *sál* flowers in their hair, dance all night on the village green. Here, the equivalence of the flower-bearing priest to the goddess of the flowering tree comes out plainly. For she is supposed to influence the rain, and the drenching of the priest with water is, doubtless, like the ducking of the Green George in Carinthia and elsewhere, a rain-charm. Thus the priest, as if he were the tree goddess herself, goes from door to door dispensing rain and bestowing fruitfulness on each house, but especially on the women. In some parts of India the harvest-goddess Gauri, the wife of Siva, is represented both by an unmarried girl and by a bundle of the wild flowering balsam plant touch-me-not (*Impatiens sp.*), which is tied up in a mummy-like figure with a woman's mask, dress, and ornaments. Before being removed from the soil to represent the goddess the plants are worshipped. The girl is also worshipped. Then the bundle of plants is carried and the girl who personates the goddess walks through the rooms of the house, while the supposed footprints of Gauri herself are imprinted on the floor with red paste. On entering each room the human representative of Gauri is asked, "Gauri, Gauri, whither have you come and what do you see?" and the girl makes appropriate replies. Then she is given a mouthful of sweets and the mistress of the house says, "Come with golden feet and stay for ever." The plant-formed effigy of Gauri is afterwards worshipped as the goddess herself and receives offerings of rice-cakes and pancakes. On the third day it is thrown into a river or tank; then a handful of pebbles or sand is brought home from the spot and thrown all over the house and the trees to bring good luck to the house and to protect the trees from vermin. A remarkable feature of the ceremonies is that the goddess Gauri is supposed to be secretly followed by her husband Siva, who remains hidden under the fold of her garment and is represented by a *lôtâ*, covered by a coco-nut and filled with rice, which is carefully measured. After the image of Gauri has been thrown into the river or tank, the rice in the *lôtâ* representing Siva is carefully measured again, in order to see whether the quantity has increased or decreased, and according to the result an abundant or a scanty harvest is prognosticated. Hence it appears that the whole ritual aims at ensuring a

plentiful crop of rice. In this case the spirit of vegetation thus represented in duplicate by a living girl and the effigy of a woman is a harvest goddess, not a tree-spirit, but the principle is the same.

Without citing more examples to the same effect, we may sum up the results of the preceding pages in the words of Mannhardt: "The customs quoted suffice to establish with certainty the conclusion that in these spring processions the spirit of vegetation is often represented both by the May-tree and in addition by a man dressed in green leaves or flowers or by a girl similarly adorned. It is the same spirit which animates the tree and is active in the inferior plants and which we have recognised in the May-tree and the Harvest-May. Quite consistently the spirit is also supposed to manifest his presence in the first flower of spring and reveals himself both in a girl representing a May-rose, and also, as giver of harvest, in the person of the *Walber*. The procession with this representative of the divinity was supposed to produce the same beneficial effects on the fowls, the fruit-trees, and the crops as the presence of the deity himself. In other words, the mummer was regarded not as an image but as an actual representative of the spirit of vegetation; hence the wish expressed by the attendants on the May-rose and the May-tree that those who refuse them gifts of eggs, bacon, and so forth, may have no share in the blessings which it is in the power of the itinerant spirit to bestow. We may conclude that these begging processions with May-trees or May-boughs from door to door ('bringing the May or the summer') had everywhere originally a serious and, so to speak, sacramental significance; people really believed that the god of growth was present unseen in the bough; by the procession he was brought to each house to bestow his blessing. The names May, Father May, May Lady, Queen of the May, by which the anthropomorphic spirit of vegetation is often denoted, shew that the idea of the spirit of vegetation is blent with a personification of the season at which his powers are most strikingly manifested."

Thus far we have seen that the tree-spirit or the spirit of vegetation in general is represented either in vegetable form alone, as by a tree, bough, or flower; or in vegetable and human form simultaneously, as by a tree, bough, or flower in combination with a puppet or a living person. It remains to shew that the representation of him by a tree, bough, or flower is sometimes entirely dropped, while the representation of him by a living person remains. In this case the representative character of the person is generally marked by dressing him or her in leaves or flowers; sometimes too it is indicated by the name he or she bears.

Thus in some parts of Russia on St. George's Day (the twenty-third of April) a youth is dressed out, like our Jack-in-the-Green, with leaves and flowers. The Slovenes call him the Green George. Holding a lighted torch in one hand and a pie in the other, he goes out to the corn-fields, followed by girls singing appropriate songs. A circle of brushwood is then lighted, in the middle of which is set the pie. All who take part in the ceremony then sit down around the fire and divide the pie among them. In this custom the Green George dressed in leaves and flowers is plainly identical with the similarly disguised Green George who is associated with a tree in the Carinthian, Transylvanian, and Roumanian customs observed on the same day. Again, we saw that in Russia at Whitsuntide a birch-tree is dressed in woman's clothes and set up in the house. Clearly equivalent to this is the custom observed on Whit-Monday by Russian girls in the district of Pinsk. They choose the prettiest of their number, envelop her in a mass of foliage taken from the birch-trees and maples, and carry her about through the village. In a district of Little Russia they take round a "poplar," represented by a girl wearing bright flowers in her hair. At Whitsuntide in Holland poor women used to go about begging with a little girl called Whitsuntide Flower (*Pinxterbloem*, perhaps a kind of iris); she was decked with flowers and sat in a waggon. In North Brabant she wears the flowers from which she takes her name and a song is sung:—

“*Whitsuntide Flower,
Turn yourself once round.*”

All over Provence on the first of May pretty little girls are dressed in white, decked with crowns and wreaths of roses, and set on seats or platforms strewn with flowers in the streets, while their companions go about begging coppers for the Mayos or Mayes, as they are called, from the passers-by. In some parts of the Ardennes on May Day a small girl, clad in white and wearing a chaplet of flowers on her head, used to go from house to house with her play-mates, collecting contributions and singing that it was May, the month of May, the pretty month of May, that the wheat was tall, the hawthorn in bloom, and the lark carolling in the sky.

In Ruhla (Thüringen) as soon as the trees begin to grow green in spring, the children assemble on a Sunday and go out into the woods, where they choose one of their play-mates to be the Little Leaf Man. They break branches from the trees and twine them about the child till only his shoes peep out from the leafy mantle. Holes are made in it for him to see through, and two of the children lead the Little Leaf Man that he may not stumble or fall. Singing and dancing they take him from house to house, asking for gifts of food such as eggs, cream, sausages, and cakes. Lastly, they sprinkle the Leaf Man with water and feast on the food they have collected. At Röllshausen on the Schwalm, in Hesse, when afternoon service is over on Whitsunday, the schoolboys and schoolgirls go out into the wood and there clothe a boy from head to foot in leaves so that nobody would know him. He is called the Little Whitsuntide Man. A procession is then formed. Two boys lead their leaf-clad playfellow; two others precede him with a basket; and two girls with another basket bring up the rear. Thus they go from house to house singing hymns or popular songs and collecting eggs and cakes in the baskets. When they have feasted on these, they strip their comrade of his verdant envelope on an open place in front of the village. In some parts of Rhenish Bavaria at Whitsuntide a boy or lad is swathed in the yellow blossom of the broom, the dark green twigs of the firs, and other foliage. Thus attired he is known as the Quack and goes from door to door, whirling about in the dance, while an appropriate song is chanted and his companions levy contributions. In the Fricktal, Switzerland, at Whitsuntide boys go out into a wood and swathe one of their number in leafy boughs. He is called the Whitsuntide-lout (*Pfingstlümmele*), and being mounted on horseback with a green branch in his hand he is led back into the village. At the village-well a halt is called and the leaf-clad lout is dismounted and ducked in the trough. Thereby he acquires the right of sprinkling water on everybody, and he exercises the right specially on girls and street urchins. The urchins march before him in bands begging him to give them a Whitsuntide wetting.

In England the best-known example of these leaf-clad mummers is the Jack-in-the-Green, a chimney-sweeper who walks encased in a pyramidal framework of wickerwork, which is covered with holly and ivy, and surmounted by a crown of flowers and ribbons. Thus arrayed he dances on May Day at the head of a troop of chimney-sweeps, who collect pence. The ceremony was witnessed at Cheltenham on the second of May 1892, by Dr. W. H. D. Rouse, who has described in detail the costume of the performers. They were all chimney-sweeps of the town. Jack-in-the-Green or the Bush-carrier was enclosed in a wooden framework on which leaves were fastened so as to make a thick cone about six feet high, topped with a crown, which consisted of two wooden hoops placed crosswise and covered with flowers. The leafy envelope was unbroken except for a single opening through which peered the face of the mummer. From time to time in their progress through the streets the performers halted, and three of them, dressed in red, blue, and yellow respectively, tripped lightly round the leaf-covered man to the inspiring strains of a fiddle and a tin whistle on which two of their comrades with blackened faces discoursed sweet music. The leader of the procession was a

clown fantastically clad in a long white pinafore or blouse with coloured fringes and frills, and wearing on his head a beaver hat of the familiar pattern, the crown of which hung loose and was adorned with ribbons and a bird or a bundle of feathers. Large black rings surrounded his eyes, and a red dab over mouth and chin lent a pleasing variety to his countenance. He contributed to the public hilarity by flapping the yellow fringe of his blouse with quaint gestures and occasionally fanning himself languidly. His efforts were seconded by another performer, who wore a red fool's cap, all stuck with flowers, and a white pinafore enriched with black human figures in front and a black gridiron-like pattern, crossed diagonally by a red bar, at the back. Two boys in white pinafores, with similar figures, or stars, on the breast, and a fish on the back, completed the company. Formerly there used to be a man in woman's clothes, who personated the clown's wife. In some parts also of France a young fellow is encased in a wicker framework covered with leaves and is led about. In Frickthal, in the Swiss canton of Aargau, a similar frame of basketwork is called the Whitsuntide Basket. As soon as the trees begin to bud, a spot is chosen in the wood, and here the village lads make the frame with all secrecy, lest others should forestall them. Leafy branches are twined round two hoops, one of which rests on the shoulders of the wearer, the other encircles his calves; holes are made for his eyes and mouth; and a large nosegay crowns the whole. In this guise he appears suddenly in the village at the hour of vespers, preceded by three boys blowing on horns made of willow bark. The great object of his supporters is to set up the Whitsuntide Basket on the village well, and to keep it and him there, despite the efforts of the lads from neighbouring villages, who seek to carry off the Whitsuntide Basket and set it up on their own well. In the neighbourhood of Ertingen (Württemberg) a masker of the same sort, known as the Lazy Man (*Latzmann*), goes about the village on Midsummer Day; he is hidden under a great pyramidal or conical frame of wickerwork, ten or twelve feet high, which is completely covered with sprigs of fir. He has a bell which he rings as he goes, and he is attended by a suite of persons dressed up in character—a footman, a colonel, a butcher, an angel, the devil, the doctor, and so on. They march in Indian file and halt before every house, where each of them speaks in character, except the Lazy Man, who says nothing. With what they get by begging from door to door they hold a feast.

In the class of cases of which the foregoing are specimens it is obvious that the leaf-clad person who is led about is equivalent to the May-tree, May-bough, or May-doll, which is carried from house to house by children begging. Both are representatives of the beneficent spirit of vegetation, whose visit to the house is recompensed by a present of money or food.

Often the leaf-clad person who represents the spirit of vegetation is known as the king or the queen; thus, for example, he or she is called the May King, Whitsuntide King, Queen of May, and so on. These titles, as Mannhardt observes, imply that the spirit incorporate in vegetation is a ruler, whose creative power extends far and wide.

In a village near Salzwedel a May-tree is set up at Whitsuntide and the boys race to it; he who reaches it first is king; a garland of flowers is put round his neck and in his hand he carries a May-bush, with which, as the procession moves along, he sweeps away the dew. At each house they sing a song, wishing the inmates good luck, referring to the "black cow in the stall milking white milk, black hen on the nest laying white eggs," and begging a gift of eggs, bacon, and so on. At the village of Ellgoth in Silesia a ceremony called the King's Race is observed at Whitsuntide. A pole with a cloth tied to it is set up in a meadow, and the young men ride past it on horseback, each trying to snatch away the cloth as he gallops by. The one who succeeds in carrying it off and dipping it in the neighbouring Oder is proclaimed King. Here the pole is clearly a substitute for a May-tree. In some villages of Brunswick at Whitsuntide a May King is completely enveloped in a May-bush. In some parts of Thüringen also they have a May King at Whitsuntide, but he is dressed up rather differently. A frame of

wood is made in which a man can stand; it is completely covered with birch boughs and is surmounted by a crown of birch and flowers, in which a bell is fastened. This frame is placed in the wood and the May King gets into it. The rest go out and look for him, and when they have found him they lead him back into the village to the magistrate, the clergyman, and others, who have to guess who is in the verdurous frame. If they guess wrong, the May King rings his bell by shaking his head, and a forfeit of beer or the like must be paid by the unsuccessful guesser. At Wahrstedt in Brunswick the boys at Whitsuntide choose by lot a king and a high-steward (*füstje-meier*). The latter is completely concealed in a May-bush, wears a wooden crown wreathed with flowers, and carries a wooden sword. The king, on the other hand, is only distinguished by a nosegay in his cap, and a reed, with a red ribbon tied to it, in his hand. They beg for eggs from house to house, threatening that, where none are given, none will be laid by the hens throughout the year. In this custom the high-steward appears, for some reason, to have usurped the insignia of the king. At Hildesheim, in Hanover, five or six young fellows go about on the afternoon of Whit-Monday cracking long whips in measured time and collecting eggs from the houses. The chief person of the band is the Leaf King, a lad swathed so completely in birchen twigs that nothing of him can be seen but his feet. A huge head-dress of birchen twigs adds to his apparent stature. In his hand he carries a long crook, with which he tries to catch stray dogs and children. In some parts of Bohemia on Whit-Monday the young fellows disguise themselves in tall caps of birch bark adorned with flowers. One of them is dressed as a king and dragged on a sledge to the village green, and if on the way they pass a pool the sledge is always overturned into it. Arrived at the green they gather round the king; the crier jumps on a stone or climbs up a tree and recites lampoons about each house and its inmates. Afterwards the disguises of bark are stripped off and they go about the village in holiday attire, carrying a May-tree and begging. Cakes, eggs, and corn are sometimes given them. At Grossvargula, near Langensalza, in the eighteenth century a Grass King used to be led about in procession at Whitsuntide. He was encased in a pyramid of poplar branches, the top of which was adorned with a royal crown of branches and flowers. He rode on horseback with the leafy pyramid over him, so that its lower end touched the ground, and an opening was left in it only for his face. Surrounded by a cavalcade of young fellows, he rode in procession to the town hall, the parsonage, and so on, where they all got a drink of beer. Then under the seven lindens of the neighbouring Sommerberg, the Grass King was stripped of his green casing; the crown was handed to the Mayor, and the branches were stuck in the flax fields in order to make the flax grow tall. In this last trait the fertilising influence ascribed to the representative of the tree-spirit comes out clearly. In the neighbourhood of Pilsen (Bohemia) a conical hut of green branches, without any door, is erected at Whitsuntide in the midst of the village. To this hut rides a troop of village lads with a king at their head. He wears a sword at his side and a sugar-loaf hat of rushes on his head. In his train are a judge, a crier, and a personage called the Frog-flayer or Hangman. This last is a sort of ragged merryandrew, wearing a rusty old sword and bestriding a sorry hack. On reaching the hut the crier dismounts and goes round it looking for a door. Finding none, he says, "Ah, this is perhaps an enchanted castle; the witches creep through the leaves and need no door." At last he draws his sword and hews his way into the hut, where there is a chair, on which he seats himself and proceeds to criticise in rhyme the girls, farmers, and farm-servants of the neighbourhood. When this is over, the Frog-flayer steps forward and, after exhibiting a cage with frogs in it, sets up a gallows on which he hangs the frogs in a row. In the neighbourhood of Plas the ceremony differs in some points. The king and his soldiers are completely clad in bark, adorned with flowers and ribbons; they all carry swords and ride horses, which are gay with green branches and flowers. While the village dames and girls are being criticised at the arbour, a frog is secretly pinched and poked by the crier till it quacks. Sentence of death is passed on the frog by the king; the hangman

beheads it and flings the bleeding body among the spectators. Lastly, the king is driven from the hut and pursued by the soldiers. The pinching and beheading of the frog are doubtless, as Mannhardt observes, a rain-charm. We have seen that some Indians of the Orinoco beat frogs for the express purpose of producing rain, and that killing a frog is a European rain-charm.

Often the spirit of vegetation in spring is represented by a queen instead of a king. In the neighbourhood of Libchovic (Bohemia), on the fourth Sunday in Lent, girls dressed in white and wearing the first spring flowers, as violets and daisies, in their hair, lead about the village a girl who is called the Queen and is crowned with flowers. During the procession, which is conducted with great solemnity, none of the girls may stand still, but must keep whirling round continually and singing. In every house the Queen announces the arrival of spring and wishes the inmates good luck and blessings, for which she receives presents. In German Hungary the girls choose the prettiest girl to be their Whitsuntide Queen, fasten a towering wreath on her brow, and carry her singing through the streets. At every house they stop, sing old ballads, and receive presents. In the south-east of Ireland on May Day the prettiest girl used to be chosen Queen of the district for twelve months. She was crowned with wild flowers; feasting, dancing, and rustic sports followed, and were closed by a grand procession in the evening. During her year of office she presided over rural gatherings of young people at dances and merry-makings. If she married before next May Day, her authority was at an end, but her successor was not elected till that day came round. The May Queen is common in France and familiar in England. Thus at the adjoining villages of Cherrington and Stourton in south Warwickshire, the Queen of May is still represented on May Day by a small girl dressed in white and wearing a wreath of flowers on her head. An older girl wheels the Queen in what is called a mail-cart, that is, a child's perambulator on two wheels. Another girl carries a money-box. Four boys bear the May-pole, a conical framework formed of a high tripod with a central shaft. The whole structure is encased in a series of five hoops, which rise one above the other, diminishing in size from bottom to top with the tapering of the cone. The hoops, as well as the tripod and the central shaft, are all covered with whatever flowers happen to be in bloom, such as marsh-marigolds, primroses, or blue-bells. To the top of the central shaft is fastened a bunch of the flower called crown-imperial, if it is in season. The lowest hoop is crossed by two bars at right angles to each other, and the projecting ends of the bars serve as handles, by which the four boys carry the May-pole. Each of the bearers has a garland of flowers slung over his shoulder. Thus the children go from house to house, singing their songs and receiving money, which goes to provide a treat for them in the afternoon.

Again the spirit of vegetation is sometimes represented by a king and queen, a lord and lady, or a bridegroom and bride. Here again the parallelism holds between the anthropomorphic and the vegetable representation of the tree-spirit, for we have seen above that trees are sometimes married to each other. At Halford in south Warwickshire the children go from house to house on May Day, walking two and two in procession and headed by a King and Queen. Two boys carry a May-pole some six or seven feet high, which is covered with flowers and greenery. Fastened to it near the top are two cross-bars at right angles to each other. These are also decked with flowers, and from the ends of the bars hang hoops similarly adorned. At the houses the children sing May songs and receive money, which is used to provide tea for them at the school-house in the afternoon. In a Bohemian village near Königgrätz on Whit-Monday the children play the king's game, at which a king and queen march about under a canopy, the queen wearing a garland, and the youngest girl carrying two wreaths on a plate behind them. They are attended by boys and girls called groomsmen and bridesmaids, and they go from house to house collecting gifts. A regular feature in the popular celebration of Whitsuntide in Silesia used to be, and to some extent still is, the

contest for the kingship. This contest took various forms, but the mark or goal was generally the May-tree or May-pole. Sometimes the youth who succeeded in climbing the smooth pole and bringing down the prize was proclaimed the Whitsuntide King and his sweetheart the Whitsuntide Bride. Afterwards the king, carrying the May-bush, repaired with the rest of the company to the ale-house, where a dance and a feast ended the merry-making. Often the young farmers and labourers raced on horseback to the May-pole, which was adorned with flowers, ribbons, and a crown. He who first reached the pole was the Whitsuntide King, and the rest had to obey his orders for that day. The worst rider became the clown. At the May-tree all dismounted and hoisted the king on their shoulders. He nimbly swarmed up the pole and brought down the May-bush and the crown, which had been fastened to the top. Meantime the clown hurried to the ale-house and proceeded to bolt thirty rolls of bread and to swig four quart bottles of brandy with the utmost possible despatch. He was followed by the king, who bore the May-bush and crown at the head of the company. If on their arrival the clown had already disposed of the rolls and the brandy, and greeted the king with a speech and a glass of beer, his score was paid by the king; otherwise he had to settle it himself. After church time the stately procession wound through the village. At the head of it rode the king, decked with flowers and carrying the May-bush. Next came the clown with his clothes turned inside out, a great flaxen beard on his chin, and the Whitsuntide crown on his head. Two riders disguised as guards followed. The procession drew up before every farmyard; the two guards dismounted, shut the clown into the house, and claimed a contribution from the housewife to buy soap with which to wash the clown's beard. Custom allowed them to carry off any victuals which were not under lock and key. Last of all they came to the house in which the king's sweetheart lived. She was greeted as Whitsuntide Queen and received suitable presents—to wit, a many-coloured sash, a cloth, and an apron. The king got as a prize, a vest, a neckcloth, and so forth, and had the right of setting up the May-bush or Whitsuntide-tree before his master's yard, where it remained as an honourable token till the same day next year. Finally the procession took its way to the tavern, where the king and queen opened the dance. Sometimes the Whitsuntide King and Queen succeeded to office in a different way. A man of straw, as large as life and crowned with a red cap, was conveyed in a cart, between two men armed and disguised as guards, to a place where a mock court was waiting to try him. A great crowd followed the cart. After a formal trial the straw man was condemned to death and fastened to a stake on the execution ground. The young men with bandaged eyes tried to stab him with a spear. He who succeeded became king and his sweetheart queen. The straw man was known as the Goliath. Near Grenoble, in France, a king and queen are chosen on the first of May and are set on a throne for all to see. At Headington, near Oxford, children used to carry garlands from door to door on May Day. Each garland was borne by two girls, and they were followed by a lord and lady—a boy and girl linked together by a white handkerchief, of which each held an end, and dressed with ribbons, sashes, and flowers. At each door they sang a verse:—

*“Gentlemen and ladies,
We wish you happy May;
We come to shew you a garland,
Because it is May-day.”*

On receiving money the lord put his arm about his lady's waist and kissed her. At Fleuriers in Switzerland on the seventh of May 1843 a May-bridegroom (*Époux de Mai*) and his bride were escorted in a procession of over two hundred children, some of whom carried green branches of beech. A number of May Fools were entrusted with the delicate duty of going round with the hat. The proceeds of their tact and industry furnished a banquet in the evening, and the day ended with a children's ball. In some Saxon villages at Whitsuntide a lad and a

lass used to disguise themselves and hide in the bushes or high grass outside the village. Then the whole village went out with music “to seek the bridal pair.” When they found the couple they all gathered round them, the music struck up, and the bridal pair was led merrily to the village. In the evening they danced. In some places the bridal pair was called the prince and the princess.

In a parish of Denmark it used to be the custom at Whitsuntide to dress up a little girl as the Whitsun-bride (*pinse-bruden*) and a little boy as her groom. She was decked in all the finery of a grown-up bride, and wore a crown of the freshest flowers of spring on her head. Her groom was as gay as flowers, ribbons, and knots could make him. The other children adorned themselves as best they could with the yellow flowers of the trollius and caltha. Then they went in great state from farmhouse to farmhouse, two little girls walking at the head of the procession as bridesmaids, and six or eight outriders galloping ahead on hobby-horses to announce their coming. Contributions of eggs, butter, loaves, cream, coffee, sugar, and tallow-candles were received and conveyed away in baskets. When they had made the round of the farms, some of the farmers’ wives helped to arrange the wedding feast, and the children danced merrily in clogs on the stamped clay floor till the sun rose and the birds began to sing. All this is now a thing of the past. Only the old folks still remember the little Whitsun-bride and her mimic pomp.

We have seen that in Sweden the ceremonies associated elsewhere with May Day or Whitsuntide commonly take place at Midsummer. Accordingly we find that in some parts of the Swedish province of Blekinge they still choose a Midsummer’s Bride, to whom the “church coronet” is occasionally lent. The girl selects for herself a Bridegroom, and a collection is made for the pair, who for the time being are looked on as man and wife. The other youths also choose each his bride. A similar ceremony seems to be still kept up in Norway, for a correspondent writes to me as follows in reference to the Danish custom of the Whitsun-bride: “It may interest you to know that on June 23, 1893, I witnessed at Ullensvang, Hardanger, Norway, a ceremony almost exactly the same as that described in your book. Wild flowers are scarce there, and the bride wore the usual metal crown, the attendants for the most part wearing the pretty Hardanger costume. The dancing took place in an unlighted barn, as the farmer was afraid of fire. There were plenty of boys at the dance, but so far as I can remember, none in the procession. The custom is clearly dying out, and the somewhat reluctant bridegroom was the subject of a good deal of chaff from his fellows.” In Sardinia the Midsummer couples are known as the Sweethearts of St. John, and their association with the growth of plants is clearly brought out by the pots of sprouting grain which form a principal part of the ceremony.

In the neighbourhood of Briançon (Dauphiné) on May Day the lads wrap up in green leaves a young fellow whose sweetheart has deserted him or married another. He lies down on the ground and feigns to be asleep. Then a girl who likes him, and would marry him, comes and wakes him, and raising him up offers him her arm and a flag. So they go to the alehouse, where the pair lead off the dancing. But they must marry within the year, or they are treated as old bachelor and old maid, and are debarred the company of the young folk. The lad is called the bridegroom of the month of May (*le fiancé du mois de May*). In the alehouse he puts off his garment of leaves, out of which, mixed with flowers, his partner in the dance makes a nosegay, and wears it at her breast next day, when he leads her again to the alehouse. Like this is a Russian custom observed in the district of Nerechta on the Thursday before Whitsunday. The girls go out into a birch-wood, wind a girdle or band round a stately birch, twist its lower branches into a wreath, and kiss each other in pairs through the wreath. The girls who kiss through the wreath call each other gossips. Then one of the girls steps forward, and mimicking a drunken man, flings herself on the ground, rolls on the grass, and

feigns to fall fast asleep. Another girl wakens the pretended sleeper and kisses him; then the whole bevy trips singing through the wood to twine garlands, which they throw into the water. In the fate of the garlands floating on the stream they read their own. Here the part of the sleeper was probably at one time played by a lad. In these French and Russian customs we have a forsaken bridegroom, in the following a forsaken bride. On Shrove Tuesday the Slovenes of Oberkrain drag a straw puppet with joyous cries up and down the village; then they throw it into the water or burn it, and from the height of the flames they judge of the abundance of the next harvest. The noisy crew is followed by a female masker, who drags a great board by a string and gives out that she is a forsaken bride.

Viewed in the light of what has gone before, the awakening of the forsaken sleeper in these ceremonies probably represents the revival of vegetation in spring. But it is not easy to assign their respective parts to the forsaken bridegroom and to the girl who wakes him from his slumber. Is the sleeper the leafless forest or the bare earth of winter? Is the girl who wakens him the fresh verdure or the genial sunshine of spring? It is hardly possible, on the evidence before us, to answer these questions. The Oraons of Bengal, it may be remembered, celebrate the marriage of earth in the springtime, when the *sál*-tree is in blossom. But from this we can hardly argue that in the European ceremonies the sleeping bridegroom is “the dreaming earth” and the girl the spring blossoms.

In the Highlands of Scotland the revival of vegetation in spring used to be graphically represented on St. Bride’s Day, the first of February. Thus in the Hebrides “the mistress and servants of each family take a sheaf of oats, and dress it up in women’s apparel, put it in a large basket, and lay a wooden club by it, and this they call Briid’s bed; and then the mistress and servants cry three times, ‘Briid is come, Briid is welcome.’ This they do just before going to bed, and when they rise in the morning they look among the ashes, expecting to see the impression of Briid’s club there; which if they do, they reckon it a true presage of a good crop and prosperous year, and the contrary they take as an ill omen.” The same custom is described by another witness thus: “Upon the night before Candlemas it is usual to make a bed with corn and hay, over which some blankets are laid, in a part of the house, near the door. When it is ready, a person goes out and repeats three times, ... ‘Bridget, Bridget, come in; thy bed is ready.’ One or more candles are left burning near it all night.” Similarly in the Isle of Man “on the eve of the first of February, a festival was formerly kept, called, in the Manks language, *Laa’l Breeshey*, in honour of the Irish lady who went over to the Isle of Man to receive the veil from St. Maughold. The custom was to gather a bundle of green rushes, and standing with them in the hand on the threshold of the door, to invite the holy Saint Bridget to come and lodge with them that night. In the Manks language, the invitation ran thus:—‘*Brede, Brede, tar gys my thie tar dyn thie aymys noght. Foshil jee yn dorrys da Brede, as lhig da Brede e heet staigh.*’ In English: ‘Bridget, Bridget, come to my house, come to my house to-night. Open the door for Bridget, and let Bridget come in.’ After these words were repeated, the rushes were strewn on the floor by way of a carpet or bed for St. Bridget. A custom very similar to this was also observed in some of the Out-Isles of the ancient kingdom of Man.” In these Manx and Highland ceremonies it is obvious that St. Bride, or St. Bridget, is an old heathen goddess of fertility, disguised in a threadbare Christian cloak. Probably she is no other than the Celtic goddess Brigit, who will meet us again later on.

Often the marriage of the spirit of vegetation in spring, though not directly represented, is implied by naming the human representative of the spirit, “the Bride,” and dressing her in wedding attire. Thus in some villages of Altmark at Whitsuntide, while the boys go about carrying a May-tree or leading a boy enveloped in leaves and flowers, the girls lead about the May Bride, a girl dressed as a bride with a great nosegay in her hair. They go from house to house, the May Bride singing a song in which she asks for a present, and tells the inmates of

each house that if they give her something they will themselves have something the whole year through; but if they give her nothing they will themselves have nothing. In some parts of Westphalia two girls lead a flower-crowned girl called the Whitsuntide Bride from door to door, singing a song in which they ask for eggs. At Waggum in Brunswick, when service is over on Whitsunday, the village girls assemble, dressed in white or bright colours, decked with flowers, and wearing chaplets of spring flowers in their hair. One of them represents the May Bride, and carries a crown of flowers on a staff as a sign of her dignity. As usual the children go about from cottage to cottage singing and begging for eggs, sausages, cakes, or money. In other parts of Brunswick it is a boy clothed all in birch leaves who personates the May Bride. In Bresse in the month of May a girl called *la Mariée* is tricked out with ribbons and nosegays and is led about by a gallant. She is preceded by a lad carrying a green May-tree, and appropriate verses are sung.

XI. The Influence Of The Sexes On Vegetation

From the preceding examination of the spring and summer festivals of Europe we may infer that our rude forefathers personified the powers of vegetation as male and female, and attempted, on the principle of homoeopathic or imitative magic, to quicken the growth of trees and plants by representing the marriage of the sylvan deities in the persons of a King and Queen of May, a Whitsun Bridegroom and Bride, and so forth. Such representations were accordingly no mere symbolic or allegorical dramas, pastoral plays designed to amuse or instruct a rustic audience. They were charms intended to make the woods to grow green, the fresh grass to sprout, the corn to shoot, and the flowers to blow. And it was natural to suppose that the more closely the mock marriage of the leaf-clad or flower-decked mummers aped the real marriage of the woodland sprites, the more effective would be the charm. Accordingly we may assume with a high degree of probability that the profligacy which notoriously attended these ceremonies was at one time not an accidental excess but an essential part of the rites, and that in the opinion of those who performed them the marriage of trees and plants could not be fertile without the real union of the human sexes. At the present day it might perhaps be vain to look in civilised Europe for customs of this sort observed for the explicit purpose of promoting the growth of vegetation. But ruder races in other parts of the world have consciously employed the intercourse of the sexes as a means to ensure the fruitfulness of the earth; and some rites which are still, or were till lately, kept up in Europe can be reasonably explained only as stunted relics of a similar practice. The following facts will make this plain.

For four days before they committed the seed to the earth the Pipiles of Central America kept apart from their wives "in order that on the night before planting they might indulge their passions to the fullest extent; certain persons are even said to have been appointed to perform the sexual act at the very moment when the first seeds were deposited in the ground." The use of their wives at that time was indeed enjoined upon the people by the priests as a religious duty, in default of which it was not lawful to sow the seed. The only possible explanation of this custom seems to be that the Indians confused the process by which human beings reproduce their kind with the process by which plants discharge the same function, and fancied that by resorting to the former they were simultaneously forwarding the latter. In the month of December, when the alligator pears begin to ripen, the Indians of Peru used to hold a festival called *Acatay mita* in order to make the fruit grow mellow. The festival lasted five days and nights, and was preceded by a fast of five days during which they ate neither salt nor pepper and refrained from their wives. At the festival men and boys assembled stark naked in an open space among the orchards, and ran from there to a distant hill. Any woman whom they overtook on the way they violated. In some parts of Java, at the season when the bloom will soon be on the rice, the husbandman and his wife visit their fields by night and there engage in sexual intercourse for the purpose of promoting the growth of the crop. In the Leti, Sarmata, and some other groups of islands which lie between the western end of New Guinea and the northern part of Australia, the heathen population regard the sun as the male principle by whom the earth or female principle is fertilised. They call him Upu-lera or Mr. Sun, and represent him under the form of a lamp made of coco-nut leaves, which may be seen hanging everywhere in their houses and in the sacred fig-tree. Under the tree lies a large flat stone, which serves as a sacrificial table. On it the heads of slain foes were and are still placed in some of the islands. Once a year, at the beginning of the rainy season, Mr. Sun comes down into the holy fig-tree to fertilise the earth, and to facilitate his descent a ladder with seven rungs is considerably placed at his disposal. It is set up under the tree and is adorned

with carved figures of the birds whose shrill clarion heralds the approach of the sun in the East. On this occasion pigs and dogs are sacrificed in profusion; men and women alike indulge in a saturnalia; and the mystic union of the sun and the earth is dramatically represented in public, amid song and dance, by the real union of the sexes under the tree. The object of the festival, we are told, is to procure rain, plenty of food and drink, abundance of cattle and children and riches from Grandfather Sun. They pray that he may make every she-goat to cast two or three young, the people to multiply, the dead pigs to be replaced by living pigs, the empty rice-baskets to be filled, and so on. And to induce him to grant their requests they offer him pork and rice and liquor, and invite him to fall to. In the Babar Islands a special flag is hoisted at this festival as a symbol of the creative energy of the sun; it is of white cotton, about nine feet high, and consists of the figure of a man in an appropriate attitude. Among the Tangkhuls of Manipur, before the rice is sown and when it is reaped, the boys and girls have a tug-of-war with a tough rope of twisted creeper. Great jars of beer are set ready, and the strictness of their ordinary morality is broken by a night of unbridled licence. It would be unjust to treat these orgies as a mere outburst of unbridled passion; no doubt they are deliberately and solemnly organised as essential to the fertility of the earth and the welfare of man.

The same means which are thus adopted to stimulate the growth of the crops are naturally employed to ensure the fruitfulness of trees. The work known as *The Agriculture of the Nabataeans* contained apparently a direction that the grafting of a tree upon another tree of a different sort should be done by a damsel, who at the very moment of inserting the graft in the bough should herself be subjected to treatment which can only be regarded as a direct copy of the operation she was performing on the tree. In some parts of Amboyna, when the state of the clove plantation indicates that the crop is likely to be scanty, the men go naked to the plantations by night, and there seek to fertilise the trees precisely as they would impregnate women, while at the same time they call out for "More cloves!" This is supposed to make the trees bear fruit more abundantly. In Java when a palm tree is to be tapped for wine, the man who proposes to relieve the tree of its superfluous juices deems it necessary to approach the palm in the character of a lover and a husband, as well as of a son. When he comes upon a palm which he thinks suitable, he will not begin cutting at the trunk until he has intimated as delicately as he can the reasons which lead him to perform that surgical operation, and the ardent affection which he cherishes for the tree. For this purpose he holds a dialogue with the palm, in which he naturally speaks in the character of the tree as well as in his own. "O mother *endang-reni!*" he begins, "for the sake of you I have let myself be drenched by the rain and scorched by the sun; long have I sought you! Now at last have I found you. How ardently have I longed for you! Often before have you given me the breast. Yet I still thirst. Therefore now I ask for four potfuls more." "Well, fair youth," replies the tree, "I have always been here. What is the reason that you have sought me?" "The reason I have sought you is that I have heard you suffer from *incontinentia urinae.*" "So I do," says the tree. "Will you marry me?" says the man. "That I will," says the tree, "but first you must plight your troth and recite the usual confession of faith." On that the man takes a rattan leaf and wraps it round the palm as a pledge of betrothal, after which he says the creed: "There is no God but Allah, and Mohammed is his prophet." The maidenly and orthodox scruples of the tree having thus been satisfied, he embraces it as his bride. At first he attaches only a small dish to the trunk to receive the juices which exude from the cut in the bark; a large dish might frighten the tree. In fastening the dish to the palm he says, "*Bok-endang-reni!* your child is languishing away for thirst. He asks you for a drink." The tree replies, "Let him slake his thirst! Mother's breasts are full to overflowing." We have already seen that in some parts of Northern India a mock marriage between two actors is performed in honour of a newly-planted orchard, no doubt for the purpose of making it bear fruit. In the Nicobar Islands a

pregnant woman is taken into the gardens in order to impart the blessing of fertility to the plants.

The Baganda of Central Africa believe so strongly in the intimate relation between the intercourse of the sexes and the fertility of the ground that among them a barren wife is generally sent away because she is supposed to prevent her husband's garden from bearing fruit. On the contrary, a couple who have given proof of extraordinary fertility by becoming the parents of twins are believed by the Baganda to be endowed with a corresponding power of increasing the fruitfulness of the plantain-trees, which furnish them with their staple food. Some little time after the birth of the twins a ceremony is performed, the object of which clearly is to transmit the reproductive virtue of the parents to the plantains. The mother lies down on her back in the thick grass near the house and places a flower of the plantain between her legs; then her husband comes and knocks the flower away with his genital member. Further, the parents go through the country, performing dances in the gardens of favoured friends, apparently for the purpose of causing the plantain-trees to bear fruit more abundantly. The same belief in the fertilising power of such parents probably explains why in Uganda the father of twins is inviolable and may go into anybody's garden and take the produce at will. To distinguish him from the common herd his hair is cut in a special way, and he wears little bells at his ankles which tinkle as he walks. His sacred character is further manifested by a rule which he must observe after the round of visits has been paid, and the dances in the gardens are over. He has to remain at home until the next time that the army goes forth to battle, and in the interval he may neither dress his hair nor cut his finger-nails. When war has been proclaimed, his whole body is shaved and his nails cut. The clipped hair and nails he ties up in a ball, which he takes with him to the war, along with the bark cloth which he wore at the dances. When he has killed a foe, he crams the ball into the dead man's mouth, ties the bark-cloth round his neck, and leaves them there on the battlefield. Apparently the ceremony is intended to rid him of the peculiar sanctity or state of taboo which he contracted by the birth of twins, and to facilitate his return to ordinary life. For, to the mind of the savage, as we shall see later on, sanctity has its dangers and inconveniences, and the sacred man may often be glad to divest himself of it by stripping himself of those separable parts of his person—the hair and nails—to which the holy contagion is apt to cling.

In various parts of Europe customs have prevailed both at spring and harvest which are clearly based on the same crude notion that the relation of the human sexes to each other can be so used as to quicken the growth of plants. For example, in the Ukraine on St. George's Day (the twenty-third of April) the priest in his robes, attended by his acolytes, goes out to the fields of the village, where the crops are beginning to shew green above the ground, and blesses them. After that the young married people lie down in couples on the sown fields and roll several times over on them, in the belief that this will promote the growth of the crops. In some parts of Russia the priest himself is rolled by women over the sprouting crop, and that without regard to the mud and holes which he may encounter in his beneficent progress. If the shepherd resists or remonstrates, his flock murmurs, "Little Father, you do not really wish us well, you do not wish us to have corn, although you do wish to live on our corn." In England it seems to have been customary for young couples to roll down a slope together on May Day; on Greenwich-hill the custom was practised at Easter and Whitsuntide, as it was till lately practised near Dublin on Whitmonday. When we consider how closely these seasons, especially May Day and Whitsuntide, are associated with ceremonies for the revival of plant life in spring, we shall scarcely doubt that the custom of rolling in couples at such times had originally the same significance which it still has in Russia; and when further we compare this particular custom with the practice of representing the vernal powers of

vegetation by a bridal pair, and remember the traditions which even in our own country attach to May Day, we shall probably do no injustice to our forefathers if we conclude that they once celebrated the return of spring with grosser rites, of which the customs I have referred to are only a stunted survival. Indeed, these rites in their grossest form are said to be still observed in various parts of Holland at Whitsuntide. In some parts of Germany at harvest the men and women, who have reaped the corn, roll together on the field. This again is probably a mitigation of an older and ruder custom designed to impart fertility to the fields by methods like those resorted to by the Pipiles of Central America long ago and by the cultivators of rice in Java at the present time. In Poso, when the rice-crop is not thriving, the farmer's wife sets bowls of rice and betel in various parts of the field; then she lies down, draws her petticoat over her head, and pretends to fall asleep. But one of her children thereupon mimics the crowing of a cock, and at the sound she gets up, "because a new day has dawned." The intention of this ceremony, which the natives could not or would not explain to the Dutch missionary who reports it, may be to place the woman at the disposal of the god of the field. We are expressly told that there is a special god of the rice-fields named Puwe-wai, and that the ceremony in question is performed in his honour.

To the student who cares to track the devious course of the human mind in its gropings after truth, it is of some interest to observe that the same theoretical belief in the sympathetic influence of the sexes on vegetation, which has led some peoples to indulge their passions as a means of fertilising the earth, has led others to seek the same end by directly opposite means. From the moment that they sowed the maize till the time that they reaped it, the Indians of Nicaragua lived chastely, keeping apart from their wives and sleeping in a separate place. They ate no salt, and drank neither cocoa nor *chicha*, the fermented liquor made from maize; in short the season was for them, as the Spanish historians observe, a time of abstinence. To this day some of the Indian tribes of Central America practise continence for the purpose of thereby promoting the growth of the crops. Thus we are told that before sowing the maize the Kekchi Indians sleep apart from their wives, and eat no flesh for five days, while among the Lanquineros and Cajaboneros the period of abstinence from these carnal pleasures extends to thirteen days. So amongst some of the Germans of Transylvania it is a rule that no man may sleep with his wife during the whole of the time that he is engaged in sowing his fields. The same rule is observed at Kalotaszeg in Hungary; the people think that if the custom were not observed the corn would be mildewed. Similarly a Central Australian headman of the Kaitish tribe strictly abstains from marital relations with his wife all the time that he is performing magical ceremonies to make the grass grow; for he believes that a breach of this rule would prevent the grass seed from sprouting properly. In some of the Melanesian islands, when the yam vines are being trained, the men sleep near the gardens and never approach their wives; should they enter the garden after breaking this rule of continence the fruits of the garden would be spoilt. In the Motu tribe of New Guinea, when rain has fallen plentifully and there is promise of a good crop of bananas, one of the chief men becomes holy or taboo, and must live apart from his wife and eat only certain kinds of food. He bids the young men beat the drum and dance, "in order that by so doing there may be a large harvest. If the dancing is not given, there will be an end to the good growth; but if it is continued, all will go well. People come in from other villages to assist, and will dance all night." In the Mekeo district of British New Guinea, when a taboo has been put on the coco-nuts and areca-nuts to promote their growth, some fourteen or fifteen men act as watchmen to enforce the taboo. Every evening they go round the village armed with clubs and wearing masks or so covered with leaves that nobody would know them. All the time they are in office they may not chew betel nor drink coco-nut water, lest the areca-nuts (which are eaten with betel) and the coco-nuts should fail. Moreover, they may not live with their wives; indeed, they may not even look at a woman, and if they pass one they must keep

their eyes on the ground. Among the Kabuis of Manipur, before the rice is sown and when it is reaped, the strictest chastity has to be observed, especially by the religious head of the village, who, besides always taking the omens on behalf of the villagers, is the first to sow and the first to reap. Some of the tribes of Assam believe that so long as the crops remain ungarnered, the slightest incontinence might ruin all. In the incense-growing region of Arabia in antiquity there were three families charged with the special care of the incense-trees. They were called sacred, and at the time when they cut the trees or gathered the incense they were forbidden to pollute themselves with women or with the contact of the dead; the observance of these rules of ceremonial purity was believed to increase the supply of incense. Apparently the incense itself was deemed holy, for on being gathered it was deposited in the sanctuary of the Sun, where the merchants inspected and purchased it. With ancient Greek husbandmen it was a maxim that olives should always be planted and gathered by pure boys and virgins; the uncommon fruitfulness of the olive-trees at Anazarbus in Cilicia was attributed to their being tended by young and innocent children. In default of such workers, the olive-gatherer had to swear that he had been faithful to his own wife; for his fidelity was believed to ensure an abundant crop of fruit the following year.

Again, the sympathetic relation supposed to exist between the commerce of the sexes and the fertility of the earth manifests itself in the belief that illicit love tends, directly or indirectly, to mar that fertility and to blight the crops. Such a belief prevails, for example, among the Karens of Burma. They imagine that adultery or fornication has a powerful influence to injure the harvest. Hence if the crops have been bad for a year or two, and no rain falls, the villagers set down the dearth to secret sins of this kind, and say that the God of heaven and earth is angry with them on that account; and they all unite in making an offering to appease him. Further, whenever adultery or fornication is detected, the elders decide that the sinners must buy a hog and kill it. Then the woman takes one foot of the hog, and the man takes another, and they scrape out furrows in the ground with each foot, and fill the furrows with the blood of the hog. Next they scratch the ground with their hands and pray: "God of heaven and earth, God of the mountains and hills, I have destroyed the productiveness of the country. Do not be angry with me, do not hate me; but have mercy on me, and compassionate me. Now I repair the mountains, now I heal the hills, and the streams and the lands. May there be no failure of crops, may there be no unsuccessful labours, or unfortunate efforts in my country. Let them be dissipated to the foot of the horizon. Make thy paddy fruitful, thy rice abundant. Make the vegetables to flourish. If we cultivate but little, still grant that we may obtain a little." After each has prayed thus, they return to the house and say they have repaired the earth. The Battas of Sumatra think that if an unmarried woman is big with child, it is necessary to give her in marriage at once, even to a man of lower rank; for otherwise the people will be infested by tigers, and the crops in the field will not yield an abundant return. The crime of incest, in their opinion, would blast the whole harvest if the wrong were not speedily repaired. Epidemics and other calamities that affect the whole people are almost always traced by them to incest, by which is to be understood any marriage that conflicts with their customs.

Similar views are held by various tribes of Borneo. Thus when the rain pours down steadily day after day and week after week, and the crops are rotting in the fields, the Dyaks of Borneo come to the conclusion that some one has been indulging in fleshly lusts; so the elders lay their heads together and adjudicate on all cases of incest and bigamy, and purify the earth with the blood of pigs, which appears to possess in a high degree the valuable property of atoning for moral guilt. For three days the villages are tabooed and all labour discontinued; the inhabitants remain at home, and no strangers are admitted. Not long ago the offenders, whose lewdness had thus brought the whole country into danger, would have been

punished with death or at least slavery. A Dyak may not marry his first cousin unless he first performs a special ceremony called *bergaput* to avert evil consequences from the land. The couple repair to the water-side, fill a small pitcher with their personal ornaments, and sink it in the river; or instead of a jar they fling a chopper and a plate into the water. A pig is then sacrificed on the bank, and its carcass, drained of blood, is thrown in after the jar. Next the pair are pushed into the water by their friends and ordered to bathe together. Lastly, a joint of bamboo is filled with pig's blood, and the couple perambulate the country and the villages round about, sprinkling the blood on the ground. After that they are free to marry. This is done, we are told, for the sake of the whole country, in order that the rice may not be blasted. The Bahaus or Kayans, a tribe in the interior of Borneo, believe that adultery is punished by the spirits, who visit the whole tribe with failure of the crops and other misfortunes. Hence in order to avert these calamities from the innocent members of the tribe, the two culprits, with all their possessions, are put in quarantine on a gravel bank in the middle of the river; then in order thoroughly to disinfect them, pigs and fowls are killed, and with the blood priestesses smear the property of the guilty pair. Finally the two are set on a raft, with sixteen eggs, and allowed to drift down the stream. They may save themselves by swimming ashore, but this is perhaps a mitigation of an older sentence of death by drowning. Young people shower long grass-stalks, which stand for spears, at the shamefaced and dripping couple. The Blu-u Kayans of the same region similarly imagine that an intrigue between an unmarried pair is punished by the spirits with failure of the harvest, of the fishing, and of the hunt. Hence the delinquents have to appease the wrath of the spirits by sacrificing a pig and some rice.

Among the Macassars and Bugineese of Southern Celebes incest is a capital crime. "In the Bugineese language this misdeed is called *sâpa-tâna*, which, literally translated, signifies that the *ground* (*tâna*) which has been polluted with the blood of such a person must above all be *shunned* (*sâpa*). When we remember how afraid of evil spirits a native is in passing even a spot that has been stained with innocent blood, we can easily conceive what passes in his mind at the thought of the blood of one who has been guilty of such a crime. When the rivers dry up and the supply of fish runs short, when the harvest and the produce of the gardens miscarry, when edible fruits fail, and especially when sickness is rife among the cattle and horses, as well as when civil strife breaks out and the country suffers from any other widespread calamity, the native generally thinks that earth and air have been sullied with the blood of persons who have committed incest. The blood of such people should naturally not be shed. Hence the punishment usually inflicted on them is that of drowning. They are tied up in a sack and thrown into the sea. Yet they get with them on their journey to eternity the necessary provisions, consisting of a bag of rice, salt, dried fish, coco-nuts and so on, not forgetting three quids of betel." Among the Tomori of Central Celebes a person guilty of incest is throttled; no drop of his blood may fall on the ground, for if it did, the rice would never grow again. The union of uncle and niece is regarded by these people as incest, but it can be expiated by an offering. A garment of the man and one of the woman are laid on a copper vessel; the blood of a sacrificed animal, either a goat or a fowl, is allowed to drip on the garments, and then the vessel with its contents is suffered to float down the river. Among the Tolalaki, another tribe of Central Celebes, persons who have defiled themselves with incest are shut up in a basket and drowned. No drop of their blood may be spilt on the ground, for that would hinder the earth from ever bearing fruit again. When it rains in torrents, the Galelareese of Halmahera say that brother and sister, or father and daughter, or in short some near relations are having illicit relations with each other, and that every human being must be informed of it, for then only will the rain cease to descend. The superstition has repeatedly caused blood relations to be accused, rightfully or wrongfully, of incest. The people also regard other alarming natural phenomena, for instance a violent earthquake or the

eruption of a volcano, as consequences of crimes of the same sort. Persons charged with such offences are brought to Ternate; it is said that formerly they were often drowned on the way or, on being haled thither, were condemned to be thrown into the volcano.

In some parts of Africa, also, it is believed that breaches of sexual morality disturb the course of nature, particularly by blighting the fruits of the earth. Thus the negroes of Loango suppose that the intercourse of a man with an immature girl is punished by God with drought and consequent famine, until the culprits atone for their sin by dancing naked before the king and an assembly of the people, who throw hot gravel and bits of glass at the pair. For example, in the year 1898, it was discovered that a long drought was caused by the misconduct of three girls, who were with child before they had passed through what is called the paint-house, that is, before they had been painted red and secluded for a time in token that they had attained to the age of puberty. The people were very angry and tried to punish or even kill the girls. Amongst the Bavili of Loango, it is believed that if a man breaks the marriage law by marrying a woman of his mother's clan, God will in like manner punish the crime by withholding the rains in their due season. Similar notions of the blighting influence of sexual crime appear to be entertained by the Nandi of British East Africa, for amongst them a girl who has been gotten with child by a warrior, may never look inside of a granary for fear of spoiling the corn. Among the Basutos likewise "while the corn is exposed to view, all defiled persons are carefully kept from it. If the aid of a man in this state is necessary for carrying home the harvest, he remains at some distance while the sacks are filled, and only approaches to place them upon the draught oxen. He withdraws as soon as the load is deposited at the dwelling, and under no pretext can he assist in pouring the corn into the baskets in which it is preserved." The nature of the defilement which thus disqualifies a man for handling the corn is not mentioned, but probably it would include unchastity. We may conjecture that it was for a similar reason that the Basoga of Central Africa used to punish severely the seduction of a virgin. "If a man was convicted of such a crime, and the woman's guilt was discovered, he and she were sent at night time to Kaluba's village, where they were tied to a tree. This tall spreading incense-tree was thought to be under the protection of a spirit called *Kakua Kambuzi*. Next morning the erring couple were discovered by people in the surrounding plantations, who released them. They were then allowed to settle near the tree of the protecting spirit." This practice of tying the culprits to a sacred tree may have been thought to atone for their crime and so to ensure the fertility of the earth which they had imperilled. The notion perhaps was to deliver the criminals into the power of the offended tree-spirit; if they were found alive in the morning, it was a sign that he had pardoned them. "Curiously enough, the Basoga also held in great abhorrence anything like incest amongst domestic animals—that is to say, they greatly disapproved of intercourse between a bull calf and its mother-cow, or between a bull and a cow that were known to be brother and sister. If this occurred, the bull and cow were sent by night to a fetish tree and tied there. The next morning the chief of the district appropriated the animals and turned them to his own use." Following out the same train of thought, the Toradjas of Central Celebes ingeniously employ the incest of animals as a rain-charm. For they believe that the anger of the gods at incest or bestiality manifests itself in the form of violent storms, heavy rain, or long drought. Accordingly they think that it is always in their power to enrage the gods by committing incest and so to procure rain when it is needed. However, they abstain from perpetrating the crime among themselves, first, because it would be necessary to put the culprits to death, and second, because the storms thus raised would be so furious that they would do more harm than good. But they fancy that the incest, real or simulated, of animals is a lighter offence, which by discomposing, without exasperating, the higher powers will disturb the balance of nature just enough to improve the weather. A ceremony of this sort was witnessed by a missionary. Rain was wanted, and the headman of the village had to see that it fell. He took

his measures accordingly. Attended by a crowd he carried a cock and a little sow to the river. Here the animals were killed, laid side by side in an intimate embrace, and wrapped tightly up in a piece of cotton. Then the headman engaged in prayer. "O gods above and gods below," said he, "if you have pity on us, and will that we eat food this year, give rain. If you will not give rain, well we have here buried a cock and a sow in an intimate embrace." By which he meant to say, "Be angry at this abomination which we have committed, and manifest your anger in storms."

These examples suffice to prove that among many savage races breaches of the marriage laws are thought to blast the fruits of the earth through excessive rain or excessive drought. Similar notions of the disastrous effects of sexual crimes may be detected among some of the civilised races of antiquity, who seem not to have limited the supposed sterilising influence of such offences to the fruits of the earth, but to have extended it also to women and cattle. Thus among the Hebrews we read how Job, passionately protesting his innocence before God, declares that he is no adulterer; "For that," says he, "were an heinous crime; yea, it were an iniquity to be punished by the judges: for it is a fire that consumeth unto Destruction, and would root out all mine increase." In this passage the Hebrew word translated "increase" commonly means "the produce of the earth;" and if we give the word its usual sense here, then Job affirms adultery to be destructive of the fruits of the ground, which is just what many savages still believe. This interpretation of his words is strongly confirmed by two narratives in Genesis, where we read how Sarah, Abraham's wife, was taken into his harem by a king who did not know her to be the wife of the patriarch, and how thereafter God visited the king and his household with great plagues, especially by closing up the wombs of the king's wives and his maid-servants, so that they bore no children. It was not till the king had discovered and confessed his sin, and Abraham had prayed God to forgive him, that the king's women again became fruitful. These narratives seem to imply that adultery, even when it is committed in ignorance, is a cause of plague and especially of sterility among women. Again, in Leviticus, after a long list of sexual crimes, we read: "Defile not ye yourselves in any of these things: for in all these the nations are defiled which I cast out from before you: and the land is defiled: therefore I do visit the iniquity thereof upon it, and the land vomiteth out her inhabitants." This passage appears to imply that the land itself was somehow physically tainted by sexual transgressions so that it could no longer support the inhabitants.

It would seem that the ancient Greeks and Romans entertained similar notions as to the wasting effect of incest. According to Sophocles the land of Thebes suffered from blight, from pestilence, and from the sterility both of women and of cattle under the reign of Oedipus, who had unwittingly slain his father and wedded his mother, and the Delphic oracle declared that the only way to restore the prosperity of the country was to banish the sinner from it, as if his mere presence withered plants, animals, and women. No doubt the poet and his hearers set down these public calamities in great part to the guilt of parricide, which rested on Oedipus; but they can hardly have failed to lay much also of the evil at the door of his incest with his mother. Again, in ancient Italy, under the Emperor Claudius, a Roman noble was accused of incest with his sister. He committed suicide, his sister was banished, and the emperor ordered that certain ancient ceremonies traditionally derived from the laws of King Servius Tullius should be performed, and that expiation should be made by the pontiffs at the sacred grove of Diana, probably the famous Arician grove, which has furnished the starting-point of our enquiry. As Diana appears to have been a goddess of fertility in general and of the fruitfulness of women in particular, the atonement made at her sanctuary for incest may perhaps be accepted as evidence that the Romans, like other peoples, attributed to sexual immorality a tendency to blast the fruits both of the earth and of the womb. This inference is strengthened by a precept laid down by grave Roman writers that

bakers, cooks, and butlers ought to be strictly chaste and continent, because it was most important that food and cups should be handled either by persons under the age of puberty, or at all events by persons who indulged very sparingly in sexual intercourse; for which reason if a baker, a cook, or a butler broke this rule of continence it was his bounden duty to wash in a river or other running water before he applied himself again to his professional duties. But for all such duties the services of a boy or of a virgin were preferred. The Celts of ancient Ireland similarly believed that incest blighted the fruits of the earth. According to legend Munster was afflicted in the third century of our era with a failure of the crops and other misfortunes. When the nobles enquired into the matter, they were told that these calamities were the result of an incest which the king had committed with his sister. In order to put an end to the evil they demanded of the king his two sons, the fruit of his unholy union, that they might consume them with fire and cast their ashes into the running stream. However, one of the sons, Corc by name, is said to have been purged of his inherited taint by being sent out of Ireland to an island, where a Druid purified him every morning, by putting him on the back of a white cow with red ears, and pouring water over him, till one day the cow jumped into the sea and became a rock, no doubt taking the sin of Corc's father away with her. After that the boy was brought back to Erin.

Thus the belief that incest or sexual crime in general has power to blast the fruits of the earth is widespread and probably goes back to a very remote antiquity; it may long have preceded the rise of agriculture. We may conjecture that in its origin the belief was magical rather than religious; in other words, that the blight was at first supposed to be a direct consequence of the act itself rather than a punishment inflicted on the criminal by gods or spirits. Conceived as an unnatural union of the sexes, incest might be thought to subvert the regular processes of reproduction, and so to prevent the earth from yielding its fruits and to hinder animals and men from propagating their kinds. At a later time the anger of spiritual beings would naturally be invoked in order to give a religious sanction to the old taboo. If this was so, it is possible that something of the horror which incest has excited among most, though by no means all, races of men, sprang from this ancient superstition and has been transmitted as an instinct in many nations long after the imaginary ground of it had been forgotten. Certainly a course of conduct which was supposed to endanger or destroy the general supply of food and therefore to strike a blow at the very life of the whole people, could not but present itself to the savage imagination as a crime of the blackest dye, fraught with the most fatal consequences to the public weal. How far such a superstition may in the beginning have operated to prevent the union of near kin, in other words, to institute the system of prohibited degrees which still prevails among the great majority of mankind, both savage and civilised, is a question which deserves to be considered by the historians of marriage.

If we ask why it is that similar beliefs should logically lead, among different peoples, to such opposite modes of conduct as strict chastity and more or less open debauchery, the reason, as it presents itself to the primitive mind, is perhaps not very far to seek. If rude man identifies himself, in a manner, with nature; if he fails to distinguish the impulses and processes in himself from the methods which nature adopts to ensure the reproduction of plants and animals, he may leap to one of two conclusions. Either he may infer that by yielding to his appetites he will thereby assist in the multiplication of plants and animals; or he may imagine that the vigour which he refuses to expend in reproducing his own kind, will form as it were a store of energy whereby other creatures, whether vegetable or animal, will somehow benefit in propagating their species. Thus from the same crude philosophy, the same primitive notions of nature and life, the savage may derive by different channels a rule either of profligacy or of asceticism.

To readers bred in a religion which is saturated with the ascetic idealism of the East, the explanation which I have given of the rule of continence observed under certain circumstances by rude or savage peoples may seem far-fetched and improbable. They may think that moral purity, which is so intimately associated in their minds with the observance of such a rule, furnishes a sufficient explanation of it; they may hold with Milton that chastity in itself is a noble virtue, and that the restraint which it imposes on one of the strongest impulses of our animal nature marks out those who can submit to it as men raised above the common herd, and therefore worthy to receive the seal of the divine approbation. However natural this mode of thought may seem to us, it is utterly foreign and indeed incomprehensible to the savage. If he resists on occasion the sexual instinct, it is from no high idealism, no ethereal aspiration after moral purity, but for the sake of some ulterior yet perfectly definite and concrete object, to gain which he is prepared to sacrifice the immediate gratification of his senses. That this is or may be so, the examples I have cited are amply sufficient to prove. They shew that where the instinct of self-preservation, which manifests itself chiefly in the search for food, conflicts or appears to conflict with the instinct which conduces to the propagation of the species, the former instinct, as the primary and more fundamental, is capable of over-mastering the latter. In short, the savage is willing to restrain his sexual propensity for the sake of food. Another object for the sake of which he consents to exercise the same self-restraint is victory in war. Not only the warrior in the field but his friends at home will often bridle their sensual appetites from a belief that by so doing they will the more easily overcome their enemies. The fallacy of such a belief, like the belief that the chastity of the sower conduces to the growth of the seed, is plain enough to us; yet perhaps the self-restraint which these and the like beliefs, vain and false as they are, have imposed on mankind, has not been without its utility in bracing and strengthening the breed. For strength of character in the race as in the individual consists mainly in the power of sacrificing the present to the future, of disregarding the immediate temptations of ephemeral pleasure for more distant and lasting sources of satisfaction. The more the power is exercised the higher and stronger becomes the character; till the height of heroism is reached in men who renounce the pleasures of life and even life itself for the sake of keeping or winning for others, perhaps in distant ages, the blessings of freedom and truth.

XII. The Sacred Marriage

§ 1. Diana as a Goddess of Fertility

In the last chapter we saw that according to a widespread belief, which is not without a foundation in fact, plants reproduce their kinds through the sexual union of male and female elements, and that on the principle of homoeopathic or imitative magic this reproduction can be stimulated by the real or mock marriage of men and women, who masquerade for the time being as spirits of vegetation. Such magical dramas have played a great part in the popular festivals of Europe, and based as they are on a very crude conception of natural law, it is clear that they must have been handed down from a remote antiquity. We shall hardly, therefore, err in assuming that they date from a time when the forefathers of the civilised nations of Europe were still barbarians, herding their cattle and cultivating patches of corn in the clearings of the vast forests, which then covered the greater part of the continent, from the Mediterranean to the Arctic Ocean. But if these old spells and enchantments for the growth of leaves and blossoms, of grass and flowers and fruit, have lingered down to our own time in the shape of pastoral plays and popular merry-makings, is it not reasonable to suppose that they survived in less attenuated forms some two thousand years ago among the civilised peoples of antiquity? Or, to put it otherwise, is it not likely that in certain festivals of the ancients we may be able to detect the equivalents of our May Day, Whitsuntide, and Midsummer celebrations, with this difference, that in those days the ceremonies had not yet dwindled into mere shows and pageants, but were still religious or magical rites, in which the actors consciously supported the high parts of gods and goddesses? Now in the first chapter of this book we found reason to believe that the priest who bore the title of King of the Wood at Nemi had for his mate the goddess of the grove, Diana herself. May not he and she, as King and Queen of the Wood, have been serious counterparts of the merry mummers who play the King and Queen of May, the Whitsuntide Bridegroom and Bride in modern Europe? and may not their union have been yearly celebrated in a *theogamy* or divine marriage? Such dramatic weddings of gods and goddesses, as we shall see presently, were carried out as solemn religious rites in many parts of the ancient world; hence there is no intrinsic improbability in the supposition that the sacred grove at Nemi may have been the scene of an annual ceremony of this sort. Direct evidence that it was so there is none, but analogy pleads in favour of the view, as I shall now endeavour to shew.

Diana was essentially a goddess of the woodlands, as Ceres was a goddess of the corn and Bacchus a god of the vine. Her sanctuaries were commonly in groves, indeed every grove was sacred to her, and she is often associated with the forest god Silvanus in dedications. We must not forget that to the ancients the sanctity of a holy grove was very real and might not be violated with impunity. For example, in Attica there was a sanctuary of Erithasean Apollo, and it was enacted by law that any person caught in the act of cutting trees in it, or carrying away timber, firewood, or fallen leaves, should be punished with fifty stripes, if he was a slave, or with a fine of fifty drachms, if he was a freeman. The culprit was denounced by the priest to the king, that is, to the sacred official or minister of state who bore the royal title. Similarly it was the duty of the sacred men at Andania, in Messenia, to scourge slaves and fine freemen who cut wood in the grove of the Great Goddesses. In Crete it was forbidden, under pain of curses and fines, to fell timber, sow corn, and herd or fold flocks within the precinct of Dictæan Zeus. In Italy like customs prevailed. Near Spoletium there was a sacred grove from which nothing might be taken, and in which no wood might be cut except just so much as was needed for the annual sacrifice. Any person who knowingly

violated the sanctity of the grove had to expiate his offence by sacrificing an ox to Jupiter, and to pay besides a fine of three hundred pence. In his treatise on farming Cato directs that before thinning a grove the Roman husbandman should offer a pig as an expiatory sacrifice to the god or goddess of the place, and should entreat his or her favour for himself, his children, and his household. The *Fratres Arvales* or Brethren of the Tilled Fields were a Roman college of twelve priests, who performed public religious rites for the purpose of making the crops to grow, and they wore wreaths of ears of corn as a badge of their office. Their sacrifices were offered in the grove of the goddess Dia, situated five miles down the Tiber from Rome. So hallowed was this grove, which is known to have included laurels and holly-oaks, that expiatory sacrifices of sows and lambs had to be offered when a rotten bough fell to the ground, or when an old tree was laid low by a storm or dragged down by a load of snow on its branches. And still more elaborate expiation had to be made with the slaughter of sows, sheep, and bulls when any of the sacred trees were struck by lightning and it was necessary to dig them up by the roots, split them, burn them, and plant others in their room. At the annual festival of the Parilia, which was intended to ensure the welfare of the flocks and herds, Roman shepherds prayed to be forgiven if they had entered a hallowed grove, or sat down under a sacred tree, or lopped a holy bough in order to feed a sick sheep on the leaves.

Nor was this sense of the indwelling divinity of the woods confined to the simple rustics who, tending their flocks in the chequered shade, felt the presence of spirits in the solemn stillness of the forest, heard their voices in the sough of the wind among the branches, and saw their handiwork in the fresh green of spring and the fading gold of autumn. The feeling was shared by the most cultivated minds in the greatest age of Roman civilisation. Pliny says that “the woods were formerly the temples of the deities, and even now simple country folk dedicate a tall tree to a god with the ritual of the olden time; and we adore sacred groves and the very silence that reigns in them not less devoutly than images that gleam with gold and ivory.” Similarly Seneca writes: “If you come upon a grove of old trees that have shot up above the common height and shut out the sight of the sky by the gloom of their matted boughs, you feel there is a spirit in the place, so lofty is the wood, so lone the spot, so wondrous the thick unbroken shade.”

Thus the ancients, like many other people in various parts of the world, were deeply impressed with the sanctity of holy groves, and regarded even the cutting of a bough in them as a sacrilege which called for expiation. If therefore a candidate for the priesthood of Diana at Nemi had to break a branch of a certain tree in the sacred grove before he could fight the King of the Wood, we may be sure that the act was a rite of solemn significance, and that to treat it as a mere piece of bravado, a challenge to the priest to come on and defend his domain, would be to commit the commonest of all errors in dealing with the past, that, namely, of interpreting the customs of other races and other generations by reference to modern European standards. In order to understand an alien religion the first essential is to divest ourselves, as well as we can, of our own familiar prepossessions, and to place ourselves at the point of view of those whose faith and practice we are studying. To do this at all is difficult; to do it completely is perhaps impossible; yet the attempt must be made if the enquiry is to progress instead of returning on itself in a vicious circle.

But whatever her origin may have been, Diana was not always a mere goddess of trees. Like her Greek sister Artemis, she appears to have developed into a personification of the teeming life of nature, both animal and vegetable. As mistress of the greenwood she would naturally be thought to own the beasts, whether wild or tame, that ranged through it, lurking for their prey in its gloomy depths, munching the fresh leaves and shoots among the boughs, or cropping the herbage in the open glades and dells. Thus she might come to be the patron

goddess both of hunters and herdsmen, just as Silvanus was the god not only of woods, but of cattle. Similarly in Finland the wild beasts of the forest were regarded as the herds of the woodland God Tapio and of his stately and beautiful wife. No man might slay one of these animals without the gracious permission of their divine owners. Hence the hunter prayed to the sylvan deities, and vowed rich offerings to them if they would drive the game across his path. And cattle also seem to have enjoyed the protection of those spirits of the woods, both when they were in their stalls and while they strayed in the forest. So in the belief of Russian peasants the spirit Leschiy rules both the wood and all the creatures in it. The bear is to him what the dog is to man; and the migrations of the squirrels, the field-mice, and other denizens of the woods are carried out in obedience to his behests. Success in the chase depends on his favour, and to assure himself of the spirit's help the huntsman lays an offering, generally of bread and salt, on the trunk of a tree in the forest. In White Russia every herdsman must present a cow to Leschiy in summer, and in the Government of Archangel some herdsmen have won his favour so far that he even feeds and tends their herds for them. Similarly the forest-god of the Lapps ruled over all the beasts of the forest; they were viewed as his herds, and good or bad luck in hunting depended on his will. So, too, the Samagitians deemed the birds and beasts of the woods sacred, doubtless because they were under the protection of the sylvan god. Before the Gayos of Sumatra hunt deer, wild goats, or wild pigs with hounds in the woods, they deem it necessary to obtain the leave of the unseen Lord of the forest. This is done according to a prescribed form by a man who has special skill in woodcraft. He lays down a quid of betel before a stake which is cut in a particular way to represent the Lord of the Wood, and having done so he prays to the spirit to signify his consent or refusal.

We have seen that at Diana's festival it was customary to crown hunting dogs, to leave wild beasts in peace, and to perform a purificatory ceremony for the benefit of young people. Some light is thrown on the meaning of these customs by a passage in Arrian's treatise on hunting. He tells us that a good hound is a boon conferred by one of the gods upon the huntsman, who ought to testify his gratitude by sacrificing to the Huntress Artemis. Further, Arrian goes on to say: "It is right that after a successful chase a man should sacrifice and dedicate the first-fruits of his bag to the goddess, in order to purify both the hounds and the hunters, in accordance with old custom and usage." He tells us that the Celts were wont to form a treasury for the goddess Artemis, into which they paid a fine of two obols for every hare they killed, a drachm for every fox, and four drachms for every roe. Once a year, on the birthday of Artemis, they opened the treasury, and with the accumulated fines purchased a sacrificial victim, it might be a sheep, a goat, or a calf. Having slain the animal and offered her share to the Huntress Artemis, they feasted, both men and dogs; and they crowned the dogs on that day "in order to signify," says Arrian, "that the festival was for their benefit." The Celts to whom Arrian, a native of Bithynia, here refers were probably the Galatians of Asia Minor; but doubtless the custom he describes was imported by these barbarians, along with their native tongue and the worship of the oak, from their old home in Central or Northern Europe. The Celtic divinity whom Arrian identifies with Artemis may well have been really akin both to her and to the Italian Diana. We know from other sources that the Celts revered a woodland goddess of this type; thus Arduinna, goddess of the forest of the Ardennes, was represented, like Artemis and Diana, with a bow and quiver. In any case the custom described by Arrian is good evidence of a belief that the wild beasts belong to the goddess of the wilds, who must be compensated for their destruction; and, taken with what he says of the need of purifying the hounds after a successful chase, the Celtic practice of crowning them at the annual festival of Artemis may have been meant to purge them of the stain they had contracted by killing the creatures of the goddess. The same explanation would naturally apply to the same custom observed by the Italians at the festival of Diana.

But why, it may be asked, should crowns or garlands cleanse dogs from the taint of bloodshed? An answer to this question is indicated by the reason which the South Slavonian peasant assigns for crowning the horns of his cows with wreaths of flowers on St. George's Day, the twenty-third of April. He does it in order to guard the cattle against witchcraft; cows that have no crowns are regarded as given over to the witches. In the evening the chaplets are fastened to the door of the cattle-stall, and remain there throughout the year. A herdsman who fails to crown his beasts is scolded and sometimes beaten by his master. The German and French custom of crowning cattle on Midsummer Day probably springs from the same motive. For on Midsummer Eve, just as on Walpurgis Night, witches are very busy holding their nocturnal assemblies and trying to steal the milk and butter from the cows. To guard against them some people at this season lay besoms crosswise before the doors of the stalls. Others make fast the doors and stop up the chinks, lest the witches should creep through them on their return from the revels. In Swabia all the church bells used to be kept ringing from nine at night till break of day on Midsummer morning to drive away the infernal rout from honest folk's houses. South Slavonian peasants are up betimes that morning, gather the dew from the grass, and wash the cows with it; that saves their milk from the hellish charms of the witches.

Now when we observe that garlands of flowers, like hawthorn and other green boughs, avail to ward off the unseen powers of mischief, we may conjecture that the practice of crowning dogs at the festival of a huntress goddess was intended to preserve the hounds from the angry and dangerous spirits of the wild beasts which they had killed in the course of the year. Fantastical as this explanation may sound to us, it is perfectly in accordance with the ideas of the savage, who, as we shall see later on, resorts to a multitude of curious expedients for disarming the wrath of the animals whose life he has been obliged to take. Thus conceived, the custom in question might still be termed a purification; but its original purpose, like that of many other purificatory rites, would be not so much to cleanse moral guilt, as to raise a physical barrier against the assaults of malignant and mischievous spirits.

But Diana was not merely a patroness of wild beasts, a mistress of woods and hills, of lonely glades and sounding rivers; conceived as the moon, and especially, it would seem, as the yellow harvest moon, she filled the farmer's grange with goodly fruits, and heard the prayers of women in travail. In her sacred grove at Nemi, as we have seen, she was especially worshipped as a goddess of childbirth, who bestowed offspring on men and women. Thus Diana, like the Greek Artemis, with whom she was constantly identified, may be described as a goddess of nature in general and of fertility in particular. We need not wonder, therefore, that in her sanctuary on the Aventine she was represented by an image copied from the many-breasted idol of the Ephesian Artemis, with all its crowded emblems of exuberant fecundity. Hence too we can understand why an ancient Roman law, attributed to King Tullius Hostilius, prescribed that, when incest had been committed, an expiatory sacrifice should be offered by the pontiffs in the grove of Diana. For we know that the crime of incest is commonly supposed to cause a dearth; hence it would be meet that atonement for the offence should be made to the goddess of fertility.

Now on the principle that the goddess of fertility must herself be fertile, it behoved Diana to have a male partner. Her mate, if the testimony of Servius may be trusted, was that Virbius who had his representative, or perhaps rather his embodiment, in the King of the Wood at Nemi. The aim of their union would be to promote the fruitfulness of the earth, of animals, and of mankind; and it might naturally be thought that this object would be more surely attained if the sacred nuptials were celebrated every year, the parts of the divine bride and bridegroom being played either by their images or by living persons. No ancient writer mentions that this was done in the grove at Nemi; but our knowledge of the Arician ritual is

so scanty that the want of information on this head can hardly count as a fatal objection to the theory. That theory, in the absence of direct evidence, must necessarily be based on the analogy of similar customs practised elsewhere. Some modern examples of such customs, more or less degenerate, were described in the last chapter. Here we shall consider their ancient counterparts.

§ 2. The Marriage of the Gods

At Babylon the imposing sanctuary of Bel rose like a pyramid above the city in a series of eight towers or stories, planted one on the top of the other. On the highest tower, reached by an ascent which wound about all the rest, there stood a spacious temple, and in the temple a great bed, magnificently draped and cushioned, with a golden table beside it. In the temple no image was to be seen, and no human being passed the night there, save a single woman, whom, according to the Chaldean priests, the god chose from among all the women of Babylon. They said that the deity himself came into the temple at night and slept in the great bed; and the woman, as a consort of the god, might have no intercourse with mortal man. As Bel at Babylon was identified with Marduk, the chief god of the city, the woman who thus shared his bed was doubtless one of the "wives of Marduk" mentioned in the code of Hammurabi. At Calah, which was for some time the capital of Assyria before it was displaced by Nineveh, the marriage of the god Nabu appears to have been annually celebrated on the third of the month Iyyar or Airu, which corresponded to May. For on that day his bed was consecrated in the city, and the god entered his bedchamber, to return to his place on the following day. The ceremonies attending the consecration of the couch are minutely described in a liturgical text. After the appropriate offerings had been presented, the officiating priestess purified the feet of the divine image with a sprig of reed and a vessel of oil, approached the bed thrice, kissed the feet of the image, then retired and sat down. After that she burned cedar wood dipped in wine, set before the image the heart of a sheep wrapped in a cloth, and offered libations. Aromatic woods were consecrated and burnt, more libations and offerings were made, tables were spread for various divinities, and the ceremony ended with a prayer for the King. The god also went in procession to a grove, riding in a chariot beside his charioteer.

At Thebes in Egypt a woman slept in the temple of Ammon as the consort of the god, and, like the human wife of Bel at Babylon, she was said to have no commerce with a man. In Egyptian texts she is often mentioned as "the divine consort," and usually she was no less a personage than the Queen of Egypt herself. For, according to the Egyptians, their monarchs were actually begotten by the god Ammon, who assumed for the time being the form of the reigning king, and in that disguise had intercourse with the queen. The divine procreation is carved and painted in great detail on the walls of two of the oldest temples in Egypt, those of Deir el Bahari and Luxor; and the inscriptions attached to the paintings leave no doubt as to the meaning of the scenes. The pictures at Deir el Bahari, which represent the begetting and birth of Queen Hatshopsitou, are the more ancient, and have been reproduced with but little change at Luxor, where they represent the begetting and birth of King Amenophis III. The nativity is depicted in about fifteen scenes, which may be grouped in three acts: first, the carnal union of the god with the queen; second, the birth; and third, the recognition of the infant by the gods. The marriage of Ammon with the queen is announced by a prologue in heaven; Ammon summons his assessors, the gods of Heliopolis, reveals to them the future birth of a new Pharaoh, a royal princess, and requests them to make ready the fluid of life and of strength, of which they are masters. Then the god is seen approaching the queen's bedchamber; in front of him marches Thoth, with a roll of papyrus in his hand, who, to prevent mistakes, recites the official names of the queen, the spouse of the reigning king (Thothmes I. at Deir el Bahari, Thothmes IV. at Luxor), the fairest of women. Then Thoth

withdraws behind Ammon, lifting his arm behind the god in order to renew his vital fluid at this critical moment. Next, according to the inscription, the mystery of incarnation takes place. Ammon lays aside his godhead and becomes flesh in the likeness of the king, the human spouse of the queen. The consummation of the divine union follows immediately. On a bed of state the god and the queen appear seated opposite each other, with their legs crossed. The queen receives from her husband the symbols of life and strength, while two goddesses, Neit and Selkit, the patronesses of matrimony, support the feet of the couple and guard them from harm. The text which encloses the scene sets forth clearly the reality of this mystic union of the human with the divine. “Thus saith Ammon-Ra, king of the gods, lord of Karnak, he who rules over Thebes, when he took the form of this male, the King of Upper and Nether Egypt, Thothmes I. (or Thothmes IV.), giver of life. He found the queen then when she lay in the glory of her palace. She awoke at the fragrance of the god, and marvelled at it. Straightway his Majesty went towards her, took possession of her, placed his heart in her, and shewed himself to her in his divine form. And upon his coming she was uplifted at the sight of his beauty, the love of the god ran through all her limbs, and the smell of the god and his breath were full of the perfumes of Pounit. And thus saith the royal spouse, the royal mother Ahmasi (or Moutemouaa), in presence of the majesty of this glorious god, Ammon, lord of Karnak, lord of Thebes, ‘Twice great are thy souls! It is noble to behold thy countenance when thou joinest thyself to my majesty in all grace! Thy dew impregnates all my limbs.’ Then, when the majesty of the god had accomplished all his desire with her, Ammon, the lord of the two lands, said to her: ‘*She who is joined to Ammon, the first of the nobles*, verily, such shall be the name of the daughter who shall open thy womb, since such is the course of the words that came forth from thy mouth. She shall reign in righteousness in all the earth, for my soul is hers, my heart is hers, my will is hers, my crown is hers, truly, that she may rule over the two lands, that she may guide the souls of all living.’”

After the begetting of the divine child—for we must remember that the kings and queens of Egypt were regarded as divinities in their lifetime—another series of scenes represents the fashioning of its body and its birth. The god Khnoumou, who in the beginning of time moulded gods and men on his potter’s wheel, is seen seated at his wheel modelling the future king or queen and their doubles—those spiritual duplicates or external souls which were believed to hover invisible about both men and gods all through life. In front of Khnoumou kneels Hiqit, the frog-headed goddess, “the great magician”; she is holding out to the newly-created figures the symbol of life, the *crux ansata* ♀, in order that they may breathe and live. Another scene represents the birth. At Deir el Bahari the queen has already been delivered, and is presenting her daughter to several goddesses, who have acted the part of midwives. At Luxor the double of the royal infant is born first; the goddesses who serve as nurses have him in their arms, and the midwives are preparing to receive the real child. Behind the queen are the goddesses who watch over childbirth, led by Isis and Nephthys; and all around the spirits of the East, the West, the North, and the South are presenting the symbol of life or uttering acclamations. In a corner the grotesque god Bes and the female hippopotamus Api keep off all evil influence and every malignant spirit.

We shall probably not err in assuming, with some eminent authorities, that the ceremonies of the nativity of the Pharaohs, thus emblazoned on the walls of Egyptian temples, were copied from the life; in other words, that the carved and painted scenes represent a real drama, which was acted by masked men and women whenever a queen of Egypt was brought to bed. “Here, as everywhere else in Egypt,” says Professor Maspero, “sculptor and painter did nothing but faithfully imitate reality. Theory required that the assimilation of the kings to the gods should be complete, so that every act of the royal life was, as it were, a tracing of the corresponding act of the divine life. From the moment that the king was Ammon, he wore the costume and

badges of Ammon—the tall hat with the long plumes, the cross of life, the greyhound-headed sceptre—and thus arrayed he presented himself in the queen’s bedchamber to consummate the marriage. The assistants also assumed the costume and appearance of the divinities whom they incarnated; the men put on masks of jackals, hawks, and crocodiles, while the women donned masks of cows or frogs, according as they played the parts of Anubis, Khnoumou, Sovkou, Hathor, or Hiqit; and I am disposed to believe that the doubles of the new-born child were represented by as many puppets as were required by the ceremonies. Some of the rites were complicated, and must have tired excessively the mother and child who underwent them; but they are nothing to those that have been observed in similar circumstances in other lands. In general, we are bound to hold that all the pictures traced on the walls of the temples, in which the person of the king is concerned, correspond to a real action in which disguised personages played the part of gods.”

In the decline of Egypt from the eleventh century onward, the wives of Ammon at Thebes were called on to play a conspicuous part in the government of the country. The strong grip of the Pharaohs was relaxed and under their feeble successors the empire crumbled away into a number of petty independent states. In this dissolution of the central authority the crafty high priests of Ammon at Thebes contrived to usurp regal powers and to reign far and wide in the name of the deity, veiling their rescripts under the guise of oracles of the god, who, with the help of a little jugglery, complacently signified his assent to their wishes by nodding his head or even by speech. But curiously enough under this pretended theocracy the nominal ruler was not the priest himself, but his wife, the earthly consort of Ammon. Thus Thebes became for a time a ghostly principality governed ostensibly by a dynasty of female popes. Their office was hereditary, passing by rights from mother to daughter. But probably the entail was often broken by the policy or ambition of the men who stood behind the scenes and worked the religious puppet-show by hidden wires to the awe and astonishment of the gaping vulgar. Certainly we know that on one occasion King Psammetichus First foisted his own daughter into the Holy See by dedicating her to Ammon under a hypocritical profession of gratitude for favours bestowed on him by the deity. And the female pope had to submit to the dictation with the best grace she could assume, protesting her affection for the adopted daughter who had ousted her own daughter from the throne.

At a later period, when Egypt lay under the heel of Rome, the character of “the divine consort” of Ammon at Thebes had greatly changed. For at the beginning of our era the custom was to appoint a young and beautiful girl, the scion of one of the noblest houses, to serve Ammon as his concubine. The Greeks called these maidens Pallades, apparently after their own virgin goddess Pallas; but the conduct of the girls was by no means maidenly, for they led the loosest of lives till puberty. Then they were mourned over and given in marriage. Their graves were shown near Thebes. The reason why their services ended at puberty may have been that as concubines of the god they might not bear children to mortal fathers; hence it was deemed prudent to terminate their relations with the divinity before they were of an age to become mothers. It was an Egyptian doctrine that a mortal woman could conceive by a god, but that a goddess could not conceive by a mortal man. The certainty of maternity and the uncertainty of paternity suggest an obvious and probably sufficient ground for this theological distinction.

Apollo was said to spend the winter months at Patara in Lycia and the summer months in the island of Delos, and accordingly he gave oracles for one half of the year in the one place, and for the other half in the other. So long as he tarried at Patara, his prophetess was shut up with him in the temple every night. At Ephesus there was a college of sacred men called Essenes or King Bees who held office for a year, during which they had to observe strict chastity and other rules of ceremonial purity. How many of them there were at a time we do not know, but

there must have been several, for in Ephesian inscriptions they are regularly referred to in the plural. They cannot have been bound to lifelong celibacy, for in one of the inscriptions an Essen mentions his wife. Possibly they were deemed the annual husbands of Artemis, the great many-breasted goddess of fertility at Ephesus, whose association with the bee is vouched for by the figures of bees which appear commonly both on her statues and on the coins of Ephesus. If this conjecture is right, the King Bees and their bee-goddess Artemis at Ephesus would be closely parallel to the King of the Wood and his woodland-goddess Diana at Nemi, as these latter are interpreted by me. The rule of chastity imposed on the King Bees during their year of office would be easily explicable on this hypothesis. As the temporary husbands of the goddess they would be expected for the time being to have no intercourse with mortal women, just as the human wives of Bel and Ammon were supposed to have no commerce with mortal men.

At Athens the god of the vine, Dionysus, was annually married to the Queen, and it appears that the consummation of the divine union, as well as the espousals, was enacted at the ceremony; but whether the part of the god was played by a man or an image we do not know. Attic law required that the Queen should be a burgess and should never have known any man but her husband. She had to offer certain secret sacrifices on behalf of the state, and was permitted to see what no foreign woman might ever behold, and to enter where no other Athenian might set foot. She was assisted in the discharge of her solemn functions by fourteen sacred women, one for each of the altars of Dionysus. The old Dionysiac festival was held on the twelfth day of the month Anthesterion, corresponding roughly to our February, at the ancient sanctuary of Dionysus in the Marshes, which was never opened throughout the year save on that one day. At this festival the Queen exacted an oath of purity and chastity from the fourteen sacred women at the altar. Possibly her marriage was celebrated on the same day, though of that we have no positive evidence, and we learn from Aristotle that the ceremony took place, not at the sanctuary in the marshes, but in the old official residence of the King, known as the Cattle-stall, which stood near the Prytaneum or Town-hall on the north-eastern slope of the Acropolis. But whatever the date of the wedding, its object can hardly have been any other than that of ensuring the fertility of the vines and other fruit-trees, of which Dionysus was the god. Thus both in form and in meaning the ceremony would answer to the nuptials of the King and Queen of May. Again, the story, dear to poets and artists, of the forsaken and sleeping Ariadne, waked and wedded by Dionysus, resembles so closely the little drama acted by French peasants of the Alps on May Day, that, considering the character of Dionysus as a god of vegetation, we can hardly help regarding it as the reflection of a spring ceremony like the French one. In point of fact the marriage of Dionysus and Ariadne was believed by Preller to have been acted every spring in Crete. His evidence, indeed, is inconclusive, but the view itself is probable. If I am right in comparing the two, the chief difference between the French and the Greek ceremonies appears to have been that in the former the sleeper was a forsaken bridegroom, in the latter a forsaken bride; and the group of stars in the sky, in which fancy saw Ariadne's wedding crown, may have been only a translation to heaven of the garland worn by the Greek girl who played the Queen of May.

If at Athens, and probably elsewhere, the vine-god was married to a queen in order that the vines might be loaded with clusters of grapes, there is reason to think that a marriage of a different kind, intended to make the fields wave with yellow corn, was annually celebrated not many miles off, beyond the low hills that bound the plain of Athens on the west. In the great mysteries solemnised at Eleusis in the month of September the union of the sky-god Zeus with the corn-goddess Demeter appears to have been represented by the union of the hierophant with the priestess of Demeter, who acted the parts of god and goddess. But their

intercourse was only dramatic or symbolical, for the hierophant had temporarily deprived himself of his virility by an application of hemlock. The torches having been extinguished, the pair descended into a murky place, while the throng of worshippers awaited in anxious suspense the result of the mystic congress, on which they believed their own salvation to depend. After a time the hierophant reappeared, and in a blaze of light silently exhibited to the assembly a reaped ear of corn, the fruit of the divine marriage. Then in a loud voice he proclaimed, "Queen Brimo has brought forth a sacred boy Brimos," by which he meant, "The Mighty One has brought forth the Mighty." The corn-mother in fact had given birth to her child, the corn, and her travail-pangs were enacted in the sacred drama. This revelation of the reaped corn appears to have been the crowning act of the mysteries. Thus through the glamour shed round these rites by the poetry and philosophy of later ages there still looms, like a distant landscape through a sunlit haze, a simple rustic festival designed to cover the wide Eleusinian plain with a plenteous harvest by wedding the goddess of the corn to the sky-god, who fertilised the bare earth with genial showers.

But Zeus was not always the sky-god, nor did he always marry the corn-goddess. If in antiquity a traveller, quitting Eleusis and passing through miles of olive-groves and corn-fields, had climbed the pine-clad mountains of Cithaeron and descended through the forest on their northern slope to Plataea, he might have chanced to find the people of that little Boeotian town celebrating a different marriage of the great god to a different goddess. The ceremony is described by a Greek antiquary whose note-book has fortunately preserved for us not a few rural customs of ancient Greece, of which the knowledge would otherwise have perished.

Every few years the people of Plataea held a festival which they called the Little Daedala. On the day of the festival they went out into an ancient oak forest, the trees of which were of gigantic girth. There they set some boiled meat on the ground, and watched the birds that gathered round it. When a raven was observed to carry off a piece of the meat and perch on an oak, the people followed it and cut down the tree. With the wood of the tree they made an image, dressed it as a bride, and placed it on a bullock-cart with a bridesmaid beside it. It seems then to have been drawn to the banks of the river Asopus and back to the town, attended by a piping and dancing crowd. After the festival the image was put away and kept till the celebration of the Great Daedala, which fell only once in sixty years, and was held by all the people of Boeotia. On this occasion all the images, fourteen in number, that had accumulated from the celebrations of the Little Daedala were dragged on wains in procession to the river Asopus, and then to the top of Mount Cithaeron. There an altar had been constructed of square blocks of wood fitted together, with brushwood heaped over it. Animals were sacrificed by being burned on the altar, and the altar itself, together with the images, was consumed by the flames. The blaze, we are told, rose to a prodigious height and was seen for many miles. To explain the origin of the festival a story ran that once upon a time Hera had quarrelled with Zeus and left him in high dudgeon. To lure her back Zeus gave out that he was about to marry the nymph Plataea, daughter of the river Asopus. He had a fine oak cut down, shaped and dressed as a bride, and conveyed on a bullock-cart. Transported with rage and jealousy, Hera flew to the cart, and tearing off the veil of the pretended bride, discovered the deceit that had been practised on her. Her rage now turned to laughter, and she became reconciled to her husband Zeus.

The resemblance of this festival to some of the European spring and midsummer festivals is tolerably close. We have seen that in Russia at Whitsuntide the villagers go out into the wood, fell a birch-tree, dress it in woman's clothes, and bring it back to the village with dance and song. On the third day it is thrown into the water. Again, we have seen that in Bohemia on Midsummer Eve the village lads fell a tall fir or pine-tree in the wood and set it up on a

height, where it is adorned with garlands, nosegays, and ribbons, and afterwards burnt. The reason for burning the tree will appear afterwards; the custom itself is not uncommon in modern Europe. In some parts of the Pyrenees a tall and slender tree is cut down on May Day and kept till Midsummer Eve. It is then rolled to the top of a hill, set up, and burned. In Angoulême on St. Peter's Day, the twenty-ninth of June, a tall leafy poplar is set up in the market-place and burned. Near Launceston in Cornwall there is a large tumulus known as Whiteborough, with a fosse round it. On this tumulus "there was formerly a great bonfire on Midsummer Eve; a large summer pole was fixed in the centre, round which the fuel was heaped up. It had a large bush on the top of it. Round this were parties of wrestlers contending for small prizes." The rustics believed that giants were buried in such mounds, and nothing would tempt them to disturb their bones. In Dublin on May-morning boys used to go out and cut a May-bush, bring it back to town, and then burn it.

Probably the Boeotian festival belonged to the same class of rites. It represented the marriage of the powers of vegetation—the union of the oak-god with the oak-goddess—in spring or midsummer, just as the same event is represented in modern Europe by a King and Queen or a Lord and Lady of the May. In the Boeotian, as in the Russian, ceremony the tree dressed as a woman stands for the English May-pole and May-queen in one. All such ceremonies, it must be remembered, are not, or at least were not originally, mere spectacular or dramatic exhibitions. They are magical rites designed to produce the effect which they dramatically set forth. If the revival of vegetation in spring is mimicked by the awakening of a sleeper, the mimicry is intended actually to quicken the growth of leaves and blossoms; if the marriage of the powers of vegetation is simulated by a King and Queen of May, the idea is that the powers thus personated will really be rendered more productive by the ceremony. In short, all these spring and midsummer festivals fall under the head of homoeopathic or imitative magic. The thing which people wish to bring about they represent dramatically, and the very representation is believed to effect, or at least to contribute to, the production of the desired result. In the case of the Daedala the story of Hera's quarrel with Zeus and her sullen retirement may perhaps without straining be interpreted as a mythical expression for a bad season and the failure of the crops. The same disastrous effects were attributed to the anger and seclusion of Demeter after the loss of her daughter Proserpine. Now the institution of a festival is often explained by a mythical story, which relates how upon a particular occasion those very calamities occurred which it is the real object of the festival to avert; so that if we know the myth told to account for the historical origin of the festival, we can often infer from it the real intention with which the festival was celebrated. If, therefore, the origin of the Daedala was explained by a story of a failure of crops and consequent famine, we may infer that the real object of the festival was to prevent the occurrence of such disasters; and, if I am right in my interpretation of the festival, the object was supposed to be effected by dramatically representing the marriage of the divinities most concerned with the production of trees and plants. The marriage of Zeus and Hera was acted at annual festivals in various parts of Greece, and it is at least a fair conjecture that the nature and intention of these ceremonies were such as I have assigned to the Plataean festival of the Daedala; in other words, that Zeus and Hera at these festivals were the Greek equivalents of the Lord and Lady of the May. Homer's glowing picture of Zeus and Hera couched on fresh hyacinths and crocuses, like Milton's description of the dalliance of Zephyr with Aurora, "as he met her once a-Maying," was perhaps painted from the life.

The sacred marriage of Zeus and Hera had, as was natural, its counterpart among the northern kinsfolk of the Greeks. In Sweden every year a life-size image of Frey, the god of fertility, both animal and vegetable, was drawn about the country in a waggon attended by a beautiful girl who was called the god's wife. She acted also as his priestess in his great temple at

Upsala. Wherever the waggon came with the image of the god and his blooming young bride, the people crowded to meet them and offered sacrifices for a fruitful year. Once on a time a Norwegian exile named Gunnar Helming gave himself out to be Frey in person, and rode about on the sacred waggon dressed up in the god's clothes. Everywhere the simple folk welcomed him as the deity, and observed with wonder and delight that a god walked about among men and ate and drank just like other people. And when the months went by, and the god's fair young wife was seen to be with child, their joy waxed greatly, for they thought, "Surely this is an omen of a fruitful season." It happened that the weather was then so mild, and the promise of a plenteous harvest so fair, that no man ever remembered such a year before. But one night the god departed in haste, with his wife and all the gold and silver and fine raiment which he had got together; and though the Swedes made after him, they could not catch him. He was over the hills and far away in Norway. Similar ceremonies appear to have been observed by the peasantry of Gaul in antiquity; for Gregory of Tours, writing in the sixth century of our era, says that at Autun the people used to carry about an image of a goddess in a waggon drawn by oxen. The intention of the ceremony was to ensure the safety of the crops and vines, and the rustics danced and sang in front of the image. The old historian identifies the goddess with Cybele, the Great Mother goddess of Phrygia, and the identification would seem to be correct. For we learn from another source that men wrought up to a pitch of frenzy by the shrill music of flutes and the clash of cymbals, sacrificed their virility to the goddess, dashing the severed portions of themselves against her image. Now this religious castration was a marked feature of the Phrygian worship of Cybele, but it is alien to Western modes of thought, although it still finds favour with a section of the barbarous, fanatical, semi-Oriental peasantry of Russia. But whether of native or of Eastern origin the rites of the goddess of Autun closely conformed to those of the great Phrygian goddess and appear to have been, like them, a perverted form of the Sacred Marriage, which was designed to fertilise the earth, and in which eunuchs, strange as it may seem, personated the lovers of the goddess.

Thus the custom of marrying gods either to images or to human beings was widespread among the nations of antiquity. The ideas on which such a custom is based are too crude to allow us to doubt that the civilised Babylonians, Egyptians, and Greeks inherited it from their barbarous or savage forefathers. This presumption is strengthened when we find rites of a similar kind in vogue among the lower races. Thus, for example, we are told that once upon a time the Wotyaks of the Malmyz district in Russia were distressed by a series of bad harvests. They did not know what to do, but at last concluded that their powerful but mischievous god Keremet must be angry at being unmarried. So a deputation of elders visited the Wotyaks of Cura and came to an understanding with them on the subject. Then they returned home, laid in a large stock of brandy, and having made ready a gaily decked waggon and horses, they drove in procession with bells ringing, as they do when they are fetching home a bride, to the sacred grove at Cura. There they ate and drank merrily all night, and next morning they cut a square piece of turf in the grove and took it home with them. After this, though it fared well with the people of Malmyz, it fared ill with the people of Cura; for in Malmyz the bread was good, but in Cura it was bad. Hence the men of Cura who had consented to the marriage were blamed and roughly handled by their indignant fellow-villagers. "What they meant by this marriage ceremony," says the writer who reports it, "it is not easy to imagine. Perhaps, as Bechterew thinks, they meant to marry Keremet to the kindly and fruitful Mukyl'cin, the Earth-wife, in order that she might influence him for good." This carrying of turf, like a bride, in a waggon from a sacred grove resembles the Plataean custom of carting an oak log as a bride from an ancient oak forest; and we have seen ground for thinking that the Plataean ceremony, like its Wotyak counterpart, was intended as a charm to

secure fertility. When wells are dug in Bengal, a wooden image of a god is made and married to the goddess of water.

Often the bride destined for the god is not a log or a clod, but a living woman of flesh and blood. The Indians of a village in Peru have been known to marry a beautiful girl, about fourteen years of age, to a stone shaped like a human being, which they regarded as a god (*huaca*). All the villagers took part in the marriage ceremony, which lasted three days, and was attended with much revelry. The girl thereafter remained a virgin and sacrificed to the idol for the people. They shewed her the utmost reverence and deemed her divine. The Blackfoot Indians of North America used to worship the Sun as their chief god, and they held a festival every year in his honour. Four days before the new moon of August the tribe halted on its march, and all hunting was suspended. Bodies of mounted men were on duty day and night to carry out the orders of the high priest of the Sun. He enjoined the people to fast and to take vapour baths during the four days before the new moon. Moreover, with the help of his council, he chose the Vestal who was to represent the Moon and to be married to the Sun at the festival. She might be either a virgin or a woman who had had but one husband. Any girl or woman found to have discharged the sacred duties without fulfilling the prescribed conditions was put to death. On the third day of preparation, after the last purification had been observed, they built a round temple of the Sun. Posts were driven into the ground in a circle; these were connected with cross-pieces, and the whole was covered with leaves. In the middle stood the sacred pole, supporting the roof. A bundle of many small branches of sacred wood, wrapped in a splendid buffalo robe, crowned the summit of the temple. The entrance was on the east, and within the sanctuary stood an altar on which rested the head of a buffalo. Beside the altar was the place reserved for the Vestal. Here, on a bed prepared for her, she slept "the sleep of war," as it was called. Her other duties consisted in maintaining a sacred fire of fragrant herbs, in presenting a lighted pipe to her husband the Sun, and in telling the high priest the dream she dreamed during "the sleep of war." On learning it the priest had it proclaimed to the whole nation to the beat of drum. Every year about the middle of March, when the season for fishing with the drag-net began, the Algonquins and Hurons married their nets to two young girls, aged six or seven. At the wedding feast the net was placed between the two maidens, and was exhorted to take courage and catch many fish. The reason for choosing the brides so young was to make sure that they were virgins. The origin of the custom is said to have been this. One year, when the fishing season came round, the Algonquins cast their nets as usual, but took nothing. Surprised at their want of success, they did not know what to make of it, till the soul or genius (*oki*) of the net appeared to them in the likeness of a tall well-built man, who said to them in a great passion, "I have lost my wife and I cannot find one who has known no other man but me; that is why you do not succeed, and why you never will succeed till you give me satisfaction on this head." So the Algonquins held a council and resolved to appease the spirit of the net by marrying him to two such very young girls that he could have no ground of complaint on that score for the future. They did so, and the fishing turned out all that could be wished. The thing got wind among their neighbours the Hurons, and they adopted the custom. A share of the catch was always given to the families of the two girls who acted as brides of the net for the year.

