fields with burning torches in their hands, while they adjured the field-mice to quit the wheat on pain of having their whiskers burned. In the department of Ain the great fires of straw and faggots which are kindled in the fields at this time are or were supposed to destroy the nests of the caterpillars. At Verges, a lonely village surrounded by forests between the Jura and the Combe d'Ain, the torches used at this season were kindled in a peculiar manner. The young people climbed to the top of a mountain, where they placed three nests of straw in three trees. These nests being then set on fire, torches made of dry lime-wood were lighted at them, and the merry troop descended the mountain to their flickering light, and went to every house in the village, demanding roasted peas and obliging all couples who had been married within the year to dance. In Berry, a district of central France, it appears that bonfires are not lighted on this day, but when the sun has set the whole population of the villages, armed with blazing torches of straw, disperse over the country and scour the fields, the vineyards, and the orchards. Seen from afar, the multitude of moving lights, twinkling in the darkness, appear like will-o'-the-wisps chasing each other across the plains, along the hillsides, and down the valleys. While the men wave their flambeaus about the branches of the fruit-trees, the women and children tie bands of wheaten-straw round the tree-trunks. The effect of the ceremony is supposed to be to avert the various plagues from which the fruits of the earth are apt to suffer; and the bands of straw fastened round the stems of the trees are believed to render them fruitful. In the peninsula of La Manche the Norman peasants used to spend almost the whole night of the first Sunday in Lent rushing about the country with lighted torches for the purpose, as they supposed, of driving away the moles and field-mice; fires were also kindled on some of the dolmens.

In Germany, Austria, and Switzerland at the same season similar customs have prevailed. Thus in the Eifel Mountains, Rhenish Prussia, on the first Sunday in Lent young people used to collect straw and brushwood from house to house. These they carried to an eminence and piled up round a tall, slim beech-tree, to which a piece of wood was fastened at right angles to form a cross. The structure was known as the "hut" or "castle." Fire was set to it and the young people marched round the blazing "castle" bareheaded, each carrying a lighted torch and praying aloud. Sometimes a straw-man was burned in the "hut." People observed the direction in which the smoke blew from the fire. If it blew towards the corn-fields, it was a sign that the harvest would be abundant. On the same day, in some parts of the Eifel, a great wheel was made of straw and dragged by three horses to the top of a hill. Thither the village boys marched at nightfall, set fire to the wheel, and sent it rolling down the slope. Two lads followed it with levers to set it in motion again, in case it should anywhere meet with a check. At Oberstattfeld the wheel had to be provided by the young man who was last married. About Echternach in Luxemburg the same ceremony is called "burning the witch"; while it is going on, the older men ascend the heights and observe what wind is blowing, for that is the wind which will prevail the whole year. At Voralberg in the Tyrol, on the first Sunday in Lent, a slender young fir-tree is surrounded with a pile of straw and firewood. To the top of the tree is fastened a human figure called the "witch," made of old clothes and stuffed with gunpowder. At night the whole is set on fire and boys and girls dance round it, swinging torches and singing rhymes in which the words "corn in the winnowing-basket, the plough in the earth" may be distinguished. In Swabia on the first Sunday in Lent a figure called the "witch" or the "old wife" or "winter's grandmother" is made up of clothes and fastened to a pole. This is stuck in the middle of a pile of wood, to which fire is applied. While the "witch" is burning, the young people throw blazing discs into the air. The discs are thin round pieces of wood, a few inches in diameter, with notched edges to imitate the rays of the sun or stars. They have a hole in the middle, by which they are attached to the end of a wand. Before the disc is thrown it is set on fire, the wand is swung to and fro, and the impetus thus communicated to the disc is augmented by dashing the rod sharply against a sloping board.

The burning disc is thus thrown off, and mounting high into the air, describes a long fiery curve before it reaches the ground. A single lad may fling up forty or fifty of these discs, one after the other. The object is to throw them as high as possible. The wand by which they are hurled must, at least in some parts of Swabia, be of hazel. Sometimes the lads also leap over the fire brandishing lighted torches of pine-wood. The charred embers of the burned "witch" and discs are taken home and planted in the flax-fields the same night, in the belief that they will keep vermin from the fields. At Wangen, near Molsheim in Baden, a like custom is observed on the first Sunday in Lent. The young people kindle a bonfire on the crest of the mountain above the village; and the burning discs which they hurl into the air are said to present in the darkness the aspect of a continual shower of falling stars. When the supply of discs is exhausted and the bonfire begins to burn low, the boys light torches and run with them at full speed down one or other of the three steep and winding paths that descend the mountain-side to the village. Bumps, bruises, and scratches are often the result of their efforts to outstrip each other in the headlong race. In the Rhön Mountains, situated on the borders of Hesse and Bavaria, the people used to march to the top of a hill or eminence on the first Sunday in Lent. Children and lads carried torches, brooms daubed with tar, and poles swathed in straw. A wheel, wrapt in combustibles, was kindled and rolled down the hill; and the young people rushed about the fields with their burning torches and brooms, till at last they flung them in a heap, and standing round them, struck up a hymn or a popular song. The object of running about the fields with the blazing torches was to "drive away the wicked sower." Or it was done in honour of the Virgin, that she might preserve the fruits of the earth throughout the year and bless them. In neighbouring villages of Hesse, between the Rhön and the Vogel Mountains, it is thought that wherever the burning wheels roll, the fields will be safe from hail and storm. At Konz on the Moselle, on the Thursday before the first Sunday in Lent, the two guilds of the butchers and the weavers used to repair to the Marxberg and there set up an oak-tree with a wheel fastened to it. On the following Sunday the people ascended the hill, cut down the oak, set fire to the wheel, and sent both oak and wheel rolling down the hillside, while a guard of butchers, mounted on horses, fired at the flaming wheel in its descent. If the wheel rolled down into the Moselle, the butchers were rewarded with a waggon-load of wine by the archbishop of Treves.

In Switzerland, also, it is or used to be customary to kindle bonfires on high places on the evening of the first Sunday in Lent, and the day is therefore popularly known as Spark Sunday. The custom prevailed, for example, throughout the canton of Lucerne. Boys went about from house to house begging for wood and straw, then piled the fuel on a conspicuous mountain or hill round about a pole, which bore a straw effigy called "the witch." At nightfall the pile was set on fire, and the young folks danced wildly round it, some of them cracking whips or ringing bells; and when the fire burned low enough, they leaped over it. This was called "burning the witch." In some parts of the canton also they used to wrap old wheels in straw and thorns, put a light to them, and send them rolling and blazing down hill. The same custom of rolling lighted wheels down hill is attested by old authorities for the cantons of Aargau and Bâle. The more bonfires could be seen sparkling and flaring in the darkness, the more fruitful was the year expected to be; and the higher the dancers leaped beside or over the fire, the higher, it was thought, would grow the flax. In the district of Freiburg and at Birseck in the district of Bâle it was the last married man or woman who must kindle the bonfire. While the bonfires blazed up, it was customary in some parts of Switzerland to propel burning discs of wood through the air by means of the same simple machinery which is used for the purpose in Swabia. Each lad tried to send his disc fizzing and flaring through the darkness as far as possible, and in discharging it he mentioned the name of the person to whose honour it was dedicated. But in Prättigau the words uttered in launching the fiery discs referred to the abundance which was apparently expected to follow the performance of the

ceremony. Among them were, “Grease in the pan, corn in the fan, and the plough in the earth!”

It seems hardly possible to separate from these bonfires, kindled on the first Sunday in Lent, the fires in which, about the same season, the effigy called Death is burned as part of the ceremony of “carrying out Death.” We have seen that at Spachendorf, in Austrian Silesia, on the morning of Rupert's Day (Shrove Tuesday?), a straw-man, dressed in a fur coat and a fur cap, is laid in a hole outside the village and there burned, and that while it is blazing every one seeks to snatch a fragment of it, which he fastens to a branch of the highest tree in his garden or buries in his field, believing that this will make the crops to grow better. The ceremony is known as the “burying of Death.” Even when the straw-man is not designated as Death, the meaning of the observance is probably the same; for the name Death, as I have tried to shew, does not express the original intention of the ceremony. At Cobern in the Eifel Mountains the lads make up a straw-man on Shrove Tuesday. The effigy is formally tried and accused of having perpetrated all the thefts that have been committed in the neighbourhood throughout the year. Being condemned to death, the straw-man is led through the village, shot, and burned upon a pyre. They dance round the blazing pile, and the last bride must leap over it. In Oldenburg on the evening of Shrove Tuesday people used to make long bundles of straw, which they set on fire, and then ran about the fields waving them, shrieking, and singing wild songs. Finally they burned a straw-man on the field. In the district of Düsseldorf the straw-man burned on Shrove Tuesday was made of an unthreshed sheaf of corn. On the first Monday after the spring equinox the urchins of Zurich drag a straw-man on a little cart through the streets, while at the same time the girls carry about a May-tree. When vespers ring, the straw-man is burned. In the district of Aachen on Ash Wednesday a man used to be encased in peas-straw and taken to an appointed place. Here he slipped quietly out of his straw casing, which was then burned, the children thinking that it was the man who was being burned. In the Val di Ledro (Tyrol) on the last day of the Carnival a figure is made up of straw and brushwood and then burned. The figure is called the Old Woman, and the ceremony “burning the Old Woman.”

§ 2. The Easter Fires.

Another occasion on which these fire-festivals are held is Easter Eve, the Saturday before Easter Sunday. On that day it has been customary in Catholic countries to extinguish all the lights in the churches, and then to make a new fire, sometimes with flint and steel, sometimes with a burning-glass. At this fire is lit the great Paschal or Easter candle, which is then used to rekindle all the extinguished lights in the church. In many parts of Germany a bonfire is also kindled, by means of the new fire, on some open space near the church. It is consecrated, and the people bring sticks of oak, walnut, and beech, which they char in the fire, and then take home with them. Some of these charred sticks are thereupon burned at home in a newly-kindled fire, with a prayer that God will preserve the homestead from fire, lightning, and hail. Thus every house receives “new fire.” Some of the sticks are kept throughout the year and laid on the hearth-fire during heavy thunder-storms to prevent the house from being struck by lightning, or they are inserted in the roof with the like intention. Others are placed in the fields, gardens, and meadows, with a prayer that God will keep them from blight and hail. Such fields and gardens are thought to thrive more than others; the corn and the plants that grow in them are not beaten down by hail, nor devoured by mice, vermin, and beetles; no witch harms them, and the ears of corn stand close and full. The charred sticks are also applied to the plough. The ashes of the Easter bonfire, together with the ashes of the consecrated palm-branches, are mixed with the seed at sowing. A wooden figure called Judas is sometimes burned in the consecrated bonfire, and even where this custom has been abolished the bonfire itself in some places goes by the name of “the burning of Judas.”

In the Hollertau, Bavaria, the young men used to light their lanterns at the newly-kindled Easter candle in the church and then race to the bonfire; he who reached it first set fire to the pile, and next day, Easter Sunday, was rewarded at the church-door by the housewives, who presented him with red eggs. Great was the jubilation while the effigy of the traitor was being consumed in the flames. The ashes were carefully collected and thrown away at sunrise in running water. In many parts of the Abruzzi, also, pious people kindle their fires on Easter Saturday with a brand brought from the sacred new fire in the church. When the brand has thus served to bless the fire on the domestic hearth, it is extinguished, and the remainder is preserved, partly in a cranny of the outer wall of the house, partly on a tree to which it is tied. This is done for the purpose of guarding the homestead against injury by storms. At Campo di Giove the people say that if you can get a piece of one of the three holy candles which the priest lights from the new fire, you should allow a few drops of the wax to fall into the crown of your hat; for after that, if it should thunder and lighten, you have nothing to do but to clap the hat on your head, and no flash of lightning can possibly strike you.

Further, it deserves to be noted that in the Abruzzi water as well as fire is, as it were, renewed and consecrated on Easter Saturday. Most people fetch holy water on that day from the churches, and every member of the family drinks a little of it, believing that it has power to protect him or her against witchcraft, fever, and stomach-aches of all sorts. And when the church bells ring again after their enforced silence, the water is sprinkled about the house, and especially under the beds, with the help of a palm-branch. Some of this blessed water is also kept in the house for use in great emergencies, when there is no time to fetch a priest; thus it may be employed to baptize a new-born infant gasping for life or to sprinkle a sick man in the last agony; such a sprinkling is reckoned equal to priestly absolution. In Calabria the customs with regard to the new water, as it is called, on Easter Saturday are similar; it is poured into a new vessel, adorned with ribbons and flowers, is blessed by the priest, and is tasted by every one of the household, beginning with the parents. And when the air vibrates with the glad music of the church bells announcing the resurrection, the people sprinkle the holy water about the houses, bidding in a loud voice all evil things to go forth and all good things to come in. At the same time, to emphasize the exorcism, they knock on doors, window-shutters, chests, and other domestic articles of furniture. At Cetraro people who suffer from diseases of the skin bathe in the sea at this propitious moment; at Pietro in Guarano they plunge into the river on the night of Easter Saturday before Easter Sunday dawns, and while they bathe they utter never a word. Moreover, the Calabrians keep the "new water" as a sacred thing. They believe that it serves as a protection against witchcraft if it is sprinkled on a fire or a lamp, when the wood crackles or the wick sputters; for they regard it as a bad omen when the fire talks, as they say. Among the Germans of Western Bohemia, also, water as well as fire is consecrated by the priest in front of the church on Easter Saturday. People bring jugs full of water to the church and set them beside the holy fire; afterwards they use the water to sprinkle on the palm-branches which are stuck in the fields. Charred sticks of the Judas fire, as it is popularly called, are supposed to possess a magical and healing virtue; hence the people take them home with them, and even scuffle with each other for the still glowing embers in order to carry them, still glimmering, to their houses and so obtain "the light" or "the holy light." At Hildesheim, also, and the neighbouring villages of central Germany rites both of fire and water are or were till lately observed at Easter. Thus on Easter night many people fetch water from the Innerste river and keep it carefully, believing it to be a remedy for many sorts of ailments both of man and beast. In the villages on the Leine river servant men and maids used to go silently on Easter night between the hours of eleven and twelve and silently draw water in buckets from the river; they mixed the water with the fodder and the drink of the cattle to make the animals thrive, and they imagined that to wash in it was good for human beings. Many were also of opinion that at the same mystic

hour the water turned to wine as far as the crowing of a cock could be heard, and in this belief they laid themselves flat on their stomachs and kept their tongues in the water till the miraculous change occurred, when they took a great gulp of the transformed water. At Hildesheim, too, and the neighbouring villages fires used to blaze on all the heights on Easter Eve; and embers taken from the bonfires were dipped in the cattle troughs to benefit the beasts and were kept in the houses to avert lightning.

In the Lesachthal, Carinthia, all the fires in the houses used to be extinguished on Easter Saturday, and rekindled with a fresh fire brought from the churchyard, where the priest had lit it by the friction of flint and steel and had bestowed his blessing on it. Such customs were probably widespread. In a Latin poem of the sixteenth century, written by a certain Thomas Kirchmeyer and translated into English by Barnabe Googe, we read:—

*“On Easter Eve the fire all is quencht in every place,
And fresh againe from out the flint is fetcht with solemne grace:
The priest doth halow this against great daungers many one,
A brande whereof doth every man with greedie mind take home,
That when the fearefull storme appeares, or tempest black arise,
By lighting this he safe may be from stroke of hurtful skies:
A taper great, the Paschall namde, with musicke then they blesse,
And franckensence herein they pricke, for greater holynesse:
This burneth night and day as signe of Christ that conquerde hell,
As if so be this foolish toye suffiseth this to tell.
Then doth the Bishop or the Priest, the water halow straight,
That for their baptisme is reservde: for now no more of waight
Is that they usde the yeare before, nor can they any more,
Yong children christen with the same, as they have done before.
With wondrous pompe and furniture, amid the Church they go,
With candles, crosses, banners, Chrisme, and oyle appoynted tho:
Nine times about the font they marche, and on the saintes doe call,
Then still at length they stande, and straight the Priest begins withall,
And thrise the water doth he touche, and crosses thereon make,
Here bigge and barbrous wordes he speakes, to make the devill quake:
And holsome waters conjureth, and foolishly doth dresse,
Supposing holyar that to make, which God before did blesse:
And after this his candle than, he thrusteth in the floode,
And thrise he breathes thereon with breath, that stinkes of former foode:
And making here an ende, his Chrisme he poureth thereupon,
The people staring hereat stande, amazed every one:
Beleaving that great powre is given to this water here,
By gaping of these learned men, and such like trifling gere.
Therefore in vessels brought they draw, and home they carie some,
Against the grieves that to themselves, or to their beastes may come.
Then Clappers ceasse, and belles are set againe at libertée,
And herewith all the hungrie times of fasting ended bée.”*

It is said that formerly all the fires in Rome were lighted afresh from the holy fire kindled in St. Peter's on Easter Saturday.

In Florence the ceremony of kindling the new fire on Easter Eve is peculiar. The holy flame is elicited from certain flints which are said to have been brought by a member of the Pazzi family from the Holy Land. They are kept in the church of the Holy Apostles on the Piazza

del Limbo, and on the morning of Easter Saturday the prior strikes fire from them and lights a candle from the new flame. The burning candle is then carried in solemn procession by the clergy and members of the municipality to the high altar in the cathedral. A vast crowd has meanwhile assembled in the cathedral and the neighbouring square to witness the ceremony; amongst the spectators are many peasants drawn from the surrounding country, for it is commonly believed that on the success or failure of the ceremony depends the fate of the crops for the year. Outside the door of the cathedral stands a festal car drawn by two fine white oxen with gilded horns. The body of the car is loaded with a pyramid of squibs and crackers and is connected by a wire with a pillar set up in front of the high altar. The wire extends down the middle of the nave at a height of about six feet from the ground. Beneath it a clear passage is left, the spectators being ranged on either side and crowding the vast interior from wall to wall. When all is ready, High Mass is celebrated, and precisely at noon, when the first words of the *Gloria* are being chanted, the sacred fire is applied to the pillar, which like the car is wreathed with fireworks. A moment more and a fiery dove comes flying down the nave, with a hissing sound and a sputter of sparks, between the two hedges of eager spectators. If all goes well, the bird pursues its course along the wire and out at the door, and in another moment a prolonged series of fizzes, pops and bangs announces to the excited crowd in the cathedral that the fireworks on the car are going off. Great is the joy accordingly, especially among the bumpkins, who are now sure of an abundant harvest. But if, as sometimes happens, the dove stops short in its career and fizzles out, revealing itself as a stuffed bird with a packet of squibs tied to its tail, great is the consternation, and deep the curses that issue from between the set teeth of the clodhoppers, who now give up the harvest for lost. Formerly the unskilful mechanic who was responsible for the failure would have been clapped into gaol; but nowadays he is thought sufficiently punished by the storm of public indignation and the loss of his pay. The disaster is announced by placards posted about the streets in the evening; and next morning the newspapers are full of gloomy prognostications.

Some of these customs have been transported by the Catholic Church to the New World. Thus in Mexico the new fire is struck from a flint early in the morning of Easter Saturday, and a candle which has been lighted at the sacred flame is carried through the church by a deacon shouting "*Lumen Christi.*" Meantime the whole city, we are informed, has been converted into a vast place of execution. Ropes stretch across the streets from house to house, and from every house dangles an effigy of Judas, made of paper pulp. Scores or hundreds of them may adorn a single street. They are of all shapes and sizes, grotesque in form and garbed in strange attire, stuffed with gunpowder, squibs and crackers, sometimes, too, with meat, bread, soap, candy, and clothing, for which the crowd will scramble and scuffle while the effigies are burning. There they hang grim, black, and sullen in the strong sunshine, greeted with a roar of execration by the pious mob. A peal of bells from the cathedral tower on the stroke of noon gives the signal for the execution. At the sound a frenzy seizes the crowd. They throw themselves furiously on the figures of the detested traitor, cut them down, hurl them with curses into the fire, and fight and struggle with each other in their efforts to tear the effigies to tatters and appropriate their contents. Smoke, stink, sputter of crackers, oaths, curses, yells are now the order of the day. But the traitor does not perish unavenged. For the anatomy of his frame has been cunningly contrived so as in burning to discharge volleys of squibs into his assailants; and the wounds and burns with which their piety is rewarded form a feature of the morning's entertainment. The English Jockey Club in Mexico used to improve on this popular pastime by suspending huge figures of Judas, stuffed with copper coins, from ropes in front of their clubhouse. These were ignited at the proper moment and lowered within reach of the expectant rabble, and it was the privilege of members of the club, seated in the balcony, to watch the grimaces and to hear the shrieks of the victims, as

they stamped and capered about with the hot coppers sticking to their hands, divided in their minds between an acute sense of pain and a thirst for filthy lucre.

Scenes of the same sort, though on a less ambitious scale, are witnessed among the Catholics of South America on the same day. In Brazil the mourning for the death of Christ ceases at noon on Easter Saturday and gives place to an extravagant burst of joy at his resurrection. Shots are fired everywhere, and effigies of Judas are hung on trees or dragged about the streets, to be finally burned or otherwise destroyed. In the Indian villages scattered among the wild valleys of the Peruvian Andes figures of the traitor, made of pasteboard and stuffed with squibs and crackers, are hanged on gibbets before the door of the church on Easter Saturday. Fire is set to them, and while they crackle and explode, the Indians dance and shout for joy at the destruction of their hated enemy. Similarly at Rio Hacha, in Colombia, Judas is represented during Holy Week by life-sized effigies, and the people fire at them as if they were discharging a sacred duty.

But usages of this sort are not confined to the Latin Church; they are common to the Greek Church also. Every year on the Saturday before Easter Sunday a new fire is miraculously kindled at the Holy Sepulchre in Jerusalem. It descends from heaven and ignites the candles which the patriarch holds in his hands, while with closed eyes he wrestles in prayer all alone in the chapel of the Angel. The worshippers meanwhile wait anxiously in the body of the church, and great are their transports of joy when at one of the windows of the chapel, which had been all dark a minute before, there suddenly appears the hand of an angel, or of the patriarch, holding a lighted taper. This is the sacred new fire; it is passed out to the expectant believers, and the desperate struggle which ensues among them to get a share of its blessed influence is only terminated by the intervention of the Turkish soldiery, who restore peace and order by hustling the whole multitude impartially out of the church. In days gone by many lives were often lost in these holy scimmages. For example, in the year 1834, the famous Ibrahim Pasha witnessed the frantic scene from one of the galleries, and, being moved with compassion at the sight, descended with a few guards into the arena in the chimerical hope of restoring peace and order among the contending Christians. He contrived to force his way into the midst of the dense crowd, but there the heat and pressure were so great that he fainted away; a body of soldiers, seeing his danger, charged straight into the throng and carried him out of it in their arms, trampling under foot the dying and dead in their passage. Nearly two hundred people were killed that day in the church. The fortunate survivors on these occasions who succeeded in obtaining a portion of the coveted fire applied it freely to their faces, their beards, and their garments. The theory was that the fire, being miraculous, could only bless and not burn them; but the practical results of the experiment were often disappointing, for while the blessings were more or less dubious, there could be no doubt whatever about the burns. The history of the miracle has been carefully investigated by a Jesuit father. The conclusions at which he arrives are that the miracle was a miracle indeed so long as the Catholics had the management of it; but that since it fell into the hands of the heretics it has been nothing but a barefaced trick and imposture. Many people will be disposed to agree with the latter conclusion who might hesitate to accept the former.

At Athens the new fire is kindled in the cathedral at midnight on Holy Saturday. A dense crowd with unlit candles in their hands fills the square in front of the cathedral; the king, the archbishop, and the highest dignitaries of the church, arrayed in their gorgeous robes, occupy a platform; and at the exact moment of the resurrection the bells ring out, and the whole square bursts as by magic into a blaze of light. Theoretically all the candles are lit from the sacred new fire in the cathedral, but practically it may be suspected that the matches which bear the name of Lucifer have some share in the sudden illumination. Effigies of Judas used to be burned at Athens on Easter Saturday, but the custom has been forbidden by the

Government. However, firing goes on more or less continuously all over the city both on Easter Saturday and Easter Sunday, and the cartridges used on this occasion are not always blank. The shots are aimed at Judas, but sometimes they miss him and hit other people. Outside of Athens the practice of burning Judas in effigy still survives in some places. For example, in Cos a straw image of the traitor is made on Easter Day, and after being hung up and shot at it is burned. A similar custom appears to prevail at Thebes; it used to be observed by the Macedonian peasantry, and it is still kept up at Therapia, a fashionable summer resort of Constantinople.

In the Armenian Church the sacred new fire is kindled not at Easter but at Candlemas, that is, on the second of February, or on the eve of that festival. The materials of the bonfire are piled in an open space near a church, and they are generally ignited by young couples who have been married within the year. However, it is the bishop or his vicar who lights the candles with which fire is set to the pile. All young married pairs are expected to range themselves about the fire and to dance round it. Young men leap over the flames, but girls and women content themselves with going round them, while they pray to be preserved from the itch and other skin-diseases. When the ceremony is over, the people eagerly pick up charred sticks or ashes of the fire and preserve them or scatter them on the four corners of the roof, in the cattle-stall, in the garden, and on the pastures; for these holy sticks and ashes protect men and cattle against disease, and fruit-trees against worms and caterpillars. Omens, too, are drawn from the direction in which the wind blows the flames and the smoke: if it carries them eastward, there is hope of a good harvest; but if it inclines them westward, the people fear that the crops will fail.

In spite of the thin cloak of Christianity thrown over these customs by representing the new fire as an emblem of Christ and the figure burned in it as an effigy of Judas, we can hardly doubt that both practices are of pagan origin. Neither of them has the authority of Christ or of his disciples; but both of them have abundant analogies in popular custom and superstition. Some instances of the practice of annually extinguishing fires and relighting them from a new and sacred flame have already come before us; but a few examples may here be cited for the sake of illustrating the wide diffusion of a custom which has found its way into the ritual both of the Eastern and of the Western Church.

The Incas of Peru celebrated a festival called Raymi, a word which their native historian Garcilasso de la Vega tells us was equivalent to our Easter. It was held in honour of the sun at the solstice in June. For three days before the festival the people fasted, men did not sleep with their wives, and no fires were lighted in Cuzco, the capital. The sacred new fire was obtained direct from the sun by concentrating his beams on a highly polished concave plate and reflecting them on a little cotton wool. With this holy fire the sheep and lambs offered to the sun were consumed, and the flesh of such as were to be eaten at the festival was roasted. Portions of the new fire were also conveyed to the temple of the sun and to the convent of the sacred virgins, where they were kept burning all the year, and it was an ill omen if the holy flame went out. At a festival held in the last month of the old Mexican year all the fires both in the temples and in the houses were extinguished, and the priest kindled a new fire by rubbing two sticks against each other before the image of the fire-god. The Zuni Indians of New Mexico kindle a new fire by the friction of wood both at the winter and the summer solstice. At the winter solstice the chosen fire-maker collects a faggot of cedar-wood from every house in the village, and each person, as he hands the wood to the fire-maker, prays that the crops may be good in the coming year. For several days before the new fire is kindled, no ashes or sweepings may be removed from the houses and no artificial light may appear outside of them, not even a burning cigarette or the flash of firearms. The Indians believe that no rain will fall on the fields of the man outside whose house a light has been

seen at this season. The signal for kindling the new fire is given by the rising of the Morning Star. The flame is produced by twirling an upright stick between the hands on a horizontal stick laid on the floor of a sacred chamber, the sparks being caught by a tinder of cedar-dust. It is forbidden to blow up the smouldering tinder with the breath, for that would offend the gods. After the fire has thus been ceremonially kindled, the women and girls of all the families in the village clean out their houses. They carry the sweepings and ashes in baskets or bowls to the fields and leave them there. To the sweepings the woman says: "I now deposit you as sweepings, but in one year you will return to me as corn." And to the ashes she says: "I now deposit you as ashes, but in one year you will return to me as meal." At the summer solstice the sacred fire which has been procured by the friction of wood is used to kindle the grass and trees, that there may be a great cloud of smoke, while bull-roarers are swung and prayers offered that the Rain-makers up aloft will water the earth. From this account we see how intimately the kindling of a new fire at the two turning-points of the sun's course is associated in the minds of these Indians with the fertility of the land, particularly with the growth of the corn. The rolling smoke is apparently an imitation of rain-clouds designed, on the principle of homoeopathic magic, to draw showers from the blue sky. Once a year the Iroquois priesthood supplied the people with a new fire. As a preparation for the annual rite the fires in all the huts were extinguished and the ashes scattered about. Then the priest, wearing the insignia of his office, went from hut to hut relighting the fires by means of a flint. Among the Esquimaux with whom C. F. Hall resided, it was the custom that at a certain time, which answered to our New Year's Day, two men went about from house to house blowing out every light in the village. One of the men was dressed to represent a woman. Afterwards the lights were rekindled from a fresh fire. An Esquimau woman being asked what all this meant, replied, "New sun—new light." Among the Esquimaux of Iglulik, when the sun first rises above the horizon after the long night of the Arctic winter, the children who have watched for his reappearance run into the houses and blow out the lamps. Then they receive from their mothers presents of pieces of wick.

In the Sudanese kingdom of Wadai all the fires in the villages are put out and the ashes removed from the houses on the day which precedes the New Year festival. At the beginning of the new year a new fire is lit by the friction of wood in the great straw hut where the village elders lounge away the sultry hours together; and every man takes thence a burning brand with which he rekindles the fire on his domestic hearth. In the Bahr-el-Ghazal province of the Egyptian Sudan the people extinguish their old fires at the Arab New Year and bring in new fire. On the same occasion they beat the walls of their huts, the grass thatches, and the walls of their enclosures in order to drive away the devil or evil spirits. The beating of the walls and roofs is accompanied by the firing of guns, the shouting of men, and the shriller cries of the women. Thus these people combine an annual expulsion of demons with an annual lighting of a new fire. Among the Swahili of East Africa the greatest festival is that of the New Year, which falls in the second half of August. At a given moment all the fires are extinguished with water and afterwards relit by the friction of two dry pieces of wood. The ashes of the old fires are carried out and deposited at cross-roads. All the people get up very early in the morning and bathe in the sea or some other water, praying to be kept in good health and to live that they may bathe again next year. Sham-fights form part of the amusements of the day; sometimes they pass into grim reality. Indeed the day was formerly one of general license; every man did that which was good in his own eyes. No awkward questions were asked about any crimes committed on this occasion, so some people improved the shining hour by knocking a few poor devils on the head. Shooting still goes on during the whole day, and at night the proceedings generally wind up with a great dance. The King of Benametapa, as the early Portuguese traders called him, in East Africa used to send commissioners annually to every town in his dominions; on the arrival of one of these

officers the inhabitants of each town had to put out all their fires and to receive a new fire from him. Failure to comply with this custom was treated as rebellion. Some tribes of British Central Africa carefully extinguish the fires on the hearths at the beginning of the hoeing season and at harvest; the fires are afterwards rekindled by friction, and the people indulge in dances of various kinds.

The Todas of the Neilgherry Hills, in Southern India, annually kindle a sacred new fire by the friction of wood in the month which begins with the October moon. The ceremony is performed by two holy dairymen at the foot of a high hill. When they have lighted the fire by rubbing two dry sticks together, and it begins to burn well, they stand a little way off and pray, saying, "May the young grass flower! May honey flourish! May fruit ripen!" The purpose of the ceremony is to make the grass and honey plentiful. In ancient times the Todas lived largely on wild fruits, and then the rite of the new fire was very important. Now that they subsist chiefly on the milk of their buffaloes, the ceremony has lost much of its old significance. When the Nagas of North-Eastern India have felled the timber and cut down the scrub in those patches of jungle which they propose to cultivate, they put out all the fires in the village and light a new fire by rubbing two dry pieces of wood together. Then having kindled torches at it they proceed with them to the jungle and ignite the felled timber and brushwood. The flesh of a cow or buffalo is also roasted on the new fire and furnishes a sacrificial meal. Near the small town of Kahma in Burma, between Prome and Thayetmyo, certain gases escape from a hollow in the ground and burn with a steady flame during the dry season of the year. The people regard the flame as the forge of a spectral smith who here carried on his business after death had removed him from his old smithy in the village. Once a year all the household fires in Kahma are extinguished and then lighted afresh from the ghostly flame.

In China every year, about the beginning of April, certain officials, called *Sz'hüen*, used of old to go about the country armed with wooden clappers. Their business was to summon the people and command them to put out every fire. This was the beginning of a season called *Han-shih-tsieh*, or "eating cold food." For three days all household fires remained extinct as a preparation for the solemn renewal of the fire, which took place on the fifth or sixth day of April, being the hundred and fifth day after the winter solstice. The ceremony was performed with great pomp by the same officials, who procured the new fire from heaven by reflecting the sun's rays either from a metal mirror or from a crystal on dry moss. Fire thus obtained is called by the Chinese heavenly fire, and its use is enjoined in sacrifices; whereas fire elicited by the friction of wood is termed by them earthly fire, and its use is prescribed for cooking and other domestic purposes. When once the new fire had thus been drawn from the sun, all the people were free to rekindle their domestic hearths; and, as a Chinese distich has it—

*"At the festival of the cold food there are a thousand white stalks among the flowers;
On the day Tsing-ming, at sunrise, you may see the smoke of ten thousand houses."*

According to a Chinese philosopher, the reason for thus renewing fire periodically is that the vital principle grows weaker and weaker in old fire, whereas in new fire it is young and vigorous. This annual renewal of fire was a ceremony of very great antiquity in China, since it is known to have been observed in the time of the first dynasty, about two thousand years before Christ. Under the Tcheou dynasty a change in the calendar led to shifting the fire-festival from spring to the summer solstice, but afterwards it was brought back to its original date. Although the custom appears to have long fallen into disuse, the barbarous inhabitants of Hainan, an island to the south of China, still call a year "a fire," as if in memory of the time when the years were reckoned by the annually recurring ceremony of rekindling the

sacred fire. "A Japanese book written two centuries ago informs us that sticks resembling the wands used for offerings at the purification ceremony were part shaven and set up in bundles at the four corners of the Gion shrine on the last day of the year. The priests, after prayers were recited, broke up the bundles and set fire to the sticks, which the people then carried home to light their household fires with for the New Year. The object of this ceremony was to avert pestilence."

In classical antiquity the Greek island of Lemnos was devoted to the worship of the smith-god Hephaestus, who was said to have fallen on it when Zeus hurled him from heaven. Once a year every fire in the island was extinguished and remained extinct for nine days, during which sacrifices were offered to the dead and to the infernal powers. New fire was brought in a ship from the sacred isle of Delos, and with it the fires in the houses and the workshops were relit. The people said that with the new fire they made a new beginning of life. If the ship that bore the sacred flame arrived too soon, it might not put in to shore, but had to cruise in the offing till the nine days were expired. At Rome the sacred fire in the temple of Vesta was kindled anew every year on the first of March, which used to be the beginning of the Roman year; the task of lighting it was entrusted to the Vestal Virgins, and they performed it by drilling a hole in a board of lucky wood till the flame was elicited by friction. The new fire thus produced was carried into the temple of Vesta by one of the virgins in a bronze sieve.

Among the Celts of Ireland a new fire was annually kindled on Hallowe'en or the Eve of Samhain, as they called it, the last day of October, from which the Irish new year began; and all the hearths throughout the country are said to have been relighted from the fresh fire. The place where this holy flame was lit bore the name of Tlachtga or Tlactga; it has been identified with a rath or native fort on the Hill of Ward near Athboy in the county of Meath. "It was there," says the old Irish historian, Geoffrey Keating, "that the Festival of the Fire of Tlactga was ordered to be held, and it was thither that the Druids of Ireland were wont to repair and to assemble, in solemn meeting, on the eve of Samhain, for the purpose of making a sacrifice to all the gods. It was in that fire at Tlactga, that their sacrifice was burnt; and it was made obligatory, under pain of punishment, to extinguish all the fires of Ireland, on that eve; and the men of Ireland were allowed to kindle no other fire but that one; and for each of the other fires, which were all to be lighted from it, the king of Munster was to receive a tax of a *sgreball*, that is, of three pence, because the land, upon which Tlactga was built, belongs to the portion of Meath which had been taken from Munster." In the villages near Moscow at the present time the peasants put out all their fires on the eve of the first of September, and next morning at sunrise a wise man or a wise woman rekindles them with the help of muttered incantations and spells.

Instances of such practices might doubtless be multiplied, but the foregoing examples may suffice to render it probable that the ecclesiastical ceremony of lighting a sacred new fire on Easter Saturday had originally nothing to do with Christianity, but is merely one case of a world-wide custom which the Church has seen fit to incorporate in its ritual. It might be supposed that in the Western Church the custom was merely a survival of the old Roman usage of renewing the fire on the first of March, were it not that the observance by the Eastern Church of the custom on the same day seems to point back to a still older period when the ceremony of lighting a new fire in spring, perhaps at the vernal equinox, was common to many peoples of the Mediterranean area. We may conjecture that wherever such a ceremony has been observed, it originally marked the beginning of a new year, as it did in ancient Rome and Ireland, and as it still does in the Sudanese kingdom of Wadai and among the Swahili of Eastern Africa.

The essentially pagan character of the Easter fire festival appears plainly both from the mode in which it is celebrated by the peasants and from the superstitious beliefs which they associate with it. All over northern and central Germany, from Altmark and Anhalt on the east, through Brunswick, Hanover, Oldenburg, the Harz district, and Hesse to Westphalia the Easter bonfires still blaze simultaneously on the hill-tops. As many as forty may sometimes be counted within sight at once. Long before Easter the young people have been busy collecting firewood; every farmer contributes, and tar-barrels, petroleum cases, and so forth go to swell the pile. Neighbouring villages vie with each other as to which shall send up the greatest blaze. The fires are always kindled, year after year, on the same hill, which accordingly often takes the name of Easter Mountain. It is a fine spectacle to watch from some eminence the bonfires flaring up one after another on the neighbouring heights. As far as their light reaches, so far, in the belief of the peasants, the fields will be fruitful, and the houses on which they shine will be safe from conflagration or sickness. At Volkmarsen and other places in Hesse the people used to observe which way the wind blew the flames, and then they sowed flax seed in that direction, confident that it would grow well. Brands taken from the bonfires preserve houses from being struck by lightning; and the ashes increase the fertility of the fields, protect them from mice, and mixed with the drinking-water of cattle make the animals thrive and ensure them against plague. As the flames die down, young and old leap over them, and cattle are sometimes driven through the smouldering embers. In some places tar-barrels or wheels wrapt in straw used to be set on fire, and then sent rolling down the hillside. In others the boys light torches and wisps of straw at the bonfires and rush about brandishing them in their hands. Where the people are divided between Protestantism and Catholicism, as in Hildesheim, it has been observed that among Protestants the Easter bonfires are generally left to the boys, while in Catholic districts they are cared for by grown-up persons, and here the whole population will gather round the blazing pile and join in singing choral hymns, which echo far and wide in the stillness of night.

In Münsterland these Easter fires are always kindled upon certain definite hills, which are hence known as Easter or Paschal Mountains. The whole community assembles about the fire. Fathers of families form an inner circle round it. An outer circle is composed of the young men and maidens, who, singing Easter hymns, march round and round the fire in the direction of the sun, till the blaze dies down. Then the girls jump over the fire in a line, one after the other, each supported by two young men who hold her hands and run beside her. When the fire has burned out, the whole assembly marches in solemn procession to the church, singing hymns. They go thrice round the church, and then break up. In the twilight boys with blazing bundles of straw run over the fields to make them fruitful. At Delmenhorst, in Oldenburg, it used to be the custom to cut down two trees, plant them in the ground side by side, and pile twelve tar-barrels, one above the other, against each of the trees. Brushwood was then heaped about the trees, and on the evening of Easter Saturday the boys, after rushing about with blazing bean-poles in their hands, set fire to the whole. At the end of the ceremony the urchins tried to blacken each other and the clothes of grown-up people. In Schaumburg the Easter bonfires may be seen blazing on all the mountains around for miles. They are made with a tar-barrel fastened to a pine-tree, which is wrapt in straw. The people dance singing round them. In the Harz Mountains the fire is commonly made by piling brushwood about a tree and setting it on fire. At Osterode every one tries to snatch a brand from the bonfire and runs about with it; the better it burns, the more lucky it is. In Grund there are torch-races. In the Altmark the Easter bonfires are composed of tar-barrels, bee-hives, and so forth, piled round a pole. The young folk dance round the fire; and when it has died out, the old folk come and collect the ashes, which they preserve as a remedy for the ailments of bees. It is also believed that as far as the blaze of the bonfire is visible, the corn will grow well throughout the year, and no conflagration will break out. At Braunröde, in the Harz

Mountains, it was the custom to burn squirrels in the Easter bonfire. In the Altmark, bones were burned in it.

Further south the Easter fires are, or used to be, lit in many districts of Bavaria. Thus on Easter Monday in some parts of Middle Franken the schoolboys collect all the old worn-out besoms they can lay hands on, and march with them in a long procession to a neighbouring height. When the first chime of the evening bell comes up from the dale they set fire to the brooms, and run along the ridges waving them, so that seen from below the hills appear to be crested with a twinkling and moving chain of fire. In some parts of Upper Bavaria at Easter burning arrows or discs of wood were shot from hill-tops high into the air, as in the Swabian and Swiss customs already described. At Oberau, instead of the discs, an old cart-wheel was sometimes wrapt in straw, ignited, and sent rolling and blazing down the mountain. The lads who hurled the discs received painted Easter eggs from the girls. Near Forchheim, in Upper Franken, a straw-man called the Judas used to be burned in the churchyards on Easter Saturday. The whole village contributed wood to the pyre on which he perished, and the charred sticks were afterwards kept and planted in the fields on Walpurgis Day (the first of May) to preserve the wheat from blight and mildew. About a hundred years ago or more the custom at Althenneberg, in Upper Bavaria, used to be as follows. On the afternoon of Easter Saturday the lads collected wood, which they piled in a cornfield, while in the middle of the pile they set up a tall wooden cross all swathed in straw. After the evening service they lighted their lanterns at the consecrated candle in the church, and ran with them at full speed to the pyre, each striving to get there first. The first to arrive set fire to the heap. No woman or girl might come near the bonfire, but they were allowed to watch it from a distance. As the flames rose the men and lads rejoiced and made merry, shouting, "We are burning the Judas!" Two of them had to watch the glowing embers the whole night long, lest people should come and steal them. Next morning at sunrise they carefully collected the ashes, and threw them into the running water of the Röten brook. The man who had been the first to reach the pyre and to kindle it was rewarded on Easter Sunday by the women, who gave him coloured eggs at the church door. Well-to-do women gave him two; poorer women gave him only one. The object of the whole ceremony was to keep off the hail. About a century ago the Judas fire, as it was called, was put down by the police. At Giggerhausen and Aufkirchen, two other villages of Upper Bavaria, a similar custom prevailed, yet with some interesting differences. Here the ceremony, which took place between nine and ten at night on Easter Saturday, was called "burning the Easter Man." On a height about a mile from the village the young fellows set up a tall cross enveloped in straw, so that it looked like a man with his arms stretched out. This was the Easter Man. No lad under eighteen years of age might take part in the ceremony. One of the young men stationed himself beside the Easter Man, holding in his hand a consecrated taper which he had brought from the church and lighted. The rest stood at equal intervals in a great circle round the cross. At a given signal they raced thrice round the circle, and then at a second signal ran straight at the cross and at the lad with the lighted taper beside it; the one who reached the goal first had the right of setting fire to the Easter Man. Great was the jubilation while he was burning. When he had been consumed in the flames, three lads were chosen from among the rest, and each of the three drew a circle on the ground with a stick thrice round the ashes. Then they all left the spot. On Easter Monday the villagers gathered the ashes and strewed them on their fields; also they planted in the fields palm-branches which had been consecrated on Palm Sunday, and sticks which had been charred and hallowed on Good Friday, all for the purpose of protecting their fields against showers of hail. The custom of burning an Easter Man made of straw on Easter Saturday was observed also at Abensberg, in Lower Bavaria. In some parts of Swabia the Easter fires might not be kindled with iron or steel or flint, but only by the friction of wood.

In Baden bonfires are still kindled in the churchyards on Easter Saturday, and ecclesiastical refuse of various sorts, such as candle-ends, old surplices, and the wool used by the priest in the application of extreme unction, is consumed in the flames. At Zoznegg down to about 1850 the fire was lighted by the priest by means of a flint which had never been used before. People bring sticks, especially oaken sticks, char them in the fire, and then carry them home and keep them in the house as a preservative against lightning. At Zoznegg these oaken sticks were sword-shaped, each about an ell and a half long, and they went by the name of "weather or thunder poles" (*Wetterpfähle*). When a thunder-storm threatened to break out, one of the sticks was put into a small fire, in order that the hallowed smoke, ascending to the clouds, might ward off the lightning from the house and the hail from the fields and gardens. At Schöllbronn the oaken sticks, which are thus charred in the Easter bonfire and kept in the house as a protective against thunder and lightning, are three in number, perhaps with an allusion to the Trinity; they are brought every Easter to be consecrated afresh in the bonfire, till they are quite burnt away. In the lake district of Baden it is also customary to burn one of these holy sticks in the fire when a heavy thunderstorm is raging. Hence it seems that the ancient association of the oak with the thunder persists in the minds of German peasants to the present day.

Thus the custom of the Easter fires appears to have prevailed all over central and western Germany from north to south. We find it also in Holland, where the fires were kindled on the highest eminences, and the people danced round them and leaped through the flames or over the glowing embers. Here too, as so often in Germany, the materials for the bonfire were collected by the young folk from door to door. In many parts of Sweden firearms are, as at Athens, discharged in all directions on Easter eve, and huge bonfires are lighted on hills and eminences. Some people think that the intention is to keep off the Troll and other evil spirits who are especially active at this season. When the afternoon service on Good Friday is over, German children in Bohemia drive Judas out of the church by running about the sacred edifice and even the streets shaking rattles and clappers. Next day, on Easter Saturday, the remains of the holy oil are burnt before the church door in a fire which must be kindled with flint and steel. This fire is called "the burning of Judas," but in spite of its evil name a beneficent virtue is ascribed to it, for the people scuffle for the cinders, which they put in the roofs of their houses as a safeguard against fire and lightning.

§ 3. The Beltane Fires.

In the central Highlands of Scotland bonfires, known as the Beltane fires, were formerly kindled with great ceremony on the first of May, and the traces of human sacrifices at them were particularly clear and unequivocal. The custom of lighting the bonfires lasted in various places far into the eighteenth century, and the descriptions of the ceremony by writers of that period present such a curious and interesting picture of ancient heathendom surviving in our own country that I will reproduce them in the words of their authors. The fullest of the descriptions, so far as I know, is the one bequeathed to us by John Ramsay, laird of Ochertyre, near Crieff, the patron of Burns and the friend of Sir Walter Scott. From his voluminous manuscripts, written in the last quarter of the eighteenth century, a selection was published in the latter part of the nineteenth century. The following account of Beltane is extracted from a chapter dealing with Highland superstitions. Ramsay says: "But the most considerable of the Druidical festivals is that of Beltane, or May-day, which was lately observed in some parts of the Highlands with extraordinary ceremonies. Of later years it is chiefly attended to by young people, persons advanced in years considering it as inconsistent with their gravity to give it any countenance. Yet a number of circumstances relative to it may be collected from tradition, or the conversation of very old people, who witnessed this feast in their youth, when the ancient rites were better observed.

“This festival is called in Gaelic *Beal-tene*—*i.e.*, the fire of Bel.... Like the other public worship of the Druids, the Beltane feast seems to have been performed on hills or eminences. They thought it degrading to him whose temple is the universe, to suppose that he would dwell in any house made with hands. Their sacrifices were therefore offered in the open air, frequently upon the tops of hills, where they were presented with the grandest views of nature, and were nearest the seat of warmth and order. And, according to tradition, such was the manner of celebrating this festival in the Highlands within the last hundred years. But since the decline of superstition, it has been celebrated by the people of each hamlet on some hill or rising ground around which their cattle were pasturing. Thither the young folks repaired in the morning, and cut a trench, on the summit of which a seat of turf was formed for the company. And in the middle a pile of wood or other fuel was placed, which of old they kindled with *tein-eigin*—*i.e.*, forced-fire or *need-fire*. Although, for many years past, they have been contented with common fire, yet we shall now describe the process, because it will hereafter appear that recourse is still had to the *tein-eigin* upon extraordinary emergencies.

“The night before, all the fires in the country were carefully extinguished, and next morning the materials for exciting this sacred fire were prepared. The most primitive method seems to be that which was used in the islands of Skye, Mull, and Tiree. A well-seasoned plank of oak was procured, in the midst of which a hole was bored. A wimble of the same timber was then applied, the end of which they fitted to the hole. But in some parts of the mainland the machinery was different. They used a frame of green wood, of a square form, in the centre of which was an axle-tree. In some places three times three persons, in others three times nine, were required for turning round by turns the axle-tree or wimble. If any of them had been guilty of murder, adultery, theft, or other atrocious crime, it was imagined either that the fire would not kindle, or that it would be devoid of its usual virtue. So soon as any sparks were emitted by means of the violent friction, they applied a species of agaric which grows on old birch-trees, and is very combustible. This fire had the appearance of being immediately derived from heaven, and manifold were the virtues ascribed to it. They esteemed it a preservative against witchcraft, and a sovereign remedy against malignant diseases, both in the human species and in cattle; and by it the strongest poisons were supposed to have their nature changed.

“After kindling the bonfire with the *tein-eigin* the company prepared their victuals. And as soon as they had finished their meal, they amused themselves a while in singing and dancing round the fire. Towards the close of the entertainment, the person who officiated as master of the feast produced a large cake baked with eggs and scalloped round the edge, called *am bonnach beal-tine*—*i.e.*, the Beltane cake. It was divided into a number of pieces, and distributed in great form to the company. There was one particular piece which whoever got was called *cailleach beal-tine*—*i.e.*, the Beltane *carline*, a term of great reproach. Upon his being known, part of the company laid hold of him and made a show of putting him into the fire; but the majority interposing, he was rescued. And in some places they laid him flat on the ground, making as if they would quarter him. Afterwards, he was pelted with egg-shells, and retained the odious appellation during the whole year. And while the feast was fresh in people's memory, they affected to speak of the *cailleach beal-tine* as dead.

“This festival was longest observed in the interior Highlands, for towards the west coast the traces of it are faintest. In Glenorchy and Lorne, a large cake is made on that day, which they consume in the house; and in Mull it has a large hole in the middle, through which each of the cows in the fold is milked. In Tiree it is of a triangular form. The more elderly people remember when this festival was celebrated without-doors with some solemnity in both these islands. There are at present no vestiges of it in Skye or the Long Island, the inhabitants of

which have substituted the *connach Micheil* or St. Michael's cake. It is made at Michaelmas with milk and oatmeal, and some eggs are sprinkled on its surface. Part of it is sent to the neighbours.

“It is probable that at the original Beltane festival there were two fires kindled near one another. When any person is in a critical dilemma, pressed on each side by unsurmountable difficulties, the Highlanders have a proverb, *The e' eada anda theine bealtuin*—*i.e.*, he is between the two Beltane fires. There are in several parts small round hills, which, it is like, owe their present names to such solemn uses. One of the highest and most central in Icolmkil is called *Cnoch-nan-ainneal*—*i.e.*, the hill of the fires. There is another of the same name near the kirk of Balquhiddy; and at Killin there is a round green eminence which seems to have been raised by art. It is called *Tom-nan-ainneal*—*i.e.*, the eminence of the fires. Around it there are the remains of a circular wall about two feet high. On the top a stone stands upon end. According to the tradition of the inhabitants, it was a place of Druidical worship; and it was afterwards pitched on as the most venerable spot for holding courts of justice for the country of Breadalbane. The earth of this eminence is still thought to be possessed of some healing virtue, for when cattle are observed to be diseased some of it is sent for, which is rubbed on the part affected.”

In the parish of Callander, a beautiful district of western Perthshire, the Beltane custom was still in vogue towards the end of the eighteenth century. It has been described as follows by the parish minister of the time: “Upon the first day of May, which is called *Beltan*, or *Baltein* day, all the boys in a township or hamlet, meet in the moors. They cut a table in the green sod, of a round figure, by casting a trench in the ground, of such circumference as to hold the whole company. They kindle a fire, and dress a repast of eggs and milk in the consistence of a custard. They knead a cake of oatmeal, which is toasted at the embers against a stone. After the custard is eaten up, they divide the cake into so many portions, as similar as possible to one another in size and shape, as there are persons in the company. They daub one of these portions all over with charcoal, until it be perfectly black. They put all the bits of the cake into a bonnet. Every one, blindfold, draws out a portion. He who holds the bonnet, is entitled to the last bit. Whoever draws the black bit, is the *devoted* person who is to be sacrificed to *Baal*, whose favour they mean to implore, in rendering the year productive of the sustenance of man and beast. There is little doubt of these inhuman sacrifices having been once offered in this country, as well as in the east, although they now pass from the act of sacrificing, and only compel the *devoted* person to leap three times through the flames; with which the ceremonies of this festival are closed.”

Thomas Pennant, who travelled in Perthshire in the year 1769, tells us that “on the first of May, the herdsmen of every village hold their Bel-tien, a rural sacrifice. They cut a square trench on the ground, leaving the turf in the middle; on that they make a fire of wood, on which they dress a large caudle of eggs, butter, oatmeal and milk; and bring besides the ingredients of the caudle, plenty of beer and whisky; for each of the company must contribute something. The rites begin with spilling some of the caudle on the ground, by way of libation: on that every one takes a cake of oatmeal, upon which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal, the real destroyer of them: each person then turns his face to the fire, breaks off a knob, and flinging it over his shoulders, says, ‘This I give to thee, preserve thou my horses; this to thee, preserve thou my sheep; and so on.’ After that, they use the same ceremony to the noxious animals: ‘This I give to thee, O fox! spare thou my lambs; this to thee, O hooded crow! this to thee, O eagle!’ When the ceremony is over, they dine on the caudle; and after the feast is finished, what is left is hid by two persons deputed for that

purpose; but on the next Sunday they re-assemble, and finish the reliques of the first entertainment.”

Another writer of the eighteenth century has described the Beltane festival as it was held in the parish of Logierait in Perthshire. He says: “On the first of May, O.S., a festival called *Beltan* is annually held here. It is chiefly celebrated by the cow-herds, who assemble by scores in the fields, to dress a dinner for themselves, of boiled milk and eggs. These dishes they eat with a sort of cakes baked for the occasion, and having small lumps in the form of *nipples*, raised all over the surface.” In this last account no mention is made of bonfires, but they were probably lighted, for a contemporary writer informs us that in the parish of Kirkmichael, which adjoins the parish of Logierait on the east, the custom of lighting a fire in the fields and baking a consecrated cake on the first of May was not quite obsolete in his time. We may conjecture that the cake with knobs was formerly used for the purpose of determining who should be the “Beltane carline” or victim doomed to the flames. A trace of this custom survived, perhaps, in the custom of baking oatmeal cakes of a special kind and rolling them down hill about noon on the first of May; for it was thought that the person whose cake broke as it rolled would die or be unfortunate within the year. These cakes, or bannocks as we call them in Scotland, were baked in the usual way, but they were washed over with a thin batter composed of whipped egg, milk or cream, and a little oatmeal. This custom appears to have prevailed at or near Kingussie in Inverness-shire. At Achterneed, near Strathpeffer in Ross-shire, the Beltane bannocks were called *tcharnican* or hand-cakes, because they were kneaded entirely in the hand, and not on a board or table like common cakes; and after being baked they might not be placed anywhere but in the hands of the children who were to eat them.

In the north-east of Scotland the Beltane fires were still kindled in the latter half of the eighteenth century; the herdsmen of several farms used to gather dry wood, kindle it, and dance three times “southways” about the burning pile. But in this region, according to a later authority, the Beltane fires were lit not on the first but on the second of May, Old Style. They were called bone-fires. The people believed that on that evening and night the witches were abroad and busy casting spells on cattle and stealing cows' milk. To counteract their machinations, pieces of rowan-tree and woodbine, but especially of rowan-tree, were placed over the doors of the cow-houses, and fires were kindled by every farmer and cottar. Old thatch, straw, furze, or broom was piled in a heap and set on fire a little after sunset. While some of the bystanders kept tossing the blazing mass, others hoisted portions of it on pitchforks or poles and ran hither and thither, holding them as high as they could. Meantime the young people danced round the fire or ran through the smoke shouting, “Fire! blaze and burn the witches; fire! fire! burn the witches.” In some districts a large round cake of oat or barley meal was rolled through the ashes. When all the fuel was consumed, the people scattered the ashes far and wide, and till the night grew quite dark they continued to run through them, crying, “Fire! burn the witches.”

In the Hebrides “the Beltane bannock is smaller than that made at St. Michael's, but is made in the same way; it is no longer made in Uist, but Father Allan remembers seeing his grandmother make one about twenty-five years ago. There was also a cheese made, generally on the first of May, which was kept to the next Beltane as a sort of charm against the bewitching of milk-produce. The Beltane customs seem to have been the same as elsewhere. Every fire was put out and a large one lit on the top of the hill, and the cattle driven round it sunwards (*dessil*), to keep off murrain all the year. Each man would take home fire wherewith to kindle his own.”

In Wales also the custom of lighting Beltane fires at the beginning of May used to be observed, but the day on which they were kindled varied from the Eve of May Day to the third of May. The flame was sometimes elicited by the friction of two pieces of oak, as appears from the following description. "The fire was done in this way. Nine men would turn their pockets inside out, and see that every piece of money and all metals were off their persons. Then the men went into the nearest woods, and collected sticks of nine different kinds of trees. These were carried to the spot where the fire had to be built. There a circle was cut in the sod, and the sticks were set crosswise. All around the circle the people stood and watched the proceedings. One of the men would then take two bits of oak, and rub them together until a flame was kindled. This was applied to the sticks, and soon a large fire was made. Sometimes two fires were set up side by side. These fires, whether one or two, were called *coelcerth* or bonfire. Round cakes of oatmeal and brown meal were split in four, and placed in a small flour-bag, and everybody present had to pick out a portion. The last bit in the bag fell to the lot of the bag-holder. Each person who chanced to pick up a piece of brown-meal cake was compelled to leap three times over the flames, or to run thrice between the two fires, by which means the people thought they were sure of a plentiful harvest. Shouts and screams of those who had to face the ordeal could be heard ever so far, and those who chanced to pick the oatmeal portions sang and danced and clapped their hands in approval, as the holders of the brown bits leaped three times over the flames, or ran three times between the two fires. As a rule, no danger attended these curious celebrations, but occasionally somebody's clothes caught fire, which was quickly put out. The greatest fire of the year was the eve of May, or May first, second, or third. The Midsummer Eve fire was more for the harvest. Very often a fire was built on the eve of November. The high ground near the Castle Ditches at Llantwit Major, in the Vale of Glamorgan, was a familiar spot for the Beltane on May third and on Midsummer Eve.... Sometimes the Beltane fire was lighted by the flames produced by stone instead of wood friction. Charred logs and faggots used in the May Beltane were carefully preserved, and from them the next fire was lighted. May fires were always started with old faggots of the previous year, and midsummer from those of the last summer. It was unlucky to build a midsummer fire from May faggots. People carried the ashes left after these fires to their homes, and a charred brand was not only effectual against pestilence, but magical in its use. A few of the ashes placed in a person's shoes protected the wearer from any great sorrow or woe."

From the foregoing account we learn that bonfires were kindled in Wales on Midsummer Eve and Hallowe'en (the thirty-first of October), as well as at the beginning of May, but that the Beltane fires in May were deemed the most important. To the Midsummer Eve and Hallowe'en fires we shall return presently. The belief of the people that by leaping thrice over the bonfires or running thrice between them they ensured a plentiful harvest is worthy of note. The mode in which this result was supposed to be brought about is indicated by another writer on Welsh folk-lore, according to whom it used to be held that "the bonfires lighted in May or Midsummer protected the lands from sorcery, so that good crops would follow. The ashes were also considered valuable as charms." Hence it appears that the heat of the fires was thought to fertilize the fields, not directly by quickening the seeds in the ground, but indirectly by counteracting the baleful influence of witchcraft or perhaps by burning up the persons of the witches.

"The Druidical anniversary of Beil or Baal is still celebrated in the Isle of Man. On the first of May, 1837, the Baal fires were, as usual on that day, so numerous as to give the island the appearance of a general conflagration." By May Day in Manx folk-lore is meant May Day Old Style, or *Shenn Laa Boaldyn*, as it is called in Manx. The day was one on which the power of elves and witches was particularly dreaded, and the people resorted to many

precautions in order to protect themselves against these mischievous beings. Hence at daybreak they set fire to the ling or gorse, for the purpose of burning out the witches, who are wont to lurk in the form of hares. On the Hemlock Stone, a natural pillar of sandstone standing on Stapleford Hill in Nottinghamshire, a fire used to be solemnly kindled every year on Beltane Eve. The custom seems to have survived down to the beginning of the nineteenth century; old people could remember and describe the ceremony long after it had fallen into desuetude.

The Beltane fires appear to have been kindled also in Ireland, for Cormac, “or somebody in his name, says that *belltaine*, May-day, was so called from the ‘lucky fire,’ or the ‘two fires,’ which the druids of Erin used to make on that day with great incantations; and cattle, he adds, used to be brought to those fires, or to be driven between them, as a safeguard against the diseases of the year.” Again, a very ancient Irish poem, enumerating the May Day celebrations, mentions among them a bonfire on a hill (*tendal ar cnuc*); and another old authority says that these fires were kindled in the name of the idol-god Bel. From an old life of St. Patrick we learn that on a day in spring the heathen of Ireland were wont to extinguish all their fires until a new fire was kindled with solemn ceremony in the king's house at Tara. In the year in which St. Patrick landed in Ireland it chanced that the night of the extinguished fires coincided with the Eve of Easter; and the saint, ignorant of this pagan superstition, resolved to celebrate his first Easter in Ireland after the true Christian fashion by lighting the holy Paschal fire on the hill of Slane, which rises high above the left bank of the Boyne, about twelve miles from the mouth of the river. So that night, looking from his palace at Tara across the darkened landscape, the king of Tara saw the solitary fire flaring on the top of the hill of Slane, and in consternation he asked his wise men what that light meant. They warned him of the danger that it betokened for the ancient faith of Erin. In spite of the difference of date between Easter and Beltane, we may suspect that the new fire annually kindled with solemn ceremony about Easter in the king of Ireland's palace at Tara was no other than the Beltane fire. We have seen that in the Highlands of Scotland down to modern times it was customary to extinguish all fires in the neighbourhood before proceeding to kindle the sacred flame. The Irish historian Geoffrey Keating, who wrote in the first part of the seventeenth century, tells us that the men of Ireland held a great fair every year in the month of May at Uisnech (*Ushnagh*) in the county of Meath, “and at it they were wont to exchange their goods and their wares and their jewels. At it, they were, also, wont to make a sacrifice to the Arch-God that they adored, whose name was Bèl (*bayl*). It was, likewise, their usage to light two fires to Bèl, in every district of Ireland, at this season, and to drive a pair of each kind of cattle that the district contained, between those two fires, as a preservative to guard them against all the diseases of that year. It is from that fire, thus made in honour of Bèl, that the day [the first of May] on which the noble feast of the apostles, Philip and James, is held, has been called Bèltaini, or Bèaltaine (*Bayltinnie*); for Beltaini is the same as Bèil-teinë, *i.e.* Teinë Bhèil (*Tinnie Vayl*) or Bèl's Fire.” The custom of driving cattle through or between fires on May Day or the eve of May Day persisted in Ireland down to a time within living memory. Thus Sir John Rhys was informed by a Manxman that an Irish cattle-dealer of his acquaintance used to drive his cattle through fire on May Day so as to singe them a little, since he believed that it would preserve them from harm. When the Manxman was asked where the dealer came from, he answered, “From the mountains over there,” pointing to the Mourne Mountains then looming faintly in the mists on the western horizon.

The first of May is a great popular festival in the more midland and southern parts of Sweden. On the eve of the festival, huge bonfires, which should be lighted by striking two flints together, blaze on all the hills and knolls. Every large hamlet has its own fire, round which the young people dance in a ring. The old folk notice whether the flames incline to the north

or to the south. In the former case, the spring will be cold and backward; in the latter, it will be mild and genial. Similarly, in Bohemia, on the eve of May Day, young people kindle fires on hills and eminences, at crossways, and in pastures, and dance round them. They leap over the glowing embers or even through the flames. The ceremony is called “burning the witches.” In some places an effigy representing a witch used to be burnt in the bonfire. We have to remember that the eve of May Day is the notorious Walpurgis Night, when the witches are everywhere speeding unseen through the air on their hellish errands. On this witching night children in Voigtland also light bonfires on the heights and leap over them. Moreover, they wave burning brooms or toss them into the air. So far as the light of the bonfire reaches, so far will a blessing rest on the fields. The kindling of the fires on Walpurgis Night is called “driving away the witches.” The custom of kindling fires on the eve of May Day (Walpurgis Night) for the purpose of burning the witches is, or used to be, widespread in the Tyrol, Moravia, Saxony and Silesia.

§ 4. The Midsummer Fires.

But the season at which these fire-festivals have been mostly generally held all over Europe is the summer solstice, that is Midsummer Eve (the twenty-third of June) or Midsummer Day (the twenty-fourth of June). A faint tinge of Christianity has been given to them by naming Midsummer Day after St. John the Baptist, but we cannot doubt that the celebration dates from a time long before the beginning of our era. The summer solstice, or Midsummer Day, is the great turning-point in the sun's career, when, after climbing higher and higher day by day in the sky, the luminary stops and thenceforth retraces his steps down the heavenly road. Such a moment could not but be regarded with anxiety by primitive man so soon as he began to observe and ponder the courses of the great lights across the celestial vault; and having still to learn his own powerlessness in face of the vast cyclic changes of nature, he may have fancied that he could help the sun in his seeming decline—could prop his failing steps and rekindle the sinking flame of the red lamp in his feeble hand. In some such thoughts as these the midsummer festivals of our European peasantry may perhaps have taken their rise. Whatever their origin, they have prevailed all over this quarter of the globe, from Ireland on the west to Russia on the east, and from Norway and Sweden on the north to Spain and Greece on the south. According to a mediæval writer, the three great features of the midsummer celebration were the bonfires, the procession with torches round the fields, and the custom of rolling a wheel. He tells us that boys burned bones and filth of various kinds to make a foul smoke, and that the smoke drove away certain noxious dragons which at this time, excited by the summer heat, copulated in the air and poisoned the wells and rivers by dropping their seed into them; and he explains the custom of trundling a wheel to mean that the sun, having now reached the highest point in the ecliptic, begins thenceforward to descend.

A good general account of the midsummer customs, together with some of the reasons popularly alleged for observing them, is given by Thomas Kirchmeyer, a writer of the sixteenth century, in his poem *The Popish Kingdome*:—

*“Then doth the joyfull feast of John the Baptist take his turne,
When bonfiers great with loftie flame, in every towne doe burne;
And yong men round about with maides, doe daunce in every streete,
With garlands wrought of Motherwort, or else with Vervain sweete,
And many other flowres faire, with Violets in their handes,
Whereas they all do fondly thinke, that whosoever standes,
And thorow the flowres beholds the flame, his eyes shall feele no paine.
When thus till night they daunced have, they through the fire amaine*

*With striving mindes doe runne, and all their hearbes they cast therin,
 And then with wordes devout and prayers, they solemnely begin,
 Desiring God that all their illes may there consumed bee,
 Whereby they thinke through all that yeare from Agues to be free.
 Some others get a rotten wheele, all worne and cast aside,
 Which covered round about with strawe, and tow, they closely hide:
 And caryed to some mountaines top, being all with fire light,
 They hurle it downe with violence, when darke appeares the night:
 Resembling much the Sunne, that from the heavens downe should fal,
 A straunge and monstrous sight it seemes, and fearfull to them all:
 But they suppose their mischiefes all are likewise throwne to hell,
 And that from harmes and daungers now, in safetie here they dwell.”*

From these general descriptions, which to some extent still hold good, or did so till lately, we see that the main features of the midsummer fire-festival resemble those which we have found to characterize the vernal festivals of fire. The similarity of the two sets of ceremonies will plainly appear from the following examples.

A writer of the first half of the sixteenth century informs us that in almost every village and town of Germany public bonfires were kindled on the Eve of St. John, and young and old, of both sexes, gathered about them and passed the time in dancing and singing. People on this occasion wore chaplets of mugwort and vervain, and they looked at the fire through bunches of larkspur which they held in their hands, believing that this would preserve their eyes in a healthy state throughout the year. As each departed, he threw the mugwort and vervain into the fire, saying, “May all my ill-luck depart and be burnt up with these.” At Lower Konz, a village prettily situated on a hillside overlooking the Moselle, in the midst of a wood of walnut-trees and fruit-trees, the midsummer festival used to be celebrated as follows. A quantity of straw was collected on the top of the steep Stromberg Hill. Every inhabitant, or at least every householder, had to contribute his share of straw to the pile; a recusant was looked at askance, and if in the course of the year he happened to break a leg or lose a child, there was not a gossip in the village but knew the reason why. At nightfall the whole male population, men and boys, mustered on the top of the hill; the women and girls were not allowed to join them, but had to take up their position at a certain spring half-way down the slope. On the summit stood a huge wheel completely encased in some of the straw which had been jointly contributed by the villagers; the rest of the straw was made into torches. From each side of the wheel the axle-tree projected about three feet, thus furnishing handles to the lads who were to guide it in its descent. The mayor of the neighbouring town of Sierck, who always received a basket of cherries for his services, gave the signal; a lighted torch was applied to the wheel, and as it burst into flame, two young fellows, strong-limbed and swift of foot, seized the handles and began running with it down the slope. A great shout went up. Every man and boy waved a blazing torch in the air, and took care to keep it alight so long as the wheel was trundling down the hill. Some of them followed the fiery wheel, and watched with amusement the shifts to which its guides were put in steering it round the hollows and over the broken ground on the mountainside. The great object of the young men who guided the wheel was to plunge it blazing into the water of the Moselle; but they rarely succeeded in their efforts, for the vineyards which cover the greater part of the declivity impeded their progress, and the wheel was often burned out before it reached the river. As it rolled past the women and girls at the spring, they raised cries of joy which were answered by the men on the top of the mountain; and the shouts were echoed by the inhabitants of neighbouring villages who watched the spectacle from their hills on the opposite bank of the Moselle. If the fiery wheel was successfully conveyed to the bank of the river and extinguished in the water,

the people looked for an abundant vintage that year, and the inhabitants of Konz had the right to exact a waggon-load of white wine from the surrounding vineyards. On the other hand, they believed that, if they neglected to perform the ceremony, the cattle would be attacked by giddiness and convulsions and would dance in their stalls.

Down at least to the middle of the nineteenth century the midsummer fires used to blaze all over Upper Bavaria. They were kindled especially on the mountains, but also far and wide in the lowlands, and we are told that in the darkness and stillness of night the moving groups, lit up by the flickering glow of the flames, presented an impressive spectacle. In some places the people shewed their sense of the sanctity of the fires by using for fuel the trees past which the gay procession had defiled, with fluttering banners, on Corpus Christi Day. In others the children collected the firewood from door to door on the eve of the festival, singing their request for fuel at every house in doggerel verse. Cattle were driven through the fire to cure the sick animals and to guard such as were sound against plague and harm of every kind throughout the year. Many a householder on that day put out the fire on the domestic hearth and rekindled it by means of a brand taken from the midsummer bonfire. The people judged of the height to which the flax would grow in the year by the height to which the flames of the bonfire rose; and whoever leaped over the burning pile was sure not to suffer from backache in reaping the corn at harvest. But it was especially the practice for lovers to spring over the fire hand in hand, and the way in which each couple made the leap was the subject of many a jest and many a superstition. In one district the custom of kindling the bonfires was combined with that of lighting wooden discs and hurling them in the air after the manner which prevails at some of the spring festivals. In many parts of Bavaria it was believed that the flax would grow as high as the young people leaped over the fire. In others the old folk used to plant three charred sticks from the bonfire in the fields, believing that this would make the flax grow tall. Elsewhere an extinguished brand was put in the roof of the house to protect it against fire. In the towns about Würzburg the bonfires used to be kindled in the market-places, and the young people who jumped over them wore garlands of flowers, especially of mugwort and vervain, and carried sprigs of larkspur in their hands. They thought that such as looked at the fire holding a bit of larkspur before their face would be troubled by no malady of the eyes throughout the year. Further, it was customary at Würzburg, in the sixteenth century, for the bishop's followers to throw burning discs of wood into the air from a mountain which overhangs the town. The discs were discharged by means of flexible rods, and in their flight through the darkness presented the appearance of fiery dragons.

In the valley of the Lech, which divides Upper Bavaria from Swabia, the midsummer customs and beliefs are, or used to be, very similar. Bonfires are kindled on the mountains on Midsummer Day; and besides the bonfire a tall beam, thickly wrapt in straw and surmounted by a cross-piece, is burned in many places. Round this cross as it burns the lads dance with loud shouts; and when the flames have subsided, the young people leap over the fire in pairs, a young man and a young woman together. If they escape unsmirched, the man will not suffer from fever, and the girl will not become a mother within the year. Further, it is believed that the flax will grow that year as high as they leap over the fire; and that if a charred billet be taken from the fire and stuck in a flax-field it will promote the growth of the flax. Similarly in Swabia, lads and lasses, hand in hand, leap over the midsummer bonfire, praying that the hemp may grow three ells high, and they set fire to wheels of straw and send them rolling down the hill. Among the places where burning wheels were thus bowled down hill at Midsummer were the Hohenstaufen mountains in Wurtemberg and the Frauenberg near Gerhausen. At Deffingen, in Swabia, as the people sprang over the midsummer bonfire they cried out, "Flax, flax! may the flax this year grow seven ells high!" At Rottenburg in Swabia,

down to the year 1807 or 1808, the festival was marked by some special features. About mid-day troops of boys went about the town begging for firewood at the houses. In each troop there were three leaders, one of whom carried a dagger, a second a paper banner, and a third a white plate covered with a white cloth. These three entered each house and recited verses, in which they expressed an intention of roasting Martin Luther and sending him to the devil; and for this meritorious service they expected to be paid, the contributions being received in the cloth-covered plate. In the evening they counted up their money and proceeded to "behead the Angel-man." For this ceremony an open space was chosen, sometimes in the middle of the town. Here a stake was thrust into the ground and straw wrapt about it, so as to make a rude effigy of human form with arms, head, and face. Every boy brought a handful of nosegays and fastened them to the straw-man, who was thus enveloped in flowers. Fuel was heaped about the stake and set on fire. When the Angel-man, as the straw-effigy was called, blazed up, all the boys of the neighbourhood, who had gathered expectantly around, fell upon him with their wooden swords and hewed him to pieces. As soon as he had vanished in smoke and flame, the lads leaped backward and forward over the glowing embers, and later in the evening they feasted on the proceeds of their collection. Here the Angel-man burnt in the fire appears to be identified with Martin Luther, to whom, as we have seen, allusion was made during the house-to-house visitation. The identification was probably modern, for we may assume that the custom of burning an effigy in the Midsummer bonfire is far older than the time of Luther.

In Baden the children used to collect fuel from house to house for the Midsummer bonfire on St. John's Day; and lads and lasses leaped over the fire in couples. Here, as elsewhere, a close connexion was traced between these bonfires and the harvest. In some places it was thought that those who leaped over the fires would not suffer from backache at reaping. Sometimes, as the young folk sprang over the flames, they cried, "Grow, that the hemp may be three ells high!" This notion that the hemp or the corn would grow as high as the flames blazed or as the people jumped over them, seems to have been widespread in Baden. It was held that the parents of the young people who bounded highest over the fire would have the most abundant harvest; and on the other hand, if a man contributed nothing to the bonfire, it was imagined that there would be no blessing on his crops, and that his hemp in particular would never grow. In the neighbourhood of Bühl and Achern the St. John's fires were kindled on the tops of hills; only the unmarried lads of the village brought the fuel, and only the unmarried young men and women sprang through the flames. But most of the villagers, old and young, gathered round the bonfires, leaving a clear space for the leapers to take their run. One of the bystanders would call out the names of a pair of sweethearts; on which the two would step out from the throng, take each other by the hand, and leap high and lightly through the swirling smoke and flames, while the spectators watched them critically and drew omens of their married life from the height to which each of them bounded. Such an invitation to jump together over the bonfire was regarded as tantamount to a public betrothal. Near Offenburg, in the Black Forest, on Midsummer Day the village boys used to collect faggots and straw on some steep and conspicuous height, and they spent some time in making circular wooden discs by slicing the trunk of a pine-tree across. When darkness had fallen, they kindled the bonfire, and then, as it blazed up, they lighted the discs at it, and, after swinging them to and fro at the end of a stout and supple hazel-wand, they hurled them one after the other, whizzing and flaming, into the air, where they described great arcs of fire, to fall at length, like shooting-stars, at the foot of the mountain. In many parts of Alsace and Lorraine the midsummer fires still blaze annually or did so not very many years ago. At Speicher in the Eifel, a district which lies on the middle Rhine, to the west of Coblenz, a bonfire used to be kindled in front of the village on St. John's Day, and all the young people had to jump over it. Those who failed to do so were not allowed to join the rest in begging for eggs from house to

house. Where no eggs were given, they drove a wedge into the keyhole of the door. On this day children in the Eifel used also to gather flowers in the fields, weave them into garlands, and throw the garlands on the roofs or hang them on the doors of the houses. So long as the flowers remained there, they were supposed to guard the house from fire and lightning. In the southern Harz district and in Thuringia the Midsummer or St. John's fires used to be commonly lighted down to about the middle of the nineteenth century, and the custom has probably not died out. At Edersleben, near Sangerhausen, a high pole was planted in the ground and a tar-barrel was hung from it by a chain which reached to the ground. The barrel was then set on fire and swung round the pole amid shouts of joy.

According to one account, German tradition required that the midsummer fire should be lighted, not from a common hearth, but by the friction of two sorts of wood, namely oak and fir. In some old farm-houses of the Surenthal and Winenthal, in Switzerland, a couple of holes or a whole row of them may be seen facing each other in the door-posts of the barn or stable. Sometimes the holes are smooth and round; sometimes they are deeply burnt and blackened. The explanation of them is this. About midsummer, but especially on Midsummer Day, two such holes are bored opposite each other, into which the extremities of a strong pole are fixed. The holes are then stuffed with tow steeped in resin and oil; a rope is looped round the pole, and two young men, who must be brothers or must have the same baptismal name, and must be of the same age, pull the ends of the rope backwards and forwards so as to make the pole revolve rapidly, till smoke and sparks issue from the two holes in the door-posts. The sparks are caught and blown up with tinder, and this is the new and pure fire, the appearance of which is greeted with cries of joy. Heaps of combustible materials are now ignited with the new fire, and blazing bundles are placed on boards and sent floating down the brook. The boys light torches at the new fire and run to fumigate the pastures. This is believed to drive away all the demons and witches that molest the cattle. Finally the torches are thrown in a heap on the meadow and allowed to burn out. On their way back the boys strew the ashes over the fields, which is supposed to make them fertile. If a farmer has taken possession of a new house, or if servants have changed masters, the boys fumigate the new abode and are rewarded by the farmer with a supper.

In Silesia, from the south-eastern part of the Sudeten range and north-westward as far as Lausitz, the mountains are ablaze with bonfires on Midsummer Eve; and from the valleys and the plains round about Leobschütz, Neustadt, Zülz, Oels, and other places answering fires twinkle through the deepening gloom. While they are smouldering and sending forth volumes of smoke across the fields, young men kindle broom-stumps, soaked in pitch, at the bonfires and then, brandishing the stumps, which emit showers of sparks, they chase one another or dance with the girls round the burning pile. Shots, too, are fired, and shouts raised. The fire, the smoke, the shots, and the shouts are all intended to scare away the witches, who are let loose on this witching day, and who would certainly work harm to the crops and the cattle, if they were not deterred by these salutary measures. Mere contact with the fire brings all sorts of blessings. Hence when the bonfire is burning low, the lads leap over it, and the higher they bound, the better is the luck in store for them. He who surpasses his fellows is the hero of the day and is much admired by the village girls. It is also thought to be very good for the eyes to stare steadily at the bonfire without blinking; moreover he who does so will not drowse and fall asleep betimes in the long winter evenings. On Midsummer Eve the windows and doors of houses in Silesia are crowned with flowers, especially with the blue corn-flowers and the bright corn-cockles; in some villages long strings of garlands and nosegays are stretched across the streets. The people believe that on that night St. John comes down from heaven to bless the flowers and to keep all evil things from house and home.

In Denmark and Norway also Midsummer fires were kindled on St. John's Eve on roads, open spaces, and hills. People in Norway thought that the fires banished sickness from among the cattle. Even yet the fires are said to be lighted all over Norway on the night of June the twenty-third, Midsummer Eve, Old Style. As many as fifty or sixty bonfires may often be counted burning on the hills round Bergen. Sometimes fuel is piled on rafts, ignited, and allowed to drift blazing across the fiords in the darkness of night. The fires are thought to be kindled in order to keep off the witches, who are said to be flying from all parts that night to the Blocksberg, where the big witch lives. In Sweden the Eve of St. John (St. Hans) is the most joyous night of the whole year. Throughout some parts of the country, especially in the provinces of Bohus and Scania and in districts bordering on Norway, it is celebrated by the frequent discharge of firearms and by huge bonfires, formerly called Balder's Balefires (*Balder's Bålar*), which are kindled at dusk on hills and eminences and throw a glare of light over the surrounding landscape. The people dance round the fires and leap over or through them. In parts of Norrland on St. John's Eve the bonfires are lit at the cross-roads. The fuel consists of nine different sorts of wood, and the spectators cast into the flames a kind of toadstool (*Bäran*) in order to counteract the power of the Trolls and other evil spirits, who are believed to be abroad that night; for at that mystic season the mountains open and from their cavernous depths the uncanny crew pours forth to dance and disport themselves for a time. The peasants believe that should any of the Trolls be in the vicinity they will shew themselves; and if an animal, for example a he or she goat, happens to be seen near the blazing, crackling pile, the peasants are firmly persuaded that it is no other than the Evil One in person. Further, it deserves to be remarked that in Sweden St. John's Eve is a festival of water as well as of fire; for certain holy springs are then supposed to be endowed with wonderful medicinal virtues, and many sick people resort to them for the healing of their infirmities.

In Switzerland on Midsummer Eve fires are, or used to be, kindled on high places in the cantons of Bern, Neuchatel, Valais, and Geneva. In Austria the midsummer customs and superstitions resemble those of Germany. Thus in some parts of the Tyrol bonfires are kindled and burning discs hurled into the air. In the lower valley of the Inn a taterdemalian effigy is carted about the village on Midsummer Day and then burned. He is called the *Lotter*, which has been corrupted into Luther. At Ambras, one of the villages where Martin Luther is thus burned in effigy, they say that if you go through the village between eleven and twelve on St. John's Night and wash yourself in three wells, you will see all who are to die in the following year. At Gratz on St. John's Eve (the twenty-third of June) the common people used to make a puppet called the *Tatermann*, which they dragged to the bleaching ground, and pelted with burning besoms till it took fire. At Reutte, in the Tyrol, people believed that the flax would grow as high as they leaped over the midsummer bonfire, and they took pieces of charred wood from the fire and stuck them in their flax-fields the same night, leaving them there till the flax harvest had been got in. In Lower Austria fires are lit in the fields, commonly in front of a cross, and the people dance and sing round them and throw flowers into the flames. Before each handful of flowers is tossed into the fire, a set speech is made; then the dance is resumed and the dancers sing in chorus the last words of the speech. At evening bonfires are kindled on the heights, and the boys caper round them, brandishing lighted torches drenched in pitch. Whoever jumps thrice across the fire will not suffer from fever within the year. Cart-wheels are often smeared with pitch, ignited, and sent rolling and blazing down the hillsides.

All over Bohemia bonfires still burn on Midsummer Eve. In the afternoon boys go about with handcarts from house to house collecting fuel, such as sticks, brushwood, old besoms, and so forth. They make their request at each house in rhyming verses, threatening with evil

consequences the curmudgeons who refuse them a dole. Sometimes the young men fell a tall straight fir in the woods and set it up on a height, where the girls deck it with nosegays, wreaths of leaves, and red ribbons. Then brushwood is piled about it, and at nightfall the whole is set on fire. While the flames break out, the young men climb the tree and fetch down the wreaths which the girls had placed on it. After that, lads and lasses stand on opposite sides of the fire and look at one another through the wreaths to see whether they will be true to each other and marry within the year. Also the girls throw the wreaths across the flames to the men, and woe to the awkward swain who fails to catch the wreath thrown him by his sweetheart. When the blaze has died down, each couple takes hands, and leaps thrice across the fire. He or she who does so will be free from ague throughout the year, and the flax will grow as high as the young folks leap. A girl who sees nine bonfires on Midsummer Eve will marry before the year is out. The singed wreaths are carried home and carefully preserved throughout the year. During thunderstorms a bit of the wreath is burned on the hearth with a prayer; some of it is given to kine that are sick or calving, and some of it serves to fumigate house and cattle-stall, that man and beast may keep hale and well. Sometimes an old cart-wheel is smeared with resin, ignited, and sent rolling down the hill. Often the boys collect all the worn-out besoms they can get hold of, dip them in pitch, and having set them on fire wave them about or throw them high into the air. Or they rush down the hillside in troops, brandishing the flaming brooms and shouting, only however to return to the bonfire on the summit when the brooms have burnt out. The stumps of the brooms and embers from the fire are preserved and stuck in cabbage gardens to protect the cabbages from caterpillars and gnats. Some people insert charred sticks and ashes from the bonfire in their sown fields and meadows, in their gardens and the roofs of their houses, as a talisman against lightning and foul weather; or they fancy that the ashes placed in the roof will prevent any fire from breaking out in the house. In some districts they crown or gird themselves with mugwort while the midsummer fire is burning, for this is supposed to be a protection against ghosts, witches, and sickness; in particular, a wreath of mugwort is a sure preventive of sore eyes. Sometimes the girls look at the bonfires through garlands of wild flowers, praying the fire to strengthen their eyes and eyelids. She who does this thrice will have no sore eyes all that year. In some parts of Bohemia they used to drive the cows through the midsummer fire to guard them against witchcraft.

The Germans of Moravia in like manner still light bonfires on open grounds and high places on Midsummer Eve; and they kindle besoms in the flames and then stick the charred stumps in the cabbage-fields as a powerful protection against caterpillars. On the same mystic evening Moravian girls gather flowers of nine sorts and lay them under their pillow when they go to sleep; then they dream every one of him who is to be her partner for life. For in Moravia maidens in their beds as well as poets by haunted streams have their Midsummer Night's dreams. In Austrian Silesia the custom also prevails of lighting great bonfires on hilltops on Midsummer Eve, and here too the boys swing blazing besoms or hurl them high in the air, while they shout and leap and dance wildly. Next morning every door is decked with flowers and birchen saplings. In the district of Cracow, especially towards the Carpathian Mountains, great fires are kindled by the peasants in the fields or on the heights at nightfall on Midsummer Eve, which among them goes by the name of Kupalo's Night. The fire must be kindled by the friction of two sticks. The young people dance round or leap over it; and a band of sturdy fellows run a race with lighted torches, the winner being rewarded with a peacock's feather, which he keeps throughout the year as a distinction. Cattle also are driven round the fire in the belief that this is a charm against pestilence and disease of every sort.

The name of Kupalo's Night, applied in this part of Galicia to Midsummer Eve, reminds us that we have now passed from German to Slavonic ground; even in Bohemia the midsummer

celebration is common to Slavs and Germans. We have already seen that in Russia the summer solstice or Eve of St. John is celebrated by young men and maidens, who jump over a bonfire in couples carrying a straw effigy of Kupalo in their arms. In some parts of Russia an image of Kupalo is burnt or thrown into a stream on St. John's Night. Again, in some districts of Russia the young folk wear garlands of flowers and girdles of holy herbs when they spring through the smoke or flames; and sometimes they drive the cattle also through the fire in order to protect the animals against wizards and witches, who are then ravenous after milk. In Little Russia a stake is driven into the ground on St. John's Night, wrapt in straw, and set on fire. As the flames rise the peasant women throw birchen boughs into them, saying, "May my flax be as tall as this bough!" In Ruthenia the bonfires are lighted by a flame procured by the friction of wood. While the elders of the party are engaged in thus "churning" the fire, the rest maintain a respectful silence; but when the flame bursts from the wood, they break forth into joyous songs. As soon as the bonfires are kindled, the young people take hands and leap in pairs through the smoke, if not through the flames; and after that the cattle in their turn are driven through the fire.

In many parts of Prussia and Lithuania great fires are kindled on Midsummer Eve. All the heights are ablaze with them, as far as the eye can see. The fires are supposed to be a protection against witchcraft, thunder, hail, and cattle disease, especially if next morning the cattle are driven over the places where the fires burned. Above all, the bonfires ensure the farmer against the arts of witches, who try to steal the milk from his cows by charms and spells. That is why next morning you may see the young fellows who lit the bonfire going from house to house and receiving jugfuls of milk. And for the same reason they stick burs and mugwort on the gate or the hedge through which the cows go to pasture, because that is supposed to be a preservative against witchcraft. In Masuren, a district of Eastern Prussia inhabited by a branch of the Polish family, it is the custom on the evening of Midsummer Day to put out all the fires in the village. Then an oaken stake is driven into the ground and a wheel is fixed on it as on an axle. This wheel the villagers, working by relays, cause to revolve with great rapidity till fire is produced by friction. Every one takes home a lighted brand from the new fire and with it rekindles the fire on the domestic hearth. In the sixteenth century Martin of Urzedow, a Polish priest, denounced the heathen practices of the women who on St. John's Eve (Midsummer Eve) kindled fires by the friction of wood, danced, and sang songs in honour of the devil.

Among the Letts who inhabit the Baltic provinces of Russia the most joyful festival of the year is held on Midsummer Day. The people drink and dance and sing and adorn themselves and their houses with flowers and branches. Chopped boughs of fir are strewn about the rooms, and leaves are stuck in the roofs. In every farm-yard a birch tree is set up, and every person of the name of John who enters the farm that day must break off a twig from the tree and hang up on its branches in return a small present for the family. When the serene twilight of the summer night has veiled the landscape, bonfires gleam on all the hills, and wild shouts of "Ligho! Ligho!" echo from the woods and fields. In Riga the day is a festival of flowers. From all the neighbourhood the peasants stream into the city laden with flowers and garlands. A market of flowers is held in an open square and on the chief bridge over the river; here wreaths of immortelles, which grow wild in the meadows and woods, are sold in great profusion and deck the houses of Riga for long afterwards. Roses, too, are now at the prime of their beauty, and masses of them adorn the flower-stalls. Till far into the night gay crowds parade the streets to music or float on the river in gondolas decked with flowers. So long ago in ancient Rome barges crowned with flowers and crowded with revellers used to float down the Tiber on Midsummer Day, the twenty-fourth of June, and no doubt the strains of music

were wafted as sweetly across the water to listeners on the banks as they still are to the throngs of merrymakers at Riga.

Bonfires are commonly kindled by the South Slavonian peasantry on Midsummer Eve, and lads and lasses dance and shout round them in the usual way. The very names of St. John's Day (*Ivanje*) and the St. John's fires (*kries*) are said to act like electric sparks on the hearts and minds of these swains, kindling a thousand wild, merry, and happy fancies and ideas in their rustic breasts. At Kamenagora in Croatia the herdsmen throw nine three-year old vines into the bonfire, and when these burst into flames the young men who are candidates for matrimony jump through the blaze. He who succeeds in leaping over the fire without singeing himself will be married within the year. At Vidovec in Croatia parties of two girls and one lad unite to kindle a Midsummer bonfire and to leap through the flames; he or she who leaps furthest will soonest wed. Afterwards lads and lasses dance in separate rings, but the ring of lads bumps up against the ring of girls and breaks it, and the girl who has to let go her neighbour's hand will forsake her true love hereafter. In Servia on Midsummer Eve herdsmen light torches of birch bark and march round the sheepfolds and cattle-stalls; then they climb the hills and there allow the torches to burn out.

Among the Magyars in Hungary the midsummer fire-festival is marked by the same features that meet us in so many parts of Europe. On Midsummer Eve in many places it is customary to kindle bonfires on heights and to leap over them, and from the manner in which the young people leap the bystanders predict whether they will marry soon. At Nograd-Ludany the young men and women, each carrying a truss of straw, repair to a meadow, where they pile the straw in seven or twelve heaps and set it on fire. Then they go round the fire singing, and hold a bunch of iron-wort in the smoke, while they say, "No boil on my body, no sprain in my foot!" This holding of the flowers over the flames is regarded, we are told, as equally important with the practice of walking through the fire barefoot and stamping it out. On this day also many Hungarian swineherds make fire by rotating a wheel round a wooden axle wrapt in hemp, and through the fire thus made they drive their pigs to preserve them from sickness. In villages on the Danube, where the population is a cross between Magyar and German, the young men and maidens go to the high banks of the river on Midsummer Eve; and while the girls post themselves low down the slope, the lads on the height above set fire to little wooden wheels and, after swinging them to and fro at the end of a wand, send them whirling through the air to fall into the Danube. As he does so, each lad sings out the name of his sweetheart, and she listens well pleased down below.

The Esthonians of Russia, who, like the Magyars, belong to the great Turanian family of mankind, also celebrate the summer solstice in the usual way. On the Eve of St. John all the people of a farm, a village, or an estate, walk solemnly in procession, the girls decked with flowers, the men with leaves and carrying bundles of straw under their arms. The lads carry lighted torches or flaming hoops steeped in tar at the top of long poles. Thus they go singing to the cattle-sheds, the granaries, and so forth, and afterwards march thrice round the dwelling-house. Finally, preceded by the shrill music of the bagpipes and shawms, they repair to a neighbouring hill, where the materials of a bonfire have been collected. Tar-barrels filled with combustibles are hung on poles, or the trunk of a felled tree has been set up with a great mass of juniper piled about it in the form of a pyramid. When a light has been set to the pile, old and young gather about it and pass the time merrily with song and music till break of day. Every one who comes brings fresh fuel for the fire, and they say, "Now we all gather together, where St. John's fire burns. He who comes not to St. John's fire will have his barley full of thistles, and his oats full of weeds." Three logs are thrown into the fire with special ceremony; in throwing the first they say, "Gold of pleasure (a plant with yellow flowers) into the fire!" in throwing the second they say, "Weeds to the unploughed land!" but in throwing

the third they cry, "Flax on my field!" The fire is said to keep the witches from the cattle. According to others, it ensures that for the whole year the milk shall be "as pure as silver and as the stars in the sky, and the butter as yellow as the sun and the fire and the gold." In the Esthonian island of Oesel, while they throw fuel into the midsummer fire, they call out, "Weeds to the fire, flax to the field," or they fling three billets into the flames, saying, "Flax grow long!" And they take charred sticks from the bonfire home with them and keep them to make the cattle thrive. In some parts of the island the bonfire is formed by piling brushwood and other combustibles round a tree, at the top of which a flag flies. Whoever succeeds in knocking down the flag with a pole before it begins to burn will have good luck. Formerly the festivities lasted till daybreak, and ended in scenes of debauchery which looked doubly hideous by the growing light of a summer morning.

Still farther north, among a people of the same Turanian stock, we learn from an eye-witness that Midsummer Night used to witness a sort of witches' sabbath on the top of every hill in Finland. The bonfire was made by setting up four tall birches in a square and piling the intermediate space with fuel. Round the roaring flames the people sang and drank and gambolled in the usual way. Farther east, in the valley of the Volga, the Cheremiss celebrate about midsummer a festival which Haxthausen regarded as identical with the midsummer ceremonies of the rest of Europe. A sacred tree in the forest, generally a tall and solitary oak, marks the scene of the solemnity. All the males assemble there, but no woman may be present. A heathen priest lights seven fires in a row from north-west to south-east; cattle are sacrificed and their blood poured in the fires, each of which is dedicated to a separate deity. Afterwards the holy tree is illumined by lighted candles placed on its branches; the people fall on their knees and with faces bowed to the earth pray that God would be pleased to bless them, their children, their cattle, and their bees, grant them success in trade, in travel, and in the chase, enable them to pay the Czar's taxes, and so forth.

When we pass from the east to the west of Europe we still find the summer solstice celebrated with rites of the same general character. Down to about the middle of the nineteenth century the custom of lighting bonfires at midsummer prevailed so commonly in France that there was hardly a town or a village, we are told, where they were not kindled. Though the pagan origin of the custom may be regarded as certain, the Catholic Church threw a Christian cloak over it by boldly declaring that the bonfires were lit in token of the general rejoicing at the birth of the Baptist, who opportunely came into the world at the solstice of summer, just as his greater successor did at the solstice of winter; so that the whole year might be said to revolve on the golden hinges of these two great birthdays. Writing in the seventeenth century Bishop Bossuet expressly affirms this edifying theory of the Midsummer bonfires, and he tells his catechumens that the Church herself participated in the illumination, since in several dioceses, including his own diocese of Meaux, a number of parishes kindled what were called ecclesiastical fires for the purpose of banishing the superstitions practised at the purely mundane bonfires. These superstitions, he goes on to say, consisted in dancing round the fire, playing, feasting, singing ribald songs, throwing herbs across the fire, gathering herbs at noon or while fasting, carrying them on the person, preserving them throughout the year, keeping brands or cinders of the fire, and other similar practices. However excellent the intentions of the ecclesiastical authorities may have been, they failed of effecting their purpose; for the superstitions as well as the bonfires survived in France far into the nineteenth century, if indeed they are extinct even now at the beginning of the twentieth. Writing in the latter part of the nineteenth century Mr. Ch. Cuissard tells us that he himself witnessed in Touraine and Poitou the superstitious practices which he describes as follows: "The most credulous examine the ways in which the flame burns and draw good or bad omens accordingly. Others, after leaping through the flames crosswise, pass their little

children through them thrice, fully persuaded that the little ones will then be able to walk at once. In some places the shepherds make their sheep tread the embers of the extinct fire in order to preserve them from the foot-rot. Here you may see about midnight an old woman grubbing among the cinders of the pyre to find the hair of the Holy Virgin or Saint John, which she deems an infallible specific against fever. There, another woman is busy plucking the roots of the herbs which have been burned on the surface of the ground; she intends to eat them, imagining that they are an infallible preservative against cancer. Elsewhere a girl wears on her neck a flower which the touch of St. John's fire has turned for her into a talisman, and she is sure to marry within the year. Shots are fired at the tree planted in the midst of the fire to drive away the demons who might purpose to send sicknesses about the country. Seats are set round about the bonfire, in order that the souls of dead relations may come and enjoy themselves for a little with the living.”

In Brittany, apparently, the custom of the Midsummer bonfires is kept up to this day. Thus in Lower Brittany every town and every village still lights its *tantad* or bonfire on St. John's Night. When the flames have died down, the whole assembly kneels round about the bonfire and an old man prays aloud. Then they all rise and march thrice round the fire; at the third turn they stop and every one picks up a pebble and throws it on the burning pile. After that they disperse. In Finistère the bonfires of St. John's Day are kindled by preference in an open space near a chapel of St. John; but if there is no such chapel, they are lighted in the square facing the parish church and in some districts at cross-roads. Everybody brings fuel for the fire, it may be a faggot, a log, a branch, or an armful of gorse. When the vespers are over, the parish priest sets a light to the pile. All heads are bared, prayers recited, and hymns sung. Then the dancing begins. The young folk skip round the blazing pile and leap over it, when the flames have died down. If anybody makes a false step and falls or rolls in the hot embers, he or she is greeted with hoots and retires abashed from the circle of dancers. Brands are carried home from the bonfire to protect the houses against lightning, conflagrations, and certain maladies and spells. The precious talisman is carefully kept in a cupboard till St. John's Day of the following year. At Quimper, and in the district of Léon, chairs used to be placed round the midsummer bonfire, that the souls of the dead might sit on them and warm themselves at the blaze. At Brest on this day thousands of people used to assemble on the ramparts towards evening and brandish lighted torches, which they swung in circles or flung by hundreds into the air. The closing of the town gates put an end to the spectacle, and the lights might be seen dispersing in all directions like wandering will-o'-the-wisps. In Upper Brittany the materials for the midsummer bonfires, which generally consist of bundles of furze and heath, are furnished by voluntary contributions, and piled on the tops of hills round poles, each of which is surmounted by a nosegay or a crown. This nosegay or crown is generally provided by a man named John or a woman named Jean, and it is always a John or a Jean who puts a light to the bonfire. While the fire is blazing the people dance and sing round it, and when the flames have subsided they leap over the glowing embers. Charred sticks from the bonfire are thrown into wells to improve the water, and they are also taken home as a protection against thunder. To make them thoroughly effective, however, against thunder and lightning you should keep them near your bed, between a bit of a Twelfth Night cake and a sprig of boxwood which has been blessed on Palm Sunday. Flowers from the nosegay or crown which overhung the fire are accounted charms against disease and pain, both bodily and spiritual; hence girls hang them at their breast by a thread of scarlet wool. In many parishes of Brittany the priest used to go in procession with the crucifix and kindle the bonfire with his own hands; and farmers were wont to drive their flocks and herds through the fire in order to preserve them from sickness till midsummer of the following year. Also it was believed that every girl who danced round nine of the bonfires would marry within the year.

In Normandy the midsummer fires have now almost disappeared, at least in the district known as the Bocage, but they used to shine on every hill. They were commonly made by piling brushwood, broom, and ferns about a tall tree, which was decorated with a crown of moss and sometimes with flowers. While they burned, people danced and sang round them, and young folk leaped over the flames or the glowing ashes. In the valley of the Orne the custom was to kindle the bonfire just at the moment when the sun was about to dip below the horizon; and the peasants drove their cattle through the fires to protect them against witchcraft, especially against the spells of witches and wizards who attempted to steal the milk and butter. At Jumièges in Normandy, down to the first half of the nineteenth century, the midsummer festival was marked by certain singular features which bore the stamp of a very high antiquity. Every year, on the twenty-third of June, the Eve of St. John, the Brotherhood of the Green Wolf chose a new chief or master, who had always to be taken from the hamlet of Conihout. On being elected, the new head of the brotherhood assumed the title of the Green Wolf, and donned a peculiar costume consisting of a long green mantle and a very tall green hat of a conical shape and without a brim. Thus arrayed he stalked solemnly at the head of the brothers, chanting the hymn of St. John, the crucifix and holy banner leading the way, to a place called Chouquet. Here the procession was met by the priest, precentors, and choir, who conducted the brotherhood to the parish church. After hearing mass the company adjourned to the house of the Green Wolf, where a simple repast, such as is required by the church on fast-days, was served up to them. Then they danced before the door till it was time to light the bonfire. Night being come, the fire was kindled to the sound of hand-bells by a young man and a young woman, both decked with flowers. As the flames rose, the *Te Deum* was sung, and a villager thundered out a parody in the Norman dialect of the hymn *ut queant laxis*. Meantime the Green Wolf and his brothers, with their hoods down on their shoulders and holding each other by the hand, ran round the fire after the man who had been chosen to be the Green Wolf of the following year. Though only the first and the last man of the chain had a hand free, their business was to surround and seize thrice the future Green Wolf, who in his efforts to escape belaboured the brothers with a long wand which he carried. When at last they succeeded in catching him they carried him to the burning pile and made as if they would throw him on it. This ceremony over, they returned to the house of the Green Wolf, where a supper, still of the most meagre fare, was set before them. Up till midnight a sort of religious solemnity prevailed. No unbecoming word might fall from the lips of any of the company, and a censor, armed with a hand-bell, was appointed to mark and punish instantly any infraction of the rule. But at the stroke of twelve all this was changed. Constraint gave way to license; pious hymns were replaced by Bacchanalian ditties, and the shrill quavering notes of the village fiddle hardly rose above the roar of voices that went up from the merry brotherhood of the Green Wolf. Next day, the twenty-fourth of June or Midsummer Day, was celebrated by the same personages with the same noisy gaiety. One of the ceremonies consisted in parading, to the sound of musketry, an enormous loaf of consecrated bread, which, rising in tiers, was surmounted by a pyramid of verdure adorned with ribbons. After that the holy hand-bells, deposited on the step of the altar, were entrusted as insignia of office to the man who was to be the Green Wolf next year.

In the canton of Breteuil in Picardy (department of Oise) the priest used to kindle the midsummer bonfire, and the people marched thrice round it in procession. Some of them took ashes of the fire home with them to protect the houses against lightning. The custom is, or was down to recent years, similar at Vorges, near Laon. An enormous pyre, some fifty or sixty feet high, supported in the middle by a tall pole, is constructed every year on the twenty-third of June, the Eve of St. John. It stands at one end of the village, and all the inhabitants contribute fuel to it: a cart goes round the village in the morning, by order of the mayor, collecting combustibles from house to house: no one would dream of refusing to

comply with the customary obligation. In the evening, after a service in honour of St. John has been performed in the church, the clergy, the mayor, the municipal authorities, the rural police, and the fire-brigade march in procession to the bonfire, accompanied by the inhabitants and a crowd of idlers drawn by curiosity from the neighbouring villages. After addressing the throng in a sermon, to which they pay little heed, the parish priest sprinkles the pyre with holy water, and taking a lighted torch from the hand of an assistant sets fire to the pile. The enormous blaze, flaring up against the dark sky of the summer night, is seen for many miles around, particularly from the hill of Laon. When it has died down into a huge heap of glowing embers and grey ashes, every one carries home a charred stick or some cinders; and the fire-brigade, playing their hose on what remains, extinguishes the smouldering fire. The people preserve the charred sticks and cinders throughout the year, believing that these relics of St. John's bonfire have power to guard them from lightning and from contagious diseases. At Château-Thierry, a town of the department of Aisne, between Paris and Reims, the custom of lighting bonfires and dancing round them at the midsummer festival of St. John lasted down to about 1850; the fires were kindled especially when June had been rainy, and the people thought that the lighting of the bonfires would cause the rain to cease.

In Beauce and Perche, two neighbouring districts of France to the south-west of Paris, the midsummer bonfires have nearly or wholly disappeared, but formerly they were commonly kindled and went by the name of the "fires of St. John." The site of the bonfire was either the village square or beside the cross in the cemetery. Here a great pile of faggots, brushwood, and grass was accumulated about a huge branch, which bore at the top a crown of fresh flowers. The priest blessed the bonfire and the people danced round it. When it blazed and crackled, the bystanders thrust their heads into the puffs of smoke, in the belief that it would preserve them from a multitude of ills; and when the fire was burnt out, they rushed upon the charred embers and ashes and carried them home, imagining that they had a secret virtue to guard their houses from being struck by lightning or consumed by fire. Some of the Perche farmers in the old days, not content with the public bonfire, used to light little private bonfires in their farmyards and make all their cattle pass through the smoke and flames for the purpose of protecting them against witchcraft or disease.

In the department of the Ardennes every one was wont to contribute his faggot to the midsummer bonfire, and the clergy marched at the head of the procession to kindle it. Failure to light the fires would, in the popular belief, have exposed the fields to the greatest danger. At Revin the young folk, besides dancing round the fire to the strains of the village fiddler, threw garlands of flowers across the flames to each other. In the Vosges it is still customary to kindle bonfires upon the hill-tops on Midsummer Eve; the people believe that the fires help to preserve the fruits of the earth and ensure good crops. In the Jura Mountains the midsummer bonfires went by the name of *bâ* or *beau*. They were lit on the most conspicuous points of the landscape. Near St. Jean, in the Jura, it appears that at this season young people still repair to the cross-roads and heights, and there wave burning torches so as to present the appearance of fiery wheels in the darkness. In Franche-Comté, the province of France which lies immediately to the west of the Jura mountains, the fires of St. John still shone on the saint's day in several villages down to recent years. They were generally lit on high ground and the young folks of both sexes sang and danced round them, and sprang over the dying flames. In Bresse bonfires used to be kindled on Midsummer Eve (the twenty-third of June) and the people danced about them in a circle. Devout persons, particularly old women, circumambulated the fires fourteen times, telling their beads and mumbling seven *Patens* and seven *Aves* in the hope that thereby they would feel no pains in their backs when they stooped over the sickle in the harvest field. In Berry, a district of Central France, the midsummer fire

was lit on the Eve of St. John and went by the name of the *jônée*, *joannée*, or *jouannée*. Every family according to its means contributed faggots, which were piled round a pole on the highest ground in the neighbourhood. In the hamlets the office of kindling the fire devolved on the oldest man, but in the towns it was the priest or the mayor who discharged the duty. Here, as in Brittany, people supposed that a girl who had danced round nine of the midsummer bonfires would marry within the year. To leap several times over the fire was regarded as a sort of purification which kept off sickness and brought good luck to the leaper. Hence the nimble youth bounded through the smoke and flames, and when the fire had somewhat abated parents jumped across it with their children in their arms in order that the little ones might also partake of its beneficent influence. Embers from the extinct bonfire were taken home, and after being dipped in holy water were kept as a talisman against all kinds of misfortune, but especially against lightning. The same virtue was ascribed to the ashes and charred sticks of the midsummer bonfire in Périgord, where everybody contributed his share of fuel to the pile and the whole was crowned with flowers, especially with roses and lilies. On the borders of the departments of Creuse and Corrèze, in Central France, the fires of St. John used to be lit on the Eve of the saint's day (the twenty-third of June); the custom seems to have survived till towards the end of the nineteenth century. Men, women, and children assembled round the fires, and the young people jumped over them. Children were brought by their parents or elder brothers into contact with the flames in the belief that this would save them from fever. Older people girded themselves with stalks of rye taken from a neighbouring field, because they fancied that by so doing they would not grow weary in reaping the corn at harvest.

Bonfires were lit in almost all the hamlets of Poitou on the Eve of St. John. People marched round them thrice, carrying a branch of walnut in their hand. Shepherdesses and children passed sprigs of mullein (*verbascum*) and nuts across the flames; the nuts were supposed to cure toothache, and the mullein to protect the cattle from sickness and sorcery. When the fire died down people took some of the ashes home with them, either to keep them in the house as a preservative against thunder or to scatter them on the fields for the purpose of destroying corn-cockles and darnel. Stones were also placed round the fire, and it was believed that the first to lift one of these stones next morning would find under it the hair of St. John. In Poitou also it used to be customary on the Eve of St. John to trundle a blazing wheel wrapt in straw over the fields to fertilize them. This last custom is said to be now extinct, but it is still usual, or was so down to recent years, in Poitou to kindle fires on this day at cross-roads or on the heights. The oldest or youngest person present sets a light to the pile, which consists of broom, gorse, and heath. A bright and crackling blaze shoots up, but soon dies down, and over it the young folk leap. They also throw stones into it, picking the stone according to the size of the turnips that they wish to have that year. It is said that "the good Virgin" comes and sits on the prettiest of the stones, and next morning they see there her beautiful golden tresses. At Lussac, in Poitou, the lighting of the midsummer bonfire is still an affair of some ceremony. A pyramid of faggots is piled round a tree or tall pole on the ground where the fair is held; the priest goes in procession to the spot and kindles the pile. When prayers have been said and the clergy have withdrawn, the people continue to march round the fire, telling their beads, but it is not till the flames have begun to die down that the youth jump over them. A brand from the midsummer bonfire is supposed to be a preservative against thunder.

In the department of Vienne the bonfire was kindled by the oldest man, and before the dance round the flames began it was the custom to pass across them a great bunch of mullein (*bouillon blanc*) and a branch of walnut, which next morning before sunrise were fastened over the door of the chief cattle-shed. A similar custom prevailed in the neighbouring department of Deux-Sèvres; but here it was the priest who kindled the bonfire, and old men

used to put embers of the fire in their wooden shoes as a preservative against many evils. In some towns and villages of Saintonge and Aunis, provinces of Western France now mostly comprised in the department of Charente Inférieure, the fires of St. John are still kindled on Midsummer Eve, but the custom is neither so common nor carried out with so much pomp and ceremony as formerly. Great quantities of wood used to be piled on an open space round about a huge post or a tree stripped of its leaves and branches. Every one took care to contribute a faggot to the pile, and the whole population marched to the spot in procession with the crucifix at their head and the priest bringing up the rear. The squire, or other person of high degree, put the torch to the pyre, and the priest blessed it. In the southern and eastern parts of Saintonge children and cattle were passed through the smoke of the bonfires to preserve them from contagious diseases, and when the fire had gone out the people scuffled for the charred fragments of the great post, which they regarded as talismans against thunder. Next morning, on Midsummer Day, every shepherdess in the neighbourhood was up very early, for the first to drive her sheep over the blackened cinders and ashes of the great bonfire was sure to have the best flock all that year. Where the shepherds shrunk from driving their flocks through the smoke and flames of the bonfire they contented themselves with marking the hinder-quarters of the animals with a broom which had been blackened in the ashes.