The Oraons of Bengal worship the Earth as a goddess, and annually celebrate her marriage with the Sun-god Dharmē at the time when the *sāl* tree is in blossom. The ceremony is as follows. All bathe, then the men repair to the sacred grove (*sarnā*), while the women assemble at the house of the village priest. After sacrificing some fowls to the Sun-god and the demon of the grove, the men eat and drink. "The priest is then carried back to the village on the shoulders of a strong man. Near the village the women meet the men and wash their feet. With beating of drums and singing, dancing, and jumping, all proceed to the priest's

house, which has been decorated with leaves and flowers. Then the usual form of marriage is performed between the priest and his wife, symbolizing the supposed union between Sun and Earth. After the ceremony all eat and drink and make merry; they dance and sing obscene songs, and finally indulge in the vilest orgies. The object is to move the mother earth to become fruitful." Thus the Sacred Marriage of the Sun and Earth, personated by the priest and his wife, is celebrated as a charm to ensure the fertility of the ground; and for the same purpose, on the principle of homoeopathic magic, the people indulge in a licentious orgy. Among the Sulka of New Britain, at the village of Kolvagat, a certain man has charge of two stone figures which are called respectively "Our grandfather" (*ngur es*) and "Our grandmother" (*ngur pei*). They are said to be kept in a house built specially for the purpose. Fruits of the field are offered to them and left beside them to rot. When their guardian puts the two figures with their faces turned towards each other, the plantations are believed to flourish; but when he sets them back to back, there is dearth and the people suffer from eruptions on the skin. This turning of the two images face to face may be regarded as a simple form of Sacred Marriage between the two divine powers represented by them, who are clearly supposed to control the fertility of the plantations.

At the village of Bas Doda, in the Gurgaon district of North-Western India, a fair is held on the twenty-sixth of the month Chait and the two following days. We are told that formerly girls of the Dhinwar class used to be married to the god at these festivals, and that they always died soon afterwards. Of late years the practice is said to have been discontinued. In Behar during the month of Sawan (August) crowds of women, calling themselves Nagin or "wives of the snake," go about for two and a half days begging; during this time they may neither sleep under a roof nor eat salt. Half the proceeds of their begging is given to Brahmans, and the other half spent in salt and sweet-meats, which are eaten by all the villagers. Amongst the Ewe-speaking peoples of the Slave Coast in West Africa human wives of gods are very common. In Dahomey they swarm, and it has even been estimated that every fourth woman is devoted to the service of some deity. The chief business of these female votaries is prostitution. In every town there is at least one seminary where the handsomest girls, between ten and twelve years of age, are trained. They stay for three years, learning the chants and dances peculiar to the worship of the gods, and prostituting themselves to the priests and the inmates of the male seminaries. At the end of their noviciate they become public harlots. But no disgrace attaches to their profession, for it is believed that they are married to the god, and that their excesses are caused and directed by him. Strictly speaking, they should confine their favours to the male worshippers at the temple, but in practice they bestow them indiscriminately. Children born of such unions belong to the deity. As the wives of a god, these sacred women may not marry. But they are not bound to the service of the divinity for life. Some only bear his name and sacrifice to him on their birthdays. Amongst these polygamous West African gods the sacred python seems to be particularly associated with the fertility of the earth; for he is invoked in excessively wet, dry, and barren seasons, and the time of year when young girls are sought out to be his brides is when the millet is beginning to sprout.

It deserves to be remarked that the supernatural being to whom women are married is often a god or spirit of water. Thus Mukasa, the god of the Victoria Nyanza lake, who was propitiated by the Baganda every time they undertook a long voyage, had virgins provided for him to serve as his wives. Like the Vestals they were bound to chastity, but unlike the Vestals they seem to have been often unfaithful. The custom lasted until Mwanga was converted to Christianity. The Akikuyu of British East Africa worship the snake of a certain river, and at intervals of several years they marry the snake-god to women, but especially to young girls. For this purpose huts are built by order of the medicine-men, who there

consummate the sacred marriage with the credulous female devotees. If the girls do not repair to the huts of their own accord in sufficient numbers, they are seized and dragged thither to the embraces of the deity. The offspring of these mystic unions appears to be fathered on God (*Ngai*); certainly there are children among the Akikuyu who pass for children of God. In Kengtung, one of the principal Shan states of Upper Burma, the spirit of the Nawng Tung lake is regarded as very powerful, and is propitiated with offerings in the eighth month (about July) of each year. A remarkable feature of the worship of this spirit consists in the dedication to him of four virgins in marriage. Custom requires that this should be done once in every three years. It was actually done by the late king or chief (Sawbwa) in 1893, but down to 1901 the rite had not been performed by his successor. The following are the chief features of the ceremony. The virgins who are to wed the spirit of the lake must be of pure Hkön race. Orders are sent out for all the Hkön of the valley to attend. From the unmarried women of suitable age, ten are selected. These are as beautiful as may be, and must be without spot or blemish. Four maidens out of the ten are chosen by lot, and carefully dressed in new garments. A festival is held, usually at the house of the Chief Minister, where the girls sit on a raised platform. Four old women, thought to be possessed by spirits, enter and remain as long as the feast lasts. During this time anything they may want, such as food, betel, or cheroots, is handed to them by the four girls. Apparently the old women pass for representatives of the spirit, and hence they are waited on by the maidens destined to be his wives. Dotage, blindness, or any great infirmity of age seems to be accounted possession by a spirit for the purposes of this function. When the feast is over, the maidens are formally presented to the spirit, along with the various sacrifices and offerings. They are next taken to the chief's residence, where strings are tied round their wrists by the ministers and elders to guard them against ill-luck. Usually they sleep a night or two at the palace, after which they may return to their homes. There seems to be no objection to their marrying afterwards. If nothing happens to any of the four, it is believed that the spirit of the lake loves them but little; but if one of them dies soon after the ceremony, it shews that she has been accepted by him. The spirit is propitiated with the sacrifice of pigs, fowls, and sometimes a buffalo.

In this last custom the death of the woman is regarded as a sign that the god has taken her to himself. Sometimes, apparently, it has not been left to the discretion of the divine bridegroom to take or leave his human bride; she was made over to him once for all in death. When the Arabs conquered Egypt they learned that at the annual rise of the Nile the Egyptians were wont to deck a young virgin in gay apparel and throw her into the river as a sacrifice, in order to obtain a plentiful inundation. The Arab general abolished the barbarous custom. It is said that under the Tang dynasty the Chinese used to marry a young girl to the Yellow River once a year by drowning her in the water. For this purpose the witches chose the fairest damsel they could find and themselves superintended the fatal marriage. At last the local mandarin, a man of sense and humanity, forbade the custom. But the witches disregarded his edicts and made their preparations for the usual murder. So when the day was come, the magistrate appeared on the scene with his soldiers and had all the witches bound and thrown into the river to drown, telling them that no doubt the god would be able to choose his bride for himself from among them. The princes of Koepang, a state in the East Indian island of Timor, deemed themselves descended from crocodiles; and on the coronation of a new prince a solemn sacrifice was made to the crocodiles in presence of the people. The offerings consisted of a pig with red bristles and a young girl prettily dressed, perfumed, and decked with flowers. She was taken down to the bank of the river and set on a sacred stone in a cave. Then one of the prince's guards summoned the crocodiles. Soon one of the beasts appeared and dragged the girl down into the water. The people thought that he married her, and that if he did not find her a maid he would bring her back. On festal occasions in the same state a new-born girl was sometimes dedicated to a crocodile, and then, with certain ceremonies of

consecration, brought up to be married to a priest. It is said that once, when the inhabitants of Cayeli in Buru—another East Indian island—were threatened with destruction by a swarm of crocodiles, they ascribed the misfortune to a passion which the prince of the crocodiles had conceived for a certain girl. Accordingly, they compelled the damsel's father to dress her in bridal array and deliver her over to the clutches of her crocodile lover.

A usage of the same sort is reported to have prevailed in the Maldivé Islands before the conversion of the inhabitants to Islam. The famous Arab traveller Ibn Batutah has described the custom and the manner in which it came to an end. He was assured by several trustworthy natives, whose names he gives, that when the people of the islands were idolaters there appeared to them every month an evil spirit among the jinn, who came from across the sea in the likeness of a ship full of burning lamps. The wont of the inhabitants, as soon as they perceived him, was to take a young virgin, and, having adorned her, to lead her to a heathen temple that stood on the shore, with a window looking out to sea. There they left the damsel for the night, and when they came back in the morning they found her a maid no more, and dead. Every month they drew lots, and he upon whom the lot fell gave up his daughter to the jinnee of the sea. In time there came to them a Berber named Abu 'Ibrecat, who knew the Coran by heart. He lodged in the house of an old woman of the isle of Mahal. One day, visiting his hostess, he found that she had gathered her family about her, and that the women were weeping as if there were a funeral. On enquiring into the cause of their distress, he learned that the lot had fallen on the old woman, and that she had an only daughter, who must be slain by the evil jinnee. Abu 'Ibrecat said to the old dame, "I will go this night instead of thy daughter." Now he was quite beardless. So when the night was come they took him, and after he had performed his ablutions, they put him in the temple of idols. He set himself to recite the Coran; then the demon appeared at the window, but the man went on with his recitation. No sooner was the jinnee within hearing of the holy words than he dived into the sea. When morning broke, the old woman and her family and the people of the island came, according to their custom, to carry away the girl and burn her body. They found the stranger repeating the Coran, and took him to their king, whose name was Chenourazah, and made him relate his adventure. The king was astonished at it. The Berber proposed to the king that he should embrace Islam. Chenourazah said to him, "Tarry with us till next month; if thou shalt do what thou hast done, and shalt escape from the evil jinnee, I will be converted." The stranger abode with the idolaters, and God disposed the king's heart to receive the true faith. So before the month was out he became a Mussalman, he and his wives and his children and the people of his court. And when the next month began, the Berber was conducted to the temple of idols; but the demon did not appear, and the Berber set himself to recite the Coran till break of day. Then the Sultan and his subjects broke the idols and demolished the temple. The people of the island embraced Islam and sent messengers to the other isles, and their inhabitants were converted likewise. But by reason of the demon many of the Maldivé Islands were depopulated before their conversion to Islam. When Ibn Batutah himself landed in the country he knew nothing of these things. One night, as he was going about his business, he heard of a sudden people saying in a loud voice, "There is no God but God," and "God is great." He saw children carrying copies of the Coran on their heads, and women beating on basins and vessels of copper. He was astonished at what they did, and he said, "What has happened?" They answered, "Dost thou not behold the sea?" He looked towards the sea, and beheld in the darkness, as it were, a great ship full of burning lamps and cressets. They said to him, "That is the demon. It is his wont to shew himself once a month; but after we have done that which thou hast seen, he returns to his place and does us no manner of harm."

It occurred to me that this myth of the demon lover may have been based on some physical phenomenon, electrical, lunar, or otherwise, which is periodically seen at night in the Maldivé Islands. Accordingly I consulted Professor J. Stanley Gardiner, our foremost authority on the archipelago. His answer, which confirms my conjecture, runs thus: "A peculiar phosphorescence, like the glow of a lamp hidden by a roughened glass shade, is occasionally visible on lagoon shoals in the Maldives. I imagine it to have been due to some single animal with a greater phosphorescence than any at present known to us. A periodical appearance at some phase of the moon due to reproduction is not improbable and has parallels. The myth still exists in the Maldives, but in a rather different form." He adds that "a number of these animals might of course appear on some shoal near Male," the principal island of the group. To the eyes of the ignorant and superstitious such a mysterious glow, suddenly lighting up the sea in the dusk of the evening, might well appear a phantom ship, hung with burning lamps, bearing down on the devoted islands, and in the stillness of night the roar of the surf on the barrier reef might sound in their ears like the voice of the demon calling for his prey.

§ 3. Sacrifices to Water-spirits

Ibn Batutah's narrative of the demon lover and his mortal brides closely resembles a well-known type of folk-tale, of which versions have been found from Japan and Annam in the East to Senegambia, Scandinavia, and Scotland in the West. The story varies in details from people to people, but as commonly told it runs thus. A certain country is infested by a many-headed serpent, dragon, or other monster, which would destroy the whole people if a human victim, generally a virgin, were not delivered up to him periodically. Many victims have perished, and at last it has fallen to the lot of the king's own daughter to be sacrificed. She is exposed to the monster, but the hero of the tale, generally a young man of humble birth, interposes in her behalf, slays the monster, and receives the hand of the princess as his reward. In many of the tales the monster, who is sometimes described as a serpent, inhabits the water of a sea, a lake, or a fountain. In other versions he is a serpent or dragon who takes possession of the springs of water, and only allows the water to flow or the people to make use of it on condition of receiving a human victim.

It would probably be a mistake to dismiss all these tales as pure inventions of the story-teller. Rather we may suppose that they reflect a real custom of sacrificing girls or women to be the wives of water-spirits, who are very often conceived as great serpents or dragons. Elsewhere I have cited many instances of this belief in serpent-shaped spirits of water; here it may be worth while to add a few more. Thus the Warramunga of Central Australia perform elaborate ceremonies to appease or coerce a gigantic, but purely mythical water-snake who is said to have destroyed a number of people. Some of the natives of western Australia fear to approach large pools, supposing them to be inhabited by a great serpent, who would kill them if they dared to drink or draw water there by night. The Indians of New Granada believed that when the mother of all mankind, named Bachue, was grown old, she and her husband plunged into the Lake of Iguague, where they were changed into two enormous serpents, which still live in the lake and sometimes shew themselves. The Oyampi Indians of French Guiana imagine that each waterfall has a guardian in the shape of a monstrous snake, who lies hidden under the eddy of the cascade, but has sometimes been seen to lift up its huge head. To see it is fatal. Canoe and Indians are then dragged down to the bottom, where the monster swallows all the men, and sometimes the canoe also. Hence the Oyampis never name a waterfall till they have passed it, for fear that the snake at the bottom of the water might hear its name and attack the rash intruders. The Huichol Indians of Mexico adore water. Springs are sacred, and the gods in them are mothers or serpents, that rise with the clouds and descend as fructifying rain. The Tarahumares, another Indian tribe of Mexico, think that every river, pool, and spring has its

serpent, who causes the water to come up out of the earth. All these water-serpents are easily offended; hence the Tarahumares place their houses some little way from the water, and will not sleep near it when they are on a journey. Whenever they construct weirs to catch fish, they take care to offer fish to the water-serpent of the river; and when they are away from home and are making pinole, that is, toasted maize-meal, they drop the first of the pinole into the water as an offering to the serpents, who would otherwise try to seize them and chase them back to their own land. In Basutoland the rivers Ketane and Maletsunyane tumble, with a roar of waters and a cloud of iridescent spray, into vast chasms hundreds of feet deep. The Basutos fear to approach the foot of these huge falls, for they think that a spirit in the shape of a gigantic snake haunts the seething cauldron which receives the falling waters.

The perils of the sea, of floods, of rapid rivers, of deep pools and lakes, naturally account for the belief that water-spirits are fickle and dangerous beings, who need to be appeased by sacrifices. Sometimes these sacrifices consist of animals, such as horses and bulls, but often the victims are human beings. Thus at the mouth of the Bonny River there is a dangerous bar on which vessels trading to the river have been lost. This is bad for business, and accordingly the negroes used to sacrifice a young man annually to the spirit of the bar. The handsomest youth was chosen for the purpose, and for many months before the ceremony he lodged with the king. The people regarded him as sacred or ju-ju, and whatever he touched, even when he passed casually through the streets, shared his sanctity and belonged to him. Hence whenever he appeared in public the inhabitants fled before him, lest he should touch their garments or anything they might be carrying. He was kept in ignorance of the fate in store for him, and no one might inform him of it under pain of death. On an appointed day he was taken out to the bar in a canoe and induced to jump into the water. Then the rowers plied their paddles and left him to drown. A similar ceremony used to be performed at the New Calabar River, but the victim was a culprit. He was thrown into the water to be devoured by the sharks, which are there the principal fetish or ju-ju. The chiefs of Duke Town, on the same coast of Guinea, were wont to make an annual offering to the river. A young woman of a light colour, or an albino, was chosen as the victim. On a set day they decked her with finery, took her down to Parrot Island, and with much ceremony plunged her in the stream. The fishermen of Efiat, at the mouth of the river, are said still to observe the rite in order to ensure a good catch of fish. The King of Dahomey used to send from time to time a man, dressed out with the insignia of office, to Whydah to be drowned at the mouth of the river. The intention of the sacrifice was to attract merchant ships. When a fisherman has been carried off by a crocodile, some of the natives on the banks of Lake Tanganyika take this for a sign that the spirit deems himself slighted, since he is obliged to come and find victims for himself instead of having them presented to him. Hence the sorcerers generally decide that a second victim is wanted; so, having chosen one, they bind him hand and foot and fling him into the lake to feed the crocodiles. The crater of the volcano Toluca in Mexico encloses two lakes of clear cold water, surrounded by gloomy forests of pine. Here, in the eighteenth month of the Toltec year, answering to February, children beautifully dressed and decked with flowers and gay feathers used to be drowned as an offering to Tlaloc, the god of the waters, who had a fine temple on the spot. The Chams of Annam have traditions of a time when living men were thrown into the sea every year in order to propitiate the deities who looked after the fishing, and when children of good family were drowned in the water-channels in order that the rice-fields might be duly irrigated.

This last instance brings out a more kindly aspect of the water-spirits. If these beings are dreaded by the fisherman and the mariner who tempt the angry sea, and by the huntsman who has to swim or ford the rushing rivers, they are viewed in a different light by the shepherd and the husbandman in hot and arid lands, where the pasture for the cattle and the produce of

the fields alike depend on the supply of water, and where prolonged drought means starvation and death for man and beast. To men in such circumstances the spirits of the waters are beneficent beings, the dispensers of life and fertility, whether their blessings descend as rain from heaven or well up as springs of bubbling water in the parched desert. In the Semitic East, for example, where the rainfall is precarious or confined to certain seasons, the face of the earth is bare and withered for most of the year, except where it is kept fresh by irrigation or by the percolation of underground water. Here, accordingly, the local gods or Baalim had their seats originally in spots of natural fertility, by fountains and the banks of rivers, in groves and tangled thickets and green glades of mountain hollows and deep watercourses. As lords of the springs and subterranean waters they were supposed to be the sources of all the gifts of the land, the corn, the wine and the oil, the wool and the flax, the vines and the fig-trees.

Where water-spirits are thus conceived as the authors of fertility in general, it is natural that they should be held to extend the sphere of their operations to men and animals; in other words, that the power of bestowing offspring on barren women and cattle should be ascribed to them. This ascription comes out clearly in a custom observed by Syrian women at the present day. Some of the channels of the Orontes are used for irrigation, but at a certain season of the year the streams are turned off and the dry bed of the channels is cleared of mud and any other matter that might clog the flow of the water. The first night that the water is turned on again, it is said to have the power of procreation. Accordingly barren women take their places in the channel, waiting for the embrace of the water-spirit in the rush of the stream. Again, a pool of water in a cave at Junch enjoys the same reputation. The people think a childless couple who bathe in the water will have offspring. In India many wells are supposed to cure sterility, which is universally attributed to the agency of evil spirits. The water of seven wells is collected on the night of the Diwali or feast of lamps, and barren women bathe in it in order to remove their reproach. There is a well in Orissa where the priests throw betel-nuts into the mud. Childless women scramble for the nuts, and she who finds them will be a happy mother before long. For the same reason, after childbirth an Indian mother is taken to worship the village well. She walks round it in the course of the sun and smears the platform with red lead, which may be a substitute for blood. A Khandh priest will take a childless woman to the meeting of two streams, where he makes an offering to the god of births and sprinkles the woman with water in order to rid her of the influence of the spirit who hinders conception. In the Punjaub a barren woman who desires to become a mother will sometimes be let down into a well on a Sunday or Tuesday night during the Diwali festival. After stripping herself of her clothes and bathing in the water, she is drawn up again and performs the *chaukpurna* ceremony with incantations taught by a wizard. When this ceremony has been performed, the well is supposed to run dry; its quickening and fertilising virtue has been abstracted by the woman. The Indian sect of the Vallabhacharyas or Maharajas believe that bathing in a sacred well is a remedy for barrenness in women. In antiquity the waters of Sinuessa in Campania were thought to bless childless wives with offspring. To this day Syrian women resort to hot springs in order to obtain children from the saint or jinnee of the waters. In Scotland the same fertilising virtue used to be, and probably still is, ascribed to certain springs. Wives who wished to become mothers formerly resorted to the well of St. Fillan at Comrie, and to the wells of St. Mary at Whitekirk and in the Isle of May. In the Aran Islands, off the coast of Galway, women desirous of children pray at St. Eany's Well, by the Angels' Walk, and the men pray at the rag well by the church of the Four Comely Ones at Onaght. Child's Well in Oxford was supposed to have the virtue of making barren women to bring forth. Near Bingfield in Northumberland there is a copious sulphur spring known as the Borewell. On the Sunday following the fourth day of July, that is about Midsummer Day, according to the old style, great crowds of people used to assemble at the

well from all the surrounding hamlets and villages. The scene was like a fair, stalls for the sale of refreshments being brought and set up for the occasion. The neighbouring slopes were terraced, and seats formed for the convenience of pilgrims and visitors. Barren women prayed at the well that they might become mothers. If their faith was strong enough, their prayers were heard within the year.

In Greek mythology similar ideas of the procreative power of water meet us in the stories of the loves of rivers for women and in the legends which traced the descent of heroes and heroines from river-gods. In Sophocles's play of *The Trachinian Women* Dejanira tells how she was wooed by the river Achelous, who came to her father and claimed her hand, appearing in the likeness now of a bull, now of a serpent, and now of a being with the body of a man and the front of an ox, while streams of water flowed from his shaggy beard. She relates, too, how glad she was when Hercules presented himself and vanquished the river-god in single combat and took her to wife. The legend perhaps preserves a reminiscence of that custom of providing a water-god with a human wife which has been practised elsewhere. The motive of such a custom may have varied with the particular conception which happened to prevail of the character of the water-god. Where he was supposed to be a cruel and destructive being, who drowned men and laid waste the country, a wife would be offered simply to keep him in good humour, and so prevent him from doing mischief. But where he was viewed as the procreative power on whom the fertility of the earth and the fecundity of men and animals depended, his marriage would be deemed necessary for the purpose of enabling him to discharge his beneficent functions. This belief in the amorous character of rivers comes out plainly in a custom which was observed at Troy down to classical times. Maidens about to marry were wont to bathe in the Scamander, saying as they did so, "Scamander, take my virginity." A similar custom appears to have been observed at the river Maeander, and perhaps in other parts of the Greek world. Occasionally, it would seem, young men took advantage of the practice to ravish the girls, and the offspring of such a union was fathered on the river-god. The bath which a Greek bride and bridegroom regularly took before marriage appears to have been intended to bless their union with offspring through the fertilising influence of the water-nymphs.

Thus it would appear that in many parts of the world a custom has prevailed of sacrificing human beings to water-spirits, and that in not a few cases the ceremony has taken the form of making over a woman to the spirit to be his wife, in order either to pacify his fury or to give play to his generative powers. Where the water-spirit was regarded as female, young men might be presented to her for a similar purpose, and this may be the reason why the victims sacrificed to water-spirits are sometimes males. Among civilised peoples these customs survive for the most part only in popular tales, of which the legend of Perseus and Andromeda, with its mediaeval counterpart of St. George and the Dragon, is the most familiar example. But occasionally they appear to have left traces of themselves in ceremonies and pageants. Thus at Furth in Bavaria a drama called the Slaying of the Dragon used to be acted every year about Midsummer, on the Sunday after Corpus Christi Day. Crowds of spectators flocked from the neighbourhood to witness it. The scene of the performance was the public square. On a platform stood or sat a princess wearing a golden crown on her head, and as many silver ornaments on her body as could be borrowed for the purpose. She was attended by a maid of honour. Opposite her was stationed the dragon, a dreadful monster of painted canvas stretched on a wooden skeleton and moved by two men inside. From time to time the creature would rush with gaping jaws into the dense crowd of spectators, who retreated hastily, tumbling over each other in their anxiety to escape. Then a knight in armour, attended by his men-at-arms, rode forth and asked the princess what she did "on this hard stone," and why she looked so sad. She told him that the dragon was coming to

eat her up. On that the knight bade her be of good cheer, for that with his sword he would rid the country of the monster. With that he charged the dragon, thrusting his spear into its maw and taking care to stab a bladder of bullock's blood which was there concealed. The gush of blood which followed was an indispensable part of the show, and if the knight missed his stroke he was unmercifully jeered and taunted by the crowd. Having despatched the monster with sword and pistol, the knight then hastened to the princess and told her that he had slain the dragon who had so long oppressed the town. In return she tied a wreath round his arm, and announced that her noble father and mother would soon come to give them half the kingdom. The men-at-arms then escorted the knight and the princess to the tavern, there to end the day with dance and revelry. Bohemians and Bavarians came from many miles to witness this play of the Slaying of the Dragon, and when the monster's blood streamed forth they eagerly mopped it up, along with the blood-soaked earth, in white cloths, which they afterwards laid on the flax-fields, in order that the flax might thrive and grow tall. For the "dragon's blood" was thought to be a sure protection against witchcraft. This use of the blood suffices to prove that the Slaying of the Dragon at Furth was not a mere popular spectacle, but a magical rite designed to fertilise the fields. As such it probably descended from a very remote antiquity, and may well have been invested with a character of solemnity, if not of tragedy, long before it degenerated into a farce.

More famous was the dragon from which, according to legend, St. Romain delivered Rouen, and far more impressive was the ceremony with which, down to the French Revolution, the city commemorated its deliverance. The stately and beautiful edifices of the Middle Ages, which still adorn Rouen, formed a fitting background for a pageant which carried the mind back to the days when Henry II. of England and Richard Cœur-de-Lion, Dukes of Normandy, still had their palace in this ancient capital of their ancestral domains. Legend ran that about the year 520 A.D. a forest or marsh near the city was infested by a monstrous beast in the shape of a serpent or dragon, which every day wrought great harm to Rouen and its neighbourhood, devouring man and beast, causing boats and mariners on the river Seine to perish, and inflicting other woes innumerable on the commonwealth. At last the archbishop, St. Romain, resolved to beard the monster in his den. He could get none to accompany him but a prisoner condemned to death for murder. On their approach the dragon made as though he would swallow them up; but the archbishop, relying on the divine help, made the sign of the cross, and at once the monster became so gentle that he suffered the saint to bind him with his stole and the murderer to lead him like a lamb to the slaughter. Thus they went in procession to a public place in Rouen, where the dragon was burnt in the presence of the people and its ashes cast into the river. The murderer was pardoned for his services; and the fame of the deed having gone abroad, St. Romain, or his successor St. Ouen, whose memory is enshrined in a church of dreamlike beauty at Rouen, obtained from King Dagobert in perpetuity a privilege for the archbishop, dean, and canons of the cathedral, to wit, that every year on Ascension Day, the anniversary of the miracle, they should pardon and release from prison a malefactor, whomsoever they chose, and whatever the crime of which he had been guilty. This privilege, unique in France, was claimed by the chapter of the cathedral as early as the beginning of the thirteenth century; for in 1210, the governor of the castle of Rouen having boggled at giving up a prisoner, the chapter appealed to King Philip Augustus, who caused an enquiry to be made into the claim. At this enquiry nine witnesses swore that never in the reigns of Henry II. and Richard Cœur-de-Lion, Dukes of Normandy, had there been any difficulty raised on the point in question. Henceforward the chapter seems to have enjoyed the right without opposition down to 1790, when it exercised its privilege of mercy for the last time. Next year the face of things had changed; there was neither archbishop nor chapter at Rouen. A register of the names of the prisoners who were pardoned, together with an account of their crimes, was kept and still exists. Only a few of the names in the thirteenth

century are known, and there are many gaps in the first half of the fourteenth century; but from that time onward the register is nearly complete. Most of the crimes appear to have been murder or homicide.

The proceedings, on the great day of pardon, varied somewhat in different ages. The following account is based in great part on a description written in the reign of Henry III. and published at Rouen in 1587. Fifteen days before Ascension Day the canons of the cathedral summoned the king's officers to stop all proceedings against criminals detained in prison. Afterwards, on the Monday of Rogations, two canons examined the prisoners and took their confessions, going from prison to prison till Ascension Day. On that day, about seven o'clock in the morning, all the canons assembled in the chapter-house and invoked the grace of the Holy Spirit by the hymn *Veni creator Spiritus*, and other prayers. Also they made oath to reveal none of the depositions of the criminals, but to hold them sacred under the seal of confession. The depositions having been taken and the commissioners heard, the chapter, after due deliberation, named him or her among the prisoners who was to receive the benefit of the privilege. A card bearing the prisoner's name and sealed with the seal of the chapter was then sent to the members of parliament, who were sitting in full assembly, clad in their red robes, in the great hall of the palace to receive the nomination of the prisoner and to give it legal effect. The criminal was then released and pardoned. Immediately the minster bells began to ring, the doors of the cathedral were flung open, the organ pealed, hymns were sung, candles lit, and every solemnity observed in token of joy and gladness. Further, in presence of the conclave all the depositions of the other prisoners were burnt on the altar of the chapter-house. Then the archbishop and the whole of the clergy of the cathedral went in procession to the great square known as the Old Tower near the river, carrying the shrines and reliquaries of the minster, and accompanied by the joyous music of hautboys and clarions. Apparently the Old Tower occupies the site of the ancient castle of the Dukes of Normandy, and the custom of going thither in procession came down from a time when the prisoners were detained in the castle-dungeons. In the square there stood, and still stands, a platform of stone raised high above the ground and approached by flights of steps. Thither they brought the shrine (*fierte*) of St. Romain, and thither too was led the pardoned prisoner. He ascended the platform, and after confessing his sins and receiving absolution he thrice lifted the shrine of St. Romain, while the innumerable multitude assembled in the square cried aloud, each time the shrine was lifted, "*Noel! Noel! Noel!*" which was understood to mean "God be with us!" That done, the procession re-formed and returned to the cathedral. At the head walked a beadle clad in violet, who bore on a pole the wicker effigy of the winged dragon of Notre Dame, holding a large fish in its mouth. The whispers and cries excited by the appearance of the monster were drowned in the loud fanfares of cornets, clarions, and trumpets. Behind the musicians, who wore the liveries of the Master of the Brotherhood of Notre Dame with his arms emblazoned on an ensign of taffeta, came the carved silver-gilt shrine of Notre Dame. After it followed the clergy of the cathedral to the number of two hundred, clad in robes of violet or crimson silk, bearing banners, crosses, and shrines, and chanting the hymn *De resurrectione Domini*. Then came the archbishop, giving his blessing to the great multitude who thronged the streets. The prisoner himself walked behind, bareheaded, crowned with flowers, carrying one end of the litter which supported the shrine of St. Romain; the fetters he had worn hung from the litter; and with him paced, with lighted torches in their hands, the men or women who, for the last seven years, had in like manner received their pardon. Another beadle, in a violet livery, marched behind bearing aloft on a pole the wicker effigy of the dragon (*Gargouille*) destroyed by St. Romain; in its mouth the dragon sometimes held a live animal, such as a young fox, a rabbit, or a sucking pig, and it was attended by the Brotherhood of the Gargouillards. The clergy of the thirty-two parishes of Rouen also took part in the procession, which moved from the Old Tower to the cathedral amid the

acclamations of the crowd, while from every church tower in the city the bells rang out a joyous peal, the great *Georges d'Amboise* thundering above them all. After mass had been performed in the cathedral, the prisoner was taken to the house of the Master of the Brotherhood of St. Romain, where he was magnificently feasted, lodged, and served, however humble his rank. Next morning he again presented himself to the chapter, where, kneeling in the presence of a great assembly, he was severely reprov'd for his sins and admonished to give thanks to God, to St. Romain, and to the canons for the pardon he had received in virtue of the privilege.

What was the origin and meaning of this remarkable privilege of the *Fierte*, as the shrine of St. Romain was called? Its history has been carefully investigated by A. Floquet, Chief Registrar of the Royal Court of Rouen, with the aid of all the documentary evidence, including the archives both at Rouen and Paris. He appears to have shewn conclusively that the association of St. Romain with the custom is comparatively late. We possess a life of the saint in Latin verse, dating from the eighth century, in which the miracles said to have been wrought by him are set forth in a strain of pompous eulogy. Yet neither in it nor in any of the other early lives of St. Romain and St. Ouen, nor in any of the older chronicles and martyrologies, is a single word said about the destruction of the dragon and the deliverance of the prisoner. It is not till 1394 that we meet for the first time with a mention of the miracle. Moreover, the deliverance of the prisoner can hardly have been instituted in honour of St. Romain, else it would have taken place on the twenty-third of October, the day on which the Church of Rouen celebrates the translation of the saint's bones to the cathedral. St. Romain died in 638, and his bones were transferred to the cathedral of Rouen at the end of the eleventh or the beginning of the twelfth century. Further, Floquet has adduced strong grounds for believing that the privilege claimed by the chapter of Rouen of annually pardoning a condemned criminal on Ascension Day was unknown in the early years of the twelfth century, and that it originated in the reign of Henry I. or Stephen, if not in that of Henry II. He supposes the ceremony to have been in its origin a scenic representation of the triumph of Christ over sin and death, the deliverance of the condemned prisoner symbolising the deliverance of man from the yoke of corruption, and bringing home to the people in a visible form the great mystery which the festival of the Ascension was instituted to commemorate. Such dramatic expositions of Christian doctrine, he points out, were common in the Middle Ages.

Plausible as is this solution of the problem, it can scarcely be regarded as satisfactory. Had this been the real origin of the privilege, we should expect to find the Ascension of Christ either plainly enacted, or at least distinctly alluded to in the ceremony; but this, so far as we can learn, was not so. Again, would it not savour of blasphemy to represent the sinless and glorified Redeemer by a ruffian stained with the blackest crimes? Moreover, the part played by the dragon in the legend and in the spectacle seems too important to allow us to explain it away, with Floquet, as a mere symbol of the suppression of paganism by St. Romain. The tale of the conquest of the dragon is older than Christianity, and cannot be explained by it. At Rouen the connexion of St. Romain with the story seems certainly to be late, but that does not prove the story itself to be late also. Judging from the analogy of similar tales elsewhere, we may conjecture that in the Rouen version the criminal represents a victim annually sacrificed to a water-spirit or other fabulous being, while the Christian saint has displaced a pagan hero, who was said to have delivered the victim from death and put an end to the sacrifice by slaying the monster. Thus it seems possible that the custom of annually pardoning a condemned malefactor may have superseded an older practice of treating him as a public scapegoat, who died to save the rest of the people. In the sequel we shall see that such customs have been observed in many lands. It is not incredible that at Rouen a usage of this

sort should have survived in a modified shape from pagan times down to the twelfth century, and that the Church should at last have intervened to save the wretch and turn a relic of heathendom to the glory of God and St. Romain. But this explanation of the famous privilege of the *Fierte* is put forward with a full sense of the difficulties attending it, and with no wish to dogmatise on so obscure a subject.

XIII. The Kings Of Rome And Alba

§ 1. Numa and Egeria

From the foregoing survey of custom and legend we may infer that the sacred marriage of the powers both of vegetation and of water has been celebrated by many peoples for the sake of promoting the fertility of the earth, on which the life of animals and men ultimately depends, and that in such rites the part of the divine bridegroom or bride is often sustained by a man or woman. The evidence may, therefore, lend some countenance to the conjecture that in the sacred grove at Nemi, where the powers of vegetation and of water manifested themselves in the fair forms of shady woods, tumbling cascades, and glassy lake, a marriage like that of our King and Queen of May was annually celebrated between the mortal King of the Wood and the immortal Queen of the Wood, Diana. In this connexion an important figure in the grove was the water-nymph Egeria, who was worshipped by pregnant women because she, like Diana, could grant them an easy delivery. From this it seems fairly safe to conclude that, like many other springs, the water of Egeria was credited with a power of facilitating conception as well as delivery. The votive offerings found on the spot, which clearly refer to the begetting of children, may possibly have been dedicated to Egeria rather than to Diana, or perhaps we should rather say that the water-nymph Egeria is only another form of the great nature-goddess Diana herself, the mistress of sounding rivers as well as of umbrageous woods, who had her home by the lake and her mirror in its calm waters, and whose Greek counterpart Artemis loved to haunt meres and springs. The identification of Egeria with Diana is confirmed by a statement of Plutarch that Egeria was one of the oak-nymphs whom the Romans believed to preside over every green oak-grove; for while Diana was a goddess of the woodlands in general she appears to have been intimately associated with oaks in particular, especially at her sacred grove of Nemi. Perhaps, then, Egeria was the fairy of a spring that flowed from the roots of a sacred oak. Such a spring is said to have gushed from the foot of the great oak at Dodona, and from its murmurous flow the priestess drew oracles. Among the Greeks a draught of water from certain sacred springs or wells was supposed to confer prophetic powers. This would explain the more than mortal wisdom with which, according to tradition, Egeria inspired her royal husband or lover Numa. When we remember how very often in early society the king is held responsible for the fall of rain and the fruitfulness of the earth, it seems hardly rash to conjecture that in the legend of the nuptials of Numa and Egeria we have a reminiscence of a sacred marriage which the old Roman kings regularly contracted with a goddess of vegetation and water for the purpose of enabling him to discharge his divine or magical functions. In such a rite the part of the goddess might be played either by an image or a woman, and if by a woman, probably by the Queen. If there is any truth in this conjecture, we may suppose that the King and Queen of Rome masqueraded as god and goddess at their marriage, exactly as the King and Queen of Egypt appear to have done. The legend of Numa and Egeria points to a sacred grove rather than to a house as the scene of the nuptial union, which, like the marriage of the King and Queen of May, or of the vine-god and the Queen of Athens, may have been annually celebrated as a charm to ensure the fertility not only of the earth but of man and beast. Now, according to some accounts, the scene of the marriage was no other than the sacred grove of Nemi, and on quite independent grounds we have been led to suppose that in that same grove the King of the Wood was wedded to Diana. The convergence of the two distinct lines of enquiry suggests that the legendary union of the Roman king with Egeria may have been a reflection or duplicate of the union of the King of the Wood with Egeria or her double Diana. This does not imply that the Roman kings ever served as Kings of the Wood in the Arician

grove, but only that they may originally have been invested with a sacred character of the same general kind, and may have held office on similar terms. To be more explicit, it is possible that they reigned, not by right of birth, but in virtue of their supposed divinity as representatives or embodiments of a god, and that as such they mated with a goddess, and had to prove their fitness from time to time to discharge their divine functions by engaging in a severe bodily struggle, which may often have proved fatal to them, leaving the crown to their victorious adversary. Our knowledge of the Roman kingship is far too scanty to allow us to affirm any one of these propositions with confidence; but at least there are some scattered hints or indications of a similarity in all these respects between the priests of Nemi and the kings of Rome, or perhaps rather between their remote predecessors in the dark ages which preceded the dawn of legend.

§ 2. The King as Jupiter

In the first place, then, it would seem that the Roman king personated no less a deity than Jupiter himself. For down to imperial times victorious generals celebrating a triumph, and magistrates presiding at the games in the Circus, wore the costume of Jupiter, which was borrowed for the occasion from his great temple on the Capitol; and it has been held with a high degree of probability both by ancients and moderns that in so doing they copied the traditional attire and insignia of the Roman kings. They rode a chariot drawn by four laurel-crowned horses through the city, where every one else went on foot; they wore purple robes embroidered or spangled with gold; in the right hand they bore a branch of laurel and in the left hand an ivory sceptre topped with an eagle; a wreath of laurel crowned their brows; their face was reddened with vermilion; and over their head a slave held a heavy crown of massy gold fashioned in the likeness of oak leaves. In this attire the assimilation of the man to the god comes out above all in the eagle-topped sceptre, the oaken crown, and the reddened face. For the eagle was the bird of Jove, the oak was his sacred tree, and the face of his image standing in his four-horse chariot on the Capitol was in like manner regularly dyed red on festivals; indeed, so important was it deemed to keep the divine features properly rouged that one of the first duties of the censors was to contract for having this done. The Greeks sometimes painted red the face or the whole body of the wine-god Dionysus. These customs may have been a substitute for an older practice of feeding a god by smearing the face, and especially the lips, of his idol with the blood of a sacrificial victim. Many examples of such a practice might be adduced from the religion of barbarous peoples. As the triumphal procession always ended in the temple of Jupiter on the Capitol, it was peculiarly appropriate that the head of the victor should be graced by a crown of oak leaves, for not only was every oak consecrated to Jupiter, but the Capitoline temple of the god was said to have been built by Romulus beside a sacred oak, venerated by shepherds, to which the king attached the spoils won by him from the enemy's general in battle. We are expressly told that the oak crown was sacred to Capitoline Jupiter; a passage of Ovid proves that it was regarded as the god's special emblem. Writing in exile on the shores of the Black Sea, the poet sends the book which he has just composed to Rome to be published there; he personifies the volume and imagines it passing along the Sacred Way and up to the door of the emperor's stately palace on the Palatine hill. Above the portal hung shining arms and a crown of oak leaves. At the sight the poet starts: "Is this, quoth I, the house of Jove? For sure to my prophetic soul the oaken crown was reason good to think it so." The senate had granted Augustus the right to have the wreath of oak always suspended over his door; and elsewhere Ovid counts this among the more than mortal honours bestowed on the emperor. On the Capitol at Circa there stood a silver image of Jupiter wearing a silver crown of oak leaves and acorns. Similarly at Dodona, the most famous sanctuary of the oak in Greece, the image of Zeus appears to have worn a chaplet of oak leaves; for the god is constantly thus portrayed on coins of Epirus. And

just as Roman kings appear to have personated the oak-god Jupiter, so Greek kings appear to have personated the oak-god Zeus. The legendary Salmoneus of Elis is certainly reported to have done so; Periphas, an ancient king of Athens, is said to have been styled Zeus by his people, and to have been changed into an eagle by his jealous name-sake. In Homer kings are often spoken of as nurtured by Zeus and divine. Indeed we are told that in ancient days every Greek king was called Zeus.

Thus we may fairly assume that on certain solemn occasions Roman generals and magistrates personated the supreme god, and that in so doing they revived the practice of the early kings. To us moderns, for whom the breach which divides the human and the divine has deepened into an impassable gulf, such mimicry may appear impious, but it was otherwise with the ancients. To their thinking gods and men were akin, for many families traced their descent from a divinity, and the deification of a man probably seemed as little extraordinary to them as the canonisation of a saint seems to a modern Catholic. The Romans in particular were quite familiar with the spectacle of men masquerading as spirits; for at the funerals of great houses all the illustrious dead of the family were personated by men specially chosen for their resemblance to the departed. These representatives wore masks fashioned and painted in the likeness of the originals: they were dressed in rich robes of office, resplendent with purple and gold, such as the dead nobles had worn in their lifetime: like them, they rode in chariots through the city preceded by the rods and axes, and attended by all the pomp and heraldry of high station; and when at last the funeral procession, after threading its way through the crowded streets, defiled into the Forum, the maskers solemnly took their seats on ivory chairs placed for them on the platform of the Rostra, in the sight of the people, recalling no doubt to the old, by their silent presence, the memories of an illustrious past, and firing the young with the ambition of a glorious future.

According to a tradition which we have no reason to reject, Rome was founded by settlers from Alba Longa, a city situated on the slope of the Alban hills, overlooking the lake and the Campagna. Hence if the Roman kings claimed to be representatives or embodiments of Jupiter, the god of the sky, of the thunder, and of the oak, it is natural to suppose that the kings of Alba, from whom the founder of Rome traced his descent, may have set up the same claim before them. Now the Alban dynasty bore the name of Silvii or Wood, and it can hardly be without significance that in the vision of the historic glories of Rome revealed to Aeneas in the underworld, Virgil, an antiquary as well as a poet, should represent all the line of Silvii as crowned with oak. A chaplet of oak leaves would thus seem to have been part of the insignia of the old kings of Alba Longa as of their successors the kings of Rome; in both cases it marked the monarch as the human representative of the oak-god. With regard to Silvius, the first king of the Alban dynasty, we are told that he got his name because he had been born or brought up in the forest, and that when he came to man's estate he contested the kingdom with his kinsman Julius, whose name, as some of the ancients themselves perceived, means the Little Jupiter. The people decided in favour of Silvius, but his rival Julius was consoled for the loss of the crown by being invested with religious authority and the office of chief pontiff, or perhaps rather of Flamen Dialis, the highest dignity after the kingship. From this Julius or Little Jupiter, the noble house of the Julii, and hence the first emperors of Rome, believed themselves to be sprung. The legend of the dispute between Silvius and Julius may preserve a reminiscence of such a partition of spiritual and temporal powers in Alba Longa as afterwards took place in Rome, when the old regal office was divided between the Consuls and the King of the Sacred Rites. Many more instances of such a schism will meet us later on. That the Julian house worshipped Vejovis, the Little Jupiter, according to the ancient rites of Alba Longa, is proved by the inscription on an altar which they dedicated to him at their ancestral home of Bovillae, a colony of Alba Longa, situated at the foot of the Alban

hills. The Caesars, the most illustrious family of the Julian house, took their name from their long hair (*caesaries*), which was probably in those early days, as it was among the Franks long afterwards, a symbol of royalty.

But in ceding the pontificate to their rivals, it would seem that the reigning dynasty of the Silvii or Woods by no means renounced their own claim to personate the god of the oak and the thunder; for the Roman annals record that one of them, Romulus, Remulus, or Amulius Silvius by name, set up for being a god in his own person, the equal or superior of Jupiter. To support his pretensions and overawe his subjects, he constructed machines whereby he mimicked the clap of thunder and the flash of lightning. Diodorus relates that in the season of fruitage, when thunder is loud and frequent, the king commanded his soldiers to drown the roar of heaven's artillery by clashing their swords against their shields. But he paid the penalty of his impiety, for he perished, he and his house, struck by a thunderbolt in the midst of a dreadful storm. Swollen by the rain, the Alban lake rose in flood and drowned his palace. But still, says an ancient historian, when the water is low and the surface unruffled by a breeze, you may see the ruins of the palace at the bottom of the clear lake. Taken along with the similar story of Salmoneus, king of Elis, this legend points to a real custom observed by the early kings of Greece and Italy, who like their fellows in Africa down to modern times may have been expected to produce rain and thunder for the good of the crops. The priestly king Numa passed for an adept in the art of drawing down lightning from the sky. Mock thunder, we know, has been made by various peoples as a rain-charm in modern times; why should it not have been made by kings in antiquity?

In this connexion it deserves to be noted that, according to the legend, Salmoneus, like his Alban counterpart, was killed by a thunderbolt; and that one of the Roman kings, Tullus Hostilius, is reported to have met with the same end in an attempt to draw down Jupiter in the form of lightning from the sky. Aeneas himself, the legendary ancestor both of the Alban and the Roman kings, vanished from the world in a violent thunderstorm, and was afterwards worshipped as Jupiter Indiges. A mound of earth, encircled with fine trees, on the bank of the little river Numicius was pointed out as his grave. Romulus, too, the first king of Rome, disappeared in like manner. It was the seventh of July, and the king was reviewing his army at the Goat's Marsh, outside the walls of the city. Suddenly the sky lowered and a tempest burst, accompanied by peals of thunder. Soon the storm had swept by, leaving the brightness and serenity of the summer day behind. But Romulus was never seen again. Those who had stood by him said they saw him caught up to heaven in a whirlwind; and not long afterwards a certain Proculus Julius, a patrician of Alban birth and descent, declared on oath that Romulus had appeared to him clad in bright armour, and announced that the Romans were to worship him as a god under the name of Quirinus, and to build him a temple on the spot. The temple was built and the place was henceforth known as the Quirinal hill. In this legend it is significant that the annunciation of the king's divinity should be put in the mouth of a member of the Julian house, a native of Alba; for we have seen reason to believe that at Alba the Julii had competed with the Silvii, from whom Romulus was descended, for the kingship, and with it for the honour of personating Jupiter. If, as seems to be philologically possible, the word Quirinus is derived from the same root as *quercus*, "an oak," the name of the deified Romulus would mean no more than "the oak-god," that is, Jupiter. Thus the tradition would square perfectly with the other indications of custom and legend which have led us to conclude that the kings both of Rome and of Alba claimed to embody in their own persons the god of the sky, of thunder, and of the oak. Certainly the stories which associated the deaths of so many of them with thunderstorms point to a close connexion with the god of thunder and lightning. A king who had been wont to fulminate in his lifetime might naturally be supposed at death to be carried up in a thunderstorm to heaven, there to discharge above

the clouds the same duties which he had performed on earth. Such a tale would be all the more likely to attach itself to the twin Romulus, if the early Romans shared the widespread superstition that twins have power over the weather in general and over rain and wind in particular. That tempests are caused by the spirits of the dead is a belief of the Araucanians of Chili. Not a storm bursts upon the Andes or the ocean which these Indians do not ascribe to a battle between the souls of their fellow-countrymen and the dead Spaniards. In the roaring of the wind they hear the trampling of the ghostly horses, in the peal of the thunder the roll of the drums, and in the flashes of lightning the fire of the artillery.

Thus, if the kings of Alba and Rome imitated Jupiter as god of the oak by wearing a crown of oak leaves, they seem also to have copied him in his character of a weather-god by pretending to make thunder and lightning. And if they did so, it is probable that, like Jupiter in heaven and many kings on earth, they also acted as public rain-makers, wringing showers from the dark sky by their enchantments whenever the parched earth cried out for the refreshing moisture. At Rome the sluices of heaven were opened by means of a sacred stone, and the ceremony appears to have formed part of the ritual of Jupiter Elicius, the god who elicits from the clouds the flashing lightning and the dripping rain. And who so well fitted to perform the ceremony as the king, the living representative of the sky-god?

The conclusion which we have reached as to the kings of Rome and Alba probably holds good of all the kings of ancient Latium: each of them, we may suppose, represented or embodied the local Jupiter. For we can hardly doubt that of old every Latin town or settlement had its own Jupiter, as every town and almost every church in modern Italy has its own Madonna; and like the Baal of the Semites the local Jupiter was commonly worshipped on high places. Wooded heights, round which the rain-clouds gather, were indeed the natural sanctuaries for a god of the sky, the rain, and the oak. At Rome he occupied one summit of the Capitoline hill, while the other summit was assigned to his wife Juno, whose temple, with the long flight of stairs leading up to it, has for ages been appropriately replaced by the church of St. Mary "in the altar of the sky" (*in Araceli*). That both heights were originally wooded seems certain, for down to imperial times the saddle which joins them was known as the place "between the two groves." Virgil tells us that the hilltop where gilded temples glittered in his day had been covered of old by shaggy thickets, the haunt of woodland elves and savage men, "born of the tree-trunks and the heart of oak." These thickets were probably composed of oaks, for the oak crown was sacred to Capitoline Juno as well as to Jupiter; it was to a sacred oak on the Capitol that Romulus fastened the spoils, and there is evidence that in early times oak-woods clothed other of the hills on which Rome was afterwards built. Thus the Caelian hill went originally by the name of the Mountain of the Oak Grove on account of the thickets of oak by which it was overgrown, and Jupiter was here worshipped in his character of the oak-god; one of the old gates of Rome, apparently between the Caelian and the Esquiline hills, was called the Gate of the Oak Grove for a similar reason; and within the walls hard by was a Chapel of the Oak Grove dedicated to the worship of the oak-nymphs. These nymphs appear on coins of the Accoleian family as three women supporting on their shoulders a pole from which rise leafy branches. The Esquiline hill seems also to have derived its name from its oaks. After mentioning the Chapel of the Oak and other hallowed groves which still dotted the hill in his time, the antiquary Varro tells us that their bounds were now much curtailed, adding with a sigh that it was no wonder the sacred old trees should give way to the modern worship of Mammon. Apparently the Roman nobles of those days sold the ancient woods, as their descendants sell their beautiful gardens, for building-land. To this list of oak-clad hills on the left bank of the Tiber must be added the Quirinal, if Quirinus, who had a very ancient shrine on the hill, was the oak-god. Under the Aventine was a grove of evergreen oaks, which appears to have been no other than the grove

of Egeria outside the Porta Capena. The old grove of Vesta, which once skirted the foot of the Palatine hill on the side of the Forum, must surely have been a grove of oaks; for not only does an oak appear growing beside the temple of Vesta on a fine relief preserved in the gallery of the Uffizi at Florence, but charred embers of the sacred Vestal fire have in recent years been discovered at the temple of Vesta in the Forum, and a microscopic analysis of them has proved that they consist of the pith or heart of trunks or great branches of oak (*quercus*). The full significance of this discovery will appear later on. When the plebeians seceded to the Janiculum in the third century before Christ, the dictator Q. Hortensius summoned a meeting of the people and passed a law in an oak grove, which perhaps grew on the hill. In this neighbourhood there was a street called the Street of the Oak Grove; it is mentioned in an inscription found in its original position near the modern Garibaldi bridge. On the Vatican hill there stood an evergreen oak which was believed to be older than Rome; an inscription in Etruscan letters on a bronze tablet proclaimed the sanctity of the tree. Finally, that oak woods existed at or near Rome in the earliest times has lately been demonstrated by the discovery in the Forum itself of a prehistoric cemetery, which contains amongst other sepultures the bones of several young children deposited in rudely hollowed trunks of oak. With all this evidence before us we need not wonder that Virgil should speak of the primitive inhabitants of Rome as “born of the tree-trunks and the heart of oak,” and that the Roman kings should have worn crowns of oak leaves in imitation of the oak-god Jupiter, who dwelt in his sacred grove on the Capitol.

If the kings of Rome aped Capitoline Jove, their predecessors the kings of Alba probably laid themselves out to mimic the great Latian Jupiter, who had his seat above the city on the summit of the Alban Mountain. Latinus, the legendary ancestor of the dynasty, was said to have been changed into Latian Jupiter after vanishing from the world in the mysterious fashion characteristic of the old Latin kings. The sanctuary of the god on the top of the mountain was the religious centre of the Latin League, as Alba was its political capital till Rome wrested the supremacy from its ancient rival. Apparently no temple, in our sense of the word, was ever erected to Jupiter on this his holy mountain; as god of the sky and thunder he appropriately received the homage of his worshippers in the open air. The massive wall, of which some remains still enclose the old garden of the Passionist monastery, seems to have been part of the sacred precinct which Tarquin the Proud, the last king of Rome, marked out for the solemn annual assembly of the Latin League. The god’s oldest sanctuary on this airy mountain-top was a grove; and bearing in mind not merely the special consecration of the oak to Jupiter, but also the traditional oak crown of the Alban kings and the analogy of the Capitoline Jupiter at Rome, we may suppose that the trees in the grove were oaks. We know that in antiquity Mount Algidus, an outlying group of the Alban hills, was covered with dark forests of oak; and among the tribes who belonged to the Latin League in the earliest days, and were entitled to share the flesh of the white bull sacrificed on the Alban Mount, there was one whose members styled themselves the Men of the Oak, doubtless on account of the woods among which they dwelt.

But we should err if we pictured to ourselves the country as covered in historical times with an unbroken forest of oaks. Theophrastus has left us a description of the woods of Latium as they were in the fourth century before Christ. He says: “The land of the Latins is all moist. The plains produce laurels, myrtles, and wonderful beeches; for they fell trees of such a size that a single stem suffices for the keel of a Tyrrhenian ship. Pines and firs grow in the mountains. What they call the land of Circe is a lofty headland thickly wooded with oak, myrtle, and luxuriant laurels. The natives say that Circe dwelt there, and they shew the grave of Elpenor, from which grow myrtles such as wreaths are made of, whereas the other myrtle-trees are tall.” Thus the prospect from the top of the Alban Mount in the early days of Rome

must have been very different in some respects from what it is to-day. The purple Apennines, indeed, in their eternal calm on the one hand, and the shining Mediterranean in its eternal unrest on the other, no doubt looked then much as they look now, whether bathed in sunshine, or chequered by the fleeting shadows of clouds; but instead of the desolate brown expanse of the fever-stricken Campagna, spanned by its long lines of ruined aqueducts, like the broken arches of the bridge in the vision of Mirza, the eye must have ranged over woodlands that stretched away, mile after mile, on all sides, till their varied hues of green or autumnal scarlet and gold melted insensibly into the blue of the distant mountains and sea.

Thus the Alban Mount was to the Latins what Olympus was to the Greeks, the lofty abode of the sky-god, who hurled his thunderbolts from above the clouds. The white steers which were here sacrificed to him in his sacred grove, as in the Capitol at Rome, remind us of the white bulls which the Druids of Gaul sacrificed under the holy oak when they cut the mistletoe; and the parallel would be all the closer if, as we have seen reason to think, the Latins worshipped Jupiter originally in groves of oak. Other resemblances between ancient Gaul and Latium will meet us later on. When we remember that the ancient Italian and Celtic peoples spoke languages which are nearly related to each other, we shall not be surprised at discovering traces of community in their religion, especially in what concerns the worship of the god of the oak and the thunder. For that worship, as we shall see presently, belongs to the oldest stratum of Aryan civilisation in Europe.

But Jupiter did not reign alone on the top of his holy mountain. He had his consort with him, the goddess Juno, who was worshipped here under the same title, Moneta, as on the Capitol at Rome. As the oak crown was sacred to Jupiter and Juno on the Capitol, so we may suppose it was on the Alban Mount, from which the Capitoline worship was derived. Thus the oak-god would have his oak-goddess in the sacred oak grove. So at Dodona the oak-god Zeus was coupled with Dione, whose very name is only a dialectically different form of Juno; and so on the top of Mount Cithaeron he was periodically wedded to an oaken image of Hera. It is probable, though it cannot be positively proved, that the sacred marriage of Jupiter and Juno was annually celebrated by all the peoples of the Latin stock in the month which they named after the goddess, the midsummer month of June. Now on the first of June the Roman pontiffs performed certain rites in the grove of Helernus beside the Tiber, and on the same day, and perhaps in the same place, a nymph of the grove, by name Carna, received offerings of lard and bean-porridge. She was said to be a huntress, chaste and coy, who gave the slip to her lovers in the depths of the wood, but was caught by Janus. Some took her to be Diana herself. If she were indeed a form of that goddess, her union with Janus, that is, Dianus, would be appropriate; and as she had a chapel on the Caelian hill, which was once covered with oak-woods, she may have been, like Egeria, an oak-nymph. Further, Janus, or Dianus, and Diana, as we shall see later on, were originally mere doubles of Jupiter and Juno, with whom they coincide in name and to some extent in function. Hence it appears to be not impossible that the rite celebrated by the pontiffs on the first of June in the sacred grove of Helernus was the marriage of Jupiter and Juno under the forms of Janus and Diana. It would be some confirmation of this view if we could be sure that, as Ovid seems to imply, the Romans were in the habit of placing branches of white thorn or buckthorn in their windows on the first of June to keep out the witches; for in some parts of Europe precisely the same custom is observed, for the same reason, a month earlier, on the marriage day of the King and Queen of May. The Greeks certainly believed that branches of white thorn or buckthorn fastened to a door or outside the house had power to disarm the malignant arts of sorcerers and to exclude spirits. Hence they hung up branches of it before the door when sacrifices were being offered to the dead, lest any of the prowling ghosts should be tempted to revisit their old homes or to invade those of other people. When the atheist Bion lay

adying, he not only caused sacrifices to be offered on his behalf to the gods whose existence he had denied, but got an old hag to mumble incantations over him and to bind magical thongs about his arms, and he had boughs of buckthorn and laurel attached to the lintel to keep out death. However, the evidence as to the rites observed by the Romans on the first of June is too slight and dubious to allow us to press the parallel with May Day.

If at any time of the year the Romans celebrated the sacred marriage of Jupiter and Juno, as the Greeks commonly celebrated the corresponding marriage of Zeus and Hera, we may suppose that under the Republic the ceremony was either performed over images of the divine pair or acted by the Flamen Dialis and his wife the Flaminica. For the Flamen Dialis was the priest of Jove; indeed, ancient and modern writers have regarded him, with much probability, as a living image of Jupiter, a human embodiment of the sky-god. In earlier times the Roman king, as representative of Jupiter, would naturally play the part of the heavenly bridegroom at the sacred marriage, while his queen would figure as the heavenly bride, just as in Egypt the king and queen masqueraded in the character of deities, and as at Athens the queen annually wedded the vine-god Dionysus. That the Roman king and queen should act the parts of Jupiter and Juno would seem all the more natural because these deities themselves bore the title of King and Queen. Even if the office of Flamen Dialis existed under the kings, as it appears to have done, the double representation of Jupiter by the king and the flamen need not have seemed extraordinary to the Romans of the time. The same sort of duplication, as we saw, appears to have taken place at Alba, when the Julii were allowed to represent the supreme god in the character of Little Jupiters, while the royal dynasty of the Silvii continued to wield the divine thunder and lightning. And long ages afterwards, history repeating itself, another member of the Julian house, the first emperor of Rome, was deified in his lifetime under the title of Jupiter, while a flamen was appointed to do for him what the Flamen Dialis did for the heavenly Jove. It is said that Numa, the typical priestly king, at first himself discharged the functions of Flamen Dialis, but afterwards appointed a separate priest of Jupiter with that title, in order that the kings, untrammelled by the burdensome religious observances attached to the priesthood, might be free to lead their armies to battle. The tradition may be substantially correct; for analogy shews that the functions of a priestly king are too harassing and too incongruous to be permanently united in the same hands, and that sooner or later the holder of the office seeks to rid himself of part of his burden by deputing to others, according to his temper and tastes, either his civil or his religious duties. Hence we may take it as probable that the fighting kings of Rome, tired of parading as Jupiter and of observing all the elaborate ritual, all the tedious restrictions which the character of godhead entailed on them, were glad to relegate these pious mummeries to a substitute, in whose hands they left the crosier at home while they went forth to wield the sharp Roman sword abroad. This would explain why the traditions of the later kings, from Tullus Hostilius onwards, exhibit so few traces of sacred or priestly functions adhering to their office. Among the ceremonies which they henceforward performed by deputy may have been the rite of the sacred marriage.

Whether that was so or not, the legend of Numa and Egeria appears to embody a reminiscence of a time when the priestly king himself played the part of the divine bridegroom; and as we have seen reason to suppose that the Roman kings personated the oak-god, while Egeria is expressly said to have been an oak-nymph, the story of their union in the sacred grove raises a presumption that at Rome in the regal period a ceremony was periodically performed exactly analogous to that which was annually celebrated at Athens down to the time of Aristotle. The marriage of the King of Rome to the oak-goddess, like the wedding of the vine-god to the Queen of Athens, must have been intended to quicken the growth of vegetation by homoeopathic magic. Of the two forms of the rite we can hardly

doubt that the Roman was the older, and that long before the northern invaders met with the vine on the shores of the Mediterranean their forefathers had married the tree-god to the tree-goddess in the vast oak forests of Central and Northern Europe. In the England of our day the forests have mostly disappeared, yet still on many a village green and in many a country lane a faded image of the sacred marriage lingers in the rustic pageantry of May Day.

XIV. The King's Fire

Thus far we have dealt mainly with those instances of the Sacred Marriage in which a human being is wedded to the divine powers of vegetation or water. Now we pass to the consideration of a different class of cases, in which the divine bridegroom is the fire and his bride a human virgin. And these cases are particularly important for our present enquiry into the early Latin kingship, since it appears that the old Latin kings were commonly supposed to be the offspring of the fire-god by mortal mothers. The evidence which points to this conclusion is as follows.

First, let us take the legend of the birth of King Servius Tullius. It is said that one day the virgin Ocrisia, a slave-woman of Queen Tanaquil, the wife of King Tarquin the elder, was offering as usual cakes and libations of wine on the royal hearth, when a flame in the shape of the male member shot out from the fire. Taking this for a sign that her handmaiden was to be the mother of a more than mortal son, the wise Queen Tanaquil bade the girl array herself as a bride and lie down beside the hearth. Her orders were obeyed; Ocrisia conceived by the god or spirit of the fire, and in due time brought forth Servius Tullius, who was thus born a slave, being the reputed son of a slave mother and a divine father, the fire-god. His birth from the fire was attested in his childhood by a lambent flame which played about his head as he slept at noon in the king's palace. This story, as others have pointed out before, seems clearly to imply that the mother of Servius was a Vestal Virgin charged with the care and worship of the sacred fire in the king's house. Now, in Promathion's *History of Italy*, cited by Plutarch, a similar tale was told of the birth of Romulus himself. It is said that in the house of the King of Alba a flame like to the male organ of generation hung over the hearth for many days. Learning from an oracle that a virgin should conceive by this phantom and bear a son of great valour and renown, the king bade one of his daughters submit to its embraces, but she disdained to do so, and sent her handmaid instead. Angry at her disobedience, her father ordered both the maidens to be put to death. But Vesta appeared to him in a dream, forbade the execution, and commanded that both the girls should be imprisoned until they had woven a certain web, after which they were to be given in marriage. But the web was never finished, for as fast as they wove it by day, other maidens, in obedience to the king's orders, unwove it at night. Meantime the handmaiden conceived by the flame of fire, and gave birth to Romulus and Remus. In this legend, as in the story of the birth of Servius Tullius, it is plain that the mother of the future King of Rome was both a slave and a priestess of Vesta. Orthodox Roman tradition always admitted that she was a Vestal, but naturally enough represented her as the king's daughter rather than his slave. The god Mars, it was said, got her with child as she drew water in his sacred grove. However, when we compare this legend with the similar story of the birth of Servius, we may suspect that Promathion has preserved, though perhaps in a perverted form, an old feature of the Latin kingship, namely, that one of the king's parents might be, and sometimes was, a slave. Whether that was so or not, such tales at least bear witness to an old belief that the early Roman kings were born of virgins and of the fire. Similarly Caeculus, the founder of Praeneste, passed for a son of Vulcan. It was said that his mother conceived him through a spark, which leapt from the fire and struck her as she sat by the hearth. She exposed the child near a temple of Jupiter, and he was found there beside a fire by some maidens who were going to draw water. In after-life he proved his divine birth by working an appropriate miracle. When an infidel crowd refused to believe that he was the son of a god, he prayed to his father, and immediately the unbelievers were surrounded with a flame of fire. More than this, the whole of the Alban dynasty appear to have traced their descent from a Vestal, for the wife of King Latinus, their legendary ancestor, was named

Amata or Beloved, and this was the regular title bestowed on a Vestal after her election, a title which cannot be fully understood except in the light of the foregoing traditions, which seem to shew that the Vestals were regularly supposed to be beloved by the fire-god. Moreover, fire is said to have played round the head of Amata's daughter Lavinia, just as it played round the head of the fire-born Servius Tullius. As the same prodigy was reported of Julius or Ascanius, the son of Aeneas, we may suspect that a similar legend was told of his miraculous conception at the hearth.

Now we may take it as certain that the Romans and Latins would never have traced the descent of their kings from Vestal Virgins unless they had thought that such a descent, far from being a stain, was, under certain circumstances, highly honourable. What the circumstances were that permitted a Vestal to become a mother, not only with impunity but with honour and glory, appear plainly from the stories of the birth of Caeculus, Romulus, and Servius Tullius. If she might not know a mortal man, she was quite free, and indeed was encouraged, to conceive and bear a son to the fire-god. In fact the legends suggest that the Vestals were regularly regarded as the fire-god's wives. This would explain why they were bound to chastity during their term of service: the bride must be true to her divine bridegroom. And the theory of chastity could be easily reconciled with the practice of maternity by allowing a man to masquerade as the fire-god at a sacred marriage, just as in Egypt the king disguised himself as the god Ammon when he wedded the queen, or as among the Ewe tribes the priest poses as the python-god when he goes in to the human brides of the serpent. Thus the doctrine of the divine birth of kings presents no serious difficulty to people who believe that a god may be made flesh in a man, and that a virgin may conceive and bear him a son. Of course the theory of the divine motherhood of the Vestals applies only to the early regal and therefore prehistoric period. Under the Republic the demand for kings had ceased, and with it, therefore, the supply. Yet a trace of the old view of the Vestals as virgin mothers lingered down to the latest times in the character of Vesta herself, their patroness and type; for Vesta always bore the official title of Mother, never that of Virgin. We may surmise that a similar belief and practice once obtained in Attica. For Erichthonius, king of Athens, is said to have been a son of the fire-god Hephaestus by the virgin goddess Athena: the story told of his miraculous birth from the ground, which had been impregnated by the seed of the fire-god, is clearly a later version devised to save the virginity of his mother. The perpetual lamp of Athena, which burned in the Erechtheum or house of Erechtheus (who was identical with Erichthonius) on the acropolis of Athens, may have answered to the perpetual fire of Vesta at Rome; and it is possible that the maidens called *Arrephoroi* or *Errephoroi*, who dwelt close to the Erechtheum, may at one time have personated Athena and passed, like the Vestals, for wives of the fire-god.

It has, indeed, been held that the Vestals were of old the king's daughters, who were kept at home and forbidden to marry for no other reason than that they might devote themselves to the domestic duties of drawing water, mopping the house, tending the fire, and baking cakes. But this rationalistic theory could hardly explain the superstitious horror which the infidelity of a Vestal always excited in the Roman mind. Customs which begin in reason seldom end in superstition. It is likely, therefore, that the rule of chastity imposed on the Vestals was based from the first on a superstition rather than on a mere consideration of practical convenience. The belief that the Vestals were the spouses of the fire-god would explain the rule. We have seen that the practice of marrying women to gods has been by no means uncommon. If the spirit of the water has his human wife, why not the spirit of the fire? Indeed, primitive man has a special reason for thinking that the fire-god should always be married. What that reason is, I will now try to explain.

But first it is necessary to apprehend clearly that the Vestal fire of republican and imperial Rome was strictly the successor or continuation of the fire which in the regal period had burned on the king's hearth. That it was so appears plainly from the stories of the birth of Romulus and Servius Tullius, which shew that Vesta was believed to be worshipped at the royal fireside by maidens who were either the king's daughters or his slaves. This conclusion is amply confirmed by a study of the temple of Vesta and the adjoining edifices in the Roman Forum. For the so-called temple of the goddess never was, strictly speaking, a temple at all. This fact we have on the authority of Varro himself, the greatest of Roman antiquaries. The little round building in which the sacred fire always burned was merely a copy of the round hut in which the king, like his subjects, had dwelt in days of old. Tradition preserved a memory of the time when its walls were made of wattled osiers and the roof was of thatch; indeed, with that peculiar clinging to the forms of the past which is characteristic of royalty and religion, the inmost shrine continued down even to late times to be fashioned of the same simple materials. The hut of Romulus, or what passed for it, constructed of wood, reeds, and straw, was always preserved and carefully repaired in the original style. It stood on the side of the Palatine hill facing the Circus Maximus. A similar hut, roofed with thatch, was in like manner maintained on the Capitoline hill, and traditionally associated with Romulus. The so-called temple of Vesta in historical times stood not on any of the hills, but in the Forum, at the northern foot of the Palatine. Its situation in the flat ground is quite consistent with the view that the building represents the king's house of early, though not of the very earliest, times; for, according to tradition, it was built by Numa in this position between the Palatine and the Capitol, at the time when he united the two separate towns on these hills and turned the low swampy ground between them into their common place of assembly. Here, too, beside the temple of Vesta, the king built himself a house, which was ever afterwards known as the Regia or palace; formerly he had dwelt on the Quirinal. In after-times this old palace of the kings was perhaps the official residence of their successor, the King of the Sacred Rites. Adjoining it was the house of the Vestals, at first, no doubt, a simple and unpretentious edifice, but afterwards a stately pile gathered round a spacious open court which must have resembled the cloister of a mediaeval monastery. We may assume that the kernel of this group of buildings was the round temple of Vesta, and that the hearth in it, on which burned the sacred fire, was originally the hearth of the king's house. That the so-called temple was built on the model of the round huts of the old Latins is proved by the discoveries made at an ancient necropolis near Albano. The ashes of the dead were here deposited in urns, which are shaped like little round huts with conical roofs, obviously in order that the souls of the dead might live in houses such as they had inhabited during life. The roofs of these miniature dwellings are raised on cross-beams, sometimes with one or more holes to let out the smoke. The door is fastened by a crossbar, which is passed through a ring on the outside and tied to the two side-posts. In some of these hut-urns the side-posts are duplicated, or even triplicated, for the sake of ornament; and it is probable that the ring of columns which encircled the little temple of Vesta in historical times was merely an extension of the door-posts of the prehistoric hut. The necropolis in which these urns were found must be very ancient, since it was buried under the streams of lava vomited by the Alban Mountain in eruption. But the mountain has not been an active volcano within historical times, unless, indeed, the showers of stones and the rain of blood often recorded as ominous prodigies by Roman writers may be explained as jets of pumice and red volcanic dust discharged by one of the craters. The prehistoric burial-ground lately discovered in the Roman Forum has yielded several hut-urns of precisely the same shape as those of the Alban cemetery. Hence we may infer with tolerable certainty that the earliest Latin settlers both on the Alban hills and at Rome dwelt in round huts built of wattle and dab, with peaked roofs of thatch.

If further evidence were needed to convince us that the round temple of Vesta merely reproduced a Roman house of the olden time, it might be supplied by the primitive vessels of coarse earthenware in which the Vestals always presented their offerings, and which, in memory of the artlessness of an earlier age, went by the name of "Numa's crockery." A Greek historian, writing when Rome was at the height of her power and glory under Augustus, praises the Romans for the austere simplicity with which, in an age of vulgar wealth and ostentation, they continued to honour the gods of their fathers. "I have seen," said he, "meals set before the gods on old-fashioned wooden tables, in mats and earthenware dishes, the food consisting of barley loaves and cakes and spelt and firstfruits and such-like things, all plain and inexpensive and free from any touch of vulgarity. And I have seen libations offered, not in vessels of silver and gold, but in little earthen cups and jugs; and I heartily admired a people which thus walked in the ways of their fathers, not deviating from the ancient rites into extravagance and display." Specimens of this antique pottery have come to light of late years at the house of the Vestals, the temple of Vesta, and other religious centres in the Forum; others had been found previously on the Esquiline hill and in the necropolis of Alba Longa. We may conjecture that if the Romans continued to serve the gods their meals in simple earthenware dishes long after they themselves quaffed their wine from goblets of crystal and gold or from murrhine cups with their cloudy iridescent hues of purple and white, they did so, not from any principle of severe good taste, but rather from that superstitious fear of innovation which has embalmed in religious ritual, as in amber, so many curious relics of the past. The old forms and materials of the vessels were consecrated by immemorial usage and might not be changed with impunity. Indeed, in the ritual of the Arval Brothers the holy pots themselves appear to have been an object of worship. Specimens of these pots have been found on the site of the sacred grove where the Brothers performed their quaint service, and they shed an interesting light on the conservatism of the Roman religion. Some of them are moulded in the most primitive fashion by the hand without any mechanical appliance. But most of them belong to a stage of art, later indeed than this rude beginning, yet earlier than the invention of the potter's wheel. In order to give the vessels their proper shape and prevent the sides from collapsing, wooden hoops were inserted in them, and the marks made by these hoops in the soft clay may still be seen on the inside of most of the pots found in the grove. We may suppose that when the potter's wheel came into universal use, the old art of making pottery by the hand was lost; but as religion would have nothing to do with pots made in the new-fangled way, the pious workman had to imitate the ancient ware as well as he could, eking out his imperfect skill with the aid of wooden hoops. Perhaps the *fictores Vestalium* and the *fictores Pontificum*, of whom we read in inscriptions, were those potters who, combining a retrograde art with sound religious principles, provided the Vestals and Pontiffs with the coarse crockery so dear to gods and to antiquaries. If that was so, they may have had in the exercise of their craft to observe some such curious rules as are still observed in similar circumstances by the savage Yuracares, a tribe of Indians living dispersed in the depths of beautiful tropical forests, at the eastern foot of the Bolivian Andes. We are told by an explorer that "the manufacture of pottery is not an everyday affair with this superstitious people, and accordingly they surround it with singular precautions. The women, who alone are entrusted with the duty, go away very solemnly to look for the clay, but they do so only when there is no crop to be gathered. In the fear of thunder they betake themselves to the most sequestered spots of the forest in order not to be seen. There they build a hut. While they are at work they observe certain ceremonies and never open their mouth, speaking to each other by signs, being persuaded that one word spoken would infallibly cause all their pots to break in the firing; and they do not go near their husbands, for if they did, all the sick people would die." Among the Ba-Ronga of South Africa pottery is made by women only, and they prefer to employ a child under puberty to light the fire in which the pots are to be

baked, because the child has pure hands and the pots are therefore less likely to crack in the furnace than if the woman lit the fire herself. If the reader objects that Roman potters cannot have been trammelled by superstitions like those which hamper the savage potters of America and Africa, I would remind him of the rules laid down by grave Roman writers for the moral guidance of cooks, bakers, and butlers. After mentioning a number of these writers by name, Columella informs us that "all of them are of opinion that he who engages in any one of these occupations is bound to be chaste and continent, since everything depends on taking care that neither the dishes nor the food should be handled by any one above the age of puberty, or at least by any one who is not exceedingly abstemious in sexual matters. Therefore a man or woman who is sexually unclean ought to wash in a river or running water before he touches the contents of the storeroom. That is why there should be a boy or a maid to fetch from the storeroom the things that are needed." When Roman cooks, bakers, and butlers were expected to be so strict in the service of their human masters, it might naturally be thought that the potters should be not less so whose business it was to fashion the rude yet precious vessels meet for the worship of the gods.

If the storeroom (*penus*) of a Roman house was deemed so holy that its contents could only be handled by persons ceremonially clean, the reason was that the Penates or gods of the storeroom dwelt in it. The domestic hearth, where the household meals were cooked in the simple days of old, was the natural altar of the Penates; their images, together with those of the Lares, stood by it and shone in the cheerful glow of the fire, when the family gathered round it in the evening. Thus in every house Vesta, the goddess of the hearth, was intimately bound up with the Penates or gods of the storeroom; indeed, she was reckoned one of them. Now the temple of Vesta, being nothing more than a type of the oldest form of Roman house, naturally had, like an ordinary house, its sacred storeroom, and its Penates or gods of the storeroom. Hence if in every common house strict chastity was, theoretically at least, expected of all who entered the storeroom, we can well understand why such an obligation should have been laid on the Vestals, who had in their charge the holiest of all storerooms, the chamber in which were popularly supposed to be preserved the talismans on which the safety of the state depended.

Thus on the whole we may regard it as highly probable that the round temple of Vesta in the Forum, with its sacred storeroom and perpetual fire, was merely a survival, under changed conditions, of the old house of the Roman kings, which again may have been a copy of the still older house of the kings of Alba. Both were modelled on the round huts of wattled osiers in which the early Latins dwelt among the woods and hills of Latium in the days when the Alban Mountain was still an active volcano. Hence it is legitimate to compare the old legends of the royal hearth with the later practice in regard to the hearth of Vesta, and from the comparison to explain, if we can, the meaning both of the legends and of the practice.

XV. The Fire-Drill

In historical times, whenever the Vestal fire at Rome happened to be extinguished, the virgins were beaten by the pontiff; after which it was their custom, apparently with the aid of the pontiff, to rekindle the fire by drilling a hole in a board of lucky wood till a flame was elicited by friction. The new fire thus obtained was carried into the temple of Vesta by one of the virgins in a bronze sieve. As this mode of producing fire is one of the most primitive known to man, and has been commonly employed by many savage tribes down to modern times, we need have no difficulty in believing that its use in the worship of Vesta was a survival from prehistoric ages, and that whenever the fire on the hearth of the Latin kings went out it was regularly relit in the same fashion. In its simplest form the fire-drill, as the apparatus has been appropriately named by Professor E. B. Tylor, consists of two sticks, the one furnished with a point and the other with a hole. The point of the one stick is inserted into the hole of the other, which is laid flat on the ground, while the operator holds the pointed stick upright in position and twirls it rapidly between his hands till the rubbing of the two sticks against each other produces sparks and at last a flame.

Many savages see in this operation a resemblance to the union of the sexes, and have accordingly named the pointed stick the man and the holed stick the woman. Thus we are told that among the Thompson Indians of British Columbia "fire was obtained by means of the fire-drill, which consisted of two dried sticks, each over a foot in length, and rounded off to less than an inch in diameter. One stick was sharpened at one end; while the other was marked with a couple of notches close to each other—one on the side, and the other on top. The sharpened end of the first stick was placed in the top notch of the other stick, and turned rapidly between the straightened palms of both hands. The heat thus produced by the friction of the sticks caused sparks to fall down the side notch upon tinder placed underneath, which, when it commenced to smoke, was taken in the hands, and blown upon until fanned into a flame. The tinder was dry grass, the shredded dry bark of the sagebrush, or cedar-bark. The sharpened stick was called the 'man,' and was made of black-pine root, tops of young yellow pine, heart of yellow-pine cones, service-berry wood, etc. The notched stick was called the 'woman,' and was generally made of poplar-root. However, many kinds of wood were used for this purpose. When hot ashes or a spark fell upon the tinder, they said, 'The woman has given birth.'" The Hopi Indians kindle fire ceremonially by the friction of two sticks, which are regarded respectively as male and female. The female stick has a notch in it and is laid flat on the floor; the point of the male stick is inserted in the notch of the female stick and is made to revolve rapidly by twirling the stick between the hands. Pollen is added as a male symbol, and the spark is caught in a tinder of shredded cedar bark. The Urabunna tribe of Central Australia, who also make fire by means of the fire-drill, call the upright piece "the child-stick," while they give to the horizontal or notched piece the name of "the mother-stick" or "the mother of the fire." So in the Murray Islands, Torres Straits, the upright stick is called the child (*werem*), and the horizontal stick the mother (*apu*). In Mabuiag, Torres Straits, on the other hand, the vertical stick is known as the male organ (*ini*), and the horizontal stick as the hole (*sakai*).

"The ancient Bedouins kindled fire by means of the fire-drill, which was composed of a horizontal stick, the *zenda*, and an upright stick, the *zend*. The science of language furnishes us with many parallels for this mode of regarding the two parts as male and female; the two parts of the lock are distinguished in like manner; the spark is then the child, *tifl*; compare also our German *Schraubenmutter*, *Muttergewinde*. The sticks for making fire by friction are

not taken from the same tree; on the contrary, they choose one as hard and tough as possible, and the other soft, which allows the hard one to fit into it more easily and catches fire the quicker on account of its loose texture. The soft wood was naturally the horizontal stick, the *zenda*, which the Arabs made out of *Calotropis procera* ('*oshar*'), while for the upright stick they used a hard branch of *markh*."

The Ngumbu of South Cameroons, in West Africa, formerly made fire by rubbing two sticks against each other. Of the sticks the one, called the male *nschio*, was put into a hole of the other, which was called the female *nschio*. In East Africa the Masai men make fire by drilling a hole in a flat piece of wood with a hard pointed stick. They say that the hard pointed stick is a man and that the flat piece of wood is his wife. The former is cut from *Ficus sycomorus* and *Ekebergia sp.*, the latter from any fibrous tree, such as *Kigelia africana*, *Cordia ovalis*, or *Acacia albida*. The women get their fire from the one which has thus been kindled by the men. The Nandi similarly produce fire by rapidly drilling a hard pointed stick into a small hole in a flat piece of soft wood. The hard stick is called the male (*kirkit*) and the piece of soft wood the female (*kôket*). Among the Nandi, as apparently among the Masai, fire-making is an exclusive privilege of the men of the tribe. The Baganda of Central Africa also made fire by means of the fire-drill; they called the upright stick the male, and the horizontal stick the female. Among the Bantu tribes of south-eastern Africa, "when the native Africans use special fire, either in connection with sacrifice or the festival of first-fruits, it is produced by a doctor, and in the following manner:—Two sticks, made of the *Uzwati* tree, and called the 'husband and wife,' are given to him by the chief. These sticks are prepared by the magicians, and are the exclusive property of the chief, the 'wife' being the shorter of the two. The doctor cuts a piece off each stick, and proceeds to kindle fire in the usual manner, by revolving the one rapidly between the palms of his hands, while its end rests in a small hollow dug in the side of the other. After he has obtained fire, he gives it to his attendant, who gets the pots in order, and everything ready for cooking the newly-reaped fruits. The sticks are handed back to the chief by the doctor—no other hand must touch them—and put away till they are required next season. They are regarded as in a measure sacred, and no one, except the chief's personal servant, may go to the side of the hut where they are kept. After being repeatedly used for fire-making, the doctor disposes of what remains, and new ones are made and consecrated by the magician. A special pot is used for the preparation of the feast, and no other than it may be set on a fire produced from the 'husband and wife.' When the feast is over, the fire is carefully extinguished, and the pot placed along with the sticks, where it remains untouched for another year." But even for the purposes of daily life these tribes still kindle fire in this manner, if they happen to be without matches. "A native takes two special sticks, made of a light wood. One of these he points: this is called the male stick. He then makes a conical hole in the centre of the other stick, which is called the female. Placing the female stick on the ground, he holds it firmly by his feet—a native finds no difficulty in this, as he can easily pick things off the ground with his toes if his hands are full. He then places the pointed stick into the conical hole, and slowly twirls the male stick between his hands. He does this while using a good deal of pressure, and the wood becomes powdered, lying round the revolving point in a little heap of dust. When he thinks he has made sufficient of the wood dust, he twirls the stick very fast, and in a moment the powder bursts into flame, which he uses to set fire to some dried grass."

The Damaras or Herero of Damaraland, in south-western Africa, maintain sacred fires in their villages, and their customs and beliefs in this respect present a close resemblance to the Roman worship of Vesta. Fortunately the Herero fire-worship has been described by a number of independent witnesses, and as their accounts agree substantially with each other, we may assume that they are correct. The people are a tall, finely-built race of nomadic

herdsmen belonging to the Bantu stock, who seem to have migrated into their present country from the north and east about a hundred and fifty or two hundred years ago. The desert character of the country and its seclusion from the outer world long combined to preserve the primitive manners of the inhabitants. In their native state the Herero are a purely pastoral people, possessing immense herds of cattle and flocks of sheep and goats, which are the pride and joy of their hearts, almost their idols. They subsist chiefly on the milk of their herds, which they commonly drink sour. Of the flesh they make but little use, for they seldom kill any of their cattle, and never a cow, a calf, or a lamb. Even oxen and weathers are only slaughtered on solemn and festal occasions, such as visits, burials, and the like. Such slaughter is a great event in a village, and young and old flock from far and near to partake of the meat. Their huts are of a round beehive shape, about ten feet in diameter. The framework consists of stout branches, of which the lower ends are rammed into the ground, while the upper ends are bent together and tied with bark. A village is composed of a number of these round huts arranged in a circle about the calves' pen as a centre and surrounded by an artificial hedge of thorn-bushes. At night the cattle are driven in through the hedge and take up their quarters in the open space round the calves' pen.

The hut of the great or principal wife of the chief, built and furnished in a more elaborate style than the rest, regularly stands to the east of the calves' pen, in the direction of sunrise, so that from its position we can always learn approximately the season of the year when the village was founded. The chief or headman of the village has no special hut of his own; he passes the day in the hut of the great wife, and the night commonly in one of the huts of his other wives in the northern semicircle. Between the house of the great wife and the calves' pen, but somewhat nearer to the pen, is a large heap of ashes on which, in good weather, a small, faintly glimmering fire may be seen to burn at any time of the day. The heap of ashes is the sacred hearth (*okuruo*); the fire is the holy fire (*omurangere* or *omurangerero*) of the village. The open space between the sacred hearth and the house of the great wife is known as the holy ground or the holy house (*otyizero*). Betwixt the hearth and the calves' fold stands a great withered branch of the *omumborombonga* (*Combretum primigenum*), the sacred tree of the Herero, from which they believe that both they and their cattle are descended. When a branch of this tree cannot be obtained its place is taken by a bough of the *omwapu* tree (*Grevia spec.*) At night and in rainy weather the fire is transferred to the hut of the great wife, where it is carefully kept alight. According to another account, the fire is regularly preserved in the house, and a brand is only brought out into the open air when the cattle are being milked at morning and evening in order that in presence of the fire the cow may be healthy and give much milk. The custom in this respect perhaps varies in different villages, and may be determined in some measure by the climate. The sacred fire is regarded as the centre of the village; from it at evening the people fetch a light to kindle the fire on their own hearths, for every householder has his own private hearth in front of his hut. At the holy hearth are kept the most sacred possessions of the tribe, to wit, the bundle of sticks which represent their ancestors; here sacrifices are offered and enchantments performed; here the flesh of the victims is cooked; here is the proper place of the chief; here the elders assemble in council, and judgment is given; here strangers are received and ambassadors entertained. At the banquets held on solemn occasions all may partake of the flesh, whether they be friends or foes; the stranger's curse would rest on the churl who should refuse him his just share; and this curse the Herero dreads above everything because he believes its effect to be infallible. So great is the veneration felt by the natives for the sacred hearth, with its hallowed bough, that they dare not approach it without testifying the deepest respect. They take off their sandals, throw themselves on the ground, and pray their great ancestor (*Tate Mukuru*) to be gracious to them. The horns of the oxen slaughtered at festivals lie beside the hearth; the

chief sits on the largest pair when he is engaged in performing his magical rites. Near the fire, too, is a stone on which none but the chief has the right to sit.

The duty of maintaining the sacred fire and preserving it from extinction is entrusted to the eldest unmarried daughter of the chief by his great wife; if he has no daughter, the task devolves on the unmarried girl who is next of kin to him. She bears the title of *ondangere*, derived from the name of the sacred fire (*omurangere*). Besides keeping up the fire she has other priestly functions to discharge. Before the men start on a dangerous expedition, she rubs the holy ashes on their foreheads. When a woman brings her new-born infant to the sacred hearth to receive its name, the maiden priestess or Vestal, as we may call her, sprinkles water on both mother and child. Every morning, when the cattle walk out of the fold, she besprinkles the fattest of them with a brush dipped in water. When an ox dies by accident at the village, she lays a piece of wood on its back, praying at the same time for long life, plenty of cattle, and so forth. Moreover, she ties a double knot in her apron for the dead beast, for a curse would follow if she neglected to do so. Lastly, when the site of the village is changed, the priestess walks at the head of the people and of the herds, carrying a firebrand from the old sacred hearth and taking the utmost care to keep it alight.

The chief or headman of the village is also the priest; he alone may perform religious ceremonies except such as fall within the province of the Vestal priestess, his daughter. In his capacity of priest he keeps the sacred bundle of sticks which represent the ancestors, and at sacrifices he offers meat to them that they may consecrate it. When the old village is abandoned, it is his duty to carry, like Aeneas quitting the ruins of Troy, these rude penates to the new home. However, it is deemed enough if he merely places the holy bundle on his back, and then hands it to a servant, who carries it for him. As a priest he introduces the newborn children to the spirits of the ancestors at the sacred hearth, and gives the infants their names; and as a priest he has a cow to himself, whose milk no one else may drink. This milk is kept in vessels which differ from the ordinary milk vessels, not only in shape and size, but also in being marked with the badge of his paternal clan. When a man goes forth from the village with his family and servants to herd the cattle on a distant pasture, or to found another village, he takes with him a burning brand from the sacred hearth wherewith to kindle the holy fire in his new home. By doing so he acknowledges himself the vassal of the chief from whose hearth he took the fire. In this way a single village may give out swarm after swarm, till it has become the metropolis or capital of a whole group of villages, the inhabitants of which recognise the supremacy of the parent community, and regard themselves as all sitting round its sacred fire. It is thus that a village may grow into a tribe and its headman into a powerful chief, who, by means of marriage alliances and the adhesion of weaker rivals, may extend his sway over alien communities, and so gradually acquire the rank and authority of a king. The political evolution of the Herero has indeed stopped short of this final stage; but among the more advanced branches of the Bantu race, such as the Zulus and the Matabeles, it is possible that the kingship has developed along these lines.

The possession of the sacred fire and of the ancestral sticks, carrying with it both political authority and priestly dignity, descends in the male line, and hence generally passes from father to son. In any case, whether the deceased had a son or not, the double office of chief and priest must always remain in his paternal clan (*oruzo*). If it should happen that the clan becomes extinct by his death, the sacred fire is put out, the hearth destroyed, no brand is taken from it, and the sticks representing the ancestors are laid with the dead man in the grave. But should there be an heir, as usually happens, he takes a fire-brand from the sacred hearth and departs with all the people to seek a new home, abandoning the old village for years. In time, however, they return to the spot, rebuild the huts on the same sites, and inhabit them again. But in the interval none of the kinsmen of the deceased may approach the

deserted village under pain of incurring the wrath of the ghost. When the return at last takes place, and the people have announced their arrival to the dead chief at his grave, which is generally in the cattle-pen, they make a new fire by the friction of the two sacred fire-sticks on the old hearth; for it is not lawful to bring with them a brand from their last settlement.

If the sacred fire should go out through the neglect of the priestess, a sudden shower of rain, or any other accident, the Herero deem it a very evil omen. The whole tribe is immediately summoned and large offerings of cattle are made as an expiation. Then the fire is relit by means of the friction of two sacred fire-sticks, which have been handed down from father to son. Every chief possesses such fire-sticks, and keeps them tied up with the bundle of holy sticks that represent the ancestors. One of the fire-sticks is pointed, the other has a hole in the middle, and sometimes also a notch cut round it. In the notch some fungus or rotten wood is placed as tinder. The holed stick is held fast on the ground by the knees of the operator, who inserts the point of the other stick in the hole and twirls it rapidly between the palms of his hands in the usual way. As soon as a spark is emitted it catches the tinder, which can then easily be blown up into a flame. Thus it is from the tinder, we are told, and not from the sticks, that the flame is elicited. In this fashion, if everything is very dry, as it generally is in Hereroland, the native gets fire in about a minute. The names applied to the two sticks indicate that the pointed stick (*ondume*) is regarded as male and the holed stick (*otyiya*) as female, and that the process of making fire by the friction of the two is compared to the intercourse of the sexes. As to the wood of which the fire-sticks are made accounts differ. According to Dr. H. Schinz the holed or female stick is of a soft wood, the pointed or male stick of a hard wood, generally of the sacred *omumborombonga* tree (*Combretum primigenum*). According to Mr. C. G. Büttner, neither of the sticks need be of a special tree, and any wood that happens to be at hand may be employed for the purpose; only the wood of the thorny acacias, which abound in the country, appears to be unsuitable. Probably the rule mentioned by Dr. Schinz is the original one, and if in some places the wood of the sacred tree has ceased to be used to light the holy fire, the reason may be simply that the tree does not grow there, and that accordingly the people are obliged to use such wood as they can find. We have seen that a branch of the sacred *omumborombonga* tree is regularly planted beside the village hearth, but that in default of it the people have to put up with a bough of another kind of tree, the *omuwapu* (*Grevia spec*). Such substitutions were especially apt to be forced on the Herero in the southern part of the country, where the *omumborombonga* tree is very rare and forests do not exist, the larger trees growing singly or in clumps. In the north, on the other hand, vegetation is much richer, and regular woods are to be found. Here, in particular, the *omumborombonga* tree is one of the ornaments of the landscape. It grows only beside water-courses, and generally stands solitary, surpassing a tall oak in height, and rivalling it in girth; indeed, so thick is the trunk that were it hollowed out a family could lodge in it. Unlike most trees in the country it is thornless. Whole forests of it grow to the eastward of Hereroland, in the direction of Lake Ngami. So close is the grain and so heavy the wood that some of the early explorers gave it the name of the "iron tree." Hence it is well adapted to form the upright stick of the fire-drill, for which a hard wood is required.

The Herero have a tradition that in the beginning they and their cattle and all four-footed beasts came forth from the *omumborombonga* tree in a single day, whereas birds, fish, and creeping things sprang from the rain. However, slightly different versions of the Herero genesis appear to be current. As to the origin of men and cattle from the tree, public opinion is unanimous; but some dissenters hold that sheep and perhaps goats, but certainly sheep, issued from a flat rock in the north of the country. For some time past, unfortunately, the tree has ceased to be prolific; it is of no use waiting beside it in the hope of capturing such oxen and sheep as it might bear. Yet still the Herero testify great respect for the tree which they

regard as their ancestor (*omukuru*). To injure it is deemed a sacrilege which the ancestor will punish sooner or later. In passing it they bow reverently and stick a bunch of green twigs or grass into the trunk or throw it down at the foot. They address the tree, saying, "*U-zero tate mukururume*, Thou art holy, grandfather!" and they even enter into conversation with it, giving the answers themselves in a changed voice. They hardly dare to sit down in its shadow. All this reverence they display for every tree of the species.

On the whole, then, we may infer that so long as the Herero dwelt in a land where their ancestral tree abounded, they made the male fire-stick from its wood; but that as they gradually migrated from a region of tropical rains and luxuriant forests to the arid mountains, open grass lands, and dry torrid climate of their present country, they had in some places to forgo its use and to take another tree in its stead. Similarly the Aryan invaders of Greece and Italy were obliged, under a southern sky, to seek substitutes for the sacred oak of their old northern home; and more and more, as time went on and the deciduous woods retreated up the mountain slopes, they found what they sought in the laurel, the olive, and the vine. Zeus himself had to put up with the white poplar at his great sanctuary of Olympia in the hot lowlands of Elis; and on summer days, when the light leaves of the poplar hardly stirred in the languid air and the buzz of the flies was more than usually exasperating, he perhaps looked wistfully away to the Arcadian mountains, looming blue in the distance through a haze of heat, and sighed for the shadow and the coolness of their oak woods.

Thus it appears that the sanctity ascribed by the Herero to the chief's fire springs from a custom of kindling it with the wood of their ancestral tree; in fact, the cult of the fire resolves itself into a form of ancestor-worship. For the religion of the Herero, like that of all Bantu peoples, is first and foremost a propitiation of the spirits of their forefathers conceived as powerful beings able and willing to harm them. From youth to death the Herero live in constant dread of their ancestors (*ovakuru*, plural of *omukuru*), who, sometimes seen and sometimes unseen, return to earth and play their descendants many a spiteful trick. They glide into the village, steal the milk, drive the cattle from the fold, and waylay women. More than that, they can inflict disease and death, decide the issue of war, and send or withhold rain at pleasure. They are the cause of every vexation and misfortune, and the whole aim of the living is by frequent sacrifices to mollify and appease the dead.

Now the sacred hearth seems to be in a special sense the seat of the worship paid to the ancestral spirits. Here the head of the family sits and communes with his forefather, giving himself the answers he thinks fit. Hither the newborn child is brought with its mother to be introduced to the spirits and to receive its name, and the chief, addressing his ancestors, announces, "To you a child is born in your village; may this village never come to an end!" Hither the bride is conducted at her marriage, and a sheep having been sacrificed, its flesh is placed on the holy bushes at the hearth. Hither the sick are carried to be commended to the care of their ghostly kinsmen, and as the sufferer is borne round and round the fire his friends chant:—

*"See, Father, we have come here,
With this sick man to you,
That he may soon recover."*

But the most tangible link between the worship of the fire and the worship of the dead is furnished by the sacred sticks representing the ancestors, which are kept in a bundle together with the two sticks used for kindling the fire by friction. Each of these rude idols or Lares, as we may call them, "symbolises a definite ancestor of the paternal clan, and, taken together, they may be regarded as the most sacred possession of a family. They stand in the closest relation to the holy hearth, or rather to the priestly dignity, and must therefore always remain

in the same paternal clan.” These sticks “are cut from trees or bushes which are dedicated to the ancestors, and they represent the ancestors at the sacrificial meals, for the cooked flesh of the victims is always set before them first. Many people always keep these sticks, tied up in a bundle with straps and hung with amulets, in the branches of the sacrificial bushes which stand on the sacred hearth (*okuruo*). The sacrificial bush serves to support the severed pieces of the victim, and thus in a measure represents an altar or table of sacrifice.” When after an absence of years the people return to a village where a chief died and was buried, a new fire is kindled by friction on the old hearth, the flesh of the first animal slaughtered here is cooked in a particular vessel, and the chief hands a portion of it to every person present. “An image, consisting of two pieces of wood, supposed to represent the household deity, or rather the deified parent, is then produced, and moistened in the platter of each individual. The chief then takes the image, and, after affixing a piece of meat to the upper end of it, he plants it in the ground, on the identical spot where his parent was accustomed to sacrifice. The first pail of milk produced from the cattle is also taken to the grave; a small quantity is poured on the ground, and a blessing asked on the remainder.” Each clan, the writer adds, has a particular tree or shrub consecrated to it, and of this tree or shrub the two sticks representing the deceased are made.