In the mountainous part of Comminges, a province of Southern France, now comprised in the department of Haute Garonne, the midsummer fire is made by splitting open the trunk of a tall tree, stuffing the crevice with shavings, and igniting the whole. A garland of flowers is fastened to the top of the tree, and at the moment when the fire is lighted the man who was last married has to climb up a ladder and bring the flowers down. In the flat parts of the same district the materials of the midsummer bonfires consist of fuel piled in the usual way; but they must be put together by men who have been married since the last midsummer festival, and each of these benedicts is obliged to lay a wreath of flowers on the top of the pile. At the entrance of the valley of Aran young people set up on the banks of the Garonne a tree covered with ribbons and garlands; at the end of a year the withered tree and faded flowers furnish excellent fuel. So on the Eve of St. John the villagers assemble, and an old man or a child kindles the fire which is to consume tree and garlands together. While the blaze lasts the people sing and dance; and the burnt tree is then replaced by another which will suffer the same fate after the lapse of a year. In some districts of the French Pyrenees it is deemed necessary to leap nine times over the midsummer fire if you would be assured of prosperity. A traveller in Southern France at the beginning of the nineteenth century tells us that "the Eve of St. John is also a day of joy for the Provençals. They light great fires and the young folk leap over them. At Aix they shower squibs and crackers on the passers-by, which has often had disagreeable consequences. At Marseilles they drench each other with scented water, which is poured from the windows or squirted from little syringes; the roughest jest is to souse passers-by with clean water, which gives rise to loud bursts of laughter." At Draguignan, in the department of Var, fires used to be lit in every street on the Eve of St. John, and the people roasted pods of garlic at them; the pods were afterwards distributed to every family. Another diversion of the evening was to pour cans of water from the houses on the heads of people in the streets. In Provence the midsummer fires are still popular. Children go from door to door begging for fuel, and they are seldom sent empty away. Formerly the priest, the mayor, and the aldermen used to walk in procession to the bonfire, and even deigned to light it; after which the assembly marched thrice round the burning pile, while the church bells pealed and rockets fizzed and sputtered in the air. Dancing began later, and the bystanders threw water on each other. At Ciotat, while the fire was blazing, the young people plunged into the sea and splashed each other vigorously. At Vitrolles they bathed in a pond in order that they might not suffer from fever during the year, and at Saintes-Maries they watered the horses to protect them from the itch. At Aix a nominal king, chosen from

among the youth for his skill in shooting at a popinjay, presided over the festival. He selected his own officers, and escorted by a brilliant train marched to the bonfire, kindled it, and was the first to dance round it. Next day he distributed largesse to his followers. His reign lasted a year, during which he enjoyed certain privileges. He was allowed to attend the mass celebrated by the commander of the Knights of St. John on St. John's Day: the right of hunting was accorded to him; and soldiers might not be quartered in his house. At Marseilles also on this day one of the guilds chose a king of the *badache* or double axe; but it does not appear that he kindled the bonfire, which is said to have been lighted with great ceremony by the préfet and other authorities.

In Belgium the custom of kindling the midsummer bonfires has long disappeared from the great cities, but it is still kept up in rural districts and small towns of Brabant, Flanders, and Limburg. People leap across the fires to protect themselves against fever, and in eastern Flanders women perform similar leaps for the purpose of ensuring an easy delivery. At Termonde young people go from door to door collecting fuel for the fires and reciting verses, in which they beg the inmates to give them "wood of St. John" and to keep some wood for St. Peter's Day (the twenty-ninth of June); for in Belgium the Eve of St. Peter's Day is celebrated by bonfires and dances exactly like those which commemorate St. John's Eve. The ashes of the St. John's fires are deemed by Belgian peasants an excellent remedy for consumption, if you take a spoonful or two of them, moistened with water, day by day. People also burn vervain in the fires, and they say that in the ashes of the plant you may find, if you look for it, the "Fool's Stone." In many parts of Brabant St. Peter's bonfire used to be much larger than that of his rival St. John. When it had burned out, both sexes engaged in a game of ball, and the winner became the King of Summer or of the Ball and had the right to choose his Queen. Sometimes the winner was a woman, and it was then her privilege to select her royal mate. This pastime was well known at Louvain and it continued to be practised at Grammont and Mespelaer down to the second half of the nineteenth century. At Mespelaer, which is a village near Termonde, a huge pile of eglantine, reeds, and straw was collected in a marshy meadow for the bonfire; and next evening after vespers the young folk who had lit it assembled at the "Good Life" tavern to play the game. The winner was crowned with a wreath of roses, and the rest danced and sang in a ring about him. At Grammont, while the bonfire was lit and the dances round it took place on St. Peter's Eve, the festival of the "Crown of Roses" was deferred till the following Sunday. The young folk arranged among themselves beforehand who should be King and Queen of the Roses: the rosy wreaths were hung on cords across the street: the dancers danced below them, and at a given moment the wreaths fell on the heads of the chosen King and Queen, who had to entertain their fellows at a feast. According to some people the fires of St. Peter, like those of St. John, were lighted in order to drive away dragons. In French Flanders down to 1789 a straw figure representing a man was always burned in the midsummer bonfire, and the figure of a woman was burned on St. Peter's Day. In Belgium people jump over the midsummer bonfires as a preventive of colic, and they keep the ashes at home to hinder fire from breaking out.

The custom of lighting bonfires at midsummer has been observed in many parts of our own country. "On the Vigil of Saint John the Baptist, commonly called Midsummer Eve, it was usual in most country places, and also in towns and cities, for the inhabitants, both old and young, and of both sexes, to meet together, and make merry by the side of a large fire made in the middle of the street, or in some open and convenient place, over which the young men frequently leaped by way of frolic, and also exercised themselves with various sports and pastimes, more especially with running, wrestling, and dancing. These diversions they continued till midnight, and sometimes till cock-crowing." In the streets of London the midsummer fires were lighted in the time of Queen Elizabeth down to the end of the sixteenth

century, as we learn from Stow's description, which runs thus: "In the months of June and July, on the vigils of festival days, and on the same festival days in the evenings after the sun setting, there were usually made bonfires in the streets, every man bestowing wood or labour towards them; the wealthier sort also, before their doors near to the said bonfires, would set out tables on the vigils furnished with sweet bread and good drink, and on the festival days with meats and drinks plentifully, whereunto they would invite their neighbours and passengers also to sit and be merry with them in great familiarity, praising God for His benefits bestowed on them. These were called bonfires as well of good amity amongst neighbours that being before at controversy, were there, by the labour of others, reconciled, and made of bitter enemies loving friends; and also for the virtue that a great fire hath to purge the infection of the air. On the vigil of St. John the Baptist, and on St. Peter and Paul the Apostles, every man's door being shadowed with green birch, long fennel, St. John's wort, orpin, white lilies, and such like, garnished upon with garlands of beautiful flowers, had also lamps of glass, with oil burning in them all the night; some hung out branches of iron curiously wrought, containing hundreds of lamps alight at once, which made a goodly show, namely, in New Fish Street, Thames Street, etc." In the sixteenth century the Eton boys used to kindle a bonfire on the east side of the church both on St. John's Day and on St. Peter's Day. Writing in the second half of the seventeenth century, the antiquary John Aubrey tells us that bonfires were still kindled in many places on St. John's Night, but that the civil wars had thrown many of these old customs out of fashion. Wars, he adds, extinguish superstition as well as religion and laws, and there is nothing like gunpowder for putting phantoms to flight.

In the north of England these fires used to be lit in the open streets. Young and old gathered round them, and while the young leaped over the fires and engaged in games, their elders looked on and probably remembered with regret the days when they used to foot it as nimbly. Sometimes the fires were kindled on the tops of high hills. The people also carried firebrands about the fields. The custom of kindling bonfires on Midsummer Eve prevailed all over Cumberland down to the second half of the eighteenth century. In Northumberland the custom seems to have lasted into the first quarter of the nineteenth century; the fires were lit in the villages and on the tops of high hills, and the people sported and danced round them. Moreover, the villagers used to run with burning brands round their fields and to snatch ashes from a neighbour's fire, saying as they did so, "We have the flower (or flour) of the wake." At Sandhill bonfires were kindled on the Eve of St. Peter as well as on Midsummer Eve; the custom is attested for the year 1575, when it was described as ancient. We are told that "on Midsummer's eve, reckoned according to the old style, it was formerly the custom of the inhabitants, young and old, not only of Whalton, but of most of the adjacent villages, to collect a large cartload of whins and other combustible materials, which was dragged by them with great rejoicing (a fiddler being seated on the top of the cart) into the village and erected into a pile. The people from the surrounding country assembled towards evening, when it was set on fire; and whilst the young danced around it, the elders looked on smoking their pipes and drinking their beer, until it was consumed. There can be little doubt that this curious old custom dates from a very remote antiquity." In a law-suit, which was tried in 1878, the rector of Whalton gave evidence of the constant use of the village green for the ceremony since 1843. "The bonfire," he said, "was lighted a little to the north-east of the well at Whalton, and partly on the footpath, and people danced round it and jumped through it. That was never interrupted." The Rev. G. R. Hall, writing in 1879, says that "the fire festivals or bonfires of the summer solstice at the Old Midsummer until recently were commemorated on Christenburg Crag and elsewhere by leaping through and dancing round the fires, as those who have been present have told me." Down to the early part of the nineteenth century bonfires called Beal-fires used to be lit on Midsummer Eve all over the wolds in the East Riding of Yorkshire.

In Herefordshire and Somersetshire the peasants used to make fires in the fields on Midsummer Eve “to bless the apples.” In Devonshire the custom of leaping over the midsummer fires was also observed. “In Cornwall, the festival fires, called bonfires, are kindled on the Eves of St. John Baptist and St. Peter's day; and Midsummer is thence, in the Cornish tongue, called *Goluan*, which signifies both light and rejoicing. At these fires the Cornish attend with lighted torches, tarred and pitched at the end, and make their perambulations round their fires, going from village to village and carrying their torches before them; this is certainly the remains of Druid superstition; for, *Faces praeferre*, to carry lighted torches was reckoned a kind of gentilism, and as such particularly prohibited by the Gallick Councils.” At Penzance and elsewhere in the county the people danced and sang about the bonfires on Midsummer Eve. On Whiteborough, a large tumulus near Launceston, a huge bonfire used to be kindled on Midsummer Eve; a tall summer pole with a large bush at the top was fixed in the centre of the bonfire. The Cornish fires at this season appear to have been commonly lit on high and conspicuous hills, such as Tregonan, Godolphin, Carnwarth, and Carn Brea. When it grew dusk on Midsummer Eve, old men would hobble away to some height whence they counted the fires and drew a presage from their number. “It is the immemorial usage in Penzance, and the neighbouring towns and villages, to kindle bonfires and torches on Midsummer-eve; and on Midsummer-day to hold a fair on Penzance quay, where the country folks assemble from the adjoining parishes in great numbers to make excursions on the water. St. Peter's Eve [the twenty-eighth of June] is distinguished by a similar display of bonfires and torches, although the ‘quay-fair’ on St. Peter's-day [the twenty-ninth of June], has been discontinued upwards of forty years. On these eves a line of tar-barrels, relieved occasionally by large bonfires, is seen in the centre of each of the principal streets in Penzance. On either side of this line young men and women pass up and down, swinging round their heads heavy torches made of large pieces of folded canvas steeped in tar, and nailed to the ends of sticks between three and four feet long; the flames of some of these almost equal those of the tar-barrels. Rows of lighted candles, also, when the air is calm, are fixed outside the windows or along the sides of the streets. In St. Just, and other mining parishes, the young miners, mimicking their fathers' employments, bore rows of holes in the rocks, load them with gunpowder, and explode them in rapid succession by trains of the same substance. As the holes are not deep enough to split the rocks, the same little batteries serve for many years. On these nights, Mount's Bay has a most animating appearance, although not equal to what was annually witnessed at the beginning of the present century, when the whole coast, from the Land's End to the Lizard, wherever a town or a village existed, was lighted up with these stationary or moving fires. In the early part of the evening, children may be seen wearing wreaths of flowers—a custom in all probability originating from the ancient use of these ornaments when they danced around the fires. At the close of the fireworks in Penzance, a great number of persons of both sexes, chiefly from the neighbourhood of the quay, used always, until within the last few years, to join hand in hand, forming a long string, and run through the streets, playing ‘thread the needle,’ heedless of the fireworks showered upon them, and oftentimes leaping over the yet glowing embers. I have on these occasions seen boys following one another, jumping through flames higher than themselves.”

In Wales the midsummer fires were kindled on St. John's Eve and on St. John's Day. Three or nine different kinds of wood and charred faggots carefully preserved from the last midsummer were deemed necessary to build the bonfire, which was generally done on rising ground. Various herbs were thrown into the blaze; and girls with bunches of three or nine different kinds of flowers would take the hands of boys, who wore flowers in their buttonholes and hats, and together the young couples would leap over the fires. On the same two midsummer days roses and wreaths of flowers were hung over the doors and

windows. "Describing a midsummer fire, an old inhabitant, born in 1809, remembered being taken to different hills in the Vale of Glamorgan to see festivities in which people from all parts of the district participated. She was at that time about fourteen, and old enough to retain a vivid recollection of the circumstances. People conveyed trusses of straw to the top of the hill, where men and youths waited for the contributions. Women and girls were stationed at the bottom of the hill. Then a large cart-wheel was thickly swathed with straw, and not an inch of wood was left in sight. A pole was inserted through the centre of the wheel, so that long ends extended about a yard on each side. If any straw remained, it was made up into torches at the top of tall sticks. At a given signal the wheel was lighted, and sent rolling downhill. If this fire-wheel went out before it reached the bottom of the hill, a very poor harvest was promised. If it kept lighted all the way down, and continued blazing for a long time, the harvest would be exceptionally abundant. Loud cheers and shouts accompanied the progress of the wheel." At Darowen in Wales small bonfires were kindled on Midsummer Eve. On the same day people in the Isle of Man were wont to light fires to the windward of every field, so that the smoke might pass over the corn; and they folded their cattle and carried blazing furze or gorse round them several times.

A writer of the last quarter of the seventeenth century tells us that in Ireland, "on the Eves of St. John Baptist and St. Peter, they always have in every town a bonfire, late in the evenings, and carry about bundles of reeds fast tied and fired; these being dry, will last long, and flame better than a torch, and be a pleasing divertive prospect to the distant beholder; a stranger would go near to imagine the whole country was on fire." Another writer says of the South of Ireland: "On Midsummer's Eve, every eminence, near which is a habitation, blazes with bonfires; and round these they carry numerous torches, shouting and dancing, which affords a beautiful sight." An author who described Ireland in the first quarter of the eighteenth century says: "On the vigil of St. John the Baptist's Nativity, they make bonfires, and run along the streets and fields with wisps of straw blazing on long poles to purify the air, which they think infectious, by believing all the devils, spirits, ghosts, and hobgoblins fly abroad this night to hurt mankind." Another writer states that he witnessed the festival in Ireland in 1782: "At the house where I was entertained, it was told me, that we should see, at midnight, the most singular sight in Ireland, which was the lighting of fires in honour of the sun. Accordingly, exactly at midnight, the fires began to appear; and taking the advantage of going up to the leads of the house, which had a widely extended view, I saw on a radius of thirty miles, all around, the fires burning on every eminence which the country afforded. I had a farther satisfaction in learning, from undoubted authority, that the people danced round the fires, and at the close went through these fires, and made their sons and daughters, together with their cattle, pass through the fire; and the whole was conducted with religious solemnity." That the custom prevailed in full force as late as 1867 appears from a notice in a newspaper of that date, which runs thus: "The old pagan fire-worship still survives in Ireland, though nominally in honour of St. John. On Sunday night bonfires were observed throughout nearly every county in the province of Leinster. In Kilkenny, fires blazed on every hillside at intervals of about a mile. There were very many in the Queen's County, also in Kildare and Wexford. The effect in the rich sunset appeared to travellers very grand. The people assemble, and dance round the fires, the children jump through the flames, and in former times live coals were carried into the corn-fields to prevent blight." In County Leitrim on St. John's Eve, which is called Bonfire Day, fires are still lighted after dusk on the hills and along the sides of the roads. All over Kerry the same thing continues to be done, though not so commonly as of old. Small fires were made across the road, and to drive through them brought luck for the year. Cattle were also driven through the fires. On Lettermore Island, in South Connemara, some of the ashes from the midsummer bonfire are thrown on the fields to fertilize them. One writer informs us that in Munster and Connaught a bone must always be

burned in the fire; for otherwise the people believe that the fire will bring no luck. He adds that in many places sterile beasts and human beings are passed through the fire, and that as a boy he himself jumped through the fire “for luck.” An eye-witness has described as follows a remarkable ceremony observed in Ireland on Midsummer Eve: “When the fire burned for some hours, and got low, an indispensable part of the ceremony commenced. Every one present of the peasantry passed through it, and several children were thrown across the sparkling embers; while a wooden frame, of some eight feet long, with a horse's head fixed to one end, and a large white sheet thrown over it concealing the wood and the man on whose head it was carried, made its appearance. This was greeted with loud shouts of ‘The white horse!’ and having been safely carried by the skill of its bearer several times through the fire with a bold leap, it pursued the people, who ran screaming and laughing in every direction. I asked what the horse was meant for, and was told that it represented ‘all cattle.’”

Lady Wilde's account of the midsummer festival in Ireland is picturesque and probably correct in substance, although she does not cite her authorities. As it contains some interesting features which are not noticed by the other writers on Ireland whom I have consulted, I will quote the greater part of it in full. “In ancient times,” she says, “the sacred fire was lighted with great ceremony on Midsummer Eve; and on that night all the people of the adjacent country kept fixed watch on the western promontory of Howth, and the moment the first flash was seen from that spot the fact of ignition was announced with wild cries and cheers repeated from village to village, when all the local fires began to blaze, and Ireland was circled by a cordon of flame rising up from every hill. Then the dance and song began round every fire, and the wild hurrahs filled the air with the most frantic revelry. Many of these ancient customs are still continued, and the fires are still lighted on St. John's Eve on every hill in Ireland. When the fire has burned down to a red glow the young men strip to the waist and leap over or through the flames; this is done backwards and forwards several times, and he who braves the greatest blaze is considered the victor over the powers of evil, and is greeted with tremendous applause. When the fire burns still lower, the young girls leap the flame, and those who leap clean over three times back and forward will be certain of a speedy marriage and good luck in after-life, with many children. The married women then walk through the lines of the burning embers; and when the fire is nearly burnt and trampled down, the yearling cattle are driven through the hot ashes, and their back is singed with a lighted hazel twig. These rods are kept safely afterwards, being considered of immense power to drive the cattle to and from the watering places. As the fire diminishes the shouting grows fainter, and the song and the dance commence; while professional story-tellers narrate tales of fairy-land, or of the good old times long ago, when the kings and princes of Ireland dwelt amongst their own people, and there was food to eat and wine to drink for all comers to the feast at the king's house. When the crowd at length separate, every one carries home a brand from the fire, and great virtue is attached to the lighted *brone* which is safely carried to the house without breaking or falling to the ground. Many contests also arise amongst the young men; for whoever enters his house first with the sacred fire brings the good luck of the year with him.”

In Ireland, as elsewhere, water was also apparently thought to acquire a certain mystical virtue at midsummer. “At Stoodle, near Downpatrick, there is a ceremony commencing at twelve o'clock at night on Midsummer Eve. Its sacred mount is consecrated to St. Patrick; the plain contains three wells, to which the most extraordinary virtues are attributed. Here and there are heaps of stones, around some of which appear great numbers of people, running with as much speed as possible; around others crowds of worshippers kneel with bare legs and feet as an indispensable part of the penance. The men, without coats, with handkerchiefs on their heads instead of hats, having gone seven times round each heap, kiss the ground,

cross themselves, and proceed to the hill; here they ascend, on their bare knees, by a path so steep and rugged that it would be difficult to walk up. Many hold their hands clasped at the back of their necks, and several carry large stones on their heads. Having repeated this ceremony seven times, they go to what is called St. Patrick's Chair, which are two great flat stones fixed upright in the hill; here they cross and bless themselves as they step in between these stones, and, while repeating prayers, an old man, seated for the purpose, turns them round on their feet three times, for which he is paid; the devotee then goes to conclude his penance at a pile of stones, named the Altar. While this busy scene is continued by the multitude, the wells and streams issuing from them are thronged by crowds of halt, maimed, and blind, pressing to wash away their infirmities with water consecrated by their patron saint, and so powerful is the impression of its efficacy on their minds, that many of those who go to be healed, and who are not totally blind, or altogether crippled, really believe for a time that they are by means of its miraculous virtues perfectly restored."

In Scotland the traces of midsummer fires are few. We are told by a writer of the eighteenth century that "the midsummer-even fire, a relict of Druidism," was kindled in some parts of the county of Perth. Another writer of the same period, describing what he calls the Druidical festivals of the Highlanders, says that "the least considerable of them is that of midsummer. In the Highlands of Perthshire there are some vestiges of it. The cowherd goes three times round the fold, according to the course of the sun, with a burning torch in his hand. They imagined this rite had a tendency to purify their herds and flocks, and to prevent diseases. At their return the landlady makes an entertainment for the cowherd and his associates." In the north-east of Scotland, down to the latter half of the eighteenth century, farmers used to go round their lands with burning torches about the middle of June. On the hill of Cairnshee, in the parish of Durris, Kincardineshire, the herdsmen of the country round about annually kindle a bonfire at sunset on Midsummer Day (the twenty-fourth of June); the men or lads collect the fuel and push each other through the smoke and flames. The custom is kept up through the benefaction of a certain Alexander Hogg, a native of the parish, who died about 1790 and left a small sum for the maintenance of a midsummer bonfire on the spot, because as a boy he had herded cattle on the hill. We may conjecture that in doing so he merely provided for the continuance of an old custom which he himself had observed in the same place in his youth. At the village of Tarbolton in Ayrshire a bonfire has been annually kindled from time immemorial on the evening of the first Monday after the eleventh of June. A noted cattle-market was formerly held at the fair on the following day. The bonfire is still lit at the gloaming by the lads and lasses of the village on a high mound or hillock just outside of the village. Fuel for it is collected by the lads from door to door. The youth dance round the fire and leap over the fringes of it. The many cattle-drovers who used to assemble for the fair were wont to gather round the blazing pile, smoke their pipes, and listen to the young folk singing in chorus on the hillock. Afterwards they wrapped themselves in their plaids and slept round the bonfire, which was intended to last all night. Thomas Moresin of Aberdeen, a writer of the sixteenth century, says that on St. Peter's Day, which is the twenty-ninth of June, the Scotch ran about at night with lighted torches on mountains and high grounds, "as Ceres did when she roamed the whole earth in search of Proserpine"; and towards the end of the eighteenth century the parish minister of Loudoun, a district of Ayrshire whose "bonny woods and braes" have been sung by Burns, wrote that "the custom still remains amongst the herds and young people to kindle fires in the high grounds in honour of Beltan. *Beltan*, which in Gaelic signifies *Baal*, or *Bel's-fire*, was antiently the time of this solemnity. It is now kept on St. Peter's day."

All over Spain great bonfires called *lumes* are still lit on Midsummer Eve. They are kept up all night, and the children leap over them in a certain rhythmical way which is said to

resemble the ancient dances. On the coast, people at this season plunge into the sea; in the inland districts the villagers go and roll naked in the dew of the meadows, which is supposed to be a sovereign preservative against diseases of the skin. On this evening, too, girls who would pry into the future put a vessel of water on the sill outside their window; and when the clocks strike twelve, they break an egg in the water and see, or fancy they see, in the shapes assumed by the pulp, as it blends with the liquid, the likeness of future bridegrooms, castles, coffins, and so forth. But generally, as might perhaps have been anticipated, the obliging egg exhibits the features of a bridegroom. In the Azores, also, bonfires are lit on Midsummer Eve (St. John's Eve), and boys jump over them for luck. On that night St. John himself is supposed to appear in person and bless all the seas and waters, driving out the devils and demons who had been disporting themselves in them ever since the second day of November; that is why in the interval between the second of November and the twenty-third of June nobody will bathe in the sea or in a hot spring. On Midsummer Eve, too, you can always see the devil, if you will go into a garden at midnight. He is invariably found standing near a mustard-plant. His reason for adopting this posture has not been ascertained; perhaps in the chilly air of the upper world he is attracted by the genial warmth of the mustard. Various forms of divination are practised by people in the Azores on Midsummer Eve. Thus a new-laid egg is broken into a glass of water, and the shapes which it assumes foreshadow the fate of the person concerned. Again, seven saucers are placed in a row, filled respectively with water, earth, ashes, keys, a thimble, money, and grass, which things signify travel, death, widowhood, housekeeping, spinsterhood, riches, and farming. A blindfolded person touches one or other of the saucers with a wand and so discovers his or her fate. Again, three broad beans are taken; one is left in its skin, one is half peeled, and the third is peeled outright. The three denote respectively riches, competence, and poverty. They are hidden and searched for; and he who finds one of them knows accordingly whether he will be rich, moderately well-off, or poor. Again, girls take slips of paper and write the names of young men twice over on them. These they fold up and crumple and place one set under their pillows and the other set in a saucer full of water. In the morning they draw one slip of paper from under their pillow, and see whether one in the water has opened out. If the names on the two slips are the same, it is the name of her future husband. Young men do the same with girls' names. Once more, if a girl rises at sunrise, goes out into the street, and asks the first passer-by his Christian name, that will be her husband's name. Some of these modes of divination resemble those which are or used to be practised in Scotland at Hallowe'en. In Corsica on the Eve of St. John the people set fire to the trunk of a tree or to a whole tree, and the young men and maidens dance round the blaze, which is called *fucaraia*. We have seen that at Ozieri, in Sardinia, a great bonfire is kindled on St. John's Eve, and that the young people dance round it.

Passing to Italy, we find that the midsummer fires are still lighted on St. John's Eve in many parts of the Abruzzi. They are commonest in the territory which was inhabited in antiquity by the Vestini; they are rarer in the land of the ancient Marsi, and they disappear entirely in the lower valley of the Sangro. For the most part, the fires are fed with straw and dry grass, and are kindled in the fields near the villages or on high ground. As they blaze up, the people dance round or over them. In leaping across the flames the boys cry out, "St. John, preserve my thighs and legs!" Formerly it used to be common to light the bonfires also in the towns in front of churches of St. John, and the remains of the sacred fire were carried home by the people; but this custom has mostly fallen into disuse. However, at Celano the practice is still kept up of taking brands and ashes from the bonfires to the houses, although the fires are no longer kindled in front of the churches, but merely in the streets. In the Abruzzi water also is supposed to acquire certain marvellous and beneficent properties on St. John's Night. Hence many people bathe or at least wash their faces and hands in the sea or a river at that season, especially at the moment of sunrise. Such a bath is said to be an excellent cure for diseases of

the skin. At Castiglione a Casauria the people, after washing in the river or in springs, gird their waists and wreath their brows with sprigs of briony in order to keep them from aches and pains. In various parts of Sicily, also, fires are kindled on Midsummer Eve (St. John's Eve), the twenty-third of June. On the Madonie mountains, in the north of the island, the herdsmen kindle them at intervals, so that the crests of the mountains are seen ablaze in the darkness for many miles. About Acireale, on the east coast of the island, the bonfires are lit by boys, who jump over them. At Chiaromonte the witches that night acquire extraordinary powers; hence everybody then puts a broom outside of his house, because a broom is an excellent protective against witchcraft. At Orvieto the midsummer fires were specially excepted from the prohibition directed against bonfires in general.

In Malta also the people celebrate Midsummer Eve (St. John's Eve) "by kindling great fires in the public streets, and giving their children dolls to carry in their arms on this day, in order to make good the prophecy respecting the Baptist, *Multi in nativitate ejus gaudebunt*. Days and even weeks before this festival, groups of children are seen going out into the country fields to gather straw, twigs, and all sorts of other combustibles, which they store up for St. John's Eve. On the night of the twenty-third of June, the day before the festival of the Saint, great fires are kindled in the streets, squares, and market places of the towns and villages of the Island, and as fire after fire blazes out of the darkness of that summer night, the effect is singularly striking. These fires are sometimes kept up for hours, being continually fed by the scores of bystanders, who take great delight in throwing amidst the flames some old rickety piece of furniture which they consider as lumber in their houses. Lots of happy and reckless children, and very often men, are seen merrily leaping in succession over and through the crackling flames. At the time of the Order of St. John of Jerusalem, the Grand Master himself, soon after the *Angelus*, used to leave his palace, accompanied by the Grand Prior, the Bishop, and two bailiffs, to set fire to some pitch barrels which were placed for the occasion in the square facing the sacred Hospital. Great crowds used to assemble here in order to assist at this ceremony. The setting ablaze of the five casks, and later on of the eight casks, by the Grand Master, was a signal for the others to kindle their fires in the different parts of the town."

In Greece, the custom of kindling fires on St. John's Eve and jumping over them is said to be still universal. One reason assigned for it is a wish to escape from the fleas. According to another account, the women cry out, as they leap over the fire, "I leave my sins behind me." In Lesbos the fires on St. John's Eve are usually lighted by threes, and the people spring thrice over them, each with a stone on his head, saying, "I jump the hare's fire, my head a stone!" On the morning of St. John's Day those who dwell near the coast go to bathe in the sea. As they go they gird themselves with osiers, and when they are in the water they let the osiers float away, saying, "Let my maladies go away!" Then they look for what is called "the hairy stone," which possesses the remarkable property not only of keeping moths from clothes but even of multiplying the clothes in the chest where it is laid up, and the more hairs on the stone the more will the clothes multiply in the chest. In Calymnos the midsummer fire is supposed to ensure abundance in the coming year as well as deliverance from fleas. The people dance round the fires singing, with stones on their heads, and then jump over the blaze or the glowing embers. When the fire is burning low, they throw the stones into it; and when it is nearly out, they make crosses on their legs and then go straightway and bathe in the sea. In Cos the lads and lasses dance round the bonfires on St. John's Eve. Each of the lads binds a black stone on his head, signifying that he wishes to become as strong as the stone. Also they make the sign of the cross on their feet and legs and jump over the fire. On Midsummer Eve the Greeks of Macedonia light fires after supper in front of their gates. The garlands, now faded, which were hung over the doors on May Day, are taken down and cast

into the flames, after which the young folk leap over the blaze, fully persuaded that St. John's fire will not burn them. In Albania fires of dry herbage are, or used to be, lit everywhere on St. John's Eve; young and old leap over them, for such a leap is thought to be good for the health.

From the Old World the midsummer fires have been carried across the Atlantic to America. In Brazil people jump over the fires of St. John, and at this season they can take hot coals in their mouths without burning themselves. In Bolivia on the Eve of St. John it is usual to see bonfires lighted on the hills and even in the streets of the capital La Paz. As the city stands at the bottom of an immense ravine, and the Indians of the neighbourhood take a pride in kindling bonfires on heights which might seem inaccessible, the scene is very striking when the darkness of night is suddenly and simultaneously lit up by hundreds of fires, which cast a glare on surrounding objects, producing an effect at once weird and picturesque.

The custom of kindling bonfires on Midsummer Day or on Midsummer Eve is widely spread among the Mohammedan peoples of North Africa, particularly in Morocco and Algeria; it is common both to the Berbers and to many of the Arabs or Arabic-speaking tribes. In these countries Midsummer Day (the twenty-fourth of June, Old Style) is called *l'ânşāra*. The fires are lit in the courtyards, at cross-roads, in the fields, and sometimes on the threshing-floors. Plants which in burning give out a thick smoke and an aromatic smell are much sought after for fuel on these occasions; among the plants used for the purpose are giant-fennel, thyme, rue, chervil-seed, camomile, geranium, and penny-royal. People expose themselves, and especially their children, to the smoke, and drive it towards the orchards and the crops. Also they leap across the fires; in some places everybody ought to repeat the leap seven times. Moreover they take burning brands from the fires and carry them through the houses in order to fumigate them. They pass things through the fire, and bring the sick into contact with it, while they utter prayers for their recovery. The ashes of the bonfires are also reputed to possess beneficial properties; hence in some places people rub their hair or their bodies with them. For example, the Andjra mountaineers of Morocco kindle large fires in open places of their villages on Midsummer Day. Men, women, and children jump over the flames or the glowing embers, believing that by so doing they rid themselves of all misfortune which may be clinging to them; they imagine, also, that such leaps cure the sick and procure offspring for childless couples. Moreover, they burn straw, together with some marjoram and alum, in the fold where the cattle, sheep, and goats are penned for the night; the smoke, in their opinion, will make the animals thrive. On Midsummer Day the Arabs of the Mnasara tribe make fires outside their tents, near their animals, on their fields, and in their gardens. Large quantities of penny-royal are burned in these fires, and over some of them the people leap thrice to and fro. Sometimes small fires are also kindled inside the tents. They say that the smoke confers blessings on everything with which it comes into contact. At Salee, on the Atlantic coast of Morocco, persons who suffer from diseased eyes rub them with the ashes of the midsummer fire; and in Casablanca and Azemmur the people hold their faces over the fire, because the smoke is thought to be good for the eyes. The Arab tribe Ulad Bu Aziz, in the Dukkala province of Morocco, kindle midsummer bonfires, not for themselves and their cattle, but only for crops and fruit; nobody likes to reap his crops before Midsummer Day, because if he did they would lose the benefit of the blessed influence which flows from the smoke of the bonfires. Again, the Beni Mgild, a Berber tribe of Morocco, light fires of straw on Midsummer Eve and leap thrice over them to and fro. They let some of the smoke pass underneath their clothes, and married women hold their breasts over the fire, in order that their children may be strong. Moreover, they paint their eyes and lips with some black powder, in which ashes of the bonfire are mixed. And in order that their horses may also benefit by the fires, they dip the right forelegs of the animals in the smoke and flames or in

the hot embers, and they rub ashes on the foreheads and between the nostrils of the horses. Berbers of the Rif province, in northern Morocco, similarly make great use of fires at midsummer for the good of themselves, their cattle, and their fruit-trees. They jump over the bonfires in the belief that this will preserve them in good health, and they light fires under fruit-trees to keep the fruit from falling untimely. And they imagine that by rubbing a paste of the ashes on their hair they prevent the hair from falling off their heads.

In all these Moroccan customs, we are told, the beneficial effect is attributed wholly to the smoke, which is supposed to be endued with a magical quality that removes misfortune from men, animals, fruit-trees, and crops. But in some parts of Morocco people at midsummer kindle fires of a different sort, not for the sake of fumigation, but in order to burn up misfortune in the flames. Thus on Midsummer Eve the Berber tribe of the Beni Mgild burn three sheaves of unthreshed wheat or barley, "one for the children, one for the crops, and one for the animals." On the same occasion they burn the tent of a widow who has never given birth to a child; by so doing they think to rid the village of ill luck. It is said that at midsummer the Zemmur burn a tent, which belongs to somebody who was killed in war during a feast; or if there is no such person in the village, the schoolmaster's tent is burned instead. Among the Arabic-speaking Beni Ahsen it is customary for those who live near the river Sbu to make a little hut of straw at midsummer, set it on fire, and let it float down the river. Similarly the inhabitants of Salee burn a straw hut on the river which flows past their town.

Further it deserves to be noticed that in Northern Africa, as in Southern Europe, the midsummer festival comprises rites concerned with water as well as with fire. For example, among the Beni-Snous the women light a fire in an oven, throw perfumes into it, and circumambulate a tank, which they also incense after a fashion. In many places on the coast, as in the province of Oran and particularly in the north of Morocco, everybody goes and bathes in the sea at midsummer; and in many towns of the interior, such as Fez, Mequinez, and especially Merrakech, people throw water over each other on this day; and where water is scarce, earth is used instead, according to the Mohammedan principle which permits ablutions to be performed with earth or sand when water cannot be spared for the purpose. People of the Andjra district in Morocco not only bathe themselves in the sea or in rivers at midsummer, they also bathe their animals, their horses, mules, donkeys, cattle, sheep, and goats; for they think that on that day water possesses a blessed virtue (*baraka*), which removes sickness and misfortune. In Aglu, again, men, women, and children bathe in the sea or springs or rivers at midsummer, alleging that by so doing they protect themselves against disease for the whole year. Among the Berbers of the Rif district the custom of bathing on this day is commonly observed, and animals share the ablutions.

The celebration of a midsummer festival by Mohammedan peoples is particularly remarkable, because the Mohammedan calendar, being purely lunar and uncorrected by intercalation, necessarily takes no note of festivals which occupy fixed points in the solar year; all strictly Mohammedan feasts, being pinned to the moon, slide gradually with that luminary through the whole period of the earth's revolution about the sun. This fact of itself seems to prove that among the Mohammedan peoples of Northern Africa, as among the Christian peoples of Europe, the midsummer festival is quite independent of the religion which the people publicly profess, and is a relic of a far older paganism. There are, indeed, independent grounds for thinking that the Arabs enjoyed the advantage of a comparatively well-regulated solar year before the prophet of God saddled them with the absurdity and inconvenience of a purely lunar calendar. Be that as it may, it is notable that some Mohammedan people of North Africa kindle fires and bathe in water at the movable New Year of their lunar calendar instead of at the fixed Midsummer of the solar year; while others again practise these observances at

both seasons. New Year's Day, on which the rites are celebrated, is called *Ashur*; it is the tenth day of Moharram, the first month of the Mohammedan calendar. On that day bonfires are kindled in Tunis and also at Merrakech and among some tribes of the neighbourhood. At Demnat, in the Great Atlas mountains, people kindle a large bonfire on New Year's Eve and leap to and fro over the flames, uttering words which imply that by these leaps they think to purify themselves from all kinds of evil. At Aglu, in the province of Sus, the fire is lighted at three different points by an unmarried girl, and when it has died down the young men leap over the glowing embers, saying, "We shook on you, O Lady Ashur, fleas, and lice, and the illnesses of the heart, as also those of the bones; we shall pass through you again next year and the following years with safety and health." Both at Aglu and Glawi, in the Great Atlas, smaller fires are also kindled, over which the animals are driven. At Demnat girls who wish to marry wash themselves in water which has been boiled over the New Year fire; and in Dukkala people use the ashes of that fire to rub sore eyes with. New Year fires appear to be commonly kindled among the Berbers who inhabit the western portion of the Great Atlas, and also among the Arabic-speaking tribes of the plains; but Dr. Westermarck found no traces of such fires among the Arabic-speaking mountaineers of Northern Morocco and the Berbers of the Rif province. Further, it should be observed that water ceremonies like those which are practised at Midsummer are very commonly observed in Morocco at the New Year, that is, on the tenth day of the first month. On the morning of that day (*Ashur*) all water or, according to some people, only spring water is endowed with a magical virtue (*baraka*), especially before sunrise. Hence at that time the people bathe and pour water over each other; in some places they also sprinkle their animals, tents, or rooms. In Dukkala some of the New Year water is preserved at home till New Year's Day (*Ashur*) of next year; some of it is kept to be used as medicine, some of it is poured on the place where the corn is threshed, and some is used to water the money which is to be buried in the ground; for the people think that the earth-spirits will not be able to steal the buried treasures which have thus been sanctified with the holy water.

Thus the rites of fire and water which are observed in Morocco at Midsummer and New Year appear to be identical in character and intention, and it seems certain that the duplication of the rites is due to a conflict between two calendars, namely the old Julian calendar of the Romans, which was based on the sun, and the newer Mohammedan calendar of the Arabs, which is based on the moon. For not only was the Julian calendar in use throughout the whole of Northern Africa under the Roman Empire; to this day it is everywhere employed among Mohammedans for the regulation of agriculture and all the affairs of daily life; its practical convenience has made it indispensable, and the lunar calendar of orthodox Mohammedanism is scarcely used except for purposes of chronology. Even the old Latin names of the months are known and employed, in slightly disguised forms, throughout the whole Moslem world; and little calendars of the Julian year circulate in manuscript among Mohammedans, permitting them to combine the practical advantages of pagan science with a nominal adherence to orthodox absurdity. Thus the heathen origin of the midsummer festival is too palpable to escape the attention of good Mohammedans, who accordingly frown upon the midsummer bonfires as pagan superstitions, precisely as similar observances in Europe have often been denounced by orthodox Christianity. Indeed, many religious people in Morocco entirely disapprove of the whole of the midsummer ceremonies, maintaining that they are all bad; and a conscientious schoolmaster will even refuse his pupils a holiday at midsummer, though the boys sometimes offer him a bribe if he will sacrifice his scruples to his avarice. As the midsummer customs appear to flourish among all the Berbers of Morocco but to be unknown among the pure Arabs who have not been affected by Berber influence, it seems reasonable to infer with Dr. Westermarck that the midsummer festival has belonged from time immemorial to the Berber race, and that so far as it is now observed by the Arabs of

Morocco, it has been learned by them from the Berbers, the old indigenous inhabitants of the country. Dr. Westermarck may also be right in holding that, in spite of the close similarity which obtains between the midsummer festival of Europe and the midsummer festival of North Africa, the latter is not a copy of the former, but that both have been handed down independently from a time beyond the purview of history, when such ceremonies were common to the Mediterranean race.

§ 5. The Autumn Fires.

In the months which elapse between midsummer and the setting in of winter the European festivals of fire appear to be few and unimportant. On the evening of the first day of August, which is the Festival of the Cross, bonfires are commonly lit in Macedonia and boys jump over them, shouting, "Dig up! bury!" but whom or what they wish to dig up or bury they do not know. The Russians hold the feast of two martyrs, Florus and Laurus, on the eighteenth day of August, Old Style. "On this day the Russians lead their horses round the church of their village, beside which on the foregoing evening they dig a hole with two mouths. Each horse has a bridle made of the bark of the linden-tree. The horses go through this hole one after the other, opposite to one of the mouths of which the priest stands with a sprinkler in his hand, with which he sprinkles them. As soon as the horses have passed by their bridles are taken off, and they are made to go between two fires that they kindle, called by the Russians *Givoy Agon*, that is to say, living fires, of which I shall give an account. I shall before remark, that the Russian peasantry throw the bridles of their horses into one of these fires to be consumed. This is the manner of their lighting these *givoy agon*, or living fires. Some men hold the ends of a stick made of the plane-tree, very dry, and about a fathom long. This stick they hold firmly over one of birch, perfectly dry, and rub with violence and quickly against the former; the birch, which is somewhat softer than the plane, in a short time inflames, and serves them to light both the fires I have described."

The Feast of the Nativity of the Virgin on the eighth day of September is celebrated at Naples and Capri with fireworks, bonfires, and assassinations. On this subject my friend Professor A. E. Housman, who witnessed the celebration in different years at both places, has kindly furnished me with the following particulars: "In 1906 I was in the island of Capri on September the eighth, the feast of the Nativity of the Virgin. The anniversary was duly solemnised by fire-works at nine or ten in the evening, which I suppose were municipal; but just after sundown the boys outside the villages were making small fires of brushwood on waste bits of ground by the wayside. Very pretty it looked, with the flames blowing about in the twilight; but what took my attention was the listlessness of the boys and their lack of interest in the proceeding. A single lad, the youngest, would be raking the fire together and keeping it alight, but the rest stood lounging about and looking in every other direction, with the air of discharging mechanically a traditional office from which all zest had evaporated." "The pious orgy at Naples on September the eighth went through the following phases when I witnessed it in 1897. It began at eight in the evening with an illumination of the façade of Santa Maria Piedigrotta and with the whole population walking about blowing penny trumpets. After four hours of this I went to bed at midnight, and was lulled to sleep by barrel-organs, which supersede the trumpets about that hour. At four in the morning I was waked by detonations as if the British fleet were bombarding the city, caused, I was afterwards told, by dynamite rockets. The only step possible beyond this is assassination, which accordingly takes place about peep of day: I forget now the number of the slain, but I think the average is eight or ten, and I know that in honour of my presence they murdered a few more than usual."

It is no doubt possible that these illuminations and fire-works, like the assassinations, are merely the natural and spontaneous expressions of that overflowing joy with which the thought of the birth of the Virgin must fill every pious heart; but when we remember how often the Church has skilfully decanted the new wine of Christianity into the old bottles of heathendom, we may be allowed to conjecture that the ecclesiastical authorities adroitly timed the Nativity of the Virgin so as to coincide with an old pagan festival of that day, in which fire, noise, and uproar, if not broken heads and bloodshed, were conspicuous features. The penny trumpets blown on this occasion recall the like melodious instruments which figure so largely in the celebration of Befana (the Eve of Epiphany) at Rome.

§ 6. The Hallowe'en Fires.

From the foregoing survey we may infer that among the heathen forefathers of the European peoples the most popular and widespread fire-festival of the year was the great celebration of Midsummer Eve or Midsummer Day. The coincidence of the festival with the summer solstice can hardly be accidental. Rather we must suppose that our pagan ancestors purposely timed the ceremony of fire on earth to coincide with the arrival of the sun at the highest point of his course in the sky. If that was so, it follows that the old founders of the midsummer rites had observed the solstices or turning-points of the sun's apparent path in the sky, and that they accordingly regulated their festal calendar to some extent by astronomical considerations.

But while this may be regarded as fairly certain for what we may call the aborigines throughout a large part of the continent, it appears not to have been true of the Celtic peoples who inhabited the Land's End of Europe, the islands and promontories that stretch out into the Atlantic ocean on the North-West. The principal fire-festivals of the Celts, which have survived, though in a restricted area and with diminished pomp, to modern times and even to our own day, were seemingly timed without any reference to the position of the sun in the heaven. They were two in number, and fell at an interval of six months, one being celebrated on the eve of May Day and the other on Allhallow Even or Hallowe'en, as it is now commonly called, that is, on the thirty-first of October, the day preceding All Saints' or Allhallows' Day. These dates coincide with none of the four great hinges on which the solar year revolves, to wit, the solstices and the equinoxes. Nor do they agree with the principal seasons of the agricultural year, the sowing in spring and the reaping in autumn. For when May Day comes, the seed has long been committed to the earth; and when November opens, the harvest has long been reaped and garnered, the fields lie bare, the fruit-trees are stripped, and even the yellow leaves are fast fluttering to the ground. Yet the first of May and the first of November mark turning-points of the year in Europe; the one ushers in the genial heat and the rich vegetation of summer, the other heralds, if it does not share, the cold and barrenness of winter. Now these particular points of the year, as has been well pointed out by a learned and ingenious writer, while they are of comparatively little moment to the European husbandman, do deeply concern the European herdsman; for it is on the approach of summer that he drives his cattle out into the open to crop the fresh grass, and it is on the approach of winter that he leads them back to the safety and shelter of the stall. Accordingly it seems not improbable that the Celtic bisection of the year into two halves at the beginning of May and the beginning of November dates from a time when the Celts were mainly a pastoral people, dependent for their subsistence on their herds, and when accordingly the great epochs of the year for them were the days on which the cattle went forth from the homestead in early summer and returned to it again in early winter. Even in Central Europe, remote from the region now occupied by the Celts, a similar bisection of the year may be clearly traced in the great popularity, on the one hand, of May Day and its Eve (Walpurgis Night), and, on the other hand, of the Feast of All Souls at the beginning of November, which under a thin

Christian cloak conceals an ancient pagan festival of the dead. Hence we may conjecture that everywhere throughout Europe the celestial division of the year according to the solstices was preceded by what we may call a terrestrial division of the year according to the beginning of summer and the beginning of winter.

Be that as it may, the two great Celtic festivals of May Day and the first of November or, to be more accurate, the Eves of these two days, closely resemble each other in the manner of their celebration and in the superstitions associated with them, and alike, by the antique character impressed upon both, betray a remote and purely pagan origin. The festival of May Day or Beltane, as the Celts called it, which ushered in summer, has already been described; it remains to give some account of the corresponding festival of Hallowe'en, which announced the arrival of winter.

Of the two feasts Hallowe'en was perhaps of old the more important, since the Celts would seem to have dated the beginning of the year from it rather than from Beltane. In the Isle of Man, one of the fortresses in which the Celtic language and lore longest held out against the siege of the Saxon invaders, the first of November, Old Style, has been regarded as New Year's day down to recent times. Thus Manx mummings used to go round on Hallowe'en (Old Style), singing, in the Manx language, a sort of Hogmanay song which began "To-night is New Year's Night, *Hogunnaa!*" One of Sir John Rhys's Manx informants, an old man of sixty-seven, "had been a farm servant from the age of sixteen till he was twenty-six to the same man, near Regaby, in the parish of Andreas, and he remembers his master and a near neighbour of his discussing the term New Year's Day as applied to the first of November, and explaining to the younger men that it had always been so in old times. In fact, it seemed to him natural enough, as all tenure of land ends at that time, and as all servant men begin their service then." In ancient Ireland, as we saw, a new fire used to be kindled every year on Hallowe'en or the Eve of Samhain, and from this sacred flame all the fires in Ireland were rekindled. Such a custom points strongly to Samhain or All Saints' Day (the first of November) as New Year's Day; since the annual kindling of a new fire takes place most naturally at the beginning of the year, in order that the blessed influence of the fresh fire may last throughout the whole period of twelve months. Another confirmation of the view that the Celts dated their year from the first of November is furnished by the manifold modes of divination which, as we shall see presently, were commonly resorted to by Celtic peoples on Hallowe'en for the purpose of ascertaining their destiny, especially their fortune in the coming year; for when could these devices for prying into the future be more reasonably put in practice than at the beginning of the year? As a season of omens and auguries Hallowe'en seems to have far surpassed Beltane in the imagination of the Celts; from which we may with some probability infer that they reckoned their year from Hallowe'en rather than Beltane. Another circumstance of great moment which points to the same conclusion is the association of the dead with Hallowe'en. Not only among the Celts but throughout Europe, Hallowe'en, the night which marks the transition from autumn to winter, seems to have been of old the time of year when the souls of the departed were supposed to revisit their old homes in order to warm themselves by the fire and to comfort themselves with the good cheer provided for them in the kitchen or the parlour by their affectionate kinsfolk. It was, perhaps, a natural thought that the approach of winter should drive the poor shivering hungry ghosts from the bare fields and the leafless woodlands to the shelter of the cottage with its familiar fireside. Did not the lowing kine then troop back from the summer pastures in the forests and on the hills to be fed and cared for in the stalls, while the bleak winds whistled among the swaying boughs and the snow drifts deepened in the hollows? and could the good-man and the good-wife deny to the spirits of their dead the welcome which they gave to the cows?

But it is not only the souls of the departed who are supposed to be hovering unseen on the day “when autumn to winter resigns the pale year.” Witches then speed on their errands of mischief, some sweeping through the air on besoms, others galloping along the roads on tabby-cats, which for that evening are turned into coal-black steeds. The fairies, too, are all let loose, and hobgoblins of every sort roam freely about. In South Uist and Eriskay there is a saying:—

*“Hallowe'en will come, will come,
Witchcraft [or divination] will be set agoing,
Fairies will be at full speed,
Running in every pass.
Avoid the road, children, children.”*

In Cardiganshire on November Eve a bogie sits on every stile. On that night in Ireland all the fairy hills are thrown wide open and the fairies swarm forth; any man who is bold enough may then peep into the open green hills and see the treasures hidden in them. Worse than that, the cave of Cruachan in Connaught, known as “the Hell-gate of Ireland,” is unbarred on Samhain Eve or Hallowe'en, and a host of horrible fiends and goblins used to rush forth, particularly a flock of copper-red birds, which blighted crops and killed animals by their poisonous breath. The Scotch Highlanders have a special name *Samhanach* (derived from *Samhain*, “All-hallows”) for the dreadful bogies that go about that night stealing babies and committing other atrocities. And though the fairies are a kindlier folk, it is dangerous to see even them at their revels on Hallowe'en. A melancholy case of this sort is reported from the Ferintosh district of the Highlands, though others say that it happened at the Slope of Big Stones in Harris. Two young men were coming home after nightfall on Hallowe'en, each with a jar of whisky on his back, when they saw, as they thought, a house all lit up by the roadside, from which proceeded the sounds of music and dancing. In reality it was not a house at all but a fairy knoll, and it was the fairies who were jigging it about there so merrily. But one of the young men was deceived and stepping into the house joined in the dance, without even stopping to put down the jar of whisky. His companion was wiser; he had a shrewd suspicion that the place was not what it seemed, and on entering he took the precaution of sticking a needle in the door. That disarmed the power of the fairies, and he got away safely. Well, that day twelve months he came back to the spot and what should he see but his poor friend still dancing away with the jar of whisky on his back? A weary man was he, as you may well believe, but he begged to be allowed to finish the reel which he was in the act of executing, and when they took him out into the open air, there was nothing of him left but skin and bones. Again, the wicked fairies are apt to carry off men's wives with them to fairyland; but the lost spouses can be recovered within a year and a day when the procession of the fairies is defiling past on Hallowe'en, always provided that the mortals did not partake of elfin food while they were in elfinland.

Sometimes valuable information may be obtained from the fairies on Hallowe'en. There was a young man named Guleesh in the County of Mayo. Near his house was a *rath* or old fort with a fine grass bank running round it. One Hallowe'en, when the darkness was falling, Guleesh went to the rath and stood on a gray old flag. The night was calm and still; there was not a breath of wind stirring, nor a sound to be heard except the hum of the insects flitting past, or the whistle of the plovers, or the hoarse scream of the wild geese as they winged their way far overhead. Above the white fog the moon rose like a knob of fire in the east, and a thousand thousand stars were twinkling in the sky. There was a little frost in the air, the grass was white and crisp and crackled under foot. Guleesh expected to see the fairies, but they did not come. Hour after hour wore away, and he was just bethinking him of going home to bed, when his ear caught a sound far off coming towards him, and he knew what it was in a

moment. The sound grew louder and louder; at first it was like the beating of waves on a stony shore, then it was like the roar of a waterfall, at last it was like a mighty rushing wind in the tops of the trees, then the storm burst upon the rath, and sure enough the fairies were in it. The rout went by so suddenly that Guleesh lost his breath; but he came to himself and listened. The fairies were now gathered within the grassy bank of the rath, and a fine uproar they made. But Guleesh listened with all his ears, and he heard one fairy saying to another that a magic herb grew by Guleesh's own door, and that Guleesh had nothing to do but pluck it and boil it and give it to his sweetheart, the daughter of the King of France, and she would be well, for just then she was lying very ill. Guleesh took the hint, and everything went as the fairy had said. And he married the daughter of the King of France; and they had never a cark nor a care, a sickness nor a sorrow, a mishap nor a misfortune to the day of their death.

In all Celtic countries Hallowe'en seems to have been the great season of the year for prying into the future; all kinds of divination were put in practice that night. We read that Dathi, a king of Ireland in the fifth century, happening to be at the Druids' Hill (*Cnoc-nan-druad*) in the county of Sligo one Hallowe'en, ordered his druid to forecast for him the future from that day till the next Hallowe'en should come round. The druid passed the night on the top of the hill, and next morning made a prediction to the king which came true. In Wales Hallowe'en was the weirdest of all the *Teir Nos Ysbrydion*, or Three Spirit Nights, when the wind, "blowing over the feet of the corpses," bore sighs to the houses of those who were to die within the year. People thought that if on that night they went out to a cross-road and listened to the wind, they would learn all the most important things that would befall them during the next twelve months. In Wales, too, not so long ago women used to congregate in the parish churches on the night of Hallowe'en and read their fate from the flame of the candle which each of them held in her hand; also they heard the names or saw the coffins of the parishioners who would die within the year, and many were the sad scenes to which these gloomy visions gave rise. And in the Highlands of Scotland anybody who pleased could hear proclaimed aloud the names of parishioners doomed to perish within the next twelve months, if he would only take a three-legged stool and go and sit on it at three cross-roads, while the church clock was striking twelve at midnight on Hallowe'en. It was even in his power to save the destined victims from their doom by taking with him articles of wearing apparel and throwing them away, one by one, as each name was called out by the mysterious voice.

But while a glamour of mystery and awe has always clung to Hallowe'en in the minds of the Celtic peasantry, the popular celebration of the festival has been, at least in modern times, by no means of a prevailingly gloomy cast; on the contrary it has been attended by picturesque features and merry pastimes, which rendered it the gayest night of all the year. Amongst the things which in the Highlands of Scotland contributed to invest the festival with a romantic beauty were the bonfires which used to blaze at frequent intervals on the heights. "On the last day of autumn children gathered ferns, tar-barrels, the long thin stalks called *gàinisg*, and everything suitable for a bonfire. These were placed in a heap on some eminence near the house, and in the evening set fire to. The fires were called *Samhnagan*. There was one for each house, and it was an object of ambition who should have the biggest. Whole districts were brilliant with bonfires, and their glare across a Highland loch, and from many eminences, formed an exceedingly picturesque scene." Like the Beltane fires on the first of May, the Hallowe'en bonfires seem to have been kindled most commonly in the Perthshire Highlands. Travelling in the parish of Moulin, near Pitlochrie, in the year 1772, the Englishman Thomas Pennant writes that "Hallow Eve is also kept sacred: as soon as it is dark, a person sets fire to a bush of broom fastened round a pole, and, attended with a crowd, runs about the village. He then flings it down, heaps great quantity of combustible matters on it, and makes a great bonfire. A whole tract is thus illuminated at the same time, and makes a

fine appearance.” The custom has been described more fully by a Scotchman of the eighteenth century, John Ramsay of Ochtertyre. On the evening of Hallowe'en “the young people of every hamlet assembled upon some eminence near the houses. There they made a bonfire of ferns or other fuel, cut the same day, which from the feast was called *Samhnag* or *Savnag*, a fire of rest and pleasure. Around it was placed a circle of stones, one for each person of the families to whom they belonged. And when it grew dark the bonfire was kindled, at which a loud shout was set up. Then each person taking a torch of ferns or sticks in his hand, ran round the fire exulting; and sometimes times they went into the adjacent fields, where, if there was another company, they visited the bonfire, taunting the others if inferior in any respect to themselves. After the fire was burned out they returned home, where a feast was prepared, and the remainder of the evening was spent in mirth and diversions of various kinds. Next morning they repaired betimes to the bonfire, where the situation of the stones was examined with much attention. If any of them were misplaced, or if the print of a foot could be discerned near any particular stone, it was imagined that the person for whom it was set would not live out the year. Of late years this is less attended to, but about the beginning of the present century it was regarded as a sure prediction. The Hallowe'en fire is still kept up in some parts of the Low country; but on the western coast and in the Isles it is never kindled, though the night is spent in merriment and entertainments.” In the Perthshire parish of Callander, which includes the now famous pass of the Trossachs opening out on the winding and wooded shores of the lovely Loch Katrine, the Hallowe'en bonfires were still kindled down to near the end of the eighteenth century. When the fire had died down, the ashes were carefully collected in the form of a circle, and a stone was put in, near the circumference, for every person of the several families interested in the bonfire. Next morning, if any of these stones was found to be displaced or injured, the people made sure that the person represented by it was *fey* or devoted, and that he could not live twelve months from that day. In the parish of Logierait, which covers the beautiful valley of the Tummel, one of the fairest regions of all Scotland, the Hallowe'en fire was somewhat different. Faggots of heath, broom, and the dressings of flax were kindled and carried on poles by men, who ran with them round the villages, attended by a crowd. As soon as one faggot was burnt out, a fresh one was lighted and fastened to the pole. Numbers of these blazing faggots were often carried about together, and when the night happened to be dark, they formed a splendid illumination.

Nor did the Hallowe'en fires die out in Perthshire with the end of the eighteenth century. Journeying from Dunkeld to Aberfeldy on Hallowe'en in the first half of the nineteenth century, Sheriff Barclay counted thirty fires blazing on the hill tops, and saw the figures of the people dancing like phantoms round the flames. Again, “in 1860, I was residing near the head of Loch Tay during the season of the Hallowe'en feast. For several days before Hallowe'en, boys and youths collected wood and conveyed it to the most prominent places on the hill sides in their neighbourhood. Some of the heaps were as large as a corn-stack or hayrick. After dark on Hallowe'en, these heaps were kindled, and for several hours both sides of Loch Tay were illuminated as far as the eye could see. I was told by old men that at the beginning of this century men as well as boys took part in getting up the bonfires, and that, when the fire was ablaze, all joined hands and danced round the fire, and made a great noise; but that, as these gatherings generally ended in drunkenness and rough and dangerous fun, the ministers set their faces against the observance, and were seconded in their efforts by the more intelligent and well-behaved in the community; and so the practice was discontinued by adults and relegated to school boys.” At Balquhidder down to the latter part of the nineteenth century each household kindled its bonfire at Hallowe'en, but the custom was chiefly observed by children. The fires were lighted on any high knoll near the house; there was no dancing round them.

Hallowe'en fires were also lighted in some districts of the north-east of Scotland, such as Buchan. Villagers and farmers alike must have their fire. In the villages the boys went from house to house and begged a peat from each householder, usually with the words, "Ge's a peat t' burn the witches." In some villages the lads collected the peats in a cart, some of them drawing it along and the others receiving the peats and loading them on the cart. Along with the peats they accumulated straw, furze, potato haulm, everything that would burn quickly, and when they had got enough they piled it all in a heap and set it on fire. Then each of the youths, one after another, laid himself down on the ground as near to the fire as he could without being scorched, and thus lying allowed the smoke to roll over him. The others ran through the smoke and jumped over their prostrate comrade. When the heap was burned down, they scattered the ashes. Each one took a share in this part of the ceremony, giving a kick first with the right foot and then with the left; and each vied with the other who should scatter the most. After that some of them still continued to run through the scattered ashes and to pelt each other with the half-burned peats. At each farm a spot as high as possible, not too near the steading, was chosen for the fire, and the proceedings were much the same as at the village bonfire. The lads of one farm, when their own fire was burned down and the ashes scattered, sometimes went to a neighbouring fire and helped to kick the ashes about. Referring to this part of Scotland, a writer at the end of the eighteenth century observes that "the Hallow-even fire, another relict of druidism, was kindled in Buchan. Various magic ceremonies were then celebrated to counteract the influence of witches and demons, and to prognosticate to the young their success or disappointment in the matrimonial lottery. These being devoutly finished, the hallow fire was kindled, and guarded by the male part of the family. Societies were formed, either by pique or humour, to scatter certain fires, and the attack and defence were often conducted with art and with fury." Down to about the middle of the nineteenth century "the Braemar Highlanders made the circuit of their fields with lighted torches at Hallowe'en to ensure their fertility in the coming year. At that date the custom was as follows: Every member of the family (in those days households were larger than they are now) was provided with a bundle of fir 'can'les' with which to go the round. The father and mother stood at the hearth and lit the splints in the peat fire, which they passed to the children and servants, who trooped out one after the other, and proceeded to tread the bounds of their little property, going slowly round at equal distances apart, and invariably with the sun. To go 'withershins' seems to have been reserved for cursing and excommunication. When the fields had thus been circumambulated the remaining spills were thrown together in a heap and allowed to burn out."

In the Highlands of Scotland, as the evening of Hallowe'en wore on, young people gathered in one of the houses and resorted to an almost endless variety of games, or rather forms of divination, for the purpose of ascertaining the future fate of each member of the company. Were they to marry or remain single, was the marriage to take place that year or never, who was to be married first, what sort of husband or wife she or he was to get, the name, the trade, the colour of the hair, the amount of property of the future spouse—these were questions that were eagerly canvassed and the answers to them furnished never-failing entertainment. Nor were these modes of divination at Hallowe'en confined to the Highlands, where the bonfires were kindled; they were practised with equal faith and in practically the same forms in the Lowlands, as we learn, for example, from Burns's poem *Hallowe'en*, which describes the auguries drawn from a variety of omens by the Ayrshire peasantry. These Lowlanders of Saxon descent may well have inherited the rites from the Celts who preceded them in the possession of the south country. A common practice at Hallowe'en was to go out stealthily to a neighbour's kailyard and there, with shut eyes, to pull up the first kail stock that came to hand. It was necessary that the plants should be stolen without the knowledge or consent of their owner; otherwise they were quite useless for the purpose of divination. Strictly

speaking, too, the neighbour upon whose garden the raid was made should be unmarried, whether a bachelor or a spinster. The stolen kail was taken home and examined, and according to its height, shape, and features would be the height, shape, and features of the future husband or wife. The taste of the *custock*, that is, the heart of the stem, was an infallible indication of his or her temper; and a clod of earth adhering to the root signified, in proportion to its size, the amount of property which he or she would bring to the common stock. Then the kail-stock or *runt*, as it was called in Ayrshire, was placed over the lintel of the door; and the baptismal name of the young man or woman who first entered the door after the kail was in position would be the baptismal name of the husband or wife. Again, young women sowed hemp seed over nine ridges of ploughed land, saying, "I sow hemp seed, and he who is to be my husband, let him come and harrow it." On looking back over her left shoulder the girl would see the figure of her future mate behind her in the darkness. In the north-east of Scotland lint seed was used instead of hemp seed and answered the purpose quite as well. Again, a mode of ascertaining your future husband or wife was this. Take a clue of blue yarn and go to a lime-kiln. Throw the clue into the kiln, but keep one end of the thread in your hand and wind it on to another clue. As you come near the end somebody or something will hold the other end tight in the kiln. Then you call out, "Who holds?" giving the thread at the same time a gentle pull. Some one or something will thereupon pull the other end of the thread, and a voice will mention the name of your future husband or wife. Another way is this. Go to the barn alone and secretly. Be sure to open both doors and if possible take them off their hinges; for if the being who is about to appear should catch you in the barn and clap the doors to on you, he or she might do you a mischief. Having done this, take the sieve or winnowing-basket, which in Lowland Scotch is called a *wecht* or *waicht*, and go through the action of winnowing corn. Repeat it thrice, and at the third time the apparition of your future husband or wife will pass through the barn, entering at the windy door and passing out at the other. Or this. Go to a southward running stream, where the lands of three lairds meet, or to a ford where the dead and living have crossed. Dip the left sleeve of your shirt in the water. Then go home, take off the shirt, hang it up before a fire to dry, and go to bed, taking care that the bed stands so that you can see your shirt hanging before the fire. Keep awake, and at midnight you will see the form of your future spouse come into the room and turn the other side of the sleeve to the fire to dry it. A Highland form of divination at Hallowe'en is to take a shoe by the tip and throw it over the house, then observe the direction in which the toe points as it lies on the ground on the other side; for in that direction you are destined to go before long. If the shoe should fall sole uppermost, it is very unlucky for you.

These ways of prying into the future are practised outside of the house; others are observed in the kitchen or the parlour before the cheerful blaze of the fire. Thus the white of eggs, dropped in a glass of pure water, indicates by certain marks how many children a person will have. The impatience and clamour of the children, eager to ascertain the exact number of their future progeny, often induced the housewife to perform this ceremony for them by daylight; and the kindly mother, standing with her face to the window, dropping the white of an egg into a crystal glass of clean water, and surrounded by a group of children intently watching her proceedings, made up a pretty picture. When the fun of the evening had fairly commenced, the names of eligible or likely matches were written on the chimney-piece, and the young man who wished to try his fortune was led up blindfolded to the list. Whatever name he put his finger on would prove that of his future wife. Again, two nuts, representing a lad and a lass whose names were announced to the company, were put side by side in the fire. If they burned quietly together, the pair would be man and wife, and from the length of time they burned and the brightness of the flame the length and happiness of the married life of the two were augured. But if instead of burning together one of the nuts leaped away from the other, then there would be no marriage, and the blame would rest with the person whose nut

had thus started away by itself. Again, a dish of milk and meal (in Gaelic *fuarag*, in Lowland Scotch *crowdie*) or of beat potatoes was made and a ring was hidden in it. Spoons were served out to the company, who supped the contents of the dish hastily with them, and the one who got the ring would be the first to be married. Again, apples and a silver sixpence were put in a tub of water; the apples naturally floated on the top and the sixpence sank to the bottom. Whoever could lift an apple or the sixpence from the water with his mouth, without using his teeth, was counted very lucky and got the prize to himself. Again, three plates or basins were placed on the hearth. One was filled with clean water, another with dirty water, and the third was empty. The enquirer was blindfolded, knelt in front of the hearth, and groped about till he put his finger in one of them. If he lighted on the plate with the clean water, he would wed a maid; if on the plate with the dirty water, he would marry a widow; and if on the empty plate, he would remain a bachelor. For a girl the answer of the oracle was analogous; she would marry a bachelor, a widower, or nobody according to the plate into which she chanced to dip her finger. But to make sure, the operation had to be repeated thrice, the position of the plates being changed each time. If the enquirer put his or her finger into the same plate thrice or even twice, it was quite conclusive.

These forms of divination in the house were practised by the company in a body; but the following had to be performed by the person alone. You took an apple and stood with it in your hand in front of a looking-glass. Then you sliced the apple, stuck each slice on the point of the knife, and held it over your left shoulder, while you looked into the glass and combed your hair. The spectre of your future husband would then appear in the mirror stretching forth his hand to take the slices of the apple over your shoulder. Some say that the number of slices should be nine, that you should eat the first eight yourself, and only throw the ninth over your left shoulder for your husband; also that at each slice you should say, "In the name of the Father and the Son." Again, take an egg, prick it with a pin, and let the white drop into a wine-glass nearly full of water. Take some of this in your mouth and go out for a walk. The first name you hear called out aloud will be that of your future husband or wife. An old woman told a lady that she had tried this mode of divination in her youth, that the name of Archibald "came up as it were from the very ground," and that Archibald sure enough was the name of her husband. In South Uist and Eriskay, two of the outer Hebrides, a salt cake called *Bonnach Salainn* is eaten at Hallowe'en to induce dreams that will reveal the future. It is baked of common meal with a great deal of salt. After eating it you may not drink water nor utter a word, not even to say your prayers. A salt herring, eaten bones and all in three bites, is equally efficacious, always provided that you drink no water and hold your tongue.

In the northern part of Wales it used to be customary for every family to make a great bonfire called *Coel Coeth* on Hallowe'en. The fire was kindled on the most conspicuous spot near the house; and when it had nearly gone out everyone threw into the ashes a white stone, which he had first marked. Then having said their prayers round the fire, they went to bed. Next morning, as soon as they were up, they came to search out the stones, and if any one of them was found to be missing, they had a notion that the person who threw it would die before he saw another Hallowe'en. A writer on Wales at the beginning of the nineteenth century says that "the autumnal fire is still kindled in North Wales, being on the eve of the first day of November, and is attended by many ceremonies; such as running through the fire and smoke, each casting a stone into the fire, and all running off at the conclusion to escape from the black short-tailed sow; then supping upon parsnips, nuts, and apples; catching up an apple suspended by a string with the mouth alone, and the same by an apple in a tub of water: each throwing a nut into the fire; and those that burn bright, betoken prosperity to the owners through the following year, but those that burn black and crackle, denote misfortune. On the following morning the stones are searched for in the fire, and if any be missing, they betide ill

to those who threw them in.” According to Sir John Rhys, the habit of celebrating Hallowe'en by lighting bonfires on the hills is perhaps not yet extinct in Wales, and men still living can remember how the people who assisted at the bonfires would wait till the last spark was out and then would suddenly take to their heels, shouting at the top of their voices, “The cropped black sow seize the hindmost!” The saying, as Sir John Rhys justly remarks, implies that originally one of the company became a victim in dead earnest. Down to the present time the saying is current in Carnarvonshire, where allusions to the cutty black sow are still occasionally made to frighten children. We can now understand why in Lower Brittany every person throws a pebble into the midsummer bonfire. Doubtless there, as in Wales and the Highlands of Scotland, omens of life and death have at one time or other been drawn from the position and state of the pebbles on the morning of All Saints' Day. The custom, thus found among three separate branches of the Celtic stock, probably dates from a period before their dispersion, or at least from a time when alien races had not yet driven home the wedges of separation between them.

In Wales, as in Scotland, Hallowe'en was also the great season for forecasting the future in respect of love and marriage, and some of the forms of divination employed for this purpose resembled those which were in use among the Scotch peasantry. Two girls, for example, would make a little ladder of yarn, without breaking it from the ball, and having done so they would throw it out of the window. Then one of the girls, holding the ball in her hand, would wind the yarn back, repeating a rhyme in Welsh. This she did thrice, and as she wound the yarn she would see her future husband climbing up the little ladder. Again, three bowls or basins were placed on a table. One of them contained clean water, one dirty water, and one was empty. The girls of the household, and sometimes the boys too, then eagerly tried their fortunes. They were blindfolded, led up to the table, and dipped their hands into a bowl. If they happened to dip into the clean water, they would marry maidens or bachelors; if into the dirty water, they would be widowers or widows; if into the empty bowl, they would live unmarried. Again, if a girl, walking backwards, would place a knife among the leeks on Hallowe'en, she would see her future husband come and pick up the knife and throw it into the middle of the garden.

In Ireland the Hallowe'en bonfires would seem to have died out, but the Hallowe'en divination has survived. Writing towards the end of the eighteenth century, General Vallancey tells us that on Hallowe'en or the vigil of Saman, as he calls it, “the peasants in Ireland assemble with sticks and clubs (the emblems of laceration) going from house to house, collecting money, bread-cake, butter, cheese, eggs, etc., etc., for the feast, repeating verses in honour of the solemnity, demanding preparations for the festival, in the name of St. Columb Kill, desiring them to lay aside the fatted calf, and to bring forth the black sheep. The good women are employed in making the griddle cake and candles; these last are sent from house to house in the vicinity, and are lighted up on the (Saman) next day, before which they pray, or are supposed to pray, for the departed souls of the donor. Every house abounds in the best viands they can afford: apples and nuts are devoured in abundance: the nut-shells are burnt, and from the ashes many strange things are foretold: cabbages are torn up by the root: hemp seed is sown by the maidens, and they believe, that if they look back, they will see the apparition of the man intended for their future spouse: they hang a smock before the fire, on the close of the feast, and sit up all night, concealed in a corner of the room, convinced that his apparition will come down the chimney and turn the smock: they throw a ball of yarn out of the window, and wind it on the reel within, convinced, that if they repeat the *Pater Noster* backwards, and look at the ball of yarn without, they will then also see his *sith* or apparition: they dip for apples in a tub of water, and endeavour to bring one up in the mouth: they suspend a cord with a cross-stick, with apples at one point, and candles lighted at the

other, and endeavour to catch the apple, while it is in a circular motion, in the mouth. These, and many other superstitious ceremonies, the remains of Druidism, are observed on this holiday, which will never be eradicated, while the name of *Saman* is permitted to remain.”

In Queen's County, Ireland, down to the latter part of the nineteenth century children practised various of these rites of divination on Hallowe'en. Girls went out into the garden blindfold and pulled up cabbages: if the cabbage was well grown, the girl would have a handsome husband, but if it had a crooked stalk, the future spouse would be a stingy old man. Nuts, again, were placed in pairs on the bar of the fire, and from their behaviour omens were drawn of the fate in love and marriage of the couple whom they represented. Lead, also, was melted and allowed to drop into a tub of cold water, and from the shapes which it assumed in the water predictions were made to the children of their future destiny. Again, apples were bobbed for in a tub of water and brought up with the teeth; or a stick was hung from a hook with an apple at one end and a candle at the other, and the stick being made to revolve you made a bite at the apple and sometimes got a mouthful of candle instead. In County Leitrim, also, down to near the end of the nineteenth century various forms of divination were practised at Hallowe'en. Girls ascertained the character of their future husbands by the help of cabbages just as in Queen's County. Again, if a girl found a branch of a briar-thorn which had bent over and grown into the ground so as to form a loop, she would creep through the loop thrice late in the evening in the devil's name, then cut the briar and put it under her pillow, all without speaking a word. Then she would lay her head on the pillow and dream of the man she was to marry. Boys, also, would dream in like manner of love and marriage at Hallowe'en, if only they would gather ten leaves of ivy without speaking, throw away one, and put the other nine under their pillow. Again, divination was practised by means of a cake called *barm-breac*, in which a nut and a ring were baked. Whoever got the ring would be married first; whoever got the nut would marry a widow or a widower; but if the nut were an empty shell, he or she would remain unwed. Again, a girl would take a clue of worsted, go to a lime kiln in the gloaming, and throw the clew into the kiln in the devil's name, while she held fast the other end of the thread. Then she would rewind the thread and ask, “Who holds my clue?” and the name of her future husband would come up from the depth of the kiln. Another way was to take a rake, go to a rick and walk round it nine times, saying, “I rake this rick in the devil's name.” At the ninth time the wraith of your destined partner for life would come and take the rake out of your hand. Once more, before the company separated for the night, they would rake the ashes smooth on the hearth, and search them next morning for tracks, from which they judged whether anybody should come to the house, or leave it, or die in it before another year was out. In County Roscommon, which borders on County Leitrim, a cake is made in nearly every house on Hallowe'en, and a ring, a coin, a sloe, and a chip of wood are put into it. Whoever gets the coin will be rich; whoever gets the ring will be married first; whoever gets the chip of wood, which stands for a coffin, will die first; and whoever gets the sloe will live longest, because the fairies blight the sloes in the hedges on Hallowe'en, so that the sloe in the cake will be the last of the year. Again, on the same mystic evening girls take nine grains of oats in their mouths, and going out without speaking walk about till they hear a man's name pronounced; it will be the name of their future husband. In County Roscommon, too, on Hallowe'en there is the usual dipping in water for apples or sixpences, and the usual bites at a revolving apple and tallow candle.

In the Isle of Man also, another Celtic country, Hallowe'en was celebrated down to modern times by the kindling of fires, accompanied with all the usual ceremonies designed to prevent the baneful influence of fairies and witches. Bands of young men perambulated the island by night, and at the door of every dwelling-house they struck up a Manx rhyme, beginning

“*Noght oie howney hop-dy-naw,*”

that is to say, "This is Hollantide Eve." For Hollantide is the Manx way of expressing the old English *All hallowen tide*, that is, All Saints' Day, the first of November. But as the people reckon this festival according to the Old Style, Hollantide in the Isle of Man is our twelfth of November. The native Manx name for the day is *Sauin* or *Laa Houney*. Potatoes, parsnips and fish, pounded up together and mixed with butter, formed the proper evening meal (*mrastyr*) on Hallowe'en in the Isle of Man. Here, too, as in Scotland forms of divination are practised by some people on this important evening. For example, the housewife fills a thimble full of salt for each member of the family and each guest; the contents of the thimblefuls are emptied out in as many neat little piles on a plate, and left there over night. Next morning the piles are examined, and if any of them has fallen down, he or she whom it represents will die within the year. Again, the women carefully sweep out the ashes from under the fireplace and flatten them down neatly on the open hearth. If they find next morning a footprint turned towards the door, it signifies a death in the family within the year; but if the footprint is turned in the opposite direction, it bodes a marriage. Again, divination by eavesdropping is practised in the Isle of Man in much the same way as in Scotland. You go out with your mouth full of water and your hands full of salt and listen at a neighbour's door, and the first name you hear will be the name of your husband. Again, Manx maids bandage their eyes and grope about the room till they dip their hands in vessels full of clean or dirty water, and so on; and from the thing they touch they draw corresponding omens. But some people in the Isle of Man observe these auguries, not on Hallowe'en or Hollantide Eve, as they call it, which was the old Manx New Year's Eve, but on the modern New Year's Eve, that is, on the thirty-first of December. The change no doubt marks a transition from the ancient to the modern mode of dating the beginning of the year.

In Lancashire, also, some traces of the old Celtic celebration of Hallowe'en have been reported in modern times. It is said that "fires are still lighted in Lancashire, on Hallowe'en, under the name of Beltains or Teanlas; and even such cakes as the Jews are said to have made in honour of the Queen of Heaven, are yet to be found at this season amongst the inhabitants of the banks of the Ribble.... Both the fires and the cakes, however, are now connected with superstitious notions respecting Purgatory, etc." On Hallowe'en, too, the Lancashire maiden "strews the ashes which are to take the form of one or more letters of her lover's name; she throws hemp-seed over her shoulder and timidly glances to see who follows her." Again, witches in Lancashire used to gather on Hallowe'en at the Malkin Tower, a ruined and desolate farm-house in the forest of Pendle. They assembled for no good purpose; but you could keep the infernal rout at bay by carrying a lighted candle about the fells from eleven to twelve o'clock at night. The witches tried to blow out the candle, and if they succeeded, so much the worse for you; but if the flame burned steadily till the clocks had struck midnight, you were safe. Some people performed the ceremony by deputy; and parties went about from house to house in the evening collecting candles, one for each inmate, and offering their services to *late* or *leet* the witches, as the phrase ran. This custom was practised at Longridge Fell in the early part of the nineteenth century. In Northumberland on Hallowe'en omens of marriage were drawn from nuts thrown into the fire; and the sports of ducking for apples and biting at a revolving apple and lighted candle were also practised on that evening. The equivalent of the Hallowe'en bonfires is reported also from France. We are told that in the department of Deux-Sèvres, which forms part of the old province of Poitou, young people used to assemble in the fields on All Saints' Day (the first of November) and kindle great fires of ferns, thorns, leaves, and stubble, at which they roasted chestnuts. They also danced round the fires and indulged in noisy pastimes.

§ 7. The Midwinter Fires.

If the heathen of ancient Europe celebrated, as we have good reason to believe, the season of Midsummer with a great festival of fire, of which the traces have survived in many places down to our own time, it is natural to suppose that they should have observed with similar rites the corresponding season of Midwinter; for Midsummer and Midwinter, or, in more technical language, the summer solstice and the winter solstice, are the two great turning-points in the sun's apparent course through the sky, and from the standpoint of primitive man nothing might seem more appropriate than to kindle fires on earth at the two moments when the fire and heat of the great luminary in heaven begin to wane or to wax. In this way the savage philosopher, to whose meditations on the nature of things we owe many ancient customs and ceremonies, might easily imagine that he helped the labouring sun to relight his dying lamp, or at all events to blow up the flame into a brighter blaze. Certain it is that the winter solstice, which the ancients erroneously assigned to the twenty-fifth of December, was celebrated in antiquity as the Birthday of the Sun, and that festal lights or fires were kindled on this joyful occasion. Our Christmas festival is nothing but a continuation under a Christian name of this old solar festivity; for the ecclesiastical authorities saw fit, about the end of the third or the beginning of the fourth century, arbitrarily to transfer the nativity of Christ from the sixth of January to the twenty-fifth of December, for the purpose of diverting to their Lord the worship which the heathen had hitherto paid on that day to the sun.

In modern Christendom the ancient fire-festival of the winter solstice appears to survive, or to have survived down to recent years, in the old custom of the Yule log, clog, or block, as it was variously called in England. The custom was widespread in Europe, but seems to have flourished especially in England, France, and among the South Slavs; at least the fullest accounts of the custom come from these quarters. That the Yule log was only the winter counterpart of the Midsummer bonfire, kindled within doors instead of in the open air on account of the cold and inclement weather of the season, was pointed out long ago by our English antiquary John Brand; and the view is supported by the many quaint superstitions attaching to the Yule log, superstitions which have no apparent connexion with Christianity but carry their heathen origin plainly stamped upon them. But while the two solstitial celebrations were both festivals of fire, the necessity or desirability of holding the winter celebration within doors lent it the character of a private or domestic festivity, which contrasts strongly with the publicity of the summer celebration, at which the people gathered on some open space or conspicuous height, kindled a huge bonfire in common, and danced and made merry round it together.

Among the Germans the custom of the Yule log is known to have been observed in the eleventh century; for in the year 1184 the parish priest of Ahlen, in Münsterland, spoke of "bringing a tree to kindle the festal fire at the Lord's Nativity." Down to about the middle of the nineteenth century the old rite was kept up in some parts of central Germany, as we learn from an account of it given by a contemporary writer. After mentioning the custom of feeding the cattle and shaking the fruit-trees on Christmas night, to make them bear fruit, he goes on as follows: "Other customs pointing back to the far-off times of heathendom may still be met with among the old-fashioned peasants of the mountain regions. Such is in the valleys of the Sieg and Lahn the practice of laying a new log as a foundation of the hearth. A heavy block of oak-wood, generally a stump grubbed up from the ground, is fitted either into the floor of the hearth, or into a niche made for the purpose in the wall under the hook on which the kettle hangs. When the fire on the hearth glows, this block of wood glows too, but it is so placed that it is hardly reduced to ashes within a year. When the new foundation is laid, the remains of the old block are carefully taken out, ground to powder, and strewed over the fields during the Twelve Nights. This, so people fancied, promotes the fruitfulness of the year's crops." In some parts of the Eifel Mountains, to the west of Coblenz, a log of wood

called the *Christbrand* used to be placed on the hearth on Christmas Eve; and the charred remains of it on Twelfth Night were put in the corn-bin to keep the mice from devouring the corn. At Weidenhausen and Girkshausen, in Westphalia, the practice was to withdraw the Yule log (*Christbrand*) from the fire so soon as it was slightly charred; it was then kept carefully to be replaced on the fire whenever a thunder-storm broke, because the people believed that lightning would not strike a house in which the Yule log was smouldering. In some villages near Berleburg in Westphalia the old custom was to tie up the Yule log in the last sheaf cut at harvest. On Christmas Eve the peasantry of the Oberland, in Meiningen, a province of Central Germany, used to put a great block of wood called the *Christklotz* on the fire before they went to bed; it should burn all night, and the charred remains were believed to guard the house for the whole year against the risk of fire, burglary, and other misfortunes. The Yule log seems to be known only in the French-speaking parts of Switzerland, where it goes by the usual French name of *Bûche de Noël*. In the Jura mountains of the canton of Bern, while the log is burning on the hearth the people sing a blessing over it as follows:—

*“May the log burn!
May all good come in!
May the women have children
And the sheep lambs!
White bread for every one
And the vat full of wine!”*

The embers of the Yule log were kept carefully, for they were believed to be a protection against lightning.

“The Christmas fires, which were formerly lit everywhere in the Low Countries, have fallen into disuse. But in Flanders a great log of wood, called the *kersavondblok* and usually cut from the roots of a fir or a beech, is still put on the fire; all the lights in the house are extinguished, and the whole family gathers round the log to spend part of the night in singing, in telling stories, especially about ghosts, were-wolves, and so on, and also in drinking gin. At Grammont and in the neighbourhood of that town, where the Yule log is called *Kersmismot*, it is customary to set fire to the remainder of the gin at the moment when the log is reduced to ashes. Elsewhere a piece of the log is kept and put under the bed to protect the house against thunder and lightning. The charcoal of the log which burned during Christmas Night, if pounded up and mixed with water, is a cure for consumption. In the country of Limburg the log burns several nights, and the pounded charcoal is kept as a preventive (so they say), of toothache.”

In several provinces of France, and particularly in Provence, the custom of the Yule log or *tréfoir*, as it was called in many places, was long observed. A French writer of the seventeenth century tells us that on Christmas Eve the log was prepared, and when the whole family had assembled in the kitchen or parlour of the house, they went and brought it in, walking in procession and singing Provençal verses to the following effect:—

*“Let the log rejoice,
To-morrow is the day of bread;
Let all good enter here;
Let the women bear children;
Let the she-goats bring forth kids;
Let the ewes drop lambs;
Let there be much wheat and flour,
And the vat full of wine.”*

Then the log was blessed by the smallest and youngest child of the house, who poured a glass of wine over it saying, *In nomine patris*, etc.; after which the log was set on the fire. The charcoal of the burnt wood was kept the whole year, and used as an ingredient in several remedies.

Amongst the superstitions denounced by the same writer is “the belief that a log called the *trefoir* or Christmas brand, which you put on the fire for the first time on Christmas Eve and continue to put on the fire for a little while every day till Twelfth Night, can, if kept under the bed, protect the house for a whole year from fire and thunder; that it can prevent the inmates from having chilblains on their heels in winter; that it can cure the cattle of many maladies; that if a piece of it be steeped in the water which cows drink it helps them to calve; and lastly that if the ashes of the log be strewn on the fields it can save the wheat from mildew.”

In Marseilles the Yule log used to be a great block of oak, which went by the name of *calendeau* or *calignau*; it was sprinkled with wine and oil, and the head of the house kindled it himself. “The Yule log plays a great part at the festival of the winter solstice in Perigord. The countryman thinks that it is best made of plum-tree, cherry, or oak, and that the larger it is the better. If it burns well, it is a good omen, the blessing of heaven rests upon it. The charcoal and ashes, which are collected very carefully, are excellent for healing swollen glands; the part of the trunk which has not been burnt in the fire is used by ploughmen to make the wedge (*técoin ou cale*) for their plough, because they allege that it causes the seeds to thrive better; and the women keep pieces of it till Twelfth Night for the sake of their chickens. Nevertheless if you sit down on the log, you become subject to boils, and to cure yourself of them you must pass nine times under a bramble branch which happens to be rooted in the ground at both ends. The charcoal heals sheep of a disease called the *goumon*; and the ashes, carefully wrapt up in white linen, preserve the whole household from accidents. Some people think that they will have as many chickens as there are sparks that fly out of the brands of the log when they shake them; and others place the extinct brands under the bed to drive away vermin. In Vienne, on Christmas Eve, when supper is over, the master of the house has a great log—the Christmas brand—brought in, and then, surrounded by all the spectators gathered in profound silence, he sprinkles salt and water on the log. It is then put on the fire to burn during the three festivals; but they carefully preserve a piece to be kindled every time that it thunders.” In Berry, a district of Central France, the Yule log was called the *cosse de Nau*, the last word being an abbreviation of the usual French word for Christmas (Noël). It consisted of an enormous tree-trunk, so heavy that the united strength of several men was needed to carry it in and place it on the hearth, where it served to feed the fire during the three days of the Christmas festivity. Strictly speaking, it should be the trunk of an old oak-tree which had never been lopped and had been felled at midnight. It was placed on the hearth at the moment when the tinkle of the bell announced the elevation of the host at the midnight mass; and the head of the family, after sprinkling it with holy water, set it on fire. The remains of the log were preserved till the same day next year. They were kept under the bed of the master of the house; and whenever thunder was heard, one of the family would take a piece of the log and throw it on the fire, which was believed to guard the family against lightning. In the Middle Ages, we are told, several fiefs were granted on condition that the vassal should bring in person a Yule log every year for the hearth of his liege lord.

Similar customs and beliefs survived till recent years in some of the remote country villages of the picturesque district known as the Bocage of Normandy. There it was the grandfather or other oldest man of the family who chose the Yule log in good time and had it ready for Christmas Eve. Then he placed it on the hearth at the moment when the church bell began to ring for the evening service. Kneeling reverently at the hearth with the members of his family

in a like attitude of devotion, the old man recited three *Pater Nosters* and three *Aves*, and invoked the blessing of heaven on the log and on the cottage. Then at the sound of the bell which proclaimed the sacrament of the mass, or, if the church was too far off to allow the tinkle of the bell to be heard, at the moment when they judged that the priest was elevating the host before the high altar, the patriarch sprinkled the burning log with holy water, blessed it in the name of the Father and of the Son and of the Holy Ghost, and drew it out of the fire. The charred log was then carefully kept till the following Christmas as a precious relic which would guard the house against the levin bolt, evil spirits, sorcerers, and every misfortune that might befall in the course of the year. In the department of Orne “the Yule-log is called *trefouet*; holy water is poured on it; it should last the three days of the festival, and the remains of it are kept to be put on the fire when it thunders. This brand is a protection both against thunder and against sorcerers.” In Upper Brittany, also, the Yule log is thought to be a safeguard against thunder and lightning. It is sprinkled with holy water on Christmas morning and allowed to burn till evening. If a piece of it is thrown into the well, it will ensure a supply of good water.

“In almost all the families of the Ardennes,” we are told, “at the present day they never fail to put the Yule log on the fireplace, but formerly it was the object of a superstitious worship which is now obsolete. The charred remains of it, placed under the pillow or under the house, preserved the house from storms, and before it was burned the Virgin used to come and sit on it, invisible, swaddling the infant Jesus. At Nouzon, twenty years ago, the traditional log was brought into the kitchen on Christmas Eve, and the grandmother, with a sprig of box in her hand, sprinkled the log with holy water as soon as the clock struck the first stroke of midnight. As she did so she chanted,

*‘When Christmas comes,
Every one should rejoice,
For it is a New Covenant.’*

Following the grandmother and joining in the song, the children and the rest of the family marched thrice round the log, which was as fine a log as could be got.” We can now, perhaps, understand why in Perigord people who sat on the Yule log suffered from boils, and why in Lorraine young folks used to be warned that if they sat on it they would have the scab. The reason probably was that the Virgin and child were supposed to be seated, invisible, upon the log and to resent the indignity of contact with mortal children.

On Christmas Eve the mountaineers of Rupt, in the Vosges, also never fail to put on the hearth the largest log which the hearth can hold; they call it *la galeuche de Noë*, that is, the Yule log. Next morning they rake the ashes for any charred fragments and keep them as valuable talismans to guard them against the stroke of lightning. At Vagney and other places near it in the Vosges it used to be customary on the same evening to grease the hinges and the latches of the doors, that no harsh grating sound should break the slumbers of the infant Christ. In the Vosges Mountains, too, as indeed in many other places, cattle acquired the gift of speech on Christmas Eve and conversed with each other in the language of Christians. Their conversation was, indeed, most instructive; for the future, it seems, had no secret worth mentioning for them. Yet few people cared to be caught eavesdropping at the byre; wise folk contented themselves with setting a good store of fodder in the manger, then shut the door, and left the animals to their ruminations. A farmer of Vecoux once hid in a corner of the byre to overhear the edifying talk of the beasts. But it did him little good; for one ox said to another ox, “What shall we do to-morrow?” and the other replied, “We shall carry our master to the churchyard.” Sure enough the farmer died that very night and was buried next morning. In Franche-Comté, the province of France to the west of the Jura mountains, if the

Yule log is really to protect a house against thunder and lightning, it is essential that it should burn during the midnight mass, and that the flame should not go out before the divine service is concluded. Otherwise the log is quite useless for the purpose. In Burgundy the log which is placed on the fire on Christmas Eve is called the *suche*. While it is burning, the father of the family, assisted by his wife and children, sings Christmas carols; and when he has finished, he tells the smallest children to go into a corner of the room and pray God that the log may give them sweeties. The prayer is invariably answered.

In England the customs and beliefs concerning the Yule log, clog, or block, as it was variously called, used to be similar. On the night of Christmas Eve, says the antiquary John Brand, "our ancestors were wont to light up candles of an uncommon size, called Christmas Candles, and lay a log of wood upon the fire, called a Yule-clog or Christmas-block, to illuminate the house, and, as it were, to turn night into day. This custom is, in some measure, still kept up in the North of England. In the buttery of St. John's College, Oxford, an ancient candle-socket of stone still remains ornamented with the figure of the Holy Lamb. It was formerly used to burn the Christmas Candle in, on the high table at supper, during the twelve nights of that festival." "A tall mould candle, called a Yule candle, is lighted and set on the table; these candles are presented by the chandlers and grocers to their customers. The Yule-log is bought of the carpenters' lads. It would be unlucky to light either of them before the time, or to stir the fire or candle during the supper; the candle must not be snuffed, neither must any one stir from the table till supper is ended. In these suppers it is considered unlucky to have an odd number at table. A fragment of the log is occasionally saved, and put under a bed, to remain till next Christmas: it secures the house from fire; a small piece of it thrown into a fire occurring at the house of a neighbour, will quell the raging flame. A piece of the candle should likewise be kept to ensure good luck." In the seventeenth century, as we learn from some verses of Herrick, the English custom was to light the Yule log with a fragment of its predecessor, which had been kept throughout the year for the purpose; where it was so kept, the fiend could do no mischief. Indeed the practice of preserving a piece of the Yule-log of one year to light that of the next was observed by at least one family at Cheadle in Staffordshire down to the latter part of the nineteenth century.

In the North of England farm-servants used to lay by a large knotty block of wood for the Christmas fire, and so long as the block lasted they were entitled by custom to ale at their meals. The log was as large as the hearth could hold. At Belford, in Northumberland, "the lord of the manor sends round to every house, on the afternoon of Christmas Eve, the Yule Logs—four or five large logs—to be burnt on Christmas Eve and Day. This old custom has always, I am told, been kept up here." The custom of burning the Yule log at Christmas used to be observed in Wensleydale and other parts of Yorkshire, and prudent housewives carefully preserved pieces of the log throughout the year. At Whitby the portions so kept were stowed away under the bed till next Christmas, when they were burnt with the new log; in the interval they were believed to protect the house from conflagration, and if one of them were thrown into the fire, it would quell a raging storm. The practice and the belief were similar at Filey on the coast of Yorkshire, where besides the Yule log a tall Yule candle was lit on the same evening. In the West Riding, while the log blazed cheerfully, the people quaffed their ale and sang, "Yule! Yule! a pack of new cards and a Christmas stool!" At Clee, in Lincolnshire, "when Christmas Eve has come the Yule cake is duly cut and the Yule log lit, and I know of some even middle-class houses where the new log must always rest upon and be lighted by the old one, a small portion of which has been carefully stored away to preserve a continuity of light and heat." At the village of Wootton Wawen in Warwickshire, down to 1759 at least, the Yule-block, as it was called, was drawn into the house by a horse on Christmas Eve "as a foundation for the fire on Christmas Day, and according to the

superstition of those times for the twelve days following, as the said block was not to be entirely reduc'd to ashes till that time had passed by." As late as 1830, or thereabout, the scene of lighting the hearth-fire on Christmas Eve, to continue burning throughout the Christmas season, might have been witnessed in the secluded and beautiful hill-country of West Shropshire, from Chirbury and Worthen to Pulverbatch and Pontesbury. The Christmas brand or brund, as they called it, was a great trunk of seasoned oak, holly, yew, or crab-tree, drawn by horses to the farm-house door and thence rolled by means of rollers and levers to the back of the wide open hearth, where the fire was made up in front of it. The embers were raked up to it every night, and it was carefully tended, that it might not go out during the whole Christmas season. All those days no light might be struck, given, or borrowed. Such was the custom at Worthen in the early part of the nineteenth century. In Herefordshire the Christmas feast "lasted for twelve days, and no work was done. All houses were, and are now, decorated with sprigs of holly and ivy, which must not be brought in until Christmas Eve. A Yule log, as large as the open hearth could accommodate, was brought into the kitchen of each farmhouse, and smaller ones were used in the cottages. W—— P—— said he had seen a tree drawn into the kitchen at Kingstone Grange years ago by two cart horses; when it had been consumed a small portion was carefully kept to be used for lighting next year's log. 'Mother always kept it very carefully; she said it was lucky, and kept the house from fire and from lightning.' It seems to have been the general practice to light it on Christmas Eve." "In many parts of Wales it is still customary to keep part of the Yule-log until the following Christmas Eve 'for luck.' It is then put into the fireplace and burnt, but before it is consumed the new log is put on, and thus 'the old fire and the new' burn together. In some families this is done from force of habit, and they cannot now tell why they do it; but in the past the observance of this custom was to keep witches away, and doubtless was a survival of fire-worship."

But nowhere, apparently, in Europe is the old heathen ritual of the Yule log preserved to the present day more perfectly than in Servia. At early dawn on Christmas Eve (*Badnyi Dan*) every peasant house sends two of its strongest young men to the nearest forest to cut down a young oak tree and bring it home. There, after offering up a short prayer or crossing themselves thrice, they throw a handful of wheat on the chosen oak and greet it with the words, "Happy *Badnyi* day to you!" Then they cut it down, taking care that it shall fall towards the east at the moment when the sun's orb appears over the rim of the eastern horizon. Should the tree fall towards the west, it would be the worst possible omen for the house and its inmates in the ensuing year; and it is also an evil omen if the tree should be caught and stopped in its fall by another tree. It is important to keep and carry home the first chip from the fallen oak. The trunk is sawn into two or three logs, one of them rather longer than the others. A flat, unleavened cake of the purest wheaten flour is brought out of the house and broken on the larger of the logs by a woman. The logs are left for the present to stand outside, leaning on one of the walls of the house. Each of them is called a Yule log (*badnyak*).

Meanwhile the children and young people go from house to house singing special songs called *Colleda* because of an old pagan divinity Colleda, who is invoked in every line. In one of them she is spoken of as "a beautiful little maid"; in another she is implored to make the cows yield milk abundantly. The day is spent in busy preparations. The women bake little cakes of a special sort in the shape of lambs, pigs, and chickens; the men make ready a pig for roasting, for in every Servian house roast pig is the principal dish at Christmas. A bundle of straw, tied with a rope, is brought into the courtyard and left to stand there near the Yule logs.

At the moment when the sun is setting all the members of the family assemble in the central hall (the great family kitchen) of the principal house. The mother of the family (or the wife of the chief of the Zadrooga) gives a pair of woollen gloves to one of the young men, who goes out and presently returns carrying in his gloved hands the largest of the logs. The mother receives him at the threshold, throwing at him a handful of wheat, in which the first chip of the oak tree cut in the early morning for the Yule log has been kept all day. Entering the central hall with the Yule log the young man greets all present with the words: "Good evening, and may you have a happy Christmas!" and they all answer in chorus, "May God and the happy and holy Christmas help thee!" In some parts of Servia the chief of the family, holding a glass of red wine in his hand, greets the Yule log as if it were a living person, and drinks to its health. After that, another glass of red wine is poured on the log. Then the oldest male member of the family, assisted by the young man who brought in the log, places it on the burning fire so that the thicker end of the log protrudes for about a foot from the hearth. In some places this end is smeared with honey.

Next the mother of the family brings in the bundle of straw which was left standing outside. All the young children arrange themselves behind her in a row. She then walks slowly round the hall and the adjoining rooms, throwing handfuls of straw on the floor and imitating the cackling of a hen, while all the children follow her peeping with their lips as if they were chickens cheeping and waddling after the mother bird. When the floor is well strewn with straw, the father or the eldest member of the family throws a few walnuts in every corner of the hall, pronouncing the words: "In the name of God the Father, and the Son, and the Holy Ghost, Amen!" A large pot, or a small wooden box, filled with wheat is placed high in the east corner of the hall, and a tall candle of yellow wax is stuck in the middle of the wheat. Then the father of the family reverently lights the candle and prays God to bless the family with health and happiness, the fields with a good harvest, the beehives with plenty of honey, the cattle and sheep with young, and the cows with abundant milk and rich cream. After that they all sit down to supper, squatting on the floor, for the use of chairs and tables is forbidden on this occasion.

By four o'clock next morning (Christmas Day) the whole village is astir; indeed most people do not sleep at all that night. It is deemed most important to keep the Yule log burning brightly all night long. Very early, too, the pig is laid on the fire to roast, and at the same moment one of the family goes out into the yard and fires a pistol or gun; and when the roast pig is removed from the fire the shot is repeated. Hence for several hours in the early morning of Christmas Day such a popping and banging of firearms goes on that a stranger might think a stubborn skirmish was in progress. Just before the sun rises a girl goes and draws water at the village spring or at the brook. Before she fills her vessels, she wishes the water a happy Christmas and throws a handful of wheat into it. The first cupfuls of water she brings home are used to bake a special Christmas cake (*chesnitsa*), of which all the members partake at dinner, and portions are kept for absent relatives. A small silver coin is baked in the cake, and he or she who gets it will be lucky during the year.

All the family gathered round the blazing Yule log now anxiously expect the arrival of the special Christmas visiter, who bears the title of *polaznik*. He is usually a young boy of a friendly family. No other person, not even the priest or the mayor of the village, would be allowed to set foot in the house before the arrival of this important personage. Therefore he ought to come, and generally does come, very early in the morning. He carries a woollen glove full of wheat, and when the door is opened at his knock he throws handfuls of wheat on the family gathered round the hearth, greeting them with the words, "Christ is born!" They all answer, "He is born indeed," and the hostess flings a handful of wheat over the Christmas visiter, who moreover casts some of his wheat into the corners of the hall as well as upon the

people. Then he walks straight to the hearth, takes a shovel and strikes the burning log so that a cloud of sparks flies up the chimney, while he says, "May you have this year so many oxen, so many horses, so many sheep, so many pigs, so many beehives full of honey, so much good luck, prosperity, progress, and happiness!" Having uttered these good wishes, he embraces and kisses his host. Then he turns again to the hearth, and after crossing himself falls on his knees and kisses the projecting part of the Yule log. On rising to his feet he places a coin on the log as his gift. Meanwhile a low wooden chair has been brought in by a woman, and the visiter is led to it to take his seat. But just as he is about to do so, the chair is jerked away from under him by a male member of the family and he measures his length on the floor. By this fall he is supposed to fix into the ground all the good wishes which he has uttered that morning. The hostess thereupon wraps him in a thick blanket, and he sits quietly muffled in it for a few minutes; the thick blanket in which he is swathed is believed, on the principles of homoeopathic magic, to ensure that the cows will give thick cream the next year. While he sits thus enriching the milk of the dairy, the lads who are to herd the sheep in the coming year go to the hearth and kneeling down before it kiss each other across the projecting end of the Yule log. By this demonstration of affection they are thought to seal the love of the ewes for their lambs.

The ritual of the Yule log is observed in a similar form by the Servians who inhabit the southern provinces of Austria. Thus in Syrmia, a district of Slavonia which borders on Servia, the head of the house sends out one or two young men on Christmas Eve to cut the Yule log in the nearest forest. On being brought in, the log is not mixed with the ordinary fuel but placed by itself, generally leaning against a fruit-tree till the evening shadows begin to fall. When a man carries it into the kitchen and lays it on the fire, the master of the house throws corn over him, and the two greet each other solemnly, the one saying, "Christ is born," and the other answering, "He is born indeed." Later in the evening the master of the house pours a glass of wine on the charred end of the log, whereupon one of the younger men takes the burnt piece of wood, carries it to the orchard, and sets it up against one of the fruit-trees. For this service he is rewarded by the master of the house with a piece of money. On Christmas Day, when the family is assembled at table, they expect the arrival of the special Christmas visiter (called *polazenik*), the only person who is allowed to enter the house that day. When he comes, he goes to the hearth, stirs the fire with the poker and says, "Christ is born. May the family enjoy all good luck and happiness in this year! May the cattle increase in number like the sparks I have struck!" As he says these words, the mistress of the house pours corn over him and leads him to the parlour, where he takes the place of honour beside the master of the house. He is treated with marked attention and respect. The family are at pains to entertain him; they sing their best songs for his amusement, and after midnight a numerous band of men and maidens escorts him by torchlight, with songs and jubilation, to his own house.

Among the Servians of Dalmatia, Herzegovina, and Montenegro it is customary on Christmas Eve (*Badnyi Dan*) to fetch a great Yule log (*badnyak*), which serves as a symbol of family luck. It is generally cut from an evergreen oak, but sometimes from an olive-tree or a beech. At nightfall the master of the house himself brings in the log and lays it on the fire. Then he and all present bare their heads, sprinkle the log with wine, and make a cross on it. After that the master of the house says, "Welcome, O log! May God keep you from mishap!" So saying he strews peas, maize, raisins, and wheat on the log, praying for God's blessing on all members of the family living and dead, for heaven's blessing on their undertakings, and for domestic prosperity. In Montenegro they meet the log with a loaf of bread and a jug of wine, drink to it, and pour wine on it, whereupon the whole family drinks out of the same beaker. In Dalmatia and other places, for example in Rizano, the Yule logs are decked by young women

with red silk, flowers, laurel leaves, ribbons, and even gold wire; and the lights near the doorposts are kindled when the log is brought into the house. Among the Morlaks, as soon as the master of the house crosses the threshold with the Yule log, one of the family must sprinkle corn on him and say, "God bless you," to which he answers, "The same to you." A piece of the log is kept till New Year's Day to kindle a light with or it is carried out to the fields to protect them from hail. It is customary to invite before hand a Christmas visiter (*položaynik*) and to admit no one else into the house on that day. He comes early, carrying in his sleeves a quantity of corn which he throws into the house, saying, "Christ is born." One of the household replies, "He is born indeed," and throws corn on the visiter. Then the newcomer goes up to the hearth, pokes the fire and strikes the burning log with the poker so hard that sparks fly off in all directions. At each blow he says, "I wish the family as many cows, calves, sucking pigs, goats, and sheep, and as many strokes of good luck, as the sparks that now fly from the log." With these words he throws some small coins into the ashes. In Albania down to recent years it was a common custom to burn a Yule log at Christmas, and with it corn, maize, and beans; moreover, wine and *rakia* were poured on the flames, and the ashes of the fire were scattered on the fields to make them fertile. The Huzuls, a Slavonic people of the Carpathians, kindle fire by the friction of wood on Christmas Eve (Old Style, the fifth of January) and keep it burning till Twelfth Night.

It is remarkable how common the belief appears to have been that the remains of the Yule-log, if kept throughout the year, had power to protect the house against fire and especially against lightning. As the Yule log was frequently of oak, it seems possible that this belief may be a relic of the old Aryan creed which associated the oak-tree with the god of thunder. Whether the curative and fertilizing virtues ascribed to the ashes of the Yule log, which are supposed to heal cattle as well as men, to enable cows to calve, and to promote the fruitfulness of the earth, may not be derived from the same ancient source, is a question which deserves to be considered.

Thus far we have regarded only the private or domestic celebration of the fire-festival at midwinter. The public celebration of such rites at that season of the year appears to have been rare and exceptional in Central and Northern Europe. However, some instances are on record. Thus at Schweina, in Thuringia, down to the second half of the nineteenth century, the young people used to kindle a great bonfire on the Antonius Mountain every year on Christmas Eve. Neither the civil nor the ecclesiastical authorities were able to suppress the celebration; nor could the cold, rain, and snow of the season damp or chill the enthusiasm of the celebrants. For some time before Christmas the young men and boys were busy building a foundation for the bonfire on the top of the mountain, where the oldest church of the village used to stand. The foundation consisted of a pyramidal structure composed of stones, turf, and moss. When Christmas Eve came round, a strong pole, with bundles of brushwood tied to it, was erected on the pyramid. The young folk also provided themselves with poles to which old brooms or faggots of shavings were attached. These were to serve as torches. When the evening grew dark and the church bells rang to service, the troop of lads ascended the mountain; and soon from the top the glare of the bonfire lit up the darkness, and the sound of a hymn broke the stillness of night. In a circle round the great fire lesser fires were kindled; and last of all the lads ran about swinging their lighted torches, till these twinkling points of fire, moving down the mountain-side, went out one by one in the darkness. At midnight the bells rang out from the church tower, mingled with the blast of horns and the sound of singing. Feasting and revelry were kept up throughout the night, and in the morning young and old went to early mass to be edified by hearing of the light eternal.

In the Bocage of Normandy the peasants used to repair, often from a distance of miles, to the churches to hear the midnight mass on Christmas Eve. They marched in procession by

torchlight, chanting Christmas carols, and the fitful illumination of the woods, the hedges, and the fields as they moved through the darkness, presented a succession of picturesque scenes. Mention is also made of bonfires kindled on the heights; the custom is said to have been observed at Athis near Condé down to recent years.

In the Isle of Man, “on the twenty-first of December, a day dedicated to Saint Thomas, the people went to the mountains to catch deer and sheep for Christmas, and in the evenings always kindled a large fire on the top of every *fingan* or cliff. Hence, at the time of casting peats, every one laid aside a large one, saying, ‘*Faaid mooar moayne son oie'l fingan*’; that is, ‘a large turf for Fingan Eve.’” At Burghead, an ancient village on the southern shore of the Moray Firth, about nine miles from the town of Elgin, a festival of fire called “the Burning of the Clavie” has been celebrated from time immemorial on Hogmanay, the last day of December. A tar-barrel is sawn in two, one half of it is set on the top of a stout pole, and filled with tar and other combustibles. The half-barrel is fastened to the pole by means of a long nail, which is made for the purpose and furnished gratuitously by the village blacksmith. The nail must be knocked in with a stone; the use of a hammer is forbidden. When the shades of evening have begun to fall, the Clavie, as it is called, is set on fire by means of a burning peat, which is always fetched from the same house; it may not be kindled with a match. As soon as it is in a blaze, it is shouldered by a man, who proceeds to carry it at a run, flaring and dripping melted tar, round the old boundaries of the village; the modern part of the town is not included in the circuit. Close at his heels follows a motley crowd, cheering and shouting. One bearer relieves another as each wearies of his burden. The first to shoulder the Clavie, which is esteemed an honour, is usually a man who has been lately married. Should the bearer stumble or fall, it is deemed a very ill omen for him and for the village. In bygone times it was thought necessary that one man should carry it all round the village; hence the strongest man was chosen for the purpose. Moreover it was customary to carry the burning Clavie round every fishing-boat and vessel in the harbour; but this part of the ceremony was afterwards discontinued. Finally, the blazing tar-barrel is borne to a small hill called the Doorie, which rises near the northern end of the promontory. Here the pole is fixed into a socket in a pillar of freestone, and fresh fuel is heaped upon the flames, which flare up higher and brighter than ever. Formerly the Clavie was allowed to burn here the whole night, but now, after blazing for about half an hour, it is lifted from the socket and thrown down the western slope of the hill. Then the crowd rushes upon it, demolishes it, and scrambles for the burning, smoking embers, which they carry home and carefully preserve as charms to protect them against witchcraft and misfortune. The great antiquity of Burghead, where this curious and no doubt ancient festival is still annually observed, appears from the remains of a very remarkable rampart which formerly encircled the place. It consists of a mound of earth faced on both sides with a solid wall of stone and strengthened internally by oak beams and planks, the whole being laid on a foundation of boulders. The style of the rampart agrees in general with Caesar's description of the mode in which the Gauls constructed their walls of earth, stone, and logs, and it resembles the ruins of Gallic fortifications which have been discovered in France, though it is said to surpass them in the strength and solidity of its structure. No similar walls appear to be known in Britain. A great part of this interesting prehistoric fortress was barbarously destroyed in the early part of the nineteenth century, much of it being tumbled into the sea and many of the stones used to build the harbour piers.