In these accounts the sacred sticks which stand for the ancestors, and to which the meat of sacrifices is first offered, are distinguished, expressly or implicitly, from the sacred sticks which are used to make the holy fire. Other writers, however, identify the two sets of sticks. Thus we are told that the Herero “make images of their ancestors as follows. They take the two sticks with which they make fire and tie them together with a fresh wisp of corn. Then they worship this object as their ancestor. They may approach it only on their knees. For hours together they sit before it and talk with it. If you ask them where they imagine their ancestors to be, since they cannot surely be these sticks, they answer that they do not know. The sticks are kept in the house of the great wife.” Again, another writer defines the *ondume* or male fire-stick as a “stick representing an *omukuru*, i.e. ancestor, deity, with which and the *otyiza* the holy fire is made.” Again, the Rev. G. Viehe, in describing the ceremonies observed at the return to a deserted village where an ancestor (*omukuru*) is buried, tells us that they bring no fire with them, “but holy fire must now be obtained from the *omukuru*. This is done with the *ondume* and the *otyiza*. The meaning of these two words plainly shows that the first represents the *omukuru*, and the other his wife.” The same excellent authority defines the *ozondume* as “sticks which represent the *ovakuru*, i.e. ancestors, deities”; and *ozondume* is simply the plural of *ondume*, the male fire-stick. Hence it appears highly probable that the sticks representing the ancestors are, in fact, nothing but the male fire-sticks, each of which was cut to make a new fire on the return to the old village after a chief's death. The stick would be an appropriate emblem of the deceased, who had been in his lifetime the owner of the sacred fire, and who now after his death bestowed it on his descendants by means of the friction of his wooden image. And the symbolism will appear all the more natural when we remember that the male fire-stick is generally made from the ancestral tree, that the process of fire-making is regarded by the Herero as the begetting of a child, and that their name for the stick, according to the most probable etymology, signifies “the begetter.” Such sticks would be far too sacred to be thrown away when they had served their immediate purpose of kindling a new fire, and thus in time a whole bundle of them would accumulate, each of them recalling, and in a sense representing, one of the great forefathers of the tribe. When the old sticks had ceased to be used as fire-lighters, and were preserved merely as memorials of the dead, it is not surprising that their original function should be overlooked by some European observers, who have thus been led to distinguish them from the sticks by which the fire is actually produced at the present day. Koryaks of north-eastern Asia, when the sacred fire-boards, roughly carved in

human form, are so full of holes that they can no longer be used for the purpose of kindling fire, they are still kept as holy relics in a shrine near the door of the house; and a stranger who observed the respect with which they are treated, but who did not know their history, might well mistake them for figures of worshipful ancestors and never guess the practical purpose which they once served as fire-lighters. A Koryak family regards its sacred fire-board not only as the deity of the household fire, the guardian of the family hearth, but also as the guardian of the reindeer, and they call it the "master of the herd." It is supposed to protect the reindeer from wolves and from sickness and to prevent the animals from straying away and being lost. When a reindeer is slaughtered, the sacred fire-board is taken out and smeared with the blood. The maritime Koryaks, who do not live by reindeer, regard the sacred fire-board as the master of the underground house and the helper in the hunt of sea-mammals. They call it "father" and feed it from time to time with fat, which they smear on its mouth. Among the neighbouring Chuckchees in the north-eastern extremity of Asia similar ideas and customs obtain in respect of the fire-boards. These are roughly carved in human form and personified, almost deified, as the supernatural guardians of the reindeer. The holes made by drilling in the board are deemed the eyes of the figure and the squeaking noise produced by the friction of the fire-drill in the hole is thought to be its voice. At every sacrifice the mouth of the figure is greased with tallow or with the marrow of bones. When a new fire-board is made, it is consecrated by being smeared with the blood of a slaughtered reindeer, and the owner says, "Enough! Take up your abode here!" Then the other fire-boards are brought to the same place and set side by side on the ground. The owner says, "Ho! these are your companions. See that I always find easily every kind of game!" Next he slaughters another reindeer and says, "Hi! Since you are one of my young men, go and drive the herd hither!" Then after a pause he asks the fire-board, "Have you brought it?" to which in the name of the fire-board he answers, "I have." Thereupon, speaking in his own person, he says, "Then catch some reindeer! It seems that you will keep a good watch over the herd. There, from the actual chief of the fire-boards, you may learn wisdom." These sacred fire-boards are often handed down from generation to generation as family heir-looms. During the calving-season they are taken from their bag and placed behind the frame in the outer tent in order that they may protect the dams.

These Koryak and Chuckchee customs illustrate the evolution of a fire-god into the patron deity of a family and his representation in human form by the board which is used in fire-making. As the fire-board is that part of the kindling apparatus which is commonly regarded as female in contradistinction to the drill, which is regarded as male, we can easily understand why the deity of the fire should sometimes, as at Rome, be conceived as a goddess rather than as a god; whereas if the drill itself were viewed as the essential part of the apparatus we should expect to find a fire-god and not a fire-goddess.

XVI. Father Jove And Mother Vesta

The reader may remember that the preceding account of the fire-customs of the Herero was introduced for the sake of comparison with the Latin worship of Vesta. The points of similarity between the two will now be indicated. In the first place we have seen reason to hold that the ever-burning Vestal fire at Rome was merely a survival of the fire on the king's hearth. So among the Herero the sacred fire of the village is the chief's fire, which is kept burning or smouldering in his house by day and by night. In Rome, as in Hereroland, the extinction of the fire was regarded as an evil omen, which had to be expiated by sacrifices, and new fire was procured in primitive fashion by twirling the point of one stick in the hole of another. The Roman fire was fed with the wood of the sacred oak tree, just as the African fire is kindled with the wood of the sacred *omumborombonga* tree. Beside both were kept the images of the ancestors, the Lares at Rome, the *ozondume* in Hereroland. The king's house which sheltered the fire and the images was originally in Italy what the chief's hut still is in Hereroland, a circular hut of osiers, not as ancient dreamers thought, because the earth is round, nor yet because a circle is the symbol of rest, but simply because it is both easier and cheaper to build a round hut than a square.

Further, in Rome the sacred fire was tended, as it still is in Hereroland, by unmarried women, and as the Herero priestesses are the chiefs daughters, so, we may conjecture, it was with some at least of the Vestals among the ancient Latins. The Roman Vestals appear to have been under the *patria potestas* of the king, and, in republican times, of the Pontifex Maximus, who succeeded to some of the king's functions. But if they were under the *patria potestas* of the king, they must have been either his wives or daughters; as virgins they cannot have been his wives; it remains, therefore, that they were his daughters. Various circumstances confirm this view. Their house at Rome, as we saw, always adjoined the Regia, the old palace of the kings; they were treated with marks of respect usually accorded to royalty; and the most famous of all the Vestals, the mother of Romulus, was said to be a daughter of the King of Alba. The custom of putting an unfaithful Vestal to death by immuring her in a subterranean chamber may have been adopted in order to avoid the necessity of taking the life of a princess by violence; for, as we shall learn later on, there is a very widespread reluctance to spill royal blood.

Amongst the Herero the chief's daughter who tends the holy fire has also to perform certain priestly rites, which have for their object the prosperity and multiplication of the cattle. So, too, it was with the Roman Vestals. On the fifteenth of April every year pregnant cows were sacrificed to the Earth goddess; the unborn calves were torn from their mothers' wombs, the chief Vestal burned them and kept their ashes for use at the shepherds' festival of the Parilia. This sacrifice of pregnant cows was a fertility charm designed, by a curious application of homoeopathic magic, to quicken both the seed in the ground and the wombs of the cows and the ewes. At the Parilia, held on the twenty-first of April, the Vestals mixed the ashes of the unborn calves with the blood of a horse which had been sacrificed in October, and this mixture they distributed to shepherds, who fumigated their flocks with it as a means of ensuring their fecundity and a plentiful supply of milk.

Strange as at first it may seem to find holy virgins assisting in operations intended to promote the fertility of the earth and of cattle, this reproductive function accords perfectly with the view that they were of old the wives of the fire-god and the mothers of kings. On that view, also, we can understand why down to imperial times the Vestals adored the male emblem of generation, and why Vesta herself, the goddess of whom they were the priestesses and

probably the embodiments, was worshipped by the Romans not as a virgin but as a mother. She was sometimes identified with Venus. Like Diana, with whom she was identified at Nemi, she appears to have been a goddess of fecundity, who bestowed offspring both on cattle and on women. That she was supposed to multiply cattle is indicated by the ceremonies which the Vestals performed in April; that she made women to be mothers is hinted at not obscurely by the legends of the birth of the old Latin kings. The ancient Aryan practice of leading a bride thrice round the hearth of her new home may have been intended not merely to introduce her to the ancestral spirits who had their seats there, but also to promote conception, perhaps by allowing one of these very spirits to enter into her and be born again. When the ancient Hindoo bridegroom led his bride round the fire, he addressed the fire-god Agni with the words, "Mayst thou give back, Agni, to the husband the wife together with offspring." When a Slavonian bride enters her husband's house after marriage she is led thrice round the hearth; then she must stir the fire with the poker, saying, "As many sparks spring up, so many cattle, so many male children shall enliven the new home." At Mostar, in Herzegovina, the bride seats herself on a bag of fruit beside the hearth in her new home and pokes the fire thrice. While she does so, they bring her a small boy and set him on her lap. She turns the child thrice round in order that she may give birth to male children. Still more clearly does belief in the impregnation of a woman by fire come out in another South Slavonian custom. When a wife wishes to have a child, she will hold a vessel full of water beside the fire on the hearth, while her husband knocks two burning brands together so that the sparks fly out. When some of them have fallen into the vessel, the woman drinks the water which has thus been fertilised by the fire. The same belief seems still to linger in England; for there is a Lincolnshire saying that if a woman's apron is burned above the knee by a spark or red-hot cinder flying out of a fire, she will become a mother. Thus the superstition which gave rise to the stories of the birth of the old Roman kings holds its ground to this day in Europe, even in our own country. So indestructible are the crude fancies of our savage forefathers. Thus we may safely infer that the old practice of leading a bride formally to or round the hearth was designed to make her fruitful through the generative virtue ascribed to the fire. The custom is not confined to peoples of the Aryan stock, for it is observed also by the Esthonians and the Wotyaks of Russia and, as we have seen, by the Herero of South Africa. It expresses in daily life the same idea which is embodied in the myths of the birth of Servius Tullius and the other Latin kings, whose virgin mothers conceived through contact with a spark or tongue of fire.

Accordingly, where beliefs and customs of this sort have prevailed, it is easy to understand why new-born children should be brought to the hearth, and why their birth should there be solemnly announced to the ancestors. This is done by the Herero, and in like manner on the fifth or seventh day after a birth the ancient Greeks used to run naked round the hearth with the new-born babe in their arms. This Greek ceremony may perhaps be regarded as merely a purification, in other words as a means of keeping at bay the demons who lie in wait for infants. Certainly in other parts of the world a custom has prevailed of passing a newly born child backwards and forwards through the smoke of the fire for the express purpose of warding off evil spirits or other baleful influences. Yet on the analogy of the preceding customs we may conjecture that a practice of solemnly bringing infants to the domestic hearth has also been resorted to as a mode of introducing them to the spirits of their fathers. In Russia the old belief that the souls of the ancestors were somehow in the fire on the hearth has left traces of itself down to the present time. Thus in the Nijegorod Government it is still forbidden to break up the smouldering faggots in a stove, because to do so might cause the ancestors to fall through into hell. And when a Russian family moves from one house to another, the fire is raked out of the old stove into a jar and solemnly conveyed to the new one, where it is received with the words, "Welcome, grandfather, to the new home!"

But why, it may be asked, should a procreative virtue be attributed to the fire, which at first sight appears to be a purely destructive agent? and why in particular should the ancestral spirits be conceived as present in it? Two different reasons perhaps led savage philosophers to these conclusions. In the first place the common mode of making fire by means of the fire-drill has suggested, as we have seen, to many savages the notion that fire is the child of the fire-sticks, in other words that the rubbing of the fire-sticks together is a sexual union which begets offspring in the shape of a flame. This of itself suffices to impress on the mind of a savage the idea that a capacity of reproduction is innate in the fire, and consequently that a woman may conceive by contact with it. Strictly speaking, he ought perhaps to refer this power of reproduction not to the fire but to the fire-sticks; but savage thought is in general too vague to distinguish clearly between cause and effect. If he thinks the matter out, as he may do if he is more than usually reflective, the savage will probably conclude that fire exists unseen in all wood, and is only elicited from it by friction, so that the spark or flame is the child, not so much of the fire-sticks, as of the parent fires in them. But this refinement of thought may well be above the reach even of a savage philosopher. The second reason which seems to have led early man to associate the fire with the souls of his ancestors was a superstitious veneration for the ancestral tree which furnished either the fuel for the sacred fire or the material out of which he carved one or both of the fire-sticks. Among the Herero, as we saw, the male fire-stick commonly is, or used to be, made out of the holy *omumborombonga* tree, from which they believe that they and their cattle sprang in days of old. Hence nothing could be more natural than that they should regard the fire produced by the friction of a piece of the ancestral tree, as akin to themselves, the offspring of the same mighty forefather, to wit, the sacred tree. Similarly, the Vestal fire at Rome was fed with the wood of the oak, the sacred tree of Jupiter, and the first Romans are described as “born of the tree trunks and the heart of oak.” No wonder, then, that the Latin kings, who claimed to represent Jupiter, and in that capacity masqueraded in his costume and made mock thunder, should have prided themselves on being sprung from a fire which was fed with the wood of the god’s holy tree; such an origin was only another form of descent from the oak and from the god of the oak, Jupiter himself.

The theory that impregnation by fire is really impregnation by the wood of the tree with which the fire is kindled, derives some confirmation from a custom which is observed at marriage by some of the Esthonians in the neighbourhood of Oberpahlen. The bride is escorted to a tree, which is thereupon cut down and burned. When the fire blazes up, she is led thrice round it and placed between three armed men, who clash their swords over her head, while the women sing a song. Then some coins are thrown into the fire, and when it has died out they are recovered and knocked into the stump of the tree, which was cut down to serve as fuel. This is clearly a mode of rewarding, first the fire, and next the tree, for some benefit they have conferred on the bride. But in early society husband and wife desire nothing so much as offspring; this therefore may very well be the benefit for which the Esthonian bride repays the tree.

Thus far we have regarded mainly the paternal aspect of the fire, which the Latins mythically embodied in Jupiter, that is literally Father Jove, the god of the oak. The maternal aspect of the fire was for them represented by Mother Vesta, as they called her; and as the Roman king stood for Father Jove, so his wife or daughter—the practice on this point appears to have varied—stood for Mother Vesta. Sometimes, as we have seen, the Vestal virgins, the priestesses or rather incarnations of Vesta, appear to have been the daughters, not the wives, of the king. But, on the other hand, there are grounds for thinking that the wife of King Latinus, the legendary ancestor of the Latins, was traditionally regarded as a Vestal, and the analogy of the Flamen Dialis with his wife the Flaminica, as I shall shew presently, points

also to a married pair of priestly functionaries concerned with the kindling and maintenance of the sacred fire. However that may have been, we may take it as probable that the notion of the fire-mother was intimately associated with, if it did not spring directly from, the female fire-stick of the fire-drill, just as the conception of the fire-father was similarly bound up with the male fire-stick.

Further, it seems that these mythical beings, the fire-father and the fire-mother, were represented in real life by a priest and a priestess, who together made the sacred fire, the priest appropriately twirling the pointed male stick, while the priestess held fast on the ground the holed female stick, ready to blow up into a flame the spark which fell on the tinder. In the composite religion of Rome, formed like the Roman state by the fusion of several tribes, each with its own gods and priests, such pairs of fire-priests may at first have been duplicated. In one or more of the tribes which afterwards made up the Roman commonwealth the function of kindling the holy fire of oak was perhaps assigned to the Flamen Dialis and his wife the Flaminica, the living representatives of Jupiter and Juno; and if, as some scholars think, the name *flamen* comes from *flare*, "to blow up," the derivation would fit well with this theory. But in historical Rome the duty of making the sacred fire lay with the Vestal virgins and the chief pontiff. The mode in which they shared the work between them is not described by ancient writers, but we may suppose that one of the virgins held the board of lucky wood on the ground while the pontiff inserted the point of a peg into the hole of the board and made the peg revolve rapidly between the palms of his hands. When the likeness of this mode of producing fire to the intercourse of the sexes had once struck people, they would deem it unnatural, and even indecent, for a woman to usurp the man's function of twirling the pointed male stick. But the Vestals certainly helped to make fire by friction; it would seem, therefore, that the part they took in the process can only have been the one I have conjecturally assigned to them. At all events, the conjecture is supported by the following analogies.

The Djakuns, a wild tribe of the Malay Peninsula, are in the habit of making fire by friction. A traveller has described the custom as follows: "When a troop was on a journey and intended either to pitch a temporary camp, or to make a longer settlement, the first camp fire was kindled for good luck by an unmarried girl with the help of the fire-drill. Generally this girl was the daughter of the man who served the troop as leader. It was deemed of special importance that on the first night of a settlement the fire of every band should be lit by the unmarried daughter of a leader. But she might only discharge this duty if she had not her monthly sickness on her at the time. This custom is all the more remarkable inasmuch as the Djakuns in their migrations always carried a smouldering rope of bark with them." "When the fire was to be kindled, the girl took the piece of soft wood and held it on the ground, while her father, or any other married man, twirled the vertical borer upon it. She waited for the spark to spring from the wood, and fanned it into a flame either by blowing on it or by waving the piece of wood quickly about in her hand. For this purpose she caught the spark in a bundle of teased bark and exposed it to a draught of air." "Fire so produced was employed to kindle the other fires for that night. They ascribed to it good luck in cooking and a greater power of keeping off tigers and so forth, than if the first fire had been kindled by a spark from the smouldering bark rope." This account suggests a reason why a holy fire should be tended by a number of virgins: one or more of them might at any time be incapacitated by a natural infirmity for the discharge of the sacred duty.

Again, the Slavs of the Balkan Peninsula ascribe a healing or protective power to "living fire," and when an epidemic is raging in a village they will sometimes extinguish all the fires on the hearths and procure a "living fire" by the friction of wood. At the present day this is done by various mechanical devices, but the oldest method, now almost obsolete, is said to be

as follows:—A girl and a boy between the ages of eleven and fourteen, having been chosen to make the fire, are led into a dark room, where they must strip themselves of all their clothes without speaking a word. Then two perfectly dry cylindrical pieces of lime-wood are given them, which they must rub rapidly against each other, turn about, till they take fire. Tinder is then lit at the flame and used for the purpose of healing. This mode of kindling the “living fire” is still practised in the Schar Mountains of Old Servia. The writer who describes it witnessed some years ago the use of the sacred fire at the village of Setonje, at the foot of the Homolye Mountains, in the heart of the great Servian forest. But on that occasion the fire was made in the manner described, not by a boy and girl, but by an old woman and an old man. Every fire in the village had previously been extinguished, and was afterwards relit with the new fire.

Among the Kachins of Burma, when people take solemn possession of a new house, a new fire is made in front of it by a man and woman jointly. A dry piece of bamboo is pegged down on the ground; the two fire-makers sit down facing each other at either end of it, and together rub another piece of bamboo on the horizontal piece, one of them holding the wrists of the other and both pressing down firmly till fire is elicited.

In the first at least of these customs, it is plain, the conception of the fire-sticks as male and female has been logically carried out by requiring the male fire-stick to be worked by a man and the female fire-stick to be held by a woman. But opinions seem to differ on the question whether the fire-makers should be wedded or single. The Djakuns prefer that the man should be married and the woman unmarried; on the other hand, the Slavs of the Schar Mountains clearly think it better that both should be single, since they entrust the duty of making the fire to a boy and girl. In so far as the man’s part in the work is concerned, some of our Scottish Highlanders agree with the Djakuns at the other end of the world; for the natives of Lewis “did also make use of a fire called *Tin-egin*, *i.e.* a forced fire, or fire of necessity, which they used as an antidote against the plague or murrain in cattle; and it was performed thus: all the fires in the parish were extinguished, and then eighty-one married men, being thought the necessary number for effecting this design, took two great planks of wood, and nine of them were employed by turns, who by their repeated efforts rubbed one of the planks against the other until the heat thereof produced fire; and from this forced fire each family is supplied with new fire, which is no sooner kindled than a pot full of water is quickly set on it, and afterwards sprinkled upon the people infected with the plague, or upon the cattle that have the murrain. And this they all say they find successful by experiment: it was practised in the main land, opposite to the south of Skie, within these thirty years.” On the other hand, the Germans of Halberstadt sided with the South Slavs on this point, for they caused the forced fire, or need fire, as it is commonly called, to be made by two chaste boys, who pulled at a rope which ran round a wooden cylinder. The theory and practice of the Basutos in South Africa were similar. After a birth had taken place they used to kindle the fire of the hut afresh, and “for this purpose it was necessary that a young man of chaste habits should rub two pieces of wood quickly one against another, until a flame sprung up, pure as himself. It was firmly believed that a premature death awaited him who should dare to take upon himself this office, after having lost his innocence. As soon, therefore, as a birth was proclaimed in the village, the fathers took their sons to undergo the ordeal. Those who felt themselves guilty confessed their crime, and submitted to be scourged rather than expose themselves to the consequences of a fatal temerity.”

It is not hard to divine why the task of twirling the male fire-stick in the hole of the female fire-stick should by some people be assigned to married men. The analogy of the process to the intercourse of the sexes furnishes an obvious reason. It is less easy to understand why other people should prefer to entrust the duty to unmarried boys. But probably the preference

is based on a belief that chastity leaves the boys with a stock of reproductive energy which they may expend on the operation of fire-making, whereas married men dissipate the same energy in other channels. A somewhat similar train of thought may explain a rule of virginity enjoined on women who assist in the production of fire by holding the female fire-stick on the ground. As a virgin's womb is free to conceive, so, it might be thought, will be the womb of the female fire-stick which she holds; whereas had the female fire-maker been already with child, she could not be reimpregnated, and consequently the female fire-stick could not give birth to a spark. Thus, in the sympathetic connexion between the fire-sticks and the fire-makers we seem to reach the ultimate origin of the order of the Vestal Virgins: they had to be chaste, because otherwise they could not light the fire. Once when the sacred fire had gone out, the Vestal in charge of it was suspected of having brought about the calamity by her unchastity, but she triumphantly repelled the suspicion by eliciting a flame from the cold ashes. Ideas of the same primitive kind still linger among the French peasantry, who think that if a girl can blow up a smouldering candle into a flame she is a virgin, but that if she fails to do so, she is not. In ancient Greece none but persons of pure life were allowed to blow up the holy fire with their mouths; a vile man who had polluted his lips was deemed unworthy to discharge the duty.

The French superstition, which I have just mentioned, may well date from Druidical times, for there are some grounds for thinking that among the old Celts, as among their near kinsmen the Latins, holy fires were tended by virgins. In our own country perpetual fires were maintained in the temple of a goddess whom the Romans identified with Minerva, but whose native Celtic name seems to have been Brigit. Like Minerva, Brigit was a goddess of poetry and wisdom, and she had two sisters also called Brigit, who presided over leechcraft and smithcraft respectively. This appears to be only another way of saying that Brigit was the patroness of bards, physicians, and smiths. Now, at Kildare in Ireland the nuns of St. Brigit tended a perpetual holy fire down to the suppression of the monasteries under Henry VIII.; and we can hardly doubt that in doing so they merely kept up, under a Christian name, an ancient pagan worship of Brigit in her character of a fire-goddess or patroness of smiths. The nuns were nineteen in number. Each of them had the care of the fire for a single night in turn; and on the twentieth evening the last nun, having heaped wood on the fire, used to say, "Brigit, take charge of your own fire; for this night belongs to you." She then went away, and next morning they always found the fire still burning and the usual quantity of fuel consumed. Like the Vestal fire at Rome in the old days, the fire of St. Brigit burned within a circular enclosure made of stakes and brushwood, and no male might set foot inside the fence. The nuns were allowed to fan the fire or blow it up with bellows, but they might not blow on it with their breath. Similarly it is said that the Balkan Slavs will not blow with their mouths on the holy fire of the domestic hearth; a Brahman is forbidden to blow a fire with his mouth; and among the Parsees the priests have to wear a veil over their mouth lest they should defile the sacred fire by their breath. The custom of maintaining a perpetual fire was not peculiar to Kildare, but seems to have been common in Ireland, for the native records shew that such fires were kept up in several monasteries, in each of which a small church or oratory was set apart for the purpose. This was done, for example, at the monasteries of Seirkieran, Kilmainham, and Inishmurray. We may conjecture that these holy fires were merely survivals of the perpetual fires which in pagan times had burned in honour of Brigit. The view that Brigit was a fire-goddess is confirmed by the observation that in the Christian calendar her festival falls the day before Candlemas, and the customs observed at that season by Celtic peasantry seem to prove that she was a goddess of the crops as well as of fire. If that was so, it is another reason for comparing her to Vesta, whose priestesses performed ceremonies to fertilise both the earth and the cattle. Further, there are some grounds for connecting Brigit, like Vesta, with the oak; for at Kildare her Christian namesake, St. Brigit,

otherwise known as St. Bride or St. Bridget, built her church under an oak-tree, which existed till the tenth century, and gave its name to the spot, for Kildare is *Cilldara*, “the church of the oak-tree.” The “church of the oak” may well have displaced a temple or sanctuary of the oak, where in Druidical days the holy fire was fed, like the Vestal fire at Rome, with the wood of the sacred tree.

We may suspect that a conversion of this sort was often effected in Ireland by the early Christian missionaries. The monasteries of Derry and Durrow, founded by St. Columba, were both named after the oak groves amidst which they were built; and at Derry the saint spared the beautiful trees and strictly enjoined his successors to do the same. In his old age, when he lived an exile on the shores of the bleak storm-swept isle of Iona, his heart yearned to the home of his youth among the oak groves of Ireland, and he gave expression to the yearning in passionate verse:—

*“That spot is the dearest on Erin’s ground,
For the treasures that peace and purity lend,
For the hosts of bright angels that circle it round,
Protecting its borders from end to end.*

*“The dearest of any on Erin’s ground,
For its peace and its beauty I gave it my love;
Each leaf of the oaks around Derry is found
To be crowded with angels from heaven above.*

*“My Derry! my Derry! my little oak grove,
My dwelling, my home, and my own little cell,
May God the Eternal in Heaven above
Send death to thy foes, and defend thee well.”*

A feeling of the same sort came over a very different exile in a very different scene, when growing old amid the turmoil, the gaieties, the distractions of Paris, he remembered the German oak woods of his youth.

*“Ich hatte einst ein schönes Vaterland.
Der Eichenbaum
Wuchs dort so hoch, die Veilchen nickten sanft.
Es war ein Traum.”*

Far from the oaks of Erin and the saint’s last home among the stormy Hebrides, a sacred fire has been tended by holy virgins, with statelier rites and in more solemn fanes, under the equinoctial line. The Incas of Peru, who deemed themselves the children of the Sun, procured a new fire from their great father at the solstice in June, our Midsummer Day. They kindled it by holding towards the sun a hollow mirror, which reflected his beams on a tinder of cotton wool. But if the sky happened to be overcast at the time, they made the new fire by rubbing two sticks against each other; and they looked upon it as a bad omen when they were obliged to do this, for they said the Sun must be angry with them, since he refused to kindle the flame with his own hand. The sacred fire, however obtained, was deposited at Cuzco, the capital of Peru, in the temple of the Sun, and also in a great convent of holy virgins, who guarded it carefully throughout the year, and it was an evil augury if they suffered it to go out. These virgins were regarded as the wives of the Sun, and they were bound to perpetual chastity. If any of them proved unfaithful to her husband the Sun, she was buried alive, like a Roman Vestal, and her paramour was strangled. The reason for putting her to death in this manner was probably, as at Rome, a reluctance to shed royal blood; for all these virgins were of the royal family, being daughters of the Incas or of his kinsmen. Besides tending the holy fire,

they had to weave and make all the clothes worn by the Inca and his legitimate wife, to bake the bread that was offered to the Sun at his great festivals, and to brew the wine which the Inca and his family drank on these occasions. All the furniture of the convent, down to the pots, pans, and jars, were of gold and silver, just as in the temple of the Sun, because the virgins were deemed to be his wives. And they had a golden garden, where the very clods were of fine gold; where golden maize reared its stalks, leaves and cobs, all of the precious metal; and where golden shepherds, with slings and crooks of gold, tended golden sheep and lambs. The analogy of these virgin guardians of the sacred flame furnishes an argument in favour of the view set forth in the preceding pages; for if the Peruvian Vestals were the brides of the Sun, may not the Roman Vestals have been the brides of the Fire?

On the summit of the great pyramidal temple at Mexico two fires burned continually on stone hearths in front of two chapels, and dreadful misfortunes were supposed to follow if the fires were allowed to go out. They were kept up by priests and maidens, some of whom had taken a vow of perpetual virginity. But most of these girls seem to have served only for a year or more until their marriage. They offered incense to the idols, wove cloths for the service of the temple, swept the sacred area, and baked the cakes which were presented to the gods but eaten by their priests. They were clad all in white, without any ornament. A broom and a censer were their emblems. Death was the penalty inflicted on the faithless virgin who polluted by her incontinence the temple of the god. In Yucatan there was an order of Vestals instituted by a princess, who acted as lady-superior and was deified after her death under the title of the Virgin of the Fire. The members enrolled themselves voluntarily either for life or for a term of years, after which they might marry. Their duty was to tend the sacred fire, the emblem of the sun. If they broke their vow of chastity or allowed the fire to go out, they were shot to death with arrows.

Amongst the Baganda of Central Africa there used to be an order of Vestal Virgins (*bakaja*) who were attached to the temples of the gods. Their duties were to keep the fire of the god burning all night, to see that there was a good supply of firewood, and to watch that the suppliants did not bring to the deity anything that was tabooed to him. These maidens are also said to have had charge of some of the vessels. All of them were young girls; no man might touch them; and when they reached the age of puberty, the god ordered them to be given in marriage. The place of a girl who thus vacated office had to be supplied by another girl taken from the same clan.

We have seen that some people commit the task of making fire by friction to married men; and following the opinion of other scholars I have conjectured that in some of the Latin tribes the duty of kindling and feeding the sacred fire may have been assigned to the Flamen Dialis, who had always to be married; if his wife died, he vacated his office. The sanctity of his fire is proved by the rule that no brand might be taken from his house except for the purpose of a sacrifice. Further, the importance ascribed to the discharge of his duties is attested by another old rule which forbade him to be absent from his house in Rome for a single night. The prohibition would be intelligible if one of his duties had formerly been to superintend the maintenance of a perpetual fire. However that may have been, the life of the priest was regulated by a whole code of curious restrictions or taboos, which rendered the office so burdensome and vexatious that, in spite of the high honours attached to the post, for a period of more than seventy years together no man was found willing to undertake it. Some of these restrictions will be examined later on. Their similarity to the rules of life still observed in India by the Brahmans who are fire-priests (*Agnihotris*) seems to confirm the view that the Flamen also was originally a fire-priest. The parallel between the two priesthoods would be all the more remarkable if, as some scholars hold, the very names Brahman and Flamen are philologically identical. As to these Brahmanical fire-priests or

Agnihotris we are told that the number of them nowadays is very limited, because the ceremonies involve heavy expenditure, and the rules which regulate them are very elaborate and difficult. The offering of food to the fire at meals is, indeed, one of the five daily duties of every Brahman; but the regular fire-service is the special duty of the Agnihotri. In order that he may be ceremonially pure he is bound by certain obligations not to travel or remain away from home for any long time; to sell nothing which is produced by himself or his family; to pay little attention to worldly affairs; to speak the truth; to bathe and worship the deities in the afternoon as well as in the morning; and to sacrifice to his deceased ancestors on the fifteenth of every month. He is not allowed to take food at night. He may not eat alkaline salt, meat, honey, and inferior grain, such as some varieties of pulse, millet, and the egg plant. He never wears shoes nor sleeps on a bed, but always on the ground. He is expected to keep awake most of the night and to study the Shâstras. He may have no connexion with, nor unholy thoughts regarding, any woman but his wife; and he must abstain from every other act that involves personal impurity. With these rules we may compare some of the obligations laid on the Flamen Dialis. In the old days, as we saw, he was bound never to be absent from his house for a single night. He might not touch or even name raw meat, beans, ivy, and a she-goat; he might not eat leavened bread, nor touch a dead body; and the feet of his bed had always to be smeared with mud. This last rule seems to be a mitigation of an older custom of sleeping on the ground, a custom which is still observed by the fire-priest in India, as it was in antiquity by the priests of Zeus at Dodona. Similarly the priest of the old Prussian god Potrimpo was bound to sleep on the bare earth for three nights before he sacrificed to the deity.

Every Agnihotri has a separate room in his house where the sacred fire is kept burning in a small pit of a cubit square. Should the fire chance to go out, the priest must get fresh fire from another priest or procure it by the friction of fire-sticks (*arani*). These comprise, first, a block of *sami* wood (*Prosopis spicigera*) in which a small hole is made emblematical of the female principle (*sakti yoni*), and, second, an upright shaft which is made to revolve in the hole of the block by means of a rope. The point in the drill where the rope is applied to cause it to revolve is called *deva yoni*. Two priests take part in the operation. Before they begin they sing a hymn in honour of the fire-god Agni. When the fire has been kindled they place it in a copper vessel and sprinkle it with powdered cow-dung. When it is well alight, they cover it with another copper vessel, sprinkle it with drops of water, and sing another hymn in honour of Agni. Finally, the new fire is consigned to the fire-pit. According to another description of the modern Indian fire-drill, the lower block is usually made of the hard wood of the *khadira* or *khair* tree (*Acacia catechu*), and it contains two shallow holes. In one of these holes the revolving drill works and produces sparks by friction; the other hole contains tinder which is ignited by means of the sparks. This latter hole is known as the *yonî*, the female organ of generation. The upper or revolving portion of the drill is called the *pramantha*. It consists of a round shaft of hard wood, with a spike of softer wood inserted in its lower end. One priest causes the shaft to revolve by pulling a cord, while another priest presses the spike down into the hole in the block by leaning hard upon a flat board placed on the top of the shaft. The spike is generally made of the peepul or sacred fig-tree. When it has become charred by friction, it is replaced by another. According to one account, the fire is made in this fashion, not by two priests, but by the Brahman and his wife; she pulls the cord, while he holds the borer in the hole and recites the spells necessary for the production of the fire.

This practice of the modern Agnihotri or fire-priest of India is in general accord with the precepts laid down in the ancient sacred books of his religion. For these direct that the upper or male stick of the fire-drill should be made of the sacred fig-tree (*asvattha*), and the lower or female stick of *sami* wood (*Prosopis spicigera*); and they draw out the analogy between

the process of fire-making and the intercourse of the sexes in minute detail. It deserves to be noted that the male fire-stick was cut by preference from a sacred fig-tree which grew as a parasite on a *sami* or female tree. The reason for this preference is obvious to the primitive mind. A parasite clasping a tree with its tendrils is conceived as a man embracing a woman, hence a pair of fire-sticks made from a pair of trees thus interlaced will naturally possess the power of procreating fire by friction in an unusually high degree. So completely, in the Hindoo mind, does the process of making fire by friction blend with the union of the human sexes that it is actually employed as part of a charm to procure male offspring. Such a confusion of thought helps us to understand the part played by the domestic fire in the ritual of marriage and birth as well as in the legends of the miraculous origin of the Latin kings. In ancient India the male and the female fire-stick were identified with King Pururavas and the nymph Urvasi, whose loves and sorrows formed the theme of a beautiful tale.

Like the ancient Indians, the Greeks seem to have preferred that one of the two fire-sticks should be made from a parasitic or creeping plant. They recommended that the borer of the fire-drill should be made of laurel and the board of ivy or another creeper, apparently a kind of wild vine which grew like ivy upon trees; but in practice both the borer and the board were sometimes made of other woods, among which buckthorn, the evergreen oak, and the lime are particularly mentioned. When we consider the analogy of the Indian preference for a borer made from a parasite, and remember how deeply rooted in the primitive mind is the comparison of the friction of the fire-sticks to the union of the sexes, we shall hardly doubt that the Greeks originally chose the ivy or wild vine for a fire-stick from motives of the sort which led the Hindoos to select the wood of a parasitic fig-tree for the same purpose. But while the Hindoos regarded the parasite as male and the tree to which it clung as female, the Greeks of Theophrastus's time seem to have inverted this conception, since they recommended that the board, which plays the part of the female in the fire-drill, should be made of ivy or another creeper, whereas the borer, which necessarily represents the male, was to be fashioned out of laurel. This would imply that the ivy was a female and the laurel a male. Yet in Greek, on the contrary, the word for ivy is masculine, and the plant was identified mythologically with the male god Dionysus; whereas the word for laurel is feminine and the tree was identified with a nymph. Hence we may conjecture that at first the Greeks, like the Hindoos, regarded the clinging creeper as the male and the tree which it embraced as the female, and that of old, therefore, they made the borer of the fire-drill out of ivy and the board out of laurel. If this was so, the reasons which led them to reverse the usage can only be guessed at. Perhaps practical convenience had a share in bringing about the change. For the laurel is, as the late Professor H. Marshall Ward kindly informed me, a harder wood than the ivy, and to judge by general, though not universal, practice most people find it easier to make fire by the friction of a hard borer on a soft board than by rubbing a hard board with a soft point. This, therefore, would be a reason for making the borer of laurel and the board of ivy. If such a change took place in the history of the Greek fire-drill, it would be an interesting example of superstition modified, if not vanquished, by utility in the struggle for existence.

XVII. The Origin Of Perpetual Fires

Whatever superstitions may have gathered about it in the course of ages, the custom of maintaining a perpetual fire probably sprang from a simple consideration of practical convenience. The primitive mode of making fire by the friction of wood is laborious at all times, and it is especially so in wet weather. Hence the savage finds it convenient to keep a fire constantly burning or smouldering in order to spare himself the troubling of kindling it. This convenience becomes a necessity with people who do not know how to make fire. That there have been such tribes down to our own time is affirmed by witnesses whose evidence we have no reason to doubt. Thus Mr. E. H. Man, who resided eleven years in the Andaman Islands and was intimately acquainted with the natives, tells us that, being ignorant of the art of making fire, they take the utmost pains to prevent its extinction. When they leave a camp intending to return in a few days, they not only take with them one or more smouldering logs, wrapped in leaves if the weather be wet, but they also place a large burning log or faggot of suitable wood in some sheltered spot, where it smoulders for several days and can be easily rekindled when it is needed. While it is the business of the women to gather the wood, the duty of keeping up the fires both at home and in travelling by land or sea is not confined to them, but is undertaken by persons of either sex who have most leisure or are least burdened. The Russian traveller, Baron Miklucho-Maclay, who lived among the natives of the Maclay coast of northern New Guinea at a time when they had hardly come into contact with Europeans, writes: "It is remarkable that here almost all the inhabitants of the coast possess no means whatever of making fire, hence they always and everywhere carry burning or glowing brands about with them. If they go in the morning to the plantation they carry a half-burnt brand from their hearth in order to kindle a fire at the corner of the plantation. If they go on a longer journey into the mountains, they again take fire with them for the purpose of smoking, since their cigars, wrapped in green leaves, continually go out. On sea voyages they usually keep glowing coals in a half-broken pot partly filled with earth. The people who remain behind in the village never forget to keep up the fire." They repeatedly told him that they had often to go to other villages to fetch fire when the fires in all the huts of their own village had chanced to go out. Yet the same traveller tells us that the mountain tribes of this part of New Guinea, such as the Englam-Mana and Tiengum-Mana, know how to make fire by friction. They partially cleave a log of dry wood with a stone axe and then draw a stout cord, formed of a split creeper, rapidly to and fro in the cleft, till sparks fly out and set fire to a tinder of dry coco-nut fibres. It is odd that the people of the coast should not have learned this mode of producing fire from their neighbours in the mountains. The Russian explorer's observations, however, have been confirmed by German writers. One of them, a Mr. Hoffmann, says of these people: "In every house care is taken that fire burns day and night on the hearth. For this purpose they choose a kind of wood which burns slowly, but glimmers for a long time and retains its glow. When a man sets out on a journey or goes to the field he has always a glimmering brand with him. If he wishes to make fire, he waves the smouldering wood to and fro till it bursts into a glow." On frequented paths, crossways, and so forth, you may often see trunks of trees lying which have been felled for the purpose of being ignited and furnishing fire to passers-by. Such trees continue to smoulder for weeks. Similarly the dwarf tribes of Central Africa "do not know how to kindle a fire quickly, and in order to get one readily at any moment they keep the burning trunks of fallen trees in suitable spots, and watch over their preservation like the Vestals of old." It seems to be at least doubtful whether these dwarfs of the vast and gloomy equatorial forests are acquainted with the art of making fire at all. A German traveller observes that the care which they take to preserve fire is

extremely remarkable. "It appears," he says, "that the pygmies, as other travellers have reported, do not know how to kindle fire by rubbing sticks against each other. Like the Wambuba of the forest, in leaving a camp, they take with them a thick glowing brand, and carry it, often for hours, in order to light a fire at their next halting place."

Whether or not tribes ignorant of the means of making fire have survived to modern times, it seems likely that mankind possessed and used fire long before they learned how to kindle it. In the violent thunderstorms which accompany the end of the dry season in Central and Eastern Africa, it is not uncommon for the lightning to strike and ignite a tree, from which the fire soon spreads to the withered herbage, till a great conflagration is started. From a source of this sort a savage tribe may have first obtained fire, and the same thing may have happened independently in many parts of the world. Other people, perhaps, procured fire from volcanoes, the lava of which will, under favourable circumstances, remain hot enough to kindle shavings of wood years after an eruption has taken place. Others again may have lit their first fire at the jets of inflammable gas which spring from the ground in various parts of the world, notably at Baku on the Caspian, where the flames burn day and night, summer and winter, to a height of fifteen or twenty feet. It is harder to conjecture how man first learned the great secret of making fire by friction. The discovery was perhaps made by jungle or forest races, who saw dry bamboos or branches thus ignited by rubbing against each other in a high wind. Fires are sometimes started in this way in the forests of New Zealand. It has also been suggested that savages may have accidentally elicited a flame for the first time in the process of chipping flints over dry moss, or boring holes with hard sticks in soft wood.

But even when the art of fire-making has been acquired, the process itself is so laborious that many savages keep fire always burning rather than be at the trouble of extracting it by friction. This, for example, was true of the roving Australian aborigines before they obtained matches from the whites. On their wanderings they carried about with them pieces of smouldering bark or cones of the *Banksia* tree wherewith to kindle their camp fires. The duty of thus transporting fire from one place to another seems commonly to have fallen to the women. "A stick, a piece of decayed wood, or more often the beautiful seed-stem of the *Banksia*, is lighted at the fire the woman is leaving; and from her bag, which, in damp weather, she would keep filled with dry cones, or from materials collected in the forest, she would easily, during her journey, preserve the fire got at the last encampment." Another writer tells us that the Australian native always had his fire-stick with him, and if his wife let it go out, so much the worse for her. The dark brown velvety-looking core of the *Banksia* is very retentive of fire and burns slowly, so that one of these little fire-sticks would last a considerable time, and a bag of them would suffice for a whole day. The Tasmanians knew how to make fire by twirling the point of a stick in a piece of soft bark; "but as it was difficult at times to obtain fire by this means, especially in wet weather, they generally, in their peregrinations, carried with them a fire-stick lighted at their last encampment." With them, as with the Australians, it was the special task of the women to keep the fire-brand alight and to carry it from place to place. When the natives of Materbert, off New Britain, are on a voyage they carry fire with them. For this purpose they press some of the soft fibrous husk of the ripe coco-nut into a coco-nut shell, and then place a red-hot ember in the middle of it. This will smoulder for three or four days, and from it they obtain a light for their fires wherever they may land. The Polynesians made fire by the friction of wood, rubbing a score in a board with a sharp-pointed stick till the dust so produced kindled into sparks, which were caught in a tinder of dry leaves or grass. While they rubbed, they chanted a prayer or hymn till the fire appeared. But in wet weather the task of fire-making was laborious, so at such times the natives usually carried fire about with them in order to avoid the trouble of kindling it. The Fuegians make fire by striking two lumps of iron pyrites together and letting the sparks fall

on birds' down or on dry moss, which serves as tinder. But rather than be at the pains of doing this they carry fire with them everywhere, both by sea and land, taking great care to prevent its extinction. The Caingua Indians of Paraguay make fire in the usual way by the fire-drill, but to save themselves trouble they keep fire constantly burning in their huts by means of great blocks of wood. The Indians of Guiana also produce fire by twirling the point of one stick in the hole of another, but they seldom need to resort to this laborious process, for they keep fire burning in every house, and on long journeys they usually carry a large piece of smouldering timber in their canoes. Even in walking across the savannah an Indian will sometimes take a fire-brand with him. The Jaggas, a Bantu tribe in the Kilimanjaro district of East Africa, keep up fire day and night in their huts on account of their cattle. If it goes out, the women fetch glowing brands from a neighbour's house; these they carry wrapped up in banana leaves. Thus they convey fire for great distances, sometimes the whole day long. Hence they seldom need to kindle fire, though the men can make it readily by means of the fire-drill. The tribes of British Central Africa also know how to produce fire in this fashion, but they do not often put their knowledge in practice. For there is sure to be a burning brand on one or other of the hearths of the village from which a fire can be lit; and when men go on a journey they take smouldering sticks with them and nurse the glowing wood rather than be at the trouble of making fire by friction. In the huts of the Ibos on the lower Niger burning embers are always kept and never allowed to go out. And this is the regular practice among all the tribes of West Africa who have not yet obtained matches. If the fire in a house should go out, a woman will run to a neighbour's hut and fetch a burning stick from the hearth. Hence in most of their villages fire has probably not needed to be made for years and years. Among domesticated tribes, like the Effiks or Agalwa, when the men are going out to the plantation they will enclose a burning stick in a hollow piece of a certain kind of wood, which has a lining of its pith left in it, and they will carry this "fire-box" with them.

Before the introduction of matches Greek peasants used to convey fire from place to place in a stalk of giant fennel. The stalks of the plant are about five feet long by three inches thick, and are encased in a hard bark. The core of the stalk consists of a white pith which, when it is dry, burns slowly like a wick without injury to the bark. Thus when Prometheus, according to the legend, stole the first fire from heaven and brought it down to earth hidden in a stalk of giant fennel, he carried his fire just as every Greek peasant and mariner did on a journey.

When a tribe ceased to be nomadic and had settled in more or less permanent villages, it would be a convenient custom to keep a fire perpetually burning in every house. Such a custom, as we have seen, has been observed by various peoples, and it appears to have prevailed universally among all branches of the Aryans. Arnobius implies that it was formerly practised by the Romans, though in his own time the usage had fallen into abeyance. But it would be obviously desirable that there should be some one place in the village where every housewife could be sure of obtaining fire without having to kindle it by friction, if her own should chance to go out. The most natural spot to look for it would be the hearth of the head man of the village, who would come in time to be regarded as responsible for its maintenance. This is what seems to have happened not only among the Herero of South Africa and the Latin peoples of Italy, but also among the ancestors of the Greeks; for in ancient Greece the perpetual fire kept up in the Prytaneum, or town-hall, was at first apparently the fire on the king's hearth. From this simple origin may have sprung the custom which in various parts of the world associates the maintenance of a perpetual fire with chiefly or royal dignity. Thus it was a distinguishing mark of the chieftainship of one of the Samoan nobility, that his fire never went out. His attendants had a particular name, from their special business of keeping his fire ablaze all night long while he slept. Among the Gallas the

maintenance of a perpetual fire, even when it serves no practical purpose, is a favourite mode of asserting high rank, and the chiefs often indulge in it. The Chitomé, a grand pontiff in the kingdom of Congo, of whom we shall hear more hereafter, kept up in his hut, day and night, a sacred fire, of which he dispensed brands to such as came to ask for them and could pay for them. He is said to have done a good business in fire, for the infatuated people believed that it preserved them from many accidents. In Uganda a perpetual sacred fire, supposed to have come down to earth with the first man Kintu, is maintained by a chief, who is put to death if he suffers it to be extinguished. From this sacred fire the king's fire (*gombolola*) is lighted and kept constantly burning at the gate of the royal enclosure during the whole of his reign. By day it burns in a small hut, but at night it is brought out and set in a little hole in the ground, where it blazes brightly till daybreak, whatever the weather may be. When the king journeys the fire goes with him, and when he dies it is extinguished. The death of a king is indeed announced to the people by the words, "The fire has gone out." A man who bears a special title is charged with the duty of maintaining the fire, and of looking after all the fuel and torches used in the royal enclosure. When the king dies the guardian of his fire is strangled near the hearth. Similarly in Dageou, a country to the west of Darfur, it is said that a custom prevailed of kindling a fire on the inauguration of a king and keeping it alight till his death. Among the Mucelis of Angola, when the king of Amboin or Sanga dies, all fires in the kingdom are extinguished. Afterwards the new king makes new fire by rubbing two sticks against each other. Such a custom is probably nothing more than an extension of the practice of putting out a chief's own fire at his death. Similarly, when a new Muata Jamwo, a great potentate in the interior of Angola, comes to the throne, one of his first duties is to make a new fire by the friction of wood, for the old fire may not be used. Before the palace gate of the king of Siam there burns, or used to burn, a perpetual fire, which was said to have been lit from heaven with a fiery ball.

Among the Natchez Indians of the lower Mississippi a perpetual fire, supposed to have been brought down from the sun, was maintained in a square temple which stood beside the hut of the supreme chief of the nation. He bore the title of the Great Sun, and believed himself to be a descendant or brother of the luminary his namesake. Every morning when the sun rose he blew three whiffs of his pipe towards it, and raising his hands above his head, and turning from east to west, he marked out the course which the bright orb was to pursue in the sky. The sacred fire in the temple was fed with logs of walnut or oak, and the greatest care was taken to prevent its extinction; for such an event would have been thought to put the whole nation in jeopardy. Eight men were appointed to guard the fire, two of whom were bound to be always on watch; and the Great Sun himself looked to the maintenance of the fire with anxious attention. If any of the guardians of the fire failed to do his duty, the rule was that he should be put to death. When the great chief died his bones were deposited in the temple, along with the bones of many attendants who were strangled in order that their souls might wait upon him in the spirit land. On such an occasion the chief's fire was extinguished, and this was the signal for putting out all the other fires in the country. Every village had also its own temple in which a perpetual fire was maintained under the guardianship of a subordinate chief. These lesser chiefs also bore the title of Suns, but acknowledged the supremacy of the head chief, the Great Sun. All of these Suns were supposed to be descended from a man and woman who had come down from the luminary from which they took their names. There were female Suns as well as male Suns, but they might not marry among themselves; they had always to mate with a woman or a man of lower rank. Their nobility was transmitted in the maternal line; that is, the children of a female Sun, both sons and daughters, were Suns, but the children of a male Sun were not. Hence a chief was never succeeded by his own son, but always by the son either of his sister or of his nearest female relation. The Natchez knew how to produce fire by means of the fire-drill; but if the sacred fire in the temple went out,

they relit it, not by the friction of wood, but by a brand brought from another temple or from a tree which had been ignited by lightning. In these customs of the Natchez we have clearly fire-worship and sun-worship of the same general type which meets us again at a higher state of evolution among the Incas of Peru. Both sets of customs probably sprang originally from the perpetual fire on the chief's domestic hearth.

When a perpetual fire has thus become a symbol of royalty, it is natural that it should be carried before the king or chief on the march. Among the Indians of the Mississippi a lighted torch used to be borne in front of a chief, and no commoner would dare to walk between a chief and his torch-bearer. A sacred fire, supposed to have descended from heaven, was carried in a brazier before the Persian kings, and the custom was adopted as a badge of imperial dignity by later Roman emperors. The practice appears to have been especially observed in time of war. Amongst the Ovambo of South Africa the chief appoints a general to lead the army to battle, and next to the general the greatest officer is he who carries a fire-brand at the head of the warriors. If the fire goes out on the march, it is an evil omen and the army beats a retreat. When the king of Monomotapa, or Benomotapa, was at war, a sacred fire was kept burning perpetually in a hut near his tent. In old days it is said that the king of Mombasa in East Africa could put an army of eighty thousand men in the field. On the march his guards were preceded by men carrying fire. High above the tent of Alexander the Great hung a fiery cresset on a pole, and "the flame of it was seen by night, and the smoke by day." When a Spartan king was about to lead an army abroad he first sacrificed at home to Zeus the Leader. Then a man called the fire-bearer took fire from the altar and marched with it at the head of the troops to the frontier. There the king again sacrificed to Zeus and Athena, and if the omens were favourable, he crossed the border, preceded by the fire from the sacrifices, which thenceforth led the way and might not be quenched. To perform such sacrifices the king always rose very early in the morning, while it was still dark, in order to get the ear of the god before the enemy could forestall him.

A custom of maintaining a fire during a king's reign and extinguishing it at his death, even if it did not originate in a superstition, would naturally lend itself to a superstitious interpretation. The distinction between the sign and the cause of an event is not readily grasped by a dull mind; hence the extinction of the king's fire, from being merely a signal of his death, might come in time to be regarded as a cause of it. In other words, a vital connexion might be supposed to exist between the king and the fire, so that if the fire were put out the king would die. That a sympathetic bond of some sort united the king's life with the fire on his hearth was apparently believed by the ancient Scythians. For their most solemn oath was by the king's hearth, and if any man who had taken this oath forswore himself, they believed that the king would fall ill. The story of Meleager, whose life was said to be bound up with a brand plucked from the fire on the hearth, belongs to the same class of ideas, which will be examined at large in a later part of this work. Wherever a superstition of this sort gathered round the king's hearth, it is obvious that he would be moved to watch over the fire with redoubled vigilance. On a certain day the Vestal Virgins at Rome used to go to the King of the Sacred Rites, the successor of the old Roman kings, and say to him, "Watchest thou, O King? Watch." The ceremony may have been a reminiscence or survival of a time when the king's life as well as the general safety was supposed to hang on the maintenance of the fire, to the guardianship of which he would thus be impelled by the motive of self-preservation as well as of public duty. When natives of the Kei Islands in the East Indies are away on a long voyage, a sacred fire is kept up the whole time of their absence by their friends at home. Three or four young girls are appointed to feed it and watch over it day and night with a jealous care lest it should go out; its extinction would be deemed a most evil omen, for the fire is the symbol of the life of the absent ones. This belief and this practice may help us to

understand the corresponding beliefs and practices concerned with the maintenance of a perpetual fire at Rome.

XVIII. The Succession To The Kingdom In Ancient Latium

Thus it appears that a variety of considerations combined to uphold, if not to originate, the custom of maintaining a perpetual fire. The sanctity of the wood which fed it, the belief in the generative virtue of the process by which it was kindled, the supposed efficacy of fire in repelling the powers of evil, the association of the hearth with the spirits of the dead and with the majesty or even the life of the king all worked together to invest the simple old custom with a halo of mystery and romance. If this was so at Rome we may assume that matters were not very different in the other Latin towns which kept up a Vestal fire. These too had their kings of the Sacred Rites, their flamens, and their pontiffs, as well as their Vestal Virgins. All the great priesthoods of Rome appear, in fact, to have had their doubles in the other ancient cities of Latium; all were probably primitive institutions common to the whole Latin race.

Accordingly, whatever is true or probable of the Roman priesthoods, about which we know most, may reasonably be regarded as true or probable of the corresponding priesthoods elsewhere in Latium, about which for the most part we know nothing more than the names. Now in regard to the Roman king, whose priestly functions were inherited by his successor the king of the Sacred Rites, the foregoing discussion has led us to the following conclusions. He represented and indeed personated Jupiter, the great god of the oak, the sky, and the thunder, and in that character made rain, thunder, and lightning for the good of his subjects, like many more kings of the weather in other parts of the world. Further, he not only mimicked the oak-god by wearing an oak wreath and other insignia of divinity, but he was married to an oak-nymph Egeria, who appears to have been merely a local form of Diana in her character of a goddess of woods, of waters, and of childbirth. Moreover, he was descended from the oak, since he was born of a virgin who conceived by contact with a fire of sacred oak-wood. Hence he had to guard the ancestral fire and keep it constantly burning, inasmuch as on its maintenance depended the continuance of the royal family. Only on certain stated occasions was it lawful and even necessary to extinguish the old fire in order to revive it in a purer and more vigorous form by the friction of the sacred wood. This was done once a year on the first of March, and we may conjecture that it was also done by the new king on his accession to power; for, as we have seen, it has been customary in various places to extinguish the king's fire at his death. Among the ancient Persians the perpetual sacred fire was put out on the death of a king and remained unlit until after his funeral. It is a common practice to extinguish the fire in any house where a death has taken place, apparently from a fear that the ghost may scorch or singe himself at it, like a moth at the flame of a candle; and the custom of putting out the king's fire at his decease may in its origin have been nothing more than this. But when the fire on the king's hearth came to be viewed as bound up in a mysterious fashion with his life, it would naturally be extinguished at his death, not to spare his fluttering ghost the risk and pain of falling into it, but because, as a sort of life-token or external soul, it too must die at his death and be born again from the holy tree. At all events, it seems probable that whenever and from whatever cause it became necessary to rekindle the royal and sacred fire by the friction of wood, the operation was performed jointly by the king and the Vestals, one or more of whom may have been his daughters or the daughters of his predecessor. Regarded as impersonations of Mother Vesta herself, these priestesses would be the chosen vessels, not only to bring to birth the seed of fire in working the fire-drill, but also to receive the seed of the fire-god in their chaste wombs, and so to become the mothers of fire-begotten kings.

All these conclusions, which we have reached mainly by a consideration of the Roman evidence, may with great probability be applied to the other Latin communities. They too probably had of old their divine or priestly kings, who transmitted their religious functions, without their civil powers, to their successors the kings of the Sacred Rites.

But we have still to ask, What was the rule of succession to the kingdom among the old Latin tribes? We possess two lists of Latin kings both professedly complete. One is the list of the kings of Alba, the other is the list of the kings of Rome. If we accept as authentic the list of the Alban kings, we can only conclude that the kingdom was hereditary in the male line, the son regularly succeeding his father on the throne. But this list, if it is not, as Niebuhr held, a late and clumsy fabrication, has somewhat the appearance of an elastic cord which ancient historians stretched in order to link Aeneas to Romulus. Yet it would be rash to set these names wholly aside as a chronological stop-gap deliberately foisted in by later annalists. In early monarchies, before the invention of writing, tradition is remarkably retentive of the names of kings. The Baganda of Central Africa, for example, remember the names of more than thirty of their kings in an unbroken chain of twenty-two generations. Even the occurrence of foreign names among the Alban kings is not of itself sufficient to condemn the list as a forgery; for, as I shall shew presently, this feature is explicable by a rule of descent which appears to have prevailed in many ancient monarchies, including that of Rome. Perhaps the most we can say for the history of the Alban kings is that their names may well be genuine, and that some general features of the monarchy, together with a few events which happened to strike the popular imagination, may have survived in the memory of the people till they found their way into written history. But no dependence can be placed either on the alleged years of their reigns, or on the hereditary principle which is assumed to have connected each king with his predecessor.

When we come to the list of the Roman kings we are on much firmer, though still slippery ground. According to tradition there were in all eight kings of Rome, and with regard to the five last of them, at all events, we can hardly doubt that they actually sat on the throne, and that the traditional history of their reigns is, in its main outlines, correct. Now it is very remarkable that though the first king of Rome, Romulus, is said to have been descended from the royal house of Alba, in which the kingship is represented as hereditary in the male line, not one of the Roman kings was immediately succeeded by his son on the throne. Yet several left sons or grandsons behind them. On the other hand, one of them was descended from a former king through his mother, not through his father, and three of the kings, namely Tadius, the elder Tarquin, and Servius Tullius, were succeeded by their sons-in-law, who were all either foreigners or of foreign descent. This suggests that the right to the kingship was transmitted in the female line, and was actually exercised by foreigners who married the royal princesses. To put it in technical language, the succession to the kingship at Rome and probably in Latium generally would seem to have been determined by certain rules which have moulded early society in many parts of the world, namely exogamy, *beena* marriage, and female kinship or mother-kin. Exogamy is the rule which obliges a man to marry a woman of a different clan from his own; *beena* marriage is the rule that he must leave the home of his birth and live with his wife's people; and female kinship or mother-kin is the system of tracing relationship and transmitting the family name through women instead of through men. If these principles regulated descent of the kingship among the ancient Latins, the state of things in this respect would be somewhat as follows. The political and religious centre of each community would be the perpetual fire on the king's hearth tended by Vestal Virgins of the royal clan. The king would be a man of another clan, perhaps of another town or even of another race, who had married a daughter of his predecessor and received the kingdom with her. The children whom he had by her would inherit their mother's name, not

his; the daughters would remain at home; the sons, when they grew up, would go away into the world, marry, and settle in their wives' country, whether as kings or commoners. Of the daughters who stayed at home, some or all would be dedicated as Vestal Virgins for a longer or shorter time to the service of the fire on the hearth, and one of them would in time become the consort of her father's successor.

This hypothesis has the advantage of explaining in a simple and natural way some obscure features in the traditional history of the Latin kingship. Thus the legends which tell how Latin kings were born of virgin mothers and divine fathers become at least more intelligible. For, stripped of their fabulous element, tales of this sort mean no more than that a woman has been gotten with child by a man unknown; and this uncertainty as to fatherhood is more easily compatible with a system of kinship which ignores paternity than with one which makes it all-important. If at the birth of the Latin kings their fathers were really unknown, the fact points either to a general looseness of life in the royal family or to a special relaxation of moral rules on certain occasions, when men and women reverted for a season to the licence of an earlier age. Such Saturnalias are not uncommon at some stages of social evolution. In our own country traces of them long survived in the practices of May Day and Whitsuntide, if not of Christmas. Children born of the more or less promiscuous intercourse which characterises festivals of this kind would naturally be fathered on the god to whom the particular festival was dedicated.

In this connexion it may not be without significance that a festival of jollity and drunkenness was celebrated by the plebeians and slaves at Rome on Midsummer Day, and that the festival was specially associated with the fire-born King Servius Tullius, being held in honour of Fortuna, the goddess who loved Servius as Egeria loved Numa. The popular merrymakings at this season included foot-races and boat-races; the Tiber was gay with flower-wreathed boats, in which young folk sat quaffing wine. The festival appears to have been a sort of Midsummer Saturnalia answering to the real Saturnalia which fell at Midwinter. In modern Europe, as we shall learn later on, the great Midsummer festival has been above all a festival of lovers and of fire; one of its principal features is the pairing of sweethearts, who leap over the bonfires hand in hand or throw flowers across the flames to each other. And many omens of love and marriage are drawn from the flowers which bloom at this mystic season. It is the time of the roses and of love. Yet the innocence and beauty of such festivals in modern times ought not to blind us to the likelihood that in earlier days they were marked by coarser features, which were probably of the essence of the rites. Indeed, among the rude Esthonian peasantry these features seem to have lingered down to our own generation, if not to the present day. One other feature in the Roman celebration of Midsummer deserves to be specially noticed. The custom of rowing in flower-decked boats on the river on this day proves that it was to some extent a water festival; and, as we shall learn later on, water has always, down to modern times, played a conspicuous part in the rites of Midsummer Day, which explains why the Church, in throwing its cloak over the old heathen festival, chose to dedicate it to St. John the Baptist.

The hypothesis that the Latin kings may have been begotten at an annual festival of love is necessarily a mere conjecture, though the traditional birth of Numa on the festival of the Parilia, when shepherds leaped across the spring bonfires, as lovers leap across the Midsummer fires, may perhaps be thought to lend it a faint colour of probability. But it is quite possible that the uncertainty as to their fathers may not have arisen till long after the death of the kings, when their figures began to melt away into the cloudland of fable, assuming fantastic shapes and gorgeous colouring as they passed from earth to heaven. If they were alien immigrants, strangers and pilgrims in the land they ruled over, it would be natural enough that the people should forget their lineage, and forgetting it should provide

them with another, which made up in lustre what it lacked in truth. The final apotheosis, which represented the kings as not merely sprung from gods but as themselves deities incarnate, would be much facilitated if in their lifetime, as we have seen reason to think, they had actually laid claim to divinity.

If among the Latins the women of royal blood always stayed at home and received as their consorts men of another stock, and often of another country, who reigned as kings in virtue of their marriage with a native princess, we can understand not only why foreigners wore the crown at Rome, but also why foreign names occur in the list of the Alban kings. In a state of society where nobility is reckoned only through women—in other words, where descent through the mother is everything, and descent through the father is nothing—no objection will be felt to uniting girls of the highest rank to men of humble birth, even to aliens or slaves, provided that in themselves the men appear to be suitable mates. What really matters is that the royal stock, on which the prosperity and even the existence of the people is supposed to depend, should be perpetuated in a vigorous and efficient form, and for this purpose it is necessary that the women of the royal family should bear children to men who are physically and mentally fit, according to the standard of early society, to discharge the important duty of procreation. Thus the personal qualities of the kings at this stage of social evolution are deemed of vital importance. If they, like their consorts, are of royal and divine descent, so much the better; but it is not essential that they should be so.

The hypothesis which we have been led to frame of the rule of succession to the Latin kingship will be confirmed by analogy if we can shew that elsewhere, under a system of female kinship, the paternity of the kings is a matter of indifference—nay, that men who are born slaves may, like Servius Tullius, marry royal princesses and be raised to the throne. Now this is true of the Tshi-speaking peoples of the Gold Coast in West Africa. Thus in Ashantee, where the kingdom descends in the female line to the king's brothers and afterwards to the sons of his sister in preference to his own sons, the sisters of the reigning monarch are free to marry or intrigue with whom they please, provided only that their husband or lover be a very strong and handsome man, in order that the kings whom he begets may be men of finer presence than their subjects. It matters not how low may be the rank and position of the king's father. If the king's sisters, however, have no sons, the throne will pass to the king's own son, and failing a son, to the chief vassal or the chief slave. But in the Fantee country the principal slave succeeds to the exclusion of the son. So little regard is paid by these people to the lineage, especially the paternal lineage, of their kings. Yet Ashantee has attained a barbaric civilisation as high perhaps as that of any negro state, and probably not at all inferior to that of the petty Latin kingdoms at the dawn of history.

A trace of a similar state of things appears to survive in Uganda, another great African monarchy. For there the queen dowager and the queen sister are, or were, allowed to have as many husbands as they choose, without going through any marriage ceremony. "Of these two women it is commonly said all Uganda is their husband; they appear to be fond of change, only living with a man for a few days and then inviting some one else to take his place." We are reminded of the legends of the lustful queen Semiramis, and the likeness may be more than superficial. Yet these women are not allowed, under pain of death, to bear children; hence they practise abortion. Both the licence and the prohibition may be explained if we suppose that formerly the kingdom descended, as it still does in Ashantee, first to the king's brothers and next to the sons of his sisters. For in that case the next heirs to the throne would be the sons of the king's mother and of his sisters, and these women might accordingly be allowed, as the king's sisters still are allowed in Ashantee, to mate with any handsome men who took their fancy, in order that their offspring might be of regal part. But when the line of descent was changed from the female to the male line, in other words, when the kings

were succeeded by their sons instead of by their brothers or their sisters' sons, then the king's mother and his sisters would be forbidden to bear children lest the descent of the crown to the king's own children should be endangered by the existence of rivals who, according to the old law of the kingdom, had a better right to the throne. We may surmise that the practice of putting the king's brothers to death at the beginning of his reign, which survived till Uganda passed under English protection, was instituted at the same time as the prohibition of child-bearing laid on the king's mother and sisters. The one custom got rid of existing rivals; the other prevented them from being born. That the kingship in Uganda was formerly transmitted in the female line is strongly indicated by the rule that the kings and the rest of the royal family take their totems from their mothers, whereas all the other people of the country get their totems from their fathers.

In Loango the blood royal is traced in the female line, and here also the princesses are free to choose and divorce their husbands at pleasure, and to cohabit at the same time with other men. These husbands are nearly always plebeians, for princes and princesses, who are very numerous and form a ruling caste in the country, may not marry each other. The lot of a prince consort is not a happy one, for he is rather the slave and prisoner than the mate of his imperious princess. In marrying her he engages never more to look at a woman during the whole time he cohabits with his royal spouse. When he goes out he is preceded by guards who drive away all females from the road where he is to pass. If in spite of these precautions he should by ill-luck cast his eyes on a woman, the princess may have his head chopped off, and commonly exercises, or used to exercise, the right. This sort of libertinism, sustained by power, often carries the princesses to the greatest excesses, and nothing is so much dreaded as their anger. No wonder that commoners in general avoid the honour of a royal alliance. Only poor and embarrassed men seek it as a protection against their creditors and enemies. All the children of such a man by such a wife are princes and princesses, and any one of the princes may in time be chosen king; for in Loango the crown is not hereditary but elective. Thus it would seem that the father of the King of Loango is nearly always a plebeian, and often little better than a slave.

Near the Chambezi river, which falls into Lake Bengweolo in Central Africa, there is a small state governed by a queen who belongs to the reigning family of Ubemba. She bears the title of *Mamfumer* or Mother of Kings. "The privileges attached to this dignity are numerous. The most singular is that the queens may choose for themselves their husband among the common people. The chosen man becomes prince-consort without sharing in the administration of affairs. He is bound to leave everything to follow his royal and often but little accommodating spouse. To shew that in these households the rights are inverted and that a man may be changed into a woman, the queen takes the title of *Monsieur* and her husband that of *Madame*."

At Athens, as at Rome, we find traces of succession to the throne by marriage with a royal princess; for two of the most ancient kings of Athens, namely Cecrops and Amphictyon, are said to have married the daughters of their predecessors. This tradition is confirmed by the evidence, which I shall adduce presently, that at Athens male kinship was preceded by female kinship.

Further, if I am right in supposing that in ancient Latium the royal families kept their daughters at home and sent forth their sons to marry princesses and reign among their wives' people, it will follow that the male descendants would reign in successive generations over different kingdoms. Now this seems to have happened both in ancient Greece and in ancient Sweden; from which we may legitimately infer that it was a custom practised by more than one branch of the Aryan stock in Europe. Take, for instance, the great house of Aeacus, the

grandfather of Achilles and Ajax. Aeacus himself reigned in Aegina, but his descendants, as has been justly observed, “from the beginning went forth to other lands.” His son Telamon migrated to the island of Salamis, married the king’s daughter, and reigned over the country. Telamon’s son Teucer, in his turn, migrated to Cyprus, wedded the king’s daughter, and succeeded his father-in-law on the throne. Again, Peleus, another son of Aeacus, quitted his native land and went away to Phthia in Thessaly, where he received the hand of the king’s daughter, and with her a third of the kingdom. Of Achilles, the son of Peleus, we are told that in his youth he was sent to the court of Lycomedes, King of Scyros, where he got one of the princesses with child. The tradition seems to shew that Achilles followed the custom of his family in seeking his fortune in a foreign land. His son Neoptolemus, after him, went away to Epirus, where he settled and became the ancestor of the kings of the country.

Again, Tydeus was a son of Oeneus, the King of Calydon in Aetolia, but he went to Argos and married the king’s daughter. His son Diomedes migrated to Daunia in Italy, where he helped the king in a war with his enemies, receiving as his reward the king’s daughter in marriage and part of the kingdom. As another example we may take the family of the Pelopidae, whose tragic fortunes the Greek poets never wearied of celebrating. Their ancestor was Tantalus, King of Sipylus in Asia Minor. But his son Pelops passed into Greece, won Hippodamia, the daughter of the King of Pisa, in the famous chariot-race, and succeeded his father-in-law on the throne. His son Atreus did not remain in Pisa, but migrated to Mycenae, of which he became king; and in the next generation Menelaus, son of Atreus, went to Sparta, where he married Helen, the king’s daughter, and himself reigned over the country. Further, it is very notable that, according to the old lyric poets, Agamemnon himself, the elder brother of Menelaus, reigned not at Mycenae but in Lacedaemon, the native land of his wife Clytaemnestra, and that he was buried at Amyclae, the ancient capital of the country.

Various reasons are assigned by ancient Greek writers for these migrations of the princes. A common one is that the king’s son had been banished for murder. This would explain very well why he fled his own land, but it is no reason at all why he should become king of another. We may suspect that such reasons are afterthoughts devised by writers who, accustomed to the rule that a son should succeed to his father’s property and kingdom, were hard put to it to account for so many traditions of kings’ sons who quitted the land of their birth to reign over a foreign kingdom.

In Scandinavian tradition we meet with traces of similar customs. For we read of daughters’ husbands who received a share of the kingdoms of their royal fathers-in-law, even when these fathers-in-law had sons of their own; in particular, during the five generations which preceded Harold the Fair-haired, male members of the Ynglingar family, which is said to have come from Sweden, are reported in the *Heimskringla* or *Sagas of the Norwegian Kings* to have obtained at least six provinces in Norway by marriage with the daughters of the local kings.

Thus it would seem that among some Aryan peoples, at a certain stage of their social evolution, it has been customary to regard women and not men as the channels in which royal blood flows, and to bestow the kingdom in each successive generation on a man of another family, and often of another country, who marries one of the princesses and reigns over his wife’s people. A common type of popular tale, which relates how an adventurer, coming to a strange land, wins the hand of the king’s daughter and with her the half or the whole of the kingdom, may well be a reminiscence of a real custom.

Where usages and ideas of this sort prevail, it is obvious that the kingship is merely an appanage of marriage with a woman of the blood royal. The old Danish historian Saxo Grammaticus puts this view of the kingship very clearly in the mouth of Hermutrude, a

legendary queen of Scotland, and her statement is all the more significant because, as we shall see presently, it reflects the actual practice of the Pictish kings. "Indeed she was a queen," says Hermutrude, "and but that her sex gainsaid it, might be deemed a king; nay (and this is yet truer), whomsoever she thought worthy of her bed was at once a king, and she yielded her kingdom with herself. Thus her sceptre and her hand went together." Wherever a custom of this sort is observed, a man may clearly acquire the kingdom just as well by marrying the widow as the daughter of his predecessor. This is what Aegisthus did at Mycenae, and what Hamlet's uncle Feng and Hamlet's successor Wiglet did in Denmark; all three slew their predecessors, married their widows, and then sat peacefully on the throne. The tame submission of the people to their rule would be intelligible, if they regarded the assassins, in spite of their crime, as the lawful occupants of the throne by reason of their marriage with the widowed queens. Similarly, Gyges murdered Candaules, King of Lydia, married his queen, and reigned over the country. Nor was this the only instance of such a succession in the history of Lydia. The wife of King Cadys conspired against his life with her paramour Spermus, and though her husband recovered from the dose of poison which she administered to him, he died soon afterwards, and the adulterer married his leman and succeeded to the throne. These cases excite a suspicion that in the royal house of Lydia descent was traced in the female line, and the suspicion is strengthened by the legendary character of Omphale, the ancestress of the dynasty. For she is represented as a masculine but dissolute queen of the Semiramis type, who wore male attire and put all her favoured lovers to death, while on the other hand her consort Hercules was her purchased slave, was treated with indignity, and went about dressed as a woman. This plainly implies that the queen was a far more powerful and important personage than the king, as would naturally happen wherever it is the queen who confers royalty on her consort at marriage instead of receiving it from him. The story that she prostituted the daughters of the Lydians to their male slaves is of a piece with the tradition that she herself married her slave Hercules. It may mean little more than that the Lydians were indifferent to paternity, and that the children of freewomen by slaves ranked as free. Such an indifference to fatherhood, coupled with the ancient accounts of the loose morals of the Lydian girls, who were accustomed to earn a dowry by prostitution, is a mark of the system of female kinship. Hence we may conjecture that Herodotus was wrong in saying that from Hercules to Candaules the crown of Lydia had descended for twenty-two generations from father to son. The old mode of transmitting the crown of Lydia through women probably did not end with Candaules. At least we are told that his murderer and successor Gyges, like Hercules, the mythical founder of the dynasty, gave himself and his kingdom into the hands of the woman he loved, and that when she died he collected all the slaves from the country round about and raised in her memory a mound so lofty that it could be seen from every part of the Lydian plain, and for centuries after was known as the Harlot's Tomb.

When Canute the Dane had been acknowledged King of England, he married Emma, the widow of his predecessor Ethelred, whose throne he had overturned and whose children he had driven into exile. The marriage has not unnaturally puzzled the historians, for Emma was much older than her second husband, she was then living in Normandy, and it is very doubtful whether Canute had ever seen her before she became his bride. All, however, becomes plain if, as the cases of Feng and Wiglet seem to shew, it was an old Danish custom that marriage with a king's widow carried the kingdom with it as a matter of right. In that case the young but prudent Canute married the mature widow merely out of policy in order to clinch, according to Danish notions, by a legal measure his claim to that crown which he had already won for himself by the sword. Among the Saxons and their near kinsmen the Varini it appears to have been a regular custom for the new king to marry his stepmother. Thus Hermegisclus, King of the Varini, on his deathbed enjoined his son Radigis to wed his

stepmother in accordance with their ancestral practice, and his injunction was obeyed. Edbald, King of Kent, married his stepmother after the death of his father Ethelbert; and as late as the ninth century Ethelbald, King of the West Saxons, wedded Judith, the widow of his father Ethelwulf. Such marriages are intelligible if we suppose that old Saxon as well as old Danish law gave the kingdom to him who married the late king's widow.

To the view that the right to the Latin kingship was derived from women and not from men, it may be objected that the system of female kinship or mother-kin is unknown among the Aryans, and that even if faint traces of it may be met with elsewhere, the last place in the world where we should look for it would be Rome, the stronghold of the patriarchal family. To meet this objection it is necessary to point to some facts which appear to be undoubted survivals among Aryan peoples of a custom of tracing descent through the mother only.

In Attica tradition ran that of old the women were the common property of the men, who coupled with them like beasts, so that while every one knew his mother, nobody knew who his father was. This system of sexual communism was abolished by Cecrops, the first King of Athens, who introduced individual marriage in its place. Little weight could be attached to this tradition, if it were not supported to a certain extent by the Attic usage which always allowed a man to marry his half-sister by the same father but not his half-sister by the same mother. Such a rule seems clearly to be a relic of a time when kinship was counted only through women. Again, the Epizephyrian Locrians in Italy traced all ancestral distinction in the female, not the male line. Among them the nobles were the members of the hundred houses from whom were chosen by lot the maidens to be sent to Troy. For in order, it is said, to expiate the sacrilege committed by the Locrian Ajax when he violated Cassandra in the sanctuary of Athena at Troy, the cities of Locris used annually to send to the Trojan goddess two maidens, whom the Trojans slew, and, burning their bodies on the wood of certain trees which bore no fruit, threw the ashes into the sea. If the maidens contrived to escape they took refuge in the sanctuary of Athena, which they thenceforth swept and washed, never quitting it except at night, and always going barefoot, shorn, and clad in a single garment. The custom is said to have been observed for a thousand years down to the fourth century before our era. Among the Locrians, as elsewhere, the system of female kinship would seem to have gone hand in hand with dissolute morals; for there is reason to think that of old the Locrians, like the Lydians and Armenians, had been wont to prostitute their daughters before marriage, though in later times the custom fell into abeyance. The Cantabrians of Spain seem also to have had mother-kin; for among them it was the daughters who inherited property and who portioned out their brothers in marriage. Again, the ancient Germans deemed the tie between a man and his sister's children as close as that between a father and his children; indeed some regarded the bond as even closer and more sacred, and therefore in exacting hostages they chose the children of a man's sister rather than his own children, believing that this gave them a firmer hold on the family. The superiority thus assigned to the maternal uncle over the father is an infallible mark of mother-kin, either present or past, as may be observed, for instance, in very many African tribes to this day, among whom both property and political power pass, not from father to son, but from the maternal uncle to his nephews. Similarly, in Melanesia the close relation of the mother's brother to his nephew is maintained even where the system of relationship has become patriarchal. Amongst the Germans in the time of Tacitus, it is true, a man's heirs were his own children, but the mother's brother could never have attained the position he held except under a system of maternal descent. Another vestige of mother-kin among a Teutonic people appears to be found in the Salic law. For it was a custom with the Salian Franks that when a widow married again, a price had to be paid to her

family, and in laying down the order in which her kinsmen were entitled to receive this payment the law gave a decided preference to the female over the male line; thus the first person entitled to claim the money was the eldest son of the widow's sister.

It is a moot point whether the Picts of Scotland belonged to the Aryan family or not; but among them the kingdom was certainly transmitted through women. Bede tells us that down to his own time, in the early part of the eighth century, whenever a doubt arose as to the succession, the Picts chose their king from the female rather than the male line. The statement is amply confirmed by historical evidence. For we possess a list of the Pictish kings and their fathers which was drawn up in the reign of Cennad, King of the Scots, towards the end of the tenth century; and for the period from the year 583 to the year 840 the register is authenticated by the Irish Annals of Tigernach and Ulster. Now, it is significant that in this list the fathers of the kings are never themselves kings; in other words, no king was succeeded on the throne by his son. Further, if we may judge by their names, the fathers of the Pictish kings were not Picts but foreigners—men of Irish, Cymric, or English race. The inference from these facts seems to be that among the Picts the royal family was exogamous, and that the crown descended in the female line; in other words, that the princesses married men of another clan or even of another race, and that their issue by these strangers sat on the throne, whether they succeeded in a prescribed order according to birth, or whether they were elected from among the sons of princesses, as the words of Bede might be taken to imply.

Another European, though apparently not Aryan, people among whom the system of female kinship appears to have prevailed were the Etruscans. For in Etruscan sepulchral inscriptions the name of the mother of the deceased is regularly recorded along with or even without the name of the father; and where the names of both father and mother are mentioned, greater prominence is given to the mother's name by writing it in full, whereas the father's name is, in accordance with Roman usage, merely indicated by an initial. The statement of Theopompus that among the Etruscans sexual communism was a recognised practice, and that paternity was unknown, may be only an exaggerated way of saying that they traced their descent through their mothers and not through their fathers. Yet apparently in Etruria, as elsewhere, this system of relationship was combined with a real indifference to fatherhood and with the dissolute morals which that indifference implies; for Etruscan girls were wont to earn a dowry by prostitution. In these customs the Etruscans resembled the Lydians, and the similarity confirms the common opinion of antiquity, which modern historians have too lightly set aside, that the Etruscans were of Lydian origin. However that may be, in considering the vestiges of mother-kin among the Latins, we shall do well to bear in mind that the same archaic mode of tracing descent appears to have prevailed among the neighbouring Etruscans, who not only exercised a powerful influence on Rome, but gave her two, if not three, of her kings.

It would be neither unnatural nor surprising if among the ancient Latins mother-kin survived in the royal family after it had been exchanged for father-kin in all others. For royalty, like religion, is essentially conservative; it clings to old forms and old customs which have long vanished from ordinary life. Thus in Uganda persons of royal blood still inherit their totems from their mothers, while other people inherit them from their fathers. So in Denmark and Scandinavia, as we have seen, the kingdom would appear to have been transmitted through women long after the family name and property had become hereditary in the male line among the people. Sometimes the difference in custom between kings and commoners is probably based rather on a distinction of race than on varying degrees of social progress; for a dynasty is often a family of alien origin who have imposed their rule on their subjects by force of arms, as the Normans did on the Saxons, and the Manchus on the Chinese. More rarely, perhaps, it may have happened that from motives of policy or superstition

a conquering tribe has left a nominal kingship to the members of the old royal house. Such a concession would be most likely to be made where the functions of the king were rather religious than civil, and where the prosperity of the country was supposed to depend on the maintenance of the established relations between the people and the gods of the land. In that case the new-comers, knowing not how to appease and conciliate these strange deities, might be glad to let the priestly kings of the conquered race perform the quaint rites and mumble the venerable spells, which had been found to answer their purpose time out of mind. In a commonwealth like the Roman, formed by the union of different stocks, the royal family might thus belong either to the conquerors or to the conquered; in other words, either to the patricians or to the plebeians. But if we leave out of account Romulus and Tatius, who are more or less legendary figures, and the two Tarquins, who came of a noble Etruscan house, all the other Roman kings appear from their names to have been men of plebeian, not patrician, families. Hence it seems probable that they belonged to the indigenous race, who may have retained mother-kin, at least in the royal succession, after they had submitted to invaders who knew father-kin only.

If that was so, it confirms the view that the old Roman kingship was essentially a religious office; for the conquerors would be much more ready to leave an office of this sort in the hands of the conquered than a kingship of the type with which we are familiar. "Let these puppets," they might think, "render to the gods their dues, while we rule the people in peace and lead them in war." Of such priestly kings Numa was the type. But not all of his successors were willing to model themselves on his saintly figure and, rejecting the pomps and vanities of earth, to devote themselves to communion with heaven. Some were men of strong will and warlike temper, who could not brook the dull routine of the cloister. They longed to exchange the stillness and gloom of the temple or the sacred grove for the sunshine, the dust, and the tumult of the battlefield. Such men broke bounds, and when they threatened to get completely out of hand and turn the tables on the patricians, it was time that they should go. This, we may conjecture, was the real meaning of the abolition of the kingship at Rome. It put an end to the solemn pretence that the state was still ruled by the ancient owners of the soil: it took the shadow of power from them and gave it to those who had long possessed the substance. The ghost of the monarchy had begun to walk and grow troublesome: the revolution laid it for centuries.

But though the effect of the revolution was to substitute the real rule of the patricians for the nominal rule of the plebeians, the break with the past was at the outset less complete than it seems. For the first two consuls were both men of the royal blood. One of them, L. Junius Brutus, was sister's son of the expelled King Tarquin the Proud. As such he would have been the heir to the throne under a strict system of mother-kin. The other consul, L. Tarquinius Collatinus, was a son of the late king's cousin Egerius. These facts suggest that the first intention of the revolutionaries was neither to abolish the kingship nor to wrest it from the royal family, but, merely retaining the hereditary monarchy, to restrict its powers. To achieve this object they limited the tenure of office to a year and doubled the number of the kings, who might thus be expected to check and balance each other. But it is not impossible that both restrictions were merely the revival of old rules which the growing power of the kings had contrived for a time to set aside in practice. The legends of Romulus and Remus, and afterwards of Romulus and Tatius, may be real reminiscences of a double kingship like that of Sparta; and in the yearly ceremony of the *Regifugium* or Flight of the King we seem to detect a trace of an annual, not a life-long, tenure of office. The same thing may perhaps be true of the parallel change which took place at Athens when the people deprived the Medontids of their regal powers and reduced them from kings to responsible magistrates, who held office at first for life, but afterwards only for periods of ten years. Here, too, the

limitation of the tenure of the kingship may have been merely the reinforcement of an old custom which had fallen into abeyance. At Rome, however, the attempt to maintain the hereditary principle, if it was made at all, was almost immediately abandoned, and the patricians openly transferred to themselves the double kingship, which thenceforth was purely elective, and was afterwards known as the consulship.

The history of the last king of Rome, Tarquin the Proud, leads us to suspect that the offence which he gave by his ambitious and domineering character was heightened by an attempt to shift the succession of the kingship from the female to the male line. He himself united both rights in his own person; for he had married the daughter of his predecessor, Servius Tullius, and he was the son or grandson of Tarquin the Elder, who preceded Servius Tullius on the throne. But in asserting his right to the crown, if we can trust Roman history on this point, Tarquin the Proud entirely ignored his claim to it through women as the son-in-law of his predecessor, and insisted only on his claim in the male line as the son or grandson of a former king. And he evidently intended to bequeath the kingdom to one of his sons; for he put out of the way two of the men who, if the succession had been through women in the way I have indicated, would have been entitled to sit on the throne before his own sons, and even before himself. One of these was his sister's husband, the other was her elder son. Her younger son, the famous Lucius Junius Brutus, only escaped the fate of his father and elder brother by feigning, like Hamlet, imbecility, and thus deluding his wicked uncle into the belief that he had nothing to fear from such a simpleton. This design of Tarquin to alter the line of succession from the female to the male side of the house may have been the last drop which filled his cup of high-handed tyranny to overflowing. At least it is a strange coincidence, if it is nothing more, that he was deposed by the man who, under a system of female kinship, was the rightful heir, and who in a sense actually sat on the throne from which he pushed his uncle. For the curule chair of the consul was little less than the king's throne under a limited tenure.

It has often been asked whether the Roman monarchy was hereditary or elective. The question implies an opposition between the two modes of succession which by no means necessarily exists. As a matter of fact, in many African tribes at the present day the succession to the kingdom or the chieftainship is determined by a combination of the hereditary and the elective principle, that is, the kings or chiefs are chosen by the people or by a body of electors from among the members of the royal family. And as the chiefs have commonly several wives and many children by them, the number of possible candidates may be not inconsiderable. For example, we are told that "the government of the Banyai is rather peculiar, being a sort of feudal republicanism. The chief is elected, and they choose the son of the deceased chief's sister in preference to his own offspring. When dissatisfied with one candidate, they even go to a distant tribe for a successor, who is usually of the family of the late chief, a brother, or a sister's son, but never his own son or daughter. When first spoken to on the subject, he answers as if he thought himself unequal to the task and unworthy of the honour, but, having accepted it, all the wives, goods, and children of his predecessor belong to him, and he takes care to keep them in a dependent position." Among these people "the children of the chief have fewer privileges than common free men. They may not be sold, but, rather than choose any one of them for a chief at any future time, the free men would prefer to elect one of themselves who bore only a very distant relationship to the family."

Sometimes the field of choice is extended still further by a rule that the chief may or must be chosen from one of several families in a certain order. Thus among the Bangalas of the Cassange Valley in Angola the chief is elected from three families in rotation. And Diagara, a country bordering on Senegambia, is ruled by an absolute monarch who is chosen alternately from two families, one of which lives in Diapina and the other in Badumar. In the

Winamwanga tribe, to the south of Lake Tanganyika, “the first male child born to a chief after he succeeds to the chieftainship is the natural heir, but many years ago there were two claimants to the throne, whose supporters were about equal, and to avoid a civil war the following arrangement was made. One of them was allowed to reign, but the other claimant or his son was to succeed him. This was carried out, so that now there are continually alternate dynasties.” So in the Matse tribe of Togoland in West Africa, there are two royal families descended from two women, which supply a king alternately. Hence the palm forest which belongs to the crown is divided into two parts; the reigning king has the right to one part, and the representative of the other royal house has a right to the other part. Among the Yorubas in western Africa the sovereign chief is always taken from one or more families which have the hereditary right of furnishing the community with rulers. In many cases the succession passes regularly from one to a second family alternately; but in one instance, apparently unique, the right of succession to the sovereignty seems to be possessed by four princely families, from each of which the head chief is elected in rotation. The principle of primogeniture is not necessarily followed in the election, but the choice of the electors must always fall on one who is related to a former chief in the male line. For paternal descent alone is recognised in Yorubaland, where even the greatest chief may take to wife a woman of the lowest rank. Sometimes the choice of the ruling chief is made by divine authority, intimated to the people through the high priest of the principal god of the district. Among the Igaras, on the lower Niger, the royal family is divided into four branches, each of which provides a king in turn. The capital and its district, both of which bear the name of Idah, are always occupied by the reigning branch of the royal family, while the three other branches, not being allowed to live there, retreat into the interior. Hence at the death of a king a double change takes place. On the one hand the late reigning family, with all their dependants, have to leave the homes in which many of them have been born and brought up, and to migrate to towns in the forest, which they know only by name. On the other hand, the new reigning family come into the capital, and their people settle in the houses occupied by their forefathers four reigns ago. The king is generally elected by the leading men of his branch of the royal family; they choose the richest and most powerful of their number.

Again, among the Khasis of Assam we meet with the same combination of the hereditary with the elective principle in the succession to the kingdom. Indeed, in this people the kingship presents several features of resemblance to the old Latin kingship as it appears to have existed at the dawn of history. For a Khasi king is the religious as well as the secular head of the state; along with the sooth-sayers he consults the auspices for the public good, and sometimes he has priestly duties to perform. Succession to the kingship always runs in the female line, for the Khasis have a regular system of mother-kin as opposed to father-kin; hence it is not the king’s sons, but his uterine brothers and the sons of his uterine sisters who succeed him on the throne in order of birth. But this hereditary principle is controlled by a body of electors, who have the right of rejecting unsuitable claimants to the throne. Generally the electors are a small body composed of the heads of certain priestly clans; but in some Khasi states the number of the electors has been greatly increased by the inclusion of representative headmen of certain important lay clans, or even by the inclusion of village headmen or of the chief superintendents of the village markets. Nay, in the Langrim state all the adult males regularly vote at the election of a monarch; and here the royal family is divided into two branches, a Black and a White, from either of which, apparently, the electors are free to choose a king. Similarly, in the Nobosohpoh state there are two royal houses, a Black and a White, and the people may select the heir to the throne from either of them.

Thus the mere circumstance that all the Roman kings, with the exception of the two Tarquins, appear to have belonged to different families, is not of itself conclusive against the view that

heredity was one of the elements which determined the succession. The number of families from whom the king might be elected may have been large. And even if, as is possible, the electors were free to choose a king without any regard to his birth, the hereditary principle would still be maintained if, as we have seen reason to conjecture, it was essential that the chosen candidate should marry a woman of the royal house, who would generally be either the daughter or the widow of his predecessor. In this way the apparently disparate principles of unfettered election and strict heredity would be combined; the marriage of the elected king with the hereditary princess would furnish the link between the two. Under such a system, to put it otherwise, the kings are elective and the queens hereditary. This is just the converse of what happens under a system of male kinship, where the kings are hereditary and the queens elective.

In the later times of Rome it was held that the custom had been for the people to elect the kings and for the senate to ratify the election. But we may suspect, with Mommsen, that this was no more than an inference from the mode of electing the consuls. The magistrates who, under the republic, represented the kings most closely were the dictator and the King of the Sacred Rites, and neither of these was elected by the people. Both were nominated, the dictator by the consul, and the King of the Sacred Rites by the chief pontiff. Accordingly it seems probable that under the monarchy the king was nominated either by his predecessor or, failing that, by an interim king (*interrex*) chosen from the senate. Now if, as we have been led to think, an essential claim to the throne was constituted by marriage with a princess of the royal house, nothing could be more natural than that the king should choose his successor, who would commonly be also his son-in-law. If he had several sons-in-law and had omitted to designate the one who was to reign after him, the election would be made by his substitute, the interim king.

The personal qualities which recommended a man for a royal alliance and succession to the throne would naturally vary according to the popular ideas of the time and the character of the king or his substitute, but it is reasonable to suppose that among them in early society physical strength and beauty would hold a prominent place. We have seen that in Ashantee the husbands or paramours of the princesses must always be men of fine presence, because they are to be the fathers of future kings. Among the Ethiopians in antiquity, as among the Ashantees and many other African tribes to this day, the crown passed in the female line to the son of the king's sister, but if there was no such heir they chose the handsomest and most valiant man to reign over them. We are told that the Gordioi elected the fattest man to the kingship, nor is this incredible when we remember that in Africa corpulence is still regarded as a great distinction and beauty, and that both the chiefs and their wives are sometimes so fat that they can hardly walk. Thus among the Caffres chiefs and rich men attain to an enormous bulk, and the queens fatten themselves on beef and porridge, of which they partake freely in the intervals of slumber. To be fat is with them a mark of riches, and therefore of high rank; common folk cannot afford to eat and drink and lounge as much as they would like to do. The Syrakoi in antiquity are reported to have bestowed the crown on the tallest man or on the man with the longest head in the literal, not the figurative, sense of the word. They seem to have been a Sarmatian people to the north of the Caucasus, and are probably the same with the long-headed people described by Hippocrates, who says that among them the men with the longest heads were esteemed the noblest, and that they applied bandages and other instruments to the heads of their children in infancy for the sake of moulding them into the shape which they admired. Such reports are probably by no means fabulous, for among the Monbuttu or Mang-bettou of Central Africa down to this day "when the children of chiefs are young, string is wound round their heads, which are gradually compressed into a shape that will allow of the longest head-dress. The skull thus treated in childhood takes the appearance

of an elongated egg.” Similarly some of the Indian tribes on the north-west coast of America artificially mould the heads of their children into the shape of a wedge or a sugar-loaf by compressing them between boards; some of them regard such heads as a personal beauty, others as a mark of high birth. For instance, “the practice among some of the Salish seems to have had a definite social, as well as aesthetic, significance. There appear to have been recognised degrees of contortion marking the social status of the individual. For example slaves, of which the Salish kept considerable numbers, were prohibited from deforming the heads of their children at all, consequently a normal, undeformed head was the sign and badge of servitude. And in the case of the base-born of the tribes the heads of their children were customarily but slightly deformed, while the heads of the children born of wealthy or noble persons, and particularly those of chiefs, were severely and excessively deformed.”

Among the Bororos of Brazil at the present day the title to chieftaincy is neither corpulence nor an egg-shaped head, but the possession of a fine musical ear and a rich baritone, bass, or tenor voice. The best singer, in fact, becomes the chief. There is no other way to supreme power but this. Hence in the education of the Bororo youth the main thing is to train, not their minds, but their voices, for the best of the tuneful quire will certainly be chief. In this tribe, accordingly, there is no such thing as hereditary chieftainship; for if the son of a chief has an indifferent ear or a poor voice, he will be a commoner to the end of his days. When two rival songsters are found in the same village, they sing against each other, and he who is judged to have acquitted himself best in the musical contest mounts the throne. His defeated rival sometimes retires in a huff with his admirers and founds a new village. Once seated in the place of power, the melodious singer is not only highly honoured and respected, but can exact unconditional obedience from all, and he gives his orders, like an operatic king or hero, in a musical recitativo. It is especially at eventide, when the sun has set and the labours of the day are over, that he pours out his soul in harmony. At that witching hour he takes up his post in front of the men’s club-house, and while his subjects are hushed in attention he bursts into sacred song, passing from that to lighter themes, and concluding the oratorio by chanting his commands to each individual for the next day. When Addison ridiculed the new fashion of the Italian opera, in which generals sang the word of command, ladies delivered their messages in music, and lovers chanted their billet-doux, he little suspected that among the backwoods of Brazil a tribe of savages in all seriousness observed a custom which he thought absurd even on the stage.

Sometimes apparently the right to the hand of the princess and to the throne has been determined by a race. The Alitemnian Libyans awarded the kingdom to the fleetest runner. Amongst the old Prussians, candidates for nobility raced on horseback to the king, and the one who reached him first was ennobled. According to tradition the earliest games at Olympia were held by Endymion, who set his sons to run a race for the kingdom. His tomb was said to be at the point of the racecourse from which the runners started. The famous story of Pelops and Hippodamia is perhaps only another version of the legend that the first races at Olympia were run for no less a prize than a kingdom. For Oenomaus was king of Pisa, a town close to Olympia; and having been warned by an oracle that he would die by the hand of the man who married his daughter Hippodamia, he resolved to keep her a maid. So when any one came a-wooing her, the king made the suitor drive away in a chariot with Hippodamia, while he himself pursued the pair in another car drawn by fleet horses, and, overtaking the unlucky wight, slew him. In this way he killed twelve suitors and nailed their heads to his house, the ruins of which were shewn at Olympia down to the second century of our era. The bodies of the suitors were buried under a lofty mound, and it is said that in former days sacrifices were offered to them yearly. When Pelops came to win the hand of Hippodamia, he bribed the charioteer of Oenomaus not to put the pins into the wheels of the king’s chariot. So

Oenomaus was thrown from the car and dragged by his horses to death. But some say he was despatched by Pelops according to the oracle. Anyhow, he died, and Pelops married Hippodamia and succeeded to the kingdom. The grave of Oenomaus was shown at Olympia; it was a mound of earth enclosed with stones. Here, too, precincts were dedicated to Pelops and Hippodamia, in which sacrifices were offered to them annually; the victim presented to Pelops was a black ram, whose blood was poured into a pit. Other traditions were current in antiquity of princesses who were offered in marriage to the fleetest runner and won by the victor in the race. Thus Icarius at Sparta set the wooers of his daughter Penelope to run a race; Ulysses won and wedded her. His father-in-law is said to have tried to induce him to take up his abode in Sparta; which seems to shew that if Ulysses had accepted the invitation he would have inherited the kingdom through his wife. So, too, the Libyan King Antaeus placed his beautiful daughter Barce or Alceis at the end of the racecourse; her many noble suitors, both Libyans and foreigners, ran to her as the goal, and Alcidas, who touched her first, gained her in marriage. Danaus, also, at Argos is said to have stationed his many daughters at the goal, and the runner who reached them first had first choice of the maidens. Somewhat different from these traditions is the story of Atalante, for in it the wooers are said to have contended, not with each other, but with the coy maiden herself in a foot-race. She slew her vanquished suitors and hung up their heads in the racecourse, till Hippomenes gained the race and her hand by throwing down the golden apples which she stooped to pick up.

These traditions may very well reflect a real custom of racing for a bride, for such a custom appears to have prevailed among various peoples, though in practice it has degenerated into a mere form or pretence. Thus "there is one race, called the 'Love Chase,' which may be considered a part of the form of marriage among the Kirghiz. In this the bride, armed with a formidable whip, mounts a fleet horse, and is pursued by all the young men who make any pretensions to her hand. She will be given as a prize to the one who catches her, but she has the right, besides urging on her horse to the utmost, to use her whip, often with no mean force, to keep off those lovers who are unwelcome to her, and she will probably favour the one whom she has already chosen in her heart. As, however, by Kirghiz custom, a suitor to the hand of a maiden is obliged to give a certain *kalym*, or purchase-money, and an agreement must be made with the father for the amount of dowry which he gives his daughter, the 'Love Chase' is a mere matter of form." Similarly "the ceremony of marriage among the Calmucks is performed on horseback. A girl is first mounted, who rides off in full speed. Her lover pursues; and if he overtakes her, she becomes his wife, and the marriage is consummated on the spot, after which she returns with him to his tent. But it sometimes happens that the woman does not wish to marry the person by whom she is pursued, in which case she will not suffer him to overtake her; and we were assured that no instance occurs of a Calmuck girl being thus caught unless she has a partiality for her pursuer. If she dislikes him she rides, to use the language of English sportsmen, 'neck or nothing,' until she has completely escaped, or until the pursuer's horse is tired out, leaving her at liberty to return, to be afterwards chased by some more favoured admirer." The race for the bride is found also among the Koryaks of north-eastern Asia. It takes place in a large tent, round which many separate compartments called *pologs* are arranged in a continuous circle. The girl gets a start and is clear of the marriage if she can run through all the compartments without being caught by the bridegroom. The women of the encampment place every obstacle in the man's way, tripping him up, belabouring him with switches, and so forth, so that he has little chance of succeeding unless the girl wishes it and waits for him. Among some of the rude indigenous tribes of the Malay Peninsula "marriage is preceded by a singular ceremony. An old man presents the future couple to the assembled guests, and, followed by their families, he leads them to a great circle, round which the girl sets off to run as fast as she can. If the young man

succeeds in overtaking her, she becomes his mate; otherwise he loses all rights, which happens especially when he is not so fortunate as to please his bride.” Another writer tells us that among these savages, when there is a river at hand, the race takes place on the water, the bride paddling away in one canoe and pursued by the bridegroom in another. Before the wedding procession starts for the bridegroom’s hut, a Caffre bride is allowed to make one last bid for freedom, and a young man is told off to catch her. Should he fail to do so, she is theoretically allowed to return to her father, and the whole performance has to be repeated; but the flight of the bride is usually a pretence.