In Lerwick, the capital of the Shetland Islands, “on Christmas Eve, the fourth of January,—for the old style is still observed—the children go *a guizing*, that is to say, they disguising themselves in the most fantastic and gaudy costumes, parade the streets, and infest the houses and shops, begging for the wherewithal to carry on their Christmas amusements. One o'clock on Yule morning having struck, the young men turn out in large numbers, dressed in the

coarsest of garments, and, at the double-quick march, drag huge tar barrels through the town, shouting and cheering as they go, or blowing loud blasts with their 'louder horns.' The tar barrel simply consists of several—say from four to eight—tubs filled with tar and chips, placed on a platform of wood. It is dragged by means of a chain, to which scores of jubilant youths readily yoke themselves. They have recently been described by the worthy burgh officer of Lerwick as 'fiery chariots, the effect of which is truly grand and terrific.' In a Christmas morning the dark streets of Lerwick are generally lighted up by the bright glare, and its atmosphere blackened by the dense smoke of six or eight tar barrels in succession. On the appearance of daybreak, at six a.m., the morning revellers put off their coarse garments—well begrimed by this time—and in their turn become guizards. They assume every imaginable form of costume—those of soldiers, sailors, highlanders, Spanish chevaliers, etc. Thus disguised, they either go in pairs, as man and wife, or in larger groups, and proceed to call on their friends, to wish them the compliments of the season. Formerly, these adolescent guizards used to seat themselves in crates, and accompanied by fiddlers, were dragged through the town."

The Persians used to celebrate a festival of fire called *Sada* or *Saza* at the winter solstice. On the longest night of the year they kindled bonfires everywhere, and kings and princes tied dry grass to the feet of birds and animals, set fire to the grass, and then let the birds and beasts fly or run blazing through the air or over the fields and mountains, so that the whole air and earth appeared to be on fire.

§ 8. The Need-fire.

The fire-festivals hitherto described are all celebrated periodically at certain stated times of the year. But besides these regularly recurring celebrations the peasants in many parts of Europe have been wont from time immemorial to resort to a ritual of fire at irregular intervals in seasons of distress and calamity, above all when their cattle were attacked by epidemic disease. No account of the popular European fire-festivals would be complete without some notice of these remarkable rites, which have all the greater claim on our attention because they may perhaps be regarded as the source and origin of all the other fire-festivals; certainly they must date from a very remote antiquity. The general name by which they are known among the Teutonic peoples is need-fire.

The history of the need-fire can be traced back to the early Middle Ages; for in the reign of Pippin, King of the Franks, the practice of kindling need-fires was denounced as a heathen superstition by a synod of prelates and nobles held under the presidency of Boniface, Archbishop of Mainz. Not long afterwards the custom was again forbidden, along with many more relics of expiring paganism, in an "Index of Superstitions and Heathenish Observances," which has been usually referred to the year 743 a.d., though some scholars assign it a later date under the reign of Charlemagne. In Germany the need-fires would seem to have been popular down to the second half of the nineteenth century. Thus in the year 1598, when a fatal cattle-plague was raging at Neustadt, near Marburg, a wise man of the name of Joh. Köhler induced the authorities of the town to adopt the following remedy. A new waggon-wheel was taken and twirled round an axle, which had never been used before, until the friction elicited fire. With this fire a bonfire was next kindled between the gates of the town, and all the cattle were driven through the smoke and flames. Moreover, every householder had to rekindle the fire on his hearth by means of a light taken from the bonfire. Strange to say, this salutary measure had no effect whatever in staying the cattle-plague, and seven years later the sapient Joh. Köhler himself was burnt as a witch. The farmers, whose pigs and cows had derived no benefit from the need-fire, perhaps assisted as spectators at the burning, and, while they shook their heads, agreed among themselves that it served Joh.

Köhler perfectly right. According to a writer who published his book about nine years afterwards, some of the Germans, especially in the Wassgaw mountains, confidently believed that a cattle-plague could be stayed by driving the animals through a need-fire which had been kindled by the violent friction of a pole on a quantity of dry oak wood; but it was a necessary condition of success that all fires in the village should previously be extinguished with water, and any householder who failed to put out his fire was heavily fined.

The method of kindling the need-fire is described as follows by a writer towards the end of the seventeenth century: "When an evil plague has broken out among the cattle, large and small, and the herds have thereby suffered great ravages, the peasants resolve to light a need-fire. On a day appointed there must be no single flame in any house nor on any hearth. From every house a quantity of straw and water and underwood must be brought forth; then a strong oaken pole is fixed firmly in the earth, a hole is bored in it, and a wooden winch, well smeared with pitch and tar, is inserted in the hole and turned round forcibly till great heat and then fire is generated. The fire so produced is caught in fuel and fed with straw, heath, and underwood till it bursts out into a regular need-fire, which must then be somewhat spread out between walls or fences, and the cattle and horses driven through it twice or thrice with sticks and whips. Others set up two posts, each with a hole in it, and insert a winch, along with old greasy rags, in the holes. Others use a thick rope, collect nine kinds of wood, and keep them in violent motion till fire leaps forth. Perhaps there may be other ways of generating or kindling this fire, but they are all directed simply at the cure of the cattle. After passing twice or thrice through the fire the cattle are driven to their stalls or to pasture, and the heap of wood that had been collected is destroyed, but in some places every householder must take with him a brand, extinguish it in a washing-tub or trough, and put it in the manger where the cattle are fed, where it must lie for some time. The poles that were used to make the need-fire, together with the wood that was employed as a winch, are sometimes burned with the rest of the fuel, sometimes carefully preserved after the cattle have been thrice driven through the flames."

Sometimes the need-fire was known as the "wild fire," to distinguish it no doubt from the tame fire produced by more ordinary methods. The following is Grimm's account of the mode of kindling it which prevailed in some parts of Central Germany, particularly about Hildesheim, down apparently to the first half of the nineteenth century: "In many places of Lower Saxony, especially among the mountains, the custom prevails of preparing the so-called 'wild fire' for the purpose of preventing cattle-plague; and through it first the pigs, then the cows, and last of all the geese are driven. The proceedings on the occasion are as follows. The principal farmers and parishioners assemble, and notice is served to every inhabitant to extinguish entirely all fire in his house, so that not even a spark remains alight in the whole village. Then young and old repair to a road in a hollow, usually towards evening, the women carrying linen, and the men wood and tow. Two oaken poles are driven into the ground about a foot and a half from each other. Each pole has in the side facing the other a socket into which a cross-piece as thick as a man's arm is fitted. The sockets are stuffed with linen, and the cross-piece is rammed in as tight as possible, while the poles are bound together at the top by ropes. A rope is wound about the round, smooth cross-piece, and the free ends of the rope at both sides are gripped by several persons, who pull the cross-piece to and fro with the utmost rapidity, till through the friction the linen in the sockets takes fire. The sparks of the linen are immediately caught in tow or oakum and waved about in a circle until they burst into a bright glow, when straw is applied to it, and the flaming straw used to kindle the brushwood which has been stacked in piles in the hollow way. When this wood has blazed up and the fire has nearly died out again, the people hasten to the herds, which have been waiting in the background, and drive them forcibly, one after the other, through the

glow. As soon as all the beasts are through, the young folk rush wildly at the ashes and cinders, sprinkling and blackening each other with them; those who have been most sprinkled and blackened march in triumph behind the cattle into the village and do not wash themselves for a long time. If after long rubbing the linen should not catch fire, they guess that there is still fire somewhere in the village; then a strict search is made from house to house, any fire that may be found is put out, and the householder is punished or upbraided. The 'wild fire' must be made by prolonged friction; it may not be struck with flint and steel. Some villages do not prepare it yearly as a preventive of cattle-plague, but only kindle it when the disease has actually broken out." In the Halberstadt district the ends of the rope which was used to make the cross-piece revolve in the sockets had to be pulled by two chaste young men.

In the Mark down to the first half of the nineteenth century the practice was similar. We read that "in many parts of the Mark there still prevails on certain occasions the custom of kindling a need-fire, it happens particularly when a farmer has sick pigs. Two posts of dry wood are planted in the earth amid solemn silence before the sun rises, and round these posts hempen ropes are pulled to and fro till the wood kindles; whereupon the fire is fed with dry leaves and twigs and the sick beasts are driven through it. In some places the fire is produced by the friction of an old cart-wheel."

In Mecklenburg the need-fire used to be lighted by the friction of a rope wound about an oaken pole or by rubbing two boards against each other. Having been thus elicited, the flame was fed with wood of seven kinds. The practice was forbidden by Gustavus Adolphus, Duke of Mecklenburg, in 1682; but the prohibition apparently had little effect, for down to the end of the eighteenth century the custom was so common that the inhabitants even of large towns made no scruple of resorting to it. For example, in the month of July 1792 sickness broke out among the cattle belonging to the town of Sternberg; some of the beasts died suddenly, and so the people resolved to drive all the survivors through a need-fire. On the tenth day of July the magistrates issued a proclamation announcing that next morning before sunrise a need-fire would be kindled for the behoof of all the cattle of the town, and warning all the inhabitants against lighting fires in their kitchens that evening. So next morning very early, about two o'clock, nearly the whole population was astir, and having assembled outside one of the gates of the town they helped to drive the timid cattle, not without much ado, through three separate need-fires; after which they dispersed to their homes in the unalterable conviction that they had rescued the cattle from destruction. But to make assurance doubly sure they deemed it advisable to administer the rest of the ashes as a bolus to the animals. However, some people in Mecklenburg used to strew the ashes of the need-fire on fields for the purpose of protecting the crops against vermin. As late as June 1868 a traveller in Mecklenburg saw a couple of peasants sweating away at a rope, which they were pulling backwards and forwards so as to make a tarry roller revolve with great speed in the socket of an upright post. Asked what they were about, they vouchsafed no reply; but an old woman who appeared on the scene from a neighbouring cottage was more communicative. In the fulness of her heart she confided to the stranger that her pigs were sick, that the two taciturn bumpkins were her sons, who were busy extracting a need-fire from the roller, and that, when they succeeded, the flame would be used to ignite a heap of rags and brushwood, through which the ailing swine would be driven. She further explained that the persons who kindle a need-fire should always be two brothers or at least bear the same Christian name.

In the summer of 1828 there was much sickness among the pigs and the cows of Eddesse, a village near Meinersen, in the south of Hanover. When all ordinary measures to arrest the malady failed, the farmers met in solemn conclave on the village green and determined that next morning there should be a need-fire. Thereupon the head man of the village sent word

from house to house that on the following day nobody should kindle a fire before sunrise, and that everybody should stand by ready to drive out the cattle. The same afternoon all the necessary preparations were made for giving effect to the decision of the collective wisdom. A narrow street was enclosed with planks, and the village carpenter set to work at the machinery for kindling the fire. He took two posts of oak wood, bored a hole about three inches deep and broad in each, and set the two poles up facing each other at a distance of about two feet. Then he fitted a roller of oak wood into the two holes of the posts, so that it formed a cross-piece between them. About two o'clock next morning every householder brought a bundle of straw and brushwood and laid it down across the street in a prescribed order. The sturdiest swains who could be found were chosen to make the need-fire. For this purpose a long hempen rope was wound twice round the oaken roller in the oaken posts: the pivots were well smeared with pitch and tar: a bundle of tow and other tinder was laid close at hand, and all was ready. The stalwart clodhoppers now seized the two ends of the rope and went to work with a will. Puffs of smoke soon issued from the sockets, but to the consternation of the bystanders not a spark of fire could be elicited. Some people openly declared their suspicion that some rascal had not put out the fire in his house, when suddenly the tinder burst into flame. The cloud passed away from all faces; the fire was applied to the heaps of fuel, and when the flames had somewhat died down, the herds were forcibly driven through the fire, first the pigs, next the cows, and last of all the horses. The herdsmen then drove the beasts to pasture, and persons whose faith in the efficacy of the need-fire was particularly robust carried home brands.

Again, at a village near Quedlinburg, in the Harz Mountains, it was resolved to put a herd of sick swine through the need-fire. Hearing of this intention the Superintendent of Quedlinburg hurried to the spot and has described for us what he saw. The beadles went from house to house to see that there was no fire in any house; for it is well known that should there be common fire burning in a house the need-fire will not kindle. The men made their rounds very early in the morning to make quite sure that all lights were out. At two o'clock a night-light was still burning in the parsonage, and this was of course a hindrance to the need-fire. The peasants knocked at the window and earnestly entreated that the night-light might be extinguished. But the parson's wife refused to put the light out; it still glimmered at the window; and in the darkness outside the angry rustics vowed that the parson's pigs should get no benefit of the need-fire. However, as good luck would have it, just as the morning broke, the night-light went out of itself, and the hopes of the people revived. From every house bundles of straw, tow, faggots and so forth were now carried to feed the bonfire. The noise and the cheerful bustle were such that you might have thought they were all hurrying to witness a public execution. Outside the village, between two garden walls, an oaken post had been driven into the ground and a hole bored through it. In the hole a wooden winch, smeared with tar, was inserted and made to revolve with such force and rapidity that fire and smoke in time issued from the socket. The collected fuel was then thrown upon the fire and soon a great blaze shot up. The pigs were now driven into the upper end of the street. As soon as they saw the fire, they turned tail, but the peasants drove them through with shrieks and shouts and lashes of whips. At the other end of the street there was another crowd waiting, who chased the swine back through the fire a second time. Then the other crowd repeated the manœuvre, and the herd of swine was driven for the third time through the smoke and flames. That was the end of the performance. Many pigs were scorched so severely that they gave up the ghost. The bonfire was broken up, and every householder took home with him a brand, which he washed in the water-barrel and laid for some time, as a treasure of great price, in the manger from which the cattle were fed. But the parson's wife had reason bitterly to repent her folly in refusing to put out that night-light; for not one of her pigs was driven through the need-fire, so they died.

In Brunswick, also, the need-fire is known to have been repeatedly kindled during the nineteenth century. After driving the pigs through the fire, which was kindled by the friction of wood, some people took brands home, dipped them in water, and then gave the water to the pigs to drink, no doubt for the purpose of inoculating them still more effectually with the precious virtue of the need-fire. In the villages of the Drömbling district everybody who bore a hand in kindling the "wild fire" must have the same Christian name; otherwise they laboured in vain. The fire was produced by the friction of a rope round the beams of a door; and bread, corn, and old boots contributed their mites to swell the blaze through which the pigs as usual were driven. In one place, apparently not far from Wolfenbüttel, the need-fire is said to have been kindled, contrary to custom, by the smith striking a spark from the cold anvil. At Gandersheim down to about the beginning of the nineteenth century the need-fire was lit in the common way by causing a cross-bar to revolve rapidly on its axis between two upright posts. The rope which produced the revolution of the bar had to be new, but it was if possible woven from threads taken from a gallows-rope, with which people had been hanged. While the need-fire was being kindled in this fashion, every other fire in the town had to be put out; search was made through the houses, and any fire discovered to be burning was extinguished. If in spite of every precaution no flame could be elicited by the friction of the rope, the failure was set down to witchcraft; but if the efforts were successful, a bonfire was lit with the new fire, and when the flames had died down, the sick swine were driven thrice through the glowing embers. On the lower Rhine the need-fire is said to have been kindled by the friction of oak-wood on fir-wood, all fires in the village having been previously extinguished. The bonfires so kindled were composed of wood of nine different sorts; there were three such bonfires, and the cattle were driven round them with great gravity and devotion.

In Silesia, also, need-fires were often employed for the purpose of curing a murrain or preventing its spread. While all other lights within the boundaries were extinguished, the new fire was produced by the friction of nine kinds of wood, and the flame so obtained was used to kindle heaps of brushwood or straw to which every inhabitant had contributed. Through these fires the cattle, both sick and sound, were driven in the confident expectation that thereby the sick would be healed and the sound saved from sickness. When plague breaks out among the herds at Dobischwald, in Austrian Silesia, a splinter of wood is chipped from the threshold of every house, the cattle are driven to a cross-road, and there a tree, growing at the boundary, is felled by a pair of twin brothers. The wood of the tree and the splinters from the thresholds furnish the fuel of a bonfire, which is kindled by the rubbing of two pieces of wood together. When the bonfire is ablaze, the horns of the cattle are pared and the parings thrown into the flames, after which the animals are driven through the fire. This is believed to guard the herd against the plague. The Germans of Western Bohemia resort to similar measures for staying a murrain. You set up a post, bore a hole in it, and insert in the hole a stick, which you have first of all smeared with pitch and wrapt in inflammable stuffs. Then you wind a rope round the stick and give the two ends of the rope to two persons who must either be brothers or have the same baptismal name. They haul the rope backwards and forwards so as to make the tarred stick revolve rapidly till the rope first smokes and then emits sparks. The sparks are used to kindle a bonfire, through which the cattle are driven in the usual way. And as usual no other fire may burn in the village while the need-fire is being kindled; for otherwise the rope could not possibly be ignited. In Upper Austria sick pigs are reported to have been driven through a need-fire about the beginning of the nineteenth century.

The need-fire is still in use in some parts of Switzerland, but it seems to have degenerated into a children's game and to be employed rather for the dispersal of a mist than for the

prevention or cure of cattle-plague. In some cantons it goes by the name of "mist-healing," while in others it is called "butter-churning." On a misty or rainy day a number of children will shut themselves up in a stable or byre and proceed to make fire for the purpose of improving the weather. The way in which they make it is this. A boy places a board against his breast, takes a peg pointed at both ends, and, setting one end of the peg against the board on his breast, presses the other end firmly against a second board, the surface of which has been flaked into a nap. A string is tied round the peg, and two other boys pull it to and fro, till through the rapid motion of the point of the peg a hole is burnt in the flaked board, to which tow or dry moss is then applied as a tinder. In this way fire and smoke are elicited, and with their appearance the children fancy that the mist will vanish. We may conjecture that this method of dispersing a mist, which is now left to children, was formerly practised in all seriousness by grown men in Switzerland. It is thus that religious or magical rites dwindle away into the sports of children. In the canton of the Grisons there is still in common use an imprecation, "Mist, go away, or I'll heal you," which points to an old custom of burning up the fog with fire. A longer form of the curse lingers in the Vallée des Bagnes of the canton Valais. It runs thus: "Mist, mist, fly, fly, or St. Martin will come with a sheaf of straw to burn your guts, a great log of wood to smash your brow, and an iron chain to drag you to hell."

In Sweden the need-fire is called, from the mode of its production, either *vrid-eld*, "turned fire," or *gnid-eld*, "rubbed fire." Down to near the end of the eighteenth century the need-fire was kindled, as in Germany, by the violent rubbing of two pieces of wood against each other; sometimes nine different kinds of wood were used for the purpose. The smoke of the fire was deemed salutary; fruit-trees and nets were fumigated with it, in order that the trees might bear fruit and the nets catch fish. Cattle were also driven through the smoke. In Sundal, a narrow Norwegian valley, shut in on both sides by precipitous mountains, there lived down to the second half of the nineteenth century an old man who was very superstitious. He set salmon-traps in the river Driva, which traverses the valley, and he caught many fish both in spring and autumn. When his fishing went wrong, he kindled *naueld* ("need-fire") or *gnideild* ("rubbed fire," "friction fire") to counteract the witchcraft, which he believed to be the cause of his bad luck. He set up two planks near each other, bored a hole in each, inserted a pointed rod in the holes, and twisted a long cord round the rod. Then he pulled the cord so as to make the rod revolve rapidly. Thus by reason of the friction he at last drew fire from the wood. That contented him, for "he believed that the witchery was thus rendered powerless, and that good luck in his fishing was now ensured."

Slavonic peoples hold the need-fire in high esteem. They call it "living fire," and attribute to it a healing virtue. The ascription of medicinal power to fire kindled by the friction of wood is said to be especially characteristic of the Slavs who inhabit the Carpathian Mountains and the Balkan peninsula. The mode in which they produce the need-fire differs somewhat in different places. Thus in the Schar mountains of Servia the task is entrusted to a boy and girl between eleven and fourteen years of age. They are led into a perfectly dark room, and having stripped themselves naked kindle the fire by rubbing two rollers of lime wood against each other, till the friction produces sparks, which are caught in tinder. The Serbs of Western Macedonia drive two oaken posts into the ground, bore a round hole in the upper end of each, insert a roller of lime wood in the holes, and set it revolving rapidly by means of a cord, which is looped round the roller and worked by a bow. Elsewhere the roller is put in motion by two men, who hold each one end of the cord and pull it backwards and forwards forcibly between them. Bulgarian shepherds sometimes kindle the need-fire by drawing a prism-shaped piece of lime wood to and fro across the flat surface of a tree-stump in the forest. But in the neighbourhood of Küstendil, in Bulgaria, the need-fire is kindled by the friction of two pieces of oak wood and the cattle are driven through it.

In many districts of Russia, also, "living fire" is made by the friction of wood on St. John's Day, and the herds are driven through it, and the people leap over it in the conviction that their health is thereby assured; when a cattle-plague is raging, the fire is produced by rubbing two pieces of oak wood against each other, and it is used to kindle the lamps before the holy pictures and the censers in the churches. Thus it appears that in Russia the need-fire is kindled for the sake of the cattle periodically as well as on special emergencies. Similarly in Poland the peasants are said to kindle fires in the village streets on St. Rochus's day and to drive the cattle thrice through them in order to protect the animals against the murrain. The fire is produced by rubbing a pole of poplar wood on a plank of poplar or fir wood and catching the sparks in tow. The embers are carried home to be used as remedies in sickness. As practised in Slavonia, the custom of the need-fire used to present some interesting features, which are best described in the words of an eye-witness:—"In the year 1833 I came for the first time as a young merchant to Slavonia; it was to Gaj that I went, in the Požega district. The time was autumn, and it chanced that a cattle-plague was raging in the neighbourhood, which inflicted much loss on the people. The peasants believed that the plague was a woman, an evil spirit (*Kuga*), who was destroying the cattle; so they sought to banish her. I had then occasion to observe the proceedings in the villages of Gaj, Kukunjevac, Brezina, and Brekinjska. Towards evening the whole population of the village was busy laying a ring of brushwood round the boundaries of the village. All fires were extinguished throughout the village. Then pairs of men in several places took pieces of wood, which had been specially prepared for the purpose, and rubbed them together till they emitted sparks. The sparks were allowed to fall on tinder and fanned into a flame, with which the dry brushwood was kindled. Thus the fire burned all round the village. The peasants persuaded themselves that thereupon *Kuga* must take her departure."

This last account leaves no doubt as to the significance of the need-fire in the minds of Slavonian peasantry. They regard it simply as a barrier interposed between their cattle and the evil spirit, which prowls, like a hungry wolf, round the fold and can, like a wolf, be kept at bay by fire. The same interpretation of the need-fire comes out, hardly less clearly, in the account which another writer gives of a ceremony witnessed by him at the village of Setonje, at the foot of the Homolje mountains in the great forest of Servia. An epidemic was raging among the children, and the need-fire was resorted to as a means of staying the plague. It was produced by an old man and an old woman in the first of the ways described above; that is, they made it in the dark by rubbing two sticks of lime wood against each other. Before the healing virtue of the fire was applied to the inhabitants of the village, two old women performed the following ceremony. Both bore the name of Stana, from the verb *stati*, "to remain standing"; for the ceremony could not be successfully performed by persons of any other name. One of them carried a copper kettle full of water, the other an old house-lock with the key. Thus equipped they repaired to a spot outside of the village, and there the old dame with the kettle asked the old dame with the lock, "Whither away?" and the other answered her, "I came to shut the village against ill-luck." With that she locked the lock and threw it with the key into the kettle of water. Then they marched thrice round the village, repeating the ceremony of the lock and key at each round. Meantime all the villagers, arrayed in their best clothes, were assembled in an open place. All the fires in the houses had been previously extinguished. Two sturdy yokels now dug a tunnel through a mound beside an oak tree; the tunnel was just high enough to let a man creep through it on all fours. Two fires, lit by the need-fire, were now laid, one at each end of the tunnel; and the old woman with the kettle took her stand at the entrance of the tunnel, while the one with the lock posted herself at the exit. Facing the latter stood another woman with a great pot of milk before her, and on the other side was set a pot full of melted swine's fat. All was now ready. The villagers thereupon crawled through the tunnel on hands and knees, one behind the other. Each, as he

emerged from the tunnel, received a spoonful of milk from the woman and looked at his face reflected in the pot of melted swine's fat. Then another woman made a cross with a piece of charcoal on his back. When all the inhabitants had thus crept through the tunnel and been doctored at the other end, each took some glowing embers home with him in a pot wherewith to rekindle the fire on the domestic hearth. Lastly they put some of the charcoal in a vessel of water and drank the mixture in order to be thereby magically protected against the epidemic.

It would be superfluous to point out in detail how admirably these measures are calculated to arrest the ravages of disease; but for the sake of those, if there are any, to whom the medicinal effect of crawling through a hole on hands and knees is not at once apparent, I shall merely say that the procedure in question is one of the most powerful specifics which the wit of man has devised for maladies of all sorts. Ample evidence of its application will be adduced in a later part of this work.

In Bulgaria the herds suffer much from the raids of certain blood-sucking vampyres called *Ustrels*. An *Ustrel* is the spirit of a Christian child who was born on a Saturday and died unfortunately before he could be baptized. On the ninth day after burial he grubs his way out of the grave and attacks the cattle at once, sucking their blood all night and returning at peep of dawn to the grave to rest from his labours. In ten days or so the copious draughts of blood which he has swallowed have so fortified his constitution that he can undertake longer journeys; so when he falls in with great herds of cattle or flocks of sheep he returns no more to the grave for rest and refreshment at night, but takes up his quarters during the day either between the horns of a sturdy calf or ram or between the hind legs of a milch-cow. Beasts whose blood he has sucked die the same night. In any herd that he may fasten on he begins with the fattest animal and works his way down steadily through the leaner kine till not one single beast is left alive. The carcasses of the victims swell up, and when the hide is stripped off you can always perceive the livid patch of flesh where the monster sucked the blood of the poor creature. In a single night he may, by working hard, kill five cows; but he seldom exceeds that number. He can change his shape and weight very easily; for example, when he is sitting by day between the horns of a ram, the animal scarcely feels his weight, but at night he will sometimes throw himself on an ox or a cow so heavily that the animal cannot stir, and lows so pitifully that it would make your heart bleed to hear. People who were born on a Saturday can see these monsters, and they have described them accurately, so that there can be no doubt whatever about their existence. It is, therefore, a matter of great importance to the peasant to protect his flocks and herds against the ravages of such dangerous vampyres. The way in which he does so is this. On a Saturday morning before sunrise the village drummer gives the signal to put out every fire in the village; even smoking is forbidden. Next all the domestic animals, with the exception of fowls, geese, and ducks, are driven out into the open. In front of the flocks and herds march two men, whose names during the ceremony may not be mentioned in the village. They go into the wood, pick two dry branches, and having stript themselves of their clothes they rub the two branches together very hard till they catch fire; then with the fire so obtained they kindle two bonfires, one on each side of a cross-road which is known to be frequented by wolves. After that the herd is driven between the two fires. Coals from the bonfires are then taken back to the village and used to rekindle the fires on the domestic hearths. For several days no one may go near the charred and blackened remains of the bonfires at the cross-road. The reason is that the vampyre is lying there, having dropped from his seat between the cow's horns when the animals were driven between the two fires. So if any one were to pass by the spot during these days, the monster would be sure to call him by name and to follow him to the village; whereas if he is left alone, a wolf will come at midnight and strangle him, and in a few days the herdsmen can see the ground soaked with his slimy blood. So that is the end of the vampyre. In this Bulgarian custom, as

in the Slavonian custom described above, the conception of the need-fire as a barrier set up between the cattle and a dangerous spirit is clearly worked out. The spirit rides the cow till he comes to the narrow pass between the two fires, but the heat there is too much for him; he drops in a faint from the saddle, or rather from the horns, and the now riderless animal escapes safe and sound beyond the smoke and flame, leaving her persecutor prostrate on the ground on the further side of the blessed barrier.

In Bosnia and Herzegovina there are some local differences in the mode of kindling the need-fire, or "living fire," as it is called. Thus at Jablanica both the uprights and the roller or cross-piece, which by its revolution kindles the fire, are made of cornel-tree wood; whereas at Dolac, near Sarajevo, the uprights and the cross-piece or roller are all made of lime wood. In Gacko, contrary to the usual custom, the fire is made by striking a piece of iron on an anvil, till sparks are given out, which are caught in tinder. The "living fire" thus produced is employed for purposes of healing. In particular, if any one suffers from wounds or sores, ashes of the need-fire are sprinkled on the ailing part. In Gacko it is also believed that if a pregnant woman witnesses a conflagration, her child will either be born with a red eruption on its skin or will contract the malady sooner or later afterwards. The only remedy consists in ashes of the need-fire, which are mixed with water and given to the child to drink.

In England the earliest notice of the need-fire seems to be contained in the Chronicle of Lanercost for the year 1268. The annalist tells with pious horror how, when an epidemic was raging in that year among the cattle, "certain beastly men, monks in garb but not in mind, taught the idiots of their country to make fire by the friction of wood and to set up an image of Priapus, whereby they thought to succour the animals." The use of the need-fire is particularly attested for the counties of Yorkshire and Northumberland. Thus in Yorkshire down to the middle of the eighteenth century "the favourite remedy of the country people, not only in the way of cure, but of prevention, was an odd one; it was to smoke the cattle almost to suffocation, by kindling straw, litter, and other combustible matter about them. The effects of this mode of cure are not stated, but the most singular part of it was that by which it was reported to have been discovered. An angel (says the legend), descended into Yorkshire, and there set a large tree on fire; the strange appearance of which or else the savour of the smoke, incited the cattle around (some of which were infected) to draw near the miracle, when they all either received an immediate cure or an absolute prevention of the disorder. It is not affirmed that the angel staid to speak to anybody, but only that he left a *written* direction for the neighbouring people to catch this supernatural fire, and to communicate it from one to another with all possible speed throughout the country; and in case it should be extinguished and utterly lost, that then new fire, of equal virtue, might be obtained, not by any common method, but by rubbing two pieces of wood together till they ignited. Upon what foundation this story stood, is not exactly known, but it put the farmers actually into a hurry of communicating flame and smoke from one house to another with wonderful speed, making it run like wildfire over the country." Again, we read that "the father of the writer, who died in 1843, in his seventy-ninth year, had a perfect remembrance of a great number of persons, belonging to the upper and middle classes of his native parish of Bowes, assembling on the banks of the river Greta to work for need-fire. A disease among cattle, called the murrain, then prevailed to a very great extent through that district of Yorkshire. The cattle were made to pass through the smoke raised by this miraculous fire, and their cure was looked upon as certain, and to neglect doing so was looked upon as wicked. This fire was produced by the violent and continued friction of two dry pieces of wood until such time as it was thereby obtained. 'To work as though one was working for need-fire' is a common proverb in the North of England." At Ingleton, a small town nestling picturesquely at the foot of the high hill of Ingleborough in western Yorkshire, "within the last thirty years or so it was a common

practice to kindle the so-called 'Need-fire' by rubbing two pieces of wood briskly together, and setting ablaze a large heap of sticks and brushwood, which were dispersed, and cattle then driven through the smoking brands. This was thought to act as a charm against the spread or development of the various ailments to which cattle are liable, and the farmers seem to have had great faith in it." Writing about the middle of the nineteenth century, Kemble tells us that the will-fire or need-fire had been used in Devonshire for the purpose of staying a murrain within the memory of man.

So in Northumberland, down to the first half of the nineteenth century, "when a contagious disease enters among cattle, the fires are extinguished in the adjacent villages. Two pieces of dried wood are then rubbed together until fire be produced; with this a quantity of straw is kindled, juniper is thrown into the flame, and the cattle are repeatedly driven through the smoke. Part of the forced fire is sent to the neighbours, who again forward it to others, and, as great expedition is used, the fires may be seen blazing over a great extent of country in a very short space of time." "It is strange," says the antiquary William Henderson, writing about 1866, "to find the custom of lighting 'need-fires' on the occasion of epidemics among cattle still lingering among us, but so it is. The vicar of Stamfordham writes thus respecting it: 'When the murrain broke out among the cattle about eighteen years ago, this fire was produced by rubbing two pieces of dry wood together, and was carried from place to place all through this district, as a charm against cattle taking the disease. Bonfires were kindled with it, and the cattle driven into the smoke, where they were left for some time. Many farmers hereabouts, I am informed, had the need-fire.' "

In the earliest systematic account of the western islands of Scotland we read that "the inhabitants here did also make use of a fire called *Tin-egin*, *i.e.* a forced fire, or fire of necessity, which they used as an antidote against the plague or murrain in cattle; and it was performed thus: all the fires in the parish were extinguished, and then eighty-one married men, being thought the necessary number for effecting this design, took two great planks of wood, and nine of them were employed by turns, who by their repeated efforts rubbed one of the planks against the other until the heat thereof produced fire; and from this forced fire each family is supplied with new fire, which is no sooner kindled than a pot full of water is quickly set on it, and afterwards sprinkled upon the people infected with the plague, or upon the cattle that have the murrain. And this they all say they find successful by experience: it was practised in the main land, opposite to the south of Skie, within these thirty years."

In the island of Mull, one of the largest of the Hebrides, the need-fire was kindled as late as 1767. "In consequence of a disease among the black cattle the people agreed to perform an incantation, though they esteemed it a wicked thing. They carried to the top of Cammoor a wheel and nine spindles of oakwood. They extinguished every fire in every house within sight of the hill; the wheel was then turned from east to west over the nine spindles long enough to produce fire by friction. If the fire were not produced before noon, the incantation lost its effect. They failed for several days running. They attributed this failure to the obstinacy of one householder, who would not let his fires be put out for what he considered so wrong a purpose. However, by bribing his servants they contrived to have them extinguished and on that morning raised their fire. They then sacrificed a heifer, cutting in pieces and burning, while yet alive, the diseased part. They then lighted their own hearths from the pile and ended by feasting on the remains. Words of incantation were repeated by an old man from Morven, who came over as master of the ceremonies, and who continued speaking all the time the fire was being raised. This man was living a beggar at Bellochroy. Asked to repeat the spell, he said, the sin of repeating it once had brought him to beggary, and that he dared not say those words again. The whole country believed him accursed." From this account we see that in Mull the kindling of the need-fire as a remedy for

cattle disease was accompanied by the sacrifice of one of the diseased animals; and though the two customs are for the most part mentioned separately by our authorities, we may surmise that they were often, perhaps usually, practised together for the purpose of checking the ravages of sickness in the herds.

In the county of Caithness, forming the extreme north-east corner of the mainland of Scotland, the practice of the need-fire survived down at least to about 1788. We read that “in those days, when the stock of any considerable farmer was seized with the murrain, he would send for one of the charm-doctors to superintend the raising of a *need-fire*. It was done by friction, thus; upon any small island, where the stream of a river or burn ran on each side, a circular booth was erected, of stone and turf, as it could be had, in which a semicircular or highland couple of birch, or other hard wood, was set; and, in short, a roof closed on it. A straight pole was set up in the centre of this building, the upper end fixed by a wooden pin to the top of the couple, and the lower end in an oblong *trink* in the earth or floor; and lastly, another pole was set across horizontally, having both ends tapered, one end of which was supported in a hole in the side of the perpendicular pole, and the other in a similar hole in the couple leg. The horizontal stick was called the auger, having four short arms or levers fixed in its centre, to work it by; the building having been thus finished, as many men as could be collected in the vicinity, (being divested of all kinds of metal in their clothes, etc.), would set to work with the said auger, two after two, constantly turning it round by the arms or levers, and others occasionally driving wedges of wood or stone behind the lower end of the upright pole, so as to press it the more on the end of the auger: by this constant friction and pressure, the ends of the auger would take fire, from which a fire would be instantly kindled, and thus the *need-fire* would be accomplished. The fire in the farmer's house, etc., was immediately quenched with water, a fire kindled from this need-fire, both in the farm-houses and offices, and the cattle brought to feel the smoke of this new and sacred fire, which preserved them from the murrain.”

The last recorded case of the need-fire in Caithness happened in 1809 or 1810. At Houstry, Dunbeath, a crofter named David Gunn had made for himself a kail-yard and in doing so had wilfully encroached on one of those prehistoric ruins called *brochs*, which the people of the neighbourhood believed to be a fairy habitation. Soon afterwards a murrain broke out among the cattle of the district and carried off many beasts. So the wise men put their heads together and resolved to light a *teine-eigin* or need-fire as the best way of stopping the plague. They cut a branch from a tree in a neighbouring wood, stripped it of bark, and carried it to a small island in the Houstry Burn. Every fire in the district having been quenched, new fire was made by the friction of wood in the island, and from this sacred flame all the hearths of the houses were lit afresh. One of the sticks used in making the fire was preserved down to about the end of the nineteenth century; apparently the mode of operation was the one known as the fire-drill: a pointed stick was twirled in a hole made in another stick till fire was elicited by the friction.

Another account of the use of need-fire in the Highlands of Scotland runs as follows: “When, by the neglect of the prescribed safeguards [against witchcraft], the seeds of iniquity have taken root, and a person's means are decaying in consequence, the only alternative, in this case, is to resort to that grand remedy, the *Tein Econuch*, or ‘Forlorn Fire,’ which seldom fails of being productive of the best effects. The cure for witchcraft, called *Tein Econuch*, is wrought in the following manner:—A consultation being held by the unhappy sufferer and his friends as to the most advisable measures of effecting a cure, if this process is adopted, notice is privately communicated to all those householders who reside within the nearest of two running streams, to extinguish their lights and fires on some appointed morning. On its being ascertained that this notice has been duly observed, a spinning-wheel, or some other

convenient instrument, calculated to produce fire by friction, is set to work with the most furious earnestness by the unfortunate sufferer, and all who wish well to his cause. Relieving each other by turns, they drive on with such persevering diligence, that at length the spindle of the wheel, ignited by excessive friction, emits 'forlorn fire' in abundance, which, by the application of tow, or some other combustible material, is widely extended over the whole neighbourhood. Communicating the fire to the tow, the tow communicates it to a candle, the candle to a fir-torch, the torch to a cartful of peats, which the master of the ceremonies, with pious ejaculations for the success of the experiment, distributes to messengers, who will proceed with portions of it to the different houses within the said two running streams, to kindle the different fires. By the influence of this operation, the machinations and spells of witchcraft are rendered null and void."

In various parts of the Highlands of Scotland the need-fire was still kindled during the first half of the nineteenth century, as we learn from the following account:—

"*Tein-eigin*, neid-fire, need-fire, forced fire, fire produced by the friction of wood or iron against wood.

"The fire of purification was kindled from the neid-fire, while the domestic fire on the hearth was re-kindled from the purification fire on the knoll. Among other names, the purification fire was called *Teine Bheuil*, fire of Beul, and *Teine mor Bheuil*, great fire of Beul. The fire of Beul was divided into two fires between which people and cattle rushed australly for purposes of purification. The ordeal was trying, as may be inferred from phrases still current. *Is teodha so na teine teodha Bheuil*, 'Hotter is this than the hot fire of Beul.' Replying to his grandchild, an old man in Lewis said ... 'Mary! sonnie, it were worse for me to do that for thee than to go between the two great fires of Beul.'

"The neid-fire was resorted to in imminent or actual calamity upon the first day of the quarter, and to ensure success in great or important events.

"The writer conversed with several persons who saw the neid-fire made, and who joined in the ceremony. As mentioned elsewhere, a woman in Arran said that her father, and the other men of the townland, made the neid-fire on the knoll on *La buidhe Bealltain*—Yellow Day of Beltane. They fed the fire from *cuaile mor conaidh caoin*—great bundles of sacred faggots brought to the knoll on Beltane Eve. When the sacred fire became kindled, the people rushed home and brought their herds and drove them through and round the fire of purification, to sain them from the *bana bhuitseach mhor Nic Creafain Mac Creafain*—the great arch witch Mac Crauford, now Crawford. That was in the second decade of this century.

"John Macphail, Middlequarter, North Uist, said that the last occasion on which the neid-fire was made in North Uist was *bliadhna an t-sneachda bhuidhe*—the year of the yellow snow—1829 (?). The snow lay so deep and remained so long on the ground, that it became yellow. Some suggest that the snow was originally yellow, as snow is occasionally red. This extraordinary continuance of snow caused much want and suffering throughout the Isles. The people of North Uist extinguished their own fires and generated a purification fire at *Sail Dharaich*, Sollas. The fire was produced from an oak log by rapidly boring with an auger. This was accomplished by the exertions of *naoi naoinear ciad ginealach mac*—the nine nines of first-begotten sons. From the neid-fire produced on the knoll the people of the parish obtained fire for their dwellings. Many cults and ceremonies were observed on the occasion, cults and ceremonies in which Pagan and Christian beliefs intermingled. *Sail Dharaich*, Oak Log, obtained its name from the log of oak for the neid-fire being there. A fragment of this log riddled with auger holes marks a grave in *Cladh Sgealoir*, the burying-ground of *Sgealoir*, in the neighbourhood.

“Mr. Alexander Mackay, Edinburgh, a native of Reay, Sutherland, says:—‘My father was the skipper of a fishing crew. Before beginning operations for the season, the crew of the boat met at night in our house to settle accounts for the past, and to plan operations for the new season. My mother and the rest of us were sent to bed. I lay in the kitchen, and was listening and watching, though they thought I was asleep. After the men had settled their past affairs and future plans, they put out the fire on the hearth, not a spark being allowed to live. They then rubbed two pieces of wood one against another so rapidly as to produce fire, the men joining in one after the other, and working with the utmost energy and never allowing the friction to relax. From this friction-fire they rekindled the fire on the hearth, from which all the men present carried away a kindling to their own homes. Whether their success was due to their skill, their industry, their perseverance, or to the neid-fire, I do not know, but I know that they were much the most successful crew in the place. They met on Saturday, and went to church on Sunday like the good men and the good Christians they were—a little of their Pagan faith mingling with their Christian belief. I have reason to believe that other crews in the place as well as my father's crew practised the neid-fire.’

“A man at Helmsdale, Sutherland, saw the *tein-eigin* made in his boyhood.

“The neid-fire was made in North Uist about the year 1829, in Arran about 1820, in Helmsdale about 1818, in Reay about 1830.”

From the foregoing account we learn that in Arran the annual Beltane fire was regularly made by the friction of wood, and that it was used to protect men and cattle against a great witch. When we remember that Beltane Eve or the Eve of May Day (Walpurgis Night) is the great witching time of the year throughout Europe, we may surmise that wherever bonfires have been ceremonially kindled on that day it has been done simply as a precaution against witchcraft; indeed this motive is expressly alleged not only in Scotland, but in Wales, the Isle of Man, and many parts of Central Europe. It deserves, further, to be noticed that in North Uist the wood used to kindle the need-fire was oak, and that the nine times nine men by whose exertions the flame was elicited were all first-born sons. Apparently the first-born son of a family was thought to be endowed with more magical virtue than his younger brothers. Similarly in the Punjab “the supernatural power ascribed to the first born is not due to his being unlucky, but the idea underlying the belief seems to be that being the first product of the parents, he inherits the spiritual powers (or magnetism) in a high degree. The success of such persons in stopping rain and hail and in stupefying snakes is proverbial. It is believed that a first child born with feet forward can cure backache by kicking the patient in the back, on a crossing.”

In the north-east of Aberdeenshire and the neighbourhood, when the cattle-disease known as the “quarter-ill” broke out, “the ‘muckle wheel’ was set in motion and turned till fire was produced. From this virgin flame fires were kindled in the byres. At the same time, if neighbours requested the favour, live coals were given them to kindle fires for the purification of their homesteads and turning off the disease. Fumigating the byres with juniper was a method adopted to ward off disease. Such a fire was called ‘needfyre.’ The kindling of it came under the censure of the Presbytery at times.”

In Perthshire the need-fire was kindled as a remedy for cattle-disease as late as 1826. “A wealthy old farmer, having lost several of his cattle by some disease very prevalent at present, and being able to account for it in no way so rationally as by witchcraft, had recourse to the following remedy, recommended to him by a weird sister in his neighbourhood, as an effectual protection from the attacks of the foul fiend. A few stones were piled together in the barnyard, and woodcoals having been laid thereon, the fuel was ignited by *will-fire*, that is fire obtained by friction; the neighbours having been called in to witness the solemnity, the

cattle were made to pass through the flames, in the order of their dignity and age, commencing with the horses and ending with the swine. The ceremony having been duly and decorously gone through, a neighbouring farmer observed to the enlightened owner of the herd, that he, along with his family, ought to have followed the example of the cattle, and the sacrifice to Baal would have been complete.”

In County Leitrim, Ireland, in order to prevent fever from spreading, “all the fires on the townland, and the two adjoining (one on each side), would be put out. Then the men of the three townlands would come to one house, and get two large blocks of wood. One would be set in the ground, and the other one, fitted with two handles, placed on the top of it. The men would then draw the upper block backwards and forwards over the lower until fire was produced by friction, and from this the fires would be lighted again. This would prevent the fever from spreading.”

Thus it appears that in many parts of Europe it has been customary to kindle fire by the friction of wood for the purpose of curing or preventing the spread of disease, particularly among cattle. The mode of striking a light by rubbing two dry sticks against each other is the one to which all over the world savages have most commonly resorted for the sake of providing themselves with fire; and we can scarcely doubt that the practice of kindling the need-fire in this primitive fashion is merely a survival from the time when our savage forefathers lit all their fires in that way. Nothing is so conservative of old customs as religious or magical ritual, which invests these relics of the past with an atmosphere of mysterious virtue and sanctity. To the educated mind it seems obvious that a fire which a man kindles with the sweat of his brow by laboriously rubbing one stick against each other can possess neither more nor less virtue than one which he has struck in a moment by the friction of a lucifer match; but to the ignorant and superstitious this truth is far from apparent, and accordingly they take infinite pains to do in a roundabout way what they might have done directly with the greatest ease, and what, even when it is done, is of no use whatever for the purpose in hand. A vast proportion of the labour which mankind has expended throughout the ages has been no better spent; it has been like the stone of Sisyphus eternally rolled up hill only to revolve eternally down again, or like the water poured for ever by the Danaids into broken pitchers which it could never fill.

The curious notion that the need-fire cannot kindle if any other fire remains alight in the neighbourhood seems to imply that fire is conceived as a unity which is broken up into fractions and consequently weakened in exact proportion to the number of places where it burns; hence in order to obtain it at full strength you must light it only at a single point, for then the flame will burst out with a concentrated energy derived from the tributary fires which burned on all the extinguished hearths of the country. So in a modern city if all the gas were turned off simultaneously at all the burners but one, the flame would no doubt blaze at that one burner with a fierceness such as no single burner could shew when all are burning at the same time. The analogy may help us to understand the process of reasoning which leads the peasantry to insist on the extinction of all common fires when the need-fire is about to be kindled. Perhaps, too, it may partly explain that ceremonial extinction of all old fires on other occasions which is often required by custom as a preliminary to the lighting of a new and sacred fire. We have seen that in the Highlands of Scotland all common fires were extinguished on the Eve of May-day as a preparation for kindling the Beltane bonfire by friction next morning; and no doubt the reason for the extinction was the same as in the case of the need-fire. Indeed we may assume with a fair degree of probability that the need-fire was the parent of the periodic fire-festivals; at first invoked only at irregular intervals to cure certain evils as they occurred, the powerful virtue of fire was afterwards employed at regular

intervals to prevent the occurrence of the same evils as well as to remedy such as had actually arisen.

The need-fire of Europe has its parallel in a ceremony which used to be observed by the Iroquois Indians of North America. "Formerly when an epidemic prevailed among the Iroquois despite the efforts to stay it, it was customary for the principal shaman to order the fires in every cabin to be extinguished and the ashes and cinders to be carefully removed; for it was believed that the pestilence was sent as a punishment for neglecting to rekindle 'new fire' or because of the manner in which the fire then in use had been kindled. So, after all the fires were out, two suitable logs of slippery elm (*Ulmus fulva*) were provided for the new fire. One of the logs was from six to eight inches in diameter and from eight to ten feet long; the other was from ten to twelve inches in diameter and about ten feet long. About midway across the larger log a cuneiform notch or cut about six inches deep was made, and in the wedge-shaped notch punk was placed. The other log was drawn rapidly to and fro in the cut by four strong men chosen for the purpose until the punk was ignited by the friction thus produced. Before and during the progress of the work of igniting the fire the shaman votively sprinkled *tcar-hũ'-ěň-wě*, 'real tobacco,' three several times into the cuneiform notch and offered earnest prayers to the Fire-god, beseeching him 'to aid, to bless, and to redeem the people from their calamities.' The ignited punk was used to light a large bonfire, and then the head of every family was required to take home 'new fire' to rekindle a fire in his or her fire-place."

§ 9. The Sacrifice of an Animal to stay a Cattle-Plague.

Sometimes apparently in England as well as in Scotland the kindling of a need-fire was accompanied by the sacrifice of a calf. Thus in Northamptonshire, at some time during the first half of the nineteenth century, "Miss C—— and her cousin walking saw a fire in a field and a crowd round it. They said, 'What is the matter?' 'Killing a calf.' 'What for?' 'To stop the murrain.' They went away as quickly as possible. On speaking to the clergyman he made enquiries. The people did not like to talk of the affair, but it appeared that when there is a disease among the cows or the calves are born sickly, they sacrifice (*i.e.* kill and burn) one 'for good luck.' " It is not here said that the fire was a need-fire, of which indeed the two horrified ladies had probably never heard; but the analogy of the parallel custom in Mull renders it probable that in Northamptonshire also the fire was kindled by the friction of wood, and that the calf or some part of it was burnt in the fire. Certainly the practice of burning a single animal alive in order to save all the others would seem to have been not uncommon in England down to the nineteenth century. Thus a farmer in Cornwall about the year 1800, having lost many cattle by disease, and tried many remedies in vain, consulted with some of his neighbours and laying their heads together "they recalled to their recollections a tale, which tradition had handed down from remote antiquity, that the calamity would not cease until he had actually burned alive the finest calf which he had upon his farm; but that, when this sacrifice was made, the murrain would afflict his cattle no more." Accordingly, on a day appointed they met, lighted a large fire, placed the best calf in it, and standing round the blazing pile drove the animal with pitchforks back into the flames whenever it attempted to escape. Thus the victim was burned alive to save the rest of the cattle. "There can be no doubt but that a belief prevailed until a very recent period, amongst the small farmers in the districts remote from towns in Cornwall, that a living sacrifice appeased the wrath of God. This sacrifice must be by fire; and I have heard it argued that the Bible gave them warranty for this belief.... While correcting these sheets I am informed of two recent instances of this superstition. One of them was the sacrifice of a calf by a farmer near Portreath, for the purpose of removing a disease which had long followed his horses and his cows. The other was the burning of a living lamb, to save, as the farmer said, 'his flocks

from spells which had been cast on 'em.' ” In a recent account of the fire-festivals of Wales we read that “I have also heard my grandfather and father say that in times gone by the people would throw a calf in the fire when there was any disease among the herds. The same would be done with a sheep if there was anything the matter with a flock. I can remember myself seeing cattle being driven between two fires to ‘stop the disease spreading.’ When in later times it was not considered humane to drive the cattle between the fires, the herdsmen were accustomed to force the animals over the wood ashes to protect them against various ailments.” Writing about 1866, the antiquary W. Henderson says that a live ox was burned near Haltwhistle in Northumberland “only twenty years ago” to stop a murrain. “About the year 1850 disease broke out among the cattle of a small farm in the parish of Resoliss, Black Isle, Ross-shire. The farmer prevailed on his wife to undertake a journey to a wise woman of renown in Banffshire to ask a charm against the effects of the ‘ill ee.’ The long journey of upwards of fifty miles was performed by the good wife, and the charm was got. One chief thing ordered was to burn to death a pig, and sprinkle the ashes over the byre and other farm buildings. This order was carried out, except that the pig was killed before it was burned. A more terrible sacrifice was made at times. One of the diseased animals was rubbed over with tar, driven forth, set on fire, and allowed to run till it fell down and died.” “Living animals have been burnt alive in sacrifice within memory to avert the loss of other stock. The burial of three puppies ‘brandise-wise’ in a field is supposed to rid it of weeds. Throughout the rural districts of Devon witchcraft is an article of current faith, and the toad is thrown into the flames as an emissary of the evil one.”

But why, we may ask, should the burning alive of a calf or a sheep be supposed to save the rest of the herd or the flock from the murrain? According to one writer, as we have seen, the burnt sacrifice was thought to appease the wrath of God. The idea of appeasing the wrath of a ferocious deity by burning an animal alive is probably no more than a theological gloss put on an old heathen rite; it would hardly occur to the simple mind of an English bumpkin, who, though he may be stupid, is not naturally cruel and does not conceive of a divinity who takes delight in the contemplation of suffering. To his thinking God has little or nothing to do with the murrain, but witches, ill-wishers, and fairies have a great deal to do with it. The English farmer who burned one of his lambs alive said that he did it “to save his flocks from spells which had been cast on them”; and the Scotch farmer who was bidden to burn a pig alive for a similar purpose, but who had the humanity to kill the animal first, believed that this was a remedy for the “evil eye” which had been cast upon his beasts. Again, we read that “a farmer, who possessed broad acres, and who was in many respects a sensible man, was greatly annoyed to find that his cattle became diseased in the spring. Nothing could satisfy him but that they were bewitched, and he was resolved to find out the person who had cast the evil eye on his oxen. According to an anciently-prescribed rule, the farmer took one of his bullocks and bled it to death, catching all the blood on bundles of straw. The bloody straw was then piled into a heap, and set on fire. Burning with a vast quantity of smoke, the farmer expected to see the witch, either in reality or in shadow, amidst the smoke.” Such reasons express the real beliefs of the peasants. “Cattle, like human beings, were exposed to the influences of the evil eye, of forespeaking, and of the casting of evil. Witches and warlocks did the work of evil among their neighbours' cattle if their anger had been aroused in any way. The fairies often wrought injury amongst cattle. Every animal that died suddenly was killed by the dart of the fairies, or, in the language of the people, was ‘shot-a-dead.’ Flint arrows and spear-heads went by the name of ‘faery dairts.’ ... When an animal died suddenly the canny woman of the district was sent for to search for the ‘faery dairt,’ and in due course she found one, to the great satisfaction of the owner of the dead animal.”

But how, we must still ask, can burning an animal alive break the spell that has been cast upon its fellows by a witch or a warlock? Some light is thrown on the question by the following account of measures which rustic wiseacres in Suffolk are said to have adopted as a remedy for witchcraft. "A woman I knew forty-three years had been employed by my predecessor to take care of his poultry. At the time I came to make her acquaintance she was a bedridden toothless crone, with chin and nose all but meeting. She did not discourage in her neighbours the idea that she knew more than people ought to know, and had more power than others had. Many years before I knew her it happened one spring that the ducks, which were a part of her charge, failed to lay eggs.... She at once took it for granted that the ducks had been bewitched. This misbelief involved very shocking consequences, for it necessitated the idea that so diabolical an act could only be combated by diabolical cruelty. And the most diabolical act of cruelty she could imagine was that of baking alive in a hot oven one of the ducks. And that was what she did. The sequence of thought in her mind was that the spell that had been laid on the ducks was that of preternaturally wicked wilfulness; that this spell could only be broken through intensity of suffering, in this case death by burning; that the intensity of suffering would break the spell in the one roasted to death; and that the spell broken in one would be altogether broken, that is, in all the ducks.... Shocking, however, as was this method of exorcising the ducks, there was nothing in it original. Just about a hundred years before, everyone in the town and neighbourhood of Ipswich had heard, and many had believed, that a witch had been burnt to death in her own house at Ipswich by the process of burning alive one of the sheep she had bewitched. It was curious, but it was as convincing as curious, that the hands and feet of this witch were the only parts of her that had not been incinerated. This, however, was satisfactorily explained by the fact that the four feet of the sheep, by which it had been suspended over the fire, had not been destroyed in the flames that had consumed its body." According to a slightly different account of the same tragic incident, the last of the "Ipswich witches," one Grace Pett, "laid her hand heavily on a farmer's sheep, who, in order to punish her, fastened one of the sheep in the ground and burnt it, except the feet, which were under the earth. The next morning Grace Pett was found burnt to a cinder, except her feet. Her fate is recorded in the *Philosophical Transactions* as a case of spontaneous combustion."