Similar customs appear to have been practised by all the Teutonic peoples; for the German, Anglo-Saxon, and Norse languages possess in common a word for marriage which means simply bride-race. Moreover, traces of the custom survived into modern times. Thus in the Mark of Brandenburg, down to the first half of the nineteenth century at least, it was the practice for bride and bridegroom to run a race on their wedding day in presence of all the guests. Two sturdy men took the bride between them and set off. The bridegroom gave them a start and then followed hot-foot. At the end of the course stood two or three young married women, who took from the bride her maiden’s crown and replaced it by the matron’s cap. If the bridegroom failed to overtake his bride, he was much ridiculed. In other parts of Germany races are still held at marriage, but the competitors are no longer the bride and bridegroom. Thus in Hesse at the wedding of a well-to-do farmer his friends race on horseback to the house of the bride, and her friends similarly race on horseback to the house of the bridegroom. The prize hangs over the gate of the farmyard or the door of the house. It consists of a silken or woollen handkerchief, which the winner winds round his head or fastens to his breast. The victors have also the right to escort the marriage procession. In Upper Bavaria, down at least to some fifty years ago, a regular feature of a rustic wedding used to be what was called the “bride-race” or the “key-race.” It generally took place when the bridal party was proceeding from the church to the alehouse. A course was marked out and two goals, consisting of heaps of straw, were set up at distances of three and four hundred yards respectively. The strongest and fleetest of the young fellows raced barefoot, clad only in shirt and trousers. He who first reached the further goal received the first prize; this was regularly a key of gilt wood, which the winner fastened to his hat. Often, as in some of the Greek legends, the bride herself was the goal of the race. The writers who record the custom suggest that the race was originally for the key of the bridechamber, and that the bridegroom ran with the rest. In Scotland also the guests at a rustic wedding used to ride on horseback for a prize, which sometimes consisted of the bride’s cake set up on a pole in front of the bridegroom’s house. The race was known as the *broose*. At Weitensfeld, in Carinthia, a festival called the Bride-race is still held every year. It is popularly supposed to commemorate a time when a plague had swept away the whole people except a girl and three young men. These three, it is said, raced with each other in order that the winner might get the maiden to wife, and so repeople the land. The race is now held on horseback. The winner receives as the prize a garland of flowers called the Bride-wreath, and the man who comes in last gets a wreath of ribbons and pig’s bristles. It seems not impossible that this custom is a relic of a fair at which the marriageable maidens of the year were assigned in order of merit to the young men who distinguished themselves by their feats of strength and agility. A practice of this sort appears to have prevailed among the ancient Samnites. Every year the youths and maidens were tested publicly, and the young man who was adjudged best had first choice of the girls; the second best had the next choice, and so on with the rest. “They say,” writes Strabo, “that the Samnites have a beautiful custom which incites to virtue. For they may not give their daughters in marriage to whom they please, but every year the ten best maidens and the ten best youths are picked out, and the best of the ten maidens is given to the best of the ten youths, and the second to the second, and so on. But if the man who wins one

of these prizes should afterwards turn out a knave, they disgrace him and take the girl from him." The nature of the test to which the young men and women were subjected is not mentioned, but we may conjecture that it was mainly athletic.

The contests for a bride may be designed to try the skill, strength, and courage of the suitors as well as their horsemanship and speed of foot. Speaking of King's County, Ireland, in the latter part of the eighteenth century, Arthur Young says: "There is a very ancient custom here, for a number of country neighbours among the poor people, to fix upon some young woman that ought, as they think, to be married; they also agree upon a young fellow as a proper husband for her; this determined, they send to the fair one's cabin to inform her that on the Sunday following 'she is to be horsed,' that is, carried on men's backs. She must then provide whisky and cyder for a treat, as all will pay her a visit after mass for a hurling match. As soon as she is horsed, the hurling begins, in which the young fellow appointed for her husband has the eyes of all the company fixed on him: if he comes off conqueror, he is certainly married to the girl; but if another is victorious, he as certainly loses her, for she is the prize of the victor. These trials are not always finished in one Sunday, they take sometimes two or three, and the common expression when they are over is, that 'such a girl was goal'd.' Sometimes one barony hurls against another, but a marriageable girl is always the prize. Hurling is a sort of cricket, but instead of throwing the ball in order to knock down a wicket, the aim is to pass it through a bent stick, the ends stuck in the ground." In the great Indian epic the *Mahabharata* it is related that the hand of the lovely Princess Draupadi or Krishna, daughter of the King of the Panchalas, was only to be won by him who could bend a certain mighty bow and shoot five arrows through a revolving wheel so as to hit the target beyond. After many noble wooers had essayed the task in vain, the disguised Arjun was successful, and carried off the princess to be the wife of himself and his four brothers. This was an instance of the ancient Indian practice of *Svayamvara*, in accordance with which a maiden of high rank either chose her husband from among her assembled suitors or was offered as the prize to the conqueror in a trial of skill. The custom was occasionally observed among the Rajputs down to a late time. The Tartar king Caidu, the cousin and opponent of Cublay Khan, is said to have had a beautiful daughter named Aijaruc, or "the Bright Moon," who was so tall and brawny that she outdid all men in her father's realm in feats of strength. She vowed she would never marry till she found a man who could vanquish her in wrestling. Many noble suitors came and tried a fall with her, but she threw them all; and from every one whom she had overcome she exacted a hundred horses. In this way she collected an immense stud. In the *Nibelungenlied* the fair Brunhild, Queen of Iceland, was only to be won in marriage by him who could beat her in three trials of strength, and the unsuccessful wooers forfeited their heads. Many had thus perished, but at last Gunther, King of the Burgundians, vanquished and married her. It is said that Sithon, King of the Odomanti in Thrace, had a lovely daughter, Pallene, and that many men came a-wooing her not only from Thrace but from Illyria and the country of the Don. But her father said that he who would wed his daughter must first fight himself and pay with his life the penalty of defeat. Thus he slew many young men. But when he was grown old and his strength had failed, he set two of the wooers, by name Dryas and Clitus, to fight each other for the kingdom and the hand of the princess. The combat was to take place in chariots, but the princess, being in love with Clitus, bribed his rival's charioteer to put no pins in the wheels of his chariot; so Dryas came to the ground, and Clitus slew him and married the king's daughter. The tale agrees closely with that of Pelops and Hippodamia. Both stories probably contain, in a legendary form, reminiscences of a real custom. Within historical times Clisthenes, tyrant of Sicyon, made public proclamation at the Olympian games that he would give his daughter Agariste in marriage to that suitor who, during a year's trial, should prove himself the best. So many young men who prided themselves on their persons and on their lineage assembled at Sicyon

from all parts of the Greek world. The tyrant had a racecourse and a wrestling school made on purpose for them, and there he put them through their paces. Of all the suitors none pleased him so much as Hippoclidus, the handsomest and richest man of Athens, a scion of the old princely house of Cypselus. And when the year was up and the day had come on which the award was to be made, the tyrant sacrificed a hundred oxen and entertained the suitors and all the people of Sicyon at a splendid banquet. Dinner being over, the wine went round and the suitors fell to wrangling as to their accomplishments and their wit. In this feast of reason the gay Hippoclidus outshone himself and them all until, flushed with triumph and liquor, he jumped on a table, danced to music, and then, as a finishing touch, stood on his head and sawed the air with his legs. This was too much. The tyrant in disgust told him he had danced away his marriage.

Thus it appears that the right to marry a girl, and especially a princess, has often been conferred as a prize in an athletic contest. There would be no reason, therefore, for surprise if the Roman kings, before bestowing their daughters in marriage, should have resorted to this ancient mode of testing the personal qualities of their future sons-in-law and successors. If my theory is correct, the Roman king and queen personated Jupiter and his divine consort, and in the character of these divinities went through the annual ceremony of a sacred marriage for the purpose of causing the crops to grow and men and cattle to be fruitful and multiply. Thus they did what in more northern lands we may suppose the King and Queen of May were believed to do in days of old. Now we have seen that the right to play the part of the King of May and to wed the Queen of May has sometimes been determined by an athletic contest, particularly by a race. This may have been a relic of an old marriage custom of the sort we have examined, a custom designed to test the fitness of a candidate for matrimony. Such a test might reasonably be applied with peculiar rigour to the king in order to ensure that no personal defect should incapacitate him for the performance of those sacred rites and ceremonies on which, even more than on the despatch of his civil and military duties, the safety and prosperity of the community were believed to depend. And it would be natural to require of him that from time to time he should submit himself afresh to the same ordeal for the sake of publicly demonstrating that he was still equal to the discharge of his high calling. A relic of that test perhaps survived in the ceremony known as the Flight of the King (*regifugium*), continued to be annually observed at Rome down to imperial times. On the twenty-fourth day of February a sacrifice used to be offered in the Comitium, and when it was over the King of the Sacred Rites fled from the Forum. We may conjecture that the Flight of the King was originally a race for an annual kingship, which may have been awarded as a prize to the fleetest runner. At the end of the year the king might run again for a second term of office; and so on, until he was defeated and deposed or perhaps slain. In this way what had once been a race would tend to assume the character of a flight and a pursuit. The king would be given a start; he ran and his competitors ran after him, and if he were overtaken he had to yield the crown and perhaps his life to the lightest of foot among them. In time a man of masterful character might succeed in seating himself permanently on the throne and reducing the annual race or flight to the empty form which it seems always to have been within historical times. The rite was sometimes interpreted as a commemoration of the expulsion of the kings from Rome; but this appears to have been a mere afterthought devised to explain a ceremony of which the old meaning was forgotten. It is far more likely that in acting thus the King of the Sacred Rites was merely keeping up an ancient custom which in the regal period had been annually observed by his predecessors the kings. What the original intention of the rite may have been must probably always remain more or less a matter of conjecture. The present explanation is suggested with a full sense of the difficulty and obscurity in which the subject is involved.

Thus, if my theory is correct, the yearly flight of the Roman king was a relic of a time when the kingship was an annual office awarded, along with the hand of a princess, to the victorious athlete or gladiator, who thereafter figured along with his bride as a god and goddess at a sacred marriage designed to ensure the fertility of the earth by homoeopathic magic. Now this theory is to a certain extent remarkably confirmed by an ancient account of the Saturnalia which was discovered and published some years ago by a learned Belgian scholar, Professor Franz Cumont of Ghent. From that account we learn that down to the beginning of the fourth century of our era, that is, down nearly to the establishment of Christianity by Constantine, the Roman soldiers stationed on the Danube were wont to celebrate the Saturnalia in a barbarous fashion which must certainly have dated from a very remote antiquity. Thirty days before the festival they chose by lot from among themselves a young and handsome man, who was dressed in royal robes to resemble the god Saturn. In that character he was allowed to indulge all his passions to the fullest extent; but when his brief reign of thirty days was over, and the festival of Saturn was come, he had to cut his own throat on the altar of the god he personated. We can hardly doubt that this tragic figure, whom a fatal lot doomed to masquerade for a short time as a deity and to die as such a violent death, was the true original of the merry monarch or King of the Saturnalia, as he was called, whom a happier lot invested with the playful dignity of Master of the Winter Revels. In all probability the grim predecessor of the frolicsome King of the Saturnalia belonged to that class of puppets who in some countries have been suffered to reign nominally for a few days each year merely for the sake of discharging a burdensome or fatal obligation which otherwise must have fallen on the real king. If that is so, we may infer that the part of the god Saturn, who was commonly spoken of as a king, was formerly played at the Saturnalia by the Roman king himself. And a trace of the Sacred Marriage may perhaps be detected in the licence accorded to the human representatives of Saturn, a licence which, if I am right, is strictly analogous to the old orgies of May Day and other similar festivals. It is to be observed that Saturn was the god of the seed, and the Saturnalia the festival of sowing held in December, when the autumn sowing was over and the husbandman gave himself up to a season of jollity after the long labours of summer and autumn. On the principles of homoeopathic magic nothing could be more natural than that, when the last seeds had been committed to the earth, the marriage of the powers of vegetation should be simulated by their human representatives for the purpose of sympathetically quickening the seed. In short, no time could be more suitable for the celebration of the Sacred Marriage. We have seen as a matter of fact that the sowing of the seed has often been accompanied by sexual orgies with the express intention of thereby promoting the growth of the crops. At all events the view that the King's Flight at Rome was a mitigation of an old custom of putting him to death at the end of a year's tenure of office, is confirmed by the practice of annually slaying a human representative of the divine king Saturn, which survived in some parts of the Roman empire, though not at Rome itself, down to Christian times.

This theory would throw light on some dark passages in the legends of the Roman kingship, such as the obscure and humble births of certain kings and their mysterious ends. For if the sacred marriage took place at a licentious festival like the Saturnalia, when slaves were temporarily granted the privileges of freemen, it might well be that the paternity of the children begotten at this time, including those of the royal family, was a matter of uncertainty; nay, it might be known that the king or queen had offspring by a slave. Such offspring of a royal father and a slave mother, or of a royal mother and a slave father, would rank as princes and princesses according as male or female kinship prevailed. Under a system of male kinship the union of the king with a slave woman would give birth to a Servius Tullius, and, according to one tradition, to a Romulus. If female kinship prevailed in the royal family, as we have seen reason to suppose, it is possible that the stories of the birth of

Romulus and Servius from slave mothers is a later inversion of the facts, and that what really happened was that some of the old Latin kings were begotten by slave fathers on royal princesses at the festival of the Saturnalia. The disappearance of female kinship would suffice to account for the warping of the tradition. All that was distinctly remembered would be that some of the kings had had a slave for one of their parents; and people living under a system of paternal descent would naturally conclude that the slave parent of a king could only be the mother, since according to their ideas no son of a slave father could be of royal blood and sit on the throne.

Again, if I am right in supposing that in very early times the old Latin kings personated a god and were regularly put to death in that character, we can better understand the mysterious or violent ends to which so many of them are said to have come. Too much stress should not, however, be laid on such legends, for in a turbulent state of society kings, like commoners, are apt to be knocked on the head for much sounder reasons than a claim to divinity. Still, it is worth while to note that Romulus is said to have vanished mysteriously like Aeneas, or to have been cut to pieces by the patricians whom he had offended, and that the seventh of July, the day on which he perished, was a festival which bore some resemblance to the Saturnalia. For on that day the female slaves were allowed to take certain remarkable liberties. They dressed up as free women in the attire of matrons and maids, and in this guise they went forth from the city, scoffed and jeered at all whom they met, and engaged among themselves in a fight, striking and throwing stones at each other. Moreover, they feasted under a wild fig-tree, made use of a rod cut from the tree for a certain purpose, perhaps to beat each other with, and offered the milky juice of the tree in sacrifice to Juno Caprotina, whose name appears to mean either the goddess of the goat (*caper*) or the goddess of the wild fig-tree, for the Romans called a wild fig-tree a goat-fig (*caprificus*). Hence the day was called the *Nonae Caprotinae* after the animal or the tree. The festival was not peculiar to Rome, but was held by women throughout Latium. It can hardly be dissociated from a custom which was observed by ancient husbandmen at this season. They sought to fertilise the fig-trees or ripen the figs by hanging strings of fruit from a wild fig-tree among the boughs. The practice appears to be very old. It has been employed in Greece both in ancient and modern times, and Roman writers often refer to it. Palladius recommends the solstice in June, that is Midsummer Day, as the best time for the operation; Columella prefers July. In Sicily at the present day the operation is performed either on Midsummer Day (the festival of St. John the Baptist) or in the early days of July; in Morocco and North Africa generally it takes place on Midsummer Day. The wild fig-tree is a male and the cultivated fig-tree is a female, and the fertilisation is effected by insects, which are engendered in the fruit of the male tree and convey the pollen to the blossom of the female. Thus the placing of wild figs, laden with pollen and insects, among the boughs of the cultivated fig-tree is, like the artificial fertilisation of the date-palm, a real marriage of the trees, and it may well have been regarded as such by the peasants of antiquity long before the true theory of the process was discovered. Now the fig is an important article of diet in countries bordering on the Mediterranean. In Palestine, for example, the fruit is not, as with us, merely an agreeable luxury, but is eaten daily and forms indeed one of the staple productions of the country. "To sit every man under his vine, and under his fig tree" was the regular Jewish expression for the peaceable possession of the Holy Land; and in the fable of Jotham the fig-tree is invited by the other trees, next after the olive, to come and reign over them. When Sandanis the Lydian attempted to dissuade Croesus from marching against the Persians, he represented to him that there was nothing to be gained by conquering the inhabitants of a barren country who neither drank wine nor ate figs. An Arab commentator on the Koran observes that "God swears by these two trees, the fig and the olive, because among fruit-trees they surpass all the rest. They relate that a basket of figs was offered to the prophet Mohammed, and when he had eaten one he bade his comrades do the

same, saying, ‘Truly, if I were to say that any fruit had come down from Paradise, I would say it of the fig.’” Hence it would be natural that a process supposed to be essential to the ripening of so favourite a fruit should be the occasion of a popular festival. We may suspect that the license allowed to slave women on this day formed part of an ancient Saturnalia, at which the loose behaviour of men and women was supposed to secure the fertilisation of the fig-trees by homoeopathic magic.

But it is possible and indeed probable that the fertilisation was believed to be mutual; in other words, it may have been imagined, that while the women caused the fig-tree to bear fruit, the tree in its turn caused them to bear children. This conjecture is confirmed by a remarkable African parallel. The Akikuyu of British East Africa attribute to the wild fig-tree the power of fertilising barren women. For this purpose they apply the white sap or milk to various parts of the body of the would-be mother; then, having sacrificed a goat, they tie the woman to a wild fig-tree with long strips cut from the intestines of the sacrificial animal. “This seems,” writes Mr. C. W. Hobley, who reports the custom, “to be a case of the tree marriage of India. I fancy there is an idea of ceremonial marriage with the ancestral spirits which are said to inhabit certain of these fig-trees; in fact it supports the Kamba idea of the spiritual husbands.” The belief in spiritual husbands, to which Mr. Hobley here briefly refers, is as follows. The Akamba of British East Africa imagine that every married woman is at the same time the wife of a living man and also the wife of the spirit of some departed ancestor (*aimu*). They are firmly convinced that the fertility of a wife depends to a great extent on the attentions of her spiritual husband, and if she does not conceive within six months after marriage they take it as a sign that her spiritual husband is neglecting her; so they offer beer and kill a goat as a propitiatory sacrifice. If after that the woman still remains barren, they make a bigger feast and kill a bullock. On the other hand, if a wife is found to be with child soon after marriage, they are glad and consider it a proof that she has found favour in the eyes of her ghostly husband. Further, they believe that at death the human spirit quits the bodily frame and takes up its abode in a wild fig-tree (*mumbo*); hence they build miniature huts at the foot of those fig-trees which are thought to be haunted by the souls of the dead, and they periodically sacrifice to these spirits. Accordingly, we may conjecture, though we are not told, that amongst the Akamba, as among the Akikuyu, a barren woman sometimes resorts to a wild fig-tree in order to obtain a child, since she believes that her spiritual spouse has his abode in the tree. The Akikuyu clearly attribute a special power of fertilisation to the milky sap of the tree, since they apply it to various parts of the woman who desires to become a mother: perhaps they regard it as the seed of the fig. This may explain why the Roman slave-women offered the milky juice of the tree to Juno Caprotina; they may have intended thereby to add to the fecundity of the mother goddess. And we can scarcely doubt that the rods which they cut from the wild fig-tree, for the purpose apparently of beating each other, were supposed to communicate the generative virtue of the tree to the women who were struck by them. The Baganda of Central Africa appear to ascribe to the wild banana-tree the same power of removing barrenness which the Akikuyu attribute to the wild fig-tree. For when a wife has no child, she and her husband will sometimes repair to a wild banana-tree and there, standing one on each side of the tree, partake of the male organs of a goat, the man eating the flesh and drinking the soup and the woman drinking the soup only. This is believed to ensure conception after the husband has gone in to his wife. Here again, as among the Akikuyu, we see that the fertilising virtue of the tree is reinforced by the fertilising virtue of the goat; and we can therefore better understand why the Romans called the male wild fig-tree “goat-fig,” and why the Messenians dubbed it simply “he-goat.”

The association of the death of Romulus with the festival of the wild fig-tree can hardly be accidental, especially as he and his twin-brother Remus were said to have been suckled by the

she-wolf under a fig-tree, the famous *ficus Ruminalis*, which was shewn in the forum as one of the sacred objects of Rome and received offerings of milk down to late times. Indeed, some have gone so far both in ancient and modern times as to derive the names of Romulus and Rome itself from this fig-tree (*ficus Ruminalis*); if they are right, Romulus was “the fig-man” and Rome “the fig-town.” Be that as it may, the clue to the association of Romulus with the fig is probably furnished by the old belief that the king is responsible for the fruits of the earth and the rain from heaven. We may conjecture that on this principle the Roman king was expected to make the fig-trees blossom and bear figs, and that in order to do so he masqueraded as the god of the fig-tree and went through a form of sacred marriage, either with his queen or with a slave-woman, on the July day when the husbandmen resorted to a more efficacious means of producing the same result. The ceremony of the sacred marriage need not have been restricted to a single day in the year. It may well have been repeated for many different crops and fruits. If the Queen of Athens was annually married to the god of the vine, why should not the King of Rome have annually wedded the goddess of the fig?

But, as we have seen, Romulus, the first king of Rome, is said to have perished on the day of this festival of the fig, which, if our hypothesis is correct, was also the day of his ceremonial marriage to the tree. That the real date of his death should have been preserved by tradition is very improbable; rather we may suppose that the reason for dating his death and his marriage on the same day was drawn from some ancient ritual in which the two events were actually associated. But we have still to ask, Why should the king’s wedding-day be also the day of his death? The answer must be deferred for the present. All we need say now is that elsewhere the marriage of the divine king or human god has been regularly followed at a brief interval by his violent end. For him, as for others, death often treads on the heels of love.

Another Roman king who perished by violence was Tatius, the Sabine colleague of Romulus. It is said that he was at Lavinium offering a public sacrifice to the ancestral gods, when some men to whom he had given umbrage despatched him with the sacrificial knives and spits which they had snatched from the altar. The occasion and the manner of his death suggest that the slaughter may have been a sacrifice rather than an assassination. Again, Tullus Hostilius, the successor of Numa, was commonly said to have been killed by lightning, but many held that he was murdered at the instigation of Ancus Marcius, who reigned after him. Speaking of the more or less mythical Numa, the type of the priestly king, Plutarch observes that “his fame was enhanced by the fortunes of the later kings. For of the five who reigned after him the last was deposed and ended his life in exile, and of the remaining four not one died a natural death; for three of them were assassinated and Tullus Hostilius was consumed by thunderbolts.” This implies that King Ancus Marcius, as well as Tarquin the Elder and Servius Tullius, perished by the hand of an assassin. No other ancient historian, so far as I know, records this of Ancus Marcius, though one of them says that the king “was carried off by an untimely death.” Tarquin the Elder was slain by two murderers whom the sons of his predecessor, Ancus Marcius, had hired to do the deed. Lastly, Servius Tullius came by his end in circumstances which recall the combat for the priesthood of Diana at Nemi. He was attacked by his successor and killed by his orders, though not by his hand. Moreover, he lived among the oak groves of the Esquiline Hill at the head of the Slope of Virbius, and it was here, beside a sanctuary of Diana, that he was slain.

These legends of the violent ends of the Roman kings suggest that the contest by which they gained the throne may sometimes have been a mortal combat rather than a race. If that were so, the analogy which we have traced between Rome and Nemi would be still closer. At both places the sacred kings, the living representatives of the godhead, would thus be liable to suffer deposition and death at the hand of any resolute man who could prove his divine right to the holy office by the strong arm and the sharp sword. It would not be surprising if among

the early Latins the claim to the kingdom should often have been settled by single combat; for down to historical times the Umbrians regularly submitted their private disputes to the ordeal of battle, and he who cut his adversary's throat was thought thereby to have proved the justice of his cause beyond the reach of cavil. "Any one who remembers how in the forests of Westphalia the *Femgericht* set the modern civil law at defiance down into the eighteenth century, and how in the mountains of Corsica and Sardinia blood-revenge has persisted and persists to our own days, will not wonder that hardly a century after the union of Italy the Roman legislation had not yet succeeded in putting down the last relics of this ancient Italian or rather Indo-European mode of doing justice in the nests of the Apennines."

A parallel to what I conceive to have been the rule of the old Latin kingship is furnished by a West African custom of to-day. When the Malungo or king of Loango, who is deemed the representative of God on earth, has been elected, he has to take his stand at *Nkumbi*, a large tree near the entrance to his sacred ground. Here, encouraged by one of his ministers, he must fight all rivals who present themselves to dispute his right to the throne. This is one of the many instances in which the rites and legends of ancient Italy are illustrated by the practice of modern Africa. Similarly among the Banyoro of Central Africa, whose king had to take his life with his own hand whenever his health and strength began to fail, the succession to the throne was determined by a mortal combat among the claimants, who fought till only one of them was left alive. Even in England a relic of a similar custom survived till lately in the coronation ceremony, at which a champion used to throw down his glove and challenge to mortal combat all who disputed the king's right to the crown. The ceremony was witnessed by Pepys at the coronation of Charles the Second.

In the foregoing enquiry we have found reason to suppose that the Roman kings personated not only Jupiter the god of the oak, but Saturn the god of the seed and perhaps also the god of the fig-tree. The question naturally arises, Did they do so simultaneously or successively? In other words, did the same king regularly represent the oak-god at one season of the year, the seed-god at another, and the fig-god at a third? or were there separate dynasties of oak-kings, seed-kings, and fig-kings, who belonged perhaps to different stocks and reigned at different times? The evidence does not allow us to answer these questions definitely. But tradition certainly points to the conclusion that in Latium and perhaps in Italy generally the seed-god Saturn was an older deity than the oak-god Jupiter, just as in Greece Cronus appears to have preceded Zeus. Perhaps Saturn and Cronus were the gods of an old indigenous and agricultural people; while Jupiter and Zeus were the divinities of a ruder invading race, which swarmed down into Italy and Greece from the forests of central Europe, bringing their wild woodland deities to dwell in more fertile lands, under softer skies, side by side with the gods of the corn and the vine, the olive and the fig. If that was so, we may suppose that before the irruption of these northern barbarians the old kings of Greece and Italy personated the gods of the fat field and fruitful orchard, and that it was not till after the conquest that their successors learned to pose as the god of the verdant oak and the thundering sky. However, on questions so obscure we must be content to suspend our judgment. It is unlikely that the student's search-light will ever pierce the mists that hang over these remote ages. All that we can do is to follow the lines of evidence backward as far as they can be traced, till, after growing fainter and fainter, they are lost altogether in the darkness.

XIX. St. George And The Parilia

In the course of the preceding investigation we found reason to assume that the old Latin kings, like their brethren in many parts of the world, were charged with certain religious duties or magical functions, amongst which the maintenance of the fertility of the earth held a principal place. By this I do not mean that they had to see to it only that the rain fell, and that the corn grew and trees put forth their fruit in due season. In those early days it is probable that the Italians were quite as much a pastoral as an agricultural people, or, in other words, that they depended for their subsistence no less on their flocks and herds than on their fields and orchards. To provide their cattle with grass and water, to ensure their fecundity and the abundance of their milk, and to guard them from the depredations of wild beasts, would be objects of the first importance with the shepherds and herdsmen who, according to tradition, founded Rome; and the king, as the representative or embodiment of the deity, would be expected to do his part towards procuring these blessings for his people by the performance of sacred rites. The Greeks of the Homeric age, as we have seen, thought that the reign of a good king not only made the land to bear wheat and barley, but also caused the flocks to multiply and the sea to yield fish.

In this connexion, accordingly, it can be no mere accident that Rome is said to have been founded and the pious king Numa to have been born on the twenty-first of April, the day of the great shepherds' festival of the Parilia. It is very unlikely that the real day either of the foundation of the city or of Numa's birth should have been remembered, even if we suppose Numa to have been an historical personage rather than a mythical type; it is far more probable that both events were arbitrarily assigned to this date by the speculative antiquaries of a later age on the ground of some assumed fitness or propriety. In what did this fitness or propriety consist? The belief that the first Romans were shepherds and herdsmen would be reason enough for supposing that Rome was founded on the day of the shepherds' festival, or even that the festival was instituted to commemorate the event. But why should Numa be thought to have been born on that day of all days? Perhaps it was because the old sacred kings, of whom he was the model, had to play an important part in the ceremonies of the day. The birthdays of the gods were celebrated by festivals; the kings were divine or semi-divine; it would be natural, therefore, that their birthdays should be identified with high feasts and holidays. Whether this was so or not, the festival of the Parilia presents so many points of resemblance to some of the popular customs discussed in these volumes that a brief examination of it may not be inappropriate in this place.

The spring festival of the twenty-first of April, known as the birthday of Rome, was deemed second in importance to none in the calendar. It was held by shepherds and herdsmen for the welfare and increase of their flocks and herds. The pastoral deity to whom they paid their devotions was Pales, as to whose sex the ancients themselves were not at one. In later times they commonly spoke of her as a goddess; but Varro regarded Pales as masculine, and we may follow his high authority. The day was celebrated with similar rites both in the town and the country, but in its origin it must have been a strictly rural festival. Indeed, it could hardly be carried out in full except among the sheepfolds and cattle-pens. At some time of the day, probably in the morning, the people repaired to the temple of Vesta, where they received from the Vestal Virgins ashes, blood, and bean-straw to be used in fumigating themselves and probably their beasts. The ashes were those of the unborn calves which had been torn from their mothers' wombs on the fifteenth of April; the blood was that which had dripped from the tail of a horse sacrificed in October. Both were probably supposed to exercise a fertilising

as well as a cleansing influence on the people and on the cattle; for apparently one effect of the ceremonies, in the popular opinion, was to quicken the wombs of women no less than of cows and ewes. At break of day the shepherd purified his sheep, after sprinkling and sweeping the ground. The fold was decked with leafy boughs, and a great wreath was hung on the door. The purification of the flocks apparently consisted in driving them over burning heaps of grass, pine-wood, laurel, and branches of the male olive-tree. Certainly at some time of the day the sheep were compelled to scamper over a fire. Moreover, the bleating flocks were touched with burning sulphur and fumigated with its blue smoke. Then the shepherd offered to Pales baskets of millet, cakes of millet, and pails of warm milk. Next he prayed to the god that he would guard the fold from the evil powers, including probably witchcraft; that the flocks, the men, and the dogs might be hale and free from disease; that the sheep might not fall a prey to wolves; that grass and leaves might abound; that water might be plentiful; that the udders of the dams might be full of milk; that the rams might be lusty, and the ewes prolific; that many lambs might be born; and that there might be much wool at shearing. This prayer the shepherd had to repeat four times, looking to the east; then he washed his hands in the morning dew. After that he drank a bowl of milk and wine, and, warmed with the liquor, leaped over burning heaps of crackling straw. This practice of jumping over a straw fire would seem to have been a principal part of the ceremonies: at least it struck the ancients themselves, for they often refer to it.

The shepherd's prayer at the Parilia is instructive, because it gives us in short a view of the chief wants of the pastoral life. The supplication for grass and leaves and water reminds us that the herdsman no less than the husbandman depends ultimately on vegetation and rain; so that the same divine powers which cover the fields of the one with yellow corn may be conceived to carpet the meadows of the other with green grass, and to diversify them with pools and rivers for the refreshment of the thirsty cattle. And it is to be borne in mind that in countries where grass is less plentiful than under the rainy skies of northern Europe, sheep, goats, and cattle still subsist in great measure on the leaves and juicy twigs of trees. Hence in these lands the pious shepherd and goatherd cannot afford to ignore or to offend the tree-spirits, on whose favour and bounty his flocks are dependent for much of their fodder. Indeed, at the Parilia the shepherd made elaborate excuses to these divine beings for any trespass he might unwittingly have committed on their hallowed domain by entering a sacred grove, sitting in the shadow of a holy tree, or lopping leafy branches from it with which to feed a sickly sheep. In like manner he craved pardon of the water-nymphs, if the hoofs of his cattle had stirred up the mud in their clear pools; and he implored Pales to intercede for him with the divinities of springs "and the gods dispersed through every woodland glade."

The Parilia was generally considered to be the best time for coupling the rams and the ewes; and it has been suggested that it was also the season when the flocks and herds, after being folded and stalled throughout the winter, were turned out for the first time to pasture in spring. The occasion is an anxious one for the shepherd, especially in countries which are infested with wolves, as ancient Italy was. Accordingly the Italian shepherd propitiated Pales with a slaughtered victim before he drove his flocks afield in spring; but it is doubtful whether this sacrifice formed part of the Parilia. None of the ancient authors who expressly describe the Parilia mention the slaughter of a victim; and in Plutarch's day a tradition ran that of old no blood was shed at the festival. But such a tradition seems to point to a contrary practice in after-times. In the absence of decisive evidence the question must be left open; but modern analogy, as we shall see, strongly supports the opinion that immediately at the close of the Parilia the flocks and herds were driven out to graze in the open pastures for the first time after their long winter confinement. On this view a special significance is seen to attach to some of the features of the festival, such as the prayer for protection against the wolf; for

the brute could hardly do the sheep and kine much harm so long as they were safely pent within the walls of the sheepcote and the cattle-stall.

As the Parilia is said to have been celebrated by Romulus, who sacrificed to the gods and caused the people to purify themselves by leaping over flames, some scholars have inferred that it was customary for the king, and afterwards for his successor, the chief pontiff, or the King of the Sacred Rites, to offer sacrifices for the people at the Parilia. The inference is reasonable and receives some confirmation, as we shall see presently, from the analogy of modern custom. Further, the tradition that Numa was born on the day of the Parilia may be thought to point in the same way, since it is most naturally explicable on the hypothesis that the king had to discharge some important function at the festival. Still, it must be confessed that the positive evidence for connecting the Roman kings with the celebration of the twenty-first of April is slight and dubious.

On the whole the festival of the Parilia, which probably fell at or near the time of turning out the cattle to pasture in spring, was designed to ensure their welfare and increase, and to guard them from the insidious machinations or the open attacks of their various enemies, among whom witches and wolves were perhaps the most dreaded.

Now it can hardly be a mere coincidence that down to modern times a great popular festival of this sort has been celebrated only two days later by the herdsmen and shepherds of eastern Europe, who still cherish a profound belief in witchcraft, and still fear, with far better reason, the raids of wolves on their flocks and herds. The festival falls on the twenty-third of April and is dedicated to St. George, the patron saint of cattle, horses, and wolves. The Esthonians say that on St. George's morning the wolf gets a ring round his snout and a halter about his neck, whereby he is rendered less dangerous till Michaelmas. But if the day should chance to be a Friday at full moon, or if before the day came round any person should have been so rash as to thump the dirty linen in the wash-tub with two beetles, the cattle will run a serious risk of being devoured by wolves. Many are the precautions taken by the anxious Esthonians on this day to guard their herds from the ravening beasts. Thus some people gather wolf's dung on the preceding night, burn it, and fumigate the cattle with it in the morning. Or they collect bones from the pastures and burn them at a cross-road, which serves as a charm against sickness, sorcery, and demons quite as well as against wolves. Others smoke the cattle with *asa foetida* or sulphur to protect them against witchcraft and noxious exhalations. They think, too, that if you sew stitches on St. George's morning the cubs of the wolves will be blind, no doubt because their eyes are sewed up by the needle and thread. In order to forecast the fate of their herds the peasants put eggs or a sharp weapon, such as an axe or a scythe, before the doors of the stalls, and the animal which crushes an egg or wounds itself will surely be rent by a wolf or will perish in some other fashion before the year is out. So certain is its fate that many a man prefers to slaughter the doomed beast out of hand for the sake of saving at least the beef.

As a rule the Esthonians drive their cattle out to pasture for the first time on St. George's Day, and the herdsman's duties begin from then. If, however, the herds should have been sent out to graze before that day, the boys who look after them must eat neither flesh nor butter while they are on duty; else the wolves will destroy many sheep, and the cream will not turn to butter in the churn. Further, the boys may not kindle a fire in the wood, or the wolf's tooth would be fiery and he would bite viciously. By St. George's Day, the twenty-third of April, there is commonly fresh grass in the meadows. But even if the spring should be late and the cattle should have to return to their stalls hungrier than they went forth, many Esthonian farmers insist on turning out the poor beasts on St. George's Day in order that the saint may guard them against his creatures the wolves. On this morning the farmer treats the herdsman

to a dram of brandy, and gives him two copper kopecks as “tail-money” for every cow in the herd. This money the giver first passes thrice round his head and then lays it on the dunghill; for if the herdsman took it from his hand, it would in some way injure the herd. Were this ceremony omitted, the wolves would prove very destructive, because they had not been appeased on St. George’s Day. After receiving the “tail-money” some herdsmen are wont to collect the herd on the village common. Here they set up their crook in the ground, place their hat on it, and walk thrice round the cattle, muttering spells or the Lord’s Prayer as they do so. The pastoral crook should be cut from the rowan or mountain-ash and consecrated by a wise man, who carves mystic signs on it. Sometimes the upper end of the crook is hollowed out and filled with quicksilver and *asa foetida*, the aperture being stopped up with resin. Some Esthonians cut a cross with a scythe under the door through which the herd is to be driven, and fill the furrows of the cross with salt to prevent certain evil beings from harming the cattle. Further, it is an almost universal custom in Esthonia not to hang bells on the necks of the kine till St. George’s Day; the few who can give a reason for the rule say that the chiming of the bells before that season would attract the wild beasts.

In the island of Dago down to the early part of the nineteenth century there were certain holy trees from which no one dared to break a bough; in spite of the lack of wood in the island the fallen branches were allowed to rot in heaps on the ground. Under such trees the Esthonians used to offer sacrifices on St. George’s Day for the safety and welfare of their horses. The offerings, which consist of an egg, a piece of money, and a bunch of horse-hair tied up with a red thread, were buried in the earth. The custom is interesting because it exhibits St. George in the two-fold character of a patron of horses and of trees. In the latter capacity he has already met us more than once under the name of Green George.

In Russia the saint is known as Yegory or Yury, and here, as in Esthonia, he is a patron of wolves as well as of flocks and herds. Many legends speak of the connexion which exists between St. George and the wolf. In Little Russia the beast is known as “St. George’s Dog,” and the carcasses of sheep which wolves have killed are not eaten, it being held that they have been made over by divine command to the beasts of the field. The festival of St. George on the twenty-third of April has a national as well as an ecclesiastical character in Russia, and the mythical features of the songs which are devoted to the day prove that the saint has supplanted some old Slavonian deity who used to be honoured at this season in heathen times. It is not as a slayer of dragons and a champion of forlorn damsels that St. George figures in these songs, but as a patron of farmers and herdsman who preserves cattle from harm, and on whose day accordingly the flocks and herds are driven out to browse the fresh pastures for the first time after their confinement through the long Russian winter. “What the wolf holds in its teeth, that Yegory has given,” is a proverb which shews how completely he is thought to rule over the fold and the stall. Here is one of the songs:—

*“We have gone around the field,
We have called Yegory ...
‘O thou, our brave Yegory,
Save our cattle,
In the field, and beyond the field,
In the forest, and beyond the forest,
Under the bright moon,
Under the red sun,
From the rapacious wolf,
From the cruel bear,
From the cunning beast.”*

A White-Russian song represents St. George as opening with golden keys, probably the sunbeams, the soil which has been frost-bound all the winter:—

*“Holy Jury, the divine envoy,
Has gone to God,
And having taken the golden keys,
Has unlocked the moist earth,
Having scattered the clinging dew
Over White-Russia and all the world.”*

In Moravia they “meet the Spring” with a song in which they ask Green Thursday, that is, the day before Good Friday, what he has done with the keys, and he answers: “I gave them to St. George. St. George arose and unlocked the earth, so that the grass grew—the green grass.” In White Russia it is customary on St. George’s Day to drive the cattle afield through the morning dew, and in Little Russia and Bulgaria young folk go out early and roll themselves in it. In the Smolensk Government on this day the cattle are driven out first to the rye-fields and then to the pastures. A religious service is held in the stalls before the departure of the herd and afterwards in the field, where the stool which supported the holy picture is allowed to stand for several weeks till the next procession with the pictures of the saints takes place. St. George’s Day in this government is the herdsman’s festival, and it is the term from which their engagements are dated. And in the Smolensk Government, when the herds are being sent out to graze on St. George’s Day, the following spell is uttered:—

*“Deaf man, deaf man, dost thou hear us?”
“I hear not.”
“God grant that the wolf may not hear our cattle!”
“Cripple, cripple, canst thou catch us?”
“I cannot catch.”
“God grant that the wolf may not catch our cattle!”
“Blind man, blind man, dost thou see us?”
“I see not.”
“God grant that the wolf may not see our cattle!”*

But in the opinion of the Russian peasant wolves are not the only foes of cattle at this season. On the eve of St. George’s Day, as well as on the night before Whitsunday and on Midsummer Eve, witches go out naked in the dark and cut chips from the doors and gates of farmyards. These they boil in a milk-pail, and thus charm away the milk from the farms. Hence careful housewives examine their doors and smear mud in any fresh gashes they may find in them, which frustrates the knavish tricks of the milk-stealing witch. Not to be baffled, however, the witches climb the wooden crosses by the wayside and chip splinters from them, or lay their hands on stray wooden wedges. These they stick into a post in the cattle-shed and squeeze them with their hands till milk flows from them as freely as from the dugs of a cow. At this time also wicked people turn themselves by magic art into dogs and black cats, and in that disguise they suck the milk of cows, mares, and ewes, while they slaughter the bulls, horses, and rams.

The Ruthenians of Bukowina and Galicia believe that at midnight before St. George’s Day (the twenty-third of April) the witches come in bands of twelve to the hills at the boundaries of the villages and there dance and play with fire. Moreover, they cull on the mountains the herbs they need for their infernal enchantments. Like the Esthonians and the Russians, the Ruthenians drive their cattle out to pasture for the first time on St. George’s Day; hence during the preceding night the witches are very busy casting their spells on the cows; and the farmer is at great pains to defeat their fell purpose. With this intent many people catch a

snake, skin it, and fumigate the cows with the skin on the eve of the saint's day. To rub the udders and horns of the cows with serpent's fat is equally effective. Others strew meal about the animals, saying, "Not till thou hast gathered up this meal, shalt thou take the milk from my cow So-and-so." Further, sods of turf, with thorn-branches stuck in them, are laid on the gate-posts; and crosses are painted with tar on the doors. These precautions keep the witches from the cows. If, however, a beast should after all be bewitched, the farmer's wife drags a rope about in the dew on the morning of St. George's Day. Then she chops it up small, mixes salt with it, and scatters the bits among the cow's fodder. No sooner has the afflicted animal partaken of this compound than the spell is broken.

The Huzuls of the Carpathian Mountains believe that when a cow gives milk tinged with blood, or no milk at all, a witch is the cause of it. These maleficent beings play their pranks especially on the eve of St. George's Day and on Midsummer Eve, but they are most dangerous at the former season, for that night they and the foul fiends hold their greatest gathering or sabbath. To steal the cows' milk they resort to various devices. Sometimes they run about in the shape of dogs and smell the cows' udders. Sometimes they rub the udders of their own cows with milk taken from a neighbour's kine; then their own cows yield abundant milk, but the udders of the neighbour's cows shrivel up or give only blood. Others again make a wooden cow on the spot where the real cows are generally milked, taking care to stick into the ground the knife they used in carving the image. Then the wooden cow yields the witch all the milk of the cattle which are commonly milked there, while the owner of the beasts gets nothing but blood from them.

Hence the Huzuls take steps to guard their cows from the machinations of witches at this season. For this purpose they kindle a great fire before the house on the eve of St. George's Day, using as fuel the dung which has accumulated during the winter. Also they place on the gate-posts clods in which are stuck the branches consecrated on Palm Sunday or boughs of the silver poplar, the wood of which is deemed especially efficacious in banning fiends. Moreover, they make crosses on the doors, sprinkle the cows with mud, and fumigate them with incense or the skin of a snake. To tie red woollen threads round the necks or tails of the animals is also a safeguard against witchcraft. And in June, when the snow has melted and the cattle are led to the high mountain pastures, the herds have no sooner reached their summer quarters than the herdsman makes "living fire" by the friction of wood and drives the animals over the ashes in order to protect them against witches and other powers of evil. The fire thus kindled is kept constantly burning in the herdsman's hut till with the chill of autumn the time comes to drive the herds down the mountains again. If the fire went out in the interval, it would be an ill omen for the owner of the pastures.

In some parts of Silesia the might of the witches is believed to be at the highest pitch on St. George's Day. The people deem the saint very powerful in the matter of cattle-breeding and especially of horse-breeding. At the Polish village of Ostroppa, not far from Gleiwitz, a sacrifice for horses used to be offered at the little village church. It has been described by an eye-witness. Peasants on horseback streamed to the spot from all the neighbouring villages, not with the staid and solemn pace of pilgrims, but with the noise and clatter of merrymakers hastening to a revel. The sorry image of the saint, carved in wood and about an ell high, stood in the churchyard on a table covered with a white cloth. It represented him seated on horseback and spearing the dragon. Beside it were two vessels to receive offerings of money and eggs respectively. As each farmer galloped up, he dismounted, led his horse by the bridle, knelt before the image of the saint, and prayed. After that he made his offering of money or eggs, according to his means, in the name of his horse. Then he led the beast round the church and churchyard, tethered it, and went into the church to hear mass and a sermon.

Having thus paid his devotions to the saint, every man leaped into the saddle and made for the nearest public-house as fast as his horse could lay legs to the ground.

At Ertringen, in South Bavaria, there is a chapel of St. George, where a festival of the saint used to be held on April the twenty-fourth down to the beginning of the nineteenth century. From the whole neighbourhood people streamed thither on horseback and in waggons to take part in the ceremony. More than fourteen hundred riders are said to have been present on one occasion. The foundation of the chapel was attributed to the monastery of Holy Cross Vale (*Heiligkreuztal*), and the abbot and prior with their suite attended the festival in state mounted on white horses. A burgher of Ertringen had to ride as patron in the costume of St. George, whom he represented. He alone bestrode a fiery stallion. After the celebration of high mass the horses were blessed at the chapel. Then the procession of men on horseback moved round the common lands, winding up at the parish church, where it broke up. In many villages near Freiburg in Baden St. George is the patron of horses, and in some parts of Baden the saint's day (April the twenty-third) is the season when cattle are driven out to pasture for the first time in spring.

The Saxons of Transylvania think that on the eve of St. George's Day the witches ride on the backs of the cows into the farmyard, if branches of wild rosebushes or other thorny shrubs are not stuck over the gate of the yard to keep them out. Beliefs and practices of this sort are shared by the Roumanians of Transylvania. They hold that on St. George's Day the witches keep their sabbath in sequestered spots, such as woodland glades, deserted farm-steadings, and the like. In Walachia green sods are laid on the window-sills and on the lintels of the doors to avert the uncanny crew. But in Transylvania the Roumanians, not content with setting a thorn-bush in the doorway of the house, keep watch and ward all night beside the cattle or elsewhere, to catch the witches who are at work stealing the milk from the cows. Here, as elsewhere, the day is above all the herdsman's festival. It marks the beginning of spring; the shepherds are preparing to start for the distant pastures, and they listen with all their ears to some wiseacre who tells them how, if the milk should fail in the udders of the sheep, they have only to thrash the shepherd's pouch, and every stroke will fall on the witch who is pumping the lost milk into her pails.

The Walachians look on St. George's Day as very holy; for they are mainly a pastoral folk, and St. George is the patron of herds and herdsmen. On that day also, as well as on the day before and the day after, the Walachian numbers his herd, beginning at one and counting continuously up to the total. This he never does at any other time of the year. On this day, too, he milks his sheep for the first time into vessels which have been carefully scoured and are wreathed with flowers. Then too a cake of white meal is baked in the shape of a ring, and is rolled on the ground in sight of the herd; and from the length of its course omens are drawn as to the good or bad luck of the cattle in their summer pastures. If the herd is owned by several men, they afterwards lay hold of the ring, and break it among them, and the one who gets the largest piece will have the best luck. The milk is made into a cheese which is divided; and the pieces of the cake are given to the shepherds. In like manner the wreaths of flowers which crowned the pails are thrown into the water, and from the way in which they float down-stream the shepherds presage good or evil fortune.

The Bulgarians seem to share the belief that cattle are especially exposed to the machinations of witches at this season, for it is a rule with them not to give away milk, butter, or cheese on the eve of St. George's Day; to do so, they say, would be to give away the profit of the milch kine. They rise very early on the morning of this day, and wash themselves in the dew, that they may be healthy. It is said, too, that a regular sacrifice is still offered on St. George's Day in Bulgaria. An old man kills a ram, while girls spread grass on which the blood is poured

forth. The intention of the sacrifice may be to make the herbage grow abundantly in the pastures. Amongst the South Slavs the twenty-third of April, St. George's Day, is the chief festival of the spring. The herdsman thinks that if his cattle are well on that day they will thrive throughout the year. As we have already seen, he crowns the horns of his cows with garlands of flowers to guard them against witchcraft, and in the evening the garlands are hung on the doors of the stalls, where they remain until the next St. George's Day. Early in the morning of that day, when the herdsman drives the cows from the byres, the housewife takes salt in one hand and a potsherd with glowing coals in the other. She offers the salt to the cow, and the beast must step over the smouldering coals, on which various kinds of roses are smoking. This deprives the witches of all power to harm the cow. On the eve or the morning of the day old women cut thistles and fasten them to the doors and gates of the farm; and they make crosses with cow's dung on the doors of the byres to ward off the witches. Many knock great nails into the doors, which is thought to be a surer preventive even than thistles. In certain districts the people cut thistles before sunrise and put some on each other's heads, some on the fences, the windows, the doors, and some in the shape of wreaths round the necks of the cows, in order that the witches may be powerless to harm man and beast, house and homestead, throughout the year. If, nevertheless, a witch should contrive to steal through the garden fence and into the byre, it is all over with the cows. A good housewife will also go round her house and cattle-stalls early in the morning of the fateful day and sprinkle them with holy water. Another approved means of driving the witches away is furnished by the froth which is shot from the spokes of a revolving mill-wheel; for common-sense tells us that just as the froth flies from the wheel, so the witches will fly from our house, if only we apply the remedy in the right way. And the right way is this. On the eve of St. George's Day you must send a child to fetch froth from the mill, three stones from three cross-roads, three twigs of a blackberry bush, three sprigs of beech, and three shoots of a wild vine. Then you insert the plants in a buttered roll, put the stones in the fire, boil the froth, toast the buttered roll over the glowing stones, and speak these words: "The blackberry twigs gather together, the beeches pull together, but the foam from the wheel shakes all evil away." Do this, and you may take my word for it that no witch will be able to charm away the milk from your cows.

Thus on the whole the festival of St. George at the present day, like the Parilia of ancient Italy, is a ceremony intended to guard the cattle against their real and their imaginary foes, the wolves and the witches, at the critical season when the flocks and herds are driven out to pasture for the first time in spring. Precautions of the same sort are naturally taken by the superstitious herdsman whenever, the winter being over, he turns his herds out into the open for the first time, whether it be on St. George's Day or not. Thus in Prussia and Lithuania, when the momentous morning broke, the herd-boy ran from house to house in the village, knocked at the windows, and cried: "Put out the fire, spin not, reel not, but drive the cattle out!" Meantime the herdsman had fetched sand from the church, which he strewed on the road by which the beasts must go from the farmyard. At the same time he laid a woodcutter's axe in every doorway, with the sharp edge outwards, over which the cows had to step. Then he walked in front of them, speaking never a word, and paying no heed to the herd, which was kept together by the herd-boys alone. His thoughts were occupied by higher things, for he was busy making crosses, blessing the cattle, and murmuring prayers, till the pastures were reached. The axe in the doorway signified that the wolf should flee from the herd as from the sharp edge of the axe: the sand from the church betokened that the cattle should not disperse and wander in the meadows, but should keep as close together as people in church.

In Sweden the cattle are confined almost wholly to their stalls during the long and dreary northern winter; and the first day in spring on which they are turned out into the forest to graze has been from time immemorial a great popular festival. The time of its celebration

depends more or less on the mildness or severity of the season. For the most part it takes place about the middle of May. On the preceding evening bonfires are kindled everywhere in the forest, because so far as their flickering light extends the cattle will be safe from the attacks of wild beasts throughout the summer. For the same reason people go about the woods that night firing guns, blowing horns, and making all kinds of discordant noises. The mode of celebrating the festival, which in some places is called the feast of flowers, varies somewhat in different provinces. In Dalsland the cattle are driven home that day from pasture at noon instead of at evening. Early in the morning the herd-boy repairs with the herd to the forest, where he decks their horns with wreaths of flowers and provides himself with a wand of the rowan or mountain-ash. During his absence the girls pluck flowers, weave them into a garland, and hang it on the gate through which the cattle must pass on their return from the forest. When they come back, the herd-boy takes the garland from the gate, fastens it to the top of his wand, and marches with it at the head of his beasts to the hamlet. Afterwards the wand with the garland on it is set up on the muck-heap, where it remains all the summer. The intention of these ceremonies is not said, but on the analogy of the preceding customs we may conjecture that both the flowers and the rowan-wand are supposed to guard the cattle against witchcraft. A little later in the season, when the grass is well grown in the forest, most of the cattle are sent away to the *säter*, or summer pastures, of which every hamlet commonly has one or more. These are clearings in the woods, and may be many miles distant from the village. In Dalecarlia the departure usually takes place in the first week of June. It is a great event for the pastoral folk. An instinctive longing seems to awaken both in the people and the beasts. The preparations of the women are accompanied by the bleating of the sheep and goats and the lowing of the cattle, which make incessant efforts to break through the pens near the house where they are shut up. Two or more girls, according to the size of the herd, attend the cattle on their migration and stay with them all the summer. Every animal as it goes forth, whether cow, sheep, or goat, is marked on the brow with a cross by means of a tar-brush in order to protect it against evil spirits. But more dangerous foes lie in wait for the cattle in the distant pastures, where bears and wolves not uncommonly rush forth on them from the woods. On such occasions the herd-girls often display the utmost gallantry, belabouring the ferocious beasts with sticks, and risking their own lives in defence of the herds.

The foregoing customs, practised down to modern times by shepherds and herdsmen with a full sense of their meaning, throw light on some features of the Parilia which might otherwise remain obscure. They seem to shew that when the Italian shepherd hung green boughs on his folds, and garlands on his doors, he did so in order to keep the witches from the ewes; and that in fumigating his flocks with sulphur and driving them over a fire of straw he sought to interpose a fiery barrier between them and the powers of evil, whether these were conceived as witches or mischievous spirits.

But St. George is more than a patron of cattle. The mummer who dresses up in green boughs on the saint's day and goes by the name of Green George clearly personifies the saint himself, and such a disguise is appropriate only to a spirit of trees or of vegetation in general. As if to make this quite clear, the Slavs of Carinthia carry a tree decked with flowers in the procession in which Green George figures; and the ceremonies in which the leaf-clad masker takes a part plainly indicate that he is thought to stand in intimate connexion with rain as well as with cattle. This counterpart of our Jack in the Green is known in some parts of Russia, and the Slovenes call him Green George. Dressed in leaves and flowers, he appears in public on St. George's Day carrying a lighted torch in one hand and a pie in the other. Thus arrayed he goes out to the cornfields, followed by girls, who sing appropriate songs. A circle of brushwood is then lighted, and the pie is set in the middle of it. All who share in the

ceremony sit down around the fire, and the pie is divided among them. The observance has perhaps a bearing on the cattle as well as on the cornfields, for in some parts of Russia when the herds go out to graze for the first time in spring a pie baked in the form of a sheep is cut up by the chief herdsman, and the bits are kept as a cure for the ills to which sheep are subject.

At Schwaz, an old Tyrolese town in the lower valley of the Inn, young lads assemble on St. George's Day, which is here the twenty-fourth of April, and having provided themselves with bells, both large and small, they go in procession ringing them to the various farms of the neighbourhood, where they are welcomed and given milk to drink. These processions, which take place in other parts of the Tyrol also, go by the name of "ringing out the grass" (*Grasausläuten*), and it is believed that wherever the bell-ringers come, there the grass grows and the crops will be abundant. This beneficial effect appears to be ascribed to the power of the bells to disperse the evil spirits, which are thought to be rampant on St. George's Day. For the same purpose of averting demoniac influence at this time, people in Salzburg and the neighbouring districts of Upper Austria go in procession round the fields and stick palm branches or small crosses in them; also they fasten branches of the *Prunus Padus*, L., at the windows of the houses and cattle-stalls. In some parts of Germany the farmer looks to the height of his corn on St. George's Day, expecting that it should then be high enough to hide a crow.

Even when we have said that St. George of Eastern Europe represents an old heathen deity of sheep, cattle, horses, wolves, vegetation, and rain, we have not exhausted all the provinces over which he is supposed to bear sway. According to an opinion which appears to be widely spread, he has the power of blessing barren women with offspring. This belief is clearly at the root of the South Slavonian custom, described above, whereby a childless woman hopes to become a mother by wearing a shirt which has hung all night on a fruitful tree on St. George's Eve. Similarly, a Bulgarian wife who desires to have a child will strike off a serpent's head on St. George's Day, put a bean in its mouth, and lay the head in a hollow tree or bury it in the earth at a spot so far from the village that the crowing of the cocks cannot be heard there. If the bean buds, her wishes will be granted.

It is natural to suppose that a saint who can bestow offspring can also bring fond lovers together. Hence among the Slavs, with whom St. George is so popular, his day is one of the seasons at which youths and maidens resort to charms and divination in order to win or discover the affections of the other sex. Thus, to take examples, a Bohemian way of gaining a girl's love is as follows. You catch a frog on St. George's Day, wrap it in a white cloth, and put it in an ant-hill after sunset or about midnight. The creature croaks terribly while the ants are gnawing the flesh from its bones. When silence reigns again, you will find nothing left of the frog but one little bone in the shape of a hook and another little bone in the shape of a shovel. Take the hook-shaped bone, go to the girl of your choice, and hook her dress with the bone, and she will fall over head and ears in love with you. If you afterwards tire of her, you have only to touch her with the shovel-shaped bone, and her affection will vanish as quickly as it came. Again, at Ceklinj, in Crnagora, maidens go at break of day on St. George's morning to a well to draw water, and look down into its dark depth till tears fill their eyes and they fancy they see in the water the image of their future husband. At Krajina, in Servia, girls who would pry into the book of fate gather flowers in the meadows on the eve of St. George, make them up into nosegays, and give to the nosegays the names of the various lads whose hearts they would win. Late at night they place the flowers by stealth under the open sky, on the roof or elsewhere, and leave them there till daybreak. The lad on whose nosegay most dew has fallen will love the girl most truly throughout the year. Sometimes mischievous young men secretly watch these doings, and steal the bunches of flowers, which makes sore

hearts among the girls. Once more, in wooded districts of Bohemia a Czech maiden will sometimes go out on St. George's Eve into an oak or beech forest and catch a young wild pigeon. It may be a ring-dove or a wood-pigeon, but it must always be a male. She takes the bird home with her, and covers it with a sieve or shuts it up in a box that nobody may know what she is about. Having kept and fed it till it can fly, she rises very early in the morning, while the household is still asleep, and goes with the dove to the hearth. Here she presses the bird thrice to her bare breast, above her heart, and then lets it fly away up the chimney, while she says:—

*“Out of the chimney, dove,
Fly, fly from here.
Take me, dear Hans, my love,
None, none so dear.*

*“Fly to your rocks, fair dove,
Fly to your lea.
So may I get, my love,
None, none but thee.”*

In the East, also, St. George is reputed to be a giver of offspring to barren women, and in this character he is revered by Moslems as well as Christians. His shrines may be found in all parts of Syria; more places are associated with him than with any other saint in the calendar. The most famous of his sanctuaries is at Kalat el Hosn, in Northern Syria. Childless women of all sects resort to it in order that the saint may remove their reproach. Some people shrug their shoulders when the shrine is mentioned in this connexion. Yet many Mohammedan women who desired offspring used to repair to it with the full consent of their husbands. Nowadays the true character of the place is beginning to be perceived, and many Moslems have forbidden their wives to visit it. Such beliefs and practices lend some colour to the theory that in the East the saint has taken the place of Tammuz or Adonis.

But we cannot suppose that the worship of Tammuz has been transplanted to Europe and struck its roots deep among the Slavs and other peoples in the eastern part of our continent. Rather amongst them we must look for a native Aryan deity who now masquerades in the costume of the Cappadocian saint and martyr St. George. Perhaps we may find him in the Pergrubius of the Lithuanians, a people who retained their heathen religion later than any other branch of the Aryan stock in Europe. This Pergrubius is described as “the god of the spring,” as “he who makes leaves and grass to grow,” or more fully as “the god of flowers, plants, and all buds.” On St. George's Day, the twenty-third of April, the heathen Prussians and Lithuanians offered a sacrifice to Pergrubius. A priest, who bore the title of *Wurschait*, held in his hand a mug of beer, while he thus addressed the deity: “Thou drivest away the winter; thou bringest back the pleasant spring. By thee the fields and gardens are green, by thee the groves and the woods put forth leaves.” According to another version, the prayer ran as follows: “Thou drivest the winter away, and givest in all lands leaves and grass. We pray thee that thou wouldst make our corn to grow and wouldst put down all weeds.” After praying thus, the priest drank the beer, holding the mug with his teeth, but not touching it with his hands. Then without handling it he threw the mug backward over his head. Afterwards it was picked up and filled again, and all present drank out of it. They also sang a hymn in praise of Pergrubius, and then spent the whole day in feasting and dancing. Thus it appears that Pergrubius was a Lithuanian god of the spring, who caused the grass and the corn to grow and the trees to burst into leaf. In this he resembles Green George, the embodiment of the fresh vegetation of spring, whose leaf-clad representative still plays his pranks on the very same day in some parts of Eastern Europe. Nothing, indeed, is said of the

relation of Pergrubius to cattle, and so far the analogy between him and St. George breaks down. But our accounts of the old Lithuanian mythology are few and scanty; if we knew more about Pergrubius we might find that as a god or personification of spring he, like St. George, was believed to exert all the quickening powers of that genial season—in other words, that his beneficent activity was not confined to clothing the bare earth with verdure, but extended to the care of the teeming flocks and herds, as well as to the propagation of mankind. Certainly it is not easy to draw a sharp line of division between the god who attends to cattle and the god who provides the food on which they subsist.

Thus Pergrubius may perhaps have been the northern equivalent of the pastoral god Pales, who was worshipped by the Romans only two days earlier at the spring festival of the Parilia. It will be remembered that the Roman shepherds prayed to Pales for grass and leaves, the very things which it was the part of Pergrubius to supply. Is it too bold to conjecture that in rural districts of Italy Pales may have been personated by a leaf-clad man, and that in the early age of Rome the duty of thus representing the god may have been one of the sacred functions of the king? The conjecture at least suggests a reason for the tradition that Numa, the typical priestly king of Rome, was born on the day of the Parilia.

XX. The Worship Of The Oak

§ 1. The Diffusion of the Oak in Europe

In a preceding chapter some reasons were given for thinking that the early Latin kings posed as living representatives of Jupiter, the god of the oak, the sky, the rain, and the thunder, and that in this capacity they attempted to exercise the fertilising functions which were ascribed to the god. The probability of this view will be strengthened if it can be proved that the same god was worshipped under other names by other branches of the Aryan stock in Europe, and that the Latin kings were not alone in arrogating to themselves his powers and attributes. In this chapter I propose briefly to put together a few of the principal facts which point to this conclusion.

But at the outset a difficulty presents itself. To us the oak, the sky, the rain, and the thunder appear things totally distinct from each other. How did our forefathers come to group them together and imagine them as attributes of one and the same god? A connexion may be seen between the sky, the rain, and the thunder; but what has any of them to do with the oak? Yet one of these apparently disparate elements was probably the original nucleus round which in time the others gathered and crystallised into the composite conception of Jupiter.

Accordingly we must ask, Which of them was the original centre of attraction? If men started with the idea of an oak-god, how came they to enlarge his kingdom by annexing to it the province of the sky, the rain, and the thunder? If, on the other hand, they set out with the notion of a god of the sky, the rain, and the thunder, or any one of them, why should they have added the oak to his attributes? The oak is terrestrial; the sky, the thunder, and the rain are celestial or aerial. What is the bridge between the two?

In the sequel I shall endeavour to shew that on the principle of primitive thought the evolution of a sky-god from an oak-god is more easily conceivable than the converse; and if I succeed, it becomes probable that in the composite character of Jupiter the oak is primary and original, the sky, the rain, and the thunder secondary and derivative.

We have seen that long before the dawn of history Europe was covered with vast primaeval woods, which must have exercised a profound influence on the thought as well as on the life of our rude ancestors who dwelt dispersed under the gloomy shadow or in the open glades and clearings of the forest. Now, of all the trees which composed these woods the oak appears to have been both the commonest and the most useful. The proof of this is drawn partly from the statements of classical writers, partly from the remains of ancient villages built on piles in lakes and marshes, and partly from the oak forests which have been found embedded in peat-bogs.

These bogs, which attain their greatest development in Northern Europe, but are met with also in the central and southern parts of the Continent, have preserved as in a museum the trees and plants which sprang up and flourished after the end of the glacial epoch. Thus in Scotland the peat, which occupies wide areas both in the highlands and lowlands, almost everywhere covers the remains of forests, among which the commoner trees are pine, oak, and birch. The oaks are of great size, and are found at heights above the sea such as the tree would not now naturally attain to. Equally remarkable for their size are the pines, but though they also had a wider distribution than at present, they appear not to have formed any extensive forests at the lowest levels of the country. Still, remains of them have been dug up in many lowland peat-mosses, where the bulk of the buried timber is oak. When Hatfield Moss in Yorkshire was drained, there were found in it trunks of oak a hundred feet long and

as black as ebony. One giant actually measured a hundred and twenty feet in length, with a diameter of twelve feet at the root and six feet at the top. No such tree now exists in Europe. Sunken forests and peat occur at many places on the coasts of England, especially on low shelving shores where the land falls away with a gentle slope to the sea. These submerged areas were once mud flats which, as the sea retreated from them, gradually became clothed with dense forests, chiefly of oak and Scotch fir, though ash, yew, alder, and other trees sooner or later mingled with them. The great peat-bogs of Ireland shew that there was a time when vast woods of oak and yew covered the country, the oak growing on the hills up to a height of four hundred feet or thereabout above the sea, while at higher levels deal was the prevailing timber. Human relics have often been discovered in these Irish bogs, and ancient roadways made of oak have also come to light. In the peat-bog near Abbeville, in the valley of the Somme, trunks of oak have been dug up fourteen feet thick, a diameter rarely met with outside the tropics in the old Continent.

At present the woods of Denmark consist for the most part of magnificent beeches, which flourish here as luxuriantly as anywhere in the world. Oaks are much rarer and appear to be on the decline. Yet the evidence of the peat-bogs proves that before the advent of the beech the country was overspread with dense forests of tall and stately oaks. It was during the ascendancy of the oak in the woods that bronze seems to have become known in Denmark; for swords and shields of that metal, now in the museum of Copenhagen, have been taken out of peat in which oaks abound. Yet at a still earlier period the oak had been preceded by the pine or Scotch fir in the Danish forests; and the discovery of neolithic implements in the peat-bogs shews that savages of the Stone Age had their homes in these old pine woods as well as in the later forests of oak. Some antiquaries are of opinion that the Iron Age in Denmark began with the coming of the beech, but of this there is no evidence; for aught we know to the contrary the beautiful beech forests may date back to the Age of Bronze. The peat-bogs of Norway abound in buried timber; and in many of them the trees occur in two distinct layers. The lower of these layers consists chiefly of oak, hazel, ash, and other deciduous trees; the upper is composed of Scotch firs and birches. In the bogs of Sweden also the oak forests underlie the pine forests. However, it appears to be doubtful whether Scandinavia was inhabited in the age of the oak woods. Neolithic tools have indeed been found in the peat, but generally not deeper down than two feet or so; hence one antiquary infers that in these bogs not more than two feet of peat has formed within historical times. But negative evidence on such a point goes for little, as only a small portion of the bogs can have been explored.

Unequivocal proof of the prevalence of the oak and its usefulness to man in early times is furnished by the remains of the pile villages which have been discovered in many of the lakes of Europe. In the British Islands the piles and the platforms on which these crannogs or lake dwellings rested appear to have been generally of oak, though fir, birch, and other trees were sometimes used in their construction. Speaking of the Irish and Scotch crannogs a learned antiquary remarks: "Every variety of structure observed in the one country is to be found in the other, from the purely artificial island, framed of oak-beams, mortised together, to the natural island, artificially fortified or enlarged by girdles of oak-piles or ramparts of loose stones." Canoes hollowed out of trunks of oak have been found both in the Scotch and in the Irish crannogs. In the lake dwellings of Switzerland and Central Europe the piles are very often of oak, but by no means as uniformly so as in the British Islands; fir, birch, alder, ash, elm, and other timber were also employed for the purpose. That the inhabitants of these villages subsisted partly on the produce of the oak, even after they had adopted agriculture, is proved by the acorns which have been found in their dwellings along with wheat, barley, and millet, as well as beech-nuts, hazel-nuts, and the remains of chestnuts and cherries. In the valley of the Po the framework of logs and planks which supports the prehistoric villages is

most commonly of elm wood, but evergreen oak and chestnut were also used; and the abundance of oaks is attested by the great quantities of acorns which were dug up in these settlements. As the acorns were sometimes found stored in earthenware vessels, it appears that they were eaten by the people as well as by their pigs.

The evidence of classical writers proves that great oak forests still existed down to their time in various parts of Europe. Thus the Veneti on the Atlantic coast of Brittany made their flat-bottomed boats out of oak timber, of which, we are told, there was abundance in their country. Pliny informs us that, while the whole of Germany was covered with cool and shady woods, the loftiest trees were to be seen not far from the country of the Chauci, who inhabited the coast of the North Sea. Among these giants of the forest he speaks especially of the oaks which grew on the banks of two lakes. When the waves had undermined their roots, the oaks are said to have torn away great portions of the bank and floated like islands on the lakes. The same writer speaks of the vast Hercynian wood of Germany as an oak forest, old as the world, untouched for ages, and passing wonderful in its immortality. So huge were the trees, he says, that when their roots met they were forced up above ground in the shape of arches, through which a troop of horse could ride as through an open gate. His testimony as to the kind of trees which composed this famous forest is confirmed by its name, which seems to mean no more than "oak wood." In the second century before our era oak forests were still so common in the valley of the Po that the herds of swine which browsed on the acorns sufficed to supply the greater part of the demand for pork throughout Italy, although nowhere in the world, according to Polybius, were more pigs butchered to feed the gods, the people, and the army. Elsewhere the same historian describes the immense herds of swine which roamed the Italian oak forests, especially on the coasts of Tuscany and Lombardy. In order to sort out the different droves when they mingled with each other in the woods, each swineherd carried a horn, and when he wound a blast on it all his own pigs came trooping to him with such vehemence that nothing could stop them; for all the herds knew the note of their own horn. In the oak forests of Greece this device was unknown, and the swineherds there had harder work to come by their own when the beasts had strayed far in the woods, as they were apt to do in autumn while the acorns were falling. Down to the beginning of our era oak woods were interspersed among the olive groves and vineyards of the Sabine country in central Italy. Among the beautiful woods which clothed the Heraean mountains in Sicily the oaks were particularly remarked for their stately growth and the great size of their acorns. In the second century after Christ the oak forests of Arcadia still harboured wild boars, bears, and huge tortoises in their dark recesses.

Even now the predominance of the oak as the principal forest tree of Europe has hardly passed away. Thus we are told that among the leaf-bearing trees of Greece, as opposed to the conifers, the oak still plays by far the most important part in regard both to the number of the individuals and the number of the species. And the British oak in particular (*Quercus robur*) is yet the prevailing tree in most of the woods of France, Germany, and southern Russia, while in England the coppice and the few fragments of natural forest still left are mainly composed of this species.

Thus the old classical tradition that men lived upon acorns before they learned to till the ground may very well be founded on fact. Indeed acorns were still an article of diet in some parts of southern Europe within historical times. Speaking of the prosperity of the righteous, Hesiod declares that for them the earth bears much substance, and the oak on the mountains puts forth acorns. The Arcadians in their oak-forests were proverbial for eating acorns, but not the acorns of all oaks, only those of a particular sort. Pliny tells us that in his day acorns still constituted the wealth of many nations, and that in time of dearth they were ground and baked into bread. According to Strabo, the mountaineers of Spain subsisted on acorn bread

for two-thirds of the year; and in that country acorns were served up as a second course even at the meals of the well-to-do. In the same regions the same practice has survived to modern times. The commonest and finest oak of modern Greece is the *Quercus Aegilops*, with a beautiful crown of leaves, and the peasants eat its acorns both roasted and raw. The sweeter acorns of the *Quercus Ballota* also serve them as food, especially in Arcadia. In Spain people eat the acorns of the evergreen oak (*Quercus Ilex*), which are known as *bellotas*, and are said to be much larger and more succulent than the produce of the British oak. The duchess in *Don Quixote* writes to Sancho's wife to send her some of them. But oaks are now few and far between in La Mancha. Even in England and France acorns have been boiled and eaten by the poor as a substitute for bread in time of dearth. And naturally the use of acorns as food for swine has also lasted into modern times. It is on acorns that those hogs are fattened in Estremadura which make the famous Montanches hams. Large herds of swine in all the great oak woods of Germany depend on acorns for their autumn subsistence; and in the remaining royal forests of England the inhabitants of the neighbouring villages still claim their ancient right of *pannage*, turning their hogs into the woods in October and November.

§ 2. The Aryan God of the Oak and the Thunder

Thus we may conclude that the primitive Aryans of Europe lived among oak woods, used oak sticks for the lighting of their fires, and oak timber for the construction of their villages, their roads, their canoes, fed their swine on acorns, and themselves subsisted in part on the same simple diet. No wonder, then, if the tree from which they received so many benefits should play an important part in their religion, and should be invested with a sacred character. We have seen that the worship of trees has been world-wide, and that, beginning with a simple reverence and dread of the tree as itself animated by a powerful spirit, it has gradually grown into a cult of tree gods and tree goddesses, who with the advance of thought become more and more detached from their old home in the trees, and assume the character of sylvan deities and powers of fertility in general, to whom the husbandman looks not merely for the prosperity of his crops, but for the fecundity of his cattle and his women. Where this evolution has taken place it has necessarily been slow and long. Though it is convenient to distinguish in theory between the worship of trees and the worship of gods of the trees, it is impossible to draw a hard and fast line between them in practice, and to say, "Here the one begins and the other ends." Such distinctions, however useful they may be as heads of classification to the student, evade in general the duller wit of the tree worshipper. We cannot therefore hope to lay our finger on that precise point in the history of the Aryans when they ceased to worship the oak for its own sake, and began to worship a god of the oak. That point, if it were ideally possible to mark it, had doubtless been left far behind them by the more intelligent, at least, of our forefathers before they emerged into the light of history. We must be content for the most part to find among them gods of whom the oak was an attribute or sacred adjunct rather than the essence. If we wish to find the original worship of the tree itself we must go for it to the ignorant peasantry of to-day, not to the enlightened writers of antiquity. Further, it is to be borne in mind that while all oaks were probably the object of superstitious awe, so that the felling of any of them for timber or firewood would be attended with ceremonies designed to appease the injured spirit of the tree, only certain particular groves or individual oaks would in general receive that measure of homage which we should term worship. The reasons which led men to venerate some trees more than others might be various. Amongst them the venerable age and imposing size of a giant oak would naturally count for much. And any other striking peculiarity which marked a tree off from its fellows would be apt to attract the attention, and to concentrate on itself the vague superstitious awe of the savage. We know, for example, that with the Druids the growth of mistletoe on an oak was a sign that the tree was especially sacred; and the rarity of this feature—for mistletoe

does not commonly grow on oaks—would enhance the sanctity and mystery of the tree. For it is the strange, the wonderful, the rare, not the familiar and commonplace, which excites the religious emotions of mankind.

The worship of the oak tree or of the oak god appears to have been shared by all the branches of the Aryan stock in Europe. Both Greeks and Italians associated the tree with their highest god, Zeus or Jupiter, the divinity of the sky, the rain, and the thunder. Perhaps the oldest and certainly one of the most famous sanctuaries in Greece was that of Dodona, where Zeus was revered in the oracular oak. The thunder-storms which are said to rage at Dodona more frequently than anywhere else in Europe, would render the spot a fitting home for the god whose voice was heard alike in the rustling of the oak leaves and in the crash of thunder. Perhaps the bronze gongs which kept up a humming in the wind round the sanctuary were meant to mimic the thunder that might so often be heard rolling and rumbling in the coombs of the stern and barren mountains which shut in the gloomy valley. In Boeotia, as we have seen, the sacred marriage of Zeus and Hera, the oak god and the oak goddess, was celebrated with much pomp by a religious federation of states. And on Mount Lycaeus in Arcadia the character of Zeus as god both of the oak and of the rain comes out clearly in the rain charm practised by the priest of Zeus, who dipped an oak branch in a sacred spring.

In his latter capacity Zeus was the god to whom the Greeks regularly prayed for rain. Nothing could be more natural; for often, though not always, he had his seat on the mountains where the clouds gather and the oaks grow. On the acropolis at Athens there was an image of Earth praying to Zeus for rain. And in time of drought the Athenians themselves prayed, "Rain, rain, O dear Zeus, on the cornland of the Athenians and on the plains." The mountains which lay round their city, and to which they looked through the clear Attic air for signs of the weather, were associated by them with the worship of the weather-god Zeus. It was a sign of rain when, away to sea, a cloud rested on the sharp peak of Aegina, which cuts the sky-line like a blue horn. On this far-seen peak Panhellenian Zeus was worshipped, and legend ran that once, when all Greece was parched with drought, envoys assembled in Aegina from every quarter and entreated Aeacus, the king of the island, that he would intercede with his father Zeus for rain. The king complied with the request, and by sacrifices and prayers wrung the needed showers from his sire the sky-god.

Again, it was a sign of rain at Athens when clouds in summer lay on the top or the sides of Hymettus, the chain of barren mountains which bounds the Attic plain on the east, facing the westerling sun and catching from his last beams a solemn glow of purple light. If during a storm a long bank of clouds was seen lowering on the mountain, it meant that the storm would increase in fury. Hence an altar of Showery Zeus stood on Hymettus. Again, omens of weather were drawn when lightning flashed or clouds hung on the top of Mount Parnes to the north of Athens; and there accordingly an altar was set up to sign-giving Zeus. The climate of eastern Argolis is dry, and the rugged mountains are little better than a stony waterless wilderness. On one of them, named Mount Arachnaeus, or the Spider Mountain, stood altars of Zeus and Hera, and when rain was wanted the people sacrificed there to the god and goddess. On the ridge of Mount Tmolus, near Sardes, there was a spot called the Birthplace of Rainy Zeus, probably because clouds resting on it were observed to presage rain. The members of a religious society in the island of Cos used to go in procession and offer sacrifices on an altar of Rainy Zeus, when the thirsty land stood in need of refreshing showers. Thus conceived as the source of fertility, it was not unnatural that Zeus should receive the title of the Fruitful One, and that at Athens he should be worshipped under the surname of the Husbandman.

Again, Zeus wielded the thunder and lightning as well as the rain. At Olympia and elsewhere he was worshipped under the surname of Thunderbolt; and at Athens there was a sacrificial hearth of Lightning Zeus on the city wall, where some priestly officials watched for lightning over Mount Parnes at certain seasons of the year. Further, spots which had been struck by lightning were regularly fenced in by the Greeks and consecrated to Zeus the Descender, that is, to the god who came down in the flash from heaven. Altars were set up within these enclosures and sacrifices offered on them. Several such places are known from inscriptions to have existed in Athens.

Thus when ancient Greek kings claimed to be descended from Zeus, and even to bear his name, we may reasonably suppose that they also attempted to exercise his divine functions by making thunder and rain for the good of their people or the terror and confusion of their foes. In this respect the legend of Salmoneus probably reflects the pretensions of a whole class of petty sovereigns who reigned of old, each over his little canton, in the oak-clad highlands of Greece. Like their kinsmen the Irish kings, they were expected to be a source of fertility to the land and of fecundity to the cattle; and how could they fulfil these expectations better than by acting the part of their kinsman Zeus, the great god of the oak, the thunder, and the rain? They personified him, apparently, just as the Italian kings personified Jupiter.

In ancient Italy every oak was sacred to Jupiter, the Italian counterpart of Zeus; and on the Capitol at Rome the god was worshipped as the deity not merely of the oak, but of the rain and the thunder. Contrasting the piety of the good old times with the scepticism of an age when nobody thought that heaven was heaven, or cared a fig for Jupiter, a Roman writer tells us that in former days noble matrons used to go with bare feet, streaming hair, and pure minds, up the long Capitoline slope, praying to Jupiter for rain. And straightway, he goes on, it rained bucketsful, then or never, and everybody returned dripping like drowned rats. "But nowadays," says he, "we are no longer religious, so the fields lie baking." And as Jupiter conjured up the clouds and caused them to discharge their genial burden on the earth, so he drove them away and brought the bright Italian sky back once more. Hence he was worshipped under the titles of the Serene, he who restores serenity. Lastly, as god of the fertilising showers he made the earth to bring forth; so people called him the Fruitful One.

When we pass from southern to central Europe we still meet with the great god of the oak and the thunder among the barbarous Aryans who dwelt in the vast primaeval forests. Thus among the Celts of Gaul the Druids esteemed nothing more sacred than the mistletoe and the oak on which it grew; they chose groves of oaks for the scene of their solemn service, and they performed none of their rites without oak leaves. "The Celts," says a Greek writer, "worship Zeus, and the Celtic image of Zeus is a tall oak." The Celtic conquerors who settled in Asia in the third century before our era appear to have carried the worship of the oak with them to their new home; for in the heart of Asia Minor the Galatian senate met in a place which bore the pure Celtic name of Drynemetum, "the sacred oak grove" or "the temple of the oak." Indeed the very name of Druids is believed by good authorities to mean no more than "oak men." When Christianity displaced Druidism in Ireland, the churches and monasteries were sometimes built in oak groves or under solitary oaks, the choice of the site being perhaps determined by the immemorial sanctity of the trees, which might predispose the minds of the converts to receive with less reluctance the teaching of the new faith. But there is no positive evidence that the Irish Druids performed their rites, like their Gallic brethren, in oak groves, so that the inference from the churches of Kildare, Derry, and the rest is merely a conjecture based on analogy.

In the religion of the ancient Germans the veneration for sacred groves seems to have held the foremost place, and according to Grimm the chief of their holy trees was the oak. It appears

to have been especially dedicated to the god of thunder, Donar or Thunar, the equivalent of the Norse Thor; for a sacred oak near Geismar, in Hesse, which Boniface cut down in the eighth century, went among the heathen by the name of Jupiter's oak (*robur Jovis*), which in old German would be *Donares eih*, "the oak of Donar." That the Teutonic thunder god Donar, Thunar, Thor was identified with the Italian thunder god Jupiter appears from our word Thursday, Thunar's day, which is merely a rendering of the Latin *dies Jovis*. Thus among the ancient Teutons, as among the Greeks and Italians, the god of the oak was also the god of the thunder. Moreover, he was regarded as the great fertilising power, who sent rain and caused the earth to bear fruit; for Adam of Bremen tells us that "Thor presides in the air; he it is who rules thunder and lightning, wind and rains, fine weather and crops." In these respects, therefore, the Teutonic thunder god again resembled his southern counterparts Zeus and Jupiter. And like them Thor appears to have been the chief god of the pantheon; for in the great temple at Upsala his image occupied the middle place between the images of Odin and Frey, and in oaths by this or other Norse trinities he was always the principal deity invoked. Beside the temple at Upsala there was a sacred grove, but the kinds of trees which grew in it are not known. Only of one tree are we told that it was of mighty size, with great spreading branches, and that it remained green winter and summer alike. Here too was a spring where sacrifices were offered. They used to plunge a living man into the water, and if he disappeared they drew a favourable omen. Every nine years, at the spring equinox, a great festival was held at Upsala in honour of Thor, the god of thunder, Odin, the god of war, and Frey, the god of peace and pleasure. The ceremonies lasted nine days. Nine male animals of every sort were sacrificed, that their blood might appease the gods. Each day six victims were slaughtered, of whom one was a man. Their bodies were fastened to the trees of the grove, where dogs and horses might be seen hanging beside men.

Amongst the Slavs also the oak appears to have been the sacred tree of the thunder god Perun, the counterpart of Zeus and Jupiter. It is said that at Novgorod there used to stand an image of Perun in the likeness of a man with a thunder-stone in his hand. A fire of oak wood burned day and night in his honour; and if ever it went out the attendants paid for their negligence with their lives. Perun seems, like Zeus and Jupiter, to have been the chief god of his people; for Procopius tells us that the Slavs "believe that one god, the maker of lightning, is alone lord of all things, and they sacrifice to him oxen and every victim."

The chief deity of the Lithuanians was Perkunas or Perkuns, the god of thunder and lightning, whose resemblance to Zeus and Jupiter has often been pointed out. Oaks were sacred to him, and when they were cut down by the Christian missionaries, the people loudly complained that their sylvan deities were destroyed. Perpetual fires, kindled with the wood of certain oak-trees, were kept up in honour of Perkunas; if such a fire went out, it was lighted again by friction of the sacred wood. Men sacrificed to oak-trees for good crops, while women did the same to lime-trees; from which we may infer that they regarded oaks as male and lime-trees as female. And in time of drought, when they wanted rain, they used to sacrifice a black heifer, a black he-goat, and a black cock to the thunder-god in the depths of the woods. On such occasions the people assembled in great numbers from the country round about, ate and drank, and called upon Perkunas. They carried a bowl of beer thrice round the fire, then poured the liquor on the flames, while they prayed to the god to send showers. Thus the chief Lithuanian deity presents a close resemblance to Zeus and Jupiter, since he was the god of the oak, the thunder, and the rain.

Wedged in between the Lithuanians and the Slavs are the Esthonians, a people who do not belong to the Aryan family. But they also shared the reverence for the oak, and associated the tree with their thunder-god Taara, the deity of their pantheon, whom they called "Old Father," or "Father of Heaven." It is said that down to the beginning of the nineteenth century

Esthonians used to smear the holy oaks, lime-trees, and ash-trees with the fresh blood of animals at least once a year. The following prayer to thunder is instructive, because it shows how easily thunder, through its association with rain, may appear to the rustic mind in the character of a beneficent and fertilising power. It was taken down from the lips of an Esthonian peasant in the seventeenth century. "Dear Thunder," he prayed, "we sacrifice to thee an ox, which has two horns and four claws, and we would beseech thee for the sake of our ploughing and sowing, that our straw may be red as copper, and our corn yellow as gold. Drive somewhere else all black, thick clouds over great marshes, high woods, and wide wastes. But to us ploughmen and sowers give a fruitful time and sweet rain. Holy Thunder, guard our fields, that they may bear good straw below, good ears above, and good grain within." Sometimes in time of great drought an Esthonian farmer would carry beer thrice round a sacrificial fire, then pour it on the flames with a prayer that the thunder-god would be pleased to send rain.

In like manner, Parjanya, the old Indian god of thunder and rain, whose name is by some scholars identified with the Lithuanian Perkunas, was conceived as a deity of fertility, who not only made plants to germinate, but caused cows, mares, and women to conceive. As the power who impregnated all things, he was compared to a bull, an animal which to the primitive herdsman is the most natural type of the procreative energies. Thus in a hymn of the Rigveda it is said of him:—

"The Bull, loud roaring, swift to send his bounty, lays in the plants the seed for germination. He smites the trees apart, he slays the demons: all life fears him who wields the mighty weapon.

From him exceeding strong flees e'en the guiltless when thundering Parjanya smites the wicked.

"Like a car-driver whipping on his horses, he makes the messengers of rain spring forward. Far off resounds the roaring of the lion what time Parjanya fills the sky with rain-cloud. Forth burst the winds, down come the lightning-flashes: the plants shoot up, the realm of light is streaming.

Food springs abundant for all living creatures what time Parjanya quickens earth with moisture."

In another hymn Parjanya is spoken of as "giver of growth to plants, the god who ruleth over the waters and all moving creatures," and it is said that "in him all living creatures have their being." Then the poet goes on:—

"May this my song to sovran lord Parjanya come near unto his heart and give him pleasure. May we attain the showers that bring enjoyment, and god-protected plants with goodly fruitage.

He is the Bull of all, and their impregner: he holds the life of all things fixed and moving."

And in yet another hymn we read:—

"Sing forth and laud Parjanya, son of Heaven, who sends the gift of rain:

May he provide our pasturage.

Parjanya is the god who forms in kine, in mares, in plants of earth

And womanhood, the germ of life."

In short, "Parjanya is a god who presides over the lightning, the thunder, the rain, and the procreation of plants and living creatures. But it is by no means clear whether he is originally a god of the rain, or a god of the thunder. For, as both phenomena are always associated in India, either of the two opinions is admissible, if no deciding evidence comes from another quarter." On this point something will be said presently. Here it is enough to have indicated

the ease with which the notion of the thunder-god passes into, or is combined with, the idea of a god of fertility in general.

The same combination meets us in Heno, the thunder-spirit of the Iroquois. His office was not only to hurl his bolts at evil-doers, but to cool and refresh the ground with showers, to ripen the harvest, and to mature the fruits of the earth. In spring, when they committed the seeds to the soil, the Indians prayed to him that he would water them and foster their growth: and at the harvest festival they thanked him for his gift of rain. The Hos of Togoland in West Africa distinguish two deities of the lightning, a god Sogle and a goddess Sodza, who are husband and wife and talk with each other in the sound of thunder. The goddess has epithets applied to her which seem to shew that she is believed to send the rain and to cause the plants to grow. She is addressed as "Mother of men and beasts, ship full of yams, ship full of the most varied fullness." Further, it is said to be she who blesses the tilled land. Moreover, like the Hindoo thunder-god Parjanya, who slays demons, the Ho thunder-goddess drives away evil spirits and witches from people's houses; under her protection children multiply and the inmates of the house remain healthy. The Indians of the Andes, about Lake Titicaca, believe in a thunder-god named Con or Cun, whom they call the "lord" or "father" of the mountains (*Ccollo-auqui*). He is regarded as a powerful being, but irritable and difficult of access, who dwells on the high mountains above the line of perpetual snow. Yet he gives great gifts to those who win his favour; and when the crops are languishing for lack of rain, the Indians try to rouse the god from his torpor by pouring a small libation of brandy into a tarn below the snow-line; for they dare not set foot on the snow lest they should meet the dreadful thunder-god face to face. His bird is the condor as the eagle was the bird of the Greek thunder-god Zeus. Similarly in time of drought the Abchases of the Caucasus sacrifice an ox to Ap-hi, the god of thunder and lightning, and an old man prays him to send rain, thunder, and lightning, telling him that the crops are parched, the grass burnt up, and the cattle starving. These examples shew how readily a thunder-god may come to be viewed as a power of fertility; the connecting link is furnished by the fertilising rain which usually accompanies a thunder-storm.

As might have been expected, the ancient worship of the oak in Europe has left its print in popular custom and superstition down to modern times. Thus in the French department of Maine it is said that solitary oak-trees in the fields are still worshipped, though the priests have sought to give the worship a Christian colour by hanging images of saints on the trees. In various parts of Lower Saxony and Westphalia, as late as the first half of the nineteenth century, traces survived of the sanctity of certain oaks, to which the people paid a half-heathenish, half-Christian worship. In the principality of Minden young people of both sexes used to dance round an old oak on Easter Saturday with loud shouts of joy. And not far from the village of Wormeln, in the neighbourhood of Paderborn, there stood a holy oak in the forest, to which the inhabitants of Wormeln and Calenberg went every year in solemn procession. Another vestige of superstitious reverence for the oak in Germany is the custom of passing sick people and animals through a natural or artificial opening in the trunk of an oak for the purpose of healing them of their infirmities. At a village near Ragnit in East Prussia there was an oak which, down to the seventeenth century, the villagers regarded as sacred, firmly believing that any person who harmed it would be visited with misfortune, especially with some bodily ailment. About the middle of the nineteenth century the Lithuanians still laid offerings for spirits under ancient oaks; and old-fashioned people among them preferred to cook the viands for funeral banquets on a fire of oak-wood, or at least under an oak-tree. On the rivulet Micksy, between the governments of Pskov and Livonia in Russia, there stood a stunted, withered, but holy oak, which received the homage of the neighbouring peasantry down at least to 1874. An eye-witness has described the ceremonies. He found a

great crowd of people, chiefly Esthonians of the Greek Church, assembled with their families about the tree, all dressed in gala costume. Some of them had brought wax candles and were fastening them about the trunk and in the branches. Soon a priest arrived, and, having donned his sacred robes, proceeded to sing a canticle, such as is usually sung in the Orthodox Church in honour of saints. But instead of saying as usual, "Holy saint, pray the Lord for us," he said, "Holy Oak Hallelujah, pray for us." Then he incensed the tree all round. During the service the tapers on the oak were lighted, and the people, throwing themselves on the ground, adored the holy tree. When the pastor had retired, his flock remained till late at night, feasting, drinking, dancing, and lighting fresh tapers on the oak, till everybody was drunk and the proceedings ended in an orgy.

Another relic of the ancient sanctity of the oak has survived to modern times in the practice of kindling ceremonial fires by means of the friction of oak-wood. This has been done, either at stated seasons of the year or on occasions of distress, by Slavs, Germans, and Celts. Taken together with the perpetual sacred fires of oak-wood which we have found among the Slavs, the Lithuanians, and the ancient Romans, the wide prevalence of the practice seems clearly to point back to a time when the forefathers of the Aryans in Europe dwelt in forests of oak, fed their fires with oak-wood, and rekindled them, when they chanced to go out, by rubbing two oaken sticks against each other.

From the foregoing survey of the facts it appears that a god of the oak, the thunder, and the rain was worshipped of old by all the main branches of the Aryan stock in Europe, and was indeed the chief deity of their pantheon. It was natural enough that the oak should loom large in the religion of people who lived in oak forests, used oak timber for building, oak sticks for fuel, and oak acorns for food and fodder; but we have still to explain how they were led to associate the thunder and the rain with the oak in their conception of this great divinity. From the nature of the case our solution of the problem must be conjectural; we can only guess at the train of thought which prompted our forefathers to link together things which to us seem so very different. Thunder and rain may indeed naturally be regarded as akin since the two so often occur together; but the difficulty is to understand why the oak should be joined with them. Which of the three elements was the original nucleus about which the others afterwards clustered? In our ignorance of the facts, this question amounts to asking whether, on the principles of savage thought, it is easier to suppose that an original god of thunder and rain should afterwards add the oak-tree to his attributes, or that, on the contrary, an old god of the oak should annex to himself the thunder and the rain? In favour of the first of these suppositions it may be said that a god of thunder and rain might in time be regarded as a god of the oak, because thunder and rain come from the sky, and the oak reaches skyward and is often struck by lightning. But this train of thought is hardly likely to carry conviction even to the mind of a savage. On the other hand, it is not difficult to imagine how early man in Europe might suppose the thunder, or rather the lightning, to be derived from the oak. Seeing that fire on earth was regularly kindled by the rubbing of oaken sticks together, he might readily infer that fire in heaven was produced in like manner; in other words, that the flash of lightning was the spark elicited by some one who was lighting his fire in the usual fashion up aloft; for the savage commonly explains natural phenomena by ideas drawn from the circle of his own daily life. Similarly, people who are accustomed to make fire by means of flints sometimes suppose that lightning is produced in the same way. This is reported of the Armenians, and it may be inferred of the many peoples who believe that the flint implements of prehistoric races are thunder-bolts.

Thus it is easy to conceive how a god of the oak, viewed as the source of earthly fire, should come to be regarded as a god of the lightning, and hence, by an easy extension of ideas, as a god of thunder and rain. Accordingly we may provisionally assume that the great Aryan gods

who combine these various functions have been evolved in this fashion. A further step in their promotion would be taken when the whole sky was assigned to their dominion. The Greeks and Italians certainly advanced their Zeus and Jupiter to this lofty position; but there seems to be no evidence that the Aryans of the north ever raised their corresponding deities to the rank of sky-gods in general. It is commonly indeed assumed that the sky was the original province of all these deities, or rather of the single Aryan god from which they are descended. But on this theory it is hard to see why the god of the sky should have taken up with the oak, and not only that, but should have clung to it even after he had, in some places at least, begun to sit very loose to his old home, the vault of heaven. Surely his fidelity to the oak from the earliest to the latest times among all the different families of his European worshippers is a strong argument for regarding the tree as the primary, not a secondary, element in his composite nature.

XXI. Dianus And Diana

In this chapter I propose to recapitulate the conclusions to which the enquiry has thus far led us, and drawing together the scattered rays of light, to turn them on the dark figure of the priest of Nemi.

We have found that at an early stage of society men, ignorant of the secret processes of Nature and of the narrow limits within which it is in our power to control and direct them, have commonly arrogated to themselves functions which in the present state of knowledge we should deem superhuman or divine. The illusion has been fostered and maintained by the same causes which begot it, namely, the marvellous order and uniformity with which Nature conducts her operations, the wheels of her great machine revolving with a smoothness and precision which enable the patient observer to anticipate in general the season, if not the very hour, when they will bring round the fulfilment of his hopes or the accomplishment of his fears. The regularly recurring events of this great cycle, or rather series of cycles, soon stamp themselves even on the dull mind of the savage. He foresees them, and foreseeing them mistakes the desired recurrence for an effect of his own will, and the dreaded recurrence for an effect of the will of his enemies. Thus the springs which set the vast machine in motion, though they lie far beyond our ken, shrouded in a mystery which we can never hope to penetrate, appear to ignorant man to lie within his reach: he fancies he can touch them and so work by magic art all manner of good to himself and evil to his foes. In time the fallacy of this belief becomes apparent to him: he discovers that there are things he cannot do, pleasures which he is unable of himself to procure, pains which even the most potent magician is powerless to avoid. The unattainable good, the inevitable ill, are now ascribed by him to the action of invisible powers, whose favour is joy and life, whose anger is misery and death. Thus magic tends to be displaced by religion, and the sorcerer by the priest. At this stage of thought the ultimate causes of things are conceived to be personal beings, many in number and often discordant in character, who partake of the nature and even of the frailty of man, though their might is greater than his, and their life far exceeds the span of his ephemeral existence. Their sharply-marked individualities, their clear-cut outlines have not yet begun, under the powerful solvent of philosophy, to melt and coalesce into that single unknown substratum of phenomena which, according to the qualities with which our imagination invests it, goes by one or other of the high-sounding names which the wit of man has devised to hide his ignorance. Accordingly, so long as men look on their gods as beings akin to themselves and not raised to an unapproachable height above them, they believe it to be possible for those of their own number who surpass their fellows to attain to the divine rank after death or even in life. Incarnate human deities of this latter sort may be said to halt midway between the age of magic and the age of religion. If they bear the names and display the pomp of deities, the powers which they are supposed to wield are commonly those of their predecessor the magician. Like him, they are expected to guard their people against hostile enchantments, to heal them in sickness, to bless them with offspring, and to provide them with an abundant supply of food by regulating the weather and performing the other ceremonies which are deemed necessary to ensure the fertility of the earth and the multiplication of animals. Men who are credited with powers so lofty and far-reaching naturally hold the highest place in the land, and while the rift between the spiritual and the temporal spheres has not yet widened too far, they are supreme in civil as well as religious matters: in a word, they are kings as well as gods. Thus the divinity which hedges a king has its roots deep down in human history, and long ages pass before these are sapped by a profounder view of nature and man.

In the classical period of Greek and Latin antiquity the reign of kings was for the most part a thing of the past; yet the stories of their lineage, titles, and pretensions suffice to prove that they too claimed to rule by divine right and to exercise superhuman powers. Hence we may without undue temerity assume that the King of the Wood at Nemi, though shorn in later times of his glory and fallen on evil days, represented a long line of sacred kings who had once received not only the homage but the adoration of their subjects in return for the manifold blessings which they were supposed to dispense. What little we know of the functions of Diana in the Arician grove seems to prove that she was here conceived as a goddess of fertility, and particularly as a divinity of childbirth. It is reasonable, therefore, to suppose that in the discharge of these important duties she was assisted by her priest, the two figuring as King and Queen of the Wood in a solemn marriage, which was intended to make the earth gay with the blossoms of spring and the fruits of autumn, and to gladden the hearts of men and women with healthful offspring.

If the priest of Nemi posed not merely as a king, but as a god of the grove, we have still to ask, What deity in particular did he personate? The answer of antiquity is that he represented Virbius, the consort or lover of Diana. But this does not help us much, for of Virbius we know little more than the name. A clue to the mystery is perhaps supplied by the Vestal fire which burned in the grove. For the perpetual holy fires of the Aryans in Europe appear to have been commonly kindled and fed with oak-wood, and we have seen that in Rome itself, not many miles from Nemi, the fuel of the Vestal fire consisted of oaken sticks or logs, which in early days the holy maidens doubtless gathered or cut in the coppices of oak that once covered the Seven Hills. But the ritual of the various Latin towns seems to have been marked by great uniformity; hence it is reasonable to conclude that wherever in Latium a Vestal fire was maintained, it was fed, as at Rome, with wood of the sacred oak. If this was so at Nemi, it becomes probable that the hallowed grove there consisted of a natural oak-wood, and that therefore the tree which the King of the Wood had to guard at the peril of his life was itself an oak; indeed it was from an evergreen oak, according to Virgil, that Aeneas plucked the Golden Bough. Now the oak was the sacred tree of Jupiter, the supreme god of the Latins. Hence it follows that the King of the Wood, whose life was bound up in a fashion with an oak, personated no less a deity than Jupiter himself. At least the evidence, slight as it is, seems to point to this conclusion. The old Alban dynasty of the Silvii or Woods, with their crown of oak leaves, apparently aped the style and emulated the powers of Latian Jupiter, who dwelt on the top of the Alban Mount. It is not impossible that the King of the Wood, who guarded the sacred oak a little lower down the mountain, was the lawful successor and representative of this ancient line of the Silvii or Woods. At all events, if I am right in supposing that he passed for a human Jupiter, it would appear that Virbius, with whom legend identified him, was nothing but a local form of Jupiter, considered perhaps in his original aspect as a god of the greenwood.

The hypothesis that in later times at all events the King of the Wood played the part of the oak god Jupiter, is confirmed by an examination of his divine partner Diana. For two distinct lines of argument converge to shew that if Diana was a queen of the woods in general, she was at Nemi a goddess of the oak in particular. In the first place, she bore the title of Vesta, and as such presided over a perpetual fire, which we have seen reason to believe was fed with oak wood. But a goddess of fire is not far removed from a goddess of the fuel which burns in the fire; primitive thought perhaps drew no sharp line of distinction between the blaze and the wood that blazes. In the second place, the nymph Egeria at Nemi appears to have been merely a form of Diana, and Egeria is definitely said to have been a Dryad, a nymph of the oak. Elsewhere in Italy the goddess had her home on oak-clad mountains. Thus Mount Algidus, a spur of the Alban hills, was covered in antiquity with dark forests of oak, both of

the evergreen and the deciduous sort. In winter the snow lay long on these cold hills, and their gloomy oak-woods were believed to be a favourite haunt of Diana, as they have been of brigands in modern times. Again, Mount Tifata, the long abrupt ridge of the Apennines which looks down on the Campanian plain behind Capua, was wooded of old with evergreen oaks, among which Diana had a temple. Here Sulla thanked the goddess for his victory over the Marians in the plain below, attesting his gratitude by inscriptions which were long afterwards to be seen in the temple. On the whole, then, we conclude that at Nemi the King of the Wood personated the oak-god Jupiter and mated with the oak-goddess Diana in the sacred grove. An echo of their mystic union has come down to us in the legend of the loves of Numa and Egeria, who according to some had their trysting-place in these holy woods.

To this theory it may naturally be objected that the divine consort of Jupiter was not Diana but Juno, and that if Diana had a mate at all he might be expected to bear the name not of Jupiter, but of Dianus or Janus, the latter of these forms being merely a corruption of the former. All this is true, but the objection may be parried by observing that the two pairs of deities, Jupiter and Juno on the one side, and Dianus and Diana, or Janus and Jana, on the other side, are merely duplicates of each other, their names and their functions being in substance and origin identical. With regard to their names, all four of them come from the same Aryan root *DI*, meaning "bright," which occurs in the names of the corresponding Greek deities, Zeus and his old female consort Dione. In regard to their functions, Juno and Diana were both goddesses of fecundity and childbirth, and both were sooner or later identified with the moon. As to the true nature and functions of Janus the ancients themselves were puzzled; and where they hesitated, it is not for us confidently to decide. But the view mentioned by Varro that Janus was the god of the sky is supported not only by the etymological identity of his name with that of the sky-god Jupiter, but also by the relation in which he appears to have stood to Jupiter's two mates, Juno and Juturna. For the epithet Junonian bestowed on Janus points to a marriage union between the two deities; and according to one account Janus was the husband of the water-nymph Juturna, who according to others was beloved by Jupiter. Moreover, Janus, like Jove, was regularly invoked, and commonly spoken of, under the title of Father. Indeed, he was identified with Jupiter not merely by the logic of a Christian doctor, but by the piety of a pagan worshipper who dedicated an offering to Jupiter Dianus. A trace of his relation to the oak may be found in the oak-woods of the Janiculum, the hill on the right bank of the Tiber, where Janus is said to have reigned as a king in the remotest ages of Italian history.

Thus, if I am right, the same ancient pair of deities was variously known among the Greek and Italian peoples as Zeus and Dione, Jupiter and Juno, or Dianus (Janus) and Diana (Jana), the names of the divinities being identical in substance, though varying in form with the dialect of the particular tribe which worshipped them. At first, when the peoples dwelt near each other, the difference between the deities would be hardly more than one of name; in other words, it would be almost purely dialectical. But the gradual dispersion of the tribes, and their consequent isolation from each other, would favour the growth of divergent modes of conceiving and worshipping the gods whom they had carried with them from their old home, so that in time discrepancies of myth and ritual would tend to spring up and thereby to convert a nominal into a real distinction between the divinities. Accordingly when, with the slow progress of culture, the long period of barbarism and separation was passing away, and the rising political power of a single strong community had begun to draw or hammer its weaker neighbours into a nation, the confluent peoples would throw their gods, like their dialects, into a common stock; and thus it might come about that the same ancient deities, which their forefathers had worshipped together before the dispersion, would now be so disguised by the accumulated effect of dialectical and religious divergencies that their

original identity might fail to be recognised, and they would take their places side by side as independent divinities in the national pantheon.

This duplication of deities, the result of the final fusion of kindred tribes who had long lived apart, would account for the appearance of Janus beside Jupiter, and of Diana or Jana beside Juno in the Roman religion. At least this appears to be a more probable theory than the opinion, which has found favour with some modern scholars, that Janus was originally nothing but the god of doors. That a deity of his dignity and importance, whom the Romans revered as a god of gods and the father of his people, should have started in life as a humble, though doubtless respectable, doorkeeper appears to me, I confess, very unlikely. So lofty an end hardly consorts with so lowly a beginning. It is more probable that the door (*janua*) got its name from Janus than that he got his name from it. This view is strengthened by a consideration of the word *janua* itself. The regular word for door is the same in all the languages of the Aryan family from India to Ireland. It is *dur* in Sanscrit, *thura* in Greek, *Tür* in German, *door* in English, *dorus* in old Irish, and *foris* in Latin. Yet besides this ordinary name for door, which the Latins shared with all their Aryan brethren, they had also the name *janua*, to which there is no corresponding term in any Indo-European speech. The word has the appearance of being an adjectival form derived from the noun *Janus*. I conjecture that it may have been customary to set up an image or symbol of Janus at the principal door of the house in order to place the entrance under the protection of the great god. A door thus guarded might be known as a *janua foris*, that is, a Januan door, and the phrase might in time be abridged into *janua*, the noun *foris* being understood but not expressed. From this to the use of *janua* to designate a door in general, whether guarded by an image of Janus or not, would be an easy and natural transition.

If there is any truth in this conjecture, it may explain very simply the origin of the double head of Janus, which has so long exercised the ingenuity of mythologists. When it had become customary to guard the entrance of houses and towns by an image of Janus, it might well be deemed necessary to make the sentinel god look both ways, before and behind, at the same time, in order that nothing should escape his vigilant eye. For if the divine watchman always faced in one direction, it is easy to imagine what mischief might have been wrought with impunity behind his back.

This explanation of the double-headed Janus at Rome is confirmed by the double-headed idol which the Bush negroes in the interior of Surinam regularly set up as a guardian at the entrance of a village. The idol consists of a block of wood with a human face rudely carved on each side; it stands under a gateway composed of two uprights and a cross-bar. Beside the idol generally lies a white rag intended to keep off the devil; and sometimes there is also a stick which seems to represent a bludgeon or weapon of some sort. Further, from the cross-bar hangs a small log which serves the useful purpose of knocking on the head any evil spirit who might attempt to pass through the gateway. Clearly this double-headed fetish at the gateway of the negro villages in Surinam bears a close resemblance to the double-headed images of Janus which, grasping a stick in one hand and a key in the other, stood sentinel at Roman gates and doorways; and we can hardly doubt that in both cases the heads facing two ways are to be similarly explained as expressive of the vigilance of the guardian god, who kept his eye on spiritual foes behind and before, and stood ready to bludgeon them on the spot. We may, therefore, dispense with the tedious and unsatisfactory explanations which the wily Janus himself fobbed off an anxious Roman enquirer. In the interior of Borneo the Kenyahs generally place before the main entrance of their houses the wooden image of Balli Atap, that is, the Spirit or God (*Balli*) of the Roof, who protects the household from harm of all kinds. But it does not appear that this divine watchman is provided with more than one face.

To apply these conclusions to the priest of Nemi, we may suppose that as the mate of Diana he represented originally Dianus or Janus rather than Jupiter, but that the difference between these deities was of old merely superficial, going little deeper than the names, and leaving practically unaffected the essential functions of the god as a power of the sky, the thunder, and the oak. If my analysis of this great divinity is correct, the original element in his composite nature was the oak. It was fitting, therefore, that his human representative at Nemi should dwell, as we have seen reason to believe he did, in an oak grove. His title of King of the Wood clearly indicates the sylvan character of the deity whom he served; and since he could only be assailed by him who had plucked the bough of a certain tree in the grove, his own life might be said to be bound up with that of the sacred tree. Thus he not only served but embodied the great Aryan god of the oak; and as an oak-god he would mate with the oak-goddess, whether she went by the name of Egeria or Diana. Their union, however consummated, would be deemed essential to the fertility of the earth and the fecundity of man and beast. Further, as the oak-god had grown into a god of the sky, the thunder, and the rain, so his human representative would be required, like many other divine kings, to cause the clouds to gather, the thunder to peal, and the rain to descend in due season, that the fields and orchards might bear fruit and the pastures be covered with luxuriant herbage. The reputed possessor of powers so exalted must have been a very important personage; and the remains of buildings and of votive offerings which have been found on the site of the sanctuary combine with the testimony of classical writers to prove that in later times it was one of the greatest and most popular shrines in Italy. Even in the old days when the champaign country around was still parcelled out among the petty tribes who composed the Latin League, the sacred grove is known to have been an object of their common reverence and care. And just as the kings of Cambodia used to send offerings to the mystic kings of Fire and Water far in the dim depths of the tropical forest, so, we may well believe, from all sides of the broad Latian plain the eyes and footsteps of Italian pilgrims turned to the quarter where, standing sharply out against the faint blue line of the Apennines or the deeper blue of the distant sea, the Alban Mountain rose before them, the home of the mysterious priest of Nemi, the King of the Wood. There, among the green woods and beside the still waters of the lonely hills the ancient Aryan worship of the god of the oak, the thunder, and the dripping sky lingered in its early, almost Druidical form, long after a great political and intellectual revolution had shifted the capital of Latin religion from the forest to the city, from Nemi to Rome.

Part II. Taboo and the Perils of the Soul

(Originally published in Volume III)

Preface

The term Taboo is one of the very few words which the English language has borrowed from the speech of savages. In the Polynesian tongue, from which we have adopted it, the word designates a remarkable system which has deeply influenced the religious, social, and political life of the Oceanic islanders, both Polynesians and Melanesians, particularly by inculcating a superstitious veneration for the persons of nobles and the rights of private property. When about the year 1886 my ever-lamented friend William Robertson Smith asked me to write an article on Taboo for the Ninth Edition of the *Encyclopaedia Britannica*, I shared what I believe to have been at the time the current view of anthropologists, that the institution in question was confined to the brown and black races of the Pacific. But an attentive study of the accounts given of Taboo by observers who wrote while it still flourished in Polynesia soon led me to modify that view. The analogies which the system presents to the superstitions, not only of savages elsewhere, but of the civilised races of antiquity, were too numerous and too striking to be overlooked; and I came to the conclusion that Taboo is only one of a number of similar systems of superstition which among many, perhaps among all races of men have contributed in large measure, under many different names and with many variations of detail, to build up the complex fabric of society in all the various sides or elements of it which we describe as religious, social, political, moral and economic. This conclusion I briefly indicated in my article. My general views on the subject were accepted by my friend Robertson Smith and applied by him in his celebrated *Lectures* to the elucidation of some aspects of Semitic religion. Since then the importance of Taboo and of systems like it in the evolution of religion and morality, of government and property, has been generally recognised and has indeed become a commonplace of anthropology.

The present volume is merely an expansion of the corresponding chapter in the first edition of *The Golden Bough*. It treats of the principles of taboo in their special application to sacred personages, such as kings and priests, who are the proper theme of the book. It does not profess to handle the subject as a whole, to pursue it into all its ramifications, to trace the manifold influences which systems of this sort have exerted in moulding the multitudinous forms of human society. A treatise which should adequately discuss these topics would far exceed the limits which I have prescribed for myself in *The Golden Bough*. For example, I have barely touched in passing on the part which these superstitions have played in shaping the moral ideas and directing the moral practice of mankind, a profound subject fraught perhaps with momentous issues for the time when men shall seriously set themselves to revise their ethical code in the light of its origin. For that the ethical like the legal code of a people stands in need of constant revision will hardly be disputed by any attentive and dispassionate observer. The old view that the principles of right and wrong are immutable and eternal is no longer tenable. The moral world is as little exempt as the physical world from the law of ceaseless change, of perpetual flux. Contemplate the diversities, the inconsistencies, the contradictions of the ethical ideas and the ethical practice, not merely of different peoples in different countries, but of the same people in the same country in different ages, then say whether the foundations of morality are eternally fixed and unchanging. If they seem so to us, as they have probably seemed to men in all ages who did not extend their views beyond the narrow limits of their time and country, it is in all likelihood merely because the rate of change is commonly so slow that it is imperceptible at any moment and can only be detected by a comparison of accurate observations extending over long periods of time. Such a comparison, could we make it, would probably convince us that if we speak of the moral law as immutable and eternal, it can only be in the relative or

figurative sense in which we apply the same words to the outlines of the great mountains, by comparison with the short-lived generations of men. The mountains, too, are passing away, though we do not see it; nothing is stable and abiding under or above the sun. We can as little arrest the process of moral evolution as we can stay the sweep of the tides or the courses of the stars.

Therefore, whether we like it or not, the moral code by which we regulate our conduct is being constantly revised and altered: old rules are being silently expunged and new rules silently inscribed in the palimpsest by the busy, the unresting hand of an invisible scribe. For unlike the public and formal revision of a legal code, the revision of the moral code is always private, tacit, and informal. The legislators who make and the judges who administer it are not clad in ermine and scarlet, their edicts are not proclaimed with the blare of trumpets and the pomp of heraldry. We ourselves are the lawgivers and the judges: it is the whole people who make and alter the ethical standard and judge every case by reference to it. We sit in the highest court of appeal, judging offenders daily, and we cannot if we would rid ourselves of the responsibility. All that we can do is to take as clear and comprehensive a view as possible of the evidence, lest from too narrow and partial a view we should do injustice, perhaps gross and irreparable injustice, to the prisoners at the bar. Few things, perhaps, can better guard us from narrowness and illiberality in our moral judgments than a survey of the amazing diversities of ethical theory and practice which have been recorded among the various races of mankind in different ages; and accordingly the Comparative Method applied to the study of ethical phenomena may be expected to do for morality what the same method applied to religious phenomena is now doing for religion, by enlarging our mental horizon, extending the boundaries of knowledge, throwing light on the origin of current beliefs and practices, and thereby directly assisting us to replace what is effete by what is vigorous, and what is false by what is true. The facts which I have put together in this volume as well as in some of my other writings may perhaps serve as materials for a future science of Comparative Ethics. They are rough stones which await the master-builder, rude sketches which more cunning hands than mine may hereafter work up into a finished picture.

J. G. Frazer.

I. The Burden Of Royalty

§ 1. Royal and Priestly Taboos.

At a certain stage of early society the king or priest is often thought to be endowed with supernatural powers or to be an incarnation of a deity, and consistently with this belief the course of nature is supposed to be more or less under his control, and he is held responsible for bad weather, failure of the crops, and similar calamities. To some extent it appears to be assumed that the king's power over nature, like that over his subjects and slaves, is exerted through definite acts of will; and therefore if drought, famine, pestilence, or storms arise, the people attribute the misfortune to the negligence or guilt of their king, and punish him accordingly with stripes and bonds, or, if he remains obdurate, with deposition and death. Sometimes, however, the course of nature, while regarded as dependent on the king, is supposed to be partly independent of his will. His person is considered, if we may express it so, as the dynamical centre of the universe, from which lines of force radiate to all quarters of the heaven; so that any motion of his—the turning of his head, the lifting of his hand— instantaneously affects and may seriously disturb some part of nature. He is the point of support on which hangs the balance of the world, and the slightest irregularity on his part may overthrow the delicate equipoise. The greatest care must, therefore, be taken both by and of him; and his whole life, down to its minutest details, must be so regulated that no act of his, voluntary or involuntary, may disarrange or upset the established order of nature. Of this class of monarchs the Mikado or Dairi, the spiritual emperor of Japan, is or rather used to be a typical example. He is an incarnation of the sun goddess, the deity who rules the universe, gods and men included; once a year all the gods wait upon him and spend a month at his court. During that month, the name of which means “without gods,” no one frequents the temples, for they are believed to be deserted. The Mikado receives from his people and assumes in his official proclamations and decrees the title of “manifest or incarnate deity” (*Akitsu Kami*) and he claims a general authority over the gods of Japan. For example, in an official decree of the year 646 the emperor is described as “the incarnate god who governs the universe.”

The following description of the Mikado's mode of life was written about two hundred years ago:—

“Even to this day the princes descended of this family more particularly those who sit on the throne, are looked upon as persons most holy in themselves, and as Popes by birth. And, in order to preserve these advantageous notions in the minds of their subjects, they are obliged to take an uncommon care of their sacred persons, and to do such things, which, examined according to the customs of other nations, would be thought ridiculous and impertinent. It will not be improper to give a few instances of it. He thinks that it would be very prejudicial to his dignity and holiness to touch the ground with his feet; for this reason when he intends to go anywhere, he must be carried thither on men's shoulders. Much less will they suffer that he should expose his sacred person to the open air, and the sun is not thought worthy to shine on his head. There is such a holiness ascribed to all the parts of his body that he dares to cut off neither his hair, nor his beard, nor his nails. However, lest he should grow too dirty, they may clean him in the night when he is asleep; because, they say, that which is taken from his body at that time, hath been stolen from him, and that such a theft doth not prejudice his holiness or dignity. In ancient times, he was obliged to sit on the throne for some hours every morning, with the imperial crown on his head, but to sit altogether like a statue, without stirring either hands or feet, head or eyes, nor indeed any part of his body, because, by this

means, it was thought that he could preserve peace and tranquillity in his empire; for if, unfortunately, he turned himself on one side or the other, or if he looked a good while towards any part of his dominions, it was apprehended that war, famine, fire, or some other great misfortune was near at hand to desolate the country. But it having been afterwards discovered, that the imperial crown was the palladium, which by its immobility could preserve peace in the empire, it was thought expedient to deliver his imperial person, consecrated only to idleness and pleasures, from this burthensome duty, and therefore the crown is at present placed on the throne for some hours every morning. His victuals must be dressed every time in new pots, and served at table in new dishes: both are very clean and neat, but made only of common clay; that without any considerable expense they may be laid aside, or broke, after they have served once. They are generally broke, for fear they should come into the hands of laymen, for they believe religiously, that if any layman should presume to eat his food out of these sacred dishes, it would swell and inflame his mouth and throat. The like ill effect is dreaded from the Dairi's sacred habits; for they believe that if a layman should wear them, without the Emperor's express leave or command, they would occasion swellings and pains in all parts of his body." To the same effect an earlier account of the Mikado says: "It was considered as a shameful degradation for him even to touch the ground with his foot. The sun and moon were not even permitted to shine upon his head. None of the superfluities of the body were ever taken from him, neither his hair, his beard, nor his nails were cut. Whatever he eat was dressed in new vessels."

Similar priestly or rather divine kings are found, at a lower level of barbarism, on the west coast of Africa. At Shark Point near Cape Padron, in Lower Guinea, lives the priestly king Kukulú, alone in a wood. He may not touch a woman nor leave his house; indeed he may not even quit his chair, in which he is obliged to sleep sitting, for if he lay down no wind would arise and navigation would be stopped. He regulates storms, and in general maintains a wholesome and equable state of the atmosphere. On Mount Agu in Togo, a German possession in West Africa, there lives a fetish or spirit called Bagba, who is of great importance for the whole of the surrounding country. The power of giving or withholding rain is ascribed to him, and he is lord of the winds, including the Harmattan, the dry, hot wind which blows from the interior. His priest dwells in a house on the highest peak of the mountain, where he keeps the winds bottled up in huge jars. Applications for rain, too, are made to him, and he does a good business in amulets, which consist of the teeth and claws of leopards. Yet though his power is great and he is indeed the real chief of the land, the rule of the fetish forbids him ever to leave the mountain, and he must spend the whole of his life on its summit. Only once a year may he come down to make purchases in the market; but even then he may not set foot in the hut of any mortal man, and must return to his place of exile the same day. The business of government in the villages is conducted by subordinate chiefs, who are appointed by him. In the West African kingdom of Congo there was a supreme pontiff called Chitomé or Chitombé, whom the negroes regarded as a god on earth and all-powerful in heaven. Hence before they would taste the new crops they offered him the first-fruits, fearing that manifold misfortunes would befall them if they broke this rule. When he left his residence to visit other places within his jurisdiction, all married people had to observe strict continence the whole time he was out; for it was supposed that any act of incontinence would prove fatal to him. And if he were to die a natural death, they thought that the world would perish, and the earth, which he alone sustained by his power and merit, would immediately be annihilated. Similarly in Humbe, a kingdom of Angola, the incontinence of young people under the age of puberty used to be a capital crime, because it was believed to entail the death of the king within the year. Of late the death penalty has been commuted for a fine of ten oxen inflicted on each of the culprits. This commutation has attracted thousands of dissolute youth to Humbe from the neighbouring tribes, among whom

the old penalty is still rigorously exacted. Amongst the semi-barbarous nations of the New World, at the date of the Spanish conquest, there were found hierarchies or theocracies like those of Japan; in particular, the high pontiff of the Zapotecs in Southern Mexico appears to have presented a close parallel to the Mikado. A powerful rival to the king himself, this spiritual lord governed Yopaa, one of the chief cities of the kingdom, with absolute dominion. It is impossible, we are told, to overrate the reverence in which he was held. He was looked on as a god whom the earth was not worthy to hold nor the sun to shine upon. He profaned his sanctity if he even touched the ground with his foot. The officers who bore his palanquin on their shoulders were members of the highest families; he hardly deigned to look on anything around him; and all who met him fell with their faces to the earth, fearing that death would overtake them if they saw even his shadow. A rule of continence was regularly imposed on the Zapotec priests, especially upon the high pontiff; but “on certain days in each year, which were generally celebrated with feasts and dances, it was customary for the high priest to become drunk. While in this state, seeming to belong neither to heaven nor to earth, one of the most beautiful of the virgins consecrated to the service of the gods was brought to him.” If the child she bore him was a son, he was brought up as a prince of the blood, and the eldest son succeeded his father on the pontifical throne. The supernatural powers attributed to this pontiff are not specified, but probably they resembled those of the Mikado and Chitomé.

Wherever, as in Japan and West Africa, it is supposed that the order of nature, and even the existence of the world, is bound up with the life of the king or priest, it is clear that he must be regarded by his subjects as a source both of infinite blessing and of infinite danger. On the one hand, the people have to thank him for the rain and sunshine which foster the fruits of the earth, for the wind which brings ships to their coasts, and even for the solid ground beneath their feet. But what he gives he can refuse; and so close is the dependence of nature on his person, so delicate the balance of the system of forces whereof he is the centre, that the least irregularity on his part may set up a tremor which shall shake the earth to its foundations. And if nature may be disturbed by the slightest involuntary act of the king, it is easy to conceive the convulsion which his death might provoke. The natural death of the Chitomé, as we have seen, was thought to entail the destruction of all things. Clearly, therefore, out of a regard for their own safety, which might be imperilled by any rash act of the king, and still more by his death, the people will exact of their king or priest a strict conformity to those rules, the observance of which is deemed necessary for his own preservation, and consequently for the preservation of his people and the world. The idea that early kingdoms are despotisms in which the people exist only for the sovereign, is wholly inapplicable to the monarchies we are considering. On the contrary, the sovereign in them exists only for his subjects; his life is only valuable so long as he discharges the duties of his position by ordering the course of nature for his people's benefit. So soon as he fails to do so, the care, the devotion, the religious homage which they had hitherto lavished on him cease and are changed into hatred and contempt; he is dismissed ignominiously, and may be thankful if he escapes with his life. Worshipped as a god one day, he is killed as a criminal the next. But in this changed behaviour of the people there is nothing capricious or inconsistent. On the contrary, their conduct is entirely of a piece. If their king is their god, he is or should be also their preserver; and if he will not preserve them, he must make room for another who will. So long, however, as he answers their expectations, there is no limit to the care which they take of him, and which they compel him to take of himself. A king of this sort lives hedged in by a ceremonious etiquette, a network of prohibitions and observances, of which the intention is not to contribute to his dignity, much less to his comfort, but to restrain him from conduct which, by disturbing the harmony of nature, might involve himself, his people, and the universe in one common catastrophe. Far from adding to his comfort, these observances, by

trammelling his every act, annihilate his freedom and often render the very life, which it is their object to preserve, a burden and sorrow to him.

Of the supernaturally endowed kings of Loango it is said that the more powerful a king is, the more taboos is he bound to observe; they regulate all his actions, his walking and his standing, his eating and drinking, his sleeping and waking. To these restraints the heir to the throne is subject from infancy; but as he advances in life the number of abstinences and ceremonies which he must observe increases, "until at the moment that he ascends the throne he is lost in the ocean of rites and taboos." In the crater of an extinct volcano, enclosed on all sides by grassy slopes, lie the scattered huts and yam-fields of Riabba, the capital of the native king of Fernando Po. This mysterious being lives in the lowest depths of the crater, surrounded by a harem of forty women, and covered, it is said, with old silver coins. Naked savage as he is, he yet exercises far more influence in the island than the Spanish governor at Santa Isabel. In him the conservative spirit of the Boobies or aboriginal inhabitants of the island is, as it were, incorporated. He has never seen a white man and, according to the firm conviction of all the Boobies, the sight of a pale face would cause his instant death. He cannot bear to look upon the sea; indeed it is said that he may never see it even in the distance, and that therefore he wears away his life with shackles on his legs in the dim twilight of his hut. Certain it is that he has never set foot on the beach. With the exception of his musket and knife, he uses nothing that comes from the whites; European cloth never touches his person, and he scorns tobacco, rum, and even salt.

Among the Ewe-speaking peoples of the Slave Coast, in West Africa, "the king is at the same time high priest. In this quality he was, particularly in former times, unapproachable by his subjects. Only by night was he allowed to quit his dwelling in order to bathe and so forth. None but his representative, the so-called 'visible king,' with three chosen elders might converse with him, and even they had to sit on an ox-hide with their backs turned to him. He might not see any European nor any horse, nor might he look upon the sea, for which reason he was not allowed to quit his capital even for a few moments. These rules have been disregarded in recent times." The king of Dahomey himself is subject to the prohibition of beholding the sea, and so are the kings of Loango and Great Ardra in Guinea. The sea is the fetish of the Eyeos, to the north-west of Dahomey, and they and their king are threatened with death by their priests if ever they dare to look on it. It is believed that the king of Cayor in Senegal would infallibly die within the year if he were to cross a river or an arm of the sea. In Mashonaland down to recent times the chiefs would not cross certain rivers, particularly the Rurikwi and the Nyadiri; and the custom was still strictly observed by at least one chief within the last few years. "On no account will the chief cross the river. If it is absolutely necessary for him to do so, he is blindfolded and carried across with shouting and singing. Should he walk across, he will go blind or die and certainly lose the chieftainship." So among the Mahafalys and Sakalavas in the south of Madagascar some kings are forbidden to sail on the sea or to cross certain rivers. The horror of the sea is not peculiar to kings. The Basutos are said to share it instinctively, though they have never seen salt water, and live hundreds of miles from the Indian Ocean. The Egyptian priests loathed the sea, and called it the foam of Typhon; they were forbidden to set salt on their table, and they would not speak to pilots because they got their living by the sea; hence too they would not eat fish, and the hieroglyphic symbol for hatred was a fish. When the Indians of the Peruvian Andes were sent by the Spaniards to work in the hot valleys of the coast, the vast ocean which they saw before them as they descended the Cordillera was dreaded by them as a cause of disease; hence they prayed to it that they might not fall ill. This they all did without exception, even the little children. Similarly the inland people of Lampong in Sumatra are said to pay a kind of

adoration to the sea, and to make it an offering of cakes and sweetmeats when they behold it for the first time, deprecating its power of doing them mischief.

Among the Sakalavas of southern Madagascar the chief is regarded as a sacred being, but “he is held in leash by a crowd of restrictions, which regulate his behaviour like that of the emperor of China. He can undertake nothing whatever unless the sorcerers have declared the omens favourable: he may not eat warm food: on certain days he may not quit his hut; and so on.” Among some of the hill tribes of Assam both the headman and his wife have to observe many taboos in respect of food; thus they may not eat buffalo, pork, dog, fowl, or tomatoes. The headman must be chaste, the husband of one wife, and he must separate himself from her on the eve of a general or public observance of taboo. In one group of tribes the headman is forbidden to eat in a strange village, and under no provocation whatever may he utter a word of abuse. Apparently the people imagine that the violation of any of these taboos by a headman would bring down misfortune on the whole village.

The ancient kings of Ireland, as well as the kings of the four provinces of Leinster, Munster, Connaught, and Ulster, were subject to certain quaint prohibitions or taboos, on the due observance of which the prosperity of the people and the country, as well as their own, was supposed to depend. Thus, for example, the sun might not rise on the king of Ireland in his bed at Tara, the old capital of Erin; he was forbidden to alight on Wednesday at Magh Breagh, to traverse Magh Cuillinn after sunset, to incite his horse at Fan-Chomair, to go in a ship upon the water the Monday after Bealltaine (May day), and to leave the track of his army upon Ath Maighne the Tuesday after All-Hallows. The king of Leinster might not go round Tuath Laighean left-hand-wise on Wednesday, nor sleep between the Dothair (Dodder) and the Duibhlinn with his head inclining to one side, nor encamp for nine days on the plains of Cualann, nor travel the road of Duibhlinn on Monday, nor ride a dirty black-heeled horse across Magh Maistean. The king of Munster was prohibited from enjoying the feast of Loch Lein from one Monday to another; from banqueting by night in the beginning of harvest before Geim at Leitreacha; from encamping for nine days upon the Siuir; and from holding a border meeting at Gabhran. The king of Connaught might not conclude a treaty respecting his ancient palace of Cruachan after making peace on All-Hallows Day, nor go in a speckled garment on a grey speckled steed to the heath of Dal Chais, nor repair to an assembly of women at Seaghais, nor sit in autumn on the sepulchral mounds of the wife of Maine, nor contend in running with the rider of a grey one-eyed horse at Ath Gallta between two posts. The king of Ulster was forbidden to attend the horse fair at Rath Line among the youths of Dal Araidhe, to listen to the fluttering of the flocks of birds of Linn Saileach after sunset, to celebrate the feast of the bull of Daire-mic-Daire, to go into Magh Cobha in the month of March, and to drink of the water of Bo Neimhidh between two darknesses. If the kings of Ireland strictly observed these and many other customs, which were enjoined by immemorial usage, it was believed that they would never meet with mischance or misfortune, and would live for ninety years without experiencing the decay of old age; that no epidemic or mortality would occur during their reigns; and that the seasons would be favourable and the earth yield its fruit in abundance; whereas, if they set the ancient usages at naught, the country would be visited with plague, famine, and bad weather.

The kings of Egypt were worshipped as gods, and the routine of their daily life was regulated in every detail by precise and unvarying rules. “The life of the kings of Egypt,” says Diodorus, “was not like that of other monarchs who are irresponsible and may do just what they choose; on the contrary, everything was fixed for them by law, not only their official duties, but even the details of their daily life.... The hours both of day and night were arranged at which the king had to do, not what he pleased, but what was prescribed for him.... For not only were the times appointed at which he should transact public business or

sit in judgment; but the very hours for his walking and bathing and sleeping with his wife, and, in short, performing every act of life were all settled. Custom enjoined a simple diet; the only flesh he might eat was veal and goose, and he might only drink a prescribed quantity of wine." However, there is reason to think that these rules were observed, not by the ancient Pharaohs, but by the priestly kings who reigned at Thebes and in Ethiopia at the close of the twentieth dynasty. Among the Karen-nis of Upper Burma a chief attains his position, not by hereditary right, but on account of his habit of abstaining from rice and liquor. The mother, too, of a candidate for the chieftainship must have eschewed these things and lived solely on yams and potatoes so long as she was with child. During that time she may not eat any meat nor drink water from a common well. And if her son is to be qualified for the office of chief he must continue to observe these habits.

Of the taboos imposed on priests we may see a striking example in the rules of life prescribed for the Flamen Dialis at Rome, who has been interpreted as a living image of Jupiter, or a human embodiment of the sky-spirit. They were such as the following:—The Flamen Dialis might not ride or even touch a horse, nor see an army under arms, nor wear a ring which was not broken, nor have a knot on any part of his garments; no fire except a sacred fire might be taken out of his house; he might not touch wheaten flour or leavened bread; he might not touch or even name a goat, a dog, raw meat, beans, and ivy; he might not walk under a vine; the feet of his bed had to be daubed with mud; his hair could be cut only by a free man and with a bronze knife, and his hair and nails when cut had to be buried under a lucky tree; he might not touch a dead body nor enter a place where one was burned; he might not see work being done on holy days; he might not be uncovered in the open air; if a man in bonds were taken into his house, the captive had to be unbound and the cords had to be drawn up through a hole in the roof and so let down into the street. His wife, the Flaminica, had to observe nearly the same rules, and others of her own besides. She might not ascend more than three steps of the kind of staircase called Greek; at a certain festival she might not comb her hair; the leather of her shoes might not be made from a beast that had died a natural death, but only from one that had been slain or sacrificed; if she heard thunder she was tabooed till she had offered an expiatory sacrifice.

Among the Grebo people of Sierra Leone there is a pontiff who bears the title of Bodia and has been compared, on somewhat slender grounds, to the high priest of the Jews. He is appointed in accordance with the behest of an oracle. At an elaborate ceremony of installation he is anointed, a ring is put on his ankle as a badge of office, and the door-posts of his house are sprinkled with the blood of a sacrificed goat. He has charge of the public talismans and idols, which he feeds with rice and oil every new moon; and he sacrifices on behalf of the town to the dead and to demons. Nominally his power is very great, but in practice it is very limited; for he dare not defy public opinion, and he is held responsible, even with his life, for any adversity that befalls the country. It is expected of him that he should cause the earth to bring forth abundantly, the people to be healthy, war to be driven far away, and witchcraft to be kept in abeyance. His life is trammelled by the observance of certain restrictions or taboos. Thus he may not sleep in any house but his own official residence, which is called the "anointed house" with reference to the ceremony of anointing him at inauguration. He may not drink water on the highway. He may not eat while a corpse is in the town, and he may not mourn for the dead. If he dies while in office, he must be buried at dead of night; few may hear of his burial, and none may mourn for him when his death is made public. Should he have fallen a victim to the poison ordeal by drinking a decoction of sassywood, as it is called, he must be buried under a running stream of water.

Among the Todas of Southern India the holy milkman (*palol*), who acts as priest of the sacred dairy, is subject to a variety of irksome and burdensome restrictions during the whole

time of his incumbency, which may last many years. Thus he must live at the sacred dairy and may never visit his home or any ordinary village. He must be celibate; if he is married he must leave his wife. On no account may any ordinary person touch the holy milkman or the holy dairy; such a touch would so defile his holiness that he would forfeit his office. It is only on two days a week, namely Mondays and Thursdays, that a mere layman may even approach the milkman; on other days if he has any business with him, he must stand at a distance (some say a quarter of a mile) and shout his message across the intervening space. Further, the holy milkman never cuts his hair or pares his nails so long as he holds office; he never crosses a river by a bridge, but wades through a ford and only certain fords; if a death occurs in his clan, he may not attend any of the funeral ceremonies, unless he first resigns his office and descends from the exalted rank of milkman to that of a mere common mortal. Indeed it appears that in old days he had to resign the seals, or rather the pails, of office whenever any member of his clan departed this life. However, these heavy restraints are laid in their entirety only on milkmen of the very highest class. Among the Todas there are milkmen and milkmen; and some of them get off more lightly in consideration of their humbler station in life. Still, apart from the dignity they enjoy, the lot even of these other milkmen is not altogether a happy one. Thus, for example, at a place called Kanodrs there is a dairy-temple of a conical form. The milkman who has charge of it must be celibate during the tenure of his office: he must sleep in the calves' house, a very flimsy structure with an open door and a fire-place that gives little heat: he may wear only one very scanty garment: he must take his meals sitting on the outer wall which surrounds the dairy: in eating he may not put his hand to his lips, but must throw the food into his mouth; and in drinking he may not put to his lips the leaf which serves as a cup, he must tilt his head back and pour the liquid into his mouth in a jet from above. With the exception of a single layman, who is allowed to bear the milkman company, but who is also bound to celibacy and has a bed rigged up for him in the calves' house, no other person is allowed to go near this very sacred dairy under any pretext whatever. No wonder that some years ago the dairy was unoccupied and the office of milkman stood vacant. "At the present time," says Dr. Rivers, "a dairyman is appointed about once a year and holds office for thirty or forty days only. So far as I could ascertain, the failure to occupy the dairy constantly is due to the very considerable hardships and restrictions which have to be endured by the holder of the office of dairyman, and the time is probably not far distant when this dairy, one of the most sacred among the Todas, will cease altogether to be used."

§ 2. Divorce of the Spiritual from the Temporal Power.

The burdensome observances attached to the royal or priestly office produced their natural effect. Either men refused to accept the office, which hence tended to fall into abeyance; or accepting it, they sank under its weight into spiritless creatures, cloistered recluses, from whose nerveless fingers the reins of government slipped into the firmer grasp of men who were often content to wield the reality of sovereignty without its name. In some countries this rift in the supreme power deepened into a total and permanent separation of the spiritual and temporal powers, the old royal house retaining their purely religious functions, while the civil government passed into the hands of a younger and more vigorous race.

To take examples. In a previous part of this work we saw that in Cambodia it is often necessary to force the kingships of Fire and Water upon the reluctant successors, and that in Savage Island the monarchy actually came to an end because at last no one could be induced to accept the dangerous distinction. In some parts of West Africa, when the king dies, a family council is secretly held to determine his successor. He on whom the choice falls is suddenly seized, bound, and thrown into the fetish-house, where he is kept in durance till he consents to accept the crown. Sometimes the heir finds means of evading the honour which it

is sought to thrust upon him; a ferocious chief has been known to go about constantly armed, resolute to resist by force any attempt to set him on the throne. The savage Timmes of Sierra Leone, who elect their king, reserve to themselves the right of beating him on the eve of his coronation; and they avail themselves of this constitutional privilege with such hearty goodwill that sometimes the unhappy monarch does not long survive his elevation to the throne. Hence when the leading chiefs have a spite at a man and wish to rid themselves of him, they elect him king. Formerly, before a man was proclaimed king of Sierra Leone, it used to be the custom to load him with chains and thrash him. Then the fetters were knocked off, the kingly robe was placed on him, and he received in his hands the symbol of royal dignity, which was nothing but the axe of the executioner. It is not therefore surprising to read that in Sierra Leone, where such customs have prevailed, "except among the Mandingoes and Suzees, few kings are natives of the countries they govern. So different are their ideas from ours, that very few are solicitous of the honour, and competition is very seldom heard of." Another writer on Sierra Leone tells us that "the honour of reigning, so much coveted in Europe, is very frequently rejected in Africa, on account of the expense attached to it, which sometimes greatly exceeds the revenues of the crown." A reluctance to accept the sovereignty in the Ethiopian kingdom of Gingiro was simulated, if not really felt, as we learn from the old Jesuit missionaries. "They wrap up the dead king's body in costly garments, and killing a cow, put it into the hide; then all those who hope to succeed him, being his sons or others of the royal blood, flying from the honour they covet, abscond and hide themselves in the woods. This done, the electors, who are all great sorcerers, agree among themselves who shall be king, and go out to seek him, when entering the woods by means of their enchantments, they say, a large bird called *liber*, as big as an eagle, comes down with mighty cries over the place where he is hid, and they find him encompass'd by lyons, tygers, snakes, and other creatures gather'd about him by witchcraft. The elect, as fierce as those beasts, rushes out upon those who seek him, wounding and sometimes killing some of them, to prevent being seiz'd. They take all in good part, defending themselves the best they can, till they have seiz'd him. Thus they carry him away by force, he still struggling and seeming to refuse taking upon him the burthen of government, all which is mere cheat and hypocrisy."

The Mikados of Japan seem early to have resorted to the expedient of transferring the honours and burdens of supreme power to their infant children; and the rise of the Tycoons, long the temporal sovereigns of the country, is traced to the abdication of a certain Mikado in favour of his three-year-old son. The sovereignty having been wrested by a usurper from the infant prince, the cause of the Mikado was championed by Yoritomo, a man of spirit and conduct, who overthrew the usurper and restored to the Mikado the shadow, while he retained for himself the substance, of power. He bequeathed to his descendants the dignity he had won, and thus became the founder of the line of Tycoons. Down to the latter half of the sixteenth century the Tycoons were active and efficient rulers; but the same fate overtook them which had befallen the Mikados. Immeshed in the same inextricable web of custom and law, they degenerated into mere puppets, hardly stirring from their palaces and occupied in a perpetual round of empty ceremonies, while the real business of government was managed by the council of state. In Tonquin the monarchy ran a similar course. Living like his predecessors in effeminacy and sloth, the king was driven from the throne by an ambitious adventurer named Mack, who from a fisherman had risen to be Grand Mandarin. But the king's brother Tring put down the usurper and restored the king, retaining, however, for himself and his descendants the dignity of general of all the forces. Thenceforward the kings or *dovas*, though invested with the title and pomp of sovereignty, ceased to govern. While they lived secluded in their palaces, all real political power was wielded by the hereditary generals or *chovas*. The present king of Sikhim, "like most of his predecessors in the

kingship, is a mere puppet in the hands of his crafty priests, who have made a sort of priest-king of him. They encourage him by every means in their power to leave the government to them, whilst he devotes all his time to the degrading rites of devil-worship, and the ceaseless muttering of meaningless jargon, of which the Tibetan form of Buddhism chiefly consists. They declare that he is a saint by birth, that he is the direct descendant of the greatest king of Tibet, the canonised Srongtsan Gampo, who was a contemporary of Mahomed in the seventh century a.d. and who first introduced Buddhism to Tibet.” “This saintly lineage, which secures for the king's person popular homage amounting to worship, is probably, however, a mere invention of the priests to glorify their puppet-prince for their own sordid ends. Such devices are common in the East.” The custom regularly observed by the Tahitian kings of abdicating on the birth of a son, who was immediately proclaimed sovereign and received his father's homage, may perhaps have originated, like the similar custom occasionally practised by the Mikados, in a wish to shift to other shoulders the irksome burden of royalty; for in Tahiti as elsewhere the sovereign was subjected to a system of vexatious restrictions. In Mangaia, another Polynesian island, religious and civil authority were lodged in separate hands, spiritual functions being discharged by a line of hereditary kings, while the temporal government was entrusted from time to time to a victorious war-chief, whose investiture, however, had to be completed by the king. To the latter were assigned the best lands, and he received daily offerings of the choicest food. The Mikado and Tycoon of Japan had their counterparts in the Roko Tui and Vunivalu of Fiji. The Roko Tui was the Reverend or Sacred King. The Vunivalu was the Root of War or War King. In one kingdom a certain Thakambau, who was the War King, kept all power in his own hands, but in a neighbouring kingdom the real ruler was the Sacred King. Similarly in Tonga, besides the civil king or *How*, whose right to the throne was partly hereditary and partly derived from his warlike reputation and the number of his fighting men, there was a great divine chief called *Tooitonga* or “Chief of Tonga,” who ranked above the king and the other chiefs in virtue of his supposed descent from one of the chief gods. Once a year the first-fruits of the ground were offered to him at a solemn ceremony, and it was believed that if these offerings were not made the vengeance of the gods would fall in a signal manner on the people. Peculiar forms of speech, such as were applied to no one else, were used in speaking of him, and everything that he chanced to touch became sacred or tabooed. When he and the king met, the monarch had to sit down on the ground in token of respect until his holiness had passed by. Yet though he enjoyed the highest veneration by reason of his divine origin, this sacred personage possessed no political authority, and if he ventured to meddle with affairs of state it was at the risk of receiving a rebuff from the king, to whom the real power belonged, and who finally succeeded in ridding himself of his spiritual rival. The king of the Getae regularly shared his power with a priest, whom his subjects called a god. This divine man led a solitary life in a cave on a holy mountain, seeing few people but the king and his attendants. His counsels added much to the king's influence with his subjects, who believed that he was thereby enabled to impart to them the commands and admonitions of the gods. At Athens the kings degenerated into little more than sacred functionaries and it is said that the institution of the new office of Polemarch or War Lord was rendered necessary by their growing effeminacy. American examples of the partition of authority between a king and a pope have already been cited from the early history of Mexico and Colombia.

In some parts of western Africa two kings reign side by side, a fetish or religious king and a civil king, but the fetish king is really supreme. He controls the weather and so forth, and can put a stop to everything. When he lays his red staff on the ground, no one may pass that way. This division of power between a sacred and a secular ruler is to be met with wherever the true negro culture has been left unmolested, but where the negro form of society has been disturbed, as in Dahomey and Ashantee, there is a tendency to consolidate the two powers in

a single king. Thus, for example, there used to be a fetish king at New Calabar who ranked above the ordinary king in all native matters, whether religious or civil, and always walked in front of him on public occasions, attended by a slave who held an umbrella over his head. His opinion carried great weight. The office and the causes which led to its extinction are thus described by a missionary who spent many years in Calabar: "The worship of the people is now given especially to their various *idems*, one of which, called Ndem Efik, is a sort of tutelary deity of the country. An individual was appointed to take charge of this object of worship, who bore the name of King Calabar; and likely, in bypast times, possessed the power indicated by the title, being both king and priest. He had as a tribute the skins of all leopards killed, and should a slave take refuge in his shrine he belonged to Ndem Efik. The office, however, imposed certain restrictions on its occupant. He, for instance, could not partake of food in the presence of any one, and he was prohibited from engaging in traffic. On account of these and other disabilities, when the last holder of the office died, a poor old man of the Cobham family, no successor was found for him, and the priesthood has become extinct." One of the practical inconveniences of such an office is that the house of the fetish king enjoys the right of sanctuary, and so tends to become little better than a rookery of bad characters. Thus on the Grain Coast of West Africa the fetish king or Bodio, as he is called, "exercises the functions of a high-priest, and is regarded as protector of the whole nation. He lives in a house provided for him by the people, and takes care of the national fetiches. He enjoys some immunities in virtue of his office, but is subject to certain restrictions which more than counterbalance his privileges. His house is a sanctum to which culprits may betake themselves without the danger of being removed by any one except by the Bodio himself." One of these Bodios resigned office because of the sort of people who quartered themselves on him, the cost of feeding them, and the squabbles they had among themselves. He led a cat-and-dog life with them for three years. Then there came a man with homicidal mania varied by epileptic fits; and soon afterwards the spiritual shepherd retired into private life, but not before he had lost an ear and sustained other bodily injury in a personal conflict with this very black sheep.

At Porto Novo there used to be, in addition to the ordinary monarch, a King of the Night, who reigned during the hours of darkness from sunset to sunrise. He might not shew himself in the street after the sun was up. His duty was to patrol the streets with his satellites and to arrest all whom he found abroad after a certain hour. Each band of his catchpoles was led by a man who went about concealed from head to foot under a conical casing of straw and blew blasts on a shell which caused every one that heard it to shudder. The King of the Night never met the ordinary king except on the first and last days of their respective reign; for each of them invested the other with office and paid him the last honours at death. With this King of the Night at Porto Novo we may compare a certain king of Hawaii who was so very sacred that no man might see him, even accidentally, by day under pain of death; he only shewed himself by night.

In some parts of the East Indian island of Timor we meet with a partition of power like that which is represented by the civil king and the fetish king of western Africa. Some of the Timorese tribes recognise two rajahs, the ordinary or civil rajah, who governs the people, and the fetish or taboo rajah (*radja pomali*), who is charged with the control of everything that concerns the earth and its products. This latter ruler has the right of declaring anything taboo; his permission must be obtained before new land may be brought under cultivation, and he must perform certain necessary ceremonies when the work is being carried out. If drought or blight threatens the crops, his help is invoked to save them. Though he ranks below the civil rajah, he exercises a momentous influence on the course of events, for his secular colleague is bound to consult him in all important matters. In some of the neighbouring islands, such as

Rotti and eastern Flores, a spiritual ruler of the same sort is recognised under various native names, which all mean "lord of the ground." Similarly in the Mekeo district of British New Guinea there is a double chieftainship. The people are divided into two groups according to families, and each of the groups has its chief. One of the two is the war chief, the other is the taboo (*afu*) chief. The office of the latter is hereditary; his duty is to impose a taboo on any of the crops, such as the coco-nuts and areca nuts, whenever he thinks it desirable to prohibit their use. In his office we may perhaps detect the beginning of a priestly dynasty, but as yet his functions appear to be more magical than religious, being concerned with the control of the harvests rather than with the propitiation of higher powers. The members of another family are bound to see to it that the taboo imposed by the chief is strictly observed. For this purpose some fourteen or fifteen men of the family form a sort of constabulary. Every evening they go round the village armed with clubs and disguised with masks or leaves. All the time they are in office they are forbidden to live with their wives and even to look at a woman. Hence women may not quit their houses while the men are going their rounds. Further, the constables on duty are prohibited from chewing betel nut and drinking coco-nut water, lest the areca and coco-nuts should not grow. When there is a good show of nuts, the taboo chief proclaims that on a certain day the restriction will come to an end. In Ponape, one of the Caroline Islands, the kingship is elective within the limits of the blood royal, which runs in the female line, so that the sovereignty passes backwards and forwards between families which we, reckoning descent in the male line, should regard as distinct. The chosen monarch must be in possession of certain secrets. He must know the places where the sacred stones are kept, on which he has to seat himself. He must understand the holy words and prayers of the liturgy, and after his election he must recite them at the place of the sacred stones. But he enjoys only the honours of his office; the real powers of government are in the hands of his prime-minister or vizier.

II. The Perils Of The Soul

§ 1. The Soul as a Mannikin.

The foregoing examples have taught us that the office of a sacred king or priest is often hedged in by a series of burdensome restrictions or taboos, of which a principal purpose appears to be to preserve the life of the divine man for the good of his people. But if the object of the taboos is to save his life, the question arises, How is their observance supposed to effect this end? To understand this we must know the nature of the danger which threatens the king's life, and which it is the intention of these curious restrictions to guard against. We must, therefore, ask: What does early man understand by death? To what causes does he attribute it? And how does he think it may be guarded against?

As the savage commonly explains the processes of inanimate nature by supposing that they are produced by living beings working in or behind the phenomena, so he explains the phenomena of life itself. If an animal lives and moves, it can only be, he thinks, because there is a little animal inside which moves it: if a man lives and moves, it can only be because he has a little man or animal inside who moves him. The animal inside the animal, the man inside the man, is the soul. And as the activity of an animal or man is explained by the presence of the soul, so the repose of sleep or death is explained by its absence; sleep or trance being the temporary, death being the permanent absence of the soul. Hence if death be the permanent absence of the soul, the way to guard against it is either to prevent the soul from leaving the body, or, if it does depart, to ensure that it shall return. The precautions adopted by savages to secure one or other of these ends take the form of certain prohibitions or taboos, which are nothing but rules intended to ensure either the continued presence or the return of the soul. In short, they are life-preservers or life-guards. These general statements will now be illustrated by examples.

Addressing some Australian blacks, a European missionary said, "I am not one, as you think, but two." Upon this they laughed. "You may laugh as much as you like," continued the missionary, "I tell you that I am two in one; this great body that you see is one; within that there is another little one which is not visible. The great body dies, and is buried, but the little body flies away when the great one dies." To this some of the blacks replied, "Yes, yes. We also are two, we also have a little body within the breast." On being asked where the little body went after death, some said it went behind the bush, others said it went into the sea, and some said they did not know. The Hurons thought that the soul had a head and body, arms and legs; in short, that it was a complete little model of the man himself. The Esquimaux believe that "the soul exhibits the same shape as the body it belongs to, but is of a more subtle and ethereal nature." According to the Nootkas of British Columbia the soul has the shape of a tiny man; its seat is the crown of the head. So long as it stands erect, its owner is hale and hearty; but when from any cause it loses its upright position, he loses his senses. Among the Indian tribes of the Lower Fraser River, man is held to have four souls, of which the principal one has the form of a mannikin, while the other three are shadows of it. The Malays conceive the human soul (*semangat*) as a little man, mostly invisible and of the bigness of a thumb, who corresponds exactly in shape, proportion, and even in complexion to the man in whose body he resides. This mannikin is of a thin unsubstantial nature, though not so impalpable but that it may cause displacement on entering a physical object, and it can flit quickly from place to place; it is temporarily absent from the body in sleep, trance, and disease, and permanently absent after death.

The ancient Egyptians believed that every man has a soul (*ka*) which is his exact counterpart or double, with the same features, the same gait, even the same dress as the man himself. Many of the monuments dating from the eighteenth century onwards represent various kings appearing before divinities, while behind the king stands his soul or double, portrayed as a little man with the king's features. Some of the reliefs in the temple at Luxor illustrate the birth of King Amenophis III. While the queen-mother is being tended by two goddesses acting as midwives, two other goddesses are bringing away two figures of new-born children, only one of which is supposed to be a child of flesh and blood: the inscriptions engraved above their heads shew that, while the first is Amenophis, the second is his soul or double. And as with kings and queens, so it was with common men and women. Whenever a child was born, there was born with him a double which followed him through the various stages of life; young while he was young, it grew to maturity and declined along with him. And not only human beings, but gods and animals, stones and trees, natural and artificial objects, everybody and everything had its own soul or double. The doubles of oxen and sheep were the duplicates of the original oxen or sheep; the doubles of linen or beds, of chairs or knives, had the same form as the real linen, beds, chairs, and knives. So thin and subtle was the stuff, so fine and delicate the texture of these doubles, that they made no impression on ordinary eyes. Only certain classes of priests or seers were enabled by natural gifts or special training to perceive the doubles of the gods, and to win from them a knowledge of the past and the future. The doubles of men and things were hidden from sight in the ordinary course of life; still, they sometimes flew out of the body endowed with colour and voice, left it in a kind of trance, and departed to manifest themselves at a distance.

So exact is the resemblance of the mannikin to the man, in other words, of the soul to the body, that, as there are fat bodies and thin bodies, so there are fat souls and thin souls; as there are heavy bodies and light bodies, long bodies and short bodies, so there are heavy souls and light souls, long souls and short souls. The people of Nias (an island to the west of Sumatra) think that every man, before he is born, is asked how long or how heavy a soul he would like, and a soul of the desired weight or length is measured out to him. The heaviest soul ever given out weighs about ten grammes. The length of a man's life is proportioned to the length of his soul; children who die young had short souls. The Fijian conception of the soul as a tiny human being comes clearly out in the customs observed at the death of a chief among the Nakelo tribe. When a chief dies, certain men, who are the hereditary undertakers, call him, as he lies, oiled and ornamented, on fine mats, saying, "Rise, sir, the chief and let us be going. The day has come over the land." Then they conduct him to the river side, where the ghostly ferryman comes to ferry Nakelo ghosts across the stream. As they thus attend the chief on his last journey, they hold their great fans close to the ground to shelter him, because, as one of them explained to a missionary, "His soul is only a little child." People in the Punjab who tattoo themselves believe that at death the soul, "the little entire man or woman" inside the mortal frame, will go to heaven blazoned with the same tattoo patterns which adorned the body in life. Sometimes, however, as we shall see, the human soul is conceived not in human but in animal form.

§ 2. Absence and Recall of the Soul.

The soul is commonly supposed to escape by the natural openings of the body, especially the mouth and nostrils. Hence in Celebes they sometimes fasten fishhooks to a sick man's nose, navel, and feet, so that if his soul should try to escape it may be hooked and held fast. A Turik on the Baram River, in Borneo, refused to part with some hook-like stones, because they, as it were, hooked his soul to his body, and so prevented the spiritual portion of him from becoming detached from the material. When a Sea Dyak sorcerer or medicine-man is initiated, his fingers are supposed to be furnished with fish-hooks, with which he will

thereafter clutch the human soul in the act of flying away, and restore it to the body of the sufferer. But hooks, it is plain, may be used to catch the souls of enemies as well as of friends. Acting on this principle head-hunters in Borneo hang wooden hooks beside the skulls of their slain enemies in the belief that this helps them on their forays to hook in fresh heads. When an epidemic is raging, the Goajiro Indians of Colombia attribute it to an evil spirit, it may be the prowling ghost of an enemy. So they hang strings furnished with hooks from the roofs of their huts and from all the trees in the neighbourhood, in order that the demon or ghost may be caught on a hook and thus rendered powerless to harm them. Similarly the Calchaquis Indians to the west of Paraguay used to plant arrows in the ground about a sick man to keep death from getting at him. One of the implements of a Haida medicine-man is a hollow bone, in which he bottles up departing souls, and so restores them to their owners. When any one yawns in their presence the Hindoos always snap their thumbs, believing that this will hinder the soul from issuing through the open mouth. The Marquesans used to hold the mouth and nose of a dying man, in order to keep him in life by preventing his soul from escaping; the same custom is reported of the New Caledonians; and with the like intention the Bagobos of the Philippine Islands put rings of brass wire on the wrists or ankles of their sick. On the other hand, the Itonamas in South America seal up the eyes, nose, and mouth of a dying person, in case his ghost should get out and carry off others; and for a similar reason the people of Nias, who fear the spirits of the recently deceased and identify them with the breath, seek to confine the vagrant soul in its earthly tabernacle by bunging up the nose or tying up the jaws of the corpse. Before leaving a corpse the Wakelbura in Australia used to place hot coals in its ears in order to keep the ghost in the body, until they had got such a good start that he could not overtake them. Esquimaux mourners plug their nostrils with deerskin, hair, or hay for several days, probably to prevent their souls from following that of their departed friend; the custom is especially incumbent on the persons who dress the corpse. In southern Celebes, to hinder the escape of a woman's soul at childbirth, the nurse ties a band as tightly as possible round the body of the expectant mother. The Minangkabauers of Sumatra observe a similar custom; a skein of thread or a string is sometimes fastened round the wrist or loins of a woman in childbed, so that when her soul seeks to depart in her hour of travail it may find the egress barred. Among the Kayans of Borneo illness is attributed to the absence of the soul; so when a man has been ill and is well again, he attempts to prevent his soul from departing afresh. For this purpose he ties the truant into his body by fastening round his wrist a piece of string on which a *lukut*, or antique bead, is threaded; for a magical virtue appears to be ascribed to such beads. But lest the string and the bead should be broken and lost, he will sometimes tattoo the pattern of the bead on his wrist, and this is found to answer the purpose of tethering his soul quite as well. Again, the Koryak of North-Eastern Asia fancy that if there are two sick people in a house and one of them is at the last extremity, the soul of the other is apt to be lured away by the soul of the dying man; hence in order to hinder its departure they tie the patient's neck by a string to the bands of the sleeping-tent and recite a charm over the string so that it may be sure to detain the soul. And lest the soul of a babe should escape and be lost as soon as it is born, the Alfoors of Celebes, when a birth is about to take place, are careful to close every opening in the house, even the keyhole; and they stop up every chink and cranny in the walls. Also they tie up the mouths of all animals inside and outside the house, for fear one of them might swallow the child's soul. For a similar reason all persons present in the house, even the mother herself, are obliged to keep their mouths shut the whole time the birth is taking place. When the question was put, Why they did not hold their noses also, lest the child's soul should get into one of them? the answer was that breath being exhaled as well as inhaled through the nostrils, the soul would be expelled before it could have time to settle down. Popular expressions in the language of civilised peoples, such as to have one's heart in

one's mouth, or the soul on the lips or in the nose, shew how natural is the idea that the life or soul may escape by the mouth or nostrils.

Often the soul is conceived as a bird ready to take flight. This conception has probably left traces in most languages, and it lingers as a metaphor in poetry. But what is metaphor to a modern European poet was sober earnest to his savage ancestor, and is still so to many people. The Bororos of Brazil fancy that the human soul has the shape of a bird, and passes in that shape out of the body in dreams. According to the Bilqula or Bella Coola Indians of British Columbia the soul dwells in the nape of the neck and resembles a bird enclosed in an egg. If the shell breaks and the soul flies away, the man must die. If he swoons or becomes crazed, it is because his soul has flown away without breaking its shell. The shaman can hear the buzzing of its wings, like the buzz of a mosquito, as the soul flits past; and he may catch and replace it in the nape of its owner's neck. A Melanesian wizard in Lepers' Island has been known to send out his soul in the form of an eagle to pursue a ship and learn the fortunes of some natives who were being carried off in it. The soul of Aristeeas of Proconnesus was seen to issue from his mouth in the shape of a raven. There is a popular opinion in Bohemia that the parting soul comes forth from the mouth like a white bird. The Malays carry out the conception of the bird-soul in a number of odd ways. If the soul is a bird on the wing, it may be attracted by rice, and so either prevented from taking wing or lured back again from its perilous flight. Thus in Java when a child is placed on the ground for the first time (a moment which uncultured people seem to regard as especially dangerous), it is put in a hen-coop and the mother makes a clucking sound, as if she were calling hens. Amongst the Battas of Sumatra, when a man returns from a dangerous enterprise, grains of rice are placed on his head, and these grains are called *padiruma tondi*, that is, "means to make the soul (*tondi*) stay at home." In Java also rice is placed on the head of persons who have escaped a great danger or have returned home unexpectedly after it had been supposed that they were lost. Similarly in the district of Sintang in West Borneo, if any one has had a great fright, or escaped a serious peril, or comes back after a long and dangerous journey, or has taken a solemn oath, the first thing that his relations or friends do is to strew yellow rice on his head, mumbling, "Cluck! cluck! soul!" (*koer, koer, semangat*). And when a person, whether man, woman, or child, has fallen out of a house or off a tree, and has been brought home, his wife or other kinswoman goes as speedily as possible to the spot where the accident happened, and there strews rice, which has been coloured yellow, while she utters the words, "Cluck! cluck! soul! So-and-so is in his house again. Cluck! cluck! soul!" Then she gathers up the rice in a basket, carries it to the sufferer, and drops the grains from her hand on his head, saying again, "Cluck! cluck! soul!" Here the intention clearly is to decoy back the loitering bird-soul and replace it in the head of its owner. In southern Celebes they think that a bridegroom's soul is apt to fly away at marriage, so coloured rice is scattered over him to induce it to stay. And, in general, at festivals in South Celebes rice is strewed on the head of the person in whose honour the festival is held, with the object of detaining his soul, which at such times is in especial danger of being lured away by envious demons. For example, after a successful war the welcome to the victorious prince takes the form of strewing him with roasted and coloured rice "to prevent his life-spirit, as if it were a bird, from flying out of his body in consequence of the envy of evil spirits." In Central Celebes, when a party of head-hunters returns from a successful expedition, a woman scatters rice on their heads for a similar purpose. Among the Minangkabauers of Sumatra the old rude notions of the soul seem to be dying out. Nowadays most of the people hold that the soul, being immaterial, has no shape or form. But some of the sorcerers assert that the soul goes and comes in the shape of a tiny man. Others are of opinion that it does so in the form of a fly; hence they make food ready to induce the absent soul to come back, and the first fly that settles on the food is regarded as the

returning truant. But in native poetry and popular expressions there are traces of the belief that the soul quits the body in the form of a bird.

The soul of a sleeper is supposed to wander away from his body and actually to visit the places, to see the persons, and to perform the acts of which he dreams. For example, when an Indian of Brazil or Guiana wakes up from a sound sleep, he is firmly convinced that his soul has really been away hunting, fishing, felling trees, or whatever else he has dreamed of doing, while all the time his body has been lying motionless in his hammock. A whole Bororo village has been thrown into a panic and nearly deserted because somebody had dreamed that he saw enemies stealthily approaching it. A Macusi Indian in weak health, who dreamed that his employer had made him haul the canoe up a series of difficult cataracts, bitterly reproached his master next morning for his want of consideration in thus making a poor invalid go out and toil during the night. The Indians of the Gran Chaco are often heard to relate the most incredible stories as things which they have themselves seen and heard; hence strangers who do not know them intimately say in their haste that these Indians are liars. In point of fact the Indians are firmly convinced of the truth of what they relate; for these wonderful adventures are simply their dreams, which they do not distinguish from waking realities.

Now the absence of the soul in sleep has its dangers, for if from any cause the soul should be permanently detained away from the body, the person thus deprived of the vital principle must die. There is a German belief that the soul escapes from a sleeper's mouth in the form of a white mouse or a little bird, and that to prevent the return of the bird or animal would be fatal to the sleeper. Hence in Transylvania they say that you should not let a child sleep with its mouth open, or its soul will slip out in the shape of a mouse, and the child will never wake. Many causes may detain the sleeper's soul. Thus, his soul may meet the soul of another sleeper and the two souls may fight; if a Guinea negro awakens with sore bones in the morning, he thinks that his soul has been thrashed by another soul in sleep. Or it may meet the soul of a person just deceased and be carried off by it; hence in the Aru Islands the inmates of a house will not sleep the night after a death has taken place in it, because the soul of the deceased is supposed to be still in the house and they fear to meet it in a dream. Similarly among the Upper Thompson Indians of British Columbia, the friends and neighbours who gathered in a house after a death and remained there till the burial was over were not allowed to sleep, lest their souls should be drawn away by the ghost of the deceased or by his guardian spirit. The Lengua Indians of the Gran Chaco hold that the vagrant spirits of the dead may come to life again if only they can take possession of a sleeper's body during the absence of his soul in dreams. Hence, when the shades of night have fallen, the ghosts of the departed gather round the villages, watching for a chance to pounce on the bodies of dreamers and to enter into them through the gateway of the breast. Again, the soul of the sleeper may be prevented by an accident or by physical force from returning to his body. When a Dyak dreams of falling into the water, he supposes that this accident has really befallen his spirit, and he sends for a wizard, who fishes for the spirit with a hand-net in a basin of water till he catches it and restores it to its owner. The Santals tell how a man fell asleep, and growing very thirsty, his soul, in the form of a lizard, left his body and entered a pitcher of water to drink. Just then the owner of the pitcher happened to cover it; so the soul could not return to the body and the man died. While his friends were preparing to burn the body some one uncovered the pitcher to get water. The lizard thus escaped and returned to the body, which immediately revived; so the man rose up and asked his friends why they were weeping. They told him they thought he was dead and were about to burn his body. He said he had been down a well to get water, but had found it hard to get out and had just returned. So they saw it all. A similar story is reported from Transylvania as follows. In the

account of a witch's trial at Mühlbach in the eighteenth century it is said that a woman had engaged two men to work in her vineyard. After noon they all lay down to rest as usual. An hour later the men got up and tried to waken the woman, but could not. She lay motionless with her mouth wide open. They came back at sunset and still she lay like a corpse. Just at that moment a big fly came buzzing past, which one of the men caught and shut up in his leathern pouch. Then they tried again to waken the woman, but could not. Afterwards they let out the fly; it flew straight into the woman's mouth and she awoke. On seeing this the men had no further doubt that she was a witch.

It is a common rule with primitive people not to waken a sleeper, because his soul is away and might not have time to get back; so if the man wakened without his soul, he would fall sick. If it is absolutely necessary to rouse a sleeper, it must be done very gradually, to allow the soul time to return. A Fijian in Matuku, suddenly wakened from a nap by somebody treading on his foot, has been heard bawling after his soul and imploring it to return. He had just been dreaming that he was far away in Tonga, and great was his alarm on suddenly wakening to find his body in Matuku. Death stared him in the face unless his soul could be induced to speed at once across the sea and reanimate its deserted tenement. The man would probably have died of fright if a missionary had not been at hand to allay his terror. Some Brazilian Indians explain the headache from which a man sometimes suffers after a broken sleep by saying that his soul is tired with the exertions it made to return quickly to the body. A Highland story, told to Hugh Miller on the picturesque shores of Loch Shin, well illustrates the haste made by the soul to regain its body when the sleeper has been prematurely roused by an indiscreet friend. Two young men had been spending the early part of a warm summer day in the open air, and sat down on a mossy bank to rest. Hard by was an ancient ruin separated from the bank on which they sat only by a slender runnel, across which there lay, immediately over a miniature cascade, a few withered stalks of grass. "Overcome by the heat of the day, one of the young men fell asleep; his companion watched drowsily beside him; when all at once the watcher was aroused to attention by seeing a little indistinct form, scarce larger than a humble-bee, issue from the mouth of the sleeping man, and, leaping upon the moss, move downwards to the runnel, which it crossed along the withered grass stalks, and then disappeared among the interstices of the ruin. Alarmed by what he saw, the watcher hastily shook his companion by the shoulder, and awoke him; though, with all his haste, the little cloud-like creature, still more rapid in its movements, issued from the interstice into which it had gone, and, flying across the runnel, instead of creeping along the grass stalks and over the sward, as before, it re-entered the mouth of the sleeper, just as he was in the act of awakening. 'What is the matter with you?' said the watcher, greatly alarmed, 'what ails you?' 'Nothing ails me,' replied the other; 'but you have robbed me of a most delightful dream. I dreamed I was walking through a fine rich country, and came at length to the shores of a noble river; and, just where the clear water went thundering down a precipice, there was a bridge all of silver, which I crossed; and then, entering a noble palace on the opposite side, I saw great heaps of gold and jewels; and I was just going to load myself with treasure, when you rudely awoke me, and I lost all.' "

Still more dangerous is it in the opinion of primitive man to move a sleeper or alter his appearance, for if this were done the soul on its return might not be able to find or recognise its body, and so the person would die. The Minangkabauers of Sumatra deem it highly improper to blacken or dirty the face of a sleeper, lest the absent soul should shrink from re-entering a body thus disfigured. Patani Malays fancy that if a person's face be painted while he sleeps, the soul which has gone out of him will not recognise him, and he will sleep on till his face is washed. In Bombay it is thought equivalent to murder to change the aspect of a sleeper, as by painting his face in fantastic colours or giving moustaches to a sleeping

woman. For when the soul returns it will not know its own body and the person will die. The Coreans are of opinion that in sleep “the soul goes out of the body, and that if a piece of paper is put over the face of the sleeper he will surely die, for his soul cannot find its way back into him again.” The Servians believe that the soul of a sleeping witch often leaves her body in the form of a butterfly. If during its absence her body be turned round, so that her feet are placed where her head was before, the butterfly soul will not find its way back into her body through the mouth, and the witch will die. The Esthonians of the island of Oesel think that the gusts which sweep up all kinds of trifles from the ground and whirl them along are the souls of old women, who have gone out in this shape to seek what they can find. Meantime the beldame's body lies as still as a stone, and if you turn it round her soul will never be able to enter it again, until you have replaced the body in its original position. You can hear the soul whining and whimpering till it has found the right aperture. Similarly in Livonia they think that when the soul of a were-wolf is out on his hateful business, his body lies like dead; and if meanwhile the body were accidentally moved, the soul would never more find its way into it, but would remain in the body of a wolf till death. In the picturesque but little known Black Mountain of southern France, which forms a sort of link between the Pyrenees and the Cevennes, they tell how a woman, who had long been suspected of being a witch, one day fell asleep at noon among the reapers in the field. Resolved to put her to the test, the reapers carried her, while she slept, to another part of the field, leaving a large pitcher on the spot from which they had moved her. When her soul returned, it entered the pitcher and cunningly rolled it over and over till the vessel lay beside her body, of which the soul thereupon took possession.

But in order that a man's soul should quit his body, it is not necessary that he should be asleep. It may quit him in his waking hours, and then sickness, insanity, or death will be the result. Thus a man of the Wurunjeri tribe in Victoria lay at his last gasp because his spirit (*murup*) had departed from him. A medicine-man went in pursuit and caught the spirit by the middle just as it was about to plunge into the sunset glow, which is the light cast by the souls of the dead as they pass in and out of the underworld, where the sun goes to rest. Having captured the vagrant spirit, the doctor brought it back under his opossum rug, laid himself down on the dying man, and put the soul back into him, so that after a time he revived. The Karens of Burma are perpetually anxious about their souls, lest these should go roving from their bodies, leaving the owners to die. When a man has reason to fear that his soul is about to take this fatal step, a ceremony is performed to retain or recall it, in which the whole family must take part. A meal is prepared consisting of a cock and hen, a special kind of rice, and a bunch of bananas. Then the head of the family takes the bowl which is used to skim rice, and knocking with it thrice on the top of the house-ladder says: “*Prrrroo!* Come back, soul, do not tarry outside! If it rains, you will be wet. If the sun shines, you will be hot. The gnats will sting you, the leeches will bite you, the tigers will devour you, the thunder will crush you. *Prrrroo!* Come back, soul! Here it will be well with you. You shall want for nothing. Come and eat under shelter from the wind and the storm.” After that the family partakes of the meal, and the ceremony ends with everybody tying their right wrist with a string which has been charmed by a sorcerer. Similarly the Lolos, an aboriginal tribe of western China, believe that the soul leaves the body in chronic illness. In that case they read a sort of elaborate litany, calling on the soul by name and beseeching it to return from the hills, the vales, the rivers, the forests, the fields, or from wherever it may be straying. At the same time cups of water, wine, and rice are set at the door for the refreshment of the weary wandering spirit. When the ceremony is over, they tie a red cord round the arm of the sick man to tether the soul, and this cord is worn by him until it decays and drops off. So among the Kenyahs of Sarawak a medicine-man has been known to recall the stray soul of a child, and to fasten it firmly in its body by tying a string round the child's right wrist, and smearing its little arm

with the blood of a fowl. The Ilocanes of Luzon think that a man may lose his soul in the woods or gardens, and that he who has thus lost his soul loses also his senses. Hence before they quit the woods or the fields they call to their soul, "Let us go! let us go!" lest it should loiter behind or go astray. And when a man becomes crazed or mad, they take him to the place where he is supposed to have lost his soul and invite the truant spirit to return to his body. The Mongols sometimes explain sickness by supposing that the patient's soul is absent, and either does not care to return to its body or cannot find the way back. To secure the return of the soul it is therefore necessary on the one hand to make its body as attractive as possible, and on the other hand to shew the soul the way home. To make the body attractive all the sick man's best clothes and most valued possessions are placed beside him; he is washed, incensed, and made as comfortable as may be; and all his friends march thrice round the hut calling out the sick man's name and coaxing his soul to return. To help the wanderer to find its way back a coloured cord is stretched from the patient's head to the door of the hut. The priest in his robes reads a list of the horrors of hell and the dangers incurred by souls which wilfully absent themselves from their bodies. Then turning to the assembled friends and the patient he asks, "Is it come?" All answer "Yes," and bowing to the returning soul throw seed over the sick man. The cord which guided the soul back is then rolled up and placed round the patient's neck, who must wear it for seven days without taking it off. No one may frighten or hurt him, lest his soul, not yet familiar with its body, should again take flight.

Some of the Congo tribes believe that when a man is ill, his soul has left his body and is wandering at large. The aid of the sorcerer is then called in to capture the vagrant spirit and restore it to the invalid. Generally the physician declares that he has successfully chased the soul into the branch of a tree. The whole town thereupon turns out and accompanies the doctor to the tree, where the strongest men are deputed to break off the branch in which the soul of the sick man is supposed to be lodged. This they do and carry the branch back to the town, insinuating by their gestures that the burden is heavy and hard to bear. When the branch has been brought to the sick man's hut, he is placed in an upright position by its side, and the sorcerer performs the enchantments by which the soul is believed to be restored to its owner. The soul or shade of a Déné or Tinneh Indian in the old days generally remained invisible, but appeared wandering about in one form or another whenever disease or death was imminent. All the efforts of the sufferer's friends were therefore concentrated on catching the roving shade. The method adopted was simple. They stuffed the patient's moccasins with down and hung them up. If next morning the down was warm, they made sure that the lost soul was in the boots, with which accordingly they carefully and silently shod their suffering friend. Nothing more could reasonably be demanded for a perfect cure. An Ottawa medicine-man has been known to catch a stray soul in a little box, which he brought back and inserted in the patient's mouth.

Pining, sickness, great fright, and death are ascribed by the Battas or Bataks of Sumatra to the absence of the soul (*tendi*) from the body. At first they try to beckon the wanderer back, and to lure him, like a fowl, by strewing rice. Then the following form of words is commonly repeated: "Come back, O soul, whether thou art lingering in the wood, or on the hills, or in the dale. See, I call thee with a *toemba bras*, with an egg of the fowl Rajah *moelija*, with the eleven healing leaves. Detain it not, let it come straight here, detain it not, neither in the wood, nor on the hill, nor in the dale. That may not be. O come straight home!" Sometimes the means adopted by the Battas to procure the return of a sick person's soul are more elaborate. A procession sets out from the village to the tuck of drum to find and bring home the strayed soul. First goes a person bearing a basket which contains cakes of rice-meal, rice dyed yellow, and a boiled fowl's egg. The sorcerer follows carrying a chicken, and behind him walks a man with a black, red, and white flag. A crowd of sympathisers brings up the

rear. On reaching the spot where the lost soul is supposed to tarry, they set up a small bamboo altar, and the sorcerer offers on it the chicken to the spirit of the place, the drums beating all the time. Then, waving his shawl to attract the soul of the sick man, he says: "Come hither, thou soul of So-and-So, whether thou sittest among the stones or in the mud. In the house is thy place. We have besought the spirit to let thee go." After that the procession reforms and marches back to the village to the roll of drums and the clash of cymbals. On reaching the door of the house the sorcerer calls out to the inmates, "Has it come?" and a voice from within answers, "It is here, good sorcerer." At evening the drums beat again. A number of plants, including rice, a species of fig, and garlic, are supposed by the Battas to possess soul-compelling virtue and are accordingly made use of by them in rites for the recovery of lost souls. When a child is sick, the mother commonly waves a cloth to beckon home its wandering spirit, and when a cock crows or a hen cackles in the yard, she knows that the prodigal has returned. If the little sufferer persists in being ill in spite of these favourable omens, the mother will hang a bag of rice at the head of her bed when she goes to sleep, and next morning on getting up she measures the rice. If the rice has increased in volume during the night, as it may do in a moisture-laden atmosphere, she is confident that the lost soul has indeed come home to stay. The Kayans of Borneo fasten packets of rice, flesh, and fish to the window in the roof through which the wandering soul of a sick man is expected to return home. The doctor sits cross-legged on a mat under the open window with a display of pretty things spread out temptingly before him as baits to entice the spirit back to its deserted tabernacle. From the window hangs a string of precious corals or pearls to serve the returning prodigal as a ladder and so facilitate his descent into the house. The lower end of the string is attached to a bundle composed of wooden hooks, a fowl's feather, little packets of rice, and so forth. Chanting his spells, the doctor strokes the soul down the string into the bundle, which he then deposits in a basket and hides in a corner till the dusk of the evening. When darkness has fallen, he blows the captured soul back into the patient's head and strokes the sufferer's arm downwards with the point of an old spear in order to settle the soul firmly in his body. Once when a popular traveller was leaving a Kayan village, the mothers, fearing that their children's souls might follow him on his journey, brought him the boards on which they carry their infants and begged him to pray that the souls of the little ones would return to the familiar boards and not go away with him into the far country. To each board was fastened a looped string for the purpose of tethering the vagrant spirits, and through the loop each baby was made to pass a chubby finger to make sure that its tiny soul would not wander away. When a Dyak is dangerously ill, the medicine-men may say that his soul has escaped far away, perhaps to the river; then they will wave a garment or cloth about to imitate the casting of a net, signifying thereby that they are catching the soul like a fish in a net. Or they may give out that the soul has escaped into the jungle; and then they will rush out of the house to circumvent and secure it there. Or again they may allege that it has been carried away over seas to some unknown land; and then they will play at paddling a boat to follow it across the great water. But more commonly their mode of treatment is as follows. A spear is set up in the middle of the verandah with a few leaves tied to it and the medicine-boxes of the medicine-men laid at its foot. Round this the doctors run at full speed, chanting the while, till one of them falls down and lies motionless. The bystanders cover him with a blanket, and wait while his spirit hies away after the errant soul and brings it back. Presently he comes to himself, stares vacantly about like a man awaking from sleep, and then rises, holding the soul in his clenched right hand. He then returns it to the patient through the crown of his head, while he mutters a spell. Among the Dyaks of the Kayan and Lower Melawie districts you will often see, in houses where there are children, a basket of a peculiar shape with shells and dried fruits attached to it. These shells contain the remains of the children's navel-strings, and the basket to which they are fastened is commonly hung beside the place where the children

sleep. When a child is frightened, for example by being bathed or by the bursting of a thunderstorm, its soul flees from its body and nestles beside its old familiar friend the navel-string in the basket, from which the mother easily induces it to return by shaking the basket and pressing it to the child's body. The Toboongkoos of Central Celebes believe that sickness in general is caused by the departure of the soul. To recover the wanderer a priest will set out food in the courtyard of the sufferer's house and then invoke the soul, promising it many fine things if it will only come back. When he thinks it has complied with his request, he catches it in a cloth which he keeps ready for the purpose. This cloth he afterwards claps on the sick man's head, thereby restoring to him his lost soul.

In an Indian story a king conveys his soul into the dead body of a Brahman, and a hunchback conveys his soul into the deserted body of the king. The hunchback is now king and the king is a Brahman. However, the hunchback is induced to shew his skill by transferring his soul to the dead body of a parrot, and the king seizes the opportunity to regain possession of his own body. A tale of the same type, with variations of detail, reappears among the Malays. A king has incautiously transferred his soul to an ape, upon which the vizier adroitly inserts his own soul into the king's body and so takes possession of the queen and the kingdom, while the true king languishes at court in the outward semblance of an ape. But one day the false king, who played for high stakes, was watching a combat of rams, and it happened that the animal on which he had laid his money fell down dead. All efforts to restore animation proved unavailing till the false king, with the instinct of a true sportsman, transferred his own soul to the body of the deceased ram, and thus renewed the fray. The real king in the body of the ape saw his chance, and with great presence of mind darted back into his own body, which the vizier had rashly vacated. So he came to his own again, and the usurper in the ram's body met with the fate he richly deserved. In another Indian story a Brahman reanimates the dead body of a king by conveying his own soul into it. Meantime the Brahman's body has been burnt, and his soul is obliged to remain in the body of the king. In a Chinese story we read of a monk in a Buddhist monastery who used from time to time to send his soul away out of himself. Whenever he was thus absent from the body, he took the precaution of locking the door of his cell. On one of these occasions an envoy from the north arrived and put up at the monastery, but there was no cell for him to pass the night in. Then he looked into the cell of the brother whose soul was not at home, and seeing his body lying there motionless, he battered the door in and said, "I will lodge here. The man is dead. Take the body and burn it." His servants obeyed his orders, the monks being powerless to interfere. That very night the soul came back, only to find its body reduced to ashes. Every night it could be heard crying, "Where shall I settle?" Those who knew him then opened their windows, saying, "Here I am." So the soul came in and united itself with their body, and the result was that they became much cleverer than before. Similarly the Greeks told how the soul of Hermotimus of Clazomenae used to quit his body and roam far and wide, bringing back intelligence of what he had seen on his rambles to his friends at home; until one day, when his spirit was abroad, his enemies contrived to seize his deserted body and committed it to the flames. It is said that during the last seven years of his life Sultan Bayazid ate nothing that had life and blood in it. One day, being seized with a great longing for sheep's trotters, he struggled long in this glorious contest with his soul, until at last, a savoury dish of trotters being set before him, he said unto his soul, "My soul, the trotters are before thee; if thou wishest to enjoy them, leave the body and feed on them." Hardly had he uttered these words when a living creature was seen to issue from his mouth and drink of the juice in the dish, after which it endeavoured to return whence it came. But the austere sultan, determined to mortify his carnal appetite, prevented it with his hand from entering his mouth, and when it fell to the ground commanded that it should be beaten. The pages kicked it to death, and after

this murder of his soul the sultan remained in gloomy seclusion, taking no part or interest in the affairs of government.

The departure of the soul is not always voluntary. It may be extracted from the body against its will by ghosts, demons, or sorcerers. Hence, when a funeral is passing the house, the Karens of Burma tie their children with a special kind of string to a particular part of the house, lest the souls of the children should leave their bodies and go into the corpse which is passing. The children are kept tied in this way until the corpse is out of sight. And after the corpse has been laid in the grave, but before the earth has been shovelled in, the mourners and friends range themselves round the grave, each with a bamboo split lengthwise in one hand and a little stick in the other; each man thrusts his bamboo into the grave, and drawing the stick along the groove of the bamboo points out to his soul that in this way it may easily climb up out of the tomb. While the earth is being shovelled in, the bamboos are kept out of the way, lest the souls should be in them, and so should be inadvertently buried with the earth as it is being thrown into the grave; and when the people leave the spot they carry away the bamboos, begging their souls to come with them. Further, on returning from the grave each Karen provides himself with three little hooks made of branches of trees, and calling his spirit to follow him, at short intervals, as he returns, he makes a motion as if hooking it, and then thrusts the hook into the ground. This is done to prevent the soul of the living from staying behind with the soul of the dead. On the return of a Burmese or Shan family from a burial, old men tie up the wrists of each member of the family with string, to prevent his or her "butterfly" or soul from escaping; and this string remains till it is worn out and falls off. When a mother dies leaving a young baby, the Burmese think that the "butterfly" or soul of the baby follows that of the mother, and that if it is not recovered the child must die. So a wise woman is called in to get back the baby's soul. She places a mirror near the corpse, and on the mirror a piece of feathery cotton down. Holding a cloth in her open hands at the foot of the mirror, she with wild words entreats the mother not to take with her the "butterfly" or soul of her child, but to send it back. As the gossamer down slips from the face of the mirror she catches it in the cloth and tenderly places it on the baby's breast. The same ceremony is sometimes observed when one of two children that have played together dies, and is thought to be luring away the soul of its playmate to the spirit-land. It is sometimes performed also for a bereaved husband or wife. The Bahnars of eastern Cochin-China think that when a man is sick of a fever his soul has gone away with the ghosts to the tombs. At sunset a sorcerer attempts to lure the soul back by offering it sugar-cane, bananas, and other fruits, while he sings an incantation inviting the wanderer to return from among the dead to the land of the living. He pretends to catch the truant soul in a piece of cotton, which he then lays on the patient's head. When the Karo-Bataks of Sumatra have buried somebody and are filling in the grave, a sorceress runs about beating the air with a stick. This she does in order to drive away the souls of the survivors, for if one of these souls happened to slip into the grave and to be covered up with earth, its owner would die. Among some of the Dyak tribes of south-eastern Borneo, as soon as the coffin is carried to the place of burial, the house in which the death occurred is sprinkled with water, and the father of the family calls out the names of all his children and the other members of his household. For they think that the ghost loves to decoy away the souls of his kinsfolk, but that his designs upon them can be defeated by calling out their names, which has the effect of bringing back the souls to their owners. The same ceremony is repeated on the return from the burial. It is a rule with the Kwakiutl Indians of British Columbia that a corpse must not be coffined in the house, or the souls of the other inmates would enter the coffin, and they, too, would die. The body is taken out either through the roof or through a hole made in one of the walls, and is then coffined outside the house. In the East Indian island of Keisar it is deemed imprudent to go near a grave at night, lest the ghosts should catch and keep the soul of the passer-by. The Kei Islanders believe that the

spirits of their forefathers, angry at not receiving food, make people sick by detaining their souls. So they lay offerings of food on the grave and beg their ancestors to allow the soul of the sick to return, or to drive it home speedily if it should be lingering by the way.

In Bolang Mongondo, a district in the west of Celebes, all sickness is ascribed to the ancestral spirits who have carried off the patient's soul. The object therefore is to bring back the soul of the sufferer and restore it to him. An eye-witness has thus described the attempted cure of a sick boy. The priestesses, who acted as physicians, made a doll of cloth and fastened it to the point of a spear, which an old woman held upright. Round this doll the priestesses danced, uttering charms, and chirruping as when one calls a dog. Then the old woman lowered the point of the spear a little, so that the priestesses could reach the doll. By this time the soul of the sick boy was supposed to be in the doll, having been brought into it by the incantations. So the priestesses approached it cautiously on tiptoe and caught the soul in the many-coloured cloths which they had been waving in the air. Then they laid the soul on the boy's head, that is, they wrapped his head in the cloth in which the soul was supposed to be, and stood still for some moments with great gravity, holding their hands on the patient's head. Suddenly there was a jerk, the priestesses whispered and shook their heads, and the cloth was taken off—the soul had escaped. The priestesses gave chase to it, running round and round the house, clucking and gesticulating as if they were driving hens into a poultry-yard. At last they recaptured the soul at the foot of the stair and restored it to its owner as before. Much in the same way an Australian medicine-man will sometimes bring the lost soul of a sick man into a puppet and restore it to the patient by pressing the puppet to his breast. In Uea, one of the Loyalty Islands, the souls of the dead seem to have been credited with the power of stealing the souls of the living. For when a man was sick the soul-doctor would go with a large troop of men and women to the graveyard. Here the men played on flutes and the women whistled softly to lure the soul home. After this had gone on for some time they formed in procession and moved homewards, the flutes playing and the women whistling all the way, while they led back the wandering soul and drove it gently along with open palms. On entering the patient's dwelling they commanded the soul in a loud voice to enter his body. In Madagascar when a man was sick or lunatic in consequence of the loss of his soul, his friends despatched a wizard in haste to fetch him a soul from the graveyard. The emissary repaired by night to the spot, and having made a hole in the wooden house which served as a tomb, begged the spirit of the patient's father to bestow a soul on his son or daughter, who had none. So saying he applied a bonnet to the hole, then folded it up and rushed back to the house of the sufferer, saying he had a soul for him. With that he clapped the bonnet on the head of the invalid, who at once said he felt much better and had recovered the soul which he had lost.

When a Dyak or Malay of some of the western tribes or districts of Borneo is taken ill, with vomiting and profuse sweating as the only symptoms, he thinks that one of his deceased kinsfolk or ancestors is at the bottom of it. To discover which of them is the culprit, a wise man or woman pulls a lock of hair on the crown of the sufferer's head, calling out the names of all his dead relations. The name at which the lock gives forth a sound is the name of the guilty party. If the patient's hair is too short to be tugged with effect, he knocks his forehead seven times against the forehead of a kinsman who has long hair. The hair of the latter is then tugged instead of that of the patient and answers to the test quite as well. When the blame has thus been satisfactorily laid at the door of the ghost who is responsible for the sickness, the physician, who, as in other countries, is often an old woman, remonstrates with him on his ill behaviour. "Go back," says she, "to your grave; what do you come here for? The soul of the sick man does not choose to be called by you, and will remain yet a long time in its body." Then she puts some ashes from the hearth in a winnowing fan and moulds out of them

a small figure or image in human likeness. Seven times she moves the basket with the little ashen figure up and down before the patient, taking care not to obliterate the figure, while at the same time she says, "Sickness, settle in the head, belly, hands, etc.; then quickly pass into the corresponding part of the image," whereupon the patient spits on the ashen image and pushes it from him with his left hand. Next the beldame lights a candle and goes to the grave of the person whose ghost is doing all the mischief. On the grave she throws the figure of ashes, calling out, "Ghost, plague the sick man no longer, and stay in your grave, that he may see you no more." On her return she asks the anxious relations in the house, "Has his soul come back?" and they must answer quickly, "Yes, the soul of the sick man has come back." Then she stands beside the patient, blows out the candle which had lighted the returning soul on its way, and strews yellow-coloured rice on the head of the convalescent, saying, "Cluck, soul! cluck, soul! cluck, soul!" Last of all she fastens on his right wrist a bracelet or ring which he must wear for three days. In this case we see that the saving of the soul is combined with a vicarious sacrifice to the ghost, who receives a puppet on which to work his will instead of on the poor soul. In San Cristoval, one of the Melanesian islands, the vicarious sacrifice takes the form of a pig or a fish. A malignant ghost of the name of Tapia is supposed to have seized on the sick man's soul and tied it up to a banyan-tree. Accordingly a man who has influence with Tapia takes a pig or fish to the holy place where the ghost resides and offers it to him, saying, "This is for you to eat in place of that man; eat this, don't kill him." This satisfies the ghost; the soul is loosed from the tree and carried back to the sufferer, who naturally recovers. A regular part of the stock-in-trade of a Dyak medicine-man is a crystal into which he gazes to detect the hiding-place of a lost soul or to identify the demon who is causing the sickness. In one of the New Hebrides a ghost will sometimes impound the souls of trespassers within a magic fence in his garden, and will only consent to pull up the fence and let the souls out on receiving an unqualified apology and a satisfactory assurance that no personal disrespect was intended. In Motlav, another Melanesian island, it is enough to call out the sick man's name in the sacred place where he rashly intruded, and then, when the cry of the kingfisher or some other bird is heard, to shout "Come back" to the soul of the sick man and run back with it to the house.

It is a comparatively easy matter to save a soul which is merely tied up to a tree or detained as a vagrant in a pound; but it is a far harder task to fetch it up from the nether world, if it once gets down there. When a Buryat shaman is called in to attend a patient, the first thing he does is to ascertain where exactly the soul of the invalid is; for it may have strayed, or been stolen, or be languishing in the prison of the gloomy Erlik, lord of the world below. If it is anywhere in the neighbourhood, the shaman soon catches and replaces it in the patient's body. If it is far away, he searches the wide world till he finds it, ransacking the deep woods, the lonely steppes, and the bottom of the sea, not to be thrown off the scent even though the cunning soul runs to the sheep-walks in the hope that its footprints will be lost among the tracks of the sheep. But when the whole world has been searched in vain for the errant soul, the shaman knows that there is nothing for it but to go down to hell and seek the lost one among the spirits in prison. At the stern call of duty he does not flinch, though he knows that the journey is toilsome, and that the travelling expenses, which are naturally defrayed by the patient, are very heavy. Sometimes the lord of the infernal regions will only agree to release the soul on condition of receiving another in its stead, and that one the soul of the sick man's dearest friend. If the patient consents to the substitution, the shaman turns himself into a hawk, pounces upon the soul of the friend as it soars from his slumbering body in the form of a lark, and hands over the fluttering, struggling thing to the grim warden of the dead, who thereupon sets the soul of the sick man at liberty. So the sick man recovers and his friend dies.

When a shaman declares that the soul of a sick Thompson Indian has been carried off by the dead, the good physician, who is the shaman himself, puts on a conical mask and sets off in pursuit. He now acts as if on a journey, jumping rivers and such like obstacles, searching, talking, and sometimes engaging in a tussle for the possession of the soul. His first step is to repair to the old trail by which the souls of heathen Thompsons went to the spirit-land; for nowadays the souls of Christian Thompsons travel by a new road. If he fails to find the tracks of the lost soul there, he searches all the graveyards, one after the other, and almost always discovers it in one of them. Sometimes he succeeds in heading off the departing soul by taking a short cut to the other world. A shaman can only stay a short time there. So as soon as he lays hands on the soul he is after, he bolts with it. The other souls give chase, but he stamps with his foot, on which he wears a rattle made of deer's hoofs. At the rattle of the hoofs the ghosts retreat and he hurries on. A bolder shaman will sometimes ask the ghosts for the soul, and if they refuse to give it, he will wrest it from them. They attack him, but he clubs them and brings away the soul by force. When he comes back to the world, he takes off his mask and shews his club all bloody. Then the people know he had a desperate struggle. If he foresees that the harrowing of hell is likely to prove a tough job, he increases the number of wooden pins in his mask. The rescued soul is placed by him on the patient's head and so returned to his body. Among the Twana Indians of Washington State the descent of the medicine-men into the nether world to rescue lost souls is represented in pantomime before the eyes of the spectators, who include women and children as well as men. The surface of the ground is often broken to facilitate the descent of the rescue party. When the adventurous band is supposed to have reached the bottom, they journey along, cross at least one stream, and travel till they come to the abode of the spirits. There they surprise, and after a desperate struggle, sustained with great ardour and a prodigious noise, they succeed in rescuing the poor souls, and so, wrapping them up in cloth, they make the best of their way back to the upper world and restore the recovered souls to their owners, who have been seen to cry heartily for joy at receiving them back.

Often the abduction of a man's soul is set down to demons. The Annamites believe that when a man meets a demon and speaks to him, the demon inhales the man's breath and soul. The souls of the Bahnars of eastern Cochin-China are apt to be carried off by evil spirits, and the modes of recovering them are various. If a man suffers from a colic, the sorcerer may say that in planting sugar-cane, maize or what-not, he has pierced the stomach of a certain god who lives like a mole in the ground, and that the injured deity has punished him by abstracting his soul and burying it under a plant. Hence the cure for the colic is to pull up the plant and water the hole with millet wine and the blood of a fowl, a goat, or a pig. Again, if a child falls ill in the forest or the fields, it is because some devil has made off with its soul. To retrieve this spiritual loss the sorcerer constructs an apparatus which comprises an egg-shell in an egg-holder, a little waxen image of the sick child, and a small bamboo full of millet wine. This apparatus he sets up at a cross-road, praying the devil to drink the wine and surrender the stolen soul by depositing it in the egg-shell. Then he returns to the house, and putting a little cotton to the child's head restores the soul to its owner. Sometimes the sorcerer lays a trap for the thievish demon, the bait consisting of the liver of a pig or a fowl and the blood-smear handle of a little mattock. At nightfall he sets the trap at a cross-road and lies in wait hard by. While the devil is licking the blood and munching the liver, the artful sorcerer pounces on him, and after a severe struggle wrests the soul from his clutches, returning to the village victorious, but breathless and bleeding from his terrific encounter with the enemy of souls. Fits and convulsions are generally set down by the Chinese to the agency of certain mischievous spirits who love to draw men's souls out of their bodies. At Amoy the spirits who serve babies and children in this way rejoice in the high-sounding titles of "celestial agencies bestriding galloping horses" and "literary graduates residing halfway up in the

sky.” When an infant is writhing in convulsions, the frightened mother hastens to the roof of the house, and, waving about a bamboo pole to which one of the child's garments is attached, cries out several times, “My child So-and-so, come back, return home!” Meantime, another inmate of the house bangs away at a gong in the hope of attracting the attention of the strayed soul, which is supposed to recognise the familiar garment and to slip into it. The garment containing the soul is then placed on or beside the child, and if the child does not die recovery is sure to follow sooner or later. Similarly we saw that some Indians catch a man's lost soul in his boots and restore it to his body by putting his feet into them.

If Galelareese mariners are sailing past certain rocks or come to a river where they never were before, they must wash their faces, for otherwise the spirits of the rocks or the river would snatch away their souls. When a Dyak is about to leave a forest through which he has been walking alone, he never forgets to ask the demons to give him back his soul, for it may be that some forest-devil has carried it off. For the abduction of a soul may take place without its owner being aware of his loss, and it may happen either while he is awake or asleep. The Papuans of Geelvink Bay in New Guinea are apt to think that the mists which sometimes hang about the tops of tall trees in their tropical forests envelop a spirit or god called Narbrooi, who draws away the breath or soul of those whom he loves, thus causing them to languish and die. Accordingly, when a man lies sick, a friend or relation will go to one of these mist-capped trees and endeavour to recover the lost soul. At the foot of the tree he makes a peculiar sound to attract the attention of the spirit, and lights a cigar. In its curling smoke his fancy discerns the fair and youthful form of Narbrooi himself, who, decked with flowers, appears and informs the anxious enquirer whether the soul of his sick friend is with him or not. If it is, the man asks, “Has he done any wrong?” “Oh no!” the spirit answers, “I love him, and therefore I have taken him to myself.” So the man lays down an offering at the foot of the tree, and goes home with the soul of the sufferer in a straw bag. Arrived at the house, he empties the bag with its precious contents over the sick man's head, rubs his arms and hands with ginger-root, which he had first chewed small, and then ties a bandage round one of the patient's wrists. If the bandage bursts, it is a sign that Narbrooi has repented of his bargain, and is drawing away the sufferer once more to himself.