This last anecdote is instructive, if perhaps not strictly authentic. It shews that in burning alive one of a bewitched flock or herd what you really do is to burn the witch, who is either actually incarnate in the animal or perhaps more probably stands in a relation of sympathy with it so close as almost to amount to identity. Hence if you burn the creature to ashes, you utterly destroy the witch and thereby save the whole of the rest of the flock or herd from her abominable machinations; whereas if you only partially burn the animal, allowing some parts of it to escape the flames, the witch is only half-baked, and her power for mischief may be hardly, if at all, impaired by the grilling. We can now see that in such matters half-measures are useless. To kill the animal first and burn it afterwards is a weak compromise, dictated no doubt by a well-meant but utterly mistaken kindness; it is like shutting the stable-door when the steed is stolen, for obviously by leaving the animal's, and therefore the witch's, body nearly intact at the moment of death, it allows her soul to escape and return safe and sound to her own human body, which all the time is probably lying quietly at home in bed. And the same train of reasoning that justifies the burning alive of bewitched animals justifies and indeed requires the burning alive of the witches themselves; it is really the only way of destroying them, body and soul, and therefore of thoroughly extirpating the whole infernal crew.

In the Isle of Man the practice of burning cattle alive in order to stop a murrain seems to have persisted down to a time within living memory. On this subject I will quote the evidence

collected by Sir John Rhys: "A respectable farmer from Andreas told me that he was driving with his wife to the neighbouring parish of Jurby some years ago, and that on the way they beheld the carcass of a cow or an ox burning in a field, with a woman engaged in stirring the fire. On reaching the village to which they were going, they found that the burning beast belonged to a farmer whom they knew. They were further told it was no wonder that the said farmer had one of his cattle burnt, as several of them had recently died. Whether this was a case of sacrifice or not I cannot say. But let me give you another instance: a man whom I have already mentioned, saw at a farm nearer the centre of the island a live calf being burnt. The owner bears an English name, but his family has long been settled in Man. The farmer's explanation to my informant was that the calf was burnt to secure luck for the rest of the herd, some of which were threatening to die. My informant thought there was absolutely nothing the matter with them, except that they had too little to eat. Be that as it may, the one calf was sacrificed as a burnt-offering to secure luck for the rest of the cattle. Let me here also quote Mr. Moore's note in his *Manx Surnames*, p. 184, on the place name *Cabbal yn Oural Losht*, or the Chapel of the Burnt Sacrifice. 'This name,' he says, 'records a circumstance which took place in the nineteenth century, but which, it is to be hoped, was never customary in the Isle of Man. A farmer, who had lost a number of his sheep and cattle by murrain, burned a calf as a propitiatory offering to the Deity on this spot, where a chapel was afterwards built. Hence the name.' Particulars, I may say, of time, place, and person could be easily added to Mr. Moore's statement, excepting, perhaps as to the deity in question; on that point I have never been informed, but Mr. Moore is probably right in the use of the capital *d*, as the sacrificer is, according to all accounts, a highly devout Christian. One more instance: an octogenarian woman, born in the parish of Bride, and now living at Kirk Andreas, saw, when she was a 'lump of a girl' of ten or fifteen years of age, a live sheep being burnt in a field in the parish of Andreas, on May-day, whereby she meant the first of May reckoned according to the Old Style. She asserts very decidedly that it was *son oural*, 'as a sacrifice,' as she put it, and 'for an object to the public': those were her words when she expressed herself in English. Further, she made the statement that it was a custom to burn a sheep on old May-day for a sacrifice. I was fully alive to the interest of this evidence, and cross-examined her so far as her age allows of it, and I find that she adheres to her statement with all firmness."

But Manxmen burn beasts when they are dead as well as when they are alive; and their reasons for burning the dead animals may help us to understand their reasons for burning the living animals. On this subject I will again quote Sir John Rhys: "When a beast dies on a farm, of course it dies, according to the old-fashioned view of things, as I understand it, from the influence of the evil eye or the interposition of a witch. So if you want to know to whom you are indebted for the loss of the beast, you have simply to burn its carcass in the open air and watch who comes first to the spot or who first passes by; that is the criminal to be charged with the death of the animal, and he cannot help coming there—such is the effect of the fire. A Michael woman, who is now about thirty, related to me how she watched while the carcass of a bewitched colt was burning, how she saw the witch coming, and how she remembers her shrivelled face, with nose and chin in close proximity. According to another native of Michael, a well-informed middle-aged man, the animal in question was oftenest a calf, and it was wont to be burnt whole, skin and all. The object, according to him, is invariably to bring the bewitcher on the spot, and he always comes; but I am not clear what happens to him when he appears. My informant added, however, that it was believed that, unless the bewitcher got possession of the heart of the burning beast, he lost all his power of bewitching."

These statements shew that in the Isle of Man the sympathetic relation between the witch and his or her animal victim is believed to be so close that by burning the animal you compel the

witch to appear. The original idea may have been that, by virtue of a magic sympathy which binds the two together, whatever harm you do to the animal is felt by the witch as if it were done to herself. That notion would fully explain why Manx people used also to burn bewitched animals alive; in doing so they probably imagined that they were simultaneously burning the witch who had cast the spell on their cattle.

This explanation of the reason for burning a bewitched animal, dead or alive, is confirmed by the parallel belief concerning were-wolves. It is commonly supposed that certain men and women can transform themselves by magic art into wolves or other animals, but that any wound inflicted on such a transformed beast (a were-wolf or other were-animal) is simultaneously inflicted on the human body of the witch or warlock who had transformed herself or himself into the creature. This belief is widely diffused; it meets us in Europe, Asia, and Africa. For example, Olaus Magnus tells us that in Livonia, not many years before he wrote, a noble lady had a dispute with her slave on the subject of were-wolves, she doubting whether there were any such things, and he maintaining that there were. To convince her he retired to a room, from which he soon appeared in the form of a wolf. Being chased by the dogs into the forest and brought to bay, the wolf defended himself fiercely, but lost an eye in the struggle. Next day the slave returned to his mistress in human form but with only one eye. Again, it happened in the year 1588 that a gentleman in a village among the mountains of Auvergne, looking out of the window one evening, saw a friend of his going out to hunt. He begged him to bring him back some of his bag, and his friend said that he would. Well, he had not gone very far before he met a huge wolf. He fired and missed it, and the animal attacked him furiously, but he stood on his guard and with an adroit stroke of his hunting knife he cut off the right fore-paw of the brute, which thereupon fled away and he saw it no more. He returned to his friend, and drawing from his pouch the severed paw of the wolf he found to his horror that it was turned into a woman's hand with a golden ring on one of the fingers. His friend recognized the ring as that of his own wife and went to find her. She was sitting by the fire with her right arm under her apron. As she refused to draw it out, her husband confronted her with the hand and the ring on it. She at once confessed the truth, that it was she in the form of a were-wolf whom the hunter had wounded. Her confession was confirmed by applying the severed hand to the stump of her arm, for the two fitted exactly. The angry husband delivered up his wicked wife to justice; she was tried and burnt as a witch. It is said that a were-wolf, scouring the streets of Padua, was caught, and when they cut off his four paws he at once turned into a man, but with both his hands and feet amputated. Again, in a farm of the French district of Beauce, there was once a herdsman who never slept at home. These nocturnal absences naturally attracted attention and set people talking. At the same time, by a curious coincidence, a wolf used to prowl round the farm every night and to excite the dogs in the farmyard to fury by thrusting his snout derisively through the cat's hole in the great gate. The farmer had his suspicions and he determined to watch. One night, when the herdsman went out as usual, his master followed him quietly till he came to a hut, where with his own eyes he saw the man put on a broad belt and at once turn into a wolf, which scoured away over the fields. The farmer smiled a sickly sort of smile and went back to the farm. There he took a stout stick and sat down at the cat's hole to wait. He had not long to wait. The dogs barked like mad, a wolf's snout shewed through the hole, down came the stick, out gushed the blood, and a voice was heard to say without the gate, "A good job too. I had still three years to run." Next day the herdsman appeared as usual, but he had a scar on his brow, and he never went out again at night.

In China also the faith in similar transformations is reflected in the following tale. A certain man in Sungyang went into the mountains to gather fuel. Night fell and he was pursued by two tigers, but scrambled up a tree out of their reach. Then said the one tiger to the other

tiger, "If we can find Chu-Tu-shi, we are sure to catch this man up the tree." So off went one of them to find Chu-Tu-shi, while the other kept watch at the foot of the tree. Soon after that another tiger, leaner and longer than the other two, appeared on the scene and made a grab at the man's coat. But fortunately the moon was shining, the man saw the paw, and with a stroke of his axe cut off one of its claws. The tigers roared and fled, one after the other, so the man climbed down the tree and went home. When he told his tale in the village, suspicion naturally fell on the said Chu-Tu-shi; and next day some men went to see him in his house. They were told that they could not see him; for he had been out the night before and had hurt his hand, and he was now ill in bed. So they put two and two together and reported him to the police. The police arrived, surrounded the house, and set fire to it; but Chu-Tu-shi rose from his bed, turned into a tiger, charged right through the police, and escaped, and to this day nobody ever knew where he went to.

The Toradjas of Central Celebes stand in very great fear of were-wolves, that is of men and women, who have the power of transforming their spirits into animals such as cats, crocodiles, wild pigs, apes, deer, and buffaloes, which roam about battenning on human flesh, and especially on human livers, while the men and women in their own proper human form are sleeping quietly in their beds at home. Among them a man is either born a were-wolf or becomes one by infection; for mere contact with a were-wolf, or even with anything that has been touched by his spittle, is quite enough to turn the most innocent person into a were-wolf; nay even to lean your head against anything against which a were-wolf has leaned his head suffices to do it. The penalty for being a were-wolf is death; but the sentence is never passed until the accused has had a fair trial and his guilt has been clearly demonstrated by an ordeal, which consists in dipping the middle finger into boiling resin. If the finger is not burnt, the man is no were-wolf; but if it is burnt, a were-wolf he most assuredly is, so they take him away to a quiet spot and hack him to bits. In cutting him up the executioners are naturally very careful not to be bespattered with his blood, for if that were to happen they would of course be turned into were-wolves themselves. Further, they place his severed head beside his hinder-quarters to prevent his soul from coming to life again and pursuing his depredations. So great is the horror of were-wolves among the Toradjas, and so great is their fear of contracting the deadly taint by infection, that many persons have assured a missionary that they would not spare their own child if they knew him to be a were-wolf. Now these people, whose faith in were-wolves is not a mere dying or dead superstition but a living, dreadful conviction, tell stories of were-wolves which conform to the type which we are examining. They say that once upon a time a were-wolf came in human shape under the house of a neighbour, while his real body lay asleep as usual at home, and calling out softly to the man's wife made an assignation with her to meet him in the tobacco-field next day. But the husband was lying awake and he heard it all, but he said nothing to anybody. Next day chanced to be a busy one in the village, for a roof had to be put on a new house and all the men were lending a hand with the work, and among them to be sure was the were-wolf himself, I mean to say his own human self; there he was up on the roof working away as hard as anybody. But the woman went out to the tobacco-field, and behind went unseen her husband, slinking through the underwood. When they were come to the field, he saw the were-wolf make up to his wife, so out he rushed and struck at him with a stick. Quick as thought, the were-wolf turned himself into a leaf, but the man was as nimble, for he caught up the leaf, thrust it into the joint of bamboo, in which he kept his tobacco, and bunged it up tight. Then he walked back with his wife to the village, carrying the bamboo with the were-wolf in it. When they came to the village, the human body of the were-wolf was still on the roof, working away with the rest. The man put the bamboo in a fire. At that the human were-wolf looked down from the roof and said, "Don't do that." The man drew the bamboo from the fire, but a moment afterwards he put it in the fire again, and again the human were-wolf

on the roof looked down and cried, "Don't do that." But this time the man kept the bamboo in the fire, and when it blazed up, down fell the human were-wolf from the roof as dead as a stone. Again, the following story went round among the Toradjas not so very many years ago. The thing happened at Soemara, on the Gulf of Tomori. It was evening and some men sat chatting with a certain Hadji Mohammad. When it had grown dark, one of the men went out of the house for something or other. A little while afterwards one of the company thought he saw a stag's antlers standing out sharp and clear against the bright evening sky. So Hadji Mohammad raised his gun and fired. A minute or two afterwards back comes the man who had gone out, and says he to Hadji Mohammad, "You shot at me and hit me. You must pay me a fine." They searched him but found no wound on him anywhere. Then they knew that he was a were-wolf who had turned himself into a stag and had healed the bullet-wound by licking it. However, the bullet had found its billet, for two days afterwards he was a dead man.

In Sennar, a province of the Egyptian Sudan, the Hammeg and Fungi enjoy the reputation of being powerful magicians who can turn themselves into hyaenas and in that guise scour the country at night, howling and gorging themselves. But by day they are men again. It is very dangerous to shoot at such human hyaenas by night. On the Jebel Bela mountain a soldier once shot at a hyaena and hit it, but it dragged itself off, bleeding, in the darkness and escaped. Next morning he followed up the trail of blood and it led him straight to the hut of a man who was everywhere known for a wizard. Nothing of the hyaena was to be seen, but the man himself was laid up in the house with a fresh wound and died soon afterwards. And the soldier did not long survive him.

But the classical example of these stories is an old Roman tale told by Petronius. It is put in the mouth of one Niceros. Late at night he left the town to visit a friend of his, a widow, who lived at a farm five miles down the road. He was accompanied by a soldier, who lodged in the same house, a man of Herculean build. When they set out it was near dawn, but the moon shone as bright as day. Passing through the outskirts of the town, they came amongst the tombs, which lined the highroad for some distance. There the soldier made an excuse for retiring behind a monument, and Niceros sat down to wait for him, humming a tune and counting the tombstones to pass the time. In a little he looked round for his companion, and saw a sight which froze him with horror. The soldier had stripped off his clothes to the last rag and laid them at the side of the highway. Then he performed a certain ceremony over them, and immediately was changed into a wolf, and ran howling into the forest. When Niceros had recovered himself a little, he went to pick up the clothes, but found that they were turned to stone. More dead than alive, he drew his sword, and, striking at every shadow cast by the tombstones on the moonlit road, he tottered to his friend's house. He entered it like a ghost, to the surprise of the widow, who wondered to see him abroad so late. "If you had only been here a little ago," said she, "you might have been of some use. For a wolf came tearing into the yard, scaring the cattle and bleeding them like a butcher. But he did not get off so easily, for the servant speared him in the neck." After hearing these words, Niceros felt that he could not close an eye, so he hurried away home again. It was now broad daylight, but when he came to the place where the clothes had been turned to stone, he found only a pool of blood. He reached home, and there lay the soldier in bed like an ox in the shambles, and the doctor was bandaging his neck. "Then I knew," said Niceros, "that the man was a were-wolf, and never again could I break bread with him, no, not if you had killed me for it."

These stories may help us to understand the custom of burning a bewitched animal, which has been observed in our own country down to recent times, if indeed it is even now extinct. For a close parallel may be traced in some respects between witches and were-wolves. Like were-wolves, witches are commonly supposed to be able to transform themselves temporarily into

animals for the purpose of playing their mischievous pranks; and like were-wolves they can in their animal disguise be compelled to unmask themselves to any one who succeeds in drawing their blood. In either case the animal-skin is conceived as a cloak thrown round the wicked enchanter; and if you can only pierce the skin, whether by the stab of a knife or the shot of a gun, you so rend the disguise that the man or woman inside of it stands revealed in his or her true colours. Strictly speaking, the stab should be given on the brow or between the eyes in the case both of a witch and of a were-wolf; and it is vain to shoot at a were-wolf unless you have had the bullet blessed in a chapel of St. Hubert or happen to be carrying about you, without knowing it, a four-leaved clover; otherwise the bullet will merely rebound from the were-wolf like water from a duck's back. However, in Armenia they say that the were-wolf, who in that country is usually a woman, can be killed neither by shot nor by steel; the only way of delivering the unhappy woman from her bondage is to get hold of her wolf's skin and burn it; for that naturally prevents her from turning into a wolf again. But it is not easy to find the skin, for she is cunning enough to hide it by day. So with witches, it is not only useless but even dangerous to shoot at one of them when she has turned herself into a hare; if you do, the gun may burst in your hand or the shot come back and kill you. The only way to make quite sure of hitting a witch-animal is to put a silver sixpence or a silver button in your gun. For example, it happened one evening that a native of the island of Tiree was going home with a new gun, when he saw a black sheep running towards him across the plain of Reef. Something about the creature excited his suspicion, so he put a silver sixpence in his gun and fired at it. Instantly the black sheep became a woman with a druggel coat wrapt round her head. The man knew her quite well, for she was a witch who had often persecuted him before in the shape of a cat.

Again, the wounds inflicted on a witch-hare or a witch-cat are to be seen on the witch herself, just as the wounds inflicted on a were-wolf are to be seen on the man himself when he has doffed the wolf's skin. To take a few instances out of a multitude, a young man in the island of Lismore was out shooting. When he was near Balnagown loch, he started a hare and fired at it. The animal gave an unearthly scream, and then for the first time it occurred to him that there were no real hares in Lismore. He threw away his gun in terror and fled home; and next day he heard that a notorious witch was laid up with a broken leg. A man need be no conjuror to guess how she came by that broken leg. Again, at Thurso certain witches used to turn themselves into cats and in that shape to torment an honest man. One night he lost patience, whipped out his broadsword, and put them to flight. As they were scurrying away he struck at them and cut off a leg of one of the cats. To his astonishment it was a woman's leg, and next morning he found one of the witches short of the corresponding limb. Glanvil tells a story of "an old woman in Cambridge-shire, whose astral spirit, coming into a man's house (as he was sitting alone at the fire) in the shape of an huge cat, and setting her self before the fire, not far from him, he stole a stroke at the back of it with a fire-fork, and seemed to break the back of it, but it scambled from him, and vanisht he knew not how. But such an old woman, a reputed witch, was found dead in her bed that very night, with her back broken, as I have heard some years ago credibly reported." In Yorkshire during the latter half of the nineteenth century a parish clergyman was told a circumstantial story of an old witch named Nanny, who was hunted in the form of a hare for several miles over the Westerdale moors and kept well away from the dogs, till a black one joined the pack and succeeded in taking a bit out of one of the hare's legs. That was the end of the chase, and immediately afterwards the sportsmen found old Nanny laid up in bed with a sore leg. On examining the wounded limb they discovered that the hurt was precisely in that part of it which in the hare had been bitten by the black dog and, what was still more significant, the wound had all the appearance of having been inflicted by a dog's teeth. So they put two and two together. The same sort of thing is often reported in Lincolnshire. "One night," said a servant from Kirton Lindsey, "my

father and brother saw a cat in front of them. Father knew it was a witch, and took a stone and hammered it. Next day the witch had her face all tied up, and shortly afterwards died." Again, a Bardney bumpkin told how a witch in his neighbourhood could take all sorts of shapes. One night a man shot a hare, and when he went to the witch's house he found her plastering a wound just where he had shot the hare. So in County Leitrim, in Ireland, they say that a hare pursued by dogs fled to a house near at hand, but just as it was bolting in at the door one of the dogs came up with it and nipped a piece out of its leg. The hunters entered the house and found no hare there but only an old woman, and her side was bleeding; so they knew what to think of her.

Again, in the Vosges Mountains a great big hare used to come out every evening to take the air at the foot of the Mont des Fourches. All the sportsmen of the neighbourhood tried their hands on that hare for a month, but not one of them could hit it. At last one marksman, more knowing than the rest, loaded his gun with some pellets of a consecrated wafer in addition to the usual pellets of lead. That did the trick. If puss was not killed outright, she was badly hurt, and limped away uttering shrieks and curses in a human voice. Later it transpired that she was no other than the witch of a neighbouring village who had the power of putting on the shape of any animal she pleased. Again, a hunter of Travexin, in the Vosges, fired at a hare and almost shot away one of its hind legs. Nevertheless the creature contrived to escape into a cottage through the open door. Immediately a child's cries were heard to proceed from the cottage, and the hunter could distinguish these words, "Daddy, daddy, come quick! Poor mammy has her leg broken."

In Swabia the witches are liable to accidents of the same sort when they go about their business in the form of animals. For example, there was a soldier who was betrothed to a young woman and used to visit her every evening when he was off duty. But one evening the girl told him that he must not come to the house on Friday nights, because it was never convenient to her to see him then. This roused his suspicion, and the very next Friday night he set out to go to his sweetheart's house. On the way a white cat ran up to him in the street and dogged his steps, and when the animal would not make off he drew his sword and slashed off one of its paws. On that the cat bolted. The soldier walked on, but when he came to his sweetheart's house he found her in bed, and when he asked her what was the matter, she gave a very confused reply. Noticing stains of blood on the bed, he drew down the coverlet and saw that the girl was weltering in her gore, for one of her feet was lopped off. "So that's what's the matter with you, you witch!" said he, and turned on his heel and left her, and within three days she was dead. Again, a farmer in the neighbourhood of Wiesensteig frequently found in his stable a horse over and above the four horses he actually owned. He did not know what to make of it and mentioned the matter to the smith. The smith said quietly, "The next time you see a fifth horse in the stable, just you send for me." Well, it was not long before the strange horse was there again, and the farmer at once sent for the smith. He came bringing four horse-shoes with him, and said, "I'm sure the nag has no shoes; I'll shoe her for you." No sooner said than done. However, the smith overreached himself; for next day when his friend the farmer paid him a visit he found the smith's own wife prancing about with horse-shoes nailed on her hands and feet. But it was the last time she ever appeared in the shape of a horse.

Once more, in Silesia they tell of a miller's apprentice, a sturdy and industrious young fellow, who set out on his travels. One day he came to a mill, and the miller told him that he wanted an apprentice but did not care to engage one, because hitherto all his apprentices had run away in the night, and when he came down in the morning the mill was at a stand. However, he liked the looks of the young chap and took him into his pay. But what the new apprentice heard about the mill and his predecessors was not encouraging; so the first night when it was

his duty to watch in the mill he took care to provide himself with an axe and a prayer-book, and while he kept one eye on the whirring, humming wheels he kept the other on the good book, which he read by the flickering light of a candle set on a table. So the hours at first passed quietly with nothing to disturb him but the monotonous drone and click of the machinery. But on the stroke of twelve, as he was still reading with the axe lying on the table within reach, the door opened and in came two grey cats mewling, an old one and a young one. They sat down opposite him, but it was easy to see that they did not like his wakefulness and the prayer-book and the axe. Suddenly the old cat reached out a paw and made a grab at the axe, but the young chap was too quick for her and held it fast. Then the young cat tried to do the same for the prayer-book, but the apprentice gripped it tight. Thus balked, the two cats set up such a squalling that the young fellow could hardly say his prayers. Just before one o'clock the younger cat sprang on the table and fetched a blow with her right paw at the candle to put it out. But the apprentice struck at her with his axe and sliced the paw off, whereupon the two cats vanished with a frightful screech. The apprentice wrapped the paw up in paper to shew it to his master. Very glad the miller was next morning when he came down and found the mill going and the young chap at his post. The apprentice told him what had happened in the night and gave him the parcel containing the cat's paw. But when the miller opened it, what was the astonishment of the two to find in it no cat's paw but a woman's hand! At breakfast the miller's young wife did not as usual take her place at the table. She was ill in bed, and the doctor had to be called in to bind up her right arm, because in hewing wood, so they said, she had made a slip and cut off her own right hand. But the apprentice packed up his traps and turned his back on that mill before the sun had set.

It would no doubt be easy to multiply instances, all equally well attested and authentic, of the transformation of witches into animals and of the damage which the women themselves have sustained through injuries inflicted on the animals. But the foregoing evidence may suffice to establish the complete parallelism between witches and were-wolves in these respects. The analogy appears to confirm the view that the reason for burning a bewitched animal alive is a belief that the witch herself is in the animal, and that by burning it you either destroy the witch completely or at least unmask her and compel her to reassume her proper human shape, in which she is naturally far less potent for mischief than when she is careering about the country in the likeness of a cat, a hare, a horse, or what not. This principle is still indeed clearly recognized by people in Oldenburg, though, as might be expected, they do not now carry out the principle to its logical conclusion by burning the bewitched animal or person alive; instead they resort to a feeble and, it must be added, perfectly futile subterfuge dictated by a mistaken humanity or a fear of the police. "When anything living is bewitched in a house, for example, children or animals, they burn or boil the nobler inwards of animals, especially the hearts, but also the lungs or the liver. If animals have died, they take the inwards of one of them or of an animal of the same kind slaughtered for the purpose; but if that is not possible they take the inwards of a cock, by preference a black one. The heart, lung, or liver is stuck all over with needles, or marked with a cross cut, or placed on the fire in a tightly closed vessel, strict silence being observed and doors and windows well shut. When the heart boils or is reduced to ashes, the witch must appear, for during the boiling she feels the burning pain. She either begs to be released or seeks to borrow something, for example, salt or a coal of fire, or she takes the lid off the pot, or tries to induce the person whose spell is on her to speak. They say, too, that a woman comes with a spinning-wheel. If it is a sheep that has died, you proceed in the same way with a tripe from its stomach and prick it with needles while it is on the boil. Instead of boiling it, some people nail the heart to the highest rafter of the house, or lay it on the edge of the hearth, in order that it may dry up, no doubt because the same thing happens to the witch. We may conjecture that other sympathetic means of destruction are employed against witchcraft. The following is expressly

reported: the heart of a calf that has died is stuck all over with needles, enclosed in a bag, and thrown into flowing water before sunset.”

And the same thing holds good also of inanimate objects on which a witch has cast her spell. In Wales they say that “if a thing is bewitched, burn it, and immediately afterwards the witch will come to borrow something of you. If you give what she asks, she will go free; if you refuse it, she will burn, and a mark will be on her body the next day.” So, too, in Oldenburg, “the burning of things that are bewitched or that have been received from witches is another way of breaking the spell. It is often said that the burning should take place at a cross-road, and in several places cross-roads are shewn where the burning used to be performed.... As a rule, while the things are burning, the guilty witches appear, though not always in their own shape. At the burning of bewitched butter they often appear as cockchafers and can be killed with impunity. Victuals received from witches may be safely consumed if only you first burn a portion of them.” For example, a young man in Oldenburg was wooing a girl, and she gave him two fine apples as a gift. Not feeling any appetite at the time, he put the apples in his pocket, and when he came home he laid them by in a chest. Two or three days afterwards he remembered the apples and went to the chest to fetch them. But when he would have put his hand on them, what was his horror to find in their stead two fat ugly toads in the chest! He hastened to a wise man and asked him what he should do with the toads. The man told him to boil the toads alive, but while he was doing so he must be sure on no account to lend anything out of the house. Well, just as he had the toads in a pot on the fire and the water began to grow nicely warm, who should come to the door but the girl who had given him the apples, and she wished to borrow something; but he refused to give her anything, rated her as a witch, and drove her out of the house. A little afterwards in came the girl's mother and begged with tears in her eyes for something or other; but he turned her out also. The last word she said to him was that he should at least spare her daughter's life; but he paid no heed to her and let the toads boil till they fell to bits. Next day word came that the girl was dead. Can any reasonable man doubt that the witch herself was boiled alive in the person of the toads?

Moreover, just as a witch can assume the form of an animal, so she can assume the form of some other human being, and the likeness is sometimes so good that it is difficult to detect the fraud. However, by burning alive the person whose shape the witch has put on, you force the witch to disclose herself, just as by burning alive the bewitched animal you in like manner oblige the witch to appear. This principle may perhaps be unknown to science, falsely so called, but it is well understood in Ireland and has been acted on within recent years. In March 1895 a peasant named Michael Cleary, residing at Ballyvadlea, a remote and lonely district in the county of Tipperary, burned his wife Bridget Cleary alive over a slow fire on the kitchen hearth in the presence of and with the active assistance of some neighbours, including the woman's own father and several of her cousins. They thought that she was not Bridget Cleary at all, but a witch, and that when they held her down on the fire she would vanish up the chimney; so they cried, while she was burning, “Away she goes! Away she goes!” Even when she lay quite dead on the kitchen floor (for contrary to the general expectation she did not disappear up the chimney), her husband still believed that the woman lying there was a witch, and that his own dear wife had gone with the fairies to the old *rath* or fort on the hill of Kyleneagranagh, where he would see her at night riding a grey horse and roped to the saddle, and that he would cut the ropes, and that she would stay with him ever afterwards. So he went with some friends to the fort night after night, taking a big table-knife with him to cut the ropes. But he never saw his wife again. He and the men who had held the woman on the fire were arrested and tried at Clonmel for wilful murder in July 1895; they

were all found guilty of manslaughter and sentenced to various terms of penal servitude and imprisonment; the sentence passed on Michael Cleary was twenty years' penal servitude.

However, our British peasants, it must be confessed, have not always acted up to the strict logical theory which seems to call for death by fire as the proper treatment both of bewitched animals and of witches. Sometimes, perhaps in moments of weakness, they have merely buried the bewitched animals alive instead of burning them. For example, in the year 1643, "many cattle having died, John Brughe and Neane Nikclerith, also one of the initiated, conjoined their mutual skill for the safety of the herd. The surviving animals were drove past a tub of water containing two enchanted stones: and each was sprinkled from the liquid contents in its course. One, however, being unable to walk, 'was by force drawin out at the byre dure; and the said Johnne with Nikclerith smelling the nois thereof said it wald not leive, caused ane hoill to be maid in Maw Greane, quhilk was put quick in the hole and maid all the rest of the cattell theireftir to go over that place: and in that devillische maner, be charmeing,' they were cured." Again, during the prevalence of a murrain about the year 1629, certain persons proposed to stay the plague with the help of a celebrated "cureing stane" of which the laird of Lee was the fortunate owner. But from this they were dissuaded by one who "had sene bestiall curet be taking ane quik seik ox, and making ane deip pitt, and bureing him therin, and be calling the oxin and bestiall over that place." Indeed Issobell Young, the mother of these persons, had herself endeavoured to check the progress of the distemper by taking "ane quik ox with ane catt, and ane grit quantitie of salt," and proceeding "to burie the ox and catt quik with the salt, in ane deip hoill in the grund, as ane sacrifice to the devill, that the rest of the guidis might be fred of the seiknes or diseases." Writing towards the end of the eighteenth century, John Ramsay of Ochertyre tells us that "the violent death even of a brute is in some cases held to be of great avail. There is a disease called the *black spauld*, which sometimes rages like a pestilence among black cattle, the symptoms of which are a mortification in the legs and a corruption of the mass of blood. Among the other engines of superstition that are directed against this fatal malady, the first cow seized with it is commonly buried alive, and the other cattle are forced to pass backwards and forwards over the pit. At other times the heart is taken out of the beast alive, and then the carcass is buried. It is remarkable that the leg affected is cut off, and hung up in some part of the house or byre, where it remains suspended, notwithstanding the seeming danger of infection. There is hardly a house in Mull where these may not be seen. This practice seems to have taken its rise antecedent to Christianity, as it reminds us of the pagan custom of hanging up offerings in their temples. In Breadalbane, when a cow is observed to have symptoms of madness, there is recourse had to a peculiar process. They tie the legs of the mad creature, and throw her into a pit dug at the door of the fold. After covering the hole with earth, a large fire is kindled upon it; and the rest of the cattle are driven out, and forced to pass through the fire one by one." In this latter custom we may suspect that the fire kindled on the grave of the buried cow was originally made by the friction of wood, in other words, that it was a need-fire. Again, writing in the year 1862, Sir Arthur Mitchell tells us that "for the cure of the murrain in cattle, one of the herd is still sacrificed for the good of the whole. This is done by burying it alive. I am assured that within the last ten years such a barbarism occurred in the county of Moray."

Sometimes, however, the animal has not even been buried alive, it has been merely killed and then buried. In this emasculated form the sacrifice, we may say with confidence, is absolutely useless for the purpose of stopping a murrain. Nevertheless, it has been tried. Thus in Lincolnshire, "when the cattle plague was so prevalent in 1866, there was, I believe, not a single cowshed in Marshland but had its wicken cross over the door; and other charms more powerful than this were in some cases resorted to. I never heard of the use of the needfire in

the Marsh, though it was, I believe, used on the wolds not many miles off. But I knew of at least one case in which a calf was killed and solemnly buried feet pointing upwards at the threshold of the cowshed. When our garthman told me of this, I pointed out to him that the charm had failed, for the disease had not spared that shed. But he promptly replied, 'Yis, but owd Edwards were a soight too cliver; he were that mean he slew nobbutt a wankling cauf as were bound to deny anny road; if he had nobbutt tekken his best cauf it wud hev worked reight enuff; 'tain't in reason that owd skrat 'ud be hanselled wi' wankling draffle.' "

V. The Interpretation of the Fire-Festivals

§ 1. On the Fire-festivals in general.

The foregoing survey of the popular fire-festivals of Europe suggests some general observations. In the first place we can hardly help being struck by the resemblance which the ceremonies bear to each other, at whatever time of the year and in whatever part of Europe they are celebrated. The custom of kindling great bonfires, leaping over them, and driving cattle through or round them would seem to have been practically universal throughout Europe, and the same may be said of the processions or races with blazing torches round fields, orchards, pastures, or cattle-stalls. Less widespread are the customs of hurling lighted discs into the air and trundling a burning wheel down hill; for to judge by the evidence which I have collected these modes of distributing the beneficial influence of the fire have been confined in the main to Central Europe. The ceremonial of the Yule log is distinguished from that of the other fire-festivals by the privacy and domesticity which characterize it; but, as we have already seen, this distinction may well be due simply to the rough weather of midwinter, which is apt not only to render a public assembly in the open air disagreeable, but also at any moment to defeat the object of the assembly by extinguishing the all-important fire under a downpour of rain or a fall of snow. Apart from these local or seasonal differences, the general resemblance between the fire-festivals at all times of the year and in all places is tolerably close. And as the ceremonies themselves resemble each other, so do the benefits which the people expect to reap from them. Whether applied in the form of bonfires blazing at fixed points, or of torches carried about from place to place, or of embers and ashes taken from the smouldering heap of fuel, the fire is believed to promote the growth of the crops and the welfare of man and beast, either positively by stimulating them, or negatively by averting the dangers and calamities which threaten them from such causes as thunder and lightning, conflagration, blight, mildew, vermin, sterility, disease, and not least of all witchcraft.

But we naturally ask, How did it come about that benefits so great and manifold were supposed to be attained by means so simple? In what way did people imagine that they could procure so many goods or avoid so many ills by the application of fire and smoke, of embers and ashes? In short, what theory underlay and prompted the practice of these customs? For that the institution of the festivals was the outcome of a definite train of reasoning may be taken for granted; the view that primitive man acted first and invented his reasons to suit his actions afterwards, is not borne out by what we know of his nearest living representatives, the savage and the peasant. Two different explanations of the fire-festivals have been given by modern enquirers. On the one hand it has been held that they are sun-charms or magical ceremonies intended, on the principle of imitative magic, to ensure a needful supply of sunshine for men, animals, and plants by kindling fires which mimic on earth the great source of light and heat in the sky. This was the view of Wilhelm Mannhardt. It may be called the solar theory. On the other hand it has been maintained that the ceremonial fires have no necessary reference to the sun but are simply purificatory in intention, being designed to burn up and destroy all harmful influences, whether these are conceived in a personal form as witches, demons, and monsters, or in an impersonal form as a sort of pervading taint or corruption of the air. This is the view of Dr. Edward Westermarck and apparently of Professor Eugen Mogk. It may be called the purificatory theory. Obviously the two theories postulate two very different conceptions of the fire which plays the principal part in the rites. On the one view, the fire, like sunshine in our latitude, is a genial creative power which fosters the growth of plants and the development of all that makes for health and happiness;

on the other view, the fire is a fierce destructive power which blasts and consumes all the noxious elements, whether spiritual or material, that menace the life of men, of animals, and of plants. According to the one theory the fire is a stimulant, according to the other it is a disinfectant; on the one view its virtue is positive, on the other it is negative.

Yet the two explanations, different as they are in the character which they attribute to the fire, are perhaps not wholly irreconcilable. If we assume that the fires kindled at these festivals were primarily intended to imitate the sun's light and heat, may we not regard the purificatory and disinfecting qualities, which popular opinion certainly appears to have ascribed to them, as attributes derived directly from the purificatory and disinfecting qualities of sunshine? In this way we might conclude that, while the imitation of sunshine in these ceremonies was primary and original, the purification attributed to them was secondary and derivative. Such a conclusion, occupying an intermediate position between the two opposing theories and recognizing an element of truth in both of them, was adopted by me in earlier editions of this work; but in the meantime Dr. Westermarck has argued powerfully in favour of the purificatory theory alone, and I am bound to say that his arguments carry great weight, and that on a fuller review of the facts the balance of evidence seems to me to incline decidedly in his favour. However, the case is not so clear as to justify us in dismissing the solar theory without discussion, and accordingly I propose to adduce the considerations which tell for it before proceeding to notice those which tell against it. A theory which had the support of so learned and sagacious an investigator as W. Mannhardt is entitled to a respectful hearing.

§ 2. The Solar Theory of the Fire-festivals.

In an earlier part of this work we saw that savages resort to charms for making sunshine, and it would be no wonder if primitive man in Europe did the same. Indeed, when we consider the cold and cloudy climate of Europe during a great part of the year, we shall find it natural that sun-charms should have played a much more prominent part among the superstitious practices of European peoples than among those of savages who live nearer the equator and who consequently are apt to get in the course of nature more sunshine than they want. This view of the festivals may be supported by various arguments drawn partly from their dates, partly from the nature of the rites, and partly from the influence which they are believed to exert upon the weather and on vegetation.

First, in regard to the dates of the festivals it can be no mere accident that two of the most important and widely spread of the festivals are timed to coincide more or less exactly with the summer and winter solstices, that is, with the two turning-points in the sun's apparent course in the sky when he reaches respectively his highest and his lowest elevation at noon. Indeed with respect to the midwinter celebration of Christmas we are not left to conjecture; we know from the express testimony of the ancients that it was instituted by the church to supersede an old heathen festival of the birth of the sun, which was apparently conceived to be born again on the shortest day of the year, after which his light and heat were seen to grow till they attained their full maturity at midsummer. Therefore it is no very far-fetched conjecture to suppose that the Yule log, which figures so prominently in the popular celebration of Christmas, was originally designed to help the labouring sun of midwinter to rekindle his seemingly expiring light.

The idea that by lighting a log on earth you can rekindle a fire in heaven or fan it into a brighter blaze, naturally seems to us absurd; but to the savage mind it wears a different aspect, and the institution of the great fire-festivals which we are considering probably dates from a time when Europe was still sunk in savagery or at most in barbarism. Now it can be shewn that in order to increase the celestial source of heat at midwinter savages resort to a practice analogous to that of our Yule log, if the kindling of the Yule log was originally a

magical rite intended to rekindle the sun. In the southern hemisphere, where the order of the seasons is the reverse of ours, the rising of Sirius or the Dog Star in July marks the season of the greatest cold instead of, as with us, the greatest heat; and just as the civilized ancients ascribed the torrid heat of midsummer to that brilliant star, so the modern savage of South Africa attributes to it the piercing cold of midwinter and seeks to mitigate its rigour by warming up the chilly star with the genial heat of the sun. How he does so may be best described in his own words as follows:—

“The Bushmen perceive Canopus, they say to a child: ‘Give me yonder piece of wood, that I may put the end of it in the fire, that I may point it burning towards grandmother, for grandmother carries Bushman rice; grandmother shall make a little warmth for us; for she coldly comes out; the sun shall warm grandmother's eye for us.’ Sirius comes out; the people call out to one another: ‘Sirius comes yonder;’ they say to one another: ‘Ye must burn a stick for us towards Sirius.’ They say to one another: ‘Who was it who saw Sirius?’ One man says to the other: ‘Our brother saw Sirius.’ The other man says to him: ‘I saw Sirius.’ The other man says to him: ‘I wish thee to burn a stick for us towards Sirius; that the sun may shining come out for us; that Sirius may not coldly come out.’ The other man (the one who saw Sirius) says to his son: ‘Bring me the small piece of wood yonder, that I may put the end of it in the fire, that I may burn it towards grandmother; that grandmother may ascend the sky, like the other one, Canopus.’ The child brings him the piece of wood, he (the father) holds the end of it in the fire. He points it burning towards Sirius; he says that Sirius shall twinkle like Canopus. He sings; he sings about Canopus, he sings about Sirius; he points to them with fire, that they may twinkle like each other. He throws fire at them. He covers himself up entirely (including his head) in his kaross and lies down. He arises, he sits down; while he does not again lie down; because he feels that he has worked, putting Sirius into the sun's warmth; so that Sirius may warmly come out. The women go out early to seek for Bushman rice; they walk, sunning their shoulder blades.” What the Bushmen thus do to temper the cold of midwinter in the southern hemisphere by blowing up the celestial fires may have been done by our rude forefathers at the corresponding season in the northern hemisphere.

Not only the date of some of the festivals but the manner of their celebration suggests a conscious imitation of the sun. The custom of rolling a burning wheel down a hill, which is often observed at these ceremonies, might well pass for an imitation of the sun's course in the sky, and the imitation would be especially appropriate on Midsummer Day when the sun's annual declension begins. Indeed the custom has been thus interpreted by some of those who have recorded it. Not less graphic, it may be said, is the mimicry of his apparent revolution by swinging a burning tar-barrel round a pole. Again, the common practice of throwing fiery discs, sometimes expressly said to be shaped like suns, into the air at the festivals may well be a piece of imitative magic. In these, as in so many cases, the magic force may be supposed to take effect through mimicry or sympathy: by imitating the desired result you actually produce it: by counterfeiting the sun's progress through the heavens you really help the luminary to pursue his celestial journey with punctuality and despatch. The name “fire of heaven,” by which the midsummer fire is sometimes popularly known, clearly implies a consciousness of a connexion between the earthly and the heavenly flame.

Again, the manner in which the fire appears to have been originally kindled on these occasions has been alleged in support of the view that it was intended to be a mock-sun. As some scholars have perceived, it is highly probable that at the periodic festivals in former times fire was universally obtained by the friction of two pieces of wood. We have seen that it is still so procured in some places both at the Easter and the midsummer festivals, and that it is expressly said to have been formerly so procured at the Beltane celebration both in Scotland and Wales. But what makes it nearly certain that this was once the invariable mode

of kindling the fire at these periodic festivals is the analogy of the need-fire, which has almost always been produced by the friction of wood, and sometimes by the revolution of a wheel. It is a plausible conjecture that the wheel employed for this purpose represents the sun, and if the fires at the regularly recurring celebrations were formerly produced in the same way, it might be regarded as a confirmation of the view that they were originally sun-charms. In point of fact there is, as Kuhn has indicated, some evidence to shew that the midsummer fire was originally thus produced. We have seen that many Hungarian swine-herds make fire on Midsummer Eve by rotating a wheel round a wooden axle wrapt in hemp, and that they drive their pigs through the fire thus made. At Obermedlingen, in Swabia, the "fire of heaven," as it was called, was made on St. Vitus's Day (the fifteenth of June) by igniting a cart-wheel, which, smeared with pitch and plaited with straw, was fastened on a pole twelve feet high, the top of the pole being inserted in the nave of the wheel. This fire was made on the summit of a mountain, and as the flame ascended, the people uttered a set form of words, with eyes and arms directed heavenward. Here the fixing of a wheel on a pole and igniting it suggests that originally the fire was produced, as in the case of the need-fire, by the revolution of a wheel. The day on which the ceremony takes place (the fifteenth of June) is near midsummer; and we have seen that in Masuren fire is, or used to be, actually made on Midsummer Day by turning a wheel rapidly about an oaken pole, though it is not said that the new fire so obtained is used to light a bonfire. However, we must bear in mind that in all such cases the use of a wheel may be merely a mechanical device to facilitate the operation of fire-making by increasing the friction; it need not have any symbolical significance.

Further, the influence which these fires, whether periodic or occasional, are supposed to exert on the weather and vegetation may be cited in support of the view that they are sun-charms, since the effects ascribed to them resemble those of sunshine. Thus, the French belief that in a rainy June the lighting of the midsummer bonfires will cause the rain to cease appears to assume that they can disperse the dark clouds and make the sun to break out in radiant glory, drying the wet earth and dripping trees. Similarly the use of the need-fire by Swiss children on foggy days for the purpose of clearing away the mist may very naturally be interpreted as a sun-charm. Again, we have seen that in the Vosges Mountains the people believe that the midsummer fires help to preserve the fruits of the earth and ensure good crops. In Sweden the warmth or cold of the coming season is inferred from the direction in which the flames of the May Day bonfire are blown; if they blow to the south, it will be warm, if to the north, cold. No doubt at present the direction of the flames is regarded merely as an augury of the weather, not as a mode of influencing it. But we may be pretty sure that this is one of the cases in which magic has dwindled into divination. So in the Eifel Mountains, when the smoke blows towards the corn-fields, this is an omen that the harvest will be abundant. But the older view may have been not merely that the smoke and flames prognosticated, but that they actually produced an abundant harvest, the heat of the flames acting like sunshine on the corn. Perhaps it was with this view that people in the Isle of Man lit fires to windward of their fields in order that the smoke might blow over them. So in South Africa, about the month of April, the Matabeles light huge fires to the windward of their gardens, "their idea being that the smoke, by passing over the crops, will assist the ripening of them." Among the Zulus also "medicine is burned on a fire placed to windward of the garden, the fumigation which the plants in consequence receive being held to improve the crop." Again, the idea of our European peasants that the corn will grow well as far as the blaze of the bonfire is visible, may be interpreted as a remnant of the belief in the quickening and fertilizing power of the bonfires. The same belief, it may be argued, reappears in the notion that embers taken from the bonfires and inserted in the fields will promote the growth of the crops, and it may be thought to underlie the customs of sowing flax-seed in the direction in which the flames blow, of mixing the ashes of the bonfire with the seed-corn at sowing, of scattering the ashes

by themselves over the field to fertilize it, and of incorporating a piece of the Yule log in the plough to make the seeds thrive. The opinion that the flax or hemp will grow as high as the flames rise or the people leap over them belongs clearly to the same class of ideas. Again, at Konz, on the banks of the Moselle, if the blazing wheel which was trundled down the hillside reached the river without being extinguished, this was hailed as a proof that the vintage would be abundant. So firmly was this belief held that the successful performance of the ceremony entitled the villagers to levy a tax upon the owners of the neighbouring vineyards. Here the unextinguished wheel might be taken to represent an unclouded sun, which in turn would portend an abundant vintage. So the waggon-load of white wine which the villagers received from the vineyards round about might pass for a payment for the sunshine which they had procured for the grapes. Similarly we saw that in the Vale of Glamorgan a blazing wheel used to be trundled down hill on Midsummer Day, and that if the fire were extinguished before the wheel reached the foot of the hill, the people expected a bad harvest; whereas if the wheel kept alight all the way down and continued to blaze for a long time, the farmers looked forward to heavy crops that summer. Here, again, it is natural to suppose that the rustic mind traced a direct connexion between the fire of the wheel and the fire of the sun, on which the crops are dependent.

But in popular belief the quickening and fertilizing influence of the bonfires is not limited to the vegetable world; it extends also to animals. This plainly appears from the Irish custom of driving barren cattle through the mid-summer fires, from the French belief that the Yule-log steeped in water helps cows to calve, from the French and Servian notion that there will be as many chickens, calves, lambs, and kids as there are sparks struck out of the Yule log, from the French custom of putting the ashes of the bonfires in the fowls' nests to make the hens lay eggs, and from the German practice of mixing the ashes of the bonfires with the drink of cattle in order to make the animals thrive. Further, there are clear indications that even human fecundity is supposed to be promoted by the genial heat of the fires. In Morocco the people think that childless couples can obtain offspring by leaping over the midsummer bonfire. It is an Irish belief that a girl who jumps thrice over the midsummer bonfire will soon marry and become the mother of many children; in Flanders women leap over the Midsummer fires to ensure an easy delivery; and in various parts of France they think that if a girl dances round nine fires she will be sure to marry within the year. On the other hand, in Lechain people say that if a young man and woman, leaping over the midsummer fire together, escape unsmirched, the young woman will not become a mother within twelve months: the flames have not touched and fertilized her. In parts of Switzerland and France the lighting of the Yule log is accompanied by a prayer that the women may bear children, the she-goats bring forth kids, and the ewes drop lambs. The rule observed in some places that the bonfires should be kindled by the person who was last married seems to belong to the same class of ideas, whether it be that such a person is supposed to receive from, or to impart to, the fire a generative and fertilizing influence. The common practice of lovers leaping over the fires hand in hand may very well have originated in a notion that thereby their marriage would be blessed with offspring; and the like motive would explain the custom which obliges couples married within the year to dance to the light of torches. And the scenes of profligacy which appear to have marked the midsummer celebration among the Esthonians, as they once marked the celebration of May Day among ourselves, may have sprung, not from the mere license of holiday-makers, but from a crude notion that such orgies were justified, if not required, by some mysterious bond which linked the life of man to the courses of the heavens at this turning-point of the year.

At the festivals which we are considering the custom of kindling bonfires is commonly associated with a custom of carrying lighted torches about the fields, the orchards, the

pastures, the flocks and the herds; and we can hardly doubt that the two customs are only two different ways of attaining the same object, namely, the benefits which are believed to flow from the fire, whether it be stationary or portable. Accordingly if we accept the solar theory of the bonfires, we seem bound to apply it also to the torches; we must suppose that the practice of marching or running with blazing torches about the country is simply a means of diffusing far and wide the genial influence of the sunshine, of which these flickering flames are a feeble imitation. In favour of this view it may be said that sometimes the torches are carried about the fields for the express purpose of fertilizing them, and for the same purpose live coals from the bonfires are sometimes placed in the fields "to prevent blight." On the Eve of Twelfth Day in Normandy men, women, and children run wildly through the fields and orchards with lighted torches, which they wave about the branches and dash against the trunks of the fruit-trees for the sake of burning the moss and driving away the moles and field mice. "They believe that the ceremony fulfils the double object of exorcizing the vermin whose multiplication would be a real calamity, and of imparting fecundity to the trees, the fields, and even the cattle"; and they imagine that the more the ceremony is prolonged, the greater will be the crop of fruit next autumn. In Bohemia they say that the corn will grow as high as they fling the blazing besoms into the air. Nor are such notions confined to Europe. In Corea, a few days before the New Year festival, the eunuchs of the palace swing burning torches, chanting invocations the while, and this is supposed to ensure bountiful crops for the next season. The custom of trundling a burning wheel over the fields, which used to be observed in Poitou for the express purpose of fertilizing them, may be thought to embody the same idea in a still more graphic form; since in this way the mock-sun itself, not merely its light and heat represented by torches, is made actually to pass over the ground which is to receive its quickening and kindly influence. Once more, the custom of carrying lighted brands round cattle is plainly equivalent to driving the animals through the bonfire; and if the bonfire is a sun-charm, the torches must be so also.

§ 3. The Purificatory Theory of the Fire-festivals.

Thus far we have considered what may be said for the theory that at the European fire-festivals the fire is kindled as a charm to ensure an abundant supply of sunshine for man and beast, for corn and fruits. It remains to consider what may be said against this theory and in favour of the view that in these rites fire is employed not as a creative but as a cleansing agent, which purifies men, animals, and plants by burning up and consuming the noxious elements, whether material or spiritual, which menace all living things with disease and death.

First, then, it is to be observed that the people who practise the fire-customs appear never to allege the solar theory in explanation of them, while on the contrary they do frequently and emphatically put forward the purificatory theory. This is a strong argument in favour of the purificatory and against the solar theory; for the popular explanation of a popular custom is never to be rejected except for grave cause. And in the present case there seems to be no adequate reason for rejecting it. The conception of fire as a destructive agent, which can be turned to account for the consumption of evil things, is so simple and obvious that it could hardly escape the minds even of the rude peasantry with whom these festivals originated. On the other hand the conception of fire as an emanation of the sun, or at all events as linked to it by a bond of physical sympathy, is far less simple and obvious; and though the use of fire as a charm to produce sunshine appears to be undeniable, nevertheless in attempting to explain popular customs we should never have recourse to a more recondite idea when a simpler one lies to hand and is supported by the explicit testimony of the people themselves. Now in the case of the fire-festivals the destructive aspect of fire is one upon which the people dwell again and again; and it is highly significant that the great evil against which the fire is

directed appears to be witchcraft. Again and again we are told that the fires are intended to burn or repel the witches; and the intention is sometimes graphically expressed by burning an effigy of a witch in the fire. Hence, when we remember the great hold which the dread of witchcraft has had on the popular European mind in all ages, we may suspect that the primary intention of all these fire-festivals was simply to destroy or at all events get rid of the witches, who were regarded as the causes of nearly all the misfortunes and calamities that befall men, their cattle, and their crops.

This suspicion is confirmed when we examine the evils for which the bonfires and torches were supposed to provide a remedy. Foremost, perhaps, among these evils we may reckon the diseases of cattle; and of all the ills that witches are believed to work there is probably none which is so constantly insisted on as the harm they do to the herds, particularly by stealing the milk from the cows. Now it is significant that the need-fire, which may perhaps be regarded as the parent of the periodic fire-festivals, is kindled above all as a remedy for a murrain or other disease of cattle; and the circumstance suggests, what on general grounds seems probable, that the custom of kindling the need-fire goes back to a time when the ancestors of the European peoples subsisted chiefly on the products of their herds, and when agriculture as yet played a subordinate part in their lives. Witches and wolves are the two great foes still dreaded by the herdsman in many parts of Europe; and we need not wonder that he should resort to fire as a powerful means of banning them both. Among Slavonic peoples it appears that the foes whom the need-fire is designed to combat are not so much living witches as vampyres and other evil spirits, and the ceremony, as we saw, aims rather at repelling these baleful beings than at actually consuming them in the flames. But for our present purpose these distinctions are immaterial. The important thing to observe is that among the Slavs the need-fire, which is probably the original of all the ceremonial fires now under consideration, is not a sun-charm, but clearly and unmistakably nothing but a means of protecting man and beast against the attacks of maleficent creatures, whom the peasant thinks to burn or scare by the heat of the fire, just as he might burn or scare wild animals.

Again, the bonfires are often supposed to protect the fields against hail and the homestead against thunder and lightning. But both hail and thunderstorms are frequently thought to be caused by witches; hence the fire which bans the witches necessarily serves at the same time as a talisman against hail, thunder, and lightning. Further, brands taken from the bonfires are commonly kept in the houses to guard them against conflagration; and though this may perhaps be done on the principle of homoeopathic magic, one fire being thought to act as a preventive of another, it is also possible that the intention may be to keep witch-incendiaries at bay. Again, people leap over the bonfires as a preventive of colic, and look at the flames steadily in order to preserve their eyes in good health; and both colic and sore eyes are in Germany, and probably elsewhere, set down to the machinations of witches. Once more, to leap over the Midsummer fires or to circumambulate them is thought to prevent a person from feeling pains in his back at reaping; and in Germany such pains are called "witch-shots" and ascribed to witchcraft.

But if the bonfires and torches of the fire-festivals are to be regarded primarily as weapons directed against witches and wizards, it becomes probable that the same explanation applies not only to the flaming discs which are hurled into the air, but also to the burning wheels which are rolled down hill on these occasions; discs and wheels, we may suppose, are alike intended to burn the witches who hover invisible in the air or haunt unseen the fields, the orchards, and the vineyards on the hillside. Certainly witches are constantly thought to ride through the air on broomsticks or other equally convenient vehicles; and if they do so, how can you get at them so effectually as by hurling lighted missiles, whether discs, torches, or besoms, after them as they flit past overhead in the gloom? The South Slavonian peasant

believes that witches ride in the dark hail-clouds; so he shoots at the clouds to bring down the hags, while he curses them, saying, "Curse, curse Herodias, thy mother is a heathen, damned of God and fettered through the Redeemer's blood." Also he brings out a pot of glowing charcoal on which he has thrown holy oil, laurel leaves, and wormwood to make a smoke. The fumes are supposed to ascend to the clouds and stupefy the witches, so that they tumble down to earth. And in order that they may not fall soft, but may hurt themselves very much, the yokel hastily brings out a chair and tilts it bottom up so that the witch in falling may break her legs on the legs of the chair. Worse than that, he cruelly lays scythes, bill-hooks and other formidable weapons edge upwards so as to cut and mangle the poor wretches when they drop plump upon them from the clouds.