In the Moluccas when a man is unwell it is thought that some devil has carried away his soul to the tree, mountain, or hill where he (the devil) resides. A sorcerer having pointed out the devil's abode, the friends of the patient carry thither cooked rice, fruit, fish, raw eggs, a hen, a chicken, a silken robe, gold, armlets, and so forth. Having set out the food in order they pray, saying: “We come to offer to you, O devil, this offering of food, clothes, gold, and so on; take it and release the soul of the patient for whom we pray. Let it return to his body, and he who now is sick shall be made whole.” Then they eat a little and let the hen loose as a ransom for the soul of the patient; also they put down the raw eggs; but the silken robe, the gold, and the armlets they take home with them. As soon as they are come to the house they place a flat bowl containing the offerings which have been brought back at the sick man's head, and say to him: “Now is your soul released, and you shall fare well and live to grey hairs on the earth.” A more modern account from the same region describes how the friend of the patient, after depositing his offerings on the spot where the missing soul is supposed to be, calls out thrice the name of the sick person, adding, “Come with me, come with me.” Then he returns, making a motion with a cloth as if he had caught the soul in it. He must not look to right or left or speak a word to any one he meets, but must go straight to the patient's house. At the door he stands, and calling out the sick person's name, asks whether he is returned. Being answered from within that he is returned, he enters and lays the cloth in which he has caught the soul on the patient's throat, saying, “Now you are returned to the house.” Sometimes a substitute is provided; a doll, dressed up in gay clothing and tinsel, is

offered to the demon in exchange for the patient's soul, with these words, "Give us back the ugly one which you have taken away and receive this pretty one instead."

Among the Alfoors or Toradjas of Poso, in Central Celebes, a wooden puppet is offered to the demon as a substitute for the soul which he has abstracted, and the patient must touch the puppet in order to identify himself with it. The effigy is then hung on a bamboo pole, which is planted at the place of sacrifice outside of the house. Here too are deposited offerings of rice, an egg, a little wood (which is afterwards kindled), a sherd of a broken cooking-pot, and so forth. A long rattan extends from the place of sacrifice to the sufferer, who grasps one end of it firmly, for along it his lost soul will return when the devil has kindly released it. All being ready, the priestess informs the demon that he has come to the wrong place, and that there are no doubt much better quarters where he could reside. Then the father of the patient, standing beside the offerings, takes up his parable as follows: "O demon, we forgot to sacrifice to you. You have visited us with this sickness; will you now go away from us to some other place? We have made ready provisions for you on the journey. See, here is a cooking-pot, here are rice, fire, and a fowl. O demon, go away from us." With that the priestess strews rice towards the bamboo-pole to lure back the wandering soul; and the fowl promised to the devil is thrown in the same direction, but is instantly jerked back again by a string which, in a spirit of intelligent economy, has been previously attached to its leg. The demon is now supposed to accept the puppet, which hangs from the pole, and to release the soul, which, sliding down the pole and along the rattan, returns to its proper owner. And lest the evil spirit should repent of the barter which has just been effected, all communication with him is broken off by cutting down the pole. Similarly the Mongols make up a horse of birch-bark and a doll, and invite the demon to take the doll instead of the patient and to ride away on the horse. A Yakut shaman, rigged out in his professional costume, with his drum in his hand, will boldly descend into the lower world and haggle with the demon who has carried off a sick man's soul. Not uncommonly the demon proves amenable to reason, and in consideration of the narrow circumstances of the patient's family will accept a more moderate ransom than he at first demanded. For instance, he may be brought to put up with the skin of an Arctic hare or Arctic fox instead of a foal or a steer. The bargain being struck, the shaman hurries back to the sufferer's bedside, from which to the merely carnal eye he has never stirred, and informs the anxious relatives of the success of his mission. They in turn gladly hasten to provide the ransom.

Demons are especially feared by persons who have just entered a new house. Hence at a house-warming among the Alfoors of Minahassa in Celebes the priest performs a ceremony for the purpose of restoring their souls to the inmates. He hangs up a bag at the place of sacrifice and then goes through a list of the gods. There are so many of them that this takes him the whole night through without stopping. In the morning he offers the gods an egg and some rice. By this time the souls of the household are supposed to be gathered in the bag. So the priest takes the bag, and holding it on the head of the master of the house, says, "Here you have your soul; go (soul) to-morrow away again." He then does the same, saying the same words, to the housewife and all the other members of the family. Amongst the same Alfoors one way of recovering a sick man's soul is to let down a bowl by a belt out of a window and fish for the soul till it is caught in the bowl and hauled up. And among the same people, when a priest is bringing back a sick man's soul which he has caught in a cloth, he is preceded by a girl holding the large leaf of a certain palm over his head as an umbrella to keep him and the soul from getting wet, in case it should rain; and he is followed by a man brandishing a sword to deter other souls from any attempt at rescuing the captured spirit.

In Nias, when a man dreams that a pig is fastened under a neighbour's house, it is a sign that some one in that house will die. They think that the sun-god is drawing away the shadows or

souls of that household from this world of shadows to his own bright world of radiant light, and a ceremony must needs be performed to win back these passing souls to earth. Accordingly, while it is still night, the priest begins to drum and pray, and he continues his orisons till about nine o'clock next morning. Then he takes his stand at an opening in the roof through which he can behold the sun, and spreading out a cloth waits till the beams of the morning sun fall full upon it. In the sunbeams he thinks the wandering souls have come back again; so he wraps the cloth up tightly, and quitting the opening in the roof, hastens with his precious charge to the expectant household. Before each member of it he stops, and dipping his fingers into the cloth takes out his or her soul and restores it to the owner by touching the person on the forehead. The Thompson Indians of British Columbia think that the setting sun draws the souls of men away towards it; hence they will never sleep with their heads to the sunset. The Samoans tell how two young wizards, passing a house where a chief lay very sick, saw a company of gods from the mountain sitting in the doorway. They were handing from one to another the soul of the dying chief. It was wrapt in a leaf, and had been passed from the gods inside the house to those sitting in the doorway. One of the gods handed the soul to one of the wizards, taking him for a god in the dark, for it was night. Then all the gods rose up and went away; but the wizard kept the chief's soul. In the morning some women went with a present of fine mats to fetch a famous physician. The wizards were sitting on the shore as the women passed, and they said to the women, "Give us the mats and we will heal him." So they went to the chief's house. He was very ill, his jaw hung down, and his end seemed near. But the wizards undid the leaf and let the soul into him again, and forthwith he brightened up and lived.

The Battas or Bataks of Sumatra believe that the soul of a living man may transmigrate into the body of an animal. Hence, for example, the doctor is sometimes desired to extract the patient's soul from the body of a fowl, in which it has been hidden away by an evil spirit.

Sometimes the lost soul is brought back in a visible shape. In Melanesia a woman, knowing that a neighbour was at the point of death, heard a rustling in her house, as of a moth fluttering, just at the moment when a noise of weeping and lamentation told her that the soul was flown. She caught the fluttering thing between her hands and ran with it, crying out that she had caught the soul. But though she opened her hands above the mouth of the corpse, it did not revive. In Lepers' Island, one of the New Hebrides, for ten days after a birth the father is careful not to exert himself or the baby would suffer for it. If during this time he goes away to any distance, he will bring back with him on his return a little stone representing the infant's soul. Arrived at home he cries, "Come hither," and puts down the stone in the house. Then he waits till the child sneezes, at which he cries, "Here it is"; for now he knows that the little soul has not been lost after all. The Salish or Flathead Indians of Oregon believe that a man's soul may be separated for a time from his body without causing death and without the man being aware of his loss. It is necessary, however, that the lost soul should be soon found and restored to its owner or he will die. The name of the man who has lost his soul is revealed in a dream to the medicine-man, who hastens to inform the sufferer of his loss. Generally a number of men have sustained a like loss at the same time; all their names are revealed to the medicine-man, and all employ him to recover their souls. The whole night long these soulless men go about the village from lodge to lodge, dancing and singing. Towards daybreak they go into a separate lodge, which is closed up so as to be totally dark. A small hole is then made in the roof, through which the medicine-man, with a bunch of feathers, brushes in the souls, in the shape of bits of bone and the like, which he receives on a piece of matting. A fire is next kindled, by the light of which the medicine-man sorts out the souls. First he puts aside the souls of dead people, of which there are usually several; for if he were to give the soul of a dead person to a living man, the man would die instantly. Next he picks out the souls of all

the persons present, and making them all to sit down before him, he takes the soul of each, in the shape of a splinter of bone, wood, or shell, and placing it on the owner's head, pats it with many prayers and contortions till it descends into the heart and so resumes its proper place. In Amboyna the sorcerer, to recover a soul detained by demons, plucks a branch from a tree, and waving it to and fro as if to catch something, calls out the sick man's name. Returning he strikes the patient over the head and body with the branch, into which the lost soul is supposed to have passed, and from which it returns to the patient. In the Babar Islands offerings for evil spirits are laid at the root of a great tree (*wokiorai*), from which a leaf is plucked and pressed on the patient's forehead and breast; the lost soul, which is in the leaf, is thus restored to its owner. In some other islands of the same seas, when a man returns ill and speechless from the forest, it is inferred that the evil spirits which dwell in the great trees have caught and kept his soul. Offerings of food are therefore left under a tree and the soul is brought home in a piece of wax. Amongst the Dyaks of Sarawak the priest conjures the lost soul into a cup, where it is seen by the uninitiated as a lock of hair, but by the initiated as a miniature human being. This the priest pokes back into the patient's body through an invisible hole in his skull. In Nias the sick man's soul is restored to him in the shape of a firefly, visible only to the sorcerer, who catches it in a cloth and places it on the forehead of the patient. Amongst the Indians of Santiago Tepehuacan, if a child has fallen from the arms of its bearer and an illness has resulted from the fall, the parents will take the child's shirt, stretch it out on the spot where the little one fell, and say, "Come, come, come back to the infant." Then they bring back a little of the earth wrapped up in the shirt, and put the shirt on the child. They say that in this manner the spirit is replaced in the child's body and that he will recover. With this we may compare an Irish custom reported by Camden. When any one happens to fall, he springs up again, and turning round thrice to the right, digs the earth with a sword or knife, and takes up a turf, because they say the earth restores his shade to him. But if he falls sick within two or three days thereafter, a woman skilled in these matters is sent to the spot, and there says: "I call thee, So-and-so, from the East and West, from the South and North, from the groves, woods, rivers, marshes, fairies white, red, and black," and so forth. After uttering certain short prayers, she returns home to the sick person, and whispering in his ear another prayer, along with a *Pater Noster*, puts some burning coals into a cup of clean water, and so decides whether the distemper has been inflicted by the fairies. Here, though Camden is not very explicit, and he probably did not quite understand the custom he describes, it seems plain that the shade or soul of a man who has fallen is conceived as adhering to the ground where he fell. Accordingly he seeks to regain possession of it by digging up the earth; but if he fails to recover it, he sends a wise woman to the spot to win back his soul from the fairies who are detaining it.

The ancient Egyptians held that a dead man is not in a state to enter on the life hereafter until his soul has been found and restored to his mummified body. The vital spark had been commonly devoured by the malignant god Sit, who concealed his true form in the likeness of a horned beast, such as an ox or a gazelle. So the priests went in quest of the missing spirit, slaughtered the animal which had devoured it, and cutting open the carcase found the soul still undigested in its stomach. Afterwards the son of the deceased embraced the mummy or the image of his father in order to restore his soul to him. Formerly it was customary to place the skin of the slain beast on the dead man for the purpose of recruiting his strength with that of the animal.

Again, souls may be extracted from their bodies or detained on their wanderings not only by ghosts and demons but also by men, especially by sorcerers. In Fiji, if a criminal refused to confess, the chief sent for a scarf with which "to catch away the soul of the rogue." At the sight or even at the mention of the scarf the culprit generally made a clean breast. For if he

did not, the scarf would be waved over his head till his soul was caught in it, when it would be carefully folded up and nailed to the end of a chief's canoe; and for want of his soul the criminal would pine and die. The sorcerers of Danger Island used to set snares for souls. The snares were made of stout cinet, about fifteen to thirty feet long, with loops on either side of different sizes, to suit the different sizes of souls; for fat souls there were large loops, for thin souls there were small ones. When a man was sick against whom the sorcerers had a grudge, they set up these soul-snares near his house and watched for the flight of his soul. If in the shape of a bird or an insect it was caught in the snare the man would infallibly die. When a Polynesian mother desired that the child in her womb should grow up to be a great warrior or a great thief, she repaired to the temple of the war-god Oro or of the thief-god Hiro. There the priest obligingly caught the spirit of the god in a snare made of coco-nut fibre, and then infused it into the woman. When the child was born, the mother took it to the temple and dedicated it to the god with whose divine spirit the infant was already possessed. The Algonquin Indians also used nets to catch souls, but only as a measure of defence. They feared lest passing souls, which had just quitted the bodies of dying people, should enter their huts and carry off the souls of the inmates to deadland. So they spread nets about their houses to catch and entangle these ghostly intruders in the meshes.

Among the Sereres of Senegambia, when a man wishes to revenge himself on his enemy he goes to the *Fitaure* (chief and priest in one), and prevails on him by presents to conjure the soul of his enemy into a large jar of red earthenware, which is then deposited under a consecrated tree. The man whose soul is shut up in the jar soon dies. Among the Baoules of the Ivory Coast it happened once that a chief's soul was extracted by the magic of an enemy, who succeeded in shutting it up in a box. To recover it, two men held a garment of the sick man, while a witch performed certain enchantments. After a time she declared that the soul was now in the garment, which was accordingly rolled up and hastily wrapped about the invalid for the purpose of restoring his spirit to him. Some of the Congo negroes think that enchanters can get possession of human souls, and enclosing them in tusks of ivory, sell them to the white man, who makes them work for him in his country under the sea. It is believed that very many of the coast labourers are men thus obtained; so when these people go to trade they often look anxiously about for their dead relations. The man whose soul is thus sold into slavery will die "in due course, if not at the time." In some parts of West Africa, indeed, wizards are continually setting traps to catch souls that wander from their bodies in sleep; and when they have caught one, they tie it up over the fire, and as it shrivels in the heat the owner sickens. This is done, not out of any grudge towards the sufferer, but purely as a matter of business. The wizard does not care whose soul he has captured, and will readily restore it to its owner if only he is paid for doing so. Some sorcerers keep regular asylums for strayed souls, and anybody who has lost or mislaid his own soul can always have another one from the asylum on payment of the usual fee. No blame whatever attaches to men who keep these private asylums or set traps for passing souls; it is their profession, and in the exercise of it they are actuated by no harsh or unkindly feelings. But there are also wretches who from pure spite or for the sake of lucre set and bait traps with the deliberate purpose of catching the soul of a particular man; and in the bottom of the pot, hidden by the bait, are knives and sharp hooks which tear and rend the poor soul, either killing it outright or mauling it so as to impair the health of its owner when it succeeds in escaping and returning to him. Miss Kingsley knew a Kruman who became very anxious about his soul, because for several nights he had smelt in his dreams the savoury smell of smoked crawfish seasoned with red pepper. Clearly some ill-wisher had set a trap baited with this dainty for his dream-soul, intending to do him grievous bodily, or rather spiritual, harm; and for the next few nights great pains were taken to keep his soul from straying abroad in his sleep. In the sweltering heat of the tropical night

he lay sweating and snorting under a blanket, his nose and mouth tied up with a handkerchief to prevent the escape of his precious soul.

When Dyaks of the Upper Melawie are about to go out head-hunting they take the precaution of securing the souls of their enemies before they attempt to kill their bodies, calculating apparently that mere bodily death will soon follow the spiritual death, or capture, of the soul. With this intention they clear a small space in the underwood of the forest, and set up in the clearing one of those miniature houses in which it is customary to deposit the ashes of the dead. Food is placed in the little house, which, though raised on four posts, is connected with the ground by a tiny inverted ladder of the sort up which spirits are believed to swarm. When these preparations have been completed, the leader of the expedition comes and sits down a little way from the miniature house, and addressing the spirits of kinsmen who had the misfortune to be beheaded by their enemies, he says, "O ghosts of So-and-so, come speedily back to our village. We have rice in abundance. Our trees all bear ripe fruit. Our baskets are full to the brim. O ghosts, come swiftly back and forget not to bring your new friends and acquaintances with you." But by the new friends and acquaintances of the ghosts he means the souls of the enemies against whom he is about to lead the expedition. Meantime the other warriors have hidden themselves close by behind trees and bushes, and are listening with all their ears. When the cry of an animal is heard in the forest, or a humming sound seems to issue from the little house, it is a sign that the ghosts of their friends have come, bringing with them the souls of their enemies, which are accordingly at their mercy. At that the lurking warriors leap forth from their ambush, and with brandished blades hew and slash at the souls of their foemen swarming unseen in the air. Taken completely by surprise, the panic-stricken souls flee in all directions, and are fain to hide under every leaf and stone on the ground. But even here their retreat is cut off. For now the leader of the expedition is hard at work, grubbing up with his hands every stone and leaf to right and left, and thrusting them with feverish haste into the basket, which he at once ties up securely. He now flatters himself that he has the souls of the enemy safe in his possession; and when in the course of the expedition the heads of the foe are severed from their bodies, he will pack them into the same basket in which their souls are already languishing in captivity.

In Hawaii there were sorcerers who caught souls of living people, shut them up in calabashes, and gave them to people to eat. By squeezing a captured soul in their hands they discovered the place where people had been secretly buried. Amongst the Canadian Indians, when a wizard wished to kill a man, he sent out his familiar spirits, who brought him the victim's soul in the shape of a stone or the like. The wizard struck the soul with a sword or an axe till it bled profusely, and as it bled the man to whom it belonged fell ill and died. In Amboyna if a doctor is convinced that a patient's soul has been carried away by a demon beyond recovery, he seeks to supply its place with a soul abstracted from another man. For this purpose he goes by night to a house and asks, "Who's there?" If an inmate is incautious enough to answer, the doctor takes up from before the door a clod of earth, into which the soul of the person who replied is thought to have passed. This clod the doctor lays under the sick man's pillow, and performs certain ceremonies by which the stolen soul is conveyed into the patient's body. Then as he goes home the doctor fires two shots to frighten the soul from returning to its proper owner. A Karen wizard will catch the wandering soul of a sleeper and transfer it to the body of a dead man. The latter, therefore, comes to life as the former dies. But the friends of the sleeper in turn engage a wizard to steal the soul of another sleeper, who dies as the first sleeper comes to life. In this way an indefinite succession of deaths and resurrections is supposed to take place.

Nowhere perhaps is the art of abducting human souls more carefully cultivated or carried to higher perfection than in the Malay Peninsula. Here the methods by which the wizard works

his will are various, and so too are his motives. Sometimes he desires to destroy an enemy, sometimes to win the love of a cold or bashful beauty. Some of the charms operate entirely without contact; in others, the receptacle into which the soul is to be lured has formed part of, or at least touched, the person of the victim. Thus, to take an instance of the latter sort of charm, the following are the directions given for securing the soul of one whom you wish to render distraught. Take soil from the middle of his footprint; wrap it up in pieces of red, black, and yellow cloth, taking care to keep the yellow outside; and hang it from the centre of your mosquito curtain with parti-coloured thread. It will then become your victim's soul. To complete the transubstantiation, however, it is needful to switch the packet with a birch composed of seven leaf-ribs from a "green" coco-nut. Do this seven times at sunset, at midnight, and at sunrise, saying, "It is not earth that I switch, but the heart of So-and-so." Then bury it in the middle of a path where your victim is sure to step over it, and he will unquestionably become distraught. Another way is to scrape the wood of the floor where your intended victim has been sitting, mix the scrapings with earth from his or her footprint, and knead the whole with wax from a deserted bees' comb into a likeness of him or her. Then fumigate the figure with incense and beckon to the soul every night for three nights successively by waving a cloth, while you recite the appropriate spell. In the following cases the charm takes effect without any contact whatever, whether direct or indirect, with the victim. When the moon, just risen, looks red above the eastern horizon, go out, and standing in the moonlight, with the big toe of your right foot on the big toe of your left, make a speaking-trumpet of your right hand and recite through it the following words:

*"OM. I loose my shaft, I loose it and the moon clouds over,
I loose it, and the sun is extinguished.
I loose it, and the stars burn dim.
But it is not the sun, moon, and stars that I shoot at,
It is the stalk of the heart of that child of the congregation, So-and-so.
Cluck! cluck! soul of So-and-so, come and walk with me,
Come and sit with me,
Come and sleep and share my pillow.
Cluck! cluck! soul."*

Repeat this thrice and after every repetition blow through your hollow fist. Or you may catch the soul in your turban, thus. Go out on the night of the full moon and the two succeeding nights; sit down on an ant-hill facing the moon, burn incense, and recite the following incantation:

*"I bring you a betel leaf to chew,
Dab the lime on to it, Prince Ferocious,
For Somebody, Prince Distraction's daughter, to chew.
Somebody at sunrise be distraught for love of me,
Somebody at sunset be distraught for love of me.
As you remember your parents, remember me;
As you remember your house and house-ladder, remember me.
When thunder rumbles, remember me;
When wind whistles, remember me;
When the heavens rain, remember me;
When cocks crow, remember me;
When the dial-bird tells its tales, remember me;
When you look up at the sun, remember me;
When you look up at the moon, remember me,*

*For in that self-same moon I am there.
Cluck! cluck! soul of Somebody come hither to me.
I do not mean to let you have my soul,
Let your soul come hither to mine."*

Now wave the end of your turban towards the moon seven times each night. Go home and put it under your pillow, and if you want to wear it in the daytime, burn incense and say, "It is not a turban that I carry in my girdle, but the soul of Somebody."

Perhaps the magical ceremonies just described may help to explain a curious rite, of immemorial antiquity, which was performed on a very solemn occasion at Athens. On the eve of the sailing of the fleet for Syracuse, when all hearts beat high with hope, and visions of empire dazzled all eyes, consternation suddenly fell on the people one May morning when they rose and found that most of the images of Hermes in the city had been mysteriously mutilated in the night. The impious perpetrators of the sacrilege were unknown, but whoever they were, the priests and priestesses solemnly cursed them according to the ancient ritual, standing with their faces to the west and shaking red cloths up and down. Perhaps in these cloths they were catching the souls of those at whom their curses were levelled, just as we have seen that Fijian chiefs used to catch the souls of criminals in scarves and nail them to canoes.

The Indians of the Nass River, in British Columbia, are impressed with a belief that a physician may swallow his patient's soul by mistake. A doctor who is believed to have done so is made by the other members of the faculty to stand over the patient, while one of them thrusts his fingers down the doctor's throat, another kneads him in the stomach with his knuckles, and a third slaps him on the back. If the soul is not in him after all, and if the same process has been repeated upon all the medical men without success, it is concluded that the soul must be in the head-doctor's box. A party of doctors, therefore, waits upon him at his house and requests him to produce his box. When he has done so and arranged its contents on a new mat, they take the votary of Aesculapius and hold him up by the heels with his head in a hole in the floor. In this position they wash his head, and "any water remaining from the ablution is taken and poured upon the sick man's head." Among the Kwakiutl Indians of British Columbia it is forbidden to pass behind the back of a shaman while he is eating, lest the shaman should inadvertently swallow the soul of the passer-by. When that happens, both the shaman and the person whose soul he has swallowed fall down in a swoon. Blood flows from the shaman's mouth, because the soul is too large for him and is tearing his inside. Then the clan of the person whose soul is doing this mischief must assemble and sing the song of the shaman. In time the suffering sorcerer vomits out the soul, which he exhibits in the shape of a small bloody ball in the open palms of his hands. He restores it to its owner, who is lying prostrate on a mat, by throwing it at him and then blowing on his head. The man whose soul was swallowed has very naturally to pay for the damage he did to the shaman as well as for his own cure.

§ 3. The Soul as a Shadow and a Reflection.

But the spiritual dangers I have enumerated are not the only ones which beset the savage. Often he regards his shadow or reflection as his soul, or at all events as a vital part of himself, and as such it is necessarily a source of danger to him. For if it is trampled upon, struck, or stabbed, he will feel the injury as if it were done to his person; and if it is detached from him entirely (as he believes that it may be) he will die. In the island of Wetar there are magicians who can make a man ill by stabbing his shadow with a pike or hacking it with a sword. After Sankara had destroyed the Buddhists in India, it is said that he journeyed to Nepaul, where he had some difference of opinion with the Grand Lama. To prove his supernatural powers, he

soared into the air. But as he mounted up, the Grand Lama, perceiving his shadow swaying and wavering on the ground, struck his knife into it and down fell Sankara and broke his neck. In the Babar Islands the demons get power over a man's soul by holding fast his shadow, or by striking and wounding it. Among the Tolindoos of central Celebes to tread on a man's shadow is an offence, because it is supposed to make the owner sick; and for the same reason the Toboongkoos of that region forbid their children to play with their shadows. The Ottawa Indians thought they could kill a man by making certain figures on his shadow. The Baganda of central Africa regarded a man's shadow as his ghost; hence they used to kill or injure their enemies by stabbing or treading on their shadows. Among the Bavili of West Africa it used to be considered a crime to trample on or even to cross the shadow of another, especially if the shadow were that of a married woman. Some Caffres are very unwilling to let anybody stand on their shadow, believing that they can be influenced for evil through it. They think that "a sick man's shadow dwindles in intensity when he is about to die; for it has such an intimate relation to the man that it suffers with him." The Ja-Luo tribes of Kavirondo, to the east of Lake Victoria Nyanza, tell of the ancestor of all men, Apodtho by name, who descended to earth from above, bringing with him cattle, fowls, and seeds. When he was old, the Ja-Luo plotted to kill him, but for a long time they did not dare to attack him. At last, hearing that he was sick, they thought their chance had come, and sent a girl to see how he was. She took a small horn, used for cupping blood, in her hand, and while she talked with him she placed the cupping-horn on his shadow. To her surprise it drew blood. So she returned and told her friends that, if they wished to kill Apodtho, they must not touch his body, but spear his shadow. They did so, and he died and turned into a rock, which has ever since possessed the property of sharpening spears unusually well. In a Chinese book we read of a sage who examined human shadows by lamplight in order to discover the fate of their owners. "A man's shadow," he said, "ought to be deep, for, if so, he will attain honourable positions, and a great age. Shadows are averse to being reflected in water, or in wells, or in washing-basins. It was on such grounds that the ancients avoided shadows, and that in old days *Khü-seu*, *twan-hu*, and other shadow-treading vermin caused injury by hitting the shadows of men. In recent times there have been men versed in the art of cauterizing the shadows of their patients." Another sapient Chinese writer observes: "I have heard that, if the shadow of a bird is hit with a piece of wood that was struck by thunder, the bird falls to the ground immediately. I never tried it, but on account of the matter stated above I consider the thing certain." The natives of Nias tremble at the sight of a rainbow, because they think it is a net spread by a powerful spirit to catch their shadows.

In the Banks Islands, Melanesia, there are certain stones of a remarkably long shape which go by the name of *tamate gangan* or "eating ghosts," because certain powerful and dangerous ghosts are believed to lodge in them. If a man's shadow falls on one of these stones, the ghost will draw his soul out from him, so that he will die. Such stones, therefore, are set in a house to guard it; and a messenger sent to a house by the absent owner will call out the name of the sender, lest the watchful ghost in the stone should fancy that he came with evil intent and should do him a mischief. In Florida, one of the Solomon Islands, there are places sacred to ghosts, some in the village, some in the gardens, and some in the bush. No man would pass one of these places when the sun was so low as to cast his shadow into it, for then the ghost would draw it from him. The Indian tribes of the Lower Fraser River believe that man has four souls, of which the shadow is one, though not the principal, and that sickness is caused by the absence of one of the souls. Hence no one will let his shadow fall on a sick shaman, lest the latter should purloin it to replace his own lost soul. At a funeral in China, when the lid is about to be placed on the coffin, most of the bystanders, with the exception of the nearest kin, retire a few steps or even retreat to another room, for a person's health is believed to be endangered by allowing his shadow to be enclosed in a coffin. And when the coffin is about

to be lowered into the grave most of the spectators recoil to a little distance lest their shadows should fall into the grave and harm should thus be done to their persons. The geomancer and his assistants stand on the side of the grave which is turned away from the sun; and the grave-diggers and coffin-bearers attach their shadows firmly to their persons by tying a strip of cloth tightly round their waists. In the Nicobar Islands burial usually takes place at sundown, before midnight, or at early dawn. In no case can an interment be carried out at noon or within an hour of it, lest the shadows of the bearers who lower the body into the earth, or of the mourners taking their last look at the shrouded figure, should fall into the grave; for that would cause them to be sick or die. And when the dead has been laid in his last home, but before the earth is shovelled in upon him, the leaves of a certain jungle tree are waved over the grave, and a lighted torch is brandished inside it, to disperse any souls of the sorrowing bystanders that may be lingering with their departed friend in his narrow bed. Then the signal is given, and the earth or sand is rapidly shovelled in by a party of young men who have been standing in readiness to perform the duty. When the Malays are building a house, and the central post is being set up, the greatest precautions are taken to prevent the shadow of any of the workers from falling either on the post or on the hole dug to receive it; for otherwise they think that sickness and trouble will be sure to follow. When members of some Victorian tribes were performing magical ceremonies for the purpose of bringing disease and misfortune on their enemies, they took care not to let their shadows fall on the object by which the evil influence was supposed to be wafted to the foe. In Darfur people think that they can do an enemy to death by burying a certain root in the earth on the spot where the shadow of his head happens to fall. The man whose shadow is thus tampered with loses consciousness at once and will die if the proper antidote be not administered. In like manner they can paralyse any limb, as a hand or leg, by planting a particular root in the earth in the shadow of the limb they desire to maim. Nor is it human beings alone who are thus liable to be injured by means of their shadows. Animals are to some extent in the same predicament. A small snail, which frequents the neighbourhood of the limestone hills in Perak, is believed to suck the blood of cattle through their shadows; hence the beasts grow lean and sometimes die from loss of blood. The ancients supposed that in Arabia, if a hyæna trod on a man's shadow, it deprived him of the power of speech and motion; and that if a dog, standing on a roof in the moonlight, cast a shadow on the ground and a hyæna trod on it, the dog would fall down as if dragged with a rope. Clearly in these cases the shadow, if not equivalent to the soul, is at least regarded as a living part of the man or the animal, so that injury done to the shadow is felt by the person or animal as if it were done to his body. Even the shadows of trees are supposed by the Caffres to be sensitive. Hence when a Caffre doctor seeks to pluck the leaves of a tree for medicinal purposes, he "takes care to run up quickly, and to avoid touching the shadow lest it should inform the tree of the danger, and so give the tree time to withdraw the medicinal properties from its extremities into the safety of the inaccessible trunk. The shadow of the tree is said to feel the touch of the man's feet."

Conversely, if the shadow is a vital part of a man or an animal, it may under certain circumstances be as hazardous to be touched by it as it would be to come into contact with the person or animal. Thus in the North-West Provinces of India people believe that if the shadow of the goat-sucker bird falls on an ox or a cow, but especially on a cow buffalo, the beast will soon die. The remedy is for some one to kill the bird, rub his hands or a stick in the blood, and then wave the stick over the animal. There are certain men who are noted for their powers in this respect all over the district. The Kaitish of central Australia hold that if the shadow of a brown hawk falls on the breast of a woman who is suckling a child, the breast will swell up and burst. Hence if a woman sees one of these birds in these circumstances, she runs away in fear. In the Central Provinces of India a pregnant woman avoids the shadow of a man, believing that if it fell on her, the child would take after him in features, though not in

character. In Shoa any obstinate disorder, for which no remedy is known, such as insanity, epilepsy, delirium, hysteria, and St. Vitus's dance, is traced either to possession by a demon or to the shadow of an enemy which has fallen on the sufferer. The Bushman is most careful not to let his shadow fall on the dead game, as he thinks this would bring bad luck. Amongst the Caffres to overshadow the king by standing in his presence was an offence worthy of instant death. And it is a Caffre superstition that if the shadow of a man who is protected by a certain charm falls on the shadow of a man who is not so protected, the unprotected person will fall down, overcome by the power of the charm which is transmitted through the shadow. In the Punjaub some people believe that if the shadow of a pregnant woman fell on a snake, it would blind the creature instantly.

Hence the savage makes it a rule to shun the shadow of certain persons whom for various reasons he regards as sources of dangerous influence. Amongst the dangerous classes he commonly ranks mourners and women in general, but especially his mother-in-law. The Shuswap Indians of British Columbia think that the shadow of a mourner falling upon a person would make him sick. Amongst the Kurnai tribe of Victoria novices at initiation were cautioned not to let a woman's shadow fall across them, as this would make them thin, lazy, and stupid. An Australian native is said to have once nearly died of fright because the shadow of his mother-in-law fell on his legs as he lay asleep under a tree. The awe and dread with which the untutored savage contemplates his mother-in-law are amongst the most familiar facts of anthropology. In the Yuin tribes of New South Wales the rule which forbade a man to hold any communication with his wife's mother was very strict. He might not look at her or even in her direction. It was a ground of divorce if his shadow happened to fall on his mother-in-law: in that case he had to leave his wife, and she returned to her parents. In the Hunter River tribes of New South Wales it was formerly death for a man to speak to his mother-in-law; however, in later times the wretch who had committed this heinous crime was suffered to live, but he was severely reprimanded and banished for a time from the camp. In the Kulin tribe it was thought that if a woman looked at or spoke to her son-in-law or even his brother, her hair would turn white. The same result, it was supposed, would follow if she ate of game which had been presented to her husband by her son-in-law; but she could obviate this ill consequence by blackening her face, and especially her mouth, with charcoal, for then her hair would not turn white. Similarly in the Kurnai tribe of Victoria a woman is not permitted to see her daughter's husband in camp or elsewhere. When he is present, she keeps her head covered with an opossum rug. The camp of the mother-in-law faces in a different direction to that of her son-in-law. A screen of high bushes is erected between both huts, so that no one can see over from either. When the mother-in-law goes for firewood, she crouches down as she goes out or in, with her head covered. In Uganda a man may not see his mother-in-law nor speak to her face to face. Should they meet by accident, she must turn aside and cover her head with her clothes; or if her garments are too scanty for that, she may squat on her haunches and hide her face in her hands. If he wishes to hold any communication with her, it must be done through a third person, or through a wall or closed door. Were he to break these rules, he would certainly be seized with a shaking of the hands and general debility. Among some tribes of eastern Africa which formerly acknowledged the suzerainty of the sultan of Zanzibar, before a young couple had children they might meet neither their father-in-law nor their mother-in-law. To avoid them they must take a long roundabout. But if they could not do that, they must throw themselves on the ground and hide their faces till the father-in-law or mother-in-law had passed by. Among the Basutos a man may never meet his wife's mother, nor speak to her, nor see her. If his wife is ill and her mother comes to nurse her, he must flee the house so long as she is in it; sentinels are posted to warn him of her departure. In New Britain the native imagination fails to conceive the extent and nature of the calamities which would result from a man's accidentally speaking to

his wife's mother; suicide of one or both would probably be the only course open to them. The most solemn form of oath a New Briton can take is, "Sir, if I am not telling the truth, I hope I may shake hands with my mother-in-law." At Vanua Lava in the Banks Islands, a man would not so much as follow his mother-in-law along the beach until the rising tide had washed out her footprints in the sand. To avoid meeting his mother-in-law face to face a very desperate Apache Indian, one of the bravest of the brave, has been seen to clamber along the brink of a precipice at the risk of his life, hanging on to rocks from which had he fallen he would have been dashed to pieces or at least have broken several of his limbs. Still more curious and difficult to explain is the rule which forbids certain African kings, after the coronation ceremonies have been completed, ever to see their own mothers again. This restriction was imposed on the kings of Benin and Uganda. Yet the queen-mothers lived in regal state with a court and lands of their own. In Uganda it was thought that if the king were to see his mother again, some evil and probably death would surely befall him.

Where the shadow is regarded as so intimately bound up with the life of the man that its loss entails debility or death, it is natural to expect that its diminution should be regarded with solicitude and apprehension, as betokening a corresponding decrease in the vital energy of its owner. An elegant Greek rhetorician has compared the man who lives only for fame to one who should set all his heart on his shadow, puffed up and boastful when it lengthened, sad and dejected when it shortened, wasting and pining away when it dwindled to nothing. The spirits of such an one, he goes on, would necessarily be volatile, since they must rise or fall with every passing hour of the day. In the morning, when the level sun, just risen above the eastern horizon, stretched out his shadow to enormous length, rivalling the shadows cast by the cypresses and the towers on the city wall, how blithe and exultant would he be, fancying that in stature he had become a match for the fabled giants of old; with what a lofty port he would then strut and shew himself in the streets and the market-place and wherever men congregated, that he might be seen and admired of all. But as the day wore on, his countenance would change and he would slink back crestfallen to his house. At noon, when his once towering shadow had shrunk to his feet, he would shut himself up and refuse to stir abroad, ashamed to look his fellow-townsmen in the face; but in the afternoon his drooping spirits would revive, and as the day declined his joy and pride would swell again with the length of the evening shadows. The rhetorician who thus sought to expose the vanity of fame as an object of human ambition by likening it to an ever-changing shadow, little dreamed that in real life there were men who set almost as much store by their shadows as the fool whom he had conjured up in his imagination to point a moral. So hard is it for the straining wings of fancy to outstrip the folly of mankind. In Amboyna and Uliase, two islands near the equator, where necessarily there is little or no shadow cast at noon, the people make it a rule not to go out of the house at mid-day, because they fancy that by doing so a man may lose the shadow of his soul. The Manganians tell of a mighty warrior, Tukaitawa, whose strength waxed and waned with the length of his shadow. In the morning, when his shadow fell longest, his strength was greatest; but as the shadow shortened towards noon his strength ebbed with it, till exactly at noon it reached its lowest point; then, as the shadow stretched out in the afternoon, his strength returned. A certain hero discovered the secret of Tukaitawa's strength and slew him at noon. The savage Besisis of the Malay Peninsula fear to bury their dead at noon, because they fancy that the shortness of their shadows at that hour would sympathetically shorten their own lives. The Baganda of central Africa used to judge of a man's health by the length of his shadow. They said, "So-and-so is going to die, his shadow is very small"; or, "He is in good health, his shadow is large." Similarly the Caffres of South Africa think that a man's shadow grows very small or vanishes at death. When her husband is away at the wars, a woman hangs up his sleeping-mat; if the shadow grows less, she says her husband is killed; if it remains unchanged, she says he is unscathed. It is possible that even in

lands outside the tropics the observation of the diminished shadow at noon may have contributed, even if it did not give rise, to the superstitious dread with which that hour has been viewed by many peoples, as by the Greeks, ancient and modern, the Bretons, the Russians, the Roumanians of Transylvania, and the Indians of Santiago Tepehuacan. In this observation, too, we may perhaps detect the reason why noon was chosen by the Greeks as the hour for sacrificing to the shadowless dead. The loss of the shadow, real or apparent, has often been regarded as a cause or precursor of death. Whoever entered the sanctuary of Zeus on Mount Lycaeus in Arcadia was believed to lose his shadow and to die within the year. In Lower Austria on the evening of St. Sylvester's day—the last day of the year—the company seated round the table mark whose shadow is not cast on the wall, and believe that the seemingly shadowless person will die next year. Similar presages are drawn in Germany both on St. Sylvester's day and on Christmas Eve. The Galelareese fancy that if a child resembles his father, they will not both live long; for the child has taken away his father's likeness or shadow, and consequently the father must soon die. Similarly among some tribes of the Lower Congo, “if the child is like its mother, father, or uncle, they think it has the spirit of the person it resembles, and that that person will soon die. Hence a parent will resent it if you say that the baby is like him or her.”

Nowhere, perhaps, does the equivalence of the shadow to the life or soul come out more clearly than in some customs practised to this day in south-eastern Europe. In modern Greece, when the foundation of a new building is being laid, it is the custom to kill a cock, a ram, or a lamb, and to let its blood flow on the foundation-stone, under which the animal is afterwards buried. The object of the sacrifice is to give strength and stability to the building. But sometimes, instead of killing an animal, the builder entices a man to the foundation-stone, secretly measures his body, or a part of it, or his shadow, and buries the measure under the foundation-stone; or he lays the foundation-stone upon the man's shadow. It is believed that the man will die within the year. In the island of Lesbos it is deemed enough if the builder merely casts a stone at the shadow of a passer-by; the man whose shadow is thus struck will die, but the building will be solid. A Bulgarian mason measures the shadow of a man with a string, places the string in a box, and then builds the box into the wall of the edifice. Within forty days thereafter the man whose shadow was measured will be dead and his soul will be in the box beside the string; but often it will come forth and appear in its former shape to persons who were born on a Saturday. If a Bulgarian builder cannot obtain a human shadow for this purpose, he will content himself with measuring the shadow of the first animal that comes that way. The Roumanians of Transylvania think that he whose shadow is thus immured will die within forty days; so persons passing by a building which is in course of erection may hear a warning cry, “Beware lest they take thy shadow!” Not long ago there were still shadow-traders whose business it was to provide architects with the shadows necessary for securing their walls. In these cases the measure of the shadow is looked on as equivalent to the shadow itself, and to bury it is to bury the life or soul of the man, who, deprived of it, must die. Thus the custom is a substitute for the old practice of immuring a living person in the walls, or crushing him under the foundation-stone of a new building, in order to give strength and durability to the structure, or more definitely in order that the angry ghost may haunt the place and guard it against the intrusion of enemies. Thus when a new gate was made or an old gate was repaired in the walls of Bangkok, it used to be customary to crush three men to death under an enormous beam in a pit at the gateway. Before they were led to their doom, they were regaled at a splendid banquet; the whole court came to salute them; and the king himself charged them straitly to guard well the gate that was to be committed to their care, and to warn him if enemies or rebels came to assault the city. The next moment the ropes were cut and the beam descended on them. The Siamese believed that these unfortunates were transformed into the genii which they called *phi*. It is said that when

the massive teak posts of the gateways of Mandalay were set up, a man was bound and placed under each post and crushed to death. The Burmese believe that men who die a violent death turn into *nats* or demons and haunt the spot where they were killed, doing a mischief to such as attempt to molest the place. Thus their spirits become guardians of the gates. This theory would explain why such sacrifices appear to be offered most commonly at thoroughfares, such as gates and bridges, where ghostly warders may be deemed especially serviceable in keeping; watch on the multitudes that go to and fro. In Bima, a district of the East Indian island of Sambawa, the custom is marked by some peculiar features, which deserve to be mentioned. When a new flag-pole is set up at the sultan's palace a woman is crushed to death under it; but she must be pregnant. If the destined victim should be brought to bed before her execution, she goes free. The notion may be that the ghost of such a woman would be more than usually fierce and vigilant. Again, when the wooden doors are set up at the palace, it is customary to bury a child under each of the door-posts. For these purposes officers are sent to scour the country for a pregnant woman or little children, as the case may be, and if they come back empty-handed they must give up their own wives or children to serve as victims. When the gates are set up, the children are killed, their bodies stript of flesh, and their bones laid in the holes in which the door-posts are erected. Then the flesh is boiled with horse's flesh and served up to the officers. Any officer who refuses to eat of it is at once cut down. The intention of this last practice is perhaps to secure the fidelity of the officers by compelling them to enter into a covenant of the most solemn and binding nature with the ghosts of the murdered children who are to guard the gates.

The practice of burying the measure of a man's shadow, as a substitute for the man himself, under the foundation-stone of a building may perhaps throw light on the singular deity whom the people of Kisser, an East Indian island, choose to guard their houses and villages. The god in question is nothing more or less than the measuring-tape which was used to measure the foundations of the house or of the village temple. After it has served this useful purpose, the tape is wound about a stick shaped like a paddle, and is then deposited in the thatch of the roof of the house, where food is offered to it on all special occasions. The deified measuring-tape of the whole village is that which was used to measure the foundations of the first house or of the village temple. The handle of the paddle-like stick on which it is wound is carved into the figure of a person squatting in the usual posture; and the whole is kept in a rough wooden box along with one or two figures to act as its guards. It is possible, though perhaps hardly probable, that these tapes may be thought to contain the souls of men whose shadows they measured at the foundation ceremony.

As some peoples believe a man's soul to be in his shadow, so other (or the same) peoples believe it to be in his reflection in water or a mirror. Thus "the Andamanese do not regard their shadows but their reflections (in any mirror) as their souls." According to one account, some of the Fijians thought that man has two souls, a light one and a dark one; the dark one goes to Hades, the light one is his reflection in water or a mirror. When the Motumotu of New Guinea first saw their likenesses in a looking-glass they thought that their reflections were their souls. In New Caledonia the old men are of opinion that a person's reflection in water or a mirror is his soul; but the younger men, taught by the Catholic priests, maintain that it is a reflection and nothing more, just like the reflection of palm-trees in the water. The reflection-soul, being external to the man, is exposed to much the same dangers as the shadow-soul. Among the Galelareese, half-grown lads and girls may not look at themselves in a mirror; for they say that the mirror takes away their bloom and leaves them ugly. And as the shadow may be stabbed, so may the reflection. Hence an Aztec mode of keeping sorcerers from the house was to leave a vessel of water with a knife in it behind the door. When a sorcerer entered he was so much alarmed at seeing his reflection in the water transfixed by a

knife that he turned and fled. In Corrèze, a district of the Auvergne, a cow's milk had dried up through the maleficent spells of a neighbouring witch, so a sorcerer was called in to help. He made the woman whose cow was bewitched sit in front of a pail of water with a knife in her hand till she thought she saw the image of the witch in the water, whereupon he made her stab the image with the knife. They say that if the knife strikes the image fair in the eye, the person whose likeness it is will suffer a corresponding injury in his or her eye. This procedure, we are informed, has been successful in restoring milk to the udders of a cow when even holy water had been tried in vain. The Zulus will not look into a dark pool because they think there is a beast in it which will take away their reflections, so that they die. The Basutos say that crocodiles have the power of thus killing a man by dragging his reflection under water. When one of them dies suddenly and from no apparent cause, his relatives will allege that a crocodile must have taken his shadow some time when he crossed a stream. In Saddle Island, Melanesia, there is a pool "into which if any one looks he dies; the malignant spirit takes hold upon his life by means of his reflection on the water."

We can now understand why it was a maxim both in ancient India and ancient Greece not to look at one's reflection in water, and why the Greeks regarded it as an omen of death if a man dreamed of seeing himself so reflected. They feared that the water-spirits would drag the person's reflection or soul under water, leaving him soulless to perish. This was probably the origin of the classical story of the beautiful Narcissus, who languished and died through seeing his reflection in the water. The explanation that he died for love of his own fair image was probably devised later, after the old meaning of the story was forgotten. The same ancient belief lingers, in a faded form, in the English superstition that whoever sees a water fairy must pine and die.

*"Alas, the moon should ever beam
To show what man should never see!—
I saw a maiden on a stream,
And fair was she!"*

*I staid to watch, a little space,
Her parted lips if she would sing;
The waters closed above her face
With many a ring.*

*I know my life will fade away,
I know that I must vainly pine,
For I am made of mortal clay,
But she's divine!"*

Further, we can now explain the widespread custom of covering up mirrors or turning them to the wall after a death has taken place in the house. It is feared that the soul, projected out of the person in the shape of his reflection in the mirror, may be carried off by the ghost of the departed, which is commonly supposed to linger about the house till the burial. The custom is thus exactly parallel to the Aru custom of not sleeping in a house after a death for fear that the soul, projected out of the body in a dream, may meet the ghost and be carried off by it. In Oldenburg it is thought that if a person sees his image in a mirror after a death he will die himself. So all the mirrors in the house are covered up with white cloth. In some parts of Germany and Belgium after a death not only the mirrors but everything that shines or glitters (windows, clocks, etc.) is covered up, doubtless because they might reflect a person's image. The same custom of covering up mirrors or turning them to the wall after a death prevails in England, Scotland, Madagascar, and among the Karaits, a Jewish sect in the Crimea. The Suni Mohammedans of Bombay cover with a cloth the mirror in the room of a dying man and

do not remove it until the corpse is carried out for burial. They also cover the looking-glasses in their bedrooms before retiring to rest at night. The reason why sick people should not see themselves in a mirror, and why the mirror in a sick-room is therefore covered up, is also plain; in time of sickness, when the soul might take flight so easily, it is particularly dangerous to project it out of the body by means of the reflection in a mirror. The rule is therefore precisely parallel to the rule observed by some peoples of not allowing sick people to sleep; for in sleep the soul is projected out of the body, and there is always a risk that it may not return. "In the opinion of the Raskolniks a mirror is an accursed thing, invented by the devil," perhaps on account of the mirror's supposed power of drawing out the soul in the reflection and so facilitating its capture.

As with shadows and reflections, so with portraits; they are often believed to contain the soul of the person portrayed. People who hold this belief are naturally loth to have their likenesses taken; for if the portrait is the soul, or at least a vital part of the person portrayed, whoever possesses the portrait will be able to exercise a fatal influence over the original of it. Thus the Esquimaux of Bering Strait believe that persons dealing in witchcraft have the power of stealing a person's *inua* or shade, so that without it he will pine away and die. Once at a village on the lower Yukon River an explorer had set up his camera to get a picture of the people as they were moving about among their houses. While he was focusing the instrument, the headman of the village came up and insisted on peeping under the cloth. Being allowed to do so, he gazed intently for a minute at the moving figures on the ground glass, then suddenly withdrew his head and bawled at the top of his voice to the people, "He has all of your shades in this box." A panic ensued among the group, and in an instant they disappeared helter-skelter into their houses. The Dacotas hold that every man has several *wanagi* or "apparitions," of which after death one remains at the grave, while another goes to the place of the departed. For many years no Yankton Dacota would consent to have his picture taken lest one of his "apparitions" should remain after death in the picture instead of going to the spirit-land. An Indian whose portrait the Prince of Wied wished to get, refused to let himself be drawn, because he believed it would cause his death. The Mandan Indians also thought that they would soon die if their portraits were in the hands of another; they wished at least to have the artist's picture as a kind of hostage. The Tepehuanes of Mexico stood in mortal terror of the camera, and five days' persuasion was necessary to induce them to pose for it. When at last they consented, they looked like criminals about to be executed. They believed that by photographing people the artist could carry off their souls and devour them at his leisure moments. They said that when the pictures reached his country they would die or some other evil would befall them. The Canelos Indians of Ecuador think that their soul is carried away in their picture. Two of them, who had been photographed, were so alarmed that they came back next day on purpose to ask if it were really true that their souls had been taken away. Similar notions are entertained by the Aymara Indians of Peru and Bolivia. The Araucanians of Chili are unwilling to have their portraits drawn, for they fancy that he who has their portraits in his possession could, by means of magic, injure or destroy themselves.

The Yaos, a tribe of British Central Africa in the neighbourhood of Lake Nyassa, believe that every human being has a *lisoka*, a soul, shade, or spirit, which they appear to associate with the shadow or picture of the person. Some of them have been known to refuse to enter a room where pictures were hung on the walls, "because of the *masoka*, souls, in them." The camera was at first an object of dread to them, and when it was turned on a group of natives they scattered in all directions with shrieks of terror. They said that the European was about to take away their shadows and that they would die; the transference of the shadow or portrait (for the Yao word for the two is the same, to wit *chiwili*) to the photographic plate would

involve the disease or death of the shadeless body. A Yao chief, after much difficulty, allowed himself to be photographed on condition that the picture should be shewn to none of his subjects, but sent out of the country as soon as possible. He feared lest some ill-wisher might use it to bewitch him. Some time afterwards he fell ill, and his attendants attributed the illness to some accident which had befallen the photographic plate in England. The Ngoni of the same region entertain a similar belief, and formerly exhibited a similar dread of sitting to a photographer, lest by so doing they should yield up their shades or spirits to him and they should die. When Joseph Thomson attempted to photograph some of the Wa-teita in eastern Africa, they imagined that he was a magician trying to obtain possession of their souls, and that if he got their likenesses they themselves would be entirely at his mercy. When Dr. Catat and some companions were exploring the Bara country on the west coast of Madagascar, the people suddenly became hostile. The day before the travellers, not without difficulty, had photographed the royal family, and now found themselves accused of taking the souls of the natives for the purpose of selling them when they returned to France. Denial was vain; in compliance with the custom of the country they were obliged to catch the souls, which were then put into a basket and ordered by Dr. Catat to return to their respective owners.

Some villagers in Sikhim betrayed a lively horror and hid away whenever the lens of a camera, or "the evil eye of the box" as they called it, was turned on them. They thought it took away their souls with their pictures, and so put it in the power of the owner of the pictures to cast spells on them, and they alleged that a photograph of the scenery blighted the landscape. Until the reign of the late King of Siam no Siamese coins were ever stamped with the image of the king, "for at that time there was a strong prejudice against the making of portraits in any medium. Europeans who travel into the jungle have, even at the present time, only to point a camera at a crowd to procure its instant dispersion. When a copy of the face of a person is made and taken away from him, a portion of his life goes with the picture. Unless the sovereign had been blessed with the years of a Methusaleh he could scarcely have permitted his life to be distributed in small pieces together with the coins of the realm." Similarly, in Corea, "the effigy of the king is not struck on the coins; only a few Chinese characters are put on them. They would deem it an insult to the king to put his sacred face on objects which pass into the most vulgar hands and often roll on the ground in the dust or the mud. When the French ships arrived for the first time in Corea, the mandarin who was sent on board to communicate with them was dreadfully shocked to see the levity with which these western barbarians treated the face of their sovereign, reproduced on the coins, and the recklessness with which they put it in the hands of the first comer, without troubling themselves in the least whether or not he would shew it due respect." In Minahassa, a district of Celebes, many chiefs are reluctant to be photographed, believing that if that were done they would soon die. For they imagine that, were the photograph lost by its owner and found by somebody else, whatever injury the finder chose to do to the portrait would equally affect the person whom it represented. Mortal terror was depicted on the faces of the Battas upon whom von Brenner turned the lens of his camera; they thought he wished to carry off their shadows or spirits in a little box. When Dr. Nieuwenhuis attempted to photograph the Kayans or Bahaus of central Borneo, they were much alarmed, fearing that their souls would follow their photographs into the far country and that their deserted bodies would fall sick. Further, they imagined that possessing their likenesses the explorer would be able by magic art to work on the originals at a distance.

Beliefs of the same sort still linger in various parts of Europe. Not very many years ago some old women in the Greek island of Carpathus were very angry at having their likenesses drawn, thinking that in consequence they would pine and die. It is a German superstition that if you have your portrait painted, you will die. Some people in Russia object to having their

silhouettes taken, fearing that if this is done they will die before the year is out. In Albania Miss Durham sketched an old man who boasted of being a hundred and ten years old. When every one recognised the likeness, a look of great anxiety came over the patriarch's face, and most earnestly he besought the artist never to destroy the sketch, for he was certain that the moment the sketch was torn he would drop down dead. An artist in England once vainly attempted to sketch a gypsy girl. "I won't have her drawed out," said the girl's aunt. "I told her I'd make her scrawl the earth before me, if ever she let herself be drawed out again." "Why, what harm can there be?" "I know there's a fiz (a charm) in it. There was my youngest, that the gorja drawed out on Newmarket Heath, she never held her head up after, but wasted away, and died, and she's buried in March churchyard." There are persons in the West of Scotland "who refuse to have their likenesses taken lest it prove unlucky; and give as instances the cases of several of their friends who never had a day's health after being photographed."

III. Tabooed Acts

§ 1. Taboos on Intercourse with Strangers.

So much for the primitive conceptions of the soul and the dangers to which it is exposed. These conceptions are not limited to one people or country; with variations of detail they are found all over the world, and survive, as we have seen, in modern Europe. Beliefs so deep-seated and so widespread must necessarily have contributed to shape the mould in which the early kingship was cast. For if every person was at such pains to save his own soul from the perils which threatened it on so many sides, how much more carefully must *he* have been guarded upon whose life hung the welfare and even the existence of the whole people, and whom therefore it was the common interest of all to preserve? Therefore we should expect to find the king's life protected by a system of precautions or safeguards still more numerous and minute than those which in primitive society every man adopts for the safety of his own soul. Now in point of fact the life of the early kings is regulated, as we have seen and shall see more fully presently, by a very exact code of rules. May we not then conjecture that these rules are in fact the very safeguards which we should expect to find adopted for the protection of the king's life? An examination of the rules themselves confirms this conjecture. For from this it appears that some of the rules observed by the kings are identical with those observed by private persons out of regard for the safety of their souls; and even of those which seem peculiar to the king, many, if not all, are most readily explained on the hypothesis that they are nothing but safeguards or lifeguards of the king. I will now enumerate some of these royal rules or taboos, offering on each of them such comments and explanations as may serve to set the original intention of the rule in its proper light.

As the object of the royal taboos is to isolate the king from all sources of danger, their general effect is to compel him to live in a state of seclusion, more or less complete, according to the number and stringency of the rules he observes. Now of all sources of danger none are more dreaded by the savage than magic and witchcraft, and he suspects all strangers of practising these black arts. To guard against the baneful influence exerted voluntarily or involuntarily by strangers is therefore an elementary dictate of savage prudence. Hence before strangers are allowed to enter a district, or at least before they are permitted to mingle freely with the inhabitants, certain ceremonies are often performed by the natives of the country for the purpose of disarming the strangers of their magical powers, of counteracting the baneful influence which is believed to emanate from them, or of disinfecting, so to speak, the tainted atmosphere by which they are supposed to be surrounded. Thus, when the ambassadors sent by Justin II., Emperor of the East, to conclude a peace with the Turks had reached their destination, they were received by shamans, who subjected them to a ceremonial purification for the purpose of exorcising all harmful influence. Having deposited the goods brought by the ambassadors in an open place, these wizards carried burning branches of incense round them, while they rang a bell and beat on a tambourine, snorting and falling into a state of frenzy in their efforts to dispel the powers of evil. Afterwards they purified the ambassadors themselves by leading them through the flames. In the island of Nanumea (South Pacific) strangers from ships or from other islands were not allowed to communicate with the people until they all, or a few as representatives of the rest, had been taken to each of the four temples in the island, and prayers offered that the god would avert any disease or treachery which these strangers might have brought with them. Meat offerings were also laid upon the altars, accompanied by songs and dances in honour of the god. While these ceremonies were going on, all the people except the priests and their attendants kept out of sight. On returning

from an attempted ascent of the great African mountain Kilimanjaro, which is believed by the neighbouring tribes to be tenanted by dangerous demons, Mr. New and his party, as soon as they reached the border of the inhabited country, were disenchanted by the inhabitants, being sprinkled with “a professionally prepared liquor, supposed to possess the potency of neutralising evil influences, and removing the spell of wicked spirits.” In the interior of Yoruba (West Africa) the sentinels at the gates of towns often oblige European travellers to wait till nightfall before they admit them, fearing that if the strangers were admitted by day the devil would enter behind them. The whole Mahafaly country in Madagascar used to be tabooed to strangers of the white race, the natives imagining that the intrusion of a white man would immediately cause the death of their king. The traveller Bastard had the greatest difficulty in overcoming the reluctance of the natives to allow him to enter their land and especially to visit their holy city. Amongst the Ot Danoms of Borneo it is the custom that strangers entering the territory should pay to the natives a certain sum, which is spent in the sacrifice of buffaloes or pigs to the spirits of the land and water, in order to reconcile them to the presence of the strangers, and to induce them not to withdraw their favour from the people of the country, but to bless the rice-harvest, and so forth. The men of a certain district in Borneo, fearing to look upon a European traveller lest he should make them ill, warned their wives and children not to go near him. Those who could not restrain their curiosity killed fowls to appease the evil spirits and smeared themselves with the blood. “More dreaded,” says a traveller in central Borneo, “than the evil spirits of the neighbourhood are the evil spirits from a distance which accompany travellers. When a company from the middle Mahakam river visited me among the Blu-u Kayans in the year 1897, no woman shewed herself outside her house without a burning bundle of *plehiding* bark, the stinking smoke of which drives away evil spirits.” In Laos, before a stranger can be accorded hospitality, the master of the house must offer sacrifice to the ancestral spirits; otherwise the spirits would be offended and would send disease on the inmates. When Madame Pfeiffer arrived at the village of Hali-Bonar, among the Battas of Sumatra, a buffalo was killed and the liver offered to her. Then a ceremony was performed to propitiate the evil spirits. Two young men danced, and one of them in dancing sprinkled water from a buffalo's horn on the visitor and the spectators. In the Mentawai Islands, when a stranger enters a house where there are children, the father or other member of the family takes the ornament which the children wear in their hair and hands it to the stranger, who holds it in his hands for a while and then gives it back to him. This is thought to protect the children from the evil effect which the sight of a stranger might have upon them. When a Dutch steamship was approaching their villages, the people of Biak, an island off the north coast of New Guinea, shook and knocked their idols about in order to ward off ill-luck. At Shepherd's Isle Captain Moresby had to be disenchanted before he was allowed to land his boat's crew. When he leaped ashore, a devil-man seized his right hand and waved a bunch of palm leaves over the captain's head. Then “he placed the leaves in my left hand, putting a small green twig into his mouth, still holding me fast, and then, as if with great effort, drew the twig from his mouth—this was extracting the evil spirit—after which he blew violently, as if to speed it away. I now held a twig between my teeth, and he went through the same process.” Then the two raced round a couple of sticks fixed in the ground and bent to an angle at the top, which had leaves tied to it. After some more ceremonies the devil-man concluded by leaping to the level of Captain Moresby's shoulders (his hands resting on the captain's shoulders) several times, “as if to show that he had conquered the devil, and was now trampling him into the earth.” North American Indians “have an idea that strangers, particularly white strangers, are oftentimes accompanied by evil spirits. Of these they have great dread, as creating and delighting in mischief. One of the duties of the medicine chief is to exorcise these spirits. I have sometimes ridden into or through a camp where I was unknown or unexpected, to be confronted by a

tall, half-naked savage, standing in the middle of the circle of lodges, and yelling in a sing-song, nasal tone, a string of unintelligible words.”

When Crevaux was travelling in South America he entered a village of the Apalai Indians. A few moments after his arrival some of the Indians brought him a number of large black ants, of a species whose bite is painful, fastened on palm leaves. Then all the people of the village, without distinction of age or sex, presented themselves to him, and he had to sting them all with the ants on their faces, thighs, and other parts of their bodies. Sometimes when he applied the ants too tenderly they called out “More! more!” and were not satisfied till their skin was thickly studded with tiny swellings like what might have been produced by whipping them with nettles. The object of this ceremony is made plain by the custom observed in Amboyna and Uliase of sprinkling sick people with pungent spices, such as ginger and cloves, chewed fine, in order by the prickling sensation to drive away the demon of disease which may be clinging to their persons. In Java a popular cure for gout or rheumatism is to rub Spanish pepper into the nails of the fingers and toes of the sufferer; the pungency of the pepper is supposed to be too much for the gout or rheumatism, who accordingly departs in haste. So on the Slave Coast of Africa the mother of a sick child sometimes believes that an evil spirit has taken possession of the child's body, and in order to drive him out, she makes small cuts in the body of the little sufferer and inserts green peppers or spices in the wounds, believing that she will thereby hurt the evil spirit and force him to be gone. The poor child naturally screams with pain, but the mother hardens her heart in the belief that the demon is suffering equally. In Hawaii a patient is sometimes pricked with bamboo needles for the sake of hurting and expelling a refractory demon who is lurking in the sufferer's body and making him ill. Dyak sorceresses in south-eastern Borneo will sometimes slash the body of a sick man with sharp knives in order, it is said, to allow the demon of disease to escape through the cuts; but perhaps the notion rather is to make the present quarters of the spirit too hot for him. With a similar intention some of the natives of Borneo and Celebes sprinkle rice upon the head or body of a person supposed to be infested by dangerous spirits; a fowl is then brought, which, by picking up the rice from the person's head or body, removes along with it the spirit or ghost which is clinging like a burr to his skin. This is done, for example, to persons who have attended a funeral, and who may therefore be supposed to be infested by the ghost of the deceased. Similarly Basutos, who have carried a corpse to the grave, have their hands scratched with a knife from the tip of the thumb to the tip of the forefinger, and magic stuff is rubbed into the wound, for the purpose, no doubt, of removing the ghost which may be adhering to their skin. Among the Barotse of south-eastern Africa a few days after a funeral the sorcerer makes an incision in the forehead of each surviving member of the family and fills it with medicine, “in order to ward off contagion and the effect of the sorcery which caused the death.” When elephant-hunters in East Africa have killed an elephant they get upon its carcase, make little cuts in their toes, and rub gunpowder into the cuts. This is done with the double intention of counteracting any evil influence that may emanate from the dead elephant, and of acquiring thereby the fleetness of foot possessed by the animal in its life. The people of Nias carefully scrub and scour the weapons and clothes which they buy, in order to efface all connexion between the things and the persons from whom they bought them.

It is probable that the same dread of strangers, rather than any desire to do them honour, is the motive of certain ceremonies which are sometimes observed at their reception, but of which the intention is not directly stated. In the Ongtong Java Islands, which are inhabited by Polynesians, and lie a little to the north of the Solomon Islands, the priests or sorcerers seem to wield great influence. Their main business is to summon or exorcise spirits for the purpose of averting or dispelling sickness, and of procuring favourable winds, a good catch of fish,

and so on. When strangers land on the islands, they are first of all received by the sorcerers, sprinkled with water, anointed with oil, and girt with dried pandanus leaves. At the same time sand and water are freely thrown about in all directions, and the newcomer and his boat are wiped with green leaves. After this ceremony the strangers are introduced by the sorcerers to the chief. In Afghanistan and in some parts of Persia the traveller, before he enters a village, is frequently received with a sacrifice of animal life or food, or of fire and incense. The Afghan Boundary Mission, in passing by villages in Afghanistan, was often met with fire and incense. Sometimes a tray of lighted embers is thrown under the hoofs of the traveller's horse, with the words, "You are welcome." On entering a village in central Africa Emin Pasha was received with the sacrifice of two goats; their blood was sprinkled on the path and the chief stepped over the blood to greet Emin. Before strangers entered the country or city of Benin, custom compelled them to have their feet washed; sometimes the ceremony was performed in a sacred place. Amongst the Esquimaux of Cumberland Inlet, when a stranger arrives at an encampment, the sorcerer goes out to meet him. The stranger folds his arms and inclines his head to one side, so as to expose his cheek, upon which the magician deals a terrible blow, sometimes felling him to the ground. Next the sorcerer in his turn presents his cheek to the smiter and receives a buffet from the stranger. Then they kiss each other, the ceremony is over, and the stranger is hospitably received by all. Sometimes the dread of strangers and their magic is too great to allow of their reception on any terms. Thus when Speke arrived at a certain village, the natives shut their doors against him, "because they had never before seen a white man nor the tin boxes that the men were carrying: 'Who knows,' they said, 'but that these very boxes are the plundering Watuta transformed and come to kill us? You cannot be admitted.' No persuasion could avail with them, and the party had to proceed to the next village."

The fear thus entertained of alien visitors is often mutual. Entering a strange land the savage feels that he is treading enchanted ground, and he takes steps to guard against the demons that haunt it and the magical arts of its inhabitants. Thus on going to a strange land the Maoris performed certain ceremonies to make it *noa* (common), lest it might have been previously *tapu* (sacred). When Baron Miklucho-Maclay was approaching a village on the Maclay Coast of New Guinea, one of the natives who accompanied him broke a branch from a tree and going aside whispered to it for a while; then stepping up to each member of the party, one after another, he spat something upon his back and gave him some blows with the branch. Lastly, he went into the forest and buried the branch under withered leaves in the thickest part of the jungle. This ceremony was believed to protect the party against all treachery and danger in the village they were approaching. The idea probably was that the malignant influences were drawn off from the persons into the branch and buried with it in the depths of the forest. Before Stuhlmann and his companions entered the territory of the Wanyamwesi in central Africa, one of his men killed a white cock and buried it in a pot just at the boundary. In Australia, when a strange tribe has been invited into a district and is approaching the encampment of the tribe which owns the land, "the strangers carry lighted bark or burning sticks in their hands, for the purpose, they say, of clearing and purifying the air." On the coast of Victoria there is a tract of country between the La Trobe River and the Yarra River, which some of the aborigines called the Bad Country. It was supposed to act injuriously on strangers. Hence when a man of another clan entered it he needed some one of the natives to look after him; and if his guardian went away from the camp, he deputed another to take his place. During his first visit, before he became as it were acclimatised, the visitor did nothing for himself as to food, drinking-water, or lodging. He was painted with a band of white pipe-clay across the face below the eyes, and had to learn the Nulit language before going further. He slept on a thick layer of leaves so that he should not touch the ground; and he was fed with flesh-meat from the point of a burnt stick, which he removed

with his teeth, not with his lips. His drinking-water was drawn from a small hole in the ground by his entertainers, and they made it muddy by stirring it with a stick. He might only take three mouthfuls at a time, each of which he had to let slowly trickle down his throat. If he did otherwise, his throat would close up. The Kayans and Kenyahs of Borneo think it well to conciliate the spirit of the land when they enter a strange country. "The old men, indeed, trusting to the protection afforded by omens, are in little need of further aid, but when young boys are brought into a new river of importance, the hospitality of the local demons is invoked. The Kayans make an offering of fowls' eggs, which must not be bought on the spot, but are carried from the house, sometimes for distances so long that the devotion of the travellers is more apparent than their presents to the spirits of the land. Each boy takes an egg and puts it in a bamboo split at the end into four, while one of the older men calls upon the hills, rocks, trees, and streams to hear him and to witness the offering. Careful to disguise the true nature of the gift, he speaks of it as *ovē*, a yam, using a form of words fixed by usage. 'Omen bird,' he shouts into the air, 'we have brought you these boys. It is on their account only that we have prepared this feast. Harm them not; make things go pleasantly; and they give you the usual offering of a yam. I give this to the country.' The little ceremony is performed behind the hut where the night is spent, and the boys wait about for the charm to take effect. The custom of the Kenyahs shows the same feeling for the unknown and unseen spirits that are supposed to abound. A fowl's feathers, one for each boy, are held by an old man, while the youngsters touch his arm. The invocation is quite a powerful example of native rhetoric: 'Smooth away trouble, ye mystic mountains, hills, valleys, soil, rocks, trees. Shield the lives of the children who have come hither.' " When the Toradjas of central Celebes are on a head-hunting expedition and have entered the enemy's country, they may not eat any fruits which the foe has planted nor any animal which he has reared until they have first committed an act of hostility, as by burning a house or killing a man. They think that if they broke this rule they would receive something of the soul or spiritual essence of the enemy into themselves, which would destroy the mystic virtue of their talismans. It is said that just before Greek armies advanced to the shock of battle, a man bearing a lighted torch stepped out from either side and threw his torch into the space between the hosts. Then they retired unmolested, for they were thought to be sacred to Ares and inviolable. Now some peoples fancy that when they advance to battle the spirits of their fathers hover in the van. Hence fire thrown out in front of the line of battle may be meant to disperse these shadowy combatants, leaving the issue of the fight to be determined by more substantial weapons than ghosts can wield. Similarly the fire which is sometimes borne at the head of an army is perhaps in some cases intended to dissipate the evil influences, whether magical or spiritual, with which the air of the enemy's country may be conceived to teem.

Again, it is thought that a man who has been on a journey may have contracted some magic evil from the strangers with whom he has been brought into contact. Hence, on returning home, before he is readmitted to the society of his tribe and friends, he has to undergo certain purificatory ceremonies. Thus the Bechuanas "cleanse or purify themselves after journeys by shaving their heads, etc., lest they should have contracted from strangers some evil by witchcraft or sorcery." In some parts of western Africa when a man returns home after a long absence, before he is allowed to visit his wife, he must wash his person with a particular fluid, and receive from the sorcerer a certain mark on his forehead, in order to counteract any magic spell which a stranger woman may have cast on him in his absence, and which might be communicated through him to the women of his village. Every year about one-third of the men of the Wanyamwesi tribe make journeys to the east coast of Africa either as porters or as traffickers. Before he sets out, the husband smears his cheeks with a sort of meal-porridge, and during his absence his wife may eat no flesh and must keep for him the sediment of the porridge in the pot. On their return from the coast the men sprinkle meal every day on all the

paths leading to the camp, for the purpose, it is supposed, of keeping evil spirits off; and when they reach their homes the men again smear porridge on their faces, while the women who have stayed at home strew ashes on their heads. In Uganda, when a man returns from a journey, his wife takes some of the bark cloths from the bed of one of his children and lays them on her husband's bed; and as he enters the house, he jumps over one of his wives who has children by him, or over one of his children. If he neglects to do this, one of his children or one of his wives will die. When Damaras return home after a long absence, they are given a small portion of the fat of particular animals, which is supposed to possess certain virtues. A story is told of a Navajo Indian who, after long wanderings, returned to his own people. When he came within sight of his house, his people made him stop and told him not to approach nearer till they had summoned a shaman. When the shaman was come "ceremonies were performed over the returned wanderer, and he was washed from head to foot, and dried with corn-meal; for thus do the Navajo treat all who return to their homes from captivity with another tribe, in order that all alien substances and influences may be removed from them. When he had been thus purified he entered the house, and his people embraced him and wept over him." Two Hindoo ambassadors, who had been sent to England by a native prince and had returned to India, were considered to have so polluted themselves by contact with strangers that nothing but being born again could restore them to purity. "For the purpose of regeneration it is directed to make an image of pure gold of the female power of nature, in the shape either of a woman or of a cow. In this statue the person to be regenerated is enclosed, and dragged through the usual channel. As a statue of pure gold and of proper dimensions would be too expensive, it is sufficient to make an image of the sacred *Yoni*, through which the person to be regenerated is to pass." Such an image of pure gold was made at the prince's command, and his ambassadors were born again by being dragged through it. In some of the Moluccas, when a brother or young blood-relation returns from a long journey, a young girl awaits him at the door with a *caladi* leaf in her hand and water in the leaf. She throws the water over his face and bids him welcome. Among the Kayans of Borneo, men who have been absent on a long journey are secluded for four days in a small hut made specially for the purpose before they are allowed to enter their own house. The natives of Savage Island (South Pacific) invariably killed, not only all strangers in distress who were drifted to their shores, but also any of their own people who had gone away in a ship and returned home. This was done out of dread of disease. Long after they began to venture out to ships they would not immediately use the things they obtained from them, but hung them up in quarantine for weeks in the bush.

When precautions like these are taken on behalf of the people in general against the malignant influence supposed to be exercised by strangers, it is no wonder that special measures are adopted to protect the king from the same insidious danger. In the middle ages the envoys who visited a Tartar Khan were obliged to pass between two fires before they were admitted to his presence, and the gifts they brought were also carried between the fires. The reason assigned for the custom was that the fire purged away any magic influence which the strangers might mean to exercise over the Khan. When subject chiefs come with their retinues to visit Kalamba (the most powerful chief of the Bashilange in the Congo Basin) for the first time or after being rebellious, they have to bathe, men and women together, in two brooks on two successive days, passing the nights under the open sky in the market-place. After the second bath they proceed, entirely naked, to the house of Kalamba, who makes a long white mark on the breast and forehead of each of them. Then they return to the market-place and dress, after which they undergo the pepper ordeal. Pepper is dropped into the eyes of each of them, and while this is being done the sufferer has to make a confession of all his sins, to answer all questions that may be put to him, and to take certain vows. This ends the ceremony, and the strangers are now free to take up their quarters in the town for as long as

they choose to remain. Before strangers were admitted to the presence of Lobengula, king of the Matebeles, they had to be treated with a sticky green medicine, which was profusely sprinkled over them by means of a cow's tail. At Kilema, in eastern Africa, when a stranger arrives, a medicine is made out of a certain plant or a tree fetched from a distance, mixed with the blood of a sheep or goat. With this mixture the stranger is besmeared or besprinkled before he is admitted to the presence of the king. The king of Monomotapa, in South-East Africa, might not wear any foreign stuffs for fear of their being poisoned. The king of Cacongo, in West Africa, might not possess or even touch European goods, except metals, arms, and articles made of wood and ivory. Persons wearing foreign stuffs were very careful to keep at a distance from his person, lest they should touch him. The king of Loango might not look upon the house of a white man. We have already seen how the native king of Fernando Po dwells secluded from all contact with the whites in the depths of an extinct volcano, shunning the very sight of a pale face, which, in the belief of his subjects, would be instantly fatal to him. In a wild mountainous district of Java, to the south of Bantam, there exists a small aboriginal race who have been described as a living antiquity. These are the Baduwis, who about the year 1443 fled from Bantam to escape conversion to Islam, and in their mountain fastnesses, holding aloof from their neighbours, still cleave to the quaint and primitive ways of their heathen forefathers. Their villages are perched in spots which deep ravines, lofty precipices, raging torrents, and impenetrable forests combine to render almost inaccessible. Their hereditary ruler bears the title of Girang-Pu-un and unites in his hands the temporal and spiritual power. He must never quit the capital, and none even of his subjects who live outside the town are ever allowed to see him. Were an alien to set foot in his dwelling, the place would be desecrated and abandoned. In former times the representatives of the Dutch Government and the Regent of Java once paid a visit to the capital of the Baduwis. That very night all the people fled the place and never returned.

§ 2. Taboos on Eating and Drinking.

In the opinion of savages the acts of eating and drinking are attended with special danger; for at these times the soul may escape from the mouth, or be extracted by the magic arts of an enemy present. Among the Ewe-speaking peoples of the Slave Coast "the common belief seems to be that the indwelling spirit leaves the body and returns to it through the mouth; hence, should it have gone out, it behoves a man to be careful about opening his mouth, lest a homeless spirit should take advantage of the opportunity and enter his body. This, it appears, is considered most likely to take place while the man is eating." Precautions are therefore taken to guard against these dangers. Thus of the Battas of Sumatra it is said that "since the soul can leave the body, they always take care to prevent their soul from straying on occasions when they have most need of it. But it is only possible to prevent the soul from straying when one is in the house. At feasts one may find the whole house shut up, in order that the soul (*tondi*) may stay and enjoy the good things set before it." The Zafimanelo in Madagascar lock their doors when they eat, and hardly any one ever sees them eating. In Shoa, one of the southern provinces of Abyssinia, the doors of the house are scrupulously barred at meals to exclude the evil eye, and a fire is invariably lighted, else devils would enter and there would be no blessing on the meat. Every time that an Abyssinian of rank drinks, a servant holds a cloth before his master to guard him from the evil eye. The Warua will not allow any one to see them eating and drinking, being doubly particular that no person of the opposite sex shall see them doing so. "I had to pay a man to let me see him drink; I could not make a man let a woman see him drink." When offered a drink of *pombe* they often ask that a cloth may be held up to hide them whilst drinking. Further, every man and woman must cook for themselves; each person must have his own fire. The Tuaregs of the Sahara never eat or drink in presence of any one else. The Thompson Indians of British Columbia thought that a

shaman could bewitch them most easily when they were eating, drinking, or smoking; hence they avoided doing any of these things in presence of an unknown shaman. In Fiji persons who suspected others of plotting against them avoided eating in their presence, or were careful to leave no fragment of food behind.

If these are the ordinary precautions taken by common people, the precautions taken by kings are extraordinary. The king of Loango may not be seen eating or drinking by man or beast under pain of death. A favourite dog having broken into the room where the king was dining, the king ordered it to be killed on the spot. Once the king's own son, a boy of twelve years old, inadvertently saw the king drink. Immediately the king ordered him to be finely apparelled and feasted, after which he commanded him to be cut in quarters, and carried about the city with a proclamation that he had seen the king drink. "When the king has a mind to drink, he has a cup of wine brought; he that brings it has a bell in his hand, and as soon as he has delivered the cup to the king, he turns his face from him and rings the bell, on which all present fall down with their faces to the ground, and continue so till the king has drank.... His eating is much in the same style, for which he has a house on purpose, where his victuals are set upon a bensa or table: which he goes to, and shuts the door: when he has done, he knocks and comes out. So that none ever see the king eat or drink. For it is believed that if any one should, the king shall immediately die." The remnants of his food are buried, doubtless to prevent them from falling into the hands of sorcerers, who by means of these fragments might cast a fatal spell over the monarch. The rules observed by the neighbouring king of Cacongo were similar; it was thought that the king would die if any of his subjects were to see him drink. It is a capital offence to see the king of Dahomey at his meals. When he drinks in public, as he does on extraordinary occasions, he hides himself behind a curtain, or handkerchiefs are held up round his head, and all the people throw themselves with their faces to the earth. Any one who saw the Muata Jamwo (a great potentate in the Congo Basin) eating or drinking would certainly be put to death. When the king (*Muata*) of Cazembe raises his glass to his mouth to drink, all who are present prostrate themselves and avert their faces in such a manner as not to see him drinking. At Asaba, on the Lower Niger, where the kings or chiefs number fully four hundred, no one is allowed to prepare the royal dishes. The chiefs act as their own cooks and eat in the strictest privacy. The king and royal family of Walo, on the Senegal, never take their meals in public; it is expressly forbidden to see them eating. Among the Monbutto of central Africa the king invariably takes his meals in private; no one may see the contents of his dish, and all that he leaves is carefully thrown into a pit set apart for that purpose. Everything that the king has handled is held sacred and may not be touched. When the king of Unyoro in central Africa went to drink milk in the dairy, every man must leave the royal enclosure and all the women had to cover their heads till the king returned. No one might see him drink. One wife accompanied him to the dairy and handed him the milk-pot, but she turned away her face while he drained it. The king of Susa, a region to the south of Abyssinia, presides daily at the feast in the long banqueting-hall, but is hidden from the gaze of his subjects by a curtain. Among the Ewe-speaking peoples of the Slave Coast the person of the king is sacred, and if he drinks in public every one must turn away the head so as not to see him, while some of the women of the court hold up a cloth before him as a screen. He never eats in public, and the people pretend to believe that he neither eats nor sleeps. It is criminal to say the contrary. When the king of Tonga ate, all the people turned their backs to him. In the palace of the Persian kings there were two dining-rooms opposite each other; in one of them the king dined, in the other his guests. He could see them through a curtain on the door, but they could not see him. Generally the king took his meals alone; but sometimes his wife or some of his sons dined with him.

§ 3. Taboos on shewing the Face.

In some of the preceding cases the intention of eating and drinking in strict seclusion may perhaps be to hinder evil influences from entering the body rather than to prevent the escape of the soul. This certainly is the motive of some drinking customs observed by natives of the Congo region. Thus we are told of these people that "there is hardly a native who would dare to swallow a liquid without first conjuring the spirits. One of them rings a bell all the time he is drinking; another crouches down and places his left hand on the earth; another veils his head; another puts a stalk of grass or a leaf in his hair, or marks his forehead with a line of clay. This fetish custom assumes very varied forms. To explain them, the black is satisfied to say that they are an energetic mode of conjuring spirits." In this part of the world a chief will commonly ring a bell at each draught of beer which he swallows, and at the same moment a lad stationed in front of him brandishes a spear "to keep at bay the spirits which might try to sneak into the old chief's body by the same road as the *massanga* (beer)." The same motive of warding off evil spirits probably explains the custom observed by some African sultans of veiling their faces. The Sultan of Darfur wraps up his face with a piece of white muslin, which goes round his head several times, covering his mouth and nose first, and then his forehead, so that only his eyes are visible. The same custom of veiling the face as a mark of sovereignty is said to be observed in other parts of central Africa. The Sultan of Wadai always speaks from behind a curtain; no one sees his face except his intimates and a few favoured persons. Similarly the Sultan of Bornu never shewed himself to his people and only spoke to them from behind a curtain. The king of Chonga, a town on the right bank of the Niger above Egga, may not be seen by his subjects nor by strangers. At an interview he sits in his palace concealed by a mat which hangs like a curtain, and from behind it he converses with his visitor. The Muysca Indians of Colombia had such a respect for their chiefs that they dared not lift their eyes on them, but always turned their backs when they had to address them. If a thief, after repeated punishments, proved incorrigible, they took him to the chief, and one of the nobles, turning the culprit round, said to him, "Since you think yourself so great a lord that you have the right to break the laws, you have the right to look at the chief." From that moment the criminal was regarded as infamous. Nobody would have anything to do with him or even speak to him, and he died an outcast. Montezuma was revered by his subjects as a god, and he set so much store on their reverence that if on going out of the city he saw a man lift up his eyes on him, he had the rash gazer put to death. He generally lived in the retirement of his palace, seldom shewing himself. On the days when he went to visit his gardens, he was carried in a litter through a street which was enclosed by walls; none but his bearers had the right to pass along that street. It was a law of the Medes that their king should be seen by nobody. The king of Jebu, on the Slave Coast of West Africa, is surrounded by a great deal of mystery. Until lately his face might not be seen even by his own subjects, and if circumstances compelled him to communicate with them he did so through a screen which concealed him from view. Now, though his face may be seen, it is customary to hide his body; and at audiences a cloth is held before him so as to conceal him from the neck downwards, and it is raised so as to cover him altogether whenever he coughs, sneezes, spits, or takes snuff. His face is partially hidden by a conical cap with hanging strings of beads. Amongst the Tuaregs of the Sahara all the men (but not the women) keep the lower part of their face, especially the mouth, veiled constantly; the veil is never put off, not even in eating or sleeping. Among the Arabs men remarkable for their good looks have been known to veil their faces, especially at festivals and markets, in order to protect themselves against the evil eye. The same reason may explain the custom of muffling their faces which has been observed by Arab women from the earliest times and by the women of Boeotian Thebes in antiquity. In Samoa a man whose family god was the turtle might not eat a turtle, and if he helped a neighbour to cut up and cook one he had to wear a bandage tied over his

mouth lest an embryo turtle should slip down his throat, grow up, and be his death. In West Timor a speaker holds his right hand before his mouth in speaking lest a demon should enter his body, and lest the person with whom he converses should harm the speaker's soul by magic. In New South Wales for some time after his initiation into the tribal mysteries, a young blackfellow (whose soul at this time is in a critical state) must always cover his mouth with a rug when a woman is present. We have already seen how common is the notion that the life or soul may escape by the mouth or nostrils.

§ 4. Taboos on quitting the House.

By an extension of the like precaution kings are sometimes forbidden ever to leave their palaces; or, if they are allowed to do so, their subjects are forbidden to see them abroad. We have seen that the priestly king at Shark Point, West Africa, may never quit his house or even his chair, in which he is obliged to sleep sitting; and that the king of Fernando Po, whom no white man may see, is reported to be confined to his house with shackles on his legs. The fetish king of Benin, who was worshipped as a deity by his subjects, might not quit his palace. After his coronation the king of Loango is confined to his palace, which he may not leave. The king of Onitsha, on the Niger, "does not step out of his house into the town unless a human sacrifice is made to propitiate the gods: on this account he never goes out beyond the precincts of his premises." Indeed we are told that he may not quit his palace under pain of death or of giving up one or more slaves to be executed in his presence. As the wealth of the country is measured in slaves, the king takes good care not to infringe the law. One day the monarch, charmed by some presents which he had received from a French officer, politely attended his visitor to the gate, and in a moment of forgetfulness was about to break bounds, when his chamberlain, seizing his majesty by his legs, and his wives, friends, and servants rushing up, prevented him from taking so fatal a step. Yet once a year at the Feast of Yams the king is allowed, and even required by custom, to dance before his people outside the high mud wall of the palace. In dancing he carries a great weight, generally a sack of earth, on his back to prove that he is still able to support the burden and cares of state. Were he unable to discharge this duty, he would be immediately deposed and perhaps stoned. The Tomas or Habes, a hardy race of mountaineers who inhabit Mount Bandiagara in Nigeria, revere a great fetish doctor called the Ogom, who is not suffered to quit his house on any pretext. Among the natives of the Cross River in Southern Nigeria the sacred chiefs of certain villages are confined to their compounds, that is, to the enclosures in which their houses are built. Such chiefs may be confined for years within these narrow bounds. "Among these primitive people, the head chief is often looked upon as half divine, the human representative of their ancestral god. He regulates their religious rites, and is by some tribes believed to have the power of making rain fall when they require it, and of bringing them good harvests. So, being of such value to the community, he is not permitted, except on very rare occasions, to go outside his compound, lest evil should befall him, and the whole town have to suffer." The kings of Ethiopia were worshipped as gods, but were mostly kept shut up in their palaces. On the mountainous coast of Pontus there dwelt in antiquity a rude and warlike people named the Mosyni or Mosynoeci, through whose rugged country the Ten Thousand marched on their famous retreat from Asia to Europe. These barbarians kept their king in close custody at the top of a high tower, from which after his election he was never more allowed to descend. Here he dispensed justice to his people; but if he offended them, they punished him by stopping his rations for a whole day, or even starving him to death. The kings of Sabaea or Sheba, the spice country of Arabia, were not allowed to go out of their palaces; if they did so, the mob stoned them to death. But at the top of the palace there was a window with a chain attached to it. If any man deemed he had suffered wrong, he pulled the chain, and the king perceived him and called him in and gave judgment. So down to recent

times the kings of Corea, whose persons were sacred and received “honours almost divine,” were shut up in their palace from the age of twelve or fifteen; and if a suitor wished to obtain justice of the king he sometimes lit a great bonfire on a mountain facing the palace; the king saw the fire and informed himself of the case. The Emperor of China seldom quits his palace, and when he does so, no one may look at him; even the guards who line the road must turn their backs. The king of Tonquin was permitted to appear abroad twice or thrice a year for the performance of certain religious ceremonies; but the people were not allowed to look at him. The day before he came forth notice was given to all the inhabitants of the city and country to keep from the way the king was to go; the women were obliged to remain in their houses and durst not shew themselves under pain of death, a penalty which was carried out on the spot if any one disobeyed the order, even through ignorance. Thus the king was invisible to all but his troops and the officers of his suite. In Mandalay a stout lattice-paling, six feet high and carefully kept in repair, lined every street in the walled city and all those streets in the suburbs through which the king was likely at any time to pass. Behind this paling, which stood two feet or so from the houses, all the people had to stay when the king or any of the queens went out. Any one who was caught outside it by the beadles after the procession had started was severely handled, and might think himself lucky if he got off with a beating. Nobody was supposed to peep through the holes in the lattice-work, which were besides partly stopped up with flowering shrubs.

§ 5. Taboos on leaving Food over.

Again, magic mischief may be wrought upon a man through the remains of the food he has partaken of, or the dishes out of which he has eaten. On the principles of sympathetic magic a real connexion continues to subsist between the food which a man has in his stomach and the refuse of it which he has left untouched, and hence by injuring the refuse you can simultaneously injure the eater. Among the Narrinyeri of South Australia every adult is constantly on the look-out for bones of beasts, birds, or fish, of which the flesh has been eaten by somebody, in order to construct a deadly charm out of them. Every one is therefore careful to burn the bones of the animals which he has eaten lest they should fall into the hands of a sorcerer. Too often, however, the sorcerer succeeds in getting hold of such a bone, and when he does so he believes that he has the power of life and death over the man, woman, or child who ate the flesh of the animal. To put the charm in operation he makes a paste of red ochre and fish oil, inserts in it the eye of a cod and a small piece of the flesh of a corpse, and having rolled the compound into a ball sticks it on the top of the bone. After being left for some time in the bosom of a dead body, in order that it may derive a deadly potency by contact with corruption, the magical implement is set up in the ground near the fire, and as the ball melts, so the person against whom the charm is directed wastes with disease; if the ball is melted quite away, the victim will die. When the bewitched man learns of the spell that is being cast upon him, he endeavours to buy the bone from the sorcerer, and if he obtains it he breaks the charm by throwing the bone into a river or lake. Further, the Narrinyeri think that if a man eats of the totem animal of his tribe, and an enemy obtains a portion of the flesh, the latter can make it grow in the inside of the eater, and so cause his death. Therefore when a man partakes of his totem he is careful either to eat it all or else to conceal or destroy the refuse. In the Encounter Bay tribe of South Australia, when a man cannot get the bone of an animal which his enemy has eaten, he cooks a bird, beast, or fish, and keeping back one of the creature's bones, offers the rest under the guise of friendship to his enemy. If the man is simple enough to partake of the proffered food, he is at the mercy of his perfidious foe, who can kill him by placing the abstracted bone near the fire.

Ideas and practices of the same sort prevail, or used to prevail, in Melanesia; all that was needed to injure a man was to bring the leavings of his food into contact with a malignant

ghost or spirit. Hence in the island of Florida when a scrap of an enemy's dinner was secreted and thrown into a haunted place, the man was supposed to fall ill; and in the New Hebrides if a snake of a certain sort carried away a fragment of food to a spot sacred to a spirit, the man who had eaten the food would sicken as the fragment decayed. In Aurora the refuse is made up by the wizard with certain leaves; as these rot and stink, the man dies. Hence it is, or was, a constant care with the Melanesians to prevent the remains of their meals from falling into the hands of persons who bore them a grudge; for this reason they regularly gave the refuse of food to the pigs. In Tana, one of the New Hebrides, people bury or throw into the sea the leavings of their food, lest these should fall into the hands of the disease-makers. For if a disease-maker finds the remnants of a meal, say the skin of a banana, he picks it up and burns it slowly in the fire. As it burns, the person who ate the banana falls ill and sends to the disease-maker, offering him presents if he will stop burning the banana skin. In German New Guinea the natives take the utmost care to destroy or conceal the husks and other remains of their food, lest these should be found by their enemies and used by them for the injury or destruction of the eaters. Hence they burn their leavings, throw them into the sea, or otherwise put them out of harm's way. To such an extent does this fear influence them that many people dare not stir beyond the territory of their own village, lest they should leave behind them on the land of their neighbours something by means of which a hostile sorcerer might do them a mischief. Similar fears have led to similar customs in New Britain and the other islands of what is now called the Bismarck Archipelago, off the north coast of New Guinea. There also the natives bury, burn, or throw into the sea the remains of their meals to prevent them from falling into the hands of magicians; there also the more superstitious of them will not eat in another village because they dread the use which a sorcerer might make of their leavings when their back is turned. This theory has led to an odd practical result; all the cats in the islands of the Archipelago go about with stumpy tails. The reason of the peculiarity is this. The natives sometimes roast and eat their cats; and unscrupulous persons might be tempted to steal a neighbour's cat in order to furnish a meal. Accordingly, in the interests of the higher morality people remove this stumbling-block from the path of their weaker brothers by docking their cats of a piece of their tails and keeping the severed portions in a secret place. If now a cat is stolen and eaten, the lawful owner of the animal has it in his power to avenge the crime: he need only bury the piece of tail with certain spells in the ground, and the thief will fall ill. Hence a man will hardly dare to steal and eat a cat with a stumpy tail, knowing the righteous retribution that would sooner or later overtake him for so doing.

From a like fear, no doubt, of sorcery, no one may touch the food which the king of Loango leaves upon his plate; it is buried in a hole in the ground. And no one may drink out of the king's vessel. Similarly, no man may drink out of the same cup or glass with the king of Fida (Whydah) in Guinea; "he hath always one kept particularly for himself; and that which hath but once touched another's lips he never uses more, though it be made of metal that may be cleansed by fire." Amongst the Alfoors of Celebes there is a priest called the *Leleen*, whose duty appears to be to make the rice grow. His functions begin about a month before the rice is sown, and end after the crop is housed. During this time he has to observe certain taboos; amongst others he may not eat or drink with any one else, and he may drink out of no vessel but his own. An ancient Indian way of injuring an enemy was to offer him a meal of rice and afterwards throw the remains of the rice into a fishpond; if the fish swam up in large numbers to devour the grains, the man's fate was sealed. In antiquity the Romans used immediately to break the shells of eggs and of snails which they had eaten in order to prevent enemies from making magic with them. The common practice, still observed among us, of breaking eggshells after the eggs have been eaten may very well have originated in the same superstition.

The superstitious fear of the magic that may be wrought on a man through the leavings of his food has had the beneficial effect of inducing many savages to destroy refuse which, if left to rot, might through its corruption have proved a real, not a merely imaginary, source of disease and death. Nor is it only the sanitary condition of a tribe which has benefited by this superstition; curiously enough the same baseless dread, the same false notion of causation, has indirectly strengthened the moral bonds of hospitality, honour, and good faith among men who entertain it. For it is obvious that no one who intends to harm a man by working magic on the refuse of his food will himself partake of that food, because if he did so he would, on the principles of sympathetic magic, suffer equally with his enemy from any injury done to the refuse. This is the idea which in primitive society lends sanctity to the bond produced by eating together; by participation in the same food two men give, as it were, hostages for their good behaviour; each guarantees the other that he will devise no mischief against him, since, being physically united with him by the common food in their stomachs, any harm he might do to his fellow would recoil on his own head with precisely the same force with which it fell on the head of his victim. In strict logic, however, the sympathetic bond lasts only so long as the food is in the stomach of each of the parties. Hence the covenant formed by eating together is less solemn and durable than the covenant formed by transfusing the blood of the covenanting parties into each other's veins, for this transfusion seems to knit them together for life.

IV. Tabooed Persons

§ 1. Chiefs and Kings tabooed.

We have seen that the Mikado's food was cooked every day in new pots and served up in new dishes; both pots and dishes were of common clay, in order that they might be broken or laid aside after they had been once used. They were generally broken, for it was believed that if any one else ate his food out of these sacred dishes, his mouth and throat would become swollen and inflamed. The same ill effect was thought to be experienced by any one who should wear the Mikado's clothes without his leave; he would have swellings and pains all over his body. In Fiji there is a special name (*kana lama*) for the disease supposed to be caused by eating out of a chief's dishes or wearing his clothes. "The throat and body swell, and the impious person dies. I had a fine mat given to me by a man who durst not use it because Thakambau's eldest son had sat upon it. There was always a family or clan of commoners who were exempt from this danger. I was talking about this once to Thakambau. 'Oh yes,' said he. 'Here, So-and-so! come and scratch my back.' The man scratched; he was one of those who could do it with impunity." The name of the men thus highly privileged was *Na nduka ni*, or the dirt of the chief.

In the evil effects thus supposed to follow upon the use of the vessels or clothes of the Mikado and a Fijian chief we see that other side of the god-man's character to which attention has been already called. The divine person is a source of danger as well as of blessing; he must not only be guarded, he must also be guarded against. His sacred organism, so delicate that a touch may disorder it, is also, as it were, electrically charged with a powerful magical or spiritual force which may discharge itself with fatal effect on whatever comes in contact with it. Accordingly the isolation of the man-god is quite as necessary for the safety of others as for his own. His magical virtue is in the strictest sense of the word contagious: his divinity is a fire, which, under proper restraints, confers endless blessings, but, if rashly touched or allowed to break bounds, burns and destroys what it touches. Hence the disastrous effects supposed to attend a breach of taboo; the offender has thrust his hand into the divine fire, which shrivels up and consumes him on the spot. The Nubas, for example, who inhabit the wooded and fertile range of Jebel Nuba in eastern Africa, believe that they would die if they entered the house of their priestly king; however they can evade the penalty of their intrusion by baring the left shoulder and getting the king to lay his hand on it. And were any man to sit on a stone which the king has consecrated to his own use, the transgressor would die within the year. The Cazembes, in the interior of Angola, regard their king (the *Muata* or *Mambo*) as so holy that no one can touch him without being killed by the magical power which pervades his sacred person. But since contact with him is sometimes unavoidable, they have devised a means whereby the sinner can escape with his life. Kneeling down before the king he touches the back of the royal hand with the back of his own, then snaps his fingers; afterwards he lays the palm of his hand on the palm of the king's hand, then snaps his fingers again. This ceremony is repeated four or five times, and averts the imminent danger of death. In Tonga it was believed that if any one fed himself with his own hands after touching the sacred person of a superior chief or anything that belonged to him, he would swell up and die; the sanctity of the chief, like a virulent poison, infected the hands of his inferior, and, being communicated through them to the food, proved fatal to the eater. A commoner who had incurred this danger could disinfect himself by performing a certain ceremony, which consisted in touching the sole of a chief's foot with the palm and back of each of his hands, and afterwards rinsing his hands in water. If there was no water near, he rubbed his hands

with the juicy stem of a plantain or banana. After that he was free to feed himself with his own hands without danger of being attacked by the malady which would otherwise follow from eating with tabooed or sanctified hands. But until the ceremony of expiation or disinfection had been performed, if he wished to eat, he had either to get some one to feed him, or else to go down on his knees and pick up the food from the ground with his mouth like a beast. He might not even use a toothpick himself, but might guide the hand of another person holding the toothpick. The Tongans were subject to induration of the liver and certain forms of scrofula, which they often attributed to a failure to perform the requisite expiation after having inadvertently touched a chief or his belongings. Hence they often went through the ceremony as a precaution, without knowing that they had done anything to call for it. The king of Tonga could not refuse to play his part in the rite by presenting his foot to such as desired to touch it, even when they applied to him at an inconvenient time. A fat unwieldy king, who perceived his subjects approaching with this intention, while he chanced to be taking his walks abroad, has been sometimes seen to waddle as fast as his legs could carry him out of their way, in order to escape the importunate and not wholly disinterested expression of their homage. If any one fancied he might have already unwittingly eaten with tabooed hands, he sat down before the chief, and, taking the chief's foot, pressed it against his own stomach, that the food in his belly might not injure him, and that he might not swell up and die. Since scrofula was regarded by the Tongans as a result of eating with tabooed hands, we may conjecture that persons who suffered from it among them often resorted to the touch or pressure of the king's foot as a cure for their malady. The analogy of the custom with the old English practice of bringing scrofulous patients to the king to be healed by his touch is sufficiently obvious, and suggests, as I have already pointed out elsewhere, that among our own remote ancestors scrofula may have obtained its name of the King's Evil, from a belief, like that of the Tongans, that it was caused as well as cured by contact with the divine majesty of kings.