On this view the fertility supposed to follow the application of fire in the form of bonfires, torches, discs, rolling wheels, and so forth, is not conceived as resulting directly from an increase of solar heat which the fire has magically generated; it is merely an indirect result obtained by freeing the reproductive powers of plants and animals from the fatal obstruction of witchcraft. And what is true of the reproduction of plants and animals may hold good also of the fertility of the human sexes. We have seen that the bonfires are supposed to promote marriage and to procure offspring for childless couples. This happy effect need not flow directly from any quickening or fertilizing energy in the fire; it may follow indirectly from the power of the fire to remove those obstacles which the spells of witches and wizards notoriously present to the union of man and wife.

On the whole, then, the theory of the purificatory virtue of the ceremonial fires appears more probable and more in accordance with the evidence than the opposing theory of their connexion with the sun. But Europe is not the only part of the world where ceremonies of this sort have been performed; elsewhere the passage through the flames or smoke or over the glowing embers of a bonfire, which is the central feature of most of the rites, has been employed as a cure or a preventive of various ills. We have seen that the midsummer ritual of fire in Morocco is practically identical with that of our European peasantry; and customs more or less similar have been observed by many races in various parts of the world. A consideration of some of them may help us to decide between the conflicting claims of the two rival theories, which explain the ceremonies as sun-charms or purifications respectively.

VI. Fire-Festivals in Other Lands

§ 1. The Fire-walk.

At first sight the interpretation of the European fire customs as charms for making sunshine is confirmed by a parallel custom observed by the Hindoos of Southern India at the Pongol or Feast of Ingathering. The festival is celebrated in the early part of January, when, according to Hindoo astrologers, the sun enters the tropic of Capricorn, and the chief event of the festival coincides with the passage of the sun. For some days previously the boys gather heaps of sticks, straw, dead leaves, and everything that will burn. On the morning of the first day of the festival the heaps are fired. Every street and lane has its bonfire. The young folk leap over the flames or pile on fresh fuel. This fire is an offering to Sûrya, the sun-god, or to Agni, the deity of fire; it "wakes him from his sleep, calling on him again to gladden the earth with his light and heat." If this is indeed the explanation which the people themselves give of the festival, it seems decisive in favour of the solar explanation of the fires; for to say that the fires waken the sun-god from his sleep is only a metaphorical or mythical way of saying that they actually help to rekindle the sun's light and heat. But the hesitation which the writer indicates between the two distinct deities of sun and fire seems to prove that he is merely giving his own interpretation of the rite, not reporting the views of the celebrants. If that is so, the expression of his opinion has no claim to authority.

A festival of Northern India which presents points of resemblance to the popular European celebrations which we have been considering is the Holi. This is a village festival held in early spring at the full moon of the month Phalgun. Large bonfires are lit and young people dance round them. The people believe that the fires prevent blight, and that the ashes cure disease. At Barsana the local village priest is expected to pass through the Holi bonfire, which, in the opinion of the faithful, cannot burn him. Indeed he holds his land rent-free simply on the score of his being fire-proof. On one occasion when the priest disappointed the expectant crowd by merely jumping over the outermost verge of the smouldering ashes and then bolting into his cell, they threatened to deprive him of his benefice if he did not discharge his spiritual functions better when the next Holi season came round. Another feature of the festival which has, or once had, its counterpart in the corresponding European ceremonies is the unchecked profligacy which prevails among the Hindoos at this time. In Kumaon, a district of North-West India, at the foot of the Himalayas, each clan celebrates the Holi festival by cutting down a tree, which is thereupon stripped of its leaves, decked with shreds of cloth, and burnt at some convenient place in the quarter of the town inhabited by the clan. Some of the songs sung on this occasion are of a ribald character. The people leap over the ashes of the fire, believing that they thus rid themselves of itch and other diseases of the skin. While the trees are burning, each clan tries to carry off strips of cloth from the tree of another clan, and success in the attempt is thought to ensure good luck. In Gwalior large heaps of cow-dung are burnt instead of trees. Among the Marwaris the festival is celebrated by the women with obscene songs and gestures. A monstrous and disgusting image of a certain Nathuram, who is said to have been a notorious profligate, is set up in a bazaar and then smashed with blows of shoes and bludgeons while the bonfire of cow-dung is blazing. No household can be without an image of Nathuram, and on the night when the bride first visits her husband, the image of this disreputable personage is placed beside her couch. Barren women and mothers whose children have died look to Nathuram for deliverance from their troubles. Various stories are told to account for the origin of the Holi festival. According to one legend it was instituted in order to get rid of a troublesome demon (*rákshasi*). The

people were directed to kindle a bonfire and circumambulate it, singing and uttering fearlessly whatever might come into their minds. Appalled by these vociferations, by the oblations to fire, and by the laughter of the children, the demon was to be destroyed.

In the Chinese province of Fo-Kien we also meet with a vernal festival of fire which may be compared to the fire-festivals of Europe. The ceremony, according to an eminent authority, is a solar festival in honour of the renewal of vegetation and of the vernal warmth. It falls in April, on the thirteenth day of the third month in the Chinese calendar, and is doubtless connected with the ancient custom of renewing the fire, which, as we saw, used to be observed in China at this season. The chief performers in the ceremony are labourers, who refrain from women for seven days, and fast for three days before the festival. During these days they are taught in the temple how to discharge the difficult and dangerous duty which is to be laid upon them. On the eve of the festival an enormous brazier of charcoal, sometimes twenty feet wide, is prepared in front of the temple of the Great God, the protector of life. At sunrise next morning the brazier is lighted and kept burning by fresh supplies of fuel. A Taoist priest throws a mixture of salt and rice on the fire to conjure the flames and ensure an abundant year. Further, two exorcists, barefooted and followed by two peasants, traverse the fire again and again till it is somewhat beaten down. Meantime the procession is forming in the temple. The image of the god of the temple is placed in a sedan-chair, resplendent with red paint and gilding, and is carried forth by a score or more of barefooted peasants. On the shafts of the sedan-chair, behind the image, stands a magician with a dagger stuck through the upper parts of his arms and grasping in each hand a great sword, with which he essays to deal himself violent blows on the back; however, the strokes as they descend are mostly parried by peasants, who walk behind him and interpose bamboo rods between his back and the swords. Wild music now strikes up, and under the excitement caused by its stirring strains the procession passes thrice across the furnace. At their third passage the performers are followed by other peasants carrying the utensils of the temple; and the rustic mob, electrified by the frenzied spectacle, falls in behind. Strange as it may seem, burns are comparatively rare. Inured from infancy to walking barefoot, the peasants can step with impunity over the glowing charcoal, provided they plant their feet squarely and do not stumble; for usage has so hardened their soles that the skin is converted into a sort of leathery or horny substance which is almost callous to heat. But sometimes, when they slip and a hot coal touches the sides of their feet or ankles, they may be seen to pull a wry face and jump out of the furnace amid the laughter of the spectators. When this part of the ceremony is over, the procession defiles round the village, and the priests distribute to every family a leaf of yellow paper inscribed with a magic character, which is thereupon glued over the door of the house. The peasants carry off the charred embers from the furnace, pound them to ashes, and mix the ashes with the fodder of their cattle, believing that it fattens them. However, the Chinese Government disapproves of these performances, and next morning a number of the performers may generally be seen in the hands of the police, laid face downwards on the ground and receiving a sound castigation on a part of their person which is probably more sensitive than the soles of their feet.

In this last festival the essential feature of the ceremony appears to be the passage of the image of the deity across the fire; it may be compared to the passage of the straw effigy of Kupalo across the midsummer bonfire in Russia. As we shall see presently, such customs may perhaps be interpreted as magical rites designed to produce light and warmth by subjecting the deity himself to the heat and glow of the furnace; and where, as at Barsana, priests or sorcerers have been accustomed in the discharge of their functions to walk through or over fire, they have sometimes done so as the living representatives or embodiments of deities, spirits, or other supernatural beings. Some confirmation of this view is furnished by

the beliefs and practices of the Dosadhs, a low Indian caste in Behar and Chota Nagpur. On the fifth, tenth, and full-moon days of three months in the year, the priest walks over a narrow trench filled with smouldering wood ashes, and is supposed thus to be inspired by the tribal god Rahu, who becomes incarnate in him for a time. Full of the spirit and also, it is surmised, of drink, the man of god then mounts a bamboo platform, where he sings hymns and distributes to the crowd leaves of *tulsi*, which cure incurable diseases, and flowers which cause barren women to become happy mothers. The service winds up with a feast lasting far into the night, at which the line that divides religious fervour from drunken revelry cannot always be drawn with absolute precision. Similarly the Bhuiyas, a Dravidian tribe of Mirzapur, worship their tribal hero Bir by walking over a short trench filled with fire, and they say that the man who is possessed by the hero does not feel any pain in the soles of his feet. Ceremonies of this sort used to be observed in most districts of the Madras Presidency, sometimes in discharge of vows made in time of sickness or distress, sometimes periodically in honour of a deity. Where the ceremony was observed periodically, it generally occurred in March or June, which are the months of the vernal equinox and the summer solstice respectively. A narrow trench, sometimes twenty yards long and half a foot deep, was filled with small sticks and twigs, mostly of tamarind, which were kindled and kept burning till they sank into a mass of glowing embers. Along this the devotees, often fifty or sixty in succession, walked, ran, or leaped barefoot. In 1854 the Madras Government instituted an enquiry into the custom, but found that it was not attended by danger or instances of injury sufficient to call for governmental interference.

The French traveller Sonnerat has described how, in the eighteenth century, the Hindoos celebrated a fire-festival of this sort in honour of the god Darma Rajah and his wife Drobedé (Draupadi). The festival lasted eighteen days, during which all who had vowed to take part in it were bound to fast, to practise continence, to sleep on the ground without a mat, and to walk on a furnace. On the eighteenth day the images of Darma Rajah and his spouse were carried in procession to the furnace, and the performers followed dancing, their heads crowned with flowers and their bodies smeared with saffron. The furnace consisted of a trench about forty feet long, filled with hot embers. When the images had been carried thrice round it, the worshippers walked over the embers, faster or slower, according to the degree of their religious fervour, some carrying their children in their arms, others brandishing spears, swords, and standards. This part of the ceremony being over, the bystanders hastened to rub their foreheads with ashes from the furnace, and to beg from the performers the flowers which they had worn in their hair; and such as obtained them preserved the flowers carefully. The rite was performed in honour of the goddess Drobedé (Draupadi), the heroine of the great Indian epic, the *Mahabharata*. For she married five brothers all at once; every year she left one of her husbands to betake herself to another, but before doing so she had to purify herself by fire. There was no fixed date for the celebration of the rite, but it could only be held in one of the first three months of the year. In some villages the ceremony is performed annually; in others, which cannot afford the expense every year, it is observed either at longer intervals, perhaps once in three, seven, ten, or twelve years, or only in special emergencies, such as the outbreak of smallpox, cholera, or plague. Anybody but a pariah or other person of very low degree may take part in the ceremony in fulfilment of a vow. For example, if a man suffers from some chronic malady, he may vow to Draupadi that, should he be healed of his disease, he will walk over the fire at her festival. As a preparation for the solemnity he sleeps in the temple and observes a fast. The celebration of the rite in any village is believed to protect the cattle and the crops and to guard the inhabitants from dangers of all kinds. When it is over, many people carry home the holy ashes of the fire as a talisman which will drive away devils and demons.

The Badagas, an agricultural tribe of the Neilgherry Hills in Southern India, annually celebrate a festival of fire in various parts of their country. For example, at Nidugala the festival is held with much ceremony in the month of January. Omens are taken by boiling two pots of milk side by side on two hearths. If the milk overflows uniformly on all sides, the crops will be abundant for all the villages; but if it flows over on one side only, the harvest will be good for villages on that side only. The sacred fire is made by friction, a vertical stick of *Rhodomyrtus tomentosus* being twirled by means of a cord in a socket let into a thick bough of *Debregeasia velutina*. With this holy flame a heap of wood of two sorts, the *Eugenia Jambolana* and *Phyllanthus Emblica*, is kindled, and the hot embers are spread over a fire-pit about five yards long and three yards broad. When all is ready, the priest ties bells on his legs and approaches the fire-pit, carrying milk freshly drawn from a cow which has calved for the first time, and also bearing flowers of *Rhododendron arboreum*, *Leucas aspera*, or jasmine. After doing obeisance, he throws the flowers on the embers and then pours some of the milk over them. If the omens are propitious, that is, if the flowers remain for a few seconds unscorched and the milk does not hiss when it falls on the embers, the priest walks boldly over the embers and is followed by a crowd of celebrants, who before they submit to the ordeal count the hairs on their feet. If any of the hairs are found to be singed after the passage through the fire-pit, it is an ill omen. Sometimes the Badagas drive their cattle, which have recovered from sickness, over the hot embers in performance of a vow. At Melur, another place of the Badagas in the Neilgherry Hills, three, five, or seven men are chosen to walk through the fire at the festival; and before they perform the ceremony they pour into an adjacent stream milk from cows which have calved for the first time during the year. A general feast follows the performance of the rite, and next day the land is ploughed and sown for the first time that season. At Jakkaneri, another place of the Badagas in the Neilgherry Hills, the passage through the fire at the festival “seems to have originally had some connection with agricultural prospects, as a young bull is made to go partly across the fire-pit before the other devotees, and the owners of young cows which have had their first calves during the year take precedence of others in the ceremony, and bring offerings of milk, which are sprinkled over the burning embers.” According to another account the ceremony among the Badagas was performed every second year at a harvest festival, and the performers were a set of degenerate Brahmans called Haruvarus, who “used to walk on burning coals with bare feet, pretending that the god they worshipped could allay the heat and make fire like cold water to them. As they only remained a few seconds, however, on the coals, it was impossible that they could receive much injury.”

In Japan the fire-walk is performed as a religious rite twice a year at a temple in the Kanda quarter of Tokio. One of the performances takes place in September. It was witnessed in the year 1903 by the wife of an American naval officer, who has described it. In a court of the temple a bed of charcoal about six yards long, two yards wide, and two feet deep was laid down and covered with a deep layer of straw. Being ignited, the straw blazed up, and when the flames had died down the bed of hot charcoal was fanned by attendants into a red glow. Priests dressed in robes of white cotton then walked round the fire, striking sparks from flint and steel and carrying trays full of salt. When mats had been laid down at the two ends of the fire and salt poured on them, the priests rubbed their bare feet twice in the salt and then walked calmly down the middle of the fire. They were followed by a number of people, including some boys and a woman with a baby in her arms. “The Shintoists claim that, having been perfectly purified by their prayers and ceremonies, no evil has any power over them. Fire they regard as the very spirit of evil; so twice a year, I believe, they go through this fire-walking as a kind of ‘outward and visible sign of inward spiritual grace.’”

In the island of Mbengga, one of the Fijian archipelago, once every year a dracaena, which grows in profusion on the grassy hillsides, becomes fit to yield the sugar of which its fibrous root is full. To render the roots edible it is necessary to bake them among hot stones for four days. A great pit is dug and filled with great stones and blazing logs, and when the flames have died down and the stones are at white heat, the oven is ready to receive the roots. At this moment the members of a certain clan called Na Ivilankata, favoured of the gods, leap into the oven and walk unharmed upon the hot stones, which would scorch the feet of any other persons. On one occasion when the ceremony was witnessed by Europeans fifteen men of the clan, dressed in garlands and fringes, walked unscathed through the furnace, where tongues of fire played among the hot stones. The pit was about nineteen feet wide and the men marched round it, planting their feet squarely and firmly on each stone. When they emerged from the pit, the feet of several were examined and shewed no trace of scorching; even the anklets of dried tree-fern leaves which they wore on their legs were unburnt. The immunity thus enjoyed by members of the clan in the fiery furnace is explained by a legend that in former days a chief of the clan, named Tui Nkualita, received for himself and his descendants this remarkable privilege from a certain god, whom the chief had accidentally dragged out of a deep pool of water by the hair of his head. A similar ceremony of walking through fire, or rather over a furnace of hot charcoal or hot stones, has also been observed in Tahiti, the Marquesas Islands, and by Hindoo coolies in the West Indian island of Trinidad; but the eye-witnesses who have described the rite, as it is observed in these islands, have said little or nothing as to its meaning and purpose, their whole attention having been apparently concentrated on the heat of the furnace and the state of the performers' legs before and after passing through it.

“Another grand custom of the Hottentots, which they likewise term *andersmaken*, is the driving their sheep at certain times through the fire. Early in the day appointed by a kraal for the observance of this custom, the women milk all their cows, and set the whole produce before their husbands. 'Tis a strict rule at those times that the women neither taste, nor suffer their children to touch, a drop of it. The whole quantity is sacred to the men, who drink it all up before they address themselves to the business of the fire. Having consumed the milk, some go and bring the sheep together to the place where the fire is to be lighted, while others repair to the place to light it. The fire is made of chips and dry twigs and thinly spread into a long square. Upon the coming up of the sheep, the fire, scattered into this figure, is covered with green twigs to raise a great smoak; and a number of men range themselves closely on both sides of it, making a lane for the sheep to pass through, and extending themselves to a good distance beyond the fire on the side where the sheep are to enter. Things being in this posture, the sheep are driven into the lane close up to the fire, which now smoaks in the thickest clouds. The foremost boggle, and being forced forward by the press behind, seek their escape by attempting breaches in the ranks. The men stand close and firm, and whoop and goad them forward; when a few hands, planted at the front of the fire, catch three or four of the foremost sheep by the head, and drag them through, and bring them round into the sight of the rest; which sometimes upon this, the whooping and goading continuing, follow with a tantivy, jumping and pouring themselves through the fire and smoak with a mighty clattering and fury. At other times they are not so tractable, but put the Hottentots to the trouble of dragging numbers of them through; and sometimes, in a great press and fright, sturdily attacking the ranks, they make a breach and escape. This is a very mortifying event at all times, the Hottentots, upon whatever account, looking upon it as a heavy disgrace and a very ill omen into the bargain. But when their labours here are attended with such success, that the sheep pass readily through or over the fire, 'tis hardly in the power of language to describe them in all the sallies of their joy.” The writer who thus describes the custom had great difficulty in extracting an explanation of it from the Hottentots. At last one of them

informed him that their country was much infested by wild dogs, which made terrible havoc among the cattle, worrying the animals to death even when they did not devour them. "Now we have it," he said, "from our ancestors, that if sheep are driven through the fire, as we say, that is, through a thick smoak, the wild dogs will not be fond of attacking them while the scent of the smoak remains upon their fleeces. We therefore from time to time, for the security of our flocks, perform this *andersmaken*."

When disease breaks out in a herd of the Nandi, a pastoral tribe of British East Africa, a large bonfire is made with the wood of a certain tree (*Olea chrysophilla*), and brushwood of two sorts of shrubs is thrown on the top. Then the sick herd is driven to the fire, and while the animals are standing near it, a sheep big with young is brought to them and anointed with milk by an elder, after which it is strangled by two men belonging to clans that may intermarry. The intestines are then inspected, and if the omens prove favourable, the meat is roasted and eaten; moreover rings are made out of the skin and worn by the cattle-owners. After the meat has been eaten, the herd is driven round the fire, and milk is poured on each beast. When their cattle are sick, the Zulus of Natal will collect their herds in a kraal, where a medicine-man kindles a fire, burns medicine in it, and so fumigates the cattle with the medicated smoke. Afterwards he sprinkles the herd with a decoction, and, taking some melted fat of the dead oxen in his mouth, squirts it on a fire-brand and holds the brand to each animal in succession. Such a custom is probably equivalent to the Hottentot and European practice of driving cattle through a fire.

Among the Indians of Yucatan the year which was marked in their calendar by the sign of *Cauac* was reputed to be very unlucky; they thought that in the course of it the death-rate would be high, the maize crops would be withered up by the extreme heat of the sun, and what remained of the harvest would be devoured by swarms of ants and birds. To avert these calamities they used to erect a great pyre of wood, to which most persons contributed a faggot. Having danced about it during the day, they set fire to it at night-fall, and when the flames had died down, they spread out the red embers and walked or ran barefoot over them, some of them escaping unsmirched by the flames, but others burning themselves more or less severely. In this way they hoped to conjure away the evils that threatened them, and to undo the sinister omens of the year.

Similar rites were performed at more than one place in classical antiquity. At Castabala, in Cappadocia, the priestesses of an Asiatic goddess, whom the Greeks called Artemis Perasia, used to walk barefoot through a furnace of hot charcoal and take no harm. Again, at the foot of Mount Soracte, in Italy, there was a sanctuary of a goddess Feronia, where once a year the men of certain families walked barefoot, but unscathed, over the glowing embers and ashes of a great fire of pinewood in presence of a vast multitude, who had assembled from all the country round about to pay their devotions to the deity or to ply their business at the fair. The families from whom the performers of the rite were drawn went by the name of Hirpi Sorani, or "Soranian Wolves"; and in consideration of the services which they rendered the state by walking through the fire, they were exempted, by a special decree of the senate, from military service and all public burdens. In the discharge of their sacred function, if we can trust the testimony of Strabo, they were believed to be inspired by the goddess Feronia. The ceremony certainly took place in her sanctuary, which was held in the highest reverence alike by Latins and Sabines; but according to Virgil and Pliny the rite was performed in honour of the god of the mountain, whom they call by the Greek name of Apollo, but whose real name appears to have been Soranus. If Soranus was a sun-god, as his name has by some been thought to indicate, we might perhaps conclude that the passage of his priests through the fire was a magical ceremony designed to procure a due supply of light and warmth for the earth by mimicking the sun's passage across the firmament. For so priceless a service, rendered at

some personal risk, it would be natural that the magicians should be handsomely rewarded by a grateful country, and that they should be released from the common obligations of earth in order the better to devote themselves to their celestial mission. The neighbouring towns paid the first-fruits of their harvest as tribute to the shrine, and loaded it besides with offerings of gold and silver, of which, however, it was swept clean by Hannibal when he hung with his dusky army, like a storm-cloud about to break, within sight of the sentinels on the walls of Rome.

§ 2. The Meaning of the Fire-walk.

The foregoing customs, observed in many different parts of the world, present at least a superficial resemblance to the modern European practices of leaping over fires and driving cattle through them; and we naturally ask whether it is not possible to discover a general explanation which will include them all. We have seen that two general theories have been proposed to account for the European practices; according to one theory the customs in question are sun-charms, according to the other they are purifications. Let us see how the two rival theories fit the other facts which we have just passed in review. To take the solar theory first, it is supported, first, by a statement that the fires at the Pongol festival in Southern India are intended to wake the sun-god or the fire-god from his sleep; and, second, by the etymology which connects Soranus, the god of Soracte, with the sun. But for reasons which have already been given, neither of these arguments carries much weight; and apart from them there appears to be nothing in the foregoing customs to suggest that they are sun-charms. Nay, some of the customs appear hardly reconcilable with such a view. For it is to be observed that the fire-walk is frequently practised in India and other tropical countries, where as a rule people would more naturally wish to abate than to increase the fierce heat of the sun. In Yucatan certainly the intention of kindling the bonfires cannot possibly have been to fan the solar flames, since one of the principal evils which the bonfires were designed to remedy was precisely the excessive heat of the sun, which had withered up the maize crops. Thus the solar theory is not strongly supported by any of the facts which we are considering, and it is actually inconsistent with some of them.

Not so with the purificatory theory. It is obviously applicable to some of the facts, and apparently consistent with them all. Thus we have seen that sick men make a vow to walk over the fire, and that sick cattle are driven over it. In such cases clearly the intention is to cleanse the suffering man or beast from the infection of disease, and thereby to restore him or it to health; and the fire is supposed to effect this salutary end, either by burning up the powers of evil or by interposing an insurmountable barrier between them and the sufferer. For it is to be remembered that evils which civilized men regard as impersonal are often conceived by uncivilized man in the personal shape of witches and wizards, of ghosts and hobgoblins; so that measures which we should consider as simple disinfectants the savage looks upon as obstacles opportunely presented to the attacks of demons or other uncanny beings. Now of all such obstacles fire seems generally to be thought the most effective; hence in passing through or leaping over it our primitive philosopher often imagines that he is not so much annihilating his spiritual foe as merely giving him the slip; the ghostly pursuer shrinks back appalled at the flames through which his intended victim, driven to desperation by his fears, has safely passed before him. This interpretation of the ceremony is confirmed, first, by the observation that in India the ashes of the bonfire are used as a talisman against devils and demons; and, second, by the employment of the ceremony for the avowed purpose of escaping from the pursuit of a troublesome ghost. For example, in China "they believe that a beheaded man wanders about a headless spectre in the World of Shades. Such spectres are frequently to be seen in walled towns, especially in the neighbourhood of places of execution. Here they often visit the people with disease and disaster, causing a considerable depreciation

in the value of the houses around such scenes. Whenever an execution takes place, the people fire crackers to frighten the headless ghost away from the spot; and the mandarin who has superintended the bloody work, on entering the gate of his mansion, has himself carried in his sedan chair over a fire lighted on the pavement, lest the headless apparition should enter there along with him; for disembodied spirits are afraid of fire." For a like reason Chinese mourners after a funeral, and persons who have paid a visit of condolence to a house of death, often purify themselves by stepping over a fire of straw; the purification, we cannot doubt, consists simply in shaking off the ghost who is supposed to dog their steps. Similarly at a coroner's inquest in China the mandarin and his subordinates hold pocket handkerchiefs or towels to their mouths and noses while they are inspecting the corpse, no doubt to hinder the ghost from insinuating himself into their bodies by these apertures; and when they have discharged their dangerous duty, they purify themselves by passing through a small fire of straw kindled on the pavement before they enter their sedan-chairs to return home, while at the same time the crowd of idlers, who have gathered about the door, assist in keeping the ghost at bay by a liberal discharge of crackers. The same double process of purification, or rather of repelling the ghost, by means of fire and crackers is repeated at the gate of the mandarin's residence when the procession defiles into it. Among some of the Tartars it used to be customary for all persons returning from a burial to leap over a fire made for the purpose, "in order that the dead man might not follow them; for apparently in their opinion he would be afraid of the fire." "The Yakuts bury their dead as a rule on the day of the death, and in order not to take the demon of death home with them, they kindle fires on the way back from the burial and jump over them in the belief that the demon of death, who dreads fire, will not follow them, and that in this way they will be freed from the persecutions of the hated demon of death." In Sikkhim, when members of the Khambu caste have buried a corpse, all persons present at the burial "adjourn to a stream for a bath of purification, and, on re-entering the house, have to tread on a bit of burning cloth, to prevent the evil spirits who attend at funerals from following them in." Among the Fans of West Africa, "when the mourning is over, the wives of the deceased must pass over a small lighted brazier in the middle of the village, then they sit down while some leaves are still burning under their feet; their heads are shaved, and from that moment they are purified from the mourning—perhaps we should translate: 'delivered from the ghost of their husband'—and may be divided among the heirs." At Agweh, on the Slave Coast of West Africa, a widow used to remain shut up for six months in the room where her husband was buried; at the end of the time a fire was lighted on the floor, and red peppers strewn in it, until in the pungent fumes the widow was nearly stifled. No doubt the intention was to rid her of her husband's ghost in order that she might mingle again in the world with safety to herself and others.

On the analogy of these customs, in which the purpose of the passage through the fire appears to be unmistakable, we may suppose that the motive of the rite is similar at the popular festivals of Europe and the like observances in other lands. In every case the ritual appears to be explained in a simple and natural way by the supposition that the performers believe themselves to be freed from certain evils, actual or threatened, through the beneficent agency of fire, which either burns up and destroys the noxious things or at all events repels and keeps them at bay. Indeed this belief, or at least this hope, is definitely expressed by some of the people who leap across the bonfires: they imagine that all ills are burnt up and consumed in the flames, or that they leave their sins, or at all events their fleas, behind them on the far side of the fire. But we may conjecture that originally all the evils from which the people thus thought to deliver themselves were conceived by them to be caused by personal beings, such as ghosts and demons or witches and warlocks, and that the fires were kindled for the sole purpose of burning or banning these noxious creatures. Of these evil powers witches and warlocks appear to have been the most dreaded by our European peasantry; and it is therefore

significant that the fires kindled on these occasions are often expressly alleged to burn the witches, that effigies of witches are not uncommonly consumed in them, and that two of the great periodic fire-festivals of the year, namely May Day and Midsummer Eve, coincide with the seasons when witches are believed to be most active and mischievous, and when accordingly many other precautions are taken against them. Thus if witchcraft, as a great part of mankind has believed, is the fertile source of almost all the calamities that afflict our species, and if the surest means of frustrating witchcraft is fire, then it follows as clearly as day follows night that to jump over a fire must be a sovereign panacea for practically all the ills that flesh is heir to. We can now, perhaps, fully understand why festivals of fire played so prominent a part in the religion or superstition of our heathen forefathers; the observance of such festivals flowed directly from their overmastering fear of witchcraft and from their theory as to the best way of combating that dreadful evil.

VII. The Burning of Human Beings in the Fires

§ 1. The Burning of Effigies in the Fires.

We have still to ask, What is the meaning of burning effigies in the fire at these festivals? After the preceding investigation the answer to the question seems obvious. As the fires are often alleged to be kindled for the purpose of burning the witches, and as the effigy burnt in them is sometimes called "the Witch," we might naturally be disposed to conclude that all the effigies consumed in the flames on these occasions represent witches or warlocks, and that the custom of burning them is merely a substitute for burning the wicked men and women themselves, since on the principle of homoeopathic or imitative magic you practically destroy the witch herself in destroying her effigy. On the whole this explanation of the burning of straw figures in human shape at the festivals appears to be the most probable.

Yet it may be that this explanation does not apply to all the cases, and that certain of them may admit and even require another interpretation, in favour of which I formerly argued as follows:—

"It remains to ask, What is the meaning of burning an effigy in these bonfires? The effigies so burned, as I have already remarked, can hardly be separated from the effigies of Death which are burned or otherwise destroyed in spring; and grounds have been already given for regarding the so-called effigies of Death as really representatives of the tree-spirit or spirit of vegetation. Are the other effigies, which are burned in the spring and midsummer bonfires, susceptible of the same explanation? It would seem so. For just as the fragments of the so-called Death are stuck in the fields to make the crops grow, so the charred embers of the figure burned in the spring bonfires are sometimes laid on the fields in the belief that they will keep vermin from the crop. Again, the rule that the last married bride must leap over the fire in which the straw-man is burned on Shrove Tuesday, is probably intended to make her fruitful. But, as we have seen, the power of blessing women with offspring is a special attribute of tree-spirits; it is therefore a fair presumption that the burning effigy over which the bride must leap is a representative of the fertilizing tree-spirit or spirit of vegetation. This character of the effigy, as representative of the spirit of vegetation, is almost unmistakable when the figure is composed of an unthreshed sheaf of corn or is covered from head to foot with flowers. Again, it is to be noted that, instead of a puppet, trees, either living or felled, are sometimes burned both in the spring and midsummer bonfires. Now, considering the frequency with which the tree-spirit is represented in human shape, it is hardly rash to suppose that when sometimes a tree and sometimes an effigy is burned in these fires, the effigy and the tree are regarded as equivalent to each other, each being a representative of the tree-spirit. This, again, is confirmed by observing, first, that sometimes the effigy which is to be burned is carried about simultaneously with a May-tree, the former being carried by the boys, the latter by the girls; and, second, that the effigy is sometimes tied to a living tree and burned with it. In these cases, we can scarcely doubt, the tree-spirit is represented, as we have found it represented before, in duplicate, both by the tree and by the effigy. That the true character of the effigy as a representative of the beneficent spirit of vegetation should sometimes be forgotten, is natural. The custom of burning a beneficent god is too foreign to later modes of thought to escape misinterpretation. Naturally enough the people who continued to burn his image came in time to identify it as the effigy of persons, whom, on various grounds, they regarded with aversion, such as Judas Iscariot, Luther, and a witch.

“The general reasons for killing a god or his representative have been examined in the preceding chapter. But when the god happens to be a deity of vegetation, there are special reasons why he should die by fire. For light and heat are necessary to vegetable growth; and, on the principle of sympathetic magic, by subjecting the personal representative of vegetation to their influence, you secure a supply of these necessities for trees and crops. In other words, by burning the spirit of vegetation in a fire which represents the sun, you make sure that, for a time at least, vegetation shall have plenty of sun. It may be objected that, if the intention is simply to secure enough sunshine for vegetation, this end would be better attained, on the principles of sympathetic magic, by merely passing the representative of vegetation through the fire instead of burning him. In point of fact this is sometimes done. In Russia, as we have seen, the straw figure of Kupalo is not burned in the midsummer fire, but merely carried backwards and forwards across it. But, for the reasons already given, it is necessary that the god should die; so next day Kupalo is stripped of her ornaments and thrown into a stream. In this Russian custom, therefore, the passage of the image through the fire is a sun-charm pure and simple; the killing of the god is a separate act, and the mode of killing him—by drowning—is probably a rain-charm. But usually people have not thought it necessary to draw this fine distinction; for the various reasons already assigned, it is advantageous, they think, to expose the god of vegetation to a considerable degree of heat, and it is also advantageous to kill him, and they combine these advantages in a rough-and-ready way by burning him.”

On the foregoing argument, which I do not now find very cogent, I would remark that we must distinguish the cases in which an effigy or an image is burnt in the fire from the cases in which it is simply carried through or over it. We have seen that in the Chinese festival of fire the image of the god is carried thrice by bearers over the glowing furnace. Here the motive for subjecting a god to the heat of the furnace must surely be the same as the motive for subjecting his worshippers to the same ordeal; and if the motive in the case of the worshippers is purificatory, it is probably the same in the case of the deity. In other words we may suppose that the image of a god is periodically carried over a furnace in order to purify him from the taint of corruption, the spells of magicians, or any other evil influences that might impair or impede his divine energies. The same theory would explain the custom of obliging the priest ceremonially to pass through the fire; the custom need not be a mitigation of an older practice of burning him in the flames, it may only be a purification designed to enable him the better to discharge his sacred duties as representative of the deity in the coming year. Similarly, when the rite is obligatory, not on the people as a whole, but only on certain persons chosen for the purpose, we may suppose that these persons act as representatives of the entire community, which thus passes through the fire by deputy and consequently participates in all the benefits which are believed to accrue from the purificatory character of the rite. In both cases, therefore, if my interpretation of them is correct, the passage over or through a fire is not a substitute for human sacrifice; it is nothing but a stringent form of purification.

§ 2. The Burning of Men and Animals in the Fires.

Yet in the popular customs connected with the fire-festivals of Europe there are certain features which appear to point to a former practice of human sacrifice. We have seen reasons for believing that in Europe living persons have often acted as representatives of the tree-spirit and corn-spirit and have suffered death as such. There is no reason, therefore, why they should not have been burned, if any special advantages were likely to be attained by putting them to death in that way. The consideration of human suffering is not one which enters into the calculations of primitive man. Now, in the fire-festivals which we are discussing, the pretence of burning people is sometimes carried so far that it seems reasonable to regard it as

a mitigated survival of an older custom of actually burning them. Thus in Aachen, as we saw, the man clad in peas-straw acts so cleverly that the children really believe he is being burned. At Jumièges in Normandy the man clad all in green, who bore the title of the Green Wolf, was pursued by his comrades, and when they caught him they feigned to fling him upon the mid-summer bonfire. Similarly at the Beltane fires in Scotland the pretended victim was seized, and a show made of throwing him into the flames, and for some time afterwards people affected to speak of him as dead. Again, in the Hallowe'en bonfires of north-eastern Scotland we may perhaps detect a similar pretence in the custom observed by a lad of lying down as close to the fire as possible and allowing the other lads to leap over him. The titular king at Aix, who reigned for a year and danced the first dance round the midsummer bonfire, may perhaps in days of old have discharged the less agreeable duty of serving as fuel for that fire which in later times he only kindled. In the following customs Mannhardt is probably right in recognizing traces of an old custom of burning a leaf-clad representative of the spirit of vegetation. At Wolfeck, in Austria, on Midsummer Day, a boy completely clad in green fir branches goes from house to house, accompanied by a noisy crew, collecting wood for the bonfire. As he gets the wood he sings—

*“Forest trees I want,
No sour milk for me,
But beer and wine,
So can the wood-man be jolly and gay.”*

In some parts of Bavaria, also, the boys who go from house to house collecting fuel for the midsummer bonfire envelop one of their number from head to foot in green branches of firs, and lead him by a rope through the whole village. At Moosheim, in Wurtemberg, the festival of St. John's Fire usually lasted for fourteen days, ending on the second Sunday after Midsummer Day. On this last day the bonfire was left in charge of the children, while the older people retired to a wood. Here they encased a young fellow in leaves and twigs, who, thus disguised, went to the fire, scattered it, and trod it out. All the people present fled at the sight of him.

In this connexion it is worth while to note that in pagan Europe the water as well as the fire seems to have claimed its human victim on Midsummer Day. Some German rivers, such as the Saale and the Spree, are believed still to require their victim on that day; hence people are careful not to bathe at this perilous season. Where the beautiful Neckar flows, between vine-clad and wooded hills, under the majestic ruins of Heidelberg castle, the spirit of the river seeks to drown three persons, one on Midsummer Eve, one on Midsummer Day, and one on the day after. On these nights, if you hear a shriek as of a drowning man or woman from the water, beware of running to the rescue; for it is only the water-fairy shrieking to lure you to your doom. Many a fisherman of the Elbe knows better than to launch his boat and trust himself to the treacherous river on Midsummer Day. And Samland fishermen will not go to sea at this season, because they are aware that the sea is then hollow and demands a victim. In the neighbourhood of the Lake of Constance the Swabian peasants say that on St. John's Day the Angel or St. John must have a swimmer and a climber; hence no one will climb a tree or bathe even in a brook on that day. According to others, St. John will have three dead men on his day; one of them must die by water, one by a fall, and one by lightning; therefore old-fashioned people warn their children not to climb or bathe, and are very careful themselves not to run into any kind of danger on Midsummer Day. So in some parts of Switzerland people are warned against bathing on St. John's Night, because the saint's day demands its victims. Thus in the Emmenthal they say, “This day will have three persons; one must perish in the air, one in the fire, and the third in the water.” At Schaffhausen the saying runs, “St. John the Baptist must have a runner, must have a swimmer, must have a climber.” That is the

reason why you should not climb cherry-trees on the saint's day, lest you should fall down and break your valuable neck. In Cologne the saint is more exacting; on his day he requires no less than fourteen dead men; seven of them must be swimmers and seven climbers. Accordingly when we find that, in one of the districts where a belief of this sort prevails, it used to be customary to throw a person into the water on Midsummer Day, we can hardly help concluding that this was only a modification of an older custom of actually drowning a human being in the river at that time. In Voigtland it was formerly the practice to set up a fine May tree, adorned with all kinds of things, on St. John's Day. The people danced round it, and when the lads had fetched down the things with which it was tricked out, the tree was thrown into the water. But before this was done, they sought out somebody whom they treated in the same manner, and the victim of this horseplay was called "the John." The brawls and disorders, which such a custom naturally provoked, led to the suppression of the whole ceremony.

At Rotenburg on the Neckar they throw a loaf of bread into the water on St. John's Day; were this offering not made, the river would grow angry and take away a man. Clearly, therefore, the loaf is regarded as a substitute which the spirit of the river consents to accept instead of a human victim. Elsewhere the water-sprite is content with flowers. Thus in Bohemia people sometimes cast garlands into water on Midsummer Eve; and if the water-sprite pulls one of them down, it is a sign that the person who threw the garland in will die. In the villages of Hesse the girl who first comes to the well early on the morning of Midsummer Day, places on the mouth of the well a gay garland composed of many sorts of flowers which she has culled from the fields and meadows. Sometimes a number of such garlands are twined together to form a crown, with which the well is decked. At Fulda, in addition to the flowery decoration of the wells, the neighbours choose a Lord of the Wells and announce his election by sending him a great nosegay of flowers; his house, too, is decorated with green boughs, and children walk in procession to it. He goes from house to house collecting materials for a feast, of which the neighbours partake on the following Sunday. What the other duties of the Lord of the Wells may be, we are not told. We may conjecture that in old days he had to see to it that the spirits of the water received their dues from men and maidens on that important day.

The belief that the spirits of the water exact a human life on Midsummer Day may partly explain why that day is regarded by some people as unlucky. At Neuburg, in Baden, people who meet on Midsummer Day bid each other beware. Sicilian mothers on that ominous day warn their little sons not to go out of the house, or, if they do go out, not to stray far, not to walk on solitary unfrequented paths, to avoid horses and carriages and persons with firearms, and not to dare to swim; in short they bid them be on their guard at every turn. The Sicilian writer who tells us this adds: "This I know and sadly remember ever since the year 1848, when, not yet seven years old, I beheld in the dusk of the evening on St. John's Day some women of my acquaintance bringing back in their arms my little brother, who had gone to play in a garden near our house, and there had found his death, my poor Francesco! In their simplicity the women who strove to console my inconsolable mother, driven distracted by the dreadful blow, kept repeating that St. John must have his due, that on that day he must be appeased. 'Who knows,' said they, 'how many other mothers are weeping now for other little sons forlorn!'"

Yet curiously enough, though the water-spirits call for human victims on Midsummer Eve or Midsummer Day, water in general is supposed at that season to acquire certain wonderful medicinal virtues, so that he who bathes in it then or drinks of it is not only healed of all his infirmities but will be well and hearty throughout the year. Hence in many parts of Europe, from Sweden in the north to Sicily in the south, and from Ireland and Spain in the west to Esthonia in the east it used to be customary for men, women, and children to bathe in crowds

in rivers, the sea, or springs on Midsummer Eve or Midsummer Day, hoping thus to fortify themselves for the next twelve months. The usual time for taking the bath was the night which intervenes between Midsummer Eve and Midsummer Day; but in Belgium the hour was noon on Midsummer Day. It was a curious sight, we are told, to see the banks of a river lined with naked children waiting for the first stroke of noon to plunge into the healing water. The dip was supposed to have a remarkable effect in strengthening the legs. People who were ashamed to bathe in public used to have cans of water brought to their houses from the river at midday, and then performed their ablutions in the privacy of their chambers. Nor did they throw away the precious fluid; on the contrary they bottled it up and kept it as a sort of elixir for use throughout the year. It was thought never to grow foul and to be as blessed as holy water fetched from a church, which we may well believe. Hence it served to guard the house against a thunder-storm; when the clouds were heavy and threatening, all you had to do was to take the palm branches (that is, the twigs of box-wood) which were blessed on Palm Sunday, dip them in the midsummer water, and burn them. That averted the tempest. In the Swiss canton of Lucerne a bath on Midsummer Eve is thought to be especially wholesome, though in other parts of Switzerland, as we saw, bathing at that season is accounted dangerous.

Nor are such customs and beliefs confined to the Christian peoples of Europe; they are shared also by the Mohammedan peoples of Morocco. There, too, on Midsummer Day all water is thought to be endowed with such marvellous virtue that it not only heals but prevents sickness for the rest of the year; hence men, women, and children bathe in the sea, in rivers, or in their houses at that time for the sake of their health. In Fez and other places on this day people pour or squirt water over each other in the streets or from the house-tops, so that the streets become almost as muddy as after a fall of rain. More than that, in the Andjra they bathe their animals also; horses, mules, donkeys, cattle, sheep, and goats, all must participate in the miraculous benefits of midsummer water. The rite forms part of that old heathen celebration of Midsummer which appears to have been common to the peoples on both sides of the Mediterranean; and as the aim of bathing in the midsummer water is undoubtedly purification, it is reasonable to assign the same motive for the custom of leaping over the midsummer bonfire. On the other hand some people in Morocco, like some people in Europe, think that water on Midsummer Day is unclean or dangerous. A Berber told Dr. Westermarck that water is haunted on Midsummer Day, and that people therefore avoid bathing in it and keep animals from drinking of it. And among the Beni Ahsen persons who swim in the river on that day are careful, before plunging into the water, to throw burning straw into it as an offering, in order that the spirits may not harm them. The parallelism between the rites of water and fire at this season is certainly in favour of interpreting both in the same way; and the traces of human sacrifice which we have detected in the rite of water may therefore be allowed to strengthen the inference of a similar sacrifice in the rite of fire.

But it seems possible to go farther than this. Of human sacrifices offered on these occasions the most unequivocal traces, as we have seen, are those which, about a hundred years ago, still lingered at the Beltane fires in the Highlands of Scotland, that is, among a Celtic people who, situated in a remote corner of Europe and almost completely isolated from foreign influence, had till then conserved their old heathenism better perhaps than any other people in the West of Europe. It is significant, therefore, that human sacrifices by fire are known, on unquestionable evidence, to have been systematically practised by the Celts. The earliest description of these sacrifices has been bequeathed to us by Julius Caesar. As conqueror of the hitherto independent Celts of Gaul, Caesar had ample opportunity of observing the national Celtic religion and manners, while these were still fresh and crisp from the native mint and had not yet been fused in the melting-pot of Roman civilization. With his own notes

Caesar appears to have incorporated the observations of a Greek explorer, by name Posidonius, who travelled in Gaul about fifty years before Caesar carried the Roman arms to the English Channel. The Greek geographer Strabo and the historian Diodorus seem also to have derived their descriptions of the Celtic sacrifices from the work of Posidonius, but independently of each other, and of Caesar, for each of the three derivative accounts contain some details which are not to be found in either of the others. By combining them, therefore, we can restore the original account of Posidonius with some probability, and thus obtain a picture of the sacrifices offered by the Celts of Gaul at the close of the second century before our era. The following seem to have been the main outlines of the custom. Condemned criminals were reserved by the Celts in order to be sacrificed to the gods at a great festival which took place once in every five years. The more there were of such victims, the greater was believed to be the fertility of the land. If there were not enough criminals to furnish victims, captives taken in war were immolated to supply the deficiency. When the time came the victims were sacrificed by the Druids or priests. Some they shot down with arrows, some they impaled, and some they burned alive in the following manner. Colossal images of wicker-work or of wood and grass were constructed; these were filled with live men, cattle, and animals of other kinds; fire was then applied to the images, and they were burned with their living contents.

Such were the great festivals held once every five years. But besides these quinquennial festivals, celebrated on so grand a scale, and with, apparently, so large an expenditure of human life, it seems reasonable to suppose that festivals of the same sort, only on a lesser scale, were held annually, and that from these annual festivals are lineally descended some at least of the fire-festivals which, with their traces of human sacrifices, are still celebrated year by year in many parts of Europe. The gigantic images constructed of osiers or covered with grass in which the Druids enclosed their victims remind us of the leafy framework in which the human representative of the tree-spirit is still so often encased. Hence, seeing that the fertility of the land was apparently supposed to depend upon the due performance of these sacrifices, Mannhardt interpreted the Celtic victims, cased in osiers and grass, as representatives of the tree-spirit or spirit of vegetation.

These wicker giants of the Druids seem to have had till lately their representatives at the spring and midsummer festivals of modern Europe. At Douay, down to the early part of the nineteenth century, a procession took place annually on the Sunday nearest to the seventh of July. The great feature of the procession was a colossal figure, some twenty or thirty feet high, made of osiers, and called "the giant," which was moved through the streets by means of rollers and ropes worked by men who were enclosed within the effigy. The wooden head of the giant is said to have been carved and painted by Rubens. The figure was armed as a knight with lance and sword, helmet and shield. Behind him marched his wife and his three children, all constructed of osiers on the same principle, but on a smaller scale. At Dunkirk the procession of the giants took place on Midsummer Day, the twenty-fourth of June. The festival, which was known as the Follies of Dunkirk, attracted such multitudes of spectators, that the inns and private houses could not lodge them all, and many had to sleep in cellars or in the streets. In 1755 an eye-witness estimated that the number of onlookers was not less than forty thousand, without counting the inhabitants of the town. The streets through which the procession took its way were lined with double ranks of soldiers, and the houses crammed with spectators from top to bottom. High mass was celebrated in the principal church and then the procession got under weigh. First came the guilds or brotherhoods, the members walking two and two with great waxen tapers, lighted, in their hands. They were followed by the friars and the secular priests, and then came the Abbot, magnificently attired, with the Host borne before him by a venerable old man. When these were past, the real "Follies of

Dunkirk” began. They consisted of pageants of various sorts wheeled through the streets in cars. These appear to have varied somewhat from year to year; but if we may judge from the processions of 1755 and 1757, both of which have been described by eye-witnesses, a standing show was a car decked with foliage and branches to imitate a wood, and carrying a number of men dressed in leaves or in green scaly skins, who squirted water on the people from pewter syringes. An English spectator has compared these maskers to the Green Men of our own country on May Day. Last of all came the giant and giantess. The giant was a huge figure of wicker-work, occasionally as much as forty-five feet high, dressed in a long blue robe with gold stripes, which reached to his feet, concealing the dozen or more men who made it dance and bob its head to the spectators. This colossal effigy went by the name of Papa Reuss, and carried in its pocket a bouncing infant of Brobdingnagian proportions, who kept bawling “Papa! papa!” in a voice of thunder, only pausing from time to time to devour the victuals which were handed out to him from the windows. The rear was brought up by the daughter of the giant, constructed, like her sire, of wicker-work, and little, if at all, inferior to him in size. She wore a rose-coloured robe, with a gold watch as large as a warming pan at her side: her breast glittered with jewels: her complexion was high, and her eyes and head turned with as easy a grace as the men inside could contrive to impart to their motions. The procession came to an end with the revolution of 1789, and has never been revived. The giant himself indeed, who had won the affections of the townspeople, survived his ancient glory for a little while and made shift to appear in public a few times more at the Carnival and other festal occasions; but his days were numbered, and within fifty years even his memory had seemingly perished.

Most towns and even villages of Brabant and Flanders have, or used to have, similar wicker giants which were annually led about to the delight of the populace, who loved these grotesque figures, spoke of them with patriotic enthusiasm, and never wearied of gazing at them. The name by which the giants went was Reuzes, and a special song called the Reuze song was sung in the Flemish dialect while they were making their triumphal progress through the streets. The most celebrated of these monstrous effigies were those of Antwerp and Wetteren. At Ypres a whole family of giants contributed to the public hilarity at the Carnival. At Cassel and Hazebrouch, in the French department of Nord, the giants made their annual appearance on Shrove Tuesday. At Antwerp the giant was so big that no gate in the city was large enough to let him go through; hence he could not visit his brother giants in neighbouring towns, as the other Belgian giants used to do on solemn occasions. He was designed in 1534 by Peter van Aelst, painter to the Emperor Charles the Fifth, and is still preserved with other colossal figures in a large hall at Antwerp. At Ath, in the Belgian province of Hainaut, the popular procession of the giants took place annually in August down to the year 1869 at least. For three days the colossal effigies of Goliath and his wife, of Samson and an Archer (*Tirant*), together with a two-headed eagle, were led about the streets on the shoulders of twenty bearers concealed under the flowing drapery of the giants, to the great delight of the townspeople and a crowd of strangers who assembled to witness the pageant. The custom can be traced back by documentary evidence to the middle of the fifteenth century; but it appears that the practice of giving Goliath a wife dates only from the year 1715. Their nuptials were solemnized every year on the eve of the festival in the church of St. Julien, whither the two huge figures were escorted by the magistrates in procession.

In England artificial giants seem to have been a standing feature of the midsummer festival. A writer of the sixteenth century speaks of “Midsommer pageants in London, where to make the people wonder, are set forth great and uglie gyants marching as if they were alive, and armed at all points, but within they are stuffed full of browne paper and tow, which the shrewd boyes, underpeering, do guilefully discover, and turne to a greate derision.” At

Chester the annual pageant on Midsummer Eve included the effigies of four giants, with animals, hobby-horses, and other figures. An officious mayor of the town suppressed the giants in 1599, but they were restored by another mayor in 1601. Under the Commonwealth the pageant was discontinued, and the giants and beasts were destroyed; but after the restoration of Charles II. the old ceremony was revived on the old date, new effigies being constructed to replace those which had fallen victims to Roundhead bigotry. The accounts preserve a record not only of the hoops, buckram, tinfoil, gold and silver leaf, paint, glue, and paste which went to make up these gorgeous figures; they also mention the arsenic which was mixed with the paste in order to preserve the poor giants from being eaten alive by the rats. At Coventry the accounts of the Cappers' and Drapers' Companies in the sixteenth century shed light on the giants which there also were carried about the town at Midsummer; from some of the entries it appears that the giant's wife figured beside the giant. At Burford, in Oxfordshire, Midsummer Eve used to be celebrated with great jollity by the carrying of a giant and a dragon up and down the town. The last survivor of these perambulating English giants dragged out a miserable existence at Salisbury, where an antiquary found him mouldering to decay in the neglected hall of the Tailors' Company about the year 1844. His bodily framework was of lath and hoop like the one which used to be worn by Jack-in-the-Green on May Day. The drapery, which concealed the bearer, was of coloured chintz, bordered with red and purple, and trimmed with yellow fringe. His head was modelled in paste-board and adorned with a gold-laced cocked hat: his flowing locks were of tow; and in his big right hand he brandished a branch of artificial laurel. In the days of his glory he promenaded about the streets, dancing clumsily and attended by two men grotesquely attired, who kept a watchful eye on his movements and checked by the wooden sword and club which they carried any incipient tendency to lose his balance and topple over in an undignified manner, which would have exposed to the derision of the populace the mystery of his inner man. The learned called him St. Christopher, the vulgar simply the giant.

In these cases the giants only figure in the processions. But sometimes they were burned in the summer bonfires. Thus the people of the Rue aux Ours in Paris used annually to make a great wicker-work figure, dressed as a soldier, which they promenaded up and down the streets for several days, and solemnly burned on the third of July, the crowd of spectators singing *Salve Regina*. A personage who bore the title of king presided over the ceremony with a lighted torch in his hand. The burning fragments of the image were scattered among the people, who eagerly scrambled for them. The custom was abolished in 1743. In Brie, Isle de France, a wicker-work giant, eighteen feet high, was annually burned on Midsummer Eve.

Again, the Druidical custom of burning live animals, enclosed in wicker-work, has its counterpart at the spring and midsummer festivals. At Luchon in the Pyrenees on Midsummer Eve "a hollow column, composed of strong wicker-work, is raised to the height of about sixty feet in the centre of the principal suburb, and interlaced with green foliage up to the very top; while the most beautiful flowers and shrubs procurable are artistically arranged in groups below, so as to form a sort of background to the scene. The column is then filled with combustible materials, ready for ignition. At an appointed hour—about 8 p.m.—a grand procession, composed of the clergy, followed by young men and maidens in holiday attire, pour forth from the town chanting hymns, and take up their position around the column. Meanwhile, bonfires are lit, with beautiful effect, in the surrounding hills. As many living serpents as could be collected are now thrown into the column, which is set on fire at the base by means of torches, armed with which about fifty boys and men dance around with frantic gestures. The serpents, to avoid the flames, wriggle their way to the top, whence they are seen lashing out laterally until finally obliged to drop, their struggles for life giving rise to enthusiastic delight among the surrounding spectators. This is a favourite annual ceremony

for the inhabitants of Luchon and its neighbourhood, and local tradition assigns it to a heathen origin." In the midsummer fires formerly kindled on the Place de Grève at Paris it was the custom to burn a basket, barrel, or sack full of live cats, which was hung from a tall mast in the midst of the bonfire; sometimes a fox was burned. The people collected the embers and ashes of the fire and took them home, believing that they brought good luck. The French kings often witnessed these spectacles and even lit the bonfire with their own hands. In 1648 Louis the Fourteenth, crowned with a wreath of roses and carrying a bunch of roses in his hand, kindled the fire, danced at it and partook of the banquet afterwards in the town hall. But this was the last occasion when a monarch presided at the midsummer bonfire in Paris. At Metz midsummer fires were lighted with great pomp on the esplanade, and a dozen cats, enclosed in wicker-cages, were burned alive in them, to the amusement of the people. Similarly at Gap, in the department of the High Alps, cats used to be roasted over the midsummer bonfire. In Russia a white cock was sometimes burned in the midsummer bonfire; in Meissen or Thuringia a horse's head used to be thrown into it. Sometimes animals are burned in the spring bonfires. In the Vosges cats were burned on Shrove Tuesday; in Alsace they were thrown into the Easter bonfire. In the department of the Ardennes cats were flung into the bonfires kindled on the first Sunday in Lent; sometimes, by a refinement of cruelty, they were hung over the fire from the end of a pole and roasted alive. "The cat, which represented the devil, could never suffer enough." While the creatures were perishing in the flames, the shepherds guarded their flocks and forced them to leap over the fire, esteeming this an infallible means of preserving them from disease and witchcraft. We have seen that squirrels were sometimes burned in the Easter fire.