In New Zealand the dread of the sanctity of chiefs was at least as great as in Tonga. Their ghostly power, derived from an ancestral spirit or *atua*, diffused itself by contagion over everything they touched, and could strike dead all who rashly or unwittingly meddled with it. For instance, it once happened that a New Zealand chief of high rank and great sanctity had left the remains of his dinner by the wayside. A slave, a stout, hungry fellow, coming up after the chief had gone, saw the unfinished dinner, and ate it up without asking questions. Hardly had he finished when he was informed by a horror-stricken spectator that the food of which he had eaten was the chief's. "I knew the unfortunate delinquent well. He was remarkable for courage, and had signalled himself in the wars of the tribe," but "no sooner did he hear the fatal news than he was seized by the most extraordinary convulsions and cramp in the stomach, which never ceased till he died, about sundown the same day. He was a strong man, in the prime of life, and if any pakeha [European] freethinker should have said he was not killed by the *tapu* of the chief, which had been communicated to the food by contact, he would have been listened to with feelings of contempt for his ignorance and inability to understand plain and direct evidence." This is not a solitary case. A Maori woman having eaten of some fruit, and being afterwards told that the fruit had been taken from a tabooed place, exclaimed that the spirit of the chief, whose sanctity had been thus profaned, would kill her. This was in the afternoon, and next day by twelve o'clock she was dead. An observer who knows the Maoris well, says, "Tapu [taboo] is an awful weapon. I have seen a strong young man die the same day he was tapued; the victims die under it as though their strength ran out as water." A Maori chief's tinder-box was once the means of killing several persons; for, having been lost by him, and found by some men who used it to light their pipes, they died of fright on learning to whom it had belonged. So, too, the garments of a high New Zealand chief will kill any one else who wears them. A chief was observed by a

missionary to throw down a precipice a blanket which he found too heavy to carry. Being asked by the missionary why he did not leave it on a tree for the use of a future traveller, the chief replied that "it was the fear of its being taken by another which caused him to throw it where he did, for if it were worn, his tapu" (that is, his spiritual power communicated by contact to the blanket and through the blanket to the man) "would kill the person." For a similar reason a Maori chief would not blow a fire with his mouth; for his sacred breath would communicate its sanctity to the fire, which would pass it on to the pot on the fire, which would pass it on to the meat in the pot, which would pass it on to the man who ate the meat, which was in the pot, which stood on the fire, which was breathed on by the chief; so that the eater, infected by the chief's breath conveyed through these intermediaries, would surely die.

Thus in the Polynesian race, to which the Maoris belong, superstition erected round the persons of sacred chiefs a real, though at the same time purely imaginary barrier, to transgress which actually entailed the death of the transgressor whenever he became aware of what he had done. This fatal power of the imagination working through superstitious terrors is by no means confined to one race; it appears to be common among savages. For example, among the aborigines of Australia a native will die after the infliction of even the most superficial wound if only he believes that the weapon which inflicted the wound had been sung over and thus endowed with magical virtue. He simply lies down, refuses food, and pines away. Similarly among some of the Indian tribes of Brazil, if the medicine-man predicted the death of any one who had offended him, "the wretch took to his hammock instantly in such full expectation of dying, that he would neither eat nor drink, and the prediction was a sentence which faith effectually executed." Speaking of certain African races Major Leonard observes: "I have seen more than one hardened old Haussa soldier dying steadily and by inches, because he believed himself to be bewitched; so that no nourishment or medicines that were given to him had the slightest effect either to check the mischief or to improve his condition in any way, and nothing was able to divert him from a fate which he considered inevitable. In the same way, and under very similar conditions, I have seen Krumen and others die, in spite of every effort that was made to save them, simply because they had made up their minds, not (as we thought at the time) to die, but that being in the clutch of malignant demons they were bound to die." The Capuchin missionary Merolla da Sorrento, who travelled in the West African kingdom of Congo in the latter part of the seventeenth century, has described a remarkable case of death wrought purely by superstitious fear. He says: "It is a custom that either the parents or the wizards give certain rules to be inviolably observed by the young people, and which they call *chegilla*: these are to abstain from eating either some sorts of poultry, the flesh of some kinds of wild beasts, such and such fruits, roots either raw or boiled after this or another manner, with several other ridiculous injunctions of the like nature, too many to be enumerated here. You would wonder with what religious observance these commands are obeyed. These young people would sooner chuse to fast several days together, than to taste the least bit of what has been forbidden them; and if it sometimes happen that the *chegilla* has been neglected to have been given them by their parents, they think they shall presently die unless they go immediately to receive it from the wizards. A certain young negro, being upon a journey, lodged in a friend's house by the way: his friend, before he went out the next morning, had got a wild hen ready for his breakfast, they being much better than the tame ones. The negro hereupon demanded, 'If it were a wild hen?' His host answered, 'No': then he fell on heartily, and afterwards proceeded on his journey. About four years after these two met together again, and the aforesaid negro being not yet married, his old friend asked him, 'If he would eat a wild hen?' To which he answered, 'That he had received the *chegilla*, and therefore could not.' Hereat the host began immediately to laugh, enquiring of him, 'What made him refuse it now, when he had eaten

one at his table about four years ago?' At the hearing of this the negro immediately fell a trembling, and suffered himself to be so far possessed with the effects of imagination, that he died in less than twenty-four hours after."

§ 2. Mourners tabooed.

Thus regarding his sacred chiefs and kings as charged with a mysterious spiritual force which so to say explodes at contact, the savage naturally ranks them among the dangerous classes of society, and imposes upon them the same sort of restraints that he lays on manslaughterers, menstruous women, and other persons whom he looks upon with a certain fear and horror. For example, sacred kings and priests in Polynesia were not allowed to touch food with their hands, and had therefore to be fed by others; and as we have just seen, their vessels, garments, and other property might not be used by others on pain of disease and death. Now precisely the same observances are exacted by some savages from girls at their first menstruation, women after childbirth, homicides, mourners, and all persons who have come into contact with the dead. Thus, for example, to begin with the last class of persons, among the Maoris any one who had handled a corpse, helped to convey it to the grave, or touched a dead man's bones, was cut off from all intercourse and almost all communication with mankind. He could not enter any house, or come into contact with any person or thing, without utterly bedevilling them. He might not even touch food with his hands, which had become so frightfully tabooed or unclean as to be quite useless. Food would be set for him on the ground, and he would then sit or kneel down, and, with his hands carefully held behind his back, would gnaw at it as best he could. In some cases he would be fed by another person, who with outstretched arm contrived to do it without touching the tabooed man; but the feeder was himself subjected to many severe restrictions, little less onerous than those which were imposed upon the other. In almost every populous village there lived a degraded wretch, the lowest of the low, who earned a sorry pittance by thus waiting upon the defiled. Clad in rags, daubed from head to foot with red ochre and stinking shark oil, always solitary and silent, generally old, haggard, and wizened, often half crazed, he might be seen sitting motionless all day apart from the common path or thoroughfare of the village, gazing with lack-lustre eyes on the busy doings in which he might never take a part. Twice a day a dole of food would be thrown on the ground before him to munch as well as he could without the use of his hands; and at night, huddling his greasy tatters about him, he would crawl into some miserable lair of leaves and refuse, where, dirty, cold, and hungry, he passed, in broken ghost-haunted slumbers, a wretched night as a prelude to another wretched day. Such was the only human being deemed fit to associate at arm's length with one who had paid the last offices of respect and friendship to the dead. And when, the dismal term of his seclusion being over, the mourner was about to mix with his fellows once more, all the dishes he had used in his seclusion were diligently smashed, and all the garments he had worn were carefully thrown away, lest they should spread the contagion of his defilement among others, just as the vessels and clothes of sacred kings and chiefs are destroyed or cast away for a similar reason. So complete in these respects is the analogy which the savage traces between the spiritual influences that emanate from divinities and from the dead, between the odour of sanctity and the stench of corruption.

The rule which forbids persons who have been in contact with the dead to touch food with their hands would seem to have been universal in Polynesia. Thus in Samoa "those who attended the deceased were most careful not to handle food, and for days were fed by others as if they were helpless infants. Baldness and the loss of teeth were supposed to be the punishment inflicted by the household god if they violated the rule." Again, in Tonga, "no person can touch a dead chief without being taboo'd for ten lunar months, except chiefs, who are only taboo'd for three, four, or five months, according to the superiority of the dead chief;

except again it be the body of Tooitonga [the great divine chief], and then even the greatest chief would be taboo'd ten months, as was the case with Finow's wife above mentioned. During the time a man is taboo'd he must not feed himself with his own hands, but must be fed by somebody else: he must not even use a toothpick himself, but must guide another person's hand holding the toothpick. If he is hungry and there is no one to feed him, he must go down upon his hands and knees, and pick up his victuals with his mouth: and if he infringes upon any of these rules, it is firmly expected that he will swell up and die: and this belief is so strong that Mr. Mariner thinks no native ever made an experiment to prove the contrary. They often saw him feed himself with his hands after having touched dead chiefs, and not observing his health to decline, they attributed it to his being a foreigner, and being governed by different gods." Again, in Wallis Island "contact with a corpse subjects the hands to the law of taboo till they are washed, which is not done for several weeks. Until that purification has taken place, the tabooed persons may not themselves put food to their mouths; other people render them that service." A rule of the same sort is or was observed in various parts of Melanesia. Thus in Fiji the taboo for handling a dead chief lasted from one to ten months according to his rank; for a commoner it lasted not more than four days. It was commonly resorted to by the lazy and idle; for during the time of their seclusion they were not only provided with food, but were actually fed by attendants or ate their food from the ground. Similarly in the Motu tribe of New Guinea a man is tabooed, generally for three days, after handling a corpse, and while the taboo lasts he may not touch food with his hands. At the end of the time he bathes and the taboo is over. So in New Caledonia the two men who are charged with the duty of burying and guarding a corpse have to remain in seclusion and observe a number of rules of abstinence. They live apart from their wives. They may not shave or cut their hair. Their food is laid for them on leaves and they take it up with their mouth or a stick; but oftener an attendant feeds them, just as he might feed a man whose limbs were palsied. So among the Nandi of British East Africa persons who have handled a corpse bathe in a river, anoint their bodies with fat, partially shave their heads, and live in the hut of the deceased for four days. All these days they may not be seen by boys or women: they may not drink milk; and they may not touch food with their hands, but must eat it with the help of a potsherd or chip of a gourd. Similarly in the Ba-Pedi and Ba-Thonga tribes of South Africa men who have dug a grave may not touch food with their fingers till the rites of their purification are accomplished; meantime they eat with the help of special spoons. If they broke this rule, it is thought that they would be consumptive. So in the Ngarigo tribe of New South Wales a novice who has just passed through the ceremony of initiation has to go away to the mountains and stay there for a while, sometimes for more than six months, under the charge of one or more old men; and all the time of his absence among the mountains he may not touch cooked food with his hands; the food is put into his mouth by the man who looks after him.

Among the Shuswap of British Columbia widows and widowers in mourning are secluded and forbidden to touch their own head or body; the cups and cooking-vessels which they use may be used by no one else. They must build a sweat-house beside a creek, sweat there all night and bathe regularly, after which they must rub their bodies with branches of spruce. The branches may not be used more than once, and when they have served their purpose they are stuck into the ground all round the hut. No hunter would come near such mourners, for their presence is unlucky. If their shadow were to fall on any one, he would be taken ill at once. They employ thorn bushes for bed and pillow, in order to keep away the ghost of the deceased; and thorn bushes are also laid all around their beds. This last precaution shews clearly what the spiritual danger is which leads to the exclusion of such persons from ordinary society; it is simply a fear of the ghost who is supposed to be hovering near them. Among the Thompson Indians of British Columbia the persons who handled a corpse and dug

the grave were secluded for four days. They fasted until the body was buried, after which they were given food apart from the other people. They would not touch the food with their hands, but must put it into their mouths with sharp-pointed sticks. They ate off a small mat, and drank out of birch-bark cups, which, together with the mat, were thrown away at the end of the four days. The first four mouthfuls of food, as well as of water, had to be spit into the fire. During their seclusion they bathed in a stream and might not sleep with their wives. Widows and widowers were obliged to observe rules of a similar kind. Immediately after the death they went out and passed through a patch of rose-bushes four times, probably in order to rid themselves of the ghost, who might be supposed to stick on a thorn. For a year they had to sleep on a bed of fir-boughs, on which sticks of rose-bushes were laid; many wore twigs of rose-bush and juniper in a piece of buckskin on their persons. The first four days they might not touch their food, but ate with sharp-pointed sticks and spat out the first four mouthfuls of each meal, and the first four of water, into the fire. A widower might not fish at another man's fishing-place or with another man's net; if he did, it would make the place and the net useless for the season. If he transplanted a trout into another lake, before releasing it he blew on the head of the fish, and after chewing deer-fat, he spat some of the grease on its head in order to remove the baneful effect of his touch. Then he let the trout go, bidding it farewell, and asking it to propagate its kind in plenty. Any grass or branches that a widow or widower sat or lay down on withered up. If a widow should break sticks or boughs, her hands or arms would also break. She might not pick berries for a year, else the whole crop of berries would fall off the bushes or wither up. She might not cook food or fetch water for her children, nor let them lie down on her bed, nor should she lie or sit where they slept. Sometimes a widow would wear a breech-cloth made of dry bunch-grass for several days to prevent her husband's ghost from having intercourse with her. Among the Tinneh or Déné Indians of North-West America all who have handled a corpse are subject to many restrictions and taboos. They are debarred for a certain period from eating any fresh meat: they may never use a knife to cut their food but must tear it with their teeth: they may not drink out of a vessel in common use, but must employ a gourd which they carry about for the purpose; and they wear peeled willow wands about their arms and necks or carry them in their hands as disinfectants to annul the evil consequences which are supposed to follow from handling the dead. Among the Indian tribes of Queen Charlotte Sound a widow or widower goes into special mourning for a month; among the Koskimos the period of mourning is four months. During this time he or she lives apart in a very small hut behind the house, eating and drinking alone, and using for that purpose dishes which are not employed by other members of the tribe.

Among the Agutainos, who inhabit Palawan, one of the Philippine Islands, a widow may not leave her hut for seven or eight days after the death; and even then she may only go out at an hour when she is not likely to meet anybody, for whoever looks upon her dies a sudden death. To prevent this fatal catastrophe, the widow knocks with a wooden peg on the trees as she goes along, thus warning people of her dangerous proximity; and the very trees on which she knocks soon die. So poisonous is the atmosphere of death that surrounds those to whom the ghost of the departed may be thought to cleave. In the Mekeo district of British New Guinea a widower loses all his civil rights and becomes a social outcast, an object of fear and horror, shunned by all. He may not cultivate a garden, nor shew himself in public, nor traverse the village, nor walk on the roads and paths. Like a wild beast he must skulk in the long grass and the bushes; and if he sees or hears any one coming, especially a woman, he must hide behind a tree or a thicket. If he wishes to fish or hunt, he must do it alone and at night. If he would consult any one, even the missionary, he does so by stealth and at night; he seems to have lost his voice and speaks only in whispers. Were he to join a party of fishers or hunters, his presence would bring misfortune on them; the ghost of his dead wife would frighten away the fish or the game. He goes about everywhere and at all times armed with a tomahawk to

defend himself, not only against wild boars in the jungle, but against the dreaded spirit of his departed spouse, who would do him an ill turn if she could; for all the souls of the dead are malignant and their only delight is to harm the living.

§ 3. Women tabooed at Menstruation and Childbirth.

In general, we may say that the prohibition to use the vessels, garments, and so on of certain persons, and the effects supposed to follow an infraction of the rule, are exactly the same whether the persons to whom the things belong are sacred or what we might call unclean and polluted. As the garments which have been touched by a sacred chief kill those who handle them, so do the things which have been touched by a menstruous woman. An Australian blackfellow, who discovered that his wife had lain on his blanket at her menstrual period, killed her and died of terror himself within a fortnight. Hence Australian women at these times are forbidden under pain of death to touch anything that men use, or even to walk on a path that any man frequents. They are also secluded at childbirth, and all vessels used by them during their seclusion are burned. In Uganda the pots which a woman touches while the impurity of childbirth or of menstruation is on her should be destroyed; spears and shields defiled by her touch are not destroyed but only purified. No Esquimaux of Alaska will willingly drink out of the same cup or eat out of the same dish that has been used by a woman at her confinement until it has been purified by certain incantations. Amongst some of the Indians of North America, women at menstruation are forbidden to touch men's utensils, which would be so defiled by their touch that their subsequent use would be attended by certain mischief or misfortune. For instance, in some of the Tinneh or Déné tribes girls verging on maturity take care that the dishes out of which they eat are used by no one else. When their first periodical sickness comes on, they are fed by their mothers or nearest kinswomen, and will on no account touch their food with their own hands. At the same time they abstain from touching their heads with their hands, and keep a small stick to scratch their heads with when they itch. They remain outside the house in a hut built for the purpose, and wear a skull-cap made of skin to fit very tight, which they never lay aside till the first monthly infirmity is over. A fringe of shells, bones, and so on hangs down from their forehead so as to cover their eyes, lest any malicious sorcerer should harm them during this critical period. "Among all the Déné and most other American tribes, hardly any other being was the object of so much dread as a menstruating woman. As soon as signs of that condition made themselves apparent in a young girl she was carefully segregated from all but female company, and had to live by herself in a small hut away from the gaze of the villagers or of the male members of the roving band. While in that awful state, she had to abstain from touching anything belonging to man, or the spoils of any venison or other animal, lest she would thereby pollute the same, and condemn the hunters to failure, owing to the anger of the game thus slighted. Dried fish formed her diet, and cold water, absorbed through a drinking tube, was her only beverage. Moreover, as the very sight of her was dangerous to society, a special skin bonnet, with fringes falling over her face down to her breast, hid her from the public gaze, even some time after she had recovered her normal state." Among the Bribri Indians of Costa Rica a menstruous woman is regarded as unclean (*bukuru*). The only plates she may use for her food are banana leaves, which, when she has done with them, she throws away in some sequestered spot; for were a cow to find them and eat them, the animal would waste away and perish. And she drinks out of a special vessel for a like reason; because if any one drank out of the same cup after her, he would surely die. In the islands of Mabuiag and Saibai, in Torres Straits, girls at their first menstruation are strictly secluded from the sight of men. In Mabuiag the seclusion lasts three months, in Saibai about a fortnight. During the time of her separation the girl is forbidden to feed herself or to handle food, which is put into her mouth by women or girls told off to wait on her.

Among many peoples similar restrictions are imposed on women in childbed and apparently for similar reasons; at such periods women are supposed to be in a dangerous condition which would infect any person or thing they might touch; hence they are put into quarantine until, with the recovery of their health and strength, the imaginary danger has passed away. Thus, in Tahiti a woman after childbirth was secluded for a fortnight or three weeks in a temporary hut erected on sacred ground; during the time of her seclusion she was debarred from touching provisions, and had to be fed by another. Further, if any one else touched the child at this period, he was subjected to the same restrictions as the mother until the ceremony of her purification had been performed. Similarly in Manahiki, an island of the Southern Pacific, for ten days after her delivery a woman was not allowed to handle food, and had to be fed by some other person. In the Sinaugolo tribe of British New Guinea, for about a month after her confinement a woman may not prepare or handle food; she may not even cook for herself, and when she is eating the food made ready for her by her friends she must use a sharpened stick to transfer it to her mouth. Similarly in the Roro and Mekeo districts of British New Guinea a woman after childbirth becomes for a time taboo (*opu*), and any person or thing she may chance to touch becomes taboo also. Accordingly during this time she abstains from cooking; for were she to cook food, not only the victuals themselves but the pot and the fire would be tabooed, so that nobody could eat the victuals, or use the pot, or warm himself at the fire. Further at meals she may not dip her hand into the dish and help herself, as the natives commonly do; she must use for the purpose a long fork, with which she takes up the bananas, sweet potatoes, yams, and so forth, in order not to contaminate the rest of the food in the vessel by the touch of her fingers. If she wishes to drink, a gourd is set before her, and wrapping up her hands in a cloth or coco-nut fibre she pours the water into a small calabash for her use; or she may pour the water directly into her mouth without letting the gourd touch her lips. If anything has to be handed to her, it is not given from hand to hand but reached to her at the end of a long stick. Similarly in the island of Kadiak, off Alaska, a woman about to be delivered retires to a miserable low hovel built of reeds, where she must remain for twenty days after the birth of her child, whatever the season may be, and she is considered so unclean that no one will touch her, and food is reached to her on sticks. In the Ba-Pedi and Ba-Thonga tribes of South Africa a woman in childbed may not touch her food with her hands all the time of her seclusion; she must eat with the help of a wooden spoon. They think that if she touched her victuals she might infect them with her bloody flux, and that having partaken of such tainted food she would fall into a consumption. The Bribri Indians regard the pollution of childbed as much more dangerous even than that of menstruation. When a woman feels her time approaching, she informs her husband, who makes haste to build a hut for her in a lonely spot. There she must live alone, holding no converse with anybody save her mother or another woman. After her delivery the medicine-man purifies her by breathing on her and laying an animal, it matters not what, upon her. But even this ceremony only mitigates her uncleanness into a state considered to be equivalent to that of a menstruous woman; and for a full lunar month she must live apart from her housemates, observing the same rules with regard to eating and drinking as at her monthly periods. The case is still worse, the pollution is still more deadly, if she has had a miscarriage or has been delivered of a stillborn child. In that case she may not go near a living soul: the mere contact with things she has used is exceedingly dangerous: her food is handed to her at the end of a long stick. This lasts generally for three weeks, after which she may go home subject only to the restrictions incident to an ordinary confinement. Among the Adivi or forest Gollas of Southern India, when a woman feels the first pains of labour, she is turned clean out of the village and must take up her quarters in a little hut made of leaves or mats about two hundred yards away. In this hut she must bring forth her offspring unaided, unless a midwife can be fetched in time to be with her before the child is born; if the midwife arrives

after the birth has taken place she may not go near the woman. For ninety days the mother lives in the hut by herself. If any one touches her, he or she becomes, like the mother herself, an outcast and is expelled from the village for three months, The woman's husband generally makes a little hut about fifty yards from hers and stays in it sometimes to watch over her, but he may not go near her on pain of being an outcast for three months. Food is placed on the ground near the woman's hut and she takes it. On the fourth day after the birth a woman of the village goes to her and pours water on her, but may not come into contact with her. On the fifth day the villagers clear away the stones and thorny bushes from a patch of ground about ten yards on the village side of the hut, and to this clearing the woman removes her hut unaided; no one may help her to do so. On the ninth, fifteenth, and thirtieth days she again shifts her hut nearer and nearer to the village; and again once in each of the two following months she brings her hut still nearer. On the ninetieth day of her seclusion the woman is called out from her hut, washed, clad in clean clothes, and after being taken to the village temple is conducted to her own house by a man of the caste, who performs purificatory ceremonies.

These customs shew that in the opinion of some primitive peoples a woman at and after childbirth is pervaded by a certain dangerous influence which can infect anything and anybody she touches; so that in the interest of the community it becomes necessary to seclude her from society for a while until the virulence of the infection has passed away, when, after submitting to certain rites of purification, she is again free to mingle with her fellows. This dread of lying-in women appears to be widespread, for the practice of shutting them up at such times in lonely huts away from the rest of the people is very common. Sometimes the nature of the danger which is apprehended from them is explicitly stated. Thus in the island of Tumbleo, off German New Guinea, after the birth of her first child a woman is shut up with her infant for five to eight days, during which no man, not even her husband, may see her; for the men think that were they to see her, their bodies would swell up and they would die. Apparently their notion is that the sight of a woman who has just been big with child will, on the principles of homoeopathic magic, make their bodies big also to bursting. The Sulka of New Britain imagine that, when a woman has been delivered of a child, the men become cowardly, weapons lose their force, and the slips which are to be planted out are deprived of their power of germinating. Hence they perform a ceremony which is intended to counteract this mysterious influence on men and plants. As soon as it is known that a woman has been brought to bed, all the male population of the village assembles in the men's clubhouse. Branches of a strong-smelling tree are fetched, the twigs are broken off, the leaves stripped off and put on the fire. All the men present then seize branches with young buds. One of them holds ginger in his hand, which, after reciting a spell over it, he distributes to the others. They chew it and spit it out on the twigs, and these twigs are afterwards laid on the shields and other weapons in the house, and also on the slips which are to be planted; moreover they are fastened on the roofs and over the doorways of the houses. In this way they seek to annul the noxious infection of childbirth. Among the Yabim of German New Guinea, when a birth has taken place in the village, all the inhabitants remain at home next morning "in order that the fruits of the field may not be spoiled." Apparently they fear that if they went out to their fields and gardens immediately after a woman had been brought to bed, they would carry with them a dangerous contagion which might blight the crops. When a Herero woman has given birth to a child, her female companions hastily construct a special hut for her to which she is transferred. Both the hut and the woman are sacred and "for this reason, the men are not allowed to see the lying-in woman until the navel string has separated from the child, otherwise they would become weaklings, and when later they *yumbana*, that is, go to war with spear and bow, they would be shot." Thus the Herero like the Sulka appear

to imagine that the weakness of a lying-in woman can, on the principles of homoeopathic magic, infect any men who may chance to see her.

Among the Saragacos Indians of eastern Ecuador, as soon as a woman feels the travail-pangs beginning, she retires into the forest to a distance of three or four leagues from her home, where she takes up her abode in a hut of leaves which has been already prepared for her. "This banishment," we are told, "is the fruit of the superstition of these Indians, who are persuaded that the spirit of evil would attach himself to their house if the women were brought to bed in it." The Esquimaux of Baffin Land think that the body of a lying-in woman exhales a vapour which would adhere to the souls of seals if she ate the flesh of any seals except such as have been caught by her husband, by a boy, or by an aged man. "Cases of premature birth require particularly careful treatment. The event must be announced publicly, else dire results will follow. If a woman should conceal from the other people that she has had a premature birth, they might come near her, or even eat in her hut of the seals procured by her husband. The vapor arising from her would thus affect them, and they would be avoided by the seals. The transgression would also become attached to the soul of the seal, which would take it down to Sedna," the mythical mother of the sea-mammals, who lives in the lower world and controls the destinies of mankind.

Some Bantu tribes of South Africa entertain even more exaggerated notions of the virulent infection spread by a woman who has had a miscarriage and has concealed it. An experienced observer of these people tells us that the blood of childbirth "appears to the eyes of the South Africans to be tainted with a pollution still more dangerous than that of the menstrual fluid. The husband is excluded from the hut for eight days of the lying-in period, chiefly from fear that he might be contaminated by this secretion. He dare not take his child in his arms for the three first months after the birth. But the secretion of childbed is particularly terrible when it is the product of a miscarriage, especially a *concealed miscarriage*. In this case it is not merely the man who is threatened or killed, it is the whole country, it is the sky itself which suffers. By a curious association of ideas a physiological fact causes cosmic troubles!" Thus, for example, the Ba-Pedi believe that a woman who has procured abortion can kill a man merely by lying with him; her victim is poisoned, shrivels up, and dies within a week. As for the disastrous effect which a miscarriage may have on the whole country I will quote the words of a medicine-man and rain-maker of the Ba-Pedi tribe: "When a woman has had a miscarriage, when she has allowed her blood to flow, and has hidden the child, it is enough to cause the burning winds to blow and to parch the country with heat. The rain no longer falls, for the country is no longer in order. When the rain approaches the place where the blood is, it will not dare to approach. It will fear and remain at a distance. That woman has committed a great fault. She has spoiled the country of the chief, for she has hidden blood which had not yet been well congealed to fashion a man. That blood is taboo (*yila*). It should never drip on the road! The chief will assemble his men and say to them, 'Are you in order in your villages?' Some one will answer, 'Such and such a woman was pregnant and we have not yet seen the child which she has given birth to.' Then they go and arrest the woman. They say to her, 'Shew us where you have hidden it.' They go and dig at the spot, they sprinkle the hole with a decoction of *mbendoula* and *nyangale* (two sorts of roots) prepared in a special pot. They take a little of the earth of this grave, they throw it into the river, then they bring back water from the river and sprinkle it where she shed her blood. She herself must wash every day with the medicine. Then the country will be moistened again (by rain). Further, we (medicine-men) summon the women of the country; we tell them to prepare a ball of the earth which contains the blood. They bring it to us one morning. If we wish to prepare medicine with which to sprinkle the whole country, we crumble this earth to powder; at the end of five days we send little boys and little girls, girls that yet know nothing of women's affairs and

have not yet had relations with men. We put the medicine in the horns of oxen, and these children go to all the fords, to all the entrances of the country. A little girl turns up the soil with her mattock, the others dip a branch in the horn and sprinkle the inside of the hole saying, 'Rain! rain!' So we remove the misfortune which the women have brought on the roads; the rain will be able to come. The country is purified!"

Similarly the Ba-Thonga, another Bantu tribe of South Africa in the valley of the Limpopo river, attribute severe droughts to the concealment of miscarriages by women, and they perform the following rites to remove the pollution and procure rain. A small clearing is made in a thick and thorny wood, and here a pot is buried in the ground so that its mouth is flush with the surface. From the pot four channels run in the form of a cross to the four cardinal points of the horizon. Then a black ox or a black ram, without a speck of white on it, is killed and the pot is stuffed with the half-digested grass found in the animal's stomach. Next, little girls, still in the age of innocence, are sent to draw water, which they pour into the pot till it overflows into the four channels. After that the women assemble, strip off their clothes, and covering their nakedness only with a scanty petticoat of grass they dance, leap, and sing, "Rain, fall!" Then they go and dig up the remains of the prematurely born infants and of twins buried in dry ground on a hill. These they collect in one place. No man may approach the spot. The women would beat any male who might be so indiscreet as to intrude on their privacy, and they would put riddles to him which he would have to answer in the most filthy language borrowed from the circumcision ceremonies; for obscene words, which are usually forbidden, are customary and legitimate on these occasions. The women pour water on the graves of the infants and of twins in order to "extinguish" (*timula*) them, as the natives phrase it; which seems to imply that the graves are thought to be the source of the scorching heat which is blasting the country. At the fall of evening they bury all the remains they have discovered, poking them away in the mud near a stream. Then the rain will be free to fall. In these ceremonies the pouring of water into channels which run in the direction of the four quarters of the heaven is clearly a charm based on the principles of homoeopathic magic to procure rain. The supposed influence of twins over the waters of heaven and the use of foul language at rain-making ceremonies have been illustrated in another part of this work.

Among the natives of the Nguôn So'n valley in Annam, during the first month after a woman has been delivered of a child, all the persons of the house are supposed to be affected with an evil destiny or ill luck called *phong long*. If a member of such a household enters another house, the inmates never fail to say to him, "You bring me the *phong long*!" Should a member of a family in which somebody is seriously ill have to enter a house infected by the *phong long*, on returning home he always fumigates himself with tea leaves or some other plant in order to rid himself of the infection which he has contracted; for they fear that the blood of the woman who has been brought to bed may harm the patient. All the time a house is tainted with the *phong long*, a branch of cactus (*Euphorbia antiquorum*) or pandanus is hung at the door. The same thing is done to a house infected by small-pox: it is a danger signal to warn people off. The *phong long* only disappears when the woman has gone to market for the first time after her delivery. A trace of a similar belief in the dangerous infection of childbirth may be seen in the rule of ancient Greek religion, which forbade persons who had handled a corpse or been in contact with a lying-in woman to enter a temple or approach an altar for a certain time, sometimes for two days.

Restrictions and taboos like those laid on menstruous and lying-in women are imposed by some savages on lads at the initiatory rites which celebrate the attainment of puberty; hence we may infer that at such times young men are supposed to be in a state like that of women at menstruation and in childbed. Thus, among the Creek Indians a lad at initiation had to abstain for twelve moons from picking his ears or scratching his head with his fingers; he had to use

a small stick for these purposes. For four moons he must have a fire of his own to cook his food at; and a little girl, a virgin, might cook for him. During the fifth moon any person might cook for him, but he must serve himself first, and use one spoon and pan. On the fifth day of the twelfth moon he gathered corn cobs, burned them to ashes, and with the ashes rubbed his body all over. At the end of the twelfth moon he sweated under blankets, and then bathed in water, which ended the ceremony. While the ceremonies lasted, he might touch no one but lads who were undergoing a like course of initiation. Caffre boys at circumcision live secluded in a special hut; they are smeared from head to foot with white clay; they wear tall head-dresses with horn-like projections and short skirts like those of ballet-dancers. When their wounds are healed, all the vessels which they had used during their seclusion and the boyish mantles which they had hitherto worn are burned, together with the hut, and the boys rush away from the burning hut without looking back, "lest a fearful curse should cling to them." After that they are bathed, anointed, and clad in new garments.

§ 4. Warriors tabooed.

Once more, warriors are conceived by the savage to move, so to say, in an atmosphere of spiritual danger which constrains them to practise a variety of superstitious observances quite different in their nature from those rational precautions which, as a matter of course, they adopt against foes of flesh and blood. The general effect of these observances is to place the warrior, both before and after victory, in the same state of seclusion or spiritual quarantine in which, for his own safety, primitive man puts his human gods and other dangerous characters. Thus when the Maoris went out on the war-path they were sacred or taboo in the highest degree, and they and their friends at home had to observe strictly many curious customs over and above the numerous taboos of ordinary life. They became, in the irreverent language of Europeans who knew them in the old fighting days, "tabooed an inch thick"; and as for the leader of the expedition, he was quite unapproachable. Similarly, when the Israelites marched forth to war they were bound by certain rules of ceremonial purity identical with rules observed by Maoris and Australian blackfellows on the war-path. The vessels they used were sacred, and they had to practise continence and a custom of personal cleanliness of which the original motive, if we may judge from the avowed motive of savages who conform to the same custom, was a fear lest the enemy should obtain the refuse of their persons, and thus be enabled to work their destruction by magic. Among some Indian tribes of North America a young warrior in his first campaign had to conform to certain customs, of which two were identical with the observances imposed by the same Indians on girls at their first menstruation: the vessels he ate and drank out of might be touched by no other person, and he was forbidden to scratch his head or any other part of his body with his fingers; if he could not help scratching himself, he had to do it with a stick. The latter rule, like the one which forbids a tabooed person to feed himself with his own fingers, seems to rest on the supposed sanctity or pollution, whichever we choose to call it, of the tabooed hands. Moreover among these Indian tribes the men on the war-path had always to sleep at night with their faces turned towards their own country; however uneasy the posture they might not change it. They might not sit upon the bare ground, nor wet their feet, nor walk on a beaten path if they could help it; when they had no choice but to walk on a path, they sought to counteract the ill effect of doing so by doctoring their legs with certain medicines or charms which they carried with them for the purpose. No member of the party was permitted to step over the legs, hands, or body of any other member who chanced to be sitting or lying on the ground; and it was equally forbidden to step over his blanket, gun, tomahawk, or anything that belonged to him. If this rule was inadvertently broken, it became the duty of the member whose person or property had been stepped over to knock the other member down, and it was similarly the duty of that other to be knocked down peaceably and without

resistance. The vessels out of which the warriors ate their food were commonly small bowls of wood or birch bark, with marks to distinguish the two sides; in marching from home the Indians invariably drank out of one side of the bowl, and in returning they drank out of the other. When on their way home they came within a day's march of the village, they hung up all their bowls on trees, or threw them away on the prairie, doubtless to prevent their sanctity or defilement from being communicated with disastrous effects to their friends, just as we have seen that the vessels and clothes of the sacred Mikado, of women at childbirth and menstruation, of boys at circumcision, and of persons defiled by contact with the dead are destroyed or laid aside for a similar reason. The first four times that an Apache Indian goes out on the war-path, he is bound to refrain from scratching his head with his fingers and from letting water touch his lips. Hence he scratches his head with a stick, and drinks through a hollow reed or cane. Stick and reed are attached to the warrior's belt and to each other by a leathern thong. The rule not to scratch their heads with their fingers, but to use a stick for the purpose instead, was regularly observed by Ojebways on the war-path.

For three or four weeks before they went on a warlike expedition, the Nootka Indians made it an invariable rule to go into the water five or six times a day, when they washed and scrubbed themselves from head to foot with bushes intermixed with briars, so that their bodies and faces were often entirely covered with blood. During this severe exercise they continually exclaimed, "Good or great God, let me live, not be sick, find the enemy, not fear him, find him asleep, and kill a great many of them." All this time they had no intercourse with their women, and for a week before setting out abstained from feasting and every kind of merriment. For the last three days they were almost constantly in the water, scrubbing and lacerating themselves in a terrible manner. They believed that this hardened their skin, so that the weapons of the enemy could not pierce them. Before they went out on the war-path the Arikaras and the Big Belly Indians ("*Gros Ventres*") "observe a rigorous fast, or rather abstain from every kind of food for four days. In this interval their imagination is exalted to delirium; whether it be through bodily weakness or the natural effect of the warlike plans they cherish, they pretend to have strange visions. The elders and sages of the tribe, being called upon to interpret these dreams, draw from them omens more or less favourable to the success of the enterprise; and their explanations are received as oracles by which the expedition will be faithfully regulated. So long as the preparatory fast continues, the warriors make incisions in their bodies, insert pieces of wood in the flesh, and having fastened leather thongs to them cause themselves to be hung from a beam which is fixed horizontally above an abyss a hundred and fifty feet deep. Often indeed they cut off one or two fingers which they offer in sacrifice to the Great Spirit in order that they may come back laden with scalps." It is hard to conceive any course of training which could more effectually incapacitate men for the business of war than that which these foolish Indians actually adopted. With regard to the Creek Indians and kindred tribes we are told they "will not cohabit with women while they are out at war; they religiously abstain from every kind of intercourse even with their own wives, for the space of three days and nights before they go to war, and so after they return home, because they are to sanctify themselves." And as a preparation for attacking the enemy they "go to the aforesaid winter house, and there drink a warm decoction of their supposed holy consecrated herbs and roots for three days and nights, sometimes without any other refreshment. This is to induce the deity to guard and prosper them, amidst their impending dangers. In the most promising appearance of things, they are not to take the least nourishment of food, nor so much as to sit down, during that time of sanctifying themselves, till after sunset. While on their expedition, they are not allowed to lean themselves against a tree, though they may be exceedingly fatigued, after a sharp day's march; nor must they lie by, a whole day to refresh themselves, or kill and barbecue deer and bear for their war journey. The more virtuous they are, they reckon the

greater will be their success against the enemy, by the bountiful smiles of the deity. To gain that favourite point, some of the aged warriors narrowly watch the young men who are newly initiated, lest they should prove irreligious, and prophane the holy fast, and bring misfortunes on the out-standing camp. A gentleman of my acquaintance, in his youthful days observed one of their religious fasts, but under the greatest suspicion of his virtue in this respect, though he had often headed them against the common enemy: during their three days' purification, he was not allowed to go out of the sanctified ground, without a trusty guard, lest hunger should have tempted him to violate their old martial law, and by that means have raised the burning wrath of the holy fire against the whole camp." "Every war captain chuses a noted warrior, to attend on him and the company. He is called *Etissû*, or 'the waiter.' Everything they eat or drink during their journey, he gives them out of his hand, by a rigid abstemious rule,—though each carries on his back all his travelling conveniencies, wrapt in a deer skin, yet they are so bigoted in their religious customs in war that none, though prompted by sharp hunger or burning thirst, dares relieve himself. They are contented with such trifling allowance as the religious waiter distributes to them, even with a scanty hand. Such a regimen would be too mortifying to any of the white people, let their opinion of its violation be ever so dangerous. When I roved the woods in a war party with the Indians, though I carried no scrip, nor bottle, nor staff, I kept a large hollow cane well corked at each end, and used to sheer off now and then to drink, while they suffered greatly by thirst. The constancy of the savages in mortifying their bodies, to gain the divine favour, is astonishing, from the very time they beat to arms, till they return from their campaign. All the while they are out, they are prohibited by ancient custom, the leaning against a tree, either sitting or standing; nor are they allowed to sit in the day-time, under the shade of trees, if it can be avoided; nor on the ground, during the whole journey, but on such rocks, stones, or fallen wood, as their ark of war rests upon. By the attention they invariably pay to those severe rules of living, they weaken themselves much more than by the unavoidable fatigues of war; but it is fruitless to endeavour to dissuade them from those things which they have by tradition, as the appointed means to move the deity, to grant them success against the enemy, and a safe return home." "An Indian, intending to go to war, will commence by blacking his face, permitting his hair to grow long, and neglecting his personal appearance, and also will frequently fast, sometimes for two or three days together, and refrain from all intercourse with the other sex. If his dreams are favorable, he thinks that the Great Spirit will give him success." Among the Ba-Pedi and Ba-Thonga tribes of south Africa not only have the warriors to abstain from women, but the people left behind in the villages are also bound to continence; they think that any incontinence on their part would cause thorns to grow on the ground traversed by the warriors, and that success would not attend the expedition.

When we observe what pains these misguided savages took to unfit themselves for the business of war by abstaining from food, denying themselves rest, and lacerating their bodies, we shall probably not be disposed to attribute their practice of continence in war to a rational fear of dissipating their bodily energies by indulgence in the lusts of the flesh. On the contrary, we can scarcely doubt that the motive which impelled them to observe chastity on a campaign was just as frivolous as the motive which led them simultaneously to fritter away their strength by severe fasts, gratuitous fatigue, and voluntary wounds at the very moment when prudence called most loudly for a precisely opposite regimen. Why exactly so many savages have made it a rule to refrain from women in time of war, we cannot say for certain, but we may conjecture that their motive was a superstitious fear lest, on the principles of sympathetic magic, close contact with women should infect them with feminine weakness and cowardice. Similarly some savages imagine that contact with a woman in childbed enervates warriors and enfeebles their weapons. Indeed the Kayans of central Borneo go so far as to hold that to touch a loom or women's clothes would so weaken a man that he would

have no success in hunting, fishing, and war. Hence it is not merely sexual intercourse with women that the savage warrior sometimes shuns; he is careful to avoid the sex altogether. Thus among the hill tribes of Assam, not only are men forbidden to cohabit with their wives during or after a raid, but they may not eat food cooked by a woman; nay they should not address a word even to their own wives. Once a woman, who unwittingly broke the rule by speaking to her husband while he was under the war taboo, sickened and died when she learned the awful crime she had committed.

§ 5. Manslayers tabooed.

If the reader still doubts whether the rules of conduct which we have just been considering are based on superstitious fears or dictated by a rational prudence, his doubts will probably be dissipated when he learns that rules of the same sort are often imposed even more stringently on warriors after the victory has been won and when all fear of the living corporeal foe is at an end. In such cases one motive for the inconvenient restrictions laid on the victors in their hour of triumph is probably a dread of the angry ghosts of the slain; and that the fear of the vengeful ghosts does influence the behaviour of the slayers is often expressly affirmed. The general effect of the taboos laid on sacred chiefs, mourners, women at childbirth, men on the war-path, and so on, is to seclude or isolate the tabooed persons from ordinary society, this effect being attained by a variety of rules, which oblige the men or women to live in separate huts or in the open air, to shun the commerce of the sexes, to avoid the use of vessels employed by others, and so forth. Now the same effect is produced by similar means in the case of victorious warriors, particularly such as have actually shed the blood of their enemies. In the island of Timor, when a warlike expedition has returned in triumph bringing the heads of the vanquished foe, the leader of the expedition is forbidden by religion and custom to return at once to his own house. A special hut is prepared for him, in which he has to reside for two months, undergoing bodily and spiritual purification. During this time he may not go to his wife nor feed himself; the food must be put into his mouth by another person. That these observances are dictated by fear of the ghosts of the slain seems certain; for from another account of the ceremonies performed on the return of a successful head-hunter in the same island we learn that sacrifices are offered on this occasion to appease the soul of the man whose head has been taken; the people think that some misfortune would befall the victor were such offerings omitted. Moreover, a part of the ceremony consists of a dance accompanied by a song, in which the death of the slain man is lamented and his forgiveness is entreated. "Be not angry," they say, "because your head is here with us; had we been less lucky, our heads might now have been exposed in your village. We have offered the sacrifice to appease you. Your spirit may now rest and leave us at peace. Why were you our enemy? Would it not have been better that we should remain friends? Then your blood would not have been spilt and your head would not have been cut off." The people of Paloo, in central Celebes, take the heads of their enemies in war and afterwards propitiate the souls of the slain in the temple. In some Dyak tribes men on returning from an expedition in which they have taken human heads are obliged to keep by themselves and abstain from a variety of things for several days; they may not touch iron nor eat salt or fish with bones, and they may have no intercourse with women.

In Logea, an island off the south-eastern extremity of New Guinea, men who have killed or assisted in killing enemies shut themselves up for about a week in their houses. They must avoid all intercourse with their wives and friends, and they may not touch food with their hands. They may eat vegetable food only, which is brought to them cooked in special pots. The intention of these restrictions is to guard the men against the smell of the blood of the slain; for it is believed that if they smelt the blood, they would fall ill and die. In the Toaripi or Motumotu tribe of south-eastern New Guinea a man who has killed another may not go

near his wife, and may not touch food with his fingers. He is fed by others, and only with certain kinds of food. These observances last till the new moon. Among the tribes at the mouth of the Wanigela River, in New Guinea, "a man who has taken life is considered to be impure until he has undergone certain ceremonies: as soon as possible after the deed he cleanses himself and his weapon. This satisfactorily accomplished, he repairs to his village and seats himself on the logs of sacrificial staging. No one approaches him or takes any notice whatever of him. A house is prepared for him which is put in charge of two or three small boys as servants. He may eat only toasted bananas, and only the centre portion of them—the ends being thrown away. On the third day of his seclusion a small feast is prepared by his friends, who also fashion some new perineal bands for him. This is called *ivi poro*. The next day the man dons all his best ornaments and badges for taking life, and sallies forth fully armed and parades the village. The next day a hunt is organised, and a kangaroo selected from the game captured. It is cut open and the spleen and liver rubbed over the back of the man. He then walks solemnly down to the nearest water, and standing straddle-legs in it washes himself. All the young untried warriors swim between his legs. This is supposed to impart courage and strength to them. The following day, at early dawn, he dashes out of his house, fully armed, and calls aloud the name of his victim. Having satisfied himself that he has thoroughly scared the ghost of the dead man, he returns to his house. The beating of flooring-boards and the lighting of fires is also a certain method of scaring the ghost. A day later his purification is finished. He can then enter his wife's house." Among the Roro-speaking tribes of British New Guinea homicides were secluded in the warriors' clubhouse. They had to pass the night in the building, but during the day they might paint and decorate themselves and dance in front of it. For some time they might not eat much food nor touch it with their hands, but were obliged to pick it up on a bone fork, the heft of which was wrapped in a banana leaf. After a while they bathed in the sea and thence forward for a period of about a month, though they had still to sleep in the warriors' clubhouse, they were free to eat as much food as they pleased and to pick it up with their bare hands. Finally, those warriors who had never killed a man before assumed a beautiful ornament made of fretted turtle shell, which none but homicides were allowed to flaunt in their head-dresses. Then came a dance, and that same night the men who wore the honourable badge of homicide for the first time were chased about the village; embers were thrown at them and firebrands waved in order, apparently, to drive away the souls of the dead enemies, who seem to be conceived as immanent in some way in the headgear of their slayers. Again, among the Koita of British New Guinea, when a man had killed another, whether the victim were male or female, he did not wash the blood off the spear or club, but carefully allowed it to dry on the weapon. On his way home he bathed in fresh or salt water, and on reaching his village went straight to his own house, where he remained in seclusion for about a week. He was taboo (*aina*): he might not approach women, and he lifted his food to his mouth with a bone fork. His women-folk were not obliged to leave the house, but they might not come near him. At the end of a week he built a rough shelter in the forest, where he lived for a few days. During this time he made a new waist-band, which he wore on his return to the village. A man who has slain another is supposed to grow thin and emaciated, because he had been splashed with the blood of his victim, and as the corpse rotted he wasted away. Among the Southern Massim of British New Guinea a warrior who has taken a prisoner or slain a man remains secluded in his house for six days. During the first three days he may eat only roasted food and must cook it for himself. Then he bathes and blackens his face for the remaining three days.

Among the Monumbos of German New Guinea any one who has slain a foe in war becomes thereby "unclean" (*bolobolo*), and they apply the same term "unclean" to menstruous and lying-in women and also to everything that has come into contact with a corpse, which shews that all these classes of persons and things are closely associated in their minds.

The “unclean” man who has killed an enemy in battle must remain a long time in the men's clubhouse, while the villagers gather round him and celebrate his victory with dance and song. He may touch nobody, not even his own wife and children; if he were to touch them it is believed that they would be covered with sores. He becomes clean again by washing and using other modes of purification. In Windessi, Dutch New Guinea, when a party of head-hunters has been successful, and they are nearing home, they announce their approach and success by blowing on triton shells. Their canoes are also decked with branches. The faces of the men who have taken a head are blackened with charcoal. If several have taken part in killing the same victim, his head is divided among them. They always time their arrival so as to reach home in the early morning. They come rowing to the village with a great noise, and the women stand ready to dance in the verandahs of the houses. The canoes row past the *room sram* or house where the young men live; and as they pass, the murderers throw as many pointed sticks or bamboos at the wall or the roof as there were enemies killed. The day is spent very quietly. Now and then they drum or blow on the conch; at other times they beat the walls of the houses with loud shouts to drive away the ghosts of the slain. Similarly in the Doreh district of Dutch New Guinea, if a murder has taken place in the village, the inhabitants assemble for several evenings in succession and utter frightful yells to drive away the ghost of the victim in case he should be minded to hang about the village. So the Yabim of German New Guinea believe that the spirit of a murdered man pursues his murderer and seeks to do him a mischief. Hence they drive away the spirit with shouts and the beating of drums. When the Fijians had buried a man alive, as they often did, they used at nightfall to make a great uproar by means of bamboos, trumpet-shells, and so forth, for the purpose of frightening away his ghost, lest he should attempt to return to his old home. And to render his house unattractive to him they dismantled it and clothed it with everything that to their ideas seemed most repulsive. On the evening of the day on which they had tortured a prisoner to death, the American Indians were wont to run through the village with hideous yells, beating with sticks on the furniture, the walls, and the roofs of the huts to prevent the angry ghost of their victim from settling there and taking vengeance for the torments that his body had endured at their hands. “Once,” says a traveller, “on approaching in the night a village of Ottawas, I found all the inhabitants in confusion: they were all busily engaged in raising noises of the loudest and most inharmonious kind. Upon inquiry, I found that a battle had been lately fought between the Ottawas and the Kickapoos, and that the object of all this noise was to prevent the ghosts of the departed combatants from entering the village.”

The executioner at Porto Novo, on the coast of Guinea, used to decorate his walls with the jawbones of the persons on whom he had operated in the course of business. But for this simple precaution their ghosts would unquestionably have come at night to knock with sobs and groans, in an insufferable manner, at the door of the room where he slept the sleep of the just. The temper of a man who has just been executed is naturally somewhat short, and in a burst of vexation his ghost is apt to fall foul of the first person he comes across, without discriminating between the objects of his wrath with that nicety of judgment which in calmer moments he may be expected to display. Hence in China it is, or used to be, customary for the spectators of an execution to shew a clean pair of heels to the ghosts as soon as the last head was off. The same fear of the spirits of his victims leads the executioner sometimes to live in seclusion for some time after he has discharged his office. Thus an old writer, speaking of Issini on the Gold Coast of West Africa, tells us that the “executioners, being reckoned impure for three days, they build them a separate hut at a distance from the village. Meantime these fellows run like madmen through the place, seizing all they can lay hands on; poultry, sheep, bread, and oil; everything they can touch is theirs; being deemed so polluted that the owners willingly give it up. They continue three days confined to their hut, their friends bringing them victuals. This time expired, they take their hut in pieces, which

they bundle up, not leaving so much as the ashes of their fire. The first executioner, having a pot on his head, leads them to the place where the criminal suffered. There they all call him thrice by his name. The first executioner breaks his pot, and leaving their old rags and bundles they all scamper home." Here the thrice-repeated invocation of the victim by name gives the clue to the rest of the observances; all of them are probably intended to ward off the angry ghost of the slain man or to give him the slip.

Among the Basutos "ablution is specially performed on return from battle. It is absolutely necessary that the warriors should rid themselves, as soon as possible, of the blood they have shed, or the shades of their victims would pursue them incessantly, and disturb their slumbers. They go in a procession, and in full armour, to the nearest stream. At the moment they enter the water a diviner, placed higher up, throws some purifying substances into the current. This is, however, not strictly necessary. The javelins and battle-axes also undergo the process of washing." According to another account of the Basuto custom, "warriors who have killed an enemy are purified. The chief has to wash them, sacrificing an ox in presence of the whole army. They are also anointed with the gall of the animal, which prevents the ghost of the enemy from pursuing them any further." Among the Bechuanas a man who has killed another, whether in war or in single combat, is not allowed to enter the village until he has been purified. The ceremony takes place in the evening. An ox is slaughtered, and a hole having been made through the middle of the carcass with a spear, the manslayer has to force himself through the animal, while two men hold its stomach open. Sometimes instead of being obliged to squeeze through the carcass of an ox the manslayer is merely smeared with the contents of its stomach. The ceremony has been described as follows: "In the purification of warriors, too, the ox takes a conspicuous part. The warrior who has slain a man in the battle is unclean, and must on no account enter his own courtyard, for it would be a serious thing if even his shadow were to fall upon his children. He studiously keeps himself apart from the civil life of the town until he is purified. The purification ceremony is significant. Having bathed himself in running water, or, if that is not convenient, in water that has been appropriately medicated, he is smeared by the doctor with the contents of the stomach of an ox, into which certain powdered roots have been already mixed, and then the doctor strikes him on the back, sides, and belly with the large bowel of an ox.... A doctor takes a piece of roasted beef and cuts it into small lumps of about the size of a walnut, laying them carefully on a large wooden trencher. He has already prepared charcoal, by roasting the root of certain trees in an old cracked pot, and this he grinds down and sprinkles on the lumps of meat on the trencher. Then the army surrounds the trencher, and every one who has slain a foe in the battle steps forth, kneels down before the trencher, and takes out a piece of meat with his mouth, taking care not to touch it or the trencher with his hands. As he takes the meat, the doctor gives him a smart cut with a switch. And when he has eaten that lump of meat his purification is complete. This ceremony is called *Go alafsha dintèè*, or 'the purification of the strikers.' " The writer to whom we owe this description adds: "This taking of meat from the trencher without using the hands is evidently a matter of ritual." The observation is correct. Here as in so many cases persons ceremonially unclean are forbidden to touch food with defiled hands until their uncleanness has been purged away. The same taboo is laid on the manslayer by the Bageshu of British East Africa. Among them a man who has killed another may not return to his own house on the same day, though he may enter the village and spend the night in a friend's house. He kills a sheep and smears his chest, his right arm, and his head with the contents of the animal's stomach. His children are brought to him and he smears them in like manner. Then he smears each side of the doorway with the tripe and entrails, and finally throws the rest of the stomach on the roof of his house. For a whole day he may not touch food with his hands, but picks it up with two sticks and so conveys it to his mouth. His wife is not under any such restrictions. She may even go to mourn for the man whom her

husband has killed, if she wishes to do so. In some Bechuana tribes the victorious warrior is obliged to eat a piece of the skin of the man he killed; the skin is taken from about the navel of his victim, and without it he may not enter the cattle pen. Moreover, the medicine-man makes a gash with a spear in the warrior's thigh for every man he has killed. Among the Angoni, a Zulu tribe settled to the north of the Zambesi, warriors who have slain foes on an expedition smear their bodies and faces with ashes, hang garments of their victims on their persons, and tie bark ropes round their necks, so that the ends hang down over their shoulders or breasts. This costume they wear for three days after their return, and rising at break of day they run through the village uttering frightful yells to drive away the ghosts of the slain, which, if they were not thus banished from the houses, might bring sickness and misfortune on the inmates. In some Caffre tribes of South Africa men who have been wounded or killed an enemy in fight may not see the king nor drink milk till they have been purified. An ox is killed, and its gall, intestines, and other parts are boiled with roots. Of this decoction the men have to take three gulps, and the rest is sprinkled on their bodies. The wounded man has then to take a stick, spit on it thrice, point it thrice at the enemy, and then throw it in his direction. After that he takes an emetic and is declared clean.

In some of these accounts nothing is said of an enforced seclusion, at least after the ceremonial cleansing, but some South African tribes certainly require the slayer of a very gallant foe in war to keep apart from his wife and family for ten days after he has washed his body in running water. He also receives from the tribal doctor a medicine which he chews with his food. When a Nandi of British East Africa has killed a member of another tribe, he paints one side of his body, spear, and sword red, and the other side white. For four days after the slaughter he is considered unclean and may not go home. He has to build a small shelter by a river and live there; he may not associate with his wife or sweetheart, and he may eat nothing but porridge, beef, and goat's flesh. At the end of the fourth day he must purify himself by taking a strong purge made from the bark of the *segetet* tree and by drinking goat's milk mixed with blood. Among the Akikuya of British East Africa all who have shed human blood must be purified. The elders assemble and one of them cuts a strip of hair from above both ears of each manslayer. After that the warriors rub themselves with the dung taken from the stomach of a sheep which has been slaughtered for the occasion. Finally their bodies are cleansed with water. All the hair remaining on their heads is subsequently shaved off by their wives. For a month after the shedding of blood they may have no contact with women. On the contrary, when a Ketosh warrior of British East Africa, who has killed a foe in battle, returns home "it is considered essential that he should have connection with his wife as soon as convenient; this is believed to prevent the spirit of his dead enemy from haunting and bewitching him." An Angoni who has killed a man in battle is obliged to perform certain purificatory ceremonies before he may return to ordinary life. Amongst other things, he must be sure to make an incision in the corpse of his slain foe, in order to let the gases escape and so prevent the body from swelling. If he fails to do so, his own body will swell in proportion as the corpse becomes inflated. Among the Ovambos of southern Africa, when the warriors return to their villages, those who have killed an enemy pass the first night in the open fields, and may not enter their houses until they have been cleansed of the guilt of blood by an older man, who smears them for this purpose with a kind of porridge. Herero warriors on their return from battle may not approach the sacred hearth until they have been purified from the guilt of bloodshed. They crouch in a circle round the hearth, but at some distance from it, while the chief besprinkles their brows and temples with water in which branches of a holy bush have been placed. Again, ancient Herero custom requires that he who has killed a man or a lion should have blood drawn from his breast and upper arm so as to trickle on the ground: a special name (*outoni*) is given to the cuts thus made; they must be made with a flint, not with an iron tool. Among the Bantu tribes of Kavirondo, in eastern Africa, when a

man has killed an enemy in warfare he shaves his head on his return home, and his friends rub a medicine, which generally consists of goat's dung, over his body to prevent the spirit of the slain man from troubling him. Exactly the same custom is practised for the same reason by the Wageia of German East Africa. With the Ja-Luo of Kavirondo the custom is somewhat different. Three days after his return from the fight the warrior shaves his head. But before he may enter his village he has to hang a live fowl, head uppermost, round his neck; then the bird is decapitated and its head left hanging round his neck. Soon after his return a feast is made for the slain man, in order that his ghost may not haunt his slayer. After the slaughter of the Midianites the Israelitish warriors were obliged to remain outside the camp for seven days: whoever had killed a man or touched the slain had to purify himself and his captive. The spoil taken from the enemy had also to be purified, according to its nature, either by fire or water. Similarly among the Basutos cattle taken from the enemy are fumigated with bundles of lighted branches before they are allowed to mingle with the herds of the tribe.

The Arunta of central Australia believe that when a party of men has been out against the enemy and taken a life, the spirit of the slain man follows the party on its return and is constantly on the watch to do a mischief to those of the band who actually shed the blood. It takes the form of a little bird called the *chichurkna*, and may be heard crying like a child in the distance as it flies. If any of the slayers should fail to hear its cry, he would become paralysed in his right arm and shoulder. At night-time especially, when the bird is flying over the camp, the slayers have to lie awake and keep the right arm and shoulder carefully hidden, lest the bird should look down upon and harm them. When once they have heard its cry their minds are at ease, because the spirit of the dead then recognises that he has been detected, and can therefore do no mischief. On their return to their friends, as soon as they come in sight of the main camp, they begin to perform an excited war-dance, approaching in the form of a square and moving their shields as if to ward off something which was being thrown at them. This action is intended to repel the angry spirit of the dead man, who is striving to attack them. Next the men who did the deed of blood separate themselves from the others, and forming a line, with spears at rest and shields held out in front, stand silent and motionless like statues. A number of old women now approach with a sort of exulting skip and strike the shields of the manslayers with fighting-clubs till they ring again. They are followed by men who smite the shields with boomerangs. This striking of the shields is supposed to be a very effective way of frightening away the spirit of the dead man. The natives listen anxiously to the sounds emitted by the shields when they are struck; for if any man's shield gives forth a hollow sound under the blow, that man will not live long, but if it rings sharp and clear, he is safe. For some days after their return the slayers will not speak of what they have done, and continue to paint themselves all over with powdered charcoal, and to decorate their foreheads and noses with green twigs. Finally, they paint their bodies and faces with bright colours, and become free to talk about the affair; but still of nights they must lie awake listening for the plaintive cry of the bird in which they fancy they hear the voice of their victim.

In the Washington group of the Marquesas Islands, the man who has slain an enemy in battle becomes tabooed for ten days, during which he may hold no intercourse with his wife, and may not meddle with fire. Hence another has to make fire and to cook for him. Nevertheless he is treated with marked distinction and receives presents of pigs. In Fiji any one who had clubbed a human being to death in war was consecrated or tabooed. He was smeared red by the king with turmeric from the roots of his hair to his heels. A hut was built, and in it he had to pass the next three nights, during which he might not lie down, but must sleep as he sat. Till the three nights had elapsed he might not change his garment, nor remove the turmeric, nor enter a house in which there was a woman. In the Pelew Islands, when the men return

from a warlike expedition in which they have taken a life, the young warriors who have been out fighting for the first time, and all who handled the slain, are shut up in the large council-house and become tabooed. They may not quit the edifice, nor bathe, nor touch a woman, nor eat fish; their food is limited to coco-nuts and syrup. They rub themselves with charmed leaves and chew charmed betel. After three days they go together to bathe as near as possible to the spot where the man was killed.

When the Tupi Indians of Brazil had made a prisoner in war, they used to bring him home amid great rejoicings, decked with the gorgeous plumage of tropical birds. In the village he was well treated: he received a house and furniture and was married to a wife. When he was thus comfortably installed, the relations and friends of his captor, who had the first pick, came and examined him and decided which of his limbs and joints they proposed to eat; and according to their choice they were bound to provide him with victuals. Thus he might live for months or years, treated like a king, supplied with all the delicacies of the country, and rearing a family of children who, when they were big, might or might not be eaten with their father. While he was thus being fattened like a capon for the slaughter, he wore a necklace of fruit or of fish-bones strung on a cotton thread. This was the measure of his life. For every fruit or every bone on the string he had a month to live; and as each moon waned and vanished they took a fruit or a bone from the necklace. When only one remained, they sent out invitations to friends and neighbours far and near, who flocked in, sometimes to the number of ten or twelve thousand, to witness the spectacle and partake of the feast; for often a number of prisoners were to die the same day, father, mother, and children all together. As a rule they shewed a remarkable stolidity and indifference to death. The club with which they were to be despatched was elaborately prepared by the women, who adorned it with tassels of feathers, smeared it with the pounded shells of a macaw's eggs, and traced lines on the egg-shell powder. Then they hung it to a pole, above the ground, in an empty hut, and sang around it all night. The executioner, who was painted grey with ashes and his whole body covered with the beautiful feathers of parrots and other birds of gay plumage, performed his office by striking the victim on the head from behind and dashing out his brains. No sooner had he despatched the prisoner than he retired to his house, where he had to stay all that day without eating or drinking, while the rest of the people feasted on the body of the victim or victims. And for three days he was obliged to fast and remain in seclusion. All this time he lay in his hammock and might not set foot on the ground; if he had to go anywhere, he was carried by bearers. They thought that, were he to break this rule, some disaster would befall him or he would die. Meantime he was given a small bow and passed his time in shooting arrows into wax. This he did in order to keep his hand and aim steady. In some of the tribes they rubbed the pulse of the executioner with one of the eyes of his victim, and hung the mouth of the murdered man like a bracelet on his arm. Afterwards he made incisions in his breast, arms, and legs, and other parts of his body with a saw made of the teeth of an animal. An ointment and a black powder were then rubbed into the wounds, which left ineffaceable scars so artistically arranged that they presented the appearance of a tightly-fitting garment. It was believed that he would die if he did not thus draw blood from his own body after slaughtering the captive. We may conjecture that the original intention of these customs was to guard the executioner against the angry and dangerous ghosts of his victims.

Among the Natchez of North America young braves who had taken their first scalps were obliged to observe certain rules of abstinence for six months. They might not sleep with their wives nor eat flesh; their only food was fish and hasty-pudding. If they broke these rules, they believed that the soul of the man they had killed would work their death by magic, that they would gain no more successes over the enemy, and that the least wound inflicted on them would prove mortal. When a Choctaw had killed an enemy and taken his scalp, he went into

mourning for a month, during which he might not comb his hair, and if his head itched he might not scratch it except with a little stick which he wore fastened to his wrist for the purpose. This ceremonial mourning for the enemies they had slain was not uncommon among the North American Indians. Thus the Dacotas, when they had killed a foe, unbraided their hair, blackened themselves all over, and wore a small knot of swan's down on the top of the head. "They dress as mourners yet rejoice." A Thompson River Indian of British Columbia, who had slain an enemy, used to blacken his own face, lest his victim's ghost should blind him. When the Osages have mourned over their own dead, "they will mourn for the foe just as if he was a friend." From observing the great respect paid by the Indians to the scalps they had taken, and listening to the mournful songs which they howled to the shades of their victims, Catlin was convinced that "they have a superstitious dread of the spirits of their slain enemies, and many conciliatory offices to perform, to ensure their own peace." When a Pima Indian has killed an Apache, he must undergo purification. Sixteen days he fasts, and only after the fourth day is he allowed to drink a little pinole. During the whole time he may not touch meat nor salt, nor look on a blazing fire, nor speak to a human being. He lives alone in the woods, waited on by an old woman, who brings him his scanty dole of food. He bathes often in a river, and keeps his head covered almost the whole time with a plaster of mud. On the seventeenth day a large space is cleared near the village and a fire lit in the middle of it. The men of the tribe form a circle round the fire, and outside of it sit all the warriors who have just been purified, each in a small excavation. Some of the old men then take the weapons of the purified and dance with them in the circle, after which both the slayer and his weapon are considered clean; but not until four days later is the man allowed to return to his family. No doubt the peace enforced by the government of the United States has, along with tribal warfare, abolished also these quaint customs. A fuller account of them has been given by a recent writer, and it deserves to be quoted at length. "There was no law among the Pimas," he says, "observed with greater strictness than that which required purification and expiation for the deed that was at the same time the most lauded—the killing of an enemy. For sixteen days the warrior fasted in seclusion and observed meanwhile a number of tabus.... Attended by an old man, the warrior who had to expiate the crime of blood guilt retired to the groves along the river bottom at some distance from the villages or wandered about the adjoining hills. During the period of sixteen days he was not allowed to touch his head with his fingers or his hair would turn white. If he touched his face it would become wrinkled. He kept a stick to scratch his head with, and at the end of every four days this stick was buried at the root and on the west side of a cat's claw tree and a new stick was made of greasewood, arrow bush, or any other convenient shrub. He then bathed in the river, no matter how cold the temperature. The feast of victory which his friends were observing in the meantime at the village lasted eight days. At the end of that time, or when his period of retirement was half-completed, the warrior might go to his home to get a fetish made from the hair of the Apache whom he had killed. The hair was wrapped in eagle down and tied with a cotton string and kept in a long medicine basket. He drank no water for the first two days and fasted for the first four. After that time he was supplied with pinole by his attendant, who also instructed him as to his future conduct, telling him that he must henceforth stand back until all others were served when partaking of food and drink. If he was a married man his wife was not allowed to eat salt during his retirement, else she would suffer from the owl disease which causes stiff limbs. The explanation offered for the observance of this law of lustration is that if it is not obeyed the warrior's limbs will become stiffened or paralyzed." The Apaches, the enemies of the Pimas, purify themselves for the slaughter of their foes by means of baths in the sweat-house, singing, and other rites. These ceremonies they perform for all the dead simultaneously after their return home; but the Pimas, more punctilious on this point, resort to their elaborate ceremonies of purification the moment a single one of their own band or of the

enemy has been laid low. How heavily these religious scruples must have told against the Pimas in their wars with their ferocious enemies is obvious enough. "This long period of retirement immediately after a battle," says an American writer, "greatly diminished the value of the Pimas as scouts and allies for the United States troops operating against the Apaches. The bravery of the Pimas was praised by all army officers having any experience with them, but Captain Bourke and others have complained of their unreliability, due solely to their rigid observance of this religious law." In nothing, perhaps, is the penalty which superstition sooner or later entails on its devotees more prompt and crushing than in the operations of war.

Far away from the torrid home of the Pima and Apaches, an old traveller witnessed ceremonies of the same sort practised near the Arctic Circle by some Indians who had surprised and brutally massacred an unoffending and helpless party of Esquimaux. His description is so interesting that I will quote it in full. "Among the various superstitious customs of those people, it is worth remarking, and ought to have been mentioned in its proper place, that immediately after my companions had killed the Esquimaux at the Copper River, they considered themselves in a state of uncleanness, which induced them to practise some very curious and unusual ceremonies. In the first place, all who were absolutely concerned in the murder were prohibited from cooking any kind of victuals, either for themselves or others. As luckily there were two in company who had not shed blood, they were employed always as cooks till we joined the women. This circumstance was exceedingly favourable on my side; for had there been no persons of the above description in company, that task, I was told, would have fallen on me; which would have been no less fatiguing and troublesome, than humiliating and vexatious. When the victuals were cooked, all the murderers took a kind of red earth, or oker, and painted all the space between the nose and chin, as well as the greater part of their cheeks, almost to the ears, before they would taste a bit, and would not drink out of any other dish, or smoke out of any other pipe, but their own; and none of the others seemed willing to drink or smoke out of theirs. We had no sooner joined the women, at our return from the expedition, than there seemed to be an universal spirit of emulation among them, vying who should first make a suit of ornaments for their husbands, which consisted of bracelets for the wrists, and a band for the forehead, composed of porcupine quills and moose-hair, curiously wrought on leather. The custom of painting the mouth and part of the cheeks before each meal, and drinking and smoking out of their own utensils, was strictly and invariably observed, till the winter began to set in; and during the whole of that time they would never kiss any of their wives or children. They refrained also from eating many parts of the deer and other animals, particularly the head, entrails, and blood; and during their uncleanness, their victuals were never sodden in water, but dried in the sun, eaten quite raw, or broiled, when a fire fit for the purpose could be procured. When the time arrived that was to put an end to these ceremonies, the men, without a female being present, made a fire at some distance from the tents, into which they threw all their ornaments, pipe-stems, and dishes, which were soon consumed to ashes; after which a feast was prepared, consisting of such articles as they had long been prohibited from eating; and when all was over, each man was at liberty to eat, drink, and smoke as he pleased; and also to kiss his wives and children at discretion, which they seemed to do with more raptures than I had ever known them do it either before or since."

Thus we see that warriors who have taken the life of a foe in battle are temporarily cut off from free intercourse with their fellows, and especially with their wives, and must undergo certain rites of purification before they are readmitted to society. Now if the purpose of their seclusion and of the expiatory rites which they have to perform is, as we have been led to believe, no other than to shake off, frighten, or appease the angry spirit of the slain man, we

may safely conjecture that the similar purification of homicides and murderers, who have imbrued their hands in the blood of a fellow-tribesman, had at first the same significance, and that the idea of a moral or spiritual regeneration symbolised by the washing, the fasting, and so on, was merely a later interpretation put upon the old custom by men who had outgrown the primitive modes of thought in which the custom originated. The conjecture will be confirmed if we can shew that savages have actually imposed certain restrictions on the murderer of a fellow-tribesman from a definite fear that he is haunted by the ghost of his victim. This we can do with regard to the Omahas, a tribe of the Siouan stock in North America. Among these Indians the kinsmen of a murdered man had the right to put the murderer to death, but sometimes they waived their right in consideration of presents which they consented to accept. When the life of the murderer was spared, he had to observe certain stringent rules for a period which varied from two to four years. He must walk barefoot, and he might eat no warm food, nor raise his voice, nor look around. He was compelled to pull his robe about him and to have it tied at the neck even in hot weather; he might not let it hang loose or fly open. He might not move his hands about, but had to keep them close to his body. He might not comb his hair and it might not be blown about by the wind. When the tribe went out hunting, he was obliged to pitch his tent about a quarter of a mile from the rest of the people "lest the ghost of his victim should raise a high wind, which might cause damage." Only one of his kindred was allowed to remain with him at his tent. No one wished to eat with him, for they said, "If we eat with him whom Wakanda hates Wakanda will hate us." Sometimes he wandered at night crying and lamenting his offence. At the end of his long isolation the kinsmen of the murdered man heard his crying and said, "It is enough. Begone, and walk among the crowd. Put on moccasins and wear a good robe." Here the reason alleged for keeping the murderer at a considerable distance from the hunters gives the clue to all the other restrictions laid on him: he was haunted and therefore dangerous. The ancient Greeks believed that the soul of a man who had just been killed was wroth with his slayer and troubled him; wherefore it was needful even for the involuntary homicide to depart from his country for a year until the anger of the dead man had cooled down; nor might the slayer return until sacrifice had been offered and ceremonies of purification performed. If his victim chanced to be a foreigner, the homicide had to shun the native country of the dead man as well as his own. The legend of the matricide Orestes, how he roamed from place to place pursued by the Furies of his murdered mother, and none would sit at meat with him, or take him in, till he had been purified, reflects faithfully the real Greek dread of such as were still haunted by an angry ghost. When the turbulent people of Cynaetha, after perpetrating an atrocious massacre, sent an embassy to Sparta, every Arcadian town through which the envoys passed on their journey ordered them out of its walls at once; and the Mantineans, after the embassy had departed, even instituted a solemn purification of the city and its territory by carrying sacrificial victims round them both.

Among the Kwakiutl Indians of British Columbia, men who have partaken of human flesh as a ceremonial rite are subject for a long time afterwards to many restrictions or taboos of the sort we have been dealing with. They may not touch their wives for a whole year; and during the same time they are forbidden to work or gamble. For four months they must live alone in their bedrooms, and when they are obliged to quit the house for a necessary purpose, they may not go out at the ordinary door, but must use only the secret door in the rear of the house. On such occasions each of them is attended by all the rest, carrying small sticks. They must all sit down together on a long log, then get up, then sit down again, repeating this three times before they are allowed to remain seated. Before they rise they must turn round four times. Then they go back to the house. Before entering they must raise their feet four times; with the fourth step they really pass the door, taking care to enter with the right foot foremost. In the doorway they turn four times and walk slowly into the house. They are not permitted to look

back. During the four months of their seclusion each man in eating must use a spoon, dish, and kettle of his own, which are thrown away at the end of the period. Before he draws water from a bucket or a brook, he must dip his cup into it thrice; and he may not take more than four mouthfuls at one time. He must carry a wing-bone of an eagle and drink through it, for his lips may not touch the brim of his cup. Also he keeps a copper nail to scratch his head with, for were his own nails to touch his own skin they would drop off. For sixteen days after he has partaken of human flesh he may not eat any warm food, and for the whole of the four months he is forbidden to cool hot food by blowing on it with his breath. At the end of winter, when the season of ceremonies is over, he feigns to have forgotten the ordinary ways of men, and has to learn everything anew. The reason for these remarkable restrictions imposed on men who have eaten human flesh is not stated; but we may surmise that fear of the ghost of the man whose body was eaten has at least a good deal to do with them. We are confirmed in our conjecture by observing that though these cannibals sometimes content themselves with taking bites out of living people, the rules in question are especially obligatory on them after they have devoured a corpse. Moreover, the careful treatment of the bones of the victim points to the same conclusion; for during the four months of seclusion observed by the cannibals, the bones of the person on whom they feasted are kept alternately for four days at a time under rocks in the sea and in their bedrooms on the north side of the house, where the sun cannot shine on them. Finally the bones are taken out of the house, tied up, weighted with a stone, and thrown into deep water, "because it is believed that if they were buried they would come back and take their master's soul." This seems to mean that if the bones of the victim were buried, his ghost would come back and fetch away the souls of the men who had eaten his body. The Gebars, a cannibal tribe in the north of New Guinea, are much afraid of the spirit of a slain man or woman. Among them persons who have partaken of human flesh for the first time reside for a month afterwards in a small hut and may not enter the dwelling-house.

§ 6. Hunters and Fishers tabooed.

In savage society the hunter and the fisherman have often to observe rules of abstinence and to submit to ceremonies of purification of the same sort as those which are obligatory on the warrior and the manslayer; and though we cannot in all cases perceive the exact purpose which these rules and ceremonies are supposed to serve, we may with some probability assume that, just as the dread of the spirits of his enemies is the main motive for the seclusion and purification of the warrior who hopes to take or has already taken their lives, so the huntsman or fisherman who complies with similar customs is principally actuated by a fear of the spirits of the beasts, birds, or fish which he has killed or intends to kill. For the savage commonly conceives animals to be endowed with souls and intelligences like his own, and hence he naturally treats them with similar respect. Just as he attempts to appease the ghosts of the men he has slain, so he essays to propitiate the spirits of the animals he has killed. These ceremonies of propitiation will be described later on in this work; here we have to deal, first, with the taboos observed by the hunter and the fisherman before or during the hunting and fishing seasons, and, second, with the ceremonies of purification which have to be practised by these men on returning with their booty from a successful chase.

While the savage respects, more or less, the souls of all animals, he treats with particular deference the spirits of such as are either especially useful to him or formidable on account of their size, strength, or ferocity. Accordingly the hunting and killing of these valuable or dangerous beasts are subject to more elaborate rules and ceremonies than the slaughter of comparatively useless and insignificant creatures. Thus the Indians of Nootka Sound prepared themselves for catching whales by observing a fast for a week, during which they ate very little, bathed in the water several times a day, sang, and rubbed their bodies, limbs, and faces

with shells and bushes till they looked as if they had been severely torn with briars. They were likewise required to abstain from any commerce with their women for the like period, this last condition being considered indispensable to their success. A chief who failed to catch a whale has been known to attribute his failure to a breach of chastity on the part of his men. It should be remarked that the conduct thus prescribed as a preparation for whaling is precisely that which in the same tribe of Indians was required of men about to go on the war-path. Rules of the same sort are, or were formerly, observed by Malagasy whalers. For eight days before they went to sea the crew of a whaler used to fast, abstaining from women and liquor, and confessing their most secret faults to each other; and if any man was found to have sinned deeply he was forbidden to share in the expedition. In the island of Kadiak, off the south coast of Alaska, whalers were reckoned unclean during the fishing season, and nobody would eat out of the same dish with them or even come near them. Yet we are told that great respect was paid to them, and that they were regarded as the purveyors of their country. Though it is not expressly said it seems to be implied, and on the strength of analogy we may assume, that these Kadiak whalers had to remain chaste so long as the whaling season lasted. In the island of Mabuiag continence was imposed on the people both before they went to hunt the dugong and while the turtles were pairing. The turtle-season lasts during parts of October and November; and if at that time unmarried persons had sexual intercourse with each other, it was believed that when the canoe approached the floating turtle, the male would separate from the female and both would dive down in different directions. So at Mowat in New Guinea men have no relation with women when the turtle are coupling, though there is considerable laxity of morals at other times. Among the Motu of Port Moresby, in New Guinea, chastity is enjoined before fishing and wallaby-hunting; they believe that men who have been unchaste will be unable to catch the fish and the wallabies, which will turn round and jeer at their pursuers. Among the tribes about the mouth of the Wanigela River in New Guinea the preparations for fishing turtle and dugong are most elaborate. They begin two months before the fishing. A headman is appointed who becomes holy. On his strict observance of the laws of the dugong net depends the success of the season. While the men of the village are making the nets, this sanctified leader lives entirely secluded from his family, and may only eat a roasted banana or two after the sun has gone down. Every evening at sundown he goes ashore and, stripping himself of all his ornaments, which he is never allowed to doff at other times, bathes near where the dugongs feed; as he does so he throws scraped coco-nut and scented herbs and gums into the water to charm the dugong. Among the Roro-speaking tribes of British New Guinea the magician who performs ceremonies for the success of a wallaby hunt must abstain from intercourse with his wife for a month before the hunt takes place; and he may not eat food cooked by his wife or by any other woman. In the island of Uap, one of the Caroline group, every fisherman plying his craft lies under a most strict taboo during the whole of the fishing season, which lasts for six or eight weeks. Whenever he is on shore he must spend all his time in the men's clubhouse (*failu*), and under no pretext whatever may he visit his own house or so much as look upon the faces of his wife and womenkind. Were he but to steal a glance at them, they think that flying fish must inevitably bore out his eyes at night. If his wife, mother, or daughter brings any gift for him or wishes to talk with him, she must stand down towards the shore with her back turned to the men's clubhouse. Then the fisherman may go out and speak to her, or with his back turned to her he may receive what she has brought him; after which he must return at once to his rigorous confinement. Indeed the fishermen may not even join in dance and song with the other men of the clubhouse in the evening; they must keep to themselves and be silent. In the Pelew Islands, also, which belong to the Caroline group, fishermen are likewise debarred from intercourse with women, since it is believed that any such intercourse would infallibly have a prejudicial effect on the fishing. The same taboo is said to be observed in all

the other islands of the South Sea. In Mirzapur, when the seed of the silkworm is brought into the house, the Kol or Bhuiyar puts it in a place which has been carefully plastered with holy cow-dung to bring good luck. From that time the owner must be careful to avoid ceremonial impurity. He must give up cohabitation with his wife; he may not sleep on a bed, nor shave himself, nor cut his nails, nor anoint himself with oil, nor eat food cooked with butter, nor tell lies, nor do anything else that he deems wrong. He vows to Singarmati Devi that if the worms are duly born he will make her an offering. When the cocoons open and the worms appear, he assembles the women of the house and they sing the same song as at the birth of a baby, and red lead is smeared on the parting of the hair of all the married women of the neighbourhood. When the worms pair, rejoicings are made as at a marriage. Thus the silkworms are treated as far as possible like human beings. Hence the custom which prohibits the commerce of the sexes while the worms are hatching may be only an extension, by analogy, of the rule which is observed by many races, that the husband may not cohabit with his wife during pregnancy and lactation.

On Lake Victoria Nyanza the Baganda fishermen use a long stout line which is supported on the surface of the water by wooden floats, while short lines with baited hooks attached to them depend from it at frequent intervals. The place where the fisherman makes his line, whether in his hut or his garden, is tabooed. People may not step over his cords or tools, and he himself has to observe a number of restrictions. He may not go near his wife or any other woman. He eats alone, works alone, sleeps alone. He may not wash, except in the lake. He may not eat salt or meat or butter. He may not smear any fat on his body. When the line is ready he goes to the god, asks his blessing on it, and offers him a pot of beer. In return he receives from the deity a stick or bit of wood to fasten to the line, and also some medicine of herbs to smoke and blow over the water in order that the fish may come to the line and be caught. Then he carries the line to the lake. If in going thither he should stumble over a stone or a tree-root, he takes it with him, and he does the same with any grass-seeds that may stick to his clothes. These stones, roots, and seeds he puts on the line, believing that just as he stumbled over them and they stuck to him, so the fish will also stumble over them and stick to the line. The taboo lasts till he has caught his first fish. If his wife has kept the taboo, he eats the fish with her; but if she has broken it, she may not partake of the fish. After that if he wishes to go in to his wife, he must take his line out of the water and place it in a tree or some other place of safety; he is then free to be with her. But so long as the line is in the water, he must keep apart from women, or the fish would at once leave the shore. Any breach of this taboo renders the line useless to him. He must sell it and make a new one and offer an expiatory offering to the god. Again, in Uganda the fisherman offers fish to his canoe, believing that if he neglected to make this offering more than twice, his net would catch nothing. The fish thus offered to the canoe is eaten by the fishermen. But if at the time of emptying the traps there is any man in the canoe who has committed adultery, eaten flesh or salt, or rubbed his body with butter or fat, that man is not allowed to partake of the fish offered to the canoe. And if the sinner has not confessed his fault to the priest and been purified, the catch will be small. When the adulterer has confessed his sin, the priest calls the husband of the guilty woman and tells him of her crime. Her paramour has to wear a sign to shew that he is doing penance, and he makes a feast for the injured husband, which the latter is obliged to accept in token of reconciliation. After that the husband may not punish either of the erring couple; the sin is atoned for and they are able to catch fish again. Among the Bangala of the Upper Congo, while fishermen are making their traps, they must observe strict continence, and the restriction lasts until the traps have caught fish and the fish have been eaten. Similarly Bangala hunters may have no sexual intercourse from the time they made their traps till they have caught game and eaten it; it is believed that any hunter who broke this rule of chastity would have bad luck in the chase.

In the island of Nias the hunters sometimes dig pits, cover them lightly over with twigs, grass, and leaves, and then drive the game into them. While they are engaged in digging the pits, they have to observe a number of taboos. They may not spit, or the game would turn back in disgust from the pits. They may not laugh, or the sides of the pit would fall in. They may eat no salt, prepare no fodder for swine, and in the pit they may not scratch themselves, for if they did, the earth would be loosened and would collapse. And the night after digging the pit they may have no intercourse with a woman, or all their labour would be in vain.

This practice of observing strict chastity as a condition of success in hunting and fishing is very common among rude races; and the instances of it which have been cited render it probable that the rule is always based on a superstition rather than on a consideration of the temporary weakness which a breach of the custom may entail on the hunter or fisherman. In general it appears to be supposed that the evil effect of incontinence is not so much that it weakens him, as that, for some reason or other, it offends the animals, who in consequence will not suffer themselves to be caught. In the Motumotu tribe of New Guinea a man will not see his wife the night before he starts on a great fishing or hunting expedition; if he did, he would have no luck. In the Motu tribe he is regarded as holy that night, and in the morning no one may speak to him or call out his name. In German East Africa elephant hunters must refrain from women for several days before they set out for the chase. We have seen that in the same region a wife's infidelity during the hunter's absence is believed to give the elephant power over him so as to kill or wound him. As this belief is clearly a superstition, based on sympathetic magic, so doubtless is the practice of chastity before the hunt. The pygmies of the great African forest are also reported to observe strict continence the night before an important hunt. It is said that at this time they propitiate their ancestors by rubbing their skulls, which they keep in boxes, with palm oil and with water in which the ashes of the bark and leaves of a certain tree (*moduma*) have been mixed.

The Huichol Indians of Mexico think that only the pure of heart should hunt the deer. The deer would never enter a snare put up by a man in love; it would only look at it, snort "Pooh, pooh," and go back the way it came. Good luck in love means bad luck in deer-hunting. But even those who have been abstinent must invoke the aid of the fire to burn the last taint or blemish out of them. So the night before they set out for the chase they gather round the fire and pray aloud, all trying to get as near as they can to the flaming god, and turning every side of their bodies to his blessed influence. They hold out their open hands to it, warm the palms, spit on them, and then rub them quickly over their joints, legs, and shoulders, as the shamans do in curing a sick man, in order that their limbs and sinews may be as strong as their hearts are pure for the task of the morrow. A Carrier Indian of British Columbia used to separate from his wife for a full month before he set traps for bears, and during this time he might not drink from the same vessel as his wife, but had to use a special cup made of birch bark. The neglect of these precautions would cause the game to escape after it had been snared. But when he was about to snare martens, the period of continence was cut down to ten days. The Sia, a tribe of Pueblo Indians, observe chastity for four days before a hunt as well as the whole time that it lasts, even if the game be only rabbits. Among the Tsetsaut Indians of British Columbia hunters who desire to secure good luck fast and wash their bodies with ginger-root for three or four days, and do not touch a woman for two or three months. A Shuswap Indian, who intends to go out hunting must also keep away from his wife, or he would have no luck. Among the Thompson Indians the grisly-bear hunter must abstain from sexual intercourse for some time before he went forth to hunt. These Indians believe that bears always hear what is said of them. Hence a man who intends to go bear-hunting must be very careful what he says about the beasts or about his preparations for killing them, or they will get wind of it and keep out of his way. In the same tribe of Indians some trappers and

hunters, who were very particular, would not eat with other people when they were engaged, or about to be engaged, in hunting or trapping; neither would they eat food cooked by any woman, unless she were old. They drank cold water in which mountain juniper or wild rhubarb had been soaked, using a cup of their own, which no one else might touch. Hunters seldom combed their hair when they were on an expedition, but waited to do so till their return. The reason for this last rule is certainly not that at such seasons they have no time to attend to their persons; the custom is probably based on that superstitious objection to touch the heads of tabooed persons of which some examples have already been given, and of which more will be adduced shortly.

In the late autumn or early winter a few families of the Hidatsa Indians seek some quiet spot in the forest and pitch their camp there to catch eagles. After setting up their tents they build a small medicine-lodge, where the ceremonies supposed to be indispensable for trapping the eagles are performed. No woman may enter it. The traps are set on high places among the neighbouring hills. When some of the men wish to take part in the trapping, they fast and then go by day to the medicine-lodge. There they continue without food until about midnight, when they partake of a little nourishment and fall asleep. They get up just before dawn, or when the morning-star has risen, and go to their traps. There they sit all day without food or drink, watching for their prey, and struggling, it may be, from time to time with a captive eagle, for they always take the birds alive. They return to the camp at sunset. As they approach, every one rushes into his tent; for the hunter may neither see nor be seen by any of his fellow-hunters until he enters the medicine-lodge. They spend the night in the lodge, and about midnight eat and drink for the first time since the previous midnight; then they lie down to sleep, only to rise again before dawn and repair anew to the traps. If any one of them has caught nothing during the day, he may not sleep at night, but must spend his time in loud lamentation and prayer. This routine has to be observed by each hunter for four days and four nights, after which he returns to his own tent, hungry, thirsty, and tired, and follows his ordinary pursuits till he feels able to go again to the eagle-traps. During the four days of the trapping he sees none of his family, and speaks to none of his friends except those who are engaged in the trapping at the same time. They believe that if any hunter fails to perform all these rites, the captive eagle will get one of his claws loose and tear his captor's hands. There are men in the tribe who have had their hands crippled for life in that way. It is obvious that the severe fasting coupled with the short sleep, or even the total sleeplessness, of these eagle-hunters can only impair their physical vigour and so far tend to incapacitate them for capturing the eagles. The motive of their behaviour in these respects is purely superstitious, not rational, and so, we may safely conclude, is the custom which simultaneously cuts them off from all intercourse with their wives and families.

An examination of all the many cases in which the savage bridles his passions and remains chaste from motives of superstition, would be instructive, but I cannot attempt it now. I will only add a few miscellaneous examples of the custom before passing to the ceremonies of purification which are observed by the hunter and fisherman after the chase and the fishing are over. The workers in the salt-pans near Siphoum, in Laos, must abstain from all sexual relations at the place where they are at work; and they may not cover their heads nor shelter themselves under an umbrella from the burning rays of the sun. Among the Kachins of Burma the ferment used in making beer is prepared by two women, chosen by lot, who during the three days that the process lasts may eat nothing acid and may have no conjugal relations with their husbands; otherwise it is supposed that the beer would be sour. Among the Masai honey-wine is brewed by a man and a woman who live in a hut set apart for them till the wine is ready for drinking. But they are strictly forbidden to have sexual intercourse with each other during this time; it is deemed essential that they should be chaste for two

days before they begin to brew and for the whole of the six days that the brewing lasts. The Masai believe that were the couple to commit a breach of chastity, not only would the wine be undrinkable but the bees which made the honey would fly away. Similarly they require that a man who is making poison should sleep alone and observe other taboos which render him almost an outcast. The Wandorobbo, a tribe of the same region as the Masai, believe that the mere presence of a woman in the neighbourhood of a man who is brewing poison would deprive the poison of its venom, and that the same thing would happen if the wife of the poison-maker were to commit adultery while her husband was brewing the poison. In this last case it is obvious that a rationalistic explanation of the taboo is impossible. How could the loss of virtue in the poison be a physical consequence of the loss of virtue in the poison-maker's wife? Clearly the effect which the wife's adultery is supposed to have on the poison is a case of sympathetic magic; her misconduct sympathetically affects her husband and his work at a distance. We may, accordingly, infer with some confidence that the rule of continence imposed on the poison-maker himself is also a simple case of sympathetic magic, and not, as a civilised reader might be disposed to conjecture, a wise precaution designed to prevent him from accidentally poisoning his wife. Again, to take other instances, in the East Indian island of Buru people smear their bodies with coco-nut oil as a protection against demons. But in order that the charm may be effective, the oil must have been made by young unmarried girls. In the Seranglao and Gorong archipelagoes the same oil is regarded as an antidote to poison; but it only possesses this virtue if the nuts have been gathered on a Friday by a youth who has never known a woman, and if the oil has been extracted by a pure maiden, while a priest recited the appropriate spells. So in the Marquesas Islands, when a woman was making coco-nut oil, she was tabooed for four or five or more days, during which she might have no intercourse with her husband. If she broke this rule, it was believed that she would obtain no oil. In the same islands when a man had placed a dish of bananas and coco-nuts in an oven of hot stones to bake over night, he might not go in to his wife, or the food would not be found baked in the morning. In ancient Mexico the men who distilled the wine known as *pulque* from the sap of the great aloe, might not touch a woman for four days; if they were unchaste, they thought the wine would be sour and putrid.

Among the Ba-Pedi and Ba-thonga tribes of South Africa, when the site of a new village has been chosen and the houses are building, all the married people are forbidden to have conjugal relations with each other. If it were discovered that any couple had broken this rule, the work of building would immediately be stopped, and another site chosen for the village. For they think that a breach of chastity would spoil the village which was growing up, that the chief would grow lean and perhaps die, and that the guilty woman would never bear another child. Among the Chams of Cochin-China, when a dam is made or repaired on a river for the sake of irrigation, the chief who offers the traditional sacrifices and implores the protection of the deities on the work, has to stay all the time in a wretched hovel of straw, taking no part in the labour, and observing the strictest continence; for the people believe that a breach of his chastity would entail a breach of the dam. Here, it is plain, there can be no idea of maintaining the mere bodily vigour of the chief for the accomplishment of a task in which he does not even bear a hand. In New Caledonia the wizard who performs certain superstitious ceremonies at the building and launching of a large canoe is bound to the most rigorous chastity the whole time that the vessel is on the stocks. Among the natives of the Gazelle Peninsula in New Britain men who are engaged in making fish-traps avoid women and observe strict continence. They believe that if a woman were even to touch a fish-trap, it would catch nothing. Here, therefore, the rule of continence probably springs from a fear of infecting sympathetically the traps with feminine weakness or perhaps with menstrual pollution. Every year at the end of September or the beginning of October, when the north-east monsoon is near an end, a fleet of large sailing canoes leaves Port Moresby and the

neighbouring Motu villages of New Guinea on a trading voyage to the deltas of the rivers which flow into the Papuan Gulf. The canoes are laden with a cargo of earthenware pots, and after about three months they return, sailing before the north-west monsoon and bringing back a cargo of sago which they have obtained by barter for their crockery. It is about the beginning of the south-east monsoon, that is, in April or May, that the skippers, who are leading men in the villages, make up their minds to go on these trading voyages. When their resolution is taken they communicate it to their wives, and from about that time husband and wife cease to cohabit. The same custom of conjugal separation is observed by what we may call the mate or second in command of each vessel. But it is not till the month of August that the work of preparing the canoes for sea by overhauling and caulking them is taken seriously in hand. From that time both skipper and mate become particularly sacred or taboo (*helaga*), and consequently they keep apart from their wives more than ever. Husband and wife, indeed, sleep in the same house but on opposite sides of it. In speaking of his wife he calls her "maiden," and she calls him "youth." They have no direct conversation or dealings with each other. If he wishes to communicate with her, he does so through a third person, usually a relative of one of them. Both refrain from washing themselves, and he from combing his hair. "The wife's position indeed becomes very much like that of a widow." When the canoe has been launched, skipper, mate, and crew are all forbidden to touch their food with their fingers; they must always handle it and convey it to their mouths with a bone fork. A briefer account of the custom and superstition had previously been given by a native pastor settled in the neighbourhood of Port Moresby. He says: "Here is a custom of trading-voyage parties:— If it is arranged to go westward, to procure arrowroot, the leader of the party sleeps apart from his wife for the time being, and on until the return from the expedition, which is sometimes a term of five months. They say if this is not done the canoe of the chief will be sunk on the return voyage, all the arrowroot lost in the sea, and he himself covered with shame. He, however, who observes the rule of self-denial, returns laden with arrowroot, has not a drop of salt water to injure his cargo, and so is praised by his companions and crew." The Akamba and Akikuyu of eastern Africa refrain from the commerce of the sexes on a journey, even if their wives are with them in the caravan; and they observe the same rule of chastity so long as the cattle are at pasture, that is, from the time the herds are driven out to graze in the morning till they come back in the evening. Why the rule should be in force just while the cattle are at pasture is not said, but we may conjecture that any act of incontinence at that time is somehow supposed, on the principles of sympathetic magic, to affect the animals injuriously. The conjecture is confirmed by the observation that among the Akikuyu for eight days after the quarterly festivals, which they hold for the sake of securing God's blessing on their flocks and herds, no commerce is permitted between the sexes. They think that any breach of continence in these eight days would be followed by a mortality among the flocks.

If the taboos or abstinences observed by hunters and fishermen before and during the chase are dictated, as we have seen reason to believe, by superstitious motives, and chiefly by a dread of offending or frightening the spirits of the creatures whom it is proposed to kill, we may expect that the restraints imposed after the slaughter has been perpetrated will be at least as stringent, the slayer and his friends having now the added fear of the angry ghosts of his victims before their eyes. Whereas on the hypothesis that the abstinences in question, including those from food, drink, and sleep, are merely salutary precautions for maintaining the men in health and strength to do their work, it is obvious that the observance of these abstinences or taboos after the work is done, that is, when the game is killed and the fish caught, must be wholly superfluous, absurd, and inexplicable. But as I shall now shew, these taboos often continue to be enforced or even increased in stringency after the death of the animals, in other words, after the hunter or fisher has accomplished his object by making his

bag or landing his fish. The rationalistic theory of them therefore breaks down entirely; the hypothesis of superstition is clearly the only one open to us.

Among the Inuit or Esquimaux of Bering Strait "the dead bodies of various animals must be treated very carefully by the hunter who obtains them, so that their shades may not be offended and bring bad luck or even death upon him or his people." Hence the Unalit hunter who has had a hand in the killing of a white whale, or even has helped to take one from the net, is not allowed to do any work for the next four days, that being the time during which the shade or ghost of the whale is supposed to stay with its body. At the same time no one in the village may use any sharp or pointed instrument for fear of wounding the whale's shade, which is believed to be hovering invisible in the neighbourhood; and no loud noise may be made lest it should frighten or offend the ghost. Whoever cuts a whale's body with an iron axe will die. Indeed the use of all iron instruments is forbidden in the village during these four days. These Inuit have a special name (*nu-na hlukh-tuk*) "for a spot of ground where certain things are tabooed, or where there is to be feared any evil influence caused by the presence of offended shades of men or animals, or through the influence of other supernatural means. This ground is sometimes considered unclean, and to go upon it would bring misfortune to the offender, producing sickness, death, or lack of success in hunting or fishing. The same term is also applied to ground where certain animals have been killed or have died." In the latter case the ground is thought to be dangerous only to him who there performs some forbidden act. For example, the shore where a dead white whale has been beached is so regarded. At such a place and time to chop wood with an iron axe is supposed to be fatal to the imprudent person who chops. Death, too, is supposed to result from cutting wood with an iron axe where salmon are being dressed. An old man at St. Michael told Mr. Nelson of a melancholy case of this kind which had fallen within the scope of his own observation. A man began to chop a log near a woman who was splitting salmon: both of them died soon afterwards. The reason of this disaster, as the old man explained, was that the shade or ghost (*inua*) of the salmon and the spirit or mystery (*yu-a*) of the ground were incensed at the proceeding. Such offences are indeed fatal to every person who may be present at the desecrated spot. Dogs are regarded as very unclean and offensive to the shades of game animals, and great care is taken that no dog shall get at the bones of a white whale. Should a dog touch one of them, the hunter might lose his luck; his nets would break or be shunned by the whales, and his spears would not strike. But in addition to the state of uncleanness or taboo which arises from the presence of the shades of men or animals, these Esquimaux believe in uncleanness of another sort which, though not so serious, nevertheless produces sickness or bad luck in hunting. It consists, we are told, of a kind of invisible, impalpable vapour, which may attach itself to a person from some contamination. A hunter infected by such a vapour is much more than usually visible to game, so that his luck in the chase is gone until he succeeds in cleansing himself once more. That is why hunters must avoid menstruous women; if they do not, they will be unable to catch game.

These same Esquimaux of Bering Strait celebrate a great annual festival in December, when the bladders of all the seals, whales, walrus, and white bears that have been killed in the year are taken into the assembly-house of the village. They remain there for several days, and so long as they do so the hunters avoid all intercourse with women, saying that if they failed in that respect the shades of the dead animals would be offended. Similarly among the Aleuts of Alaska the hunter who had struck a whale with a charmed spear would not throw again, but returned at once to his home and separated himself from his people in a hut specially constructed for the purpose, where he stayed for three days without food or drink, and without touching or looking upon a woman. During this time of seclusion he snorted occasionally in imitation of the wounded and dying whale, in order to prevent the whale

which he had struck from leaving the coast. On the fourth day he emerged from his seclusion and bathed in the sea, shrieking in a hoarse voice and beating the water with his hands. Then, taking with him a companion, he repaired to that part of the shore where he expected to find the whale stranded. If the beast was dead he at once cut out the place where the death-wound had been inflicted. If the whale was not dead, he again returned to his home and continued washing himself until the whale died. Here the hunter's imitation of the wounded whale is probably intended by means of homoeopathic magic to make the beast die in earnest. Among the Kaniagnuts of Alaska the men who attacked the whale were considered by their countrymen as unclean during the fishing season, though otherwise they were held in high honour.

The central Esquimaux of Baffin Land and Hudson Bay think that whales, ground seals, and common seals originated in the severed fingers of the goddess Sedna. Hence an Esquimau of these regions must make atonement for each of these animals that he kills, and must observe strictly certain taboos after their slaughter. Some of the rules of conduct thus enjoined are identical with those which are in force after the death of a human being. Thus after the killing of one of these sea-mammals, as after the decease of a person, it is forbidden to scrape the frost from the window, to shake the bed or to disturb the shrubs under the bed, to remove the drippings of oil from under the lamp, to scrape hair from skins, to cut snow for the purpose of melting it, to work on iron, wood, stone, or ivory. Furthermore, women are forbidden to comb their hair, to wash their faces, and to dry their boots and stockings. All these regulations must be kept with the greatest care after a ground seal has been killed, because the transgression of taboos that refer to this animal makes the hands of Sedna very sore. When a seal is brought into the hut, the women must stop working until it is cut up. After the capture of a ground seal, walrus, or whale, they must rest for three days. Not all kinds of work, however, are forbidden; they may mend articles made of sealskin, but they may not make anything new. Working on the new skins of caribou, the American reindeer, is strictly prohibited; for a series of rules forbids all contact between that animal and the sea-mammals. Thus reindeer-skins obtained in summer may not be prepared before the ice has formed and the first seal is caught with the harpoon. Later, as soon as the first walrus has been killed, the work must stop again until the next autumn. Hence everybody is eager to have his reindeer-skins ready as quickly as possible, for until that is done the walrus season will not begin. When the first walrus has been killed a messenger goes from village to village and announces the news, whereupon all work on reindeer-skins immediately ceases. On the other hand, when the season for hunting the reindeer begins, all the winter clothing and the winter tents that had been in use during the walrus hunting season become tabooed and are buried under stones; they may not be used again till the next walrus hunting season comes round. No walrus-hide or thongs made of such hide may be taken inland, where the reindeer live. Venison may not be put in the same boat with walrus-meat, nor yet with salmon. If venison or the antlers of the reindeer were in a boat which goes walrus-hunting, the boat would be liable to be broken by the walrus. The Esquimaux are not allowed to eat venison and walrus on the same day, unless they first strip naked or put on clothing of reindeer-skin that has never been worn in hunting walrus. The transgression of these taboos gives umbrage to the souls of walrus; and a myth is told to account for the mutual aversion of the walrus and the reindeer. And in general the Esquimaux say that Sedna dislikes the reindeer, wherefore they may not bring the beast into contact with her favourites, the sea-mammals. Hence the meat of the whale and the seal, as well as of the walrus, may not be eaten on the same day with venison. It is not permitted that both sorts of meat lie on the floor of the hut or behind the lamps at the same time. If a man who has eaten venison in the morning happens to enter a hut in which seal meat is being cooked, he is allowed to eat venison on the bed, but it must be wrapped up before it is carried

into the hut, and he must take care to keep clear of the floor. Before they change from one food to the other the Esquimaux must wash themselves.

But even among the sea-beasts themselves there are rules of mutual avoidance which these central Esquimaux must observe. Thus a person who has been eating or hunting walrus must strip naked or change his clothes before he eats seal; otherwise the transgression will become fastened to the soul of the walrus in a manner which will be explained presently. Again, the soul of a salmon is very powerful, and its body may not be eaten on the same day with walrus or venison. Salmon may not be cooked in a pot that has been used to boil any other kind of meat; and it must always be cooked at some distance from the hut. The salmon-fisher is not allowed to wear boots that have been used in hunting walrus; and no work may be done on boot-legs till the first salmon has been caught and put on a boot-leg. Once more the soul of the grim polar bear is offended if the taboos which concern him are not observed. His soul tarries for three days near the spot where it left his body, and during these days the Esquimaux are particularly careful to conform rigidly to the laws of taboo, because they believe that punishment overtakes the transgressor who sins against the soul of a bear far more speedily than him who sins against the souls of the sea-beasts.

The native explanation of the taboos thus enjoined on hunters among the central Esquimaux has been given us by the eminent American ethnologist Dr. Franz Boas. As it sets what may be called the spiritual basis of taboo in the clearest light, it deserves to be studied with attention.

The goddess Sedna, he tells us, the mother of the sea-mammals, may be considered to be the chief deity of the central Esquimaux. She is supposed to bear supreme sway over the destinies of mankind, and almost all the observances of these tribes have for their object to retain her good will or appease her anger. Her home is in the lower world, where she dwells in a house built of stone and whale-ribs. "The souls of seals, ground seals, and whales are believed to proceed from her house. After one of these animals has been killed, its soul stays with the body for three days. Then it goes back to Sedna's abode, to be sent forth again by her. If, during the three days that the soul stays with the body, any taboo or proscribed custom is violated, the violation (*pitssēte*) becomes attached to the animal's soul, and causes it pain. The soul strives in vain to free itself of these attachments, but is compelled to take them down to Sedna. The attachments, in some manner not explained, make her hands sore, and she punishes the people who are the cause of her pains by sending to them sickness, bad weather, and starvation. If, on the other hand, all taboos have been observed, the sea-animals will allow themselves to be caught; they will even come to meet the hunter. The object of the innumerable taboos that are in force after the killing of these sea-animals, therefore, is to keep their souls free from attachments that would hurt their souls as well as Sedna.

"The souls of the sea-animals are endowed with greater powers than those of ordinary human beings. They can see the effect of contact with a corpse, which causes objects touched by it to appear dark in colour; and they can see the effect of flowing human blood, from which a vapour rises that surrounds the bleeding person and is communicated to every one and every thing that comes in contact with such a person. This vapour and the dark colour of death are exceedingly unpleasant to the souls of the sea-animals, that will not come near a hunter thus affected. The hunter must therefore avoid contact with people who have touched a body, or with those who are bleeding, more particularly with menstruating women or with those who have recently given birth. The hands of menstruating women appear red to the sea-animals. If any one who has touched a body or who is bleeding should allow others to come in contact with him, he would cause them to become distasteful to the seals, and therefore to Sedna as well. For this reason custom demands that every person must at once announce if he has

touched a body, and that women must make known when they are menstruating or when they have had a miscarriage. If they do not do so, they will bring ill-luck to all the hunters.

“These ideas have given rise to the belief that it is necessary to announce the transgression of any taboo. The transgressor of a custom is distasteful to Sedna and to the animals, and those who abide with him will become equally distasteful through contact with him. For this reason it has come to be an act required by custom and morals to confess any and every transgression of a taboo, in order to protect the community from the evil influence of contact with the evil-doer. The descriptions of Eskimo life given by many observers contain records of starvation, which, according to the belief of the natives, was brought about by some one transgressing a law, and not announcing what he had done.

“I presume the importance of the confession of a transgression, with a view to warning others to keep at a distance from the transgressor, has gradually led to the idea that a transgression, or, we might say, a sin can be atoned for by confession. This is one of the most remarkable traits among the religious beliefs of the central Eskimo. There are innumerable tales of starvation brought about by the transgression of a taboo. In vain the hunters try to supply their families with food; gales and drifting snow make their endeavours fruitless. Finally the help of the *angakok* is invoked, and he discovers that the cause of the misfortune of the people is due to the transgression of a taboo. Then the guilty one is searched for. If he confesses, all is well; the weather moderates, and the seals allow themselves to be caught; but if he obstinately maintains his innocence, his death alone will soothe the wrath of the offended deity....

“The transgressions of taboos do not affect the souls of game alone. It has already been stated that the sea-mammals see their effect upon man also, who appears to them of a dark colour, or surrounded by a vapour which is invisible to ordinary man. This means, of course, that the transgression also affects the soul of the evil-doer. It becomes attached to it, and makes him sick. The *angakok* is able to see these attachments with the help of his guardian spirit, and is able to free the soul from them. If this is not done, the person must die. In many cases the transgressions become fastened also to persons who come in contact with the evil-doer. This is especially true of children, to whose souls the sins of their parents, and particularly of their mothers, become readily attached. Therefore, when a child is sick, the *angakok* first of all, asks its mother if she has transgressed any taboos. The attachment seems to have a different appearance, according to the taboo that has been violated. A black attachment is due to removing oil-drippings from under the lamp, a piece of caribou-skin represents the scrapings removed from a caribou-skin at a time when such work was forbidden. As soon as the mother acknowledges the transgression of a taboo, the attachment leaves the child's soul, and the child recovers.

“A number of customs may be explained by the endeavours of the natives to keep the sea-mammals free from contaminating influences. All the clothing of a dead person, the tent in which he died, and the skins obtained by him, must be discarded; for if a hunter should wear clothing made of skins that had been in contact with the deceased, these would appear dark, and the seal would avoid him. Neither would a seal allow itself to be taken into a hut darkened by a dead body; and all those who entered such a hut would appear dark to it, and would be avoided.

“While it is customary for a successful hunter to invite all the men of the village to eat of the seal that he has caught, they must not take any of the seal-meat out of the hut, because it might come in contact with persons who are under taboo, and thus the hunter might incur the displeasure of the seal and of Sedna. This is particularly strictly forbidden in the case of the first seal of the season.

“A woman who has a new-born child, and who has not quite recovered, must eat only of seals caught by her husband, by a boy, or by an aged man; else the vapour arising from her body would become attached to the souls of other seals, which would take the transgression down to Sedna, thus making her hands sore.

“Cases of premature birth require particularly careful treatment. The event must be announced publicly, else dire results will follow. If a woman should conceal from the other people that she has had a premature birth, they might come near her, or even eat in her hut of the seals procured by her husband. The vapour arising from her would thus affect them, and they would be avoided by the seals. The transgression would also become attached to the soul of the seal, which would take it down to Sedna.”

In these elaborate taboos so well described by Dr. Boas we seem to see a system of animism in the act of passing into religion. The rules themselves bear the clearest traces of having originated in a doctrine of souls, and of being determined by the supposed likes and dislikes, sympathies and antipathies of the various classes of spirits toward each other. But above and behind the souls of men and animals has grown up the overshadowing conception of a powerful goddess who rules them all, so that the taboos come more and more to be viewed as a means of propitiating her rather than as merely adapted to suit the tastes of the souls themselves. Thus the standard of conduct is shifted from a natural to a supernatural basis: the supposed wish of the deity or, as we commonly put it, the will of God, tends to supersede the wishes, real or imaginative, of purely natural beings as the measure of right and wrong. The old savage taboos, resting on a theory of the direct relations of living creatures to each other, remain in substance unchanged, but they are outwardly transformed into ethical precepts with a religious or supernatural sanction. In this gradual passage of a rude philosophy into an elementary religion the place occupied by confession as a moral purgative is particularly interesting. I can hardly agree with Dr. Boas that among these Esquimaux the confession of sins was in its origin no more than a means of warning others against the dangerous contagion of the sinner; in other words, that its saving efficacy consisted merely in preventing the innocent from suffering with the guilty, and that it had no healing virtue, no purifying influence, for the evil-doer himself. It seems more probable that originally the violation of taboo, in other words, the sin, was conceived as something almost physical, a sort of morbid substance lurking in the sinner's body, from which it could be expelled by confession as by a sort of spiritual purge or emetic. This is confirmed by the form of auricular confession which is practised by the Akikuyu of British East Africa. Amongst them, we are told, “sin is essentially remissable; it suffices to confess it. Usually this is done to the sorcerer, who expels the sin by a ceremony of which the principal rite is a pretended emetic: *kotahikio*, derived from *tahika*, ‘to vomit.’” Thus among these savages the confession and absolution of sins is, so to say, a purely physical process of relieving a sufferer of a burden which sits heavy on his stomach rather than on his conscience. This view of the matter is again confirmed by the observation that these same Akikuyu resort to another physical mode of expelling sin from a sinner, and that is by the employment of a scapegoat, which by them, as by the Jews and many other people, has been employed as a vehicle for carting away moral rubbish and dumping it somewhere else. For example, if a Kikuyu man has committed incest, which would naturally entail his death, he produces a substitute in the shape of a he-goat, to which by an ignoble ceremony he transfers his guilt. Then the throat of the animal is cut, and the human culprit is thereby purged of his sin.

Hence we may suspect that the primary motive of the confession of sins among savages was self-regarding; in other words, the intention was rather to benefit the sinner himself than to safeguard others by warning them of the danger they would incur by coming into contact with him. This view is borne out by the observation that confession is sometimes used as a

means of healing the sick transgressor himself, who is supposed to recover as soon as he has made a clean breast of his transgression. Thus “when the Carriers are severely sick, they often think that they shall not recover, unless they divulge to a priest or magician every crime which they may have committed, which has hitherto been kept secret. In such a case they will make a full confession, and then they expect that their lives will be spared for a time longer. But should they keep back a single crime, they as firmly believe that they shall suffer almost instant death.” Again, the Aurohuaca Indians, who, under the tropical sun of South America, inhabit a chilly region bordering on the perpetual snows of the Sierra Nevada in Colombia, believe that all sickness is a punishment for sin. So when one of their medicine-men is summoned to a sick bed, he does not enquire after the patient's symptoms but makes strange passes over him and asks in a sepulchral voice whether he will confess his sins. If the sick man persists in drawing a veil of silence over his frailties, the doctor will not attempt to treat him, but will turn on his heel and leave the house. On the other hand if a satisfactory confession has been made, the leech directs the patient's friends to procure certain odd-looking bits of stone or shell to which the sins of the sufferer may be transferred, for when that is done he will be made whole. For this purpose the sin-laden stones or shells are carried high up into the mountains and laid in some spot where the first beams of the sun, rising in clear or clouded majesty above the long white slopes or the towering crags of the Sierra Nevada, will strike down on them, driving sin and sickness far away by their radiant influence. Here, again, we see that sin is regarded as something almost material which by confession can be removed from the body of the patient and laid on stones or shells. Further, the confession of sins has been resorted to by some people as a means of accelerating the birth of a child when the mother was in hard labour. Thus, “among the Indians of Guatemala, in the time of their idolatry when a woman was in labour, the midwife ordered her to confess her sins; and if she was not delivered, the husband was to confess his; and if that did not do they took off his clouts and put them about his wife's loins; if still she could not be delivered, the midwife drew blood from herself and sprinkled it towards the four quarters of heaven with some invocations and ceremonies.” In these attempts of the Indians to accelerate the birth of the child it seems clear that the confession of sins on the part first of the wife and afterwards of the husband is nothing but a magical ceremony like the putting of the husband's clothes on the suffering woman or the sprinkling of the midwife's blood towards the four quarters of the heaven. Amongst the Antambahoaka, a savage tribe of Madagascar, when a woman is in hard labour, a sorcerer is called in to her aid. After making some magical signs and uttering some incantations, he generally declares that the patient cannot be delivered until she has publicly confessed a secret fault which she has committed. In such a case a woman has been known to confess to incest with her brother; and immediately after her confession the child was born. In these cases the confession of sins is clearly not a mode of warning people to keep clear of the sinner; it is a magical ceremony primarily intended to benefit the sinner himself or herself and no other. The same thing may perhaps be said of a confession which was prescribed in a certain case by ancient Hindoo ritual. At a great festival of Varuna, which fell at the beginning of the rainy season, the priest asked the wife of the sacrificer to name her paramour or paramours, and she had to mention their names or at least to take up as many grass-stalks as she had lovers. “Now when a woman who belongs to one man carries on intercourse with another, she undoubtedly commits a sin against Varuna. He therefore thus asks her, lest she should sacrifice with a secret pang in her mind; for when confessed the sin becomes less, since it becomes truth; this is why he thus asks her. And whatever connection she confesses not, that indeed will turn out injurious to her relatives.” In this passage of the *Satapatha Brahmana* confession of sin is said to diminish the sin, just as if the mere utterance of the words ejected or expelled some morbid matter from the person of the sinner,

thereby relieving her of its burden and benefiting also her relatives, who would suffer through any sin which she might not have confessed.

Thus at an early stage of culture the confession of sins wears the aspect of a bodily rather than of a moral and spiritual purgation; it is a magical rather than a religious rite, and as such it resembles the ceremonies of washing, scouring, fumigation, and so forth, which in like manner are applied by many primitive peoples to the purification of what we should regard as moral guilt, but what they consider rather as a corporeal pollution or infection, which can be removed by the physical agencies of fire, water, fasts, purgatives, abrasion, scarification, and so forth. But when the guilt of sin ceases to be regarded as something material, a sort of clinging vapour of death, and is conceived as the transgression of the will of a wise and good God, it is obvious that the observance of these outward rites of purification becomes superfluous and absurd, a vain show which cannot appease the anger of the offended deity. The only means of turning away his wrath and averting the fatal consequences of sin is now believed to be the humble confession and true repentance of the sinner. At this stage of ethical evolution the practice of confession loses its old magical character as a bodily purge and assumes the new aspect of a purely religious rite, the propitiation of a great supernatural and moral being, who by a simple fiat can cancel the transgression and restore the transgressor to a state of pristine innocence. This comfortable doctrine teaches us that in order to blot out the effects of our misdeeds we have only to acknowledge and confess them with a lowly and penitent heart, whereupon a merciful God will graciously pardon our sin and absolve us and ours from its consequences. It might indeed be well for the world if we could thus easily undo the past, if we could recall the words that have been spoken amiss, if we could arrest the long train that follows, like a flight of avenging Furies, on every evil action. But this we cannot do. Our words and acts, good and bad, have their natural, their inevitable consequences. God may pardon sin, but Nature cannot.

It seems not improbable that in our own rules of conduct, in what we call the common decencies of life as well as in the weightier matters of morality, there may survive not a few old savage taboos which, masquerading as an expression of the divine will or draped in the flowing robes of a false philosophy, have maintained their credit long after the crude ideas out of which they sprang have been discarded by the progress of thought and knowledge; while on the other hand many ethical precepts and social laws, which now rest firmly on a solid basis of utility, may at first have drawn some portion of their sanctity from the same ancient system of superstition. For example, we can hardly doubt that in primitive society the crime of murder derived much of its horror from a fear of the angry ghost of the murdered man. Thus superstition may serve as a convenient crutch to morality till she is strong enough to throw away the crutch and walk alone. To judge by the legislation of the Pentateuch the ancient Semites appear to have passed through a course of moral evolution not unlike that which we can still detect in process among the Esquimaux of Baffin Land. Some of the old laws of Israel are clearly savage taboos of a familiar type thinly disguised as commands of the deity. This disguise is indeed a good deal more perfect in Palestine than in Baffin Land, but in substance it is the same. Among the Esquimaux it is the will of Sedna; among the Israelites it is the will of Jehovah.

But it is time to return to our immediate subject, to wit, the rules of conduct observed by hunters after the slaughter of the game.

When the Kayans or Bahaus of central Borneo have shot one of the dreaded Bornean panthers, they are very anxious about the safety of their souls, for they think that the soul of a panther is almost more powerful than their own. Hence they step eight times over the carcass of the dead beast reciting the spell, "Panther, thy soul under my soul." On returning home

they smear themselves, their dogs, and their weapons with the blood of fowls in order to calm their souls and hinder them from fleeing away; for being themselves fond of the flesh of fowls they ascribe the same taste to their souls. For eight days afterwards they must bathe by day and by night before going out again to the chase. After killing an animal some Indian hunters used to purify themselves in water as a religious rite. When a Damara hunter returns from a successful chase he takes water in his mouth and ejects it three times over his feet, and also into the fire on his own hearth. Amongst the Caffres of South Africa “the slaughter of a lion, however honourable it is esteemed, is nevertheless associated with an idea of moral uncleanness, and is followed by a very strange ceremony. When the hunters approach the village on their return, the man who gave the lion the first wound is hidden from every eye by the shields which his comrades hold up before him. One of the hunters steps forward and, leaping and bounding in a strange manner, praises the courage of the lion-killer. Then he rejoins the band, and the same performance is repeated by another. All the rest meanwhile keep up a ceaseless shouting, rattling with their clubs on their shields. This goes on till they have reached the village. Then a mean hut is run up not far from the village; and in this hut the lion-killer, because he is unclean, must remain four days, cut off from all association with the tribe. There he dyes his body all over with white paint; and lads who have not yet been circumcised, and are therefore, in respect to uncleanness, in the same state as himself, bring him a calf to eat, and wait upon him. When the four days are over, the unclean man washes himself, paints himself with red paint in the usual manner, and is escorted back to the village by the head chief, attended with a guard of honour. Lastly, a second calf is killed; and, the uncleanness being now at an end, every one is free to eat of the calf with him.” Among the Hottentots, when a man has killed a lion, leopard, elephant, or rhinoceros he is esteemed a great hero, but he is deluged with urine by the medicine-man and has to remain at home quite idle for three days, during which his wife may not come near him; she is also enjoined to restrict herself to a poor diet and to eat no more than is barely necessary to keep her in health. Similarly the Lapps deem it the height of glory to kill a bear, which they consider the king of beasts. Nevertheless, all the men who take part in the slaughter are regarded as unclean, and must live by themselves for three days in a hut or tent made specially for them, where they cut up and cook the bear's carcass. The reindeer which brought in the carcass on a sledge may not be driven by a woman for a whole year; indeed, according to one account, it may not be used by anybody for that period. Before the men go into the tent where they are to be secluded, they strip themselves of the garments they had worn in killing the bear, and their wives spit the red juice of alder bark in their faces. They enter the tent not by the ordinary door but by an opening at the back. When the bear's flesh has been cooked, a portion of it is sent by the hands of two men to the women, who may not approach the men's tent while the cooking is going on. The men who convey the flesh to the women pretend to be strangers bringing presents from a foreign land; the women keep up the pretence and promise to tie red threads round the legs of the strangers. The bear's flesh may not be passed in to the women through the door of their tent, but must be thrust in at a special opening made by lifting up the hem of the tent-cover. When the three days' seclusion is over and the men are at liberty to return to their wives, they run, one after the other, round the fire, holding the chain by which pots are suspended over it. This is regarded as a form of purification; they may now leave the tent by the ordinary door and rejoin the women. But the leader of the party must still abstain from cohabitation with his wife for two days more.

Again, the Caffres are said to dread greatly the boa-constrictor or an enormous serpent resembling it; “and being influenced by certain superstitious notions they even fear to kill it. The man who happened to put it to death, whether in self-defence or otherwise, was formerly required to lie in a running stream of water during the day for several weeks together; and no beast whatever was allowed to be slaughtered at the hamlet to which he belonged, until this

duty had been fully performed. The body of the snake was then taken and carefully buried in a trench, dug close to the cattle-fold, where its remains, like those of a chief, were henceforward kept perfectly undisturbed. The period of penance, as in the case of mourning for the dead, is now happily reduced to a few days." Amongst the Ewe-speaking peoples of the Slave Coast, who worship the python, a native who killed one of these serpents used to be burned alive. But for some time past, though a semblance of carrying out the old penalty is preserved, the culprit is allowed to escape with his life, but he has to pay a heavy fine. A small hut of dry faggots and grass is set up, generally near the lagoon at Whydah, if the crime has been perpetrated there; the guilty man is thrust inside, the door of plaited grass is shut on him, and the hut is set on fire. Sometimes a dog, a kid, and two fowls are enclosed along with him, and he is drenched with palm-oil and yeast, probably to render him the more combustible. As he is unbound, he easily breaks out of the frail hut before the flames consume him; but he has to run the gauntlet of the angry serpent-worshippers, who belabour the murderer of their god with sticks and pelt him with clods until he reaches water and plunges into it, which is supposed to wash away his sin. Thirteen days later a commemoration service is held in honour of the deceased python. In Madras it is considered a great sin to kill a cobra. When this has happened, the people generally burn the body of the serpent just as they burn the bodies of human beings. The murderer deems himself polluted for three days. On the second day milk is poured on the remains of the cobra. On the third day the guilty wretch is free from pollution. Under native rule, we may suspect, he would not get off so lightly.

In these last cases the animal whose slaughter has to be atoned for is sacred, that is, it is one whose life is commonly spared from motives of superstition. Yet the treatment of the sacrilegious slayer seems to resemble so closely the treatment of hunters and fishermen who have killed animals for food in the ordinary course of business, that the ideas on which both sets of customs are based may be assumed to be substantially the same. Those ideas, if I am right, are the respect which the savage feels for the souls of beasts, especially valuable or formidable beasts, and the dread which he entertains of their vengeful ghosts. Some confirmation of this view may be drawn from the ceremonies observed by fishermen of Annam when the carcass of a whale is washed ashore. These fisherfolk, we are told, worship the whale on account of the benefits they derive from it. There is hardly a village on the sea-shore which has not its small pagoda, containing the bones, more or less authentic, of a whale. When a dead whale is washed ashore, the people accord it a solemn burial. The man who first caught sight of it acts as chief mourner, performing the rites which as chief mourner and heir he would perform for a human kinsman. He puts on all the garb of woe, the straw hat, the white robe with long sleeves turned inside out, and the other paraphernalia of full mourning. As next of kin to the deceased he presides over the funeral rites. Perfumes are burned, sticks of incense kindled, leaves of gold and silver scattered, crackers let off. When the flesh has been cut off and the oil extracted, the remains of the carcass are buried in the sand. Afterwards a shed is set up and offerings are made in it. Usually some time after the burial the spirit of the dead whale takes possession of some person in the village and declares by his mouth whether he is a male or a female.

V. Tabooed Things

§ 1. The Meaning of Taboo.

Thus in primitive society the rules of ceremonial purity observed by divine kings, chiefs, and priests agree in many respects with the rules observed by homicides, mourners, women in childbed, girls at puberty, hunters and fishermen, and so on. To us these various classes of persons appear to differ totally in character and condition; some of them we should call holy, others we might pronounce unclean and polluted. But the savage makes no such moral distinction between them; the conceptions of holiness and pollution are not yet differentiated in his mind. To him the common feature of all these persons is that they are dangerous and in danger, and the danger in which they stand and to which they expose others is what we should call spiritual or ghostly, and therefore imaginary. The danger, however, is not less real because it is imaginary; imagination acts upon man as really as does gravitation, and may kill him as certainly as a dose of prussic acid. To seclude these persons from the rest of the world so that the dreaded spiritual danger shall neither reach them, nor spread from them, is the object of the taboos which they have to observe. These taboos act, so to say, as electrical insulators to preserve the spiritual force with which these persons are charged from suffering or inflicting harm by contact with the outer world.

To the illustrations of these general principles which have been already given I shall now add some more, drawing my examples, first, from the class of tabooed things, and, second, from the class of tabooed words; for in the opinion of the savage both things and words may, like persons, be charged or electrified, either temporarily or permanently, with the mysterious virtue of taboo, and may therefore require to be banished for a longer or shorter time from the familiar usage of common life. And the examples will be chosen with special reference to those sacred chiefs, kings and priests, who, more than anybody else, live fenced about by taboo as by a wall. Tabooed things will be illustrated in the present chapter, and tabooed words in the next.

§ 2. Iron tabooed.

In the first place we may observe that the awful sanctity of kings naturally leads to a prohibition to touch their sacred persons. Thus it was unlawful to lay hands on the person of a Spartan king; no one might touch the body of the king or queen of Tahiti; it is forbidden to touch the person of the king of Siam under pain of death; and no one may touch the king of Cambodia, for any purpose whatever, without his express command. In July 1874 the king was thrown from his carriage and lay insensible on the ground, but not one of his suite dared to touch him; a European coming to the spot carried the injured monarch to his palace. Formerly no one might touch the king of Corea; and if he deigned to touch a subject, the spot touched became sacred, and the person thus honoured had to wear a visible mark (generally a cord of red silk) for the rest of his life. Above all, no iron might touch the king's body. In 1800 King Tieng-tsong-tai-oang died of a tumour in the back, no one dreaming of employing the lancet, which would probably have saved his life. It is said that one king suffered terribly from an abscess in the lip, till his physician called in a jester, whose pranks made the king laugh heartily, and so the abscess burst. Roman and Sabine priests might not be shaved with iron but only with bronze razors or shears; and whenever an iron graving-tool was brought into the sacred grove of the Arval Brothers at Rome for the purpose of cutting an inscription in stone, an expiatory sacrifice of a lamb and a pig must be offered, which was repeated when the graving-tool was removed from the grove. As a general rule iron might not

be brought into Greek sanctuaries. In Crete sacrifices were offered to Menedemus without the use of iron, because the legend ran that Menedemus had been killed by an iron weapon in the Trojan war. The Archon of Plataea might not touch iron; but once a year, at the annual commemoration of the men who fell at the battle of Plataea, he was allowed to carry a sword wherewith to sacrifice a bull. To this day a Hottentot priest never uses an iron knife, but always a sharp splint of quartz, in sacrificing an animal or circumcising a lad. Among the Ovambo of south-west Africa custom requires that lads should be circumcised with a sharp flint; if none is to hand, the operation may be performed with iron, but the iron must afterwards be buried. The Antandroy and Tanala of Madagascar cut the navel-strings of their children with sharp wood or with a thread, but never with an iron knife. In Uap, one of the Caroline Islands, wood of the hibiscus tree, which was used to make the fire-drill, must be cut with shell knives or shell axes, never with iron or steel. Amongst the Moquis of Arizona stone knives, hatchets, and so on have passed out of common use, but are retained in religious ceremonies. After the Pawnees had ceased to use stone arrow-heads for ordinary purposes, they still employed them to slay the sacrifices, whether human captives or buffalo and deer. We have seen that among the Esquimaux of Bering Strait the use of iron implements is forbidden for four days after the slaughter of a white whale, and that the use of an iron axe at a place where salmon are being dressed is believed by these people to be a fatal imprudence. They hold a festival in the assembly-house of the village, while the bladders of the slain beasts are hanging there, and during its celebration no wood may be cut with an iron axe. If it is necessary to split firewood, this may be done with wedges of bone. At Kushunuk, near Cape Vancouver, it happened that Mr. Nelson and his party entered an assembly-house of these Esquimaux while the festival of the bladders was in progress. "When our camping outfit was brought in from the sledges, two men took drums, and as the clothing and goods of the traders who were with me were brought in, the drums were beaten softly and a song was sung in a low, humming tone, but when our guns and some steel traps were brought in, with other articles of iron, the drums were beaten loudly and the songs raised in proportion. This was done that the shades of the animals present in the bladders might not be frightened." The Esquimaux on the western coast of Hudson Bay may not work on iron during the season for hunting musk-oxen, which falls in March. And no such work may be done by them until the seals have their pups. Negroes of the Gold Coast remove all iron or steel from their person when they consult their fetish. The men who made the need-fire in Scotland had to divest themselves of all metal. There was hardly any belief, we are told, that had a stronger hold on the mind of a Scottish Highlander than that on no account whatever should iron be put in the ground on Good Friday. Hence no grave was dug and no field ploughed on that day. It has been suggested that the belief was based on that rooted aversion to iron which fairies are known to feel. These touchy beings live underground, and might resent having the roof pulled from over their heads on the hallowed day. Again, in the Highlands of Scotland the shoulder-blades of sheep are employed in divination, being consulted as to future marriages, births, deaths, and funerals; but the forecasts thus made will not be accurate unless the flesh has been removed from the bones without the use of any iron. In making the *clavie* (a kind of Yule-tide fire-wheel) at Burghead, no hammer may be used; the hammering must be done with a stone. Amongst the Jews no iron tool was used in building the Temple at Jerusalem or in making an altar. The old wooden bridge (*Pons Sublicius*) at Rome, which was considered sacred, was made and had to be kept in repair without the use of iron or bronze. It was expressly provided by law that the temple of Jupiter Liber at Furfo might be repaired with iron tools. The council chamber at Cyzicus was constructed of wood without any iron nails, the beams being so arranged that they could be taken out and replaced. The late Rajah Vijyanagram, a member of the Viceroy's Council, and described as one of the most enlightened and estimable of Hindoo princes, would not allow iron to be used in the

construction of buildings within his territory, believing that its use would inevitably be followed by small-pox and other epidemics.

This superstitious objection to iron perhaps dates from that early time in the history of society when iron was still a novelty, and as such was viewed by many with suspicion and dislike. For everything new is apt to excite the awe and dread of the savage. "It is a curious superstition," says a pioneer in Borneo, "this of the Dusuns, to attribute anything—whether good or bad, lucky or unlucky—that happens to them to something novel which has arrived in their country. For instance, my living in Kindram has caused the intensely hot weather we have experienced of late." Some years ago a harmless naturalist was collecting plants among the high forest-clad mountains on the borders of China and Tibet. From the summit of a pass he gazed with delight down a long valley which, stretching away as far as eye could reach to the south, resembled a sea of bloom, for everywhere the forest was ablaze with the gorgeous hues of the rhododendron and azalea in flower. In this earthly paradise the votary of science hastened to install himself beside a lake. But hardly had he done so when, alas! the weather changed. Though the season was early June, the cold became intense, snow fell heavily, and the bloom of the rhododendrons was cut off. The inhabitants of a neighbouring village at once set down the unusual severity of the weather to the presence of a stranger in the forest; and a round-robin, signed by them unanimously, was forwarded to the nearest mandarin, setting forth that the snow which had blocked the road, and the hail which was blasting their crops, were alike caused by the intruder, and that all sorts of disturbances would follow if he were allowed to remain. In these circumstances the naturalist, who had intended to spend most of the summer among the mountains, was forced to decamp. "Collecting in this country," he adds pathetically, "is not an easy matter." The unusually heavy rains which happened to follow the English survey of the Nicobar Islands in the winter of 1886-1887 were imputed by the alarmed natives to the wrath of the spirits at the theodolites, dumpy-levellers, and other strange instruments which had been set up in so many of their favourite haunts; and some of them proposed to soothe the anger of the spirits by sacrificing a pig. When the German Hans Stade was a captive in a cannibal tribe of Brazilian Indians, it happened that, shortly before a prisoner was to be eaten, a great wind arose and blew away part of the roofs of the huts. The savages were angry with Stade, and said he had made the wind to come by looking into his thunder-skins, by which they meant a book he had been reading, in order to save the prisoner, who was a friend of his, from their stomachs. So the pious German prayed to God, and God mercifully heard his prayer; for next morning the weather was beautifully fine, and his friend was butchered, carved, and eaten in the most perfect comfort. According to the Orotchis of eastern Siberia, misfortunes have multiplied on them with the coming of Europeans; "they even go so far as to lay the appearance of *new* phenomena like thunder at the door of the Russians." In the seventeenth century a succession of bad seasons excited a revolt among the Esthonian peasantry, who traced the origin of the evil to a water-mill, which put a stream to some inconvenience by checking its flow. The first introduction of iron ploughshares into Poland having been followed by a succession of bad harvests, the farmers attributed the badness of the crops to the iron ploughshares, and discarded them for the old wooden ones. To this day the primitive Baduwis of Java, who live chiefly by husbandry, will use no iron tools in tilling their fields.

The general dislike of innovation, which always makes itself strongly felt in the sphere of religion, is sufficient by itself to account for the superstitious aversion to iron entertained by kings and priests and attributed by them to the gods; possibly this aversion may have been intensified in places by some such accidental cause as the series of bad seasons which cast discredit on iron ploughshares in Poland. But the disfavour in which iron is held by the gods and their ministers has another side. Their antipathy to the metal furnishes men with a

weapon which may be turned against the spirits when occasion serves. As their dislike of iron is supposed to be so great that they will not approach persons and things protected by the obnoxious metal, iron may obviously be employed as a charm for banning ghosts and other dangerous spirits. And often it is so used. Thus in the Highlands of Scotland the great safeguard against the elfin race is iron, or, better yet, steel. The metal in any form, whether as a sword, a knife, a gun-barrel, or what not, is all-powerful for this purpose. Whenever you enter a fairy dwelling you should always remember to stick a piece of steel, such as a knife, a needle, or a fish-hook, in the door; for then the elves will not be able to shut the door till you come out again. So too when you have shot a deer and are bringing it home at night, be sure to thrust a knife into the carcase, for that keeps the fairies from laying their weight on it. A knife or a nail in your pocket is quite enough to prevent the fairies from lifting you up at night. Nails in the front of a bed ward off elves from women "in the straw" and from their babes; but to make quite sure it is better to put the smoothing-iron under the bed, and the reaping-hook in the window. If a bull has fallen over a rock and been killed, a nail stuck into it will preserve the flesh from the fairies. Music discoursed on that melodious instrument, a Jew's harp, keeps the elfin women away from the hunter, because the tongue of the instrument is of steel. Again, when Scotch fishermen were at sea, and one of them happened to take the name of God in vain, the first man who heard him called out "Cauld airn," at which every man of the crew grasped the nearest bit of iron and held it between his hands for a while. So too when he hears the unlucky word "pig" mentioned, a Scotch fisherman will feel for the nails in his boots and mutter "Cauld airn." The same magic words are even whispered in the churches of Scotch fishing-villages when the clergyman reads the passage about the Gadarene swine. In Morocco iron is considered a great protection against demons; hence it is usual to place a knife or dagger under a sick man's pillow. The Singhalese believe that they are constantly surrounded by evil spirits, who lie in wait to do them harm. A peasant would not dare to carry good food, such as cakes or roast meat, from one place to another without putting an iron nail on it to prevent a demon from taking possession of the viands and so making the eater ill. No sick person, whether man or woman, would venture out of the house without a bunch of keys or a knife in his hand, for without such a talisman he would fear that some devil might take advantage of his weak state to slip into his body. And if a man has a large sore on his body he tries to keep a morsel of iron on it as a protection against demons. The inhabitants of Salsette, an island near Bombay, dread a spirit called *gîrâ*, which plays many pranks with a solitary traveller, leading him astray, lowering him into an empty well, and so on. But a *gîrâ* dare not touch a person who has on him anything made of iron or steel, particularly a knife or a nail, of which the spirit stands in great fear. Nor will he meddle with a woman, especially a married woman, because he is afraid of her bangles. Among the Majhwâr, an aboriginal tribe in the hill country of South Mirzapur, an iron implement such as a sickle or a betel-cutter is constantly kept near an infant's head during its first year for the purpose of warding off the attacks of ghosts. Among the Maravars, an aboriginal race of southern India, a knife or other iron object lies beside a woman after childbirth to keep off the devil. When a Mala woman is in labour, a sickle and some *nîm* leaves are always kept on the cot. In Malabar people who have to pass by burning-grounds or other haunted places commonly carry with them iron in some form, such as a knife or an iron rod used as a walking-stick. When pregnant women go on a journey, they carry with them a few twigs or leaves of the *nîm* tree, or iron in some shape, to scare evil spirits lurking in groves or burial-grounds which they may pass. In Bilaspore people attribute cholera to a goddess who visits the afflicted family. But they think that she may be kept off by iron; hence during an epidemic of cholera people go about with axes or sickles in their hands. "Their horses are not shod, otherwise they might possibly nail horse-shoes to the door, but their belief is more primitive; for with them iron does not *bring* good luck, but it *scares away* the evil spirits, so

when a man has had an epileptic fit he will wear an iron bracelet to keep away the evil spirit which was supposed to have possessed him." The Annamites imagine that a new-born child is exposed to the attacks of evil spirits. To protect the infant from these malignant beings the parents sometimes sell the child to the village smith, who makes a small ring or circlet of iron and puts it on the child's foot, commonly adding a little chain of iron. When the infant has been sold to the smith and firmly attached to him by the chain, the demons no longer have any power over him. After the child has grown big and the danger is over, the parents ask the smith to break the iron ring and thank him for his services. No metal but iron will serve the purpose. On the Slave Coast of Africa when a mother sees her child gradually wasting away, she concludes that a demon has entered into the child and takes her measures accordingly. To lure the demon out of the body of her offspring, she offers a sacrifice of food; and while the devil is bolting it, she attaches iron rings and small bells to her child's ankles and hangs iron chains round his neck. The jingling of the iron and the tinkling of the bells are supposed to prevent the demon, when he has concluded his repast, from entering again into the body of the little sufferer. Hence many children may be seen in this part of Africa weighed down with iron ornaments. The use of iron as a means to exorcise demons was forbidden by the Coptic church. In India "the mourner who performs the ceremony of putting fire into the dead person's mouth carries with him a piece of iron: it may be a key or a knife, or a simple piece of iron, and during the whole time of his separation (for he is unclean for a certain time, and no one will either touch him or eat or drink with him, neither can he change his clothes) he carries the piece of iron about with him to keep off the evil spirit. In Calcutta the Bengali clerks in the Government Offices used to wear a small key on one of their fingers when they had been chief mourners." When a woman dies in childbed in the island of Salsette, they put a nail or other piece of iron in the folds of her dress; this is done especially if the child survives her. The intention plainly is to prevent her spirit from coming back; for they believe that a dead mother haunts the house and seeks to carry away her child. In the north-east of Scotland immediately after a death had taken place, a piece of iron, such as a nail or a knitting-wire, used to be stuck into all the meal, butter, cheese, flesh, and whisky in the house, "to prevent death from entering them." The neglect of this salutary precaution is said to have been closely followed by the corruption of the food and drink; the whisky has been known to become as white as milk. When iron is used as a protective charm after a death, as in these Hindoo and Scotch customs, the spirit against which it is directed is the ghost of the deceased.

§ 3. Sharp Weapons tabooed.

There is a priestly king to the north of Zengwih in Burma, revered by the Sotih as the highest spiritual and temporal authority, into whose house no weapon or cutting instrument may be brought. This rule may perhaps be explained by a custom observed by various peoples after a death; they refrain from the use of sharp instruments so long as the ghost of the deceased is supposed to be near, lest they should wound it. Thus among the Esquimaux of Bering Strait "during the day on which a person dies in the village no one is permitted to work, and the relatives must perform no labour during the three following days. It is especially forbidden during this period to cut with any edged instrument, such as a knife or an axe; and the use of pointed instruments, like needles or bodkins, is also forbidden. This is said to be done to avoid cutting or injuring the shade, which may be present at any time during this period, and, if accidentally injured by any of these things, it would become very angry and bring sickness or death to the people. The relatives must also be very careful at this time not to make any loud or harsh noises that may startle or anger the shade." We have seen that in like manner after killing a white whale these Esquimaux abstain from the use of cutting or pointed instruments for four days, lest they should unwittingly cut or stab the whale's

ghost. The same taboo is sometimes observed by them when there is a sick person in the village, probably from a fear of injuring his shade which may be hovering outside of his body. After a death the Roumanians of Transylvania are careful not to leave a knife lying with the sharp edge uppermost as long as the corpse remains in the house, "or else the soul will be forced to ride on the blade." For seven days after a death, the corpse being still in the house, the Chinese abstain from the use of knives and needles, and even of chopsticks, eating their food with their fingers. On the third, sixth, ninth, and fortieth days after the funeral the old Prussians and Lithuanians used to prepare a meal, to which, standing at the door, they invited the soul of the deceased. At these meals they sat silent round the table and used no knives, and the women who served up the food were also without knives. If any morsels fell from the table they were left lying there for the lonely souls that had no living relations or friends to feed them. When the meal was over the priest took a broom and swept the souls out of the house, saying, "Dear souls, ye have eaten and drunk. Go forth, go forth." In cutting the nails and combing the hair of a dead prince in South Celebes only the back of the knife and of the comb may be used. The Germans say that a knife should not be left edge upwards, because God and the spirits dwell there, or because it will cut the face of God and the angels. Among the Monumbos of New Guinea a pregnant woman may not use sharp instruments; for example, she may not sew. If she used such instruments, they think that she would thereby stab the child in her womb. Among the Kayans of Borneo, when the birth-pangs begin, all men leave the room, and all cutting weapons and iron are also removed, "perhaps in order not to frighten the child," says the writer who reports the custom. The reason may rather be a fear of injuring the flitting soul of mother or babe. In Uganda, when the hour of a woman's delivery is at hand, her husband carries all spears and weapons out of the house, doubtless in order that they may not hurt the tender soul of the new-born child. Early in the period of the Ming dynasty a professor of geomancy made the alarming discovery that the spiritual atmosphere of Kü-yung, a city near Nanking, was in a truly deplorable condition through the intrusion of an evil spirit. The Chinese emperor, with paternal solicitude, directed that the north gate, by which the devil had effected his entrance, should be built up solid, and that for the future the population of the city should devote their energies to the pursuits of hair-dressing, corn-cutting, and the shaving of bamboo-roots, because, as he sagaciously perceived, all these professions call for the use of sharp-edged instruments, which could not fail to keep the demon at bay. We can now understand why no cutting instrument may be taken into the house of the Burmese pontiff. Like so many priestly kings, he is probably regarded as divine, and it is therefore right that his sacred spirit should not be exposed to the risk of being cut or wounded whenever it quits his body to hover invisible in the air or to fly on some distant mission.

§ 4. Blood tabooed.

We have seen that the Flamen Dialis was forbidden to touch or even name raw flesh. At certain times a Brahman teacher is enjoined not to look on raw flesh, blood, or persons whose hands have been cut off. In Uganda the father of twins is in a state of taboo for some time after the birth; among other rules he is forbidden to kill anything or to see blood. In the Pelew Islands when a raid has been made on a village and a head carried off, the relations of the slain man are tabooed and have to submit to certain observances in order to escape the wrath of his ghost. They are shut up in the house, touch no raw flesh, and chew betel over which an incantation has been uttered by the exorcist. After this the ghost of the slaughtered man goes away to the enemy's country in pursuit of his murderer. The taboo is probably based on the common belief that the soul or spirit of the animal is in the blood. As tabooed persons are believed to be in a perilous state—for example, the relations of the slain man are liable to the attacks of his indignant ghost—it is especially necessary to isolate them from contact with

spirits; hence the prohibition to touch raw meat. But as usual the taboo is only the special enforcement of a general precept; in other words, its observance is particularly enjoined in circumstances which seem urgently to call for its application, but apart from such circumstances the prohibition is also observed, though less strictly, as a common rule of life. Thus some of the Esthonians will not taste blood because they believe that it contains the animal's soul, which would enter the body of the person who tasted the blood. Some Indian tribes of North America, "through a strong principle of religion, abstain in the strictest manner from eating the blood of any animal, as it contains the life and spirit of the beast." These Indians "commonly pull their new-killed venison (before they dress it) several times through the smoke and flame of the fire, both by the way of a sacrifice and to consume the blood, life, or animal spirits of the beast, which with them would be a most horrid abomination to eat." Among the western Dénés or Tinneh Indians of British Columbia until lately no woman would partake of blood, "and both men and women abhorred the flesh of a beaver which had been caught and died in a trap, and of a bear strangled to death in a snare, because the blood remained in the carcass." Many of the Slave, Hare, and Dogrib Indians scruple to taste the blood of game; hunters of the former tribes collect the blood in the animal's paunch and bury it in the snow. The Malepa, a Bantu tribe in the north of the Transvaal, will taste no blood. Hence they cut the throats of the cattle they slaughter and let the blood drain out of the carcass before they will eat it. And they do the same with game. Jewish hunters poured out the blood of the game they had killed and covered it up with dust. They would not taste the blood, believing that the soul or life of the animal was in the blood, or actually was the blood. The same belief was held by the Romans, and is shared by the Arabs, by Chinese medical writers, and by some of the Papuan tribes of New Guinea.

It is a common rule that royal blood may not be shed upon the ground. Hence when a king or one of his family is to be put to death a mode of execution is devised by which the royal blood shall not be spilt upon the earth. About the year 1688 the generalissimo of the army rebelled against the king of Siam and put him to death "after the manner of royal criminals, or as princes of the blood are treated when convicted of capital crimes, which is by putting them into a large iron caldron, and pounding them to pieces with wooden pestles, because none of their royal blood must be spilt on the ground, it being, by their religion, thought great impiety to contaminate the divine blood by mixing it with earth." Other Siamese modes of executing a royal person are starvation, suffocation, stretching him on a scarlet cloth and thrusting a billet of fragrant sandal-wood into his stomach, or lastly, sewing him up in a leather sack with a large stone and throwing him into the river; sometimes the sufferer's neck is broken with sandal-wood clubs before he is thrown into the water. When Kublai Khan defeated and took his uncle Nayan, who had rebelled against him, he caused Nayan to be put to death by being wrapt in a carpet and tossed to and fro till he died, "because he would not have the blood of his Line Imperial spilt upon the ground or exposed in the eye of Heaven and before the Sun." "Friar Ricold mentions the Tartar maxim: 'One Khan will put another to death to get possession of the throne, but he takes great care that the blood be not spilt. For they say that it is highly improper that the blood of the Great Khan should be spilt upon the ground; so they cause the victim to be smothered somehow or other.' The like feeling prevails at the court of Burma, where a peculiar mode of execution without bloodshed is reserved for princes of the blood." Another writer on Burma observes that "according to Mongolian tradition, it is considered improper to spill the blood of any member of the royal race. Princes of the Blood are executed by a blow, or blows, of a bludgeon, inflicted on the back of the neck. The corpse is placed in a red velvet sack, which is fixed between two large perforated jars, and then sunk in the river Irawadi. Princesses are executed in a similar manner, with the exception that they are put to death by a blow in front, instead of the back of the neck." In 1878 the relations of Theebaw, king of Burma, were despatched by being beaten across the throat with a

bamboo. In Tonquin the ordinary mode of execution is beheading, but persons of the blood royal are strangled. In Ashantee the blood of none of the royal family may be shed; if one of them is guilty of a great crime he is drowned in the river Dah. As the blood royal of Dahomey may not be spilled, offenders of the royal family are drowned or strangled. Commonly they are bound hand and foot, carried out to sea in a canoe, and thrown overboard. When a king of Benin came to the throne he used to put his brothers to death; but as no one might lay hands on a prince of the blood, the king commanded his brothers to hang themselves, after which he buried their bodies with great pomp. In Madagascar the blood of nobles might not be shed; hence when four Christians of that class were to be executed they were burned alive. In Uganda "no one may shed royal blood on any account, not even when ordered by the king to slay one of the royal house; royalty may only be starved or burned to death." Formerly when a young king of Uganda came of age all his brothers were burnt except two or three, who were preserved to keep up the succession. Or a space of ground having been fenced in with a high paling and a deep ditch, the doomed men were led into the enclosure and left there till they died, while guards kept watch outside to prevent their escape. Among the Bawenda of southern Africa dangerous princes are strangled, for their blood may not be shed.

The reluctance to spill royal blood seems to be only a particular case of a general unwillingness to shed blood or at least to allow it to fall on the ground. Marco Polo tells us that in his day persons caught in the streets of Cambaluc (Peking) at unseasonable hours were arrested, and if found guilty of a misdemeanour were beaten with a stick. "Under this punishment people sometimes die, but they adopt it in order to eschew bloodshed, for their *Bacsis* say that it is an evil thing to shed man's blood." When Captain Christian was shot by the Manx Government at the Restoration in 1660, the spot on which he stood was covered with white blankets, that his blood might not fall on the ground. In West Sussex people believe that the ground on which human blood has been shed is accursed and will remain barren for ever. Among some primitive peoples, when the blood of a tribesman has to be spilt it is not suffered to fall upon the ground, but is received upon the bodies of his fellow-tribesmen. Thus in some Australian tribes boys who are being circumcised are laid on a platform, formed by the living bodies of the tribesmen; and when a boy's tooth is knocked out as an initiatory ceremony, he is seated on the shoulders of a man, on whose breast the blood flows and may not be wiped away. When Australian blacks bleed each other as a cure for headache and other ailments, they are very careful not to spill any of the blood on the ground, but sprinkle it on each other. We have already seen that in the Australian ceremony for making rain the blood which is supposed to imitate the rain is received upon the bodies of the tribesmen. "Also the Gauls used to drink their enemies' blood and paint themselves therewith. So also they write that the old Irish were wont; and so have I seen some of the Irish do, but not their enemies' but friends' blood, as, namely, at the execution of a notable traitor at Limerick, called Murrough O'Brien, I saw an old woman, which was his foster-mother, take up his head whilst he was quartered and suck up all the blood that ran thereout, saying that the earth was not worthy to drink it, and therewith also steeped her face and breast and tore her hair, crying out and shrieking most terribly." After a battle in Horne Island, South Pacific, it was found that the brother of the vanquished king was among the wounded. "It was sad to see his wife collect in her hands the blood which had flowed from his wounds, and throw it on to her head, while she uttered piercing cries. All the relatives of the wounded collected in the same manner the blood which had flowed from them, down even to the last drop, and they even applied their lips to the leaves of the shrubs and licked it all up to the last drop." In the Marquesas Islands the persons who helped a woman at childbirth received on their heads the blood which flowed at the cutting of the navel-string; for the blood might not touch anything but a sacred object, and in Polynesia the head is sacred in a high degree. In South Celebes at childbirth a female slave stands under the house (the houses being raised on posts above the

ground) and receives in a basin on her head the blood which trickles through the bamboo floor. Among the Latuka of central Africa the earth on which a drop of blood has fallen at childbirth is carefully scraped up with an iron shovel, put into a pot along with the water used in washing the mother, and buried tolerably deep outside the house on the left-hand side. In West Africa, if a drop of your blood has fallen on the ground, you must carefully cover it up, rub and stamp it into the soil; if it has fallen on the side of a canoe or a tree, the place is cut out and the chip destroyed. The Caffres, we are told, have a great horror of blood, and must purify themselves from the pollution if they have shed it and been bespattered by it. Hence warriors on the return from battle purge themselves with emetics, and that so violently that some of them give up the ghost. A Caffre would never allow even a drop of blood from his nose or a wound to lie uncovered, but huddles it over with earth, that his feet may not be defiled by it. One motive of these African customs may be a wish to prevent the blood from falling into the hands of magicians, who might make an evil use of it. That is admittedly the reason why people in West Africa stamp out any blood of theirs which has fallen on the ground or cut out any wood that has been soaked with it. From a like dread of sorcery natives of New Guinea are careful to burn any sticks, leaves, or rags which are stained with their blood; and if the blood has dripped on the ground they turn up the soil and if possible light a fire on the spot. The same fear explains the curious duties discharged by a class of men called *ramanga* or "blue blood" among the Betsileo of Madagascar. It is their business to eat all the nail-parings and to lick up all the spilt blood of the nobles. When the nobles pare their nails, the parings are collected to the last scrap and swallowed by these *ramanga*. If the parings are too large, they are minced small and so gulped down. Again, should a nobleman wound himself, say in cutting his nails or treading on something, the *ramanga* lick it up as fast as possible. Nobles of high rank hardly go anywhere without these humble attendants; but if it should happen that there are none of them present, the cut nails and the spilt blood are carefully collected to be afterwards swallowed by the *ramanga*. There is scarcely a nobleman of any pretensions who does not strictly observe this custom, the intention of which probably is to prevent these parts of his person from falling into the hands of sorcerers, who on the principles of contagious magic could work him harm thereby. The tribes of the White Nile are said never to shed human blood in their villages because they think the sight of it would render women barren or bring misfortune on their children. Hence executions and murders commonly take place on the roads or in the forest.

The unwillingness to shed blood is extended by some peoples to the blood of animals. Thus, when the Caffres offer an ox to the spirits, the blood of the beast must be carefully caught in a calabash, and none of it may fall on the ground. When the Wanika in eastern Africa kill their cattle for food, "they either stone or beat the animal to death, so as not to shed the blood." Amongst the Damaras cattle killed for food are suffocated, but when sacrificed they are speared to death. But like most pastoral tribes in Africa, both the Wanika and Damaras very seldom kill their cattle, which are indeed commonly invested with a kind of sanctity. Some of the Ewe-speaking negroes of Togoland, in West Africa, celebrate a festival in honour of the Earth at which it is unlawful to shed blood on the ground. Hence the fowls which are sacrificed on these occasions have their necks wrung, not their throats cut. In killing an animal for food the Easter Islanders do not shed its blood, but stun it or suffocate it in smoke. When the natives of San Cristoval, one of the Solomon Islands, sacrifice a pig to a ghost in a sacred place, they take great care that the blood shall not fall on the ground; so they place the animal in a large bowl and cut it up there. It is said that in ancient India the sacrificial victims were not slaughtered but strangled.

The general explanation of the reluctance to shed blood on the ground is probably to be found in the belief that the soul is in the blood, and that therefore any ground on which it may fall

necessarily becomes taboo or sacred. In New Zealand anything upon which even a drop of a high chief's blood chances to fall becomes taboo or sacred to him. For instance, a party of natives having come to visit a chief in a fine new canoe, the chief got into it, but in doing so a splinter entered his foot, and the blood trickled on the canoe, which at once became sacred to him. The owner jumped out, dragged the canoe ashore opposite the chief's house, and left it there. Again, a chief in entering a missionary's house knocked his head against a beam, and the blood flowed. The natives said that in former times the house would have belonged to the chief. As usually happens with taboos of universal application, the prohibition to spill the blood of a tribesman on the ground applies with peculiar stringency to chiefs and kings, and is observed in their case long after it has ceased to be observed in the case of others.

We have seen that the Flamen Dialis was not allowed to walk under a trellised vine. The reason for this prohibition was perhaps as follows. It has been shewn that plants are considered as animate beings which bleed when cut, the red juice which exudes from some of them being regarded as the blood of the plant. The juice of the grape is therefore naturally conceived as the blood of the vine. And since, as we have just seen, the soul is often believed to be in the blood, the juice of the grape is regarded as the soul, or as containing the soul, of the vine. This belief is strengthened by the intoxicating effects of wine. For, according to primitive notions, all abnormal mental states, such as intoxication or madness, are caused by the entrance of a spirit into the person; such mental states, in other words, are accounted forms of possession or inspiration. Wine, therefore, is considered on two distinct grounds as a spirit, or containing a spirit; first because, as a red juice, it is identified with the blood of the plant, and second because it intoxicates or inspires. Therefore if the Flamen Dialis had walked under a trellised vine, the spirit of the vine, embodied in the clusters of grapes, would have been immediately over his head and might have touched it, which for a person like him in a state of permanent taboo would have been highly dangerous. This interpretation of the prohibition will be made probable if we can shew, first, that wine has been actually viewed by some peoples as blood, and intoxication as inspiration produced by drinking the blood; and, second, that it is often considered dangerous, especially for tabooed persons, to have either blood or a living person over their heads.

With regard to the first point, we are informed by Plutarch that of old the Egyptian kings neither drank wine nor offered it in libations to the gods, because they held it to be the blood of beings who had once fought against the gods, the vine having sprung from their rotting bodies; and the frenzy of intoxication was explained by the supposition that the drunken man was filled with the blood of the enemies of the gods. The Aztecs regarded *pulque* or the wine of the country as bad, on account of the wild deeds which men did under its influence. But these wild deeds were believed to be the acts, not of the drunken man, but of the wine-god by whom he was possessed and inspired; and so seriously was this theory of inspiration held that if any one spoke ill of or insulted a tipsy man, he was liable to be punished for disrespect to the wine-god incarnate in his votary. Hence, says Sahagun, it was believed, not without ground, that the Indians intoxicated themselves on purpose to commit with impunity crimes for which they would certainly have been punished if they had committed them sober. Thus it appears that on the primitive view intoxication or the inspiration produced by wine is exactly parallel to the inspiration produced by drinking the blood of animals. The soul or life is in the blood, and wine is the blood of the vine. Hence whoever drinks the blood of an animal is inspired with the soul of the animal or of the god, who, as we have seen, is often supposed to enter into the animal before it is slain; and whoever drinks wine drinks the blood, and so receives into himself the soul or spirit, of the god of the vine.

With regard to the second point, the fear of passing under blood or under a living person, we are told that some of the Australian blacks have a dread of passing under a leaning tree or

even under the rails of a fence. The reason they give is that a woman may have been upon the tree or fence, and some blood from her may have fallen on it and might fall from it on them. In Ugi, one of the Solomon Islands, a man will never, if he can help it, pass under a tree which has fallen across the path, for the reason that a woman may have stepped over it before him. Amongst the Karens of Burma "going under a house, especially if there are females within, is avoided; as is also the passing under trees of which the branches extend downwards in a particular direction, and the butt-end of fallen trees, etc." The Siamese think it unlucky to pass under a rope on which women's clothes are hung, and to avert evil consequences the person who has done so must build a chapel to the earth-spirit.

Probably in all such cases the rule is based on a fear of being brought into contact with blood, especially the blood of women. From a like fear a Maori will never lean his back against the wall of a native house. For the blood of women is supposed to have disastrous effects upon males. The Arunta of central Australia believe that a draught of woman's blood would kill the strongest man. In the Encounter Bay tribe of South Australia boys are warned that if they see the blood of women they will early become grey-headed and their strength will fail prematurely. Men of the Booandik tribe in South Australia think that if they see the blood of their women they will not be able to fight against their enemies and will be killed; if the sun dazzles their eyes at a fight, the first woman they afterwards meet is sure to get a blow from their club. In the island of Wetar it is thought that if a man or a lad comes upon a woman's blood he will be unfortunate in war and other undertakings, and that any precautions he may take to avoid the misfortune will be vain. The people of Ceram also believe that men who see women's blood will be wounded in battle. It is an Esthonian belief that men who see women's blood will suffer from an eruption on the skin. A Fan negro told Miss Kingsley that a young man in his village, who was so weak that he could hardly crawl about, had fallen into this state through seeing the blood of a woman who had been killed by a falling tree. "The underlying idea regarding blood is of course the old one that the blood is the life. The life in Africa means a spirit, hence the liberated blood is the liberated spirit, and liberated spirits are always whipping into people who do not want them. In the case of the young Fan, the opinion held was that the weak spirit of the woman had got into him."

§ 5. The Head tabooed.

Again, the reason for not passing under dangerous objects, like a vine or women's blood, is a fear that they may come in contact with the head; for among many peoples the head is peculiarly sacred. The special sanctity attributed to it is sometimes explained by a belief that it is the seat of a spirit which is very sensitive to injury or disrespect. Thus the Yorubas of the Slave Coast hold that every man has three spiritual inmates, of whom the first, called Olori, dwells in the head and is the man's protector, guardian, and guide. Offerings are made to this spirit, chiefly of fowls, and some of the blood mixed with palm-oil is rubbed on the forehead. The Karens of Burma suppose that a being called the *tso* resides in the upper part of the head, and while it retains its seat no harm can befall the person from the efforts of the seven *Kelahs*, or personified passions. "But if the *tso* becomes heedless or weak certain evil to the person is the result. Hence the head is carefully attended to, and all possible pains are taken to provide such dress and attire as will be pleasing to the *tso*." The Siamese think that a spirit called *khuan* or *kwun* dwells in the human head, of which it is the guardian spirit. The spirit must be carefully protected from injury of every kind; hence the act of shaving or cutting the hair is accompanied with many ceremonies. The *kwun* is very sensitive on points of honour, and would feel mortally insulted if the head in which he resides were touched by the hand of a stranger. When Dr. Bastian, in conversation with a brother of the king of Siam, raised his hand to touch the prince's skull in order to illustrate some medical remarks he was making, a sullen and threatening murmur bursting from the lips of the crouching courtiers

warned him of the breach of etiquette he had committed, for in Siam there is no greater insult to a man of rank than to touch his head. If a Siamese touch the head of another with his foot, both of them must build chapels to the earth-spirit to avert the omen. Nor does the guardian spirit of the head like to have the hair washed too often; it might injure or incommode him. It was a grand solemnity when the king of Burma's head was washed with water drawn from the middle of the river. Whenever the native professor, from whom Dr. Bastian took lessons in Burmese at Mandalay, had his head washed, which took place as a rule once a month, he was generally absent for three days together, that time being consumed in preparing for, and recovering from, the operation of head-washing. Dr. Bastian's custom of washing his head daily gave rise to much remark. The head of the king of Persia was cleaned only once a year, on his birthday. Roman women washed their heads annually on the thirteenth of August, Diana's day. The Indians of Peru fancied they could rid themselves of their sins by scrubbing their heads with a small stone and then washing them in a stream.

Again, the Burmese think it an indignity to have any one, especially a woman, over their heads, and for this reason Burmese houses have never more than one story. The houses are raised on posts above the ground, and whenever anything fell through the floor Dr. Bastian had always difficulty in persuading a servant to fetch it from under the house. In Rangoon a priest, summoned to the bedside of a sick man, climbed up a ladder and got in at the window rather than ascend the staircase, to reach which he must have passed under a gallery. A pious Burman of Rangoon, finding some images of Buddha in a ship's cabin, offered a high price for them, that they might not be degraded by sailors walking over them on the deck. Formerly in Siam no person might cross a bridge while his superior in rank was passing underneath, nor might he walk in a room above one in which his superior was sitting or lying. The Cambodians esteem it a grave offence to touch a man's head; some of them will not enter a place where anything whatever is suspended over their heads; and the meanest Cambodian would never consent to live under an inhabited room. Hence the houses are built of one story only; and even the Government respects the prejudice by never placing a prisoner in the stocks under the floor of a house, though the houses are raised high above the ground. The same superstition exists amongst the Malays; for an early traveller reports that in Java people "wear nothing on their heads, and say that nothing must be on their heads ... and if any person were to put his hand upon their head they would kill him; and they do not build houses with storeys, in order that they may not walk over each other's heads." In Uganda no person belonging to the king's totem clan was allowed to get on the top of the palace to roof it, for that would have been regarded as equivalent to getting on the top of the king. Hence the palace had to be roofed by men of a different clan from the king.

The same superstition as to the head is found in full force throughout Polynesia. Thus of Gattanewa, a Marquesan chief, it is said that "to touch the top of his head, or anything which had been on his head, was sacrilege. To pass over his head was an indignity never to be forgotten. Gattanewa, nay, all his family, scorned to pass a gateway which is ever closed, or a house with a door; all must be as open and free as their unrestrained manners. He would pass under nothing that had been raised by the hand of man, if there was a possibility of getting round or over it. Often have I seen him walk the whole length of our barrier, in preference to passing between our water-casks; and at the risk of his life scramble over the loose stones of a wall, rather than go through the gateway." Marquesan women have been known to refuse to go on the decks of ships for fear of passing over the heads of chiefs who might be below. The son of a Marquesan high priest has been seen to roll on the ground in an agony of rage and despair, begging for death, because some one had desecrated his head and deprived him of his divinity by sprinkling a few drops of water on his hair. But it was not the Marquesan chiefs only whose heads were sacred. The head of every Marquesan was taboo, and might

neither be touched nor stepped over by another; even a father might not step over the head of his sleeping child; women were forbidden to carry or touch anything that had been in contact with, or had merely hung over, the head of their husband or father. No one was allowed to be over the head of the king of Tonga. In Hawaii (the Sandwich Islands) if a man climbed upon a chiefs house or upon the wall of his yard, he was put to death; if his shadow fell on a chief, he was put to death; if he walked in the shadow of a chiefs house with his head painted white or decked with a garland or wetted with water, he was put to death. In Tahiti any one who stood over the king or queen, or passed his hand over their heads, might be put to death. Until certain rites were performed over it, a Tahitian infant was especially taboo; whatever touched the child's head, while it was in this state, became sacred and was deposited in a consecrated place raised in for the purpose at the child's house. If a branch of a tree touched the child's head, the tree was cut down; and if in its fall it injured another tree so as to penetrate the bark, that tree also was cut down as unclean and unfit for use. After the rites were performed these special taboos ceased; but the head of a Tahitian was always sacred, he never carried anything on it, and to touch it was an offence. In New Zealand "the heads of the chiefs were always tabooed (*tapu*), hence they could not pass, or sit, under food hung up; or carry food, as others, on their backs; neither would they eat a meal in a house, nor touch a calabash of water in drinking. No one could touch their head, nor, indeed, commonly speak of it, or allude to it; to do so offensively was one of their heaviest curses, and grossest insults, only to be wiped out with blood." So sacred was the head of a Maori chief that "if he only touched it with his fingers, he was obliged immediately to apply them to his nose, and snuff up the sanctity which they had acquired by the touch, and thus restore it to the part from whence it was taken." On account of the sacredness of his head a Maori chief "could not blow the fire with his mouth, for the breath being sacred, communicated his sanctity to it, and a brand might be taken by a slave, or a man of another tribe, or the fire might be used for other purposes, such as cooking, and so cause his death." It is a crime for a sacred person in New Zealand to leave his comb, or anything else which has touched his head, in a place where food has been cooked, or to suffer another person to drink out of any vessel which has touched his lips. Hence when a chief wishes to drink he never puts his lips to the vessel, but holds his hands close to his mouth so as to form a hollow, into which water is poured by another person, and thence is allowed to flow into his mouth. If a light is needed for his pipe, the burning ember taken from the fire must be thrown away as soon as it is used; for the pipe becomes sacred because it has touched his mouth; the coal becomes sacred because it has touched the pipe; and if a particle of the sacred cinder were replaced on the common fire, the fire would also become sacred and could no longer be used for cooking. Some Maori chiefs, like other Polynesians, object to go down into a ship's cabin from fear of people passing over their heads. Dire misfortune was thought by the Maoris to await those who entered a house where any article of animal food was suspended over their heads. "A dead pigeon, or a piece of pork hung from the roof, was a better protection from molestation than a sentinel." If I am right, the reason for the special objection to having animal food over the head is the fear of bringing the sacred head into contact with the spirit of the animal; just as the reason why the Flamen Dialis might not walk under a vine was the fear of bringing his sacred head into contact with the spirit of the vine. Similarly King Darius would not pass through a gate over which there was a tomb, because in doing so he would have had a corpse above his head. Among the Awuna tribes of the Gold Coast, West Africa, the worshippers of Hebesio, the god of thunder, believe that their heads are sacred, being associated in some mysterious way with the presence of the protective spirit of their god, which has passed into them through this channel at baptism. Hence they carefully guard their heads against injury, especially against any wound that might draw blood, for they think that such a wound would

entail the loss of reason on the sufferer, and that it would bring down the wrath of the thundering god and of his mouth-piece the fetish priest on the impious smiter.

§ 6. Hair tabooed.

When the head was considered so sacred that it might not even be touched without grave offence, it is obvious that the cutting of the hair must have been a delicate and difficult operation. The difficulties and dangers which, on the primitive view, beset the operation are of two kinds. There is first the danger of disturbing the spirit of the head, which may be injured in the process and may revenge itself upon the person who molests him. Secondly, there is the difficulty of disposing of the shorn locks. For the savage believes that the sympathetic connexion which exists between himself and every part of his body continues to exist even after the physical connexion has been broken, and that therefore he will suffer from any harm that may befall the severed parts of his body, such as the clippings of his hair or the parings of his nails. Accordingly he takes care that these severed portions of himself shall not be left in places where they might either be exposed to accidental injury or fall into the hands of malicious persons who might work magic on them to his detriment or death. Such dangers are common to all, but sacred persons have more to fear from them than ordinary people, so the precautions taken by them are proportionately stringent. The simplest way of evading the peril is not to cut the hair at all; and this is the expedient adopted where the risk is thought to be more than usually great. The Frankish kings were never allowed to crop their hair; from their childhood upwards they had to keep it unshorn. To poll the long locks that floated on their shoulders would have been to renounce their right to the throne. When the wicked brothers Clotaire and Chilbert coveted the kingdom of their dead brother Clodomir, they inveigled into their power their little nephews, the two sons of Clodomir; and having done so, they sent a messenger bearing scissors and a naked sword to the children's grandmother, Queen Clotilde, at Paris. The envoy shewed the scissors and the sword to Clotilde, and bade her choose whether the children should be shorn and live or remain unshorn and die. The proud queen replied that if her grandchildren were not to come to the throne she would rather see them dead than shorn. And murdered they were by their ruthless uncle Clotaire with his own hand. The king of Ponape, one of the Caroline Islands, must wear his hair long, and so must his grandees. The hair of the Aztec priests hung down to their hams, so that the weight of it became very troublesome; for they might never poll it so long as they lived, or at least until they had been relieved of their office on the score of old age. They wore it braided in great tresses, six fingers broad, and tied with cotton. A Haida medicine-man may neither clip nor comb his tresses, so they are always long and tangled. Among the Hos, a negro tribe of Togoland in West Africa, "there are priests on whose head no razor may come during the whole of their lives. The god who dwells in the man forbids the cutting of his hair on pain of death. If the hair is at last too long, the owner must pray to his god to allow him at least to clip the tips of it. The hair is in fact conceived as the seat and lodging-place of his god, so that were it shorn the god would lose his abode in the priest." A rain-maker at Boroma, on the lower Zambesi, used to give out that he was possessed by two spirits, one of a lion, the other of a leopard, and in the assemblies of the people he mimicked the roaring of these beasts. In order that their spirits might not leave him, he never cut his hair nor drank alcohol. The Masai clan of the El Kiboron, who are believed to possess the art of making rain, may not pluck out their beards, because the loss of their beards would, it is supposed, entail the loss of their rain-making powers. The head chief and the sorcerers of the Masai observe the same rule for a like reason: they think that were they to pull out their beards, their supernatural gifts would desert them. In central Borneo the chiefs of a particular Kayan family never allow their hair to be shorn. Ancient Indian law required that when a new king had performed the ceremony of consecration he might not shave his

hair for a year, though he was allowed to crop it. According to one account none of his subjects, except a Brahman, might have his hair cut during this period, and even horses were left unclipped. Amongst the Alfoors of Celebes the *Leleen* or priest who looks after the rice-fields may not shear his hair during the time that he exercises his special functions, that is from a month before the rice is sown until it is housed. In Usukuma, a district to the south of Lake Victoria Nyanza, the people are forbidden to shave their heads till the corn has been sown. Men of the Tsetsaut tribe in British Columbia do not cut their hair, believing that if they cut it they would quickly grow old. In Ceram men do not crop their hair: if married men did so, they would lose their wives; if young men did so, they would grow weak and enervated. In Timorlaut married men may not poll their hair for the same reason as in Ceram, but widowers and men on a journey may do so after offering a fowl or a pig in sacrifice. Malays of the Peninsula are forbidden to clip their hair during their wife's pregnancy and for forty days after the child has been born; and a similar abstention is said to have been formerly incumbent on all persons prosecuting a journey or engaged in war. Elsewhere men travelling abroad have been in the habit of leaving their hair unshorn until their return. The reason for this custom is probably the danger to which, as we have seen, a traveller is believed to be exposed from the magic arts of the strangers amongst whom he sojourns; if they got possession of his shorn hair, they might work his destruction through it. The Egyptians on a journey kept their hair uncut till they returned home. "At Tâif when a man returned from a journey his first duty was to visit the Rabba and poll his hair." Achilles kept unshorn his yellow hair, because his father had vowed to offer it to the River Sperchius if ever his son came home from the wars beyond the sea. Formerly when Dyak warriors returned with the heads of their enemies, each man cut off a lock from the front of his head and threw it into the river as a mode of ending the taboo to which they had been subjected during the expedition. Bechuanas after a battle had their hair shorn by their mothers "in order that new hair might grow, and that all which was old and polluted might disappear and be no more."

Again, men who have taken a vow of vengeance sometimes keep their hair unshorn till they have fulfilled their vow. Thus of the Marquesans we are told that "occasionally they have their head entirely shaved, except one lock on the crown, which is worn loose or put up in a knot. But the latter mode of wearing the hair is only adopted by them when they have a solemn vow, as to revenge the death of some near relation, etc. In such case the lock is never cut off until they have fulfilled their promise." A similar custom was sometimes observed by the ancient Germans; among the Chatti the young warriors never clipped their hair or their beard till they had slain an enemy. Six thousand Saxons once swore that they would not poll their hair nor shave their beards until they had taken vengeance on their foes. On one occasion a Hawaiian taboo is said to have lasted thirty years, "during which the men were not allowed to trim their beards, etc." While his vow lasted, a Nazarite might not have his hair cut: "All the days of the vow of his separation there shall no razor come upon his head." Possibly in this case there was a special objection to touching the tabooed man's head with iron. The Roman priests, as we have seen, were shorn with bronze knives. The same feeling perhaps gave rise to the European rule that a child's nails should not be pared during the first year, but that if it is absolutely necessary to shorten them they should be bitten off by the mother or nurse. For in all parts of the world a young child is believed to be especially exposed to supernatural dangers, and particular precautions are taken to guard it against them; in other words, the child is under a number of taboos, of which the rule just mentioned is one. "Among Hindus the usual custom seems to be that the nails of a first-born child are cut at the age of six months. With other children a year or two is allowed to elapse." The Slave, Hare, and Dogrib Indians of North-West America do not pare the nails of female children till they are four years of age. In Uganda a child's hair may not be cut until the child has received

a name. Should any of it be rubbed or plucked off accidentally, it is refastened to the child's head with string or by being knotted to the other hair. Amongst the Ewe negroes of the Slave Coast, a mother sometimes vows a sacrifice to the fetish if her infant should live. She then leaves the child unshorn till its fourth or sixth year, when she fulfils her vow and has the child's hair cut by a priest. To this day a Syrian mother will sometimes, like Hannah, devote her little one to God. When the child reaches a certain age, its hair is cut and weighed, and money is paid in proportion to the weight. If the boy thus dedicated is a Moslem, he becomes in time a dervish; if he is a Christian, he becomes a monk. Among the Toradjas of central Celebes, when a child's hair is cut to rid it of vermin, some locks are allowed to remain on the crown of the head as a refuge for one of the child's souls. Otherwise the soul would have no place in which to settle, and the child would sicken. The Karo-Bataks of Sumatra are much afraid of frightening away the soul (*těndi*) of a child; hence when they cut its hair, they always leave a patch unshorn, to which the soul can retreat before the shears. Usually this lock remains unshorn all through life, or at least up till manhood. In some parts of Germany it is thought that if a child's hair is combed in its first year the child will be unlucky; or that if a boy's hair is cut before his seventh year he will have no courage.

§ 7. Ceremonies at Hair-cutting.

But when it becomes necessary to crop the hair, measures are taken to lessen the dangers which are supposed to attend the operation. The chief of Namosi in Fiji always ate a man by way of precaution when he had had his hair cut. "There was a certain clan that had to provide the victim, and they used to sit in solemn council among themselves to choose him. It was a sacrificial feast to avert evil from the chief." This remarkable custom has been described more fully by another observer. The old heathen temple at Namosi is called Rukunitambua, "and round about it are hundreds of stones, each of which tells a fearful tale. A subject tribe, whose town was some little distance from Namosi, had committed an unpardonable offence, and were condemned to a frightful doom. The earth-mound on which their temple had stood was planted with the mountain *ndalo* (arum), and when the crop was ripe, the poor wretches had to carry it down to Namosi, and give at least one of their number to be killed and eaten by the chief. He used to take advantage of these occasions to have his hair cut, for the human sacrifice was supposed to avert all danger of witchcraft if any ill-wisher got hold of the cuttings of his hair, human hair being the most dangerous channel for the deadliest spells of the sorcerers. The stones round Rukunitambua represented these and other victims who had been killed and eaten at Namosi. Each stone was the record of a murder succeeded by a cannibal feast." Amongst the Maoris many spells were uttered at hair-cutting; one, for example, was spoken to consecrate the obsidian knife with which the hair was cut; another was pronounced to avert the thunder and lightning which hair-cutting was believed to cause. "He who has had his hair cut is in immediate charge of the Atua (spirit); he is removed from the contact and society of his family and his tribe; he dare not touch his food himself; it is put into his mouth by another person; nor can he for some days resume his accustomed occupations or associate with his fellow-men." The person who cuts the hair is also tabooed; his hands having been in contact with a sacred head, he may not touch food with them or engage in any other employment; he is fed by another person with food cooked over a sacred fire. He cannot be released from the taboo before the following day, when he rubs his hands with potato or fern root which has been cooked on a sacred fire; and this food having been taken to the head of the family in the female line and eaten by her, his hands are freed from the taboo. In some parts of New Zealand the most sacred day of the year was that appointed for hair-cutting; the people assembled in large numbers on that day from all the neighbourhood. Sometimes a Maori chief's hair was shorn by his wife, who was then tabooed for a week as a consequence of having touched his sacred locks. It is an affair of state when

the king of Cambodia's hair is cropped. The priests place on the barber's fingers certain old rings set with large stones, which are supposed to contain spirits favourable to the kings, and during the operation the Brahmans keep up a noisy music to drive away the evil spirits. The hair and nails of the Mikado could only be cut while he was asleep, perhaps because his soul being then absent from his body, there was less chance of injuring it with the shears.

From their earliest days little Siamese children have the crown of the head clean shorn with the exception of a single small tuft of hair, which is daily combed, twisted, oiled, and tied in a little knot until the day when it is finally removed with great pomp and ceremony. The ceremony of shaving the top-knot takes place before the child has reached puberty, and great anxiety is felt at this time lest the *kwun*, or guardian-spirit who commonly resides in the body and especially the head of every Siamese, should be so disturbed by the tonsure as to depart and leave the child a hopeless wreck for life. Great pains are therefore taken to recall this mysterious being in case he should have fled, and to fix him securely in the child. This is the object of an elaborate ceremony performed on the afternoon of the day when the top-knot has been cut. A miniature pagoda is erected, and on it are placed several kinds of food known to be favourites of the spirit. When the *kwun* has arrived and is feasting on these dainties, he is caught and held fast under a cloth thrown over the food. The child is now placed near the pagoda, and all the family and friends form a circle, with the child, the captured spirit, and the Brahman priests in the middle. Hereupon the priests address the spirit, earnestly entreating him to enter into the child. They amuse him with tales, and coax and wheedle him with flattery, jest, and song; the gongs ring out their loudest; the people cheer and only a *kwun* of the sourest and most obdurate disposition could resist the combined appeal. The last sentences of the formal invocation run as follows: "Benignant *kwun*! Thou fickle being who art wont to wander and dally about! From the moment that the child was conceived in the womb, thou hast enjoyed every pleasure, until ten (lunar) months having elapsed and the time of delivery arrived, thou hast suffered and run the risk of perishing by being born alive into the world. Gracious *kwun*! thou wast at that time so tender, delicate, and wavering as to cause great anxiety concerning thy fate; thou wast exactly like a child, youthful, innocent, and inexperienced. The least trifle frightened thee and made thee shudder. In thy infantile playfulness thou wast wont to frolic and wander to no purpose. As thou didst commence to learn to sit, and, unassisted, to crawl tottering on all fours, thou wast ever falling flat on thy face or on thy back. As thou didst grow up in years and couldst move thy steps firmly, thou didst begin to run and sport thoughtlessly and rashly all round the rooms, the terrace, and bridging planks of travelling boat or floating house, and at times thou didst fall into the stream, creek, or pond, among the floating water-weeds, to the utter dismay of those to whom thy existence was most dear. O gentle *kwun*, come into thy corporeal abode; do not delay this auspicious rite. Thou art now full-grown and dost form everybody's delight and admiration. Let all the tiny particles of *kwun* that have fallen on land or water assemble and take permanent abode in this darling little child. Let them all hurry to the site of this auspicious ceremony and admire the magnificent preparations made for them in this hall." The brocaded cloth from the pagoda, under which lurks the captive spirit, is now rolled up tightly and handed to the child, who is told to clasp it firmly to his breast and not let the *kwun* escape. Further, the child drinks the milk of the coco-nuts which had been offered to the spirit, and by thus absorbing the food of the *kwun* ensures the presence of that precious spirit in his body. A magic cord is tied round his wrist to keep off the wicked spirits who would lure the *kwun* away from home; and for three nights he sleeps with the embroidered cloth from the pagoda fast clasped in his arms.

§ 8. Disposal of Cut Hair and Nails.

But even when the hair and nails have been safely cut, there remains the difficulty of disposing of them, for their owner believes himself liable to suffer from any harm that may befall them. The notion that a man may be bewitched by means of the clippings of his hair, the parings of his nails, or any other severed portion of his person is almost world-wide, and attested by evidence too ample, too familiar, and too tedious in its uniformity to be here analysed at length. The general idea on which the superstition rests is that of the sympathetic connexion supposed to persist between a person and everything that has once been part of his body or in any way closely related to him. A very few examples must suffice. They belong to that branch of sympathetic magic which may be called contagious. Thus, when the Chilote Indians, inhabiting the wild, deeply indented coasts and dark rain-beaten forests of southern Chili, get possession of the hair of an enemy, they drop it from a high tree or tie it to a piece of seaweed and fling it into the surf; for they think that the shock of the fall, or the blows of the waves as the tress is tossed to and fro on the heaving billows, will be transmitted through the hair to the person from whose head it was cut. Dread of sorcery, we are told, formed one of the most salient characteristics of the Marquesan islanders in the old days. The sorcerer took some of the hair, spittle, or other bodily refuse of the man he wished to injure, wrapped it up in a leaf, and placed the packet in a bag woven of threads or fibres, which were knotted in an intricate way. The whole was then buried with certain rites, and thereupon the victim wasted away of a languishing sickness which lasted twenty days. His life, however, might be saved by discovering and digging up the buried hair, spittle, or what not; for as soon as this was done the power of the charm ceased. A Marquesan chief told Lieutenant Gamble that he was extremely ill, the Happah tribe having stolen a lock of his hair and buried it in a plantain leaf for the purpose of taking his life. Lieutenant Gamble argued with him, but in vain; die he must unless the hair and the plantain leaf were brought back to him; and to obtain them he had offered the Happahs the greater part of his property. He complained of excessive pain in the head, breast, and sides. A Maori sorcerer intent on bewitching somebody sought to get a tress of his victim's hair, the parings of his nails, some of his spittle, or a shred of his garment. Having obtained the object, whatever it was, he chanted certain spells and curses over it in a falsetto voice and buried it in the ground. As the thing decayed, the person to whom it had belonged was supposed to waste away. Again, an Australian girl, sick of a fever, laid the blame of her illness on a young man who had come behind her and cut off a lock of her hair; she was sure he had buried it and that it was rotting. "Her hair," she said, "was rotting somewhere, and her *Marm-bu-la* (kidney fat) was wasting away, and when her hair had completely rotted, she would die." When an Australian blackfellow wishes to get rid of his wife, he cuts off a lock of her hair in her sleep, ties it to his spear-thrower, and goes with it to a neighbouring tribe, where he gives it to a friend. His friend sticks the spear-thrower up every night before the camp fire, and when it falls down it is a sign that the wife is dead. The way in which the charm operates was explained to Dr. Howitt by a Wirajuri man. "You see," he said, "when a blackfellow doctor gets hold of something belonging to a man and roasts it with things, and sings over it, the fire catches hold of the smell of the man, and that settles the poor fellow." A slightly different form of the charm as practised in Australia is to fasten the enemy's hair with wax to the pinion bone of a hawk, and set the bone in a small circle of fire. According as the sorcerer desires the death or only the sickness of his victim he leaves the bone in the midst of the fire or removes it and lays it in the sun. When he thinks he has done his enemy enough harm, he places the bone in water, which ends the enchantment. Lucian describes how a Syrian witch professed to bring back a faithless lover to his forsaken fair one by means of a lock of his hair, his shoes, his garments, or something of that sort. She hung the hair, or whatever it was, on a peg and fumigated it with brimstone, sprinkling salt on the fire and mentioning the names of the lover and his lass. Then she drew a magic wheel from her bosom and set it spinning, while she gabbled a spell full of barbarous

and fearsome words. This soon brought the false lover back to the feet of his charmer. Apuleius tells how an amorous Thessalian witch essayed to win the affections of a handsome Boeotian youth by similar means. As darkness fell she mounted the roof, and there, surrounded by a hellish array of dead men's bones, she knotted the severed tresses of auburn hair and threw them on the glowing embers of a perfumed fire. But her cunning handmaid had outwitted her; the hair was only goat's hair; and all her enchantments ended in dismal and ludicrous failure.

The Huzuls of the Carpathians imagine that if mice get a person's shorn hair and make a nest of it, the person will suffer from headache or even become idiotic. Similarly in Germany it is a common notion that if birds find a person's cut hair, and build their nests with it, the person will suffer from headache; sometimes it is thought that he will have an eruption on the head. The same superstition prevails, or used to prevail, in West Sussex. "I knew how it would be," exclaimed a maidservant one day, "when I saw that bird fly off with a bit of my hair in its beak that blew out of the window this morning when I was dressing; I knew I should have a clapping headache, and so I have." In like manner the Scottish Highlanders believe that if cut or loose hair is allowed to blow away with the wind and it passes over an empty nest, or a bird takes it to its nest, the head from which it came will ache. The Todas of southern India hide their clipped hair in bushes or hollows in the rocks, in order that it may not be found by crows, and they bury the parings of their nails lest they should be eaten by buffaloes, with whom, it is believed, they would disagree.

Again it is thought that cut or combed-out hair may disturb the weather by producing rain and hail, thunder and lightning. We have seen that in New Zealand a spell was uttered at hair-cutting to avert thunder and lightning. In the Tyrol, witches are supposed to use cut or combed-out hair to make hailstones or thunderstorms with. Thlinket Indians have been known to attribute stormy weather to the rash act of a girl who had combed her hair outside of the house. The Romans seem to have held similar views, for it was a maxim with them that no one on shipboard should cut his hair or nails except in a storm, that is, when the mischief was already done. In the Highlands of Scotland it is said that no sister should comb her hair at night if she have a brother at sea. In West Africa, when the Mani of Chitombe or Jumba died, the people used to run in crowds to the corpse and tear out his hair, teeth, and nails, which they kept as a rain-charm, believing that otherwise no rain would fall. The Makoko of the Anzikos begged the missionaries to give him half their beards as a rain-charm. When Du Chaillu had his hair cut among the Ashira of West Africa, the people scuffled and fought for the clippings of his hair, even the aged king himself taking part in the scrimmage. Every one who succeeded in getting some of the hairs wrapped them up carefully and went off in triumph. When the traveller, who was regarded as a spirit by these simple-minded folk, asked the king what use the clippings could be to him, his sable majesty replied, "Oh, spirit! these hairs are very precious; we shall make *mondas* (fetiches) of them, and they will bring other white men to us, and bring us great good luck and riches. Since you have come to us, oh spirit! we have wished to have some of your hair, but did not dare to ask for it, not knowing that it could be cut." The Wabondei of eastern Africa preserve the hair and nails of their dead chiefs and use them both for the making of rain and the healing of the sick. The hair, beard, and nails of their deceased chiefs are the most sacred possession, the most precious treasure of the Baronga of south-eastern Africa. Preserved in pellets of cow-dung wrapt round with leathern thongs, they are kept in a special hut under the charge of a high priest, who offers sacrifices and prayers at certain seasons, and has to observe strict continence for a month before he handles these holy relics in the offices of religion. A terrible drought was once the result of this palladium falling into the hands of the enemy. In some Victorian tribes the sorcerer used to burn human hair in time of drought; it was never burned at other times for

fear of causing a deluge of rain. Also when the river was low, the sorcerer would place human hair in the stream to increase the supply of water.

If cut hair and nails remain in sympathetic connexion with the person from whose body they have been severed, it is clear that they can be used as hostages for his good behaviour by any one who may chance to possess them; for on the principles of contagious magic he has only to injure the hair or nails in order to hurt simultaneously their original owner. Hence when the Nandi have taken a prisoner they shave his head and keep the shorn hair as a surety that he will not attempt to escape; but when the captive is ransomed, they return his shorn hair with him to his own people. For a similar reason, perhaps, when the Tiaha, an Arab tribe of Moab, have taken a prisoner whom they do not wish to put to death, they shave one corner of his head above his temples and let him go. So, too, an Arab of Moab who pardons a murderer will sometimes cut off the man's hair and shave his chin before releasing him. Again, when two Moabite Arabs had got hold of a traitor who had revealed their plan of campaign to the enemy, they contented themselves with shaving completely one side of his head and his moustache on the other, after which they set him at liberty. We can now, perhaps, understand why Hanun King of Ammon shaved off one-half of the beards of King David's messengers and cut off half their garments before he sent them back to their master. His intention, we may conjecture, was not simply to put a gross affront on the envoys. He distrusted the ambitious designs of King David and wished to have some guarantee of the maintenance of peace and friendly relations between the two countries. That guarantee he may have imagined that he possessed in half of the beards and garments of the ambassadors; and if that was so, we may suppose that when the indignant David set the army of Israel in motion against Ammon, and the fords of Jordan were alive with the passage of his troops, the wizards of Ammon were busy in the strong keep of Rabbah muttering their weird spells and performing their quaint enchantments over the shorn hair and severed skirts in order to dispel the thundercloud of war that was gathering black about their country. Vain hopes! The city fell, and from the gates the sad inhabitants trooped forth in thousands to be laid in long lines on the ground and sawed asunder or ripped up with harrows or to walk into the red glow of the burning brick kilns. Again, the parings of nails may serve the same purpose as the clippings of hair; they too may be treated as bail for the good behaviour of the persons from whose fingers they have been cut. It is apparently on this principle that when the Ba-yaka of the Congo valley cement a peace, the chiefs of the two tribes meet and eat a cake which contains some of their nail-parings as a pledge of the maintenance of the treaty. They believe that he who breaks an engagement contracted in this solemn manner will die. Each of the high contracting parties has in fact given hostages to fortune in the shape of the nail-parings which are lodged in the other man's stomach.

To preserve the cut hair and nails from injury and from the dangerous uses to which they may be put by sorcerers, it is necessary to deposit them in some safe place. Hence the natives of the Maldives carefully keep the cuttings of their hair and nails and bury them, with a little water, in the cemeteries; "for they would not for the world tread upon them nor cast them in the fire, for they say that they are part of their body, and demand burial as it does; and, indeed, they fold them neatly in cotton; and most of them like to be shaved at the gates of temples and mosques." In New Zealand the severed hair was deposited on some sacred spot of ground "to protect it from being touched accidentally or designedly by any one." The shorn locks of a chief were gathered with much care and placed in an adjoining cemetery. The Tahitians buried the cuttings of their hair at the temples. In the streets of Soku, West Africa, a modern traveller observed cairns of large stones piled against walls with tufts of human hair inserted in the crevices. On asking the meaning of this, he was told that when any native of the place polled his hair he carefully gathered up the clippings and deposited

them in one of these cairns, all of which were sacred to the fetish and therefore inviolable. These cairns of sacred stones, he further learned, were simply a precaution against witchcraft, for if a man were not thus careful in disposing of his hair, some of it might fall into the hands of his enemies, who would, by means of it, be able to cast spells over him and so compass his destruction. When the top-knot of a Siamese child has been cut with great ceremony, the short hairs are put into a little vessel made of plantain leaves and set adrift on the nearest river or canal. As they float away, all that was wrong or harmful in the child's disposition is believed to depart with them. The long hairs are kept till the child makes a pilgrimage to the holy Footprint of Buddha on the sacred hill at Prabat. They are then presented to the priests, who are supposed to make them into brushes with which they sweep the Footprint; but in fact so much hair is thus offered every year that the priests cannot use it all, so they quietly burn the superfluity as soon as the pilgrims' backs are turned. The cut hair and nails of the Flamen Dialis were buried under a lucky tree. The shorn tresses of the Vestal virgins were hung on an ancient lotus-tree. In Morocco women often hang their cut hair on a tree that grows on or near the grave of a wonder-working saint; for they think thus to rid themselves of headache or to guard against it. In Germany the clippings of hair used often to be buried under an elder-bush. In Oldenburg cut hair and nails are wrapt in a cloth which is deposited in a hole in an elder-tree three days before the new moon; the hole is then plugged up. In the West of Northumberland it is thought that if the first parings of a child's nails are buried under an ash-tree, the child will turn out a fine singer. In Amboyna, before a child may taste sago-pap for the first time, the father cuts off a lock of the infant's hair, which he buries under a sago-palm. In the Aru Islands, when a child is able to run alone, a female relation shears a lock of its hair and deposits it on a banana-tree. In the island of Rotti it is thought that the first hair which a child gets is not his own, and that, if it is not cut off, it will make him weak and ill. Hence, when the child is about a month old, his hair is polled with much ceremony. As each of the friends who are invited to the ceremony enters the house he goes up to the child, snips off a little of its hair and drops it into a coco-nut shell full of water. Afterwards the father or another relation takes the hair and packs it into a little bag made of leaves, which he fastens to the top of a palm-tree. Then he gives the leaves of the palm a good shaking, climbs down, and goes home without speaking to any one. Indians of the Yukon territory, Alaska, do not throw away their cut hair and nails, but tie them up in little bundles and place them in the crotches of trees or wherever they are not likely to be disturbed by beasts. For "they have a superstition that disease will follow the disturbance of such remains by animals."

Often the clipped hair and nails are stowed away in any secret place, not necessarily in a temple or cemetery or at a tree, as in the cases already mentioned. Thus in Swabia you are recommended to deposit your clipped hair in some spot where neither sun nor moon can shine on it, for example in the earth or under a stone. In Danzig it is buried in a bag under the threshold. In Ugi, one of the Solomon Islands, men bury their hair lest it should fall into the hands of an enemy who would make magic with it and so bring sickness or calamity on them. The same fear seems to be general in Melanesia, and has led to a regular practice of hiding cut hair and nails. In Fiji, the shorn hair is concealed in the thatch of the house. Most Burmese and Shans tie the combings of their hair and the parings of their nails to a stone and sink them in deep water or bury them in the ground. The Zend-Avesta directs that the clippings of hair and the parings of nails shall be placed in separate holes, and that three, six, or nine furrows shall be drawn round each hole with a metal knife. In the *Grihya-Sûtras* it is provided that the hair cut from a child's head at the end of the first, third, fifth, or seventh year shall be buried in the earth at a place covered with grass or in the neighbourhood of water. At the end of the period of his studentship a Brahman has his hair shaved and his nails cut; and a person who is kindly disposed to him gathers the shorn hair and the clipped nails, puts them in a lump of bull's dung, and buries them in a cow-stable or near an *adumbara* tree

or in a clump of *darbha* grass, with the words, "Thus I hide the sins of So-and-so." The Madi or Moru tribe of central Africa bury the parings of their nails in the ground. In Uganda grown people throw away the clippings of their hair, but carefully bury the parings of their nails. The A-lur are careful to collect and bury both their hair and nails in safe places. The same practice prevails among many tribes of South Africa, from a fear lest wizards should get hold of the severed particles and work evil with them. The Caffres carry still further this dread of allowing any portion of themselves to fall into the hands of an enemy; for not only do they bury their cut hair and nails in a secret spot, but when one of them cleans the head of another he preserves the vermin which he catches, "carefully delivering them to the person to whom they originally appertained, supposing, according to their theory, that as they derived their support from the blood of the man from whom they were taken, should they be killed by another, the blood of his neighbour would be in his possession, thus placing in his hands the power of some superhuman influence." Amongst the Wanyoro of central Africa all cuttings of the hair and nails are carefully stored under the bed and afterwards strewed about among the tall grass. Similarly the Wahoko of central Africa take pains to collect their cut hair and nails and scatter them in the forest. The Asa, a branch of the Masai, hide the clippings of their hair and the parings of their nails or throw them away far from the kraal, lest a sorcerer should get hold of them and make their original owners ill by his magic. In North Guinea the parings of the finger-nails and the shorn locks of the head are scrupulously concealed, lest they be converted into a charm for the destruction of the person to whom they belong. For the same reason the clipped hair and nail-parings of chiefs in Southern Nigeria are secretly buried. Among the Thompson Indians of British Columbia loose hair was buried, hidden, or thrown into the water, because, if an enemy got hold of it, he might bewitch the owner. In Bolang Mongondo, a district of western Celebes, the first hair cut from a child's head is kept in a young coco-nut, which is commonly hung on the front of the house, under the roof. To spit upon the hair before throwing it away is thought in some parts of Europe to be a sufficient safeguard against its use by witches. Spitting as a protective charm is well known.

Sometimes the severed hair and nails are preserved, not to prevent them from falling into the hands of a magician, but that the owner may have them at the resurrection of the body, to which some races look forward. Thus the Incas of Peru "took extreme care to preserve the nail-parings and the hairs that were shorn off or torn out with a comb; placing them in holes or niches in the walls; and if they fell out, any other Indian that saw them picked them up and put them in their places again. I very often asked different Indians, at various times, why they did this, in order to see what they would say, and they all replied in the same words saying, 'Know that all persons who are born must return to life' (they have no word to express resuscitation), 'and the souls must rise out of their tombs with all that belonged to their bodies. We, therefore, in order that we may not have to search for our hair and nails at a time when there will be much hurry and confusion, place them in one place, that they may be brought together more conveniently, and, whenever it is possible, we are also careful to spit in one place.' " In Chili this custom of stuffing the shorn hair into holes in the wall is still observed, it being thought the height of imprudence to throw the hair away. Similarly the Turks never throw away the parings of their nails, but carefully stow them in cracks of the walls or of the boards, in the belief that they will be needed at the resurrection. The Armenians do not throw away their cut hair and nails and extracted teeth, but hide them in places that are esteemed holy, such as a crack in the church wall, a pillar of the house, or a hollow tree. They think that all these severed portions of themselves will be wanted at the resurrection, and that he who has not stowed them away in a safe place will have to hunt about for them on the great day. With the same intention the Macedonians bury the parings of their nails in a hole, and devout Moslems in Morocco hide them in a secret place. Similarly the Arabs of Moab bestow the parings of their nails in the crannies of walls, where they are

sanguine enough to expect to find them when they appear before their Maker. Some of the Esthonians keep the parings of their finger and toe nails in their bosom, in order to have them at hand when they are asked for them at the day of judgment. In a like spirit peasants of the Vosges will sometimes bury their extracted teeth secretly, marking the spot well so that they may be able to walk straight to it on the resurrection day. In the village of Drumconrath, near Abbeyleix, in Ireland, there used to be some old women who, having ascertained from Scripture that the hairs of their heads were all numbered by the Almighty, expected to have to account for them at the day of judgment. In order to be able to do so they stuffed the severed hair away in the thatch of their cottages. In Abyssinia men who have had their hands or feet cut off are careful to dry the severed limbs over a fire and preserve them in butter for the purpose of being buried with them in the grave. Thus they expect to get up with all their limbs complete at the general rising. The pains taken by the Chinese to preserve corpses entire and free from decay seems to rest on a firm belief in the resurrection of the dead; hence it is natural to find their ancient books laying down a rule that the hair, nails, and teeth which have fallen out during life should be buried with the dead in the coffin, or at least in the grave. The Fors of central Africa object to cut any one else's nails, for should the part cut off be lost and not delivered into its owner's hands, it will have to be made up to him somehow or other after death. The parings are buried in the ground.