Thus it appears that the sacrificial rites of the Celts of ancient Gaul can be traced in the popular festivals of modern Europe. Naturally it is in France, or rather in the wider area comprised within the limits of ancient Gaul, that these rites have left the clearest traces in the customs of burning giants of wicker-work and animals enclosed in wicker-work or baskets. These customs, it will have been remarked, are generally observed at or about midsummer. From this we may infer that the original rites of which these are the degenerate successors were solemnized at midsummer. This inference harmonizes with the conclusion suggested by a general survey of European folk-custom, that the midsummer festival must on the whole have been the most widely diffused and the most solemn of all the yearly festivals celebrated by the primitive Aryans in Europe. At the same time we must bear in mind that among the British Celts the chief fire-festivals of the year appear certainly to have been those of Beltane (May Day) and Hallowe'en (the last day of October); and this suggests a doubt whether the Celts of Gaul also may not have celebrated their principal rites of fire, including their burnt sacrifices of men and animals, at the beginning of May or the beginning of November rather than at Midsummer.

We have still to ask, What is the meaning of such sacrifices? Why were men and animals burnt to death at these festivals? If we are right in interpreting the modern European fire-festivals as attempts to break the power of witchcraft by burning or banning the witches and warlocks, it seems to follow that we must explain the human sacrifices of the Celts in the same manner; that is, we must suppose that the men whom the Druids burnt in wicker-work images were condemned to death on the ground that they were witches or wizards, and that the mode of execution by fire was chosen because, as we have seen, burning alive is deemed the surest mode of getting rid of these noxious and dangerous beings. The same explanation would apply to the cattle and wild animals of many kinds which the Celts burned along with the men. They, too, we may conjecture, were supposed to be either under the spell of witchcraft or actually to be the witches and wizards, who had transformed themselves into animals for the purpose of prosecuting their infernal plots against the welfare of their fellow

creatures. This conjecture is confirmed by the observation that the victims most commonly burned in modern bonfires have been cats, and that cats are precisely the animals into which, with the possible exception of hares, witches were most usually supposed to transform themselves. Again, we have seen that serpents and foxes used sometimes to be burnt in the midsummer fires; and Welsh and German witches are reported to have assumed the form both of foxes and serpents. In short, when we remember the great variety of animals whose forms witches can assume at pleasure, it seems easy on this hypothesis to account for the variety of living creatures that have been burnt at festivals both in ancient Gaul and modern Europe; all these victims, we may surmise, were doomed to the flames, not because they were animals, but because they were believed to be witches who had taken the shape of animals for their nefarious purposes. One advantage of explaining the ancient Celtic sacrifices in this way is that it introduces, as it were, a harmony and consistency into the treatment which Europe has meted out to witches from the earliest times down to about two centuries ago, when the growing influence of rationalism discredited the belief in witchcraft and put a stop to the custom of burning witches. On this view the Christian Church in its dealings with the black art merely carried out the traditional policy of Druidism, and it might be a nice question to decide which of the two, in pursuance of that policy, exterminated the larger number of innocent men and women. Be that as it may, we can now perhaps understand why the Druids believed that the more persons they sentenced to death, the greater would be the fertility of the land. To a modern reader the connexion at first sight may not be obvious between the activity of the hangman and the productivity of the earth. But a little reflection may satisfy him that when the criminals who perish at the stake or on the gallows are witches, whose delight it is to blight the crops of the farmer or to lay them low under storms of hail, the execution of these wretches is really calculated to ensure an abundant harvest by removing one of the principal causes which paralyze the efforts and blast the hopes of the husbandman.

The Druidical sacrifices which we are considering were explained in a different way by W. Mannhardt. He supposed that the men whom the Druids burned in wickerwork images represented the spirits of vegetation, and accordingly that the custom of burning them was a magical ceremony intended to secure the necessary sunshine for the crops. Similarly, he seems to have inclined to the view that the animals which used to be burnt in the bonfires represented the corn-spirit, which, as we saw in an earlier part of this work, is often supposed to assume the shape of an animal. This theory is no doubt tenable, and the great authority of W. Mannhardt entitles it to careful consideration. I adopted it in former editions of this book; but on reconsideration it seems to me on the whole to be less probable than the theory that the men and animals burnt in the fires perished in the character of witches. This latter view is strongly supported by the testimony of the people who celebrate the fire-festivals, since a popular name for the custom of kindling the fires is "burning the witches," effigies of witches are sometimes consumed in the flames, and the fires, their embers, or their ashes are supposed to furnish protection against witchcraft. On the other hand there is little to shew that the effigies or the animals burnt in the fires are regarded by the people as representatives of the vegetation-spirit, and that the bonfires are sun-charms. With regard to serpents in particular, which used to be burnt in the midsummer fire at Luchon, I am not aware of any certain evidence that in Europe snakes have been regarded as embodiments of the tree-spirit or corn-spirit, though in other parts of the world the conception appears to be not unknown. Whereas the popular faith in the transformation of witches into animals is so general and deeply rooted, and the fear of these uncanny beings is so strong, that it seems safer to suppose that the cats and other animals which were burnt in the fire suffered death as embodiments of witches than that they perished as representatives of vegetation-spirits.

VIII. The Magic Flowers of Midsummer Eve

A feature of the great midsummer festival remains to be considered, which may perhaps help to clear up the doubt as to the meaning of the fire-ceremonies and their relation to Druidism. For in France and England, the countries where the sway of the Druids is known to have been most firmly established, Midsummer Eve is still the time for culling certain magic plants, whose evanescent virtue can be secured at this mystic season alone. Indeed all over Europe antique fancies of the same sort have lingered about Midsummer Eve, imparting to it a fragrance of the past, like withered rose leaves that, found by chance in the pages of an old volume, still smell of departed summers. Thus in Saintonge and Aunis, two of the ancient provinces of Western France, we read that "of all the festivals for which the merry bells ring out there is not one which has given rise to a greater number of superstitious practices than the festival of St. John the Baptist. The Eve of St. John was the day of all days for gathering the wonderful herbs by means of which you could combat fever, cure a host of diseases, and guard yourself against sorcerers and their spells. But in order to attain these results two conditions had to be observed; first, you must be fasting when you gathered the herbs, and second, you must cull them before the sun rose. If these conditions were not fulfilled, the plants had no special virtue." In the neighbouring province of Perigord the person who gathered the magic herbs before sunrise at this season had to walk backwards, to mutter some mystic words, and to perform certain ceremonies. The plants thus collected were carefully kept as an infallible cure for fever; placed above beds and the doors of houses and of cattle-sheds they protected man and beast from disease, witchcraft, and accident. In Normandy a belief in the marvellous properties of herbs and plants, of flowers and seeds and leaves gathered, with certain traditional rites, on the Eve or the Day of St. John has remained part of the peasant's creed to this day. Thus he fancies that seeds of vegetables and plants, which have been collected on St. John's Eve, will keep better than others, and that flowers plucked that day will never fade. Indeed so widespread in France used to be the faith in the magic virtue of herbs culled on that day that there is a French proverb "to employ all the herbs of St. John in an affair," meaning "to leave no stone unturned." In the early years of the nineteenth century a traveller reported that at Marseilles, "on the Eve of St. John, the Place de Noailles and the course are cleaned. From three o'clock in the morning the country-people flock thither, and by six o'clock the whole place is covered with a considerable quantity of flowers and herbs, aromatic or otherwise. The folk attribute superstitious virtues to these plants; they are persuaded that if they have been gathered the same day before sunrise they are fitted to heal many ailments. People buy them emulously to give away in presents and to fill the house with." On the Eve of St. John (Midsummer Eve), before sunset, the peasants of Perche still gather the herb called St. John's herb. It is a creeping plant, very aromatic, with small flowers of a violet blue. Other scented flowers are added, and out of the posies they make floral crosses and crowns, which they hang up over the doors of houses and stables. Such floral decorations are sold like the box-wood on Palm Sunday, and the withered wreaths are kept from year to year. If an animal dies, it may be a cow, they carefully clean the byre or the stable, make a pile of these faded garlands, and set them on fire, having previously closed up all the openings and interstices, so that the whole place is thoroughly fumigated. This is thought to eradicate the germs of disease from the byre or stable. At Nellingen, near Saaralben, in Lorraine the hedge doctors collect their store of simples between eleven o'clock and noon on Midsummer Day; and on that day nut-water is brewed from nuts that have been picked on the stroke of noon. Such water is a panacea for all ailments. In the Vosges Mountains they say that wizards have but one day in the year, and but one hour in that day, to

find and cull the baleful herbs which they use in their black art. That day is the Eve of St. John, and that hour is the time when the church bells are ringing the noonday Angelus. Hence in many villages they say that the bells ought not to ring at noon on that day.

In the Tyrol also they think that the witching hour is when the *Ave Maria* bell is ringing on Midsummer Eve, for then the witches go forth to gather the noxious plants whereby they raise thunderstorms. Therefore in many districts the bells ring for a shorter time than usual that evening; at Folgareit the sexton used to steal quietly into the church, and when the clock struck three he contented himself with giving a few pulls to the smallest of the bells. At Rengen, in the Eifel Mountains, the sexton rings the church bell for an hour on the afternoon of Midsummer Day. As soon as the bell begins to ring, the children run out into the meadows, gather flowers, and weave them into garlands which they throw on the roofs of the houses and buildings. There the garlands remain till the wind blows them away. It is believed that they protect the houses against fire and thunderstorms. At Niederehe, in the Eifel Mountains, on Midsummer Day little children used to make wreaths and posies out of "St. John's flowers and Maiden-flax" and throw them on the roofs. Some time afterwards, when the wild gooseberries were ripe, all the children would gather round an old woman on a Sunday afternoon, and taking the now withered wreaths and posies with them march out of the village, praying while they walked. Wreaths and posies were then thrown in a heap and kindled, whereupon the children snatched them up, still burning, and ran and fumigated the wild gooseberry bushes with the smoke. Then they returned with the old woman to the village, knelt down before her, and received her blessing. From that time the children were free to pick and eat the wild gooseberries. In the Mark of Brandenburg the peasants gather all sorts of simples on Midsummer Day, because they are of opinion that the drugs produce their medicinal effect only if they have been culled at that time. Many of these plants, especially roots, must be dug up at midnight and in silence. In Mecklenburg not merely is a special healing virtue ascribed to simples collected on Midsummer Day; the very smoke of such plants, if they are burned in the fire, is believed to protect a house against thunder and lightning, and to still the raging of the storm. The Wends of the Spreewald twine wreaths of herbs and flowers at midsummer, and hang them up in their rooms; and when any one gets a fright he will lay some of the leaves and blossoms on hot coals and fumigate himself with the smoke. In Eastern Prussia, some two hundred years ago, it used to be customary on Midsummer Day to make up a bunch of herbs of various sorts and fasten it to a pole, which was then put up over the gate or door through which the corn would be brought in at harvest. Such a pole was called Kaupole, and it remained in its place till the crops had been reaped and garnered. Then the bunch of herbs was taken down; part of it was put with the corn in the barn to keep rats and mice from the grain, and part was kept as a remedy for diseases of all sorts.

The Germans of West Bohemia collect simples on St. John's Night, because they believe the healing virtue of the plants to be especially powerful at that time. The theory and practice of the Huzuls in the Carpathian Mountains are similar; they imagine that the plants gathered on that night are not only medicinal but possess the power of restraining the witches; some say that the herbs should be plucked in twelve gardens or meadows. Among the simples which the Czechs and Moravians of Silesia cull at this season are dandelions, ribwort, and the bloom of the lime-tree. The Esthonians of the island of Oesel gather St. John's herbs (*Jani rohhud*) on St. John's Day, tie them up in bunches, and hang them up about the houses to prevent evil spirits from entering. A subsidiary use of the plants is to cure diseases; gathered at that time they have a greater medical value than if they were collected at any other season. Everybody does not choose exactly the same sorts of plants; some gather more and some less, but in the collection St. John's wort (*Jani rohhi*, *Hypericum perforatum*) should never be

wanting. A writer of the early part of the seventeenth century informs us that the Livonians, among whom he lived, were impressed with a belief in the great and marvellous properties possessed by simples which had been culled on Midsummer Day. Such simples, they thought, were sure remedies for fever and for sickness and pestilence in man and beast; but if gathered one day too late they lost all their virtue. Among the Letts of the Baltic provinces of Russia girls and women go about on Midsummer Day crowned with wreaths of aromatic plants, which are afterwards hung up for good luck in the houses. The plants are also dried and given to cows to eat, because they are supposed to help the animals to calve.

In Bulgaria St. John's Day is the special season for culling simples. On this day, too, Bulgarian girls gather nosegays of a certain white flower, throw them into a vessel of water, and place the vessel under a rose-tree in bloom. Here it remains all night. Next morning they set it in the courtyard and dance singing round it. An old woman then takes the flowers out of the vessel, and the girls wash themselves with the water, praying that God would grant them health throughout the year. After that the old woman restores her nosegay to each girl and promises her a rich husband. Among the South Slavs generally on St. John's Eve it is the custom for girls to gather white flowers in the meadows and to place them in a sieve or behind the rafters. A flower is assigned to each member of the household: next morning the flowers are inspected; and he or she whose flower is fresh will be well the whole year, but he or she whose flower is faded will be sickly or die. Garlands are then woven out of the flowers and laid on roofs, folds, and beehives. In some parts of Macedonia on St. John's Eve the peasants are wont to festoon their cottages and gird their own waists with wreaths of what they call St. John's flower; it is the blossom of a creeping plant which resembles honeysuckle. Similar notions as to the magical virtue which plants acquire at midsummer have been transported by Europeans to the New World. At La Paz in Bolivia people believe that flowers of mint (*Yerba buena*) gathered before sunrise on St. John's Day foretell an endless felicity to such as are so lucky as to find them.

Nor is the superstition confined to Europe and to people of European descent. In Morocco also the Mohammedans are of opinion that certain plants, such as penny-royal, marjoram, and the oleander, acquire a special magic virtue (*baraka*) when they are gathered shortly before midsummer. Hence the people collect these plants at this season and preserve them for magical or medical purposes. For example, branches of oleander are brought into the houses before midsummer and kept under the roof as a charm against the evil eye; but while the branches are being brought in they may not touch the ground, else they would lose their marvellous properties. Cases of sickness caused by the evil eye are cured by fumigating the patients with the smoke of these boughs. The greatest efficacy is ascribed to "the sultan of the oleander," which is a stalk with four pairs of leaves clustered round it. Such a stalk is always endowed with magical virtue, but that virtue is greatest when the stalk has been cut just before midsummer. Arab women in the Hiaina district of Morocco gather *Daphne gnidium* on Midsummer Day, dry it in the sun, and make it into a powder which, mixed with water, they daub on the heads of their little children to protect them from sunstroke and vermin and to make their hair grow well. Indeed such marvellous powers do these Arabs attribute to plants at this mystic season that a barren woman will walk naked about a vegetable garden on Midsummer Night in the hope of conceiving a child through the fertilizing influence of the vegetables.

Sometimes in order to produce the desired effect it is deemed necessary that seven or nine different sorts of plants should be gathered at this mystic season. Norman peasants, who wish to fortify themselves for the toil of harvest, will sometimes go out at dawn on St. John's Day and pull seven kinds of plants, which they afterwards eat in their soup as a means of imparting strength and suppleness to their limbs in the harvest field. In Mecklenburg maidens

are wont to gather seven sorts of flowers at noon on Midsummer Eve. These they weave into garlands, and sleep with them under their pillows. Then they are sure to dream of the men who will marry them. But the flowers on which youthful lovers dream at Midsummer Eve are oftener nine in number. Thus in Voigtland nine different kinds of flowers are twined into a garland at the hour of noon, but they may not enter the dwelling by the door in the usual way; they must be passed through the window, or, if they come in at the door, they must be thrown, not carried, into the house. Sleeping on them that night you will dream of your future wife or future husband. The Bohemian maid, who gathers nine kinds of flowers on which to dream of love at Midsummer Eve, takes care to wrap her hand in a white cloth, and afterwards to wash it in dew; and when she brings her garland home she must speak no word to any soul she meets by the way, for then all the magic virtue of the flowers would be gone. Other Bohemian girls look into the book of fate at this season after a different fashion. They twine their hair with wreaths made of nine sorts of leaves, and go, when the stars of the summer night are twinkling in the sky, to a brook that flows beside a tree. There, gazing on the stream, the girl beholds, beside the broken reflections of the tree and the stars, the watery image of her future lord. So in Masuren maidens gather nosegays of wild flowers in silence on Midsummer Eve. At the midnight hour each girl takes the nosegay and a glass of water, and when she has spoken certain words she sees her lover mirrored in the water.

Sometimes Bohemian damsels make a different use of their midsummer garlands twined of nine sorts of flowers. They lie down with the garland laid as a pillow under their right ear, and a hollow voice, swooning from underground, proclaims their destiny. Yet another mode of consulting the oracle by means of these same garlands is to throw them backwards and in silence upon a tree at the hour of noon, just when the flowers have been gathered. For every time that the wreath is thrown without sticking to the branches of the tree the girl will have a year to wait before she weds. This mode of divination is practised in Voigtland, East Prussia, Silesia, Belgium, and Wales, and the same thing is done in Masuren, although we are not told that there the wreaths must be composed of nine sorts of flowers. However, in Masuren chaplets of nine kinds of herbs are gathered on St. John's Eve and put to a more prosaic use than that of presaging the course of true love. They are carefully preserved, and the people brew a sort of tea from them, which they administer as a remedy for many ailments; or they keep the chaplets under their pillows till they are dry, and thereupon dose their sick cattle with them. In Esthonia the virtues popularly ascribed to wreaths of this sort are many and various. These wreaths, composed of nine kinds of herbs culled on the Eve or the Day of St. John, are sometimes inserted in the roof or hung up on the walls of the house, and each of them receives the name of one of the inmates. If the plants which have been thus dedicated to a girl happen to take root and grow in the chinks and crannies, she will soon wed; if they have been dedicated to an older person and wither away, that person will die. The people also give them as medicine to cattle at the time when the animals are driven forth to pasture; or they fumigate the beasts with the smoke of the herbs, which are burnt along with shavings from the wooden threshold. Bunches of the plants are also hung about the house to keep off evil spirits, and maidens lay them under their pillows to dream on. In Sweden the "Midsummer Brooms," made up of nine sorts of flowers gathered on Midsummer Eve, are put to nearly the same uses. Fathers of families hang up such "brooms" to the rafters, one for each inmate of the house; and he or she whose broom (*quast*) is the first to wither will be the first to die. Girls also dream of their future husbands with these bunches of flowers under their pillows. A decoction made from the flowers is, moreover, a panacea for all disorders, and if a bunch of them be hung up in the cattle shed, the Troll cannot enter to bewitch the beasts. The Germans of Moravia think that nine kinds of herbs gathered on St. John's Night (Midsummer Eve) are a remedy for fever; and some of the Wends attribute a curative virtue in general to such plants.

Of the flowers which it has been customary to gather for purposes of magic or divination at midsummer none perhaps is so widely popular as St. John's wort (*Hypericum perforatum*). The reason for associating this particular plant with the great summer festival is perhaps not far to seek, for the flower blooms about Midsummer Day, and with its bright yellow petals and masses of golden stamens it might well pass for a tiny copy on earth of the great sun which reaches its culminating point in heaven at this season. Gathered on Midsummer Eve, or on Midsummer Day before sunrise, the blossoms are hung on doorways and windows to preserve the house against thunder, witches, and evil spirits; and various healing properties are attributed to the different species of the plant. In the Tyrol they say that if you put St. John's wort in your shoe before sunrise on Midsummer Day you may walk as far as you please without growing weary. In Scotland people carried it about their persons as an amulet against witchcraft. On the lower Rhine children twine chaplets of St. John's wort on the morning of Midsummer Day, and throw them on the roofs of the houses. Here, too, the people who danced round the midsummer bonfires used to wear wreaths of these yellow flowers in their hair, and to deck the images of the saints at wayside shrines with the blossoms. Sometimes they flung the flowers into the bonfires. In Sicily they dip St. John's wort in oil, and so apply it as a balm for every wound. During the Middle Ages the power which the plant notoriously possesses of banning devils won for it the name of *fuga daemonum*; and before witches and wizards were stretched on the rack or otherwise tortured, the flower used to be administered to them as a means of wringing the truth from their lips. In North Wales people used to fix sprigs of St. John's wort over their doors, and sometimes over their windows, "in order to purify their houses, and by that means drive away all fiends and evil spirits." In Saintonge and Aunis the flowers served to detect the presence of sorcerers, for if one of these pestilent fellows entered a house, the bunches of St. John's wort, which had been gathered on Midsummer Eve and hung on the walls, immediately dropped their yellow heads as if they had suddenly faded. However, the Germans of Western Bohemia think that witches, far from dreading St. John's wort, actually seek the plant on St. John's Eve. Further, the edges of the calyx and petals of St. John's wort, as well as their external surface, are marked with dark purple spots and lines, which, if squeezed, yield a red essential oil soluble in spirits. German peasants believe that this red oil is the blood of St. John, and this may be why the plant is supposed to heal all sorts of wounds. In Mecklenburg they say that if you pull up St. John's wort at noon on Midsummer Day you will find at the root a bead of red juice called St. John's blood; smear this blood on your shirt just over your heart, and no mad dog will bite you. In the Mark of Brandenburg the same blood, procured in the same manner and rubbed on the barrel of a gun, will make every shot from that gun to hit the mark. According to others, St. John's blood is found at noon on St. John's Day, and only then, adhering in the form of beads to the root of a weed called knawel, which grows in sandy soil. But some people say that these beads of red juice are not really the blood of the martyred saint, but only insects resembling the cochineal or kermes-berry. "About Hanover I have often observed devout Roman Catholics going on the morning of St. John's day to neighbouring sandhills, gathering on the roots of herbs a certain insect (*Coccus Polonica*) looking like drops of blood, and thought by them to be created on purpose to keep alive the remembrance of the foul murder of St. John the Baptist, and only to be met with on the morning of the day set apart for him by the Church. I believe the life of this insect is very ephemeral, but by no means restricted to the twenty-fourth of June."

Yet another plant whose root has been thought to yield the blood of St. John is the mouse-ear hawkweed (*Hieracium pilosella*), which grows very commonly in dry exposed places, such as gravelly banks, sunny lawns, and the tops of park walls. "It blossoms from May to the end of July, presenting its elegant sulphur-coloured flowers to the noontide sun, while the surrounding herbage, and even its own foliage, is withered and burnt up"; and these round

yellow flowers may be likened not inaptly to the disc of the great luminary whose light they love. At Hildesheim, in Germany, people used to dig up hawkweed, especially on the Gallows' Hill, when the clocks were striking noon on Midsummer Day; and the blood of St. John, which they found at the roots, was carefully preserved in quills for good luck. A little of it smeared secretly on the clothes was sure to make the wearer fortunate in the market that day. According to some the plant ought to be dug up with a gold coin. Near Gablonz, in Bohemia, it used to be customary to make a bed of St. John's flowers, as they were called, on St. John's Eve, and in the night the saint himself came and laid his head on the bed; next morning you could see the print of his head on the flowers, which derived a healing virtue from his blessed touch, and were mixed with the fodder of sick cattle to make them whole. But whether these St. John's flowers were the mouse-ear hawkweed or not is doubtful.

More commonly in Germany the name of St. John's flowers (*Johannisblumen*) appears to be given to the mountain arnica. In Voigtland the mountain arnica if plucked on St. John's Eve and stuck in the fields, laid under the roof, or hung on the wall, is believed to protect house and fields from lightning and hail. So in some parts of Bavaria they think that no thunderstorm can harm a house which has a blossom of mountain arnica in the window or the roof, and in the Tyrol the same flower fastened to the door will render the dwelling fire-proof. But it is needless to remark that the flower, which takes its popular name from St. John, will be no protection against either fire or thunder unless it has been culled on the saint's own day.

Another plant which possesses wondrous virtues, if only it be gathered on the Eve or the Day of St. John, is mugwort (*Artemisia vulgaris*). Hence in France it goes by the name of the herb of St. John. Near Péronne, in the French department of Somme, people used to go out fasting before sunrise on St. John's Day to cull the plant; put among the wheat in the barn it protected the corn against mice. In Artois people carried bunches of mugwort, or wore it round their body; in Poitou they still wear girdles of mugwort or hemp when they warm their backs at the midsummer fire as a preservative against backache at harvest; and the custom of wearing girdles of mugwort on the Eve or Day of St. John has caused the plant to be popularly known in Germany and Bohemia as St. John's girdle. In Bohemia such girdles are believed to protect the wearer for the whole year against ghosts, magic, misfortune, and sickness. People also weave garlands of the plant and look through them at the midsummer bonfire or put them on their heads; and by doing so they ensure that their heads will not ache nor their eyes smart all that year. Another Bohemian practice is to make a decoction of mugwort which has been gathered on St. John's Day; then, when your cow is bewitched and will yield no milk, you have only to wash the animal thrice with the decoction and the spell will be broken. In Germany, people used to crown their heads or gird their bodies with mugwort, which they afterwards threw into the midsummer bonfire, pronouncing certain rhymes and believing that they thus rid themselves of all their ill-luck. Sometimes wreaths or girdles of mugwort were kept in houses, cattle-sheds, and sheep-folds throughout the year. In Normandy such wreaths are a protection against thunder and thieves; and stalks of mugwort hinder witches from laying their spells on the butter. In the Isle of Man on Midsummer Eve people gathered *barran fealoin* or mugwort "as a preventive against the influence of witchcraft"; in Belgium bunches of mugwort gathered on St. John's Day or Eve and hung on the doors of stables and houses are believed to bring good luck and to furnish a protection against sorcery. It is curious to find that in China a similar use is, or was formerly, made of mugwort at the same season of the year. In an old Chinese calendar we read that "on the fifth day of the fifth month the four classes of the people gambol in the herbage, and have competitive games with plants of all kinds. They pluck mugwort and make dolls of it, which they suspend over their gates and doors, in order to expel poisonous airs or influences." On this custom Professor J. J. M. de Groot observes: "Notice that the plant owed its efficacy to

the time when it was plucked: a day denoting the midsummer festival, when light and fire of the universe are in their apogee." On account of this valuable property mugwort is used by Chinese surgeons in cautery. The Ainos of Japan employ bunches of mugwort in exorcisms, "because it is thought that demons of disease dislike the smell and flavour of this herb." It is an old German belief that he who carries mugwort in his shoes will not grow weary. In Mecklenburg, they say that if you will dig up a plant of mugwort at noon on Midsummer Day, you will find under the root a burning coal, which vanishes away as soon as the church bells have ceased to ring. If you find the coal and carry it off in silence, it will prove a remedy for all sorts of maladies. According to another German superstition, such a coal will turn to gold. English writers record the popular belief that a rare coal is to be found under the root of mugwort at a single hour of a single day in the year, namely, at noon or midnight on Midsummer Eve, and that this coal will protect him who carries it on his person from plague, carbuncle, lightning, fever, and ague. In Eastern Prussia, on St. John's Eve, people can foretell a marriage by means of mugwort; they bend two stalks of the growing plant outward, and then observe whether the stalks, after straightening themselves again, incline towards each other or not.

A similar mode of divination has been practised both in England and in Germany with the orpine (*Sedum telephium*), a plant which grows on a gravelly or chalky soil about hedges, the borders of fields, and on bushy hills. It flowers in August, and the blossoms consist of dense clustered tufts of crimson or purple petals; sometimes, but rarely, the flowers are white. In England the plant is popularly known as Midsummer Men, because people used to plant slips of them in pairs on Midsummer Eve, one slip standing for a young man and the other for a young woman. If the plants, as they grew up, bent towards each other, the couple would marry; if either of them withered, he or she whom it represented would die. In Masuren, Westphalia, and Switzerland the method of forecasting the future by means of the orpine is precisely the same.

Another plant which popular superstition has often associated with the summer solstice is vervain. In some parts of Spain people gather vervain after sunset on Midsummer Eve, and wash their faces next morning in the water in which the plants have been allowed to steep overnight. In Belgium vervain is gathered on St. John's Day and worn as a safeguard against rupture. In Normandy the peasants cull vervain on the Day or the Eve of St. John, believing that, besides its medical properties, it possesses at this season the power of protecting the house from thunder and lightning, from sorcerers, demons, and thieves. Bohemian poachers wash their guns with a decoction of vervain and southernwood, which they have gathered naked before sunrise on Midsummer Day; guns which have been thus treated never miss the mark. In our own country vervain used to be sought for its magical virtues on Midsummer Eve. In the Tyrol they think that he who finds a four-leaved clover while the vesper-bell is ringing on Midsummer Eve can work magic from that time forth. People in Berry say that the four-leaved clover is endowed with all its marvellous virtues only when it has been plucked by a virgin on the night of Midsummer Eve. In Saintonge and Aunis the four-leaved clover, if it be found on the Eve of St. John, brings good luck at play; in Belgium it brings a girl a husband.

At Kirchvers, in Hesse, people run out to the fields at noon on Midsummer Day to gather camomile; for the flowers, plucked at the moment when the sun is at the highest point of his course, are supposed to possess the medicinal qualities of the plant in the highest degree. In heathen times the camomile flower, with its healing qualities, its yellow calix and white stamens, is said to have been sacred to the kindly and shining Balder and to have borne his name, being called *Balders-brâ*, that is, Balder's eyelashes. In Westphalia, also, the belief prevails that camomile is most potent as a drug when it has been gathered on Midsummer

Day; in Masuren the plant must always be one of the nine different kinds of plants that are culled on Midsummer Eve to form wreaths, and tea brewed from the flower is a remedy for many sorts of maladies.

Thuringian peasants hold that if the root of the yellow mullein (*Verbascum*) has been dug up in silence with a ducat at midnight on Midsummer Eve, and is worn in a piece of linen next to the skin, it will preserve the wearer from epilepsy. In Prussia girls go out into the fields on Midsummer Day, gather mullein, and hang it up over their beds. The girl whose flower is the first to wither will be the first to die. Perhaps the bright yellow flowers of mullein, clustering round the stem like lighted candles, may partly account for the association of the plant with the summer solstice. In Germany great mullein (*Verbascum thapsus*) is called the King's Candle; in England it is popularly known as High Taper. The yellow, hoary mullein (*Verbascum pulverulentum*) "forms a golden pyramid a yard high, of many hundreds of flowers, and is one of the most magnificent of British herbaceous plants." We may trace a relation between mullein and the sun in the Prussian custom of bending the flower, after sunset, towards the point where the sun will rise, and praying at the same time that a sick person or a sick beast may be restored to health.

In Bohemia poachers fancy that they can render themselves invulnerable by swallowing the seed from a fir-cone which they have found growing upwards before sunrise on the morning of St. John's Day. Again, wild thyme gathered on Midsummer Day is used in Bohemia to fumigate the trees on Christmas Eve in order that they may grow well; in Voigtland a tea brewed from wild thyme which has been pulled at noon on Midsummer Day is given to women in childbed. The Germans of Western Bohemia brew a tea or wine from elder-flowers, but they say that the brew has no medicinal virtue unless the flowers have been gathered on Midsummer Eve. They do say, too, that whenever you see an elder-tree, you should take off your hat. In the Tyrol dwarf-elder serves to detect witchcraft in cattle, provided of course that the shrub has been pulled up or the branches broken on Midsummer Day. Russian peasants regard the plant known as purple loosestrife (*Lythrum salicaria*) with respect and even fear. Wizards make much use of it. They dig the root up on St. John's morning, at break of day, without the use of iron tools; and they believe that by means of the root, as well as of the blossom, they can subdue evil spirits and make them serviceable, and also drive away witches and the demons that guard treasures.

More famous, however, than these are the marvellous properties which popular superstition in many parts of Europe has attributed to the fern at this season. At midnight on Midsummer Eve the plant is supposed to bloom and soon afterwards to seed; and whoever catches the bloom or the seed is thereby endowed with supernatural knowledge and miraculous powers; above all, he knows where treasures lie hidden in the ground, and he can render himself invisible at will by putting the seed in his shoe. But great precautions must be observed in procuring the wondrous bloom or seed, which else quickly vanishes like dew on sand or mist in the air. The seeker must neither touch it with his hand nor let it touch the ground; he spreads a white cloth under the plant, and the blossom or the seed falls into it. Beliefs of this sort concerning fern-seed have prevailed, with trifling variations of detail, in England, France, Germany, Austria, Italy, and Russia. In Bohemia the magic bloom is said to be golden, and to glow or sparkle like fire. In Russia, they say that at dead of night on Midsummer Eve the plant puts forth buds like glowing coals, which on the stroke of twelve burst open with a clap like thunder and light up everything near and far. In the Azores they say that the fern only blooms at midnight on St. John's Eve, and that no one ever sees the flower because the fairies instantly carry it off. But if any one, watching till it opens, throws a cloth over it, and then, when the magic hour has passed, burns the blossoms carefully, the ashes will serve as a mirror in which you can read the fate of absent friends; if your friends

are well and happy, the ashes will resume the shape of a lovely flower; but if they are unhappy or dead, the ashes will remain cold and lifeless. In Thuringia people think that he who has on his person or in his house the male fern (*Aspidium filix mas*) cannot be bewitched. They call it St. John's root (*Johanniswurzel*), and say that it blooms thrice in the year, on Christmas Eve, Easter Eve, and the day of St. John the Baptist; it should be dug up when the sun enters the sign of the lion. Armed with this powerful implement you can detect a sorcerer at any gathering, it may be a wedding feast or what not. All you have to do is to put the root under the tablecloth unseen by the rest of the company, and, if there should be a sorcerer among them, he will turn as pale as death and get up and go away. Fear and horror come over him when the fern-root is under the tablecloth. And when oxen, horses, or other domestic cattle are bewitched by wicked people, you need only take the root at full moon, soak it in water, and sprinkle the cattle with the water, or rub them down with a cloth that has been steeped in it, and witchcraft will have no more power over the animals.

Once more, people have fancied that if they cut a branch of hazel on Midsummer Eve it would serve them as a divining rod to discover treasures and water. This belief has existed in Moravia, Mecklenburg, and apparently in Scotland. In the Mark of Brandenburg, they say that if you would procure the mystic wand you must go to the hazel by night on Midsummer Eve, walking backwards, and when you have come to the bush you must silently put your hands between your legs and cut a fork-shaped stick; that stick will be the divining-rod, and, as such, will detect treasures buried in the ground. If you have any doubt as to the quality of the wand, you have only to hold it in water; for in that case your true divining-rod will squeak like a pig, but your spurious one will not. In Bavaria they say that the divining-rod should be cut from a hazel bush between eleven and twelve on St. John's Night, and that by means of it you can discover not only veins of metal and underground springs, but also thieves and murderers and unknown ways. In cutting it you should say, "God greet thee, thou noble twig! With God the Father I seek thee, with God the Son I find thee, with the might of God the Holy Ghost I break thee. I adjure thee, rod and sprig, by the power of the Highest that thou shew me what I order, and that as sure and clear as Mary the Mother of God was a pure virgin when she bare our Lord Jesus, in the name of God the Father, God the Son, and God the Holy Ghost, Amen!" In Berlin and the neighbourhood they say that every seventh year there grows a wonderful branch on a hazel bush, and that branch is the divining-rod. Only an innocent child, born on a Sunday and nursed in the true faith, can find it on St. John's Night; to him then all the treasures of the earth lie open. In the Tyrol the divining-rod ought to be cut at new moon, but may be cut either on St. John's Day or on Twelfth Night. Having got it you baptize it in the name of one of the Three Holy Kings according to the purpose for which you intend to use it: if the rod is to discover gold, you name it Caspar; if it is to reveal silver, you call it Balthasar; and if it is to point out hidden springs of water, you dub it Melchior. In Lechrain the divining-rod is a yearling shoot of hazel with two branches; a good time for cutting it is new moon, and if the sun is rising, so much the better. As for the day of the year, you may take your choice between St. John's Day, Twelfth Night, and Shrove Tuesday. If cut with the proper form of words, the rod will as usual discover underground springs and hidden treasures.

Midsummer Eve is also the favourite time for procuring the divining-rod in Sweden. Some say that it should then be cut from a mistletoe bough. However, other people in Sweden are of opinion that the divining-rod (*Slag ruta*) which is obtained on Midsummer Eve ought to be compounded out of four different kinds of wood, to wit, mistletoe, mountain-ash, the aspen, and another; and they say that the mountain-ash which is employed for this purpose should, like the mistletoe, be a parasite growing from the hollow root of a fallen tree, whither the seed was carried by a bird or wafted by the wind. Armed with this fourfold implement of

power the treasure-seeker proceeds at sundown to the spot where he expects to find hidden wealth; there he lays the rod on the ground in perfect silence, and when it lies directly over treasure, it will begin to hop about as if it were alive.

A mystical plant which to some extent serves the same purpose as the divining-rod is the springwort, which is sometimes supposed to be caper-spurge (*Euphorbia lathyris*). In the Harz Mountains they say that many years ago there was a wondrous flower called springwort or Johnswort, which was as rare as it was marvellous. It bloomed only on St. John's Night (some say under a fern) between the hours of eleven and twelve; but when the last stroke of twelve was struck, the flower vanished away. Only in mountainous regions, where many noble metals reposed in the bosom of the earth, was the flower seen now and then in lonely meadows among the hills. The spirits of the hills wished by means of it to shew to men where their treasures were to be found. The flower itself was yellow and shone like a lamp in the darkness of night. It never stood still, but kept hopping constantly to and fro. It was also afraid of men and fled before them, and no man ever yet plucked it unless he had been set apart by Providence for the task. To him who was lucky enough to cull it the flower revealed all the treasures of the earth, and it made him rich, oh so rich and so happy!

However, the usual account given of the springwort is somewhat different. They say that the way to procure it is this. You mark a hollow in a tree where a green or black woodpecker has built its nest and hatched its young; you plug up the hole with a wooden wedge; then you hide behind the tree and wait. The woodpecker meantime has flown away but very soon returns with the springwort in its bill. It flutters up to the tree-trunk holding the springwort to the wedge, which at once, as if struck by a hammer, jumps out with a bang. Now is your chance. You rush from your concealment, you raise a loud cry, and in its fright the bird opens its bill and drops the springwort. Quick as thought you reach out a red or white cloth, with which you have taken care to provide yourself, and catch the magic flower as it falls. The treasure is now yours. Before its marvellous power all doors and locks fly open; it can make the bearer of it invisible; and neither steel nor lead can wound the man who carries it in the right-hand pocket of his coat. That is why people in Swabia say of a thief who cannot be caught, "He must surely have a springwort." The superstition which associates the springwort with the woodpecker is very ancient, for it is recorded by Pliny. It was a vulgar belief, he tells us, that if a shepherd plugged up a woodpecker's nest in the hollow of a tree with a wedge, the bird would bring a herb which caused the wedge to slip out of the hole; Trebius indeed affirmed that the wedge leaped out with a bang, however hard and fast you might have driven it into the tree. Another flower which possesses the same remarkable power of bursting open all doors and locks is chicory, provided always that you cut the flower with a piece of gold at noon or midnight on St. James's Day, the twenty-fifth of July. But in cutting it you must be perfectly silent; if you utter a sound, it is all up with you. There was a man who was just about to cut the flower of the chicory, when he looked up and saw a millstone hovering over his head. He fled for his life and fortunately escaped; but had he so much as opened his lips, the millstone would have dropped on him and crushed him as flat as a pancake. However, it is only a rare white variety of the chicory flower which can act as a picklock; the common bright blue flower is perfectly useless for the purpose.

Many more examples might perhaps be cited of the marvellous virtues which certain plants have been supposed to acquire at the summer solstice, but the foregoing instances may suffice to prove that the superstition is widely spread, deeply rooted, and therefore probably very ancient in Europe. Why should plants be thought to be endowed with these wonderful properties on the longest day more than on any other day of the year? It seems difficult or impossible to explain such a belief except on the supposition that in some mystic way the plants catch from the sun, then at the full height of his power and glory, some fleeting

effluence of radiant light and heat, which invests them for a time with powers above the ordinary for the healing of diseases and the unmasking and baffling of all the evil things that threaten the life of man. That the supposition is not purely hypothetical will appear from a folk-tale, to be noticed later on, in which the magic bloom of the fern is directly derived from the sun at noon on Midsummer Day. And if the magic flowers of Midsummer Eve thus stand in direct relation to the sun, which many of them resemble in shape and colour, blooming in the meadows like little yellow suns fallen from the blue sky, does it not become probable that the bonfires kindled at the same time are the artificial, as the flowers are the natural, imitations of the great celestial fire then blazing in all its strength? At least analogy seems to favour the inference and so far to support Mannhardt's theory, that the bonfires kindled at the popular festivals of Europe, especially at the summer solstice, are intended to reinforce the waning or waxing fires of the sun. Thus if in our enquiry into these fire-festivals the scales of judgment are loaded with the adverse theories of Mannhardt and Westermarck, we may say that the weight, light as it is, of the magic flowers of Midsummer Eve seems to incline the trembling balance back to the side of Mannhardt.

Nor is it, perhaps, an argument against Mannhardt's view that the midsummer flowers and plants are so often employed as talismans to break the spells of witchcraft. For granted that employment, which is undeniable, we have still to explain it, and that we can hardly do except by reference to the midsummer sun. And what is here said of the midsummer flowers applies equally to the midsummer bonfires. They too are used to destroy the charms of witches and warlocks; but if they can do so, may it not be in part because fires at midsummer are thought to burn with fiercer fury than at other times by sympathy with the fiercer fervour of the sun? This consideration would bring us back to an intermediate position between the opposing theories, namely, to the view that while the purely destructive aspect of fire is generally the most prominent and apparently the most important at these festivals, we must not overlook the additional force which by virtue of homoeopathic or imitative magic the bonfires may be supposed both to derive from and to impart to the sun, especially at the moment of the summer solstice when his strength is greatest and begins to decline, and when accordingly he can at once give and receive help to the greatest advantage.

To conclude this part of our subject it may not be amiss to illustrate by a few more miscellaneous examples the belief that Midsummer Eve is one of the great days of the year in which witches and warlocks pursue their nefarious calling; indeed in this respect Midsummer Eve perhaps stands second only to the famous Walpurgis Night (the Eve of May Day). For instance, in the neighbourhood of Lierre, in Belgium, the people think that on the night of Midsummer Eve all witches and warlocks must repair to a certain field which is indicated to them beforehand. There they hold their infernal Sabbath and are passed in review by a hellish magician, who bestows on them fresh powers. That is why old women are most careful, before going to bed on that night, to stop up doors and windows and every other opening in order to bar out the witches and warlocks, who but for this sage precaution might steal into the house and make the first trial of their new powers on the unfortunate inmates. At Rottenburg, in Swabia, people thought that the devil and the witches could do much harm on Midsummer Eve; so they made fast their shutters and bunged up even the chinks and crannies, for wherever air can penetrate, there the devil and witches can worm their way in. All night long, too, from nine in the evening till break of day, the church bells rang to disturb the dreadful beings at their evil work, since there is perhaps no better means of putting the whole devilish crew to flight than the sound of church bells. Down to the second half of the nineteenth century the belief in witches was still widespread in Voigtland, a bleak mountainous region of Central Germany. It was especially on the Eve of May Day (Walpurgis), St. Thomas's Day, St. John's Day, and Christmas Eve, as well as on Mondays,

that they were dreaded. Then they would come into a neighbour's house to beg, borrow, or steal something, no matter what; but woe to the poor wretch who suffered them to carry away so much as a chip or splinter of wood; for they would certainly use it to his undoing. On these witching nights the witches rode to their Sabbath on baking-forks and the dashers of churns; but if when they were hurtling through the darkness any one standing below addressed one of the witches by name, she would die within the year. To counteract and undo the spells which witches cast on man and beast, people resorted to all kinds of measures. Thus on the before-mentioned days folk made three crosses on the doors of the byres or guarded them by hanging up St. John's wort, marjoram, or other equally powerful talismans. Very often, too, the village youth would carry the war into the enemy's quarters by marching out in a body, cracking whips, firing guns, waving burning besoms, shouting and making an uproar, all for the purpose of frightening and driving away the witches. In Prussia witches and warlocks used regularly to assemble twice a year on Walpurgis Night and the Eve of St. John. The places where they held their infernal Sabbath were various; for example, one was Pogdanzig, in the district of Schlochau. They generally rode on a baking-fork, but often on a black three-legged horse, and they took their departure up the chimney with the words, "Up and away and nowhere to stop!" When they were all gathered on the Blocksberg or Mount of the Witches, they held high revelry, feasting first and then dancing on a tight rope lefthanded-wise to the inspiring strains which an old warlock drew from a drum and a pig's head. The South Slavs believe that on the night of Midsummer Eve a witch will slink up to the fence of the farmyard and say, "The cheese to me, the lard to me, the butter to me, the milk to me, but the cowhide to thee!" After that the cow will perish miserably and you will be obliged to bury the flesh and sell the hide. To prevent this disaster the thing to do is to go out into the meadows very early on Midsummer morning while the dew is on the grass, collect a quantity of dew in a waterproof mantle, carry it home, and having tethered your cow wash her down with the dew. After that you have only to place a milkpail under her udders and to milk away as hard as you can; the amount of milk that you will extract from that cow's dugs is quite surprising. Again, the Slovenians about Görz and the Croats of Istria believe that on the same night the witches wage pitched battles with baptized folk, attacking them fiercely with broken stakes of palings and stumps of trees. It is therefore a wise precaution to grub up all the stumps in autumn and carry them home, so that the witches may be weaponless on St. John's Night. If the stumps are too heavy to be grubbed up, it is well to ram them down tighter into the earth, for then the witches will not be able to pull them up.

IX. Balder and the Mistletoe

The reader may remember that the preceding account of the popular fire-festivals of Europe was suggested by the myth of the Norse god Balder, who is said to have been slain by a branch of mistletoe and burnt in a great fire. We have now to enquire how far the customs which have been passed in review help to shed light on the myth. In this enquiry it may be convenient to begin with the mistletoe, the instrument of Balder's death.

From time immemorial the mistletoe has been the object of superstitious veneration in Europe. It was worshipped by the Druids, as we learn from a famous passage of Pliny. After enumerating the different kinds of mistletoe, he proceeds: "In treating of this subject, the admiration in which the mistletoe is held throughout Gaul ought not to pass unnoticed. The Druids, for so they call their wizards, esteem nothing more sacred than the mistletoe and the tree on which it grows, provided only that the tree is an oak. But apart from this they choose oak-woods for their sacred groves and perform no sacred rites without oak-leaves; so that the very name of Druids may be regarded as a Greek appellation derived from their worship of the oak. For they believe that whatever grows on these trees is sent from heaven, and is a sign that the tree has been chosen by the god himself. The mistletoe is very rarely to be met with; but when it is found, they gather it with solemn ceremony. This they do above all on the sixth day of the moon, from whence they date the beginnings of their months, of their years, and of their thirty years' cycle, because by the sixth day the moon has plenty of vigour and has not run half its course. After due preparations have been made for a sacrifice and a feast under the tree, they hail it as the universal healer and bring to the spot two white bulls, whose horns have never been bound before. A priest clad in a white robe climbs the tree and with a golden sickle cuts the mistletoe, which is caught in a white cloth. Then they sacrifice the victims, praying that God may make his own gift to prosper with those upon whom he has bestowed it. They believe that a potion prepared from mistletoe will make barren animals to bring forth, and that the plant is a remedy against all poison. So much of men's religion is commonly concerned with trifles."

In another passage Pliny tells us that in medicine the mistletoe which grows on an oak was esteemed the most efficacious, and that its efficacy was by some superstitious people supposed to be increased if the plant was gathered on the first day of the moon without the use of iron, and if when gathered it was not allowed to touch the earth; oak-mistletoe thus obtained was deemed a cure for epilepsy; carried about by women it assisted them to conceive; and it healed ulcers most effectually, if only the sufferer chewed a piece of the plant and laid another piece on the sore. Yet, again, he says that mistletoe was supposed, like vinegar and an egg, to be an excellent means of extinguishing a fire.

If in these latter passages Pliny refers, as he apparently does, to the beliefs current among his contemporaries in Italy, it will follow that the Druids and the Italians were to some extent agreed as to the valuable properties possessed by mistletoe which grows on an oak; both of them deemed it an effectual remedy for a number of ailments, and both of them ascribed to it a quickening virtue, the Druids believing that a potion prepared from mistletoe would fertilize barren cattle, and the Italians holding that a piece of mistletoe carried about by a woman would help her to conceive a child. Further, both peoples thought that if the plant were to exert its medicinal properties it must be gathered in a certain way and at a certain time. It might not be cut with iron, hence the Druids cut it with gold; and it might not touch the earth, hence the Druids caught it in a white cloth. In choosing the time for gathering the plant, both

peoples were determined by observation of the moon; only they differed as to the particular day of the moon, the Italians preferring the first, and the Druids the sixth.

With these beliefs of the ancient Gauls and Italians as to the wonderful medicinal properties of mistletoe we may compare the similar beliefs of the modern Ainos of Japan. We read that they, "like many nations of the Northern origin, hold the mistletoe in peculiar veneration. They look upon it as a medicine, good in almost every disease, and it is sometimes taken in food and at others separately as a decoction. The leaves are used in preference to the berries, the latter being of too sticky a nature for general purposes.... But many, too, suppose this plant to have the power of making the gardens bear plentifully. When used for this purpose, the leaves are cut up into fine pieces, and, after having been prayed over, are sown with the millet and other seeds, a little also being eaten with the food. Barren women have also been known to eat the mistletoe, in order to be made to bear children. That mistletoe which grows upon the willow is supposed to have the greatest efficacy. This is because the willow is looked upon by them as being an especially sacred tree."

Thus the Ainos agree with the Druids in regarding mistletoe as a cure for almost every disease, and they agree with the ancient Italians that applied to women it helps them to bear children. A similar belief as to the fertilizing influence of mistletoe, or of similar plants, upon women is entertained by the natives of Mabuiag, an island in Torres Straits. These savages imagine that twins can be produced "by the pregnant woman touching or breaking a branch of a loranthaceous plant (*Viscum sp.*, probably *V. orientale*) parasitic on a tree, *mader*. The wood of this tree is much esteemed for making digging sticks and as firewood, no twin-producing properties are inherent in it, nor is it regarded as being infected with the properties of its twin-producing parasite." Again, the Druidical notion that the mistletoe was an "all-healer" or panacea may be compared with a notion entertained by the Walos of Senegambia. These people "have much veneration for a sort of mistletoe, which they call *tob*; they carry leaves of it on their persons when they go to war as a preservative against wounds, just as if the leaves were real talismans (*gris-gris*)." The French writer who records this practice adds: "Is it not very curious that the mistletoe should be in this part of Africa what it was in the superstitions of the Gauls? This prejudice, common to the two countries, may have the same origin; blacks and whites will doubtless have seen, each of them for themselves, something supernatural in a plant which grows and flourishes without having roots in the earth. May they not have believed, in fact, that it was a plant fallen from the sky, a gift of the divinity?"

This suggestion as to the origin of the superstition is strongly confirmed by the Druidical belief, reported by Pliny, that whatever grew on an oak was sent from heaven and was a sign that the tree had been chosen by the god himself. Such a belief explains why the Druids cut the mistletoe, not with a common knife, but with a golden sickle, and why, when cut, it was not suffered to touch the earth; probably they thought that the celestial plant would have been profaned and its marvellous virtue lost by contact with the ground. With the ritual observed by the Druids in cutting the mistletoe we may compare the ritual which in Cambodia is prescribed in a similar case. They say that when you see an orchid growing as a parasite on a tamarind tree, you should dress in white, take a new earthenware pot, then climb the tree at noon, break off the plant, put it in the pot, and let the pot fall to the ground. After that you make in the pot a decoction which confers the gift of invulnerability. Thus just as in Africa the leaves of one parasitic plant are supposed to render the wearer invulnerable, so in Cambodia a decoction made from another parasitic plant is considered to render the same service to such as make use of it, whether by drinking or washing. We may conjecture that in both places the notion of invulnerability is suggested by the position of the plant, which, occupying a place of comparative security above the ground, appears to promise to its

fortunate possessor a similar security from some of the ills that beset the life of man on earth. We have already met with many examples of the store which the primitive mind sets on such vantage grounds.

Whatever may be the origin of these beliefs and practices concerning the mistletoe, certain it is that some of them have their analogies in the folk-lore of modern European peasants. For example, it is laid down as a rule in various parts of Europe that mistletoe may not be cut in the ordinary way but must be shot or knocked down with stones from the tree on which it is growing. Thus, in the Swiss canton of Aargau "all parasitic plants are esteemed in a certain sense holy by the country folk, but most particularly so the mistletoe growing on an oak. They ascribe great powers to it, but shrink from cutting it off in the usual manner. Instead of that they procure it in the following manner. When the sun is in Sagittarius and the moon is on the wane, on the first, third, or fourth day before the new moon, one ought to shoot down with an arrow the mistletoe of an oak and to catch it with the left hand as it falls. Such mistletoe is a remedy for every ailment of children." Here among the Swiss peasants, as among the Druids of old, special virtue is ascribed to mistletoe which grows on an oak: it may not be cut in the usual way: it must be caught as it falls to the ground; and it is esteemed a panacea for all diseases, at least of children. In Sweden, also, it is a popular superstition that if mistletoe is to possess its peculiar virtue, it must either be shot down out of the oak or knocked down with stones. Similarly, "so late as the early part of the nineteenth century, people in Wales believed that for the mistletoe to have any power, it must be shot or struck down with stones off the tree where it grew."

Again, in respect of the healing virtues of mistletoe the opinion of modern peasants, and even of the learned, has to some extent agreed with that of the ancients. The Druids appear to have called the plant, or perhaps the oak on which it grew, the "all-healer"; and "all-healer" is said to be still a name of the mistletoe in the modern Celtic speech of Brittany, Wales, Ireland, and Scotland. On St. John's morning (Midsummer morning) peasants of Piedmont and Lombardy go out to search the oak-leaves for the "oil of St. John," which is supposed to heal all wounds made with cutting instruments. Originally, perhaps, the "oil of St. John" was simply the mistletoe, or a decoction made from it. For in Holstein the mistletoe, especially oak-mistletoe, is still regarded as a panacea for green wounds and as a sure charm to secure success in hunting; and at Lacaune, in the south of France, the old Druidical belief in the mistletoe as an antidote to all poisons still survives among the peasantry; they apply the plant to the stomach of the sufferer or give him a decoction of it to drink. Again, the ancient belief that mistletoe is a cure for epilepsy has survived in modern times not only among the ignorant but among the learned. Thus in Sweden persons afflicted with the falling sickness think they can ward off attacks of the malady by carrying about with them a knife which has a handle of oak mistletoe; and in Germany for a similar purpose pieces of mistletoe used to be hung round the necks of children. In the French province of Bourbonnais a popular remedy for epilepsy is a decoction of mistletoe which has been gathered on an oak on St. John's Day and boiled with rye-flour. So at Bottesford in Lincolnshire a decoction of mistletoe is supposed to be a palliative for this terrible disease. Indeed mistletoe was recommended as a remedy for the falling sickness by high medical authorities in England and Holland down to the eighteenth century. At Kirton-in-Lindsey, in Lincolnshire, it is thought that St. Vitus's dance may be cured by the water in which mistletoe berries have been boiled. In the Scotch shires of Elgin and Moray, down to the second half of the eighteenth century, at the full moon of March people used to cut withes of mistletoe or ivy, make circles of them, keep them all the year, and profess to cure hectic and other troubles by means of them. In Sweden, apparently, for other complaints a sprig of mistletoe is hung round the patient's neck or a ring of it is worn on his finger.

However, the opinion of the medical profession as to the curative virtues of mistletoe has undergone a radical alteration. Whereas the Druids thought that mistletoe cured everything, modern doctors appear to think that it cures nothing. If they are right, we must conclude that the ancient and widespread faith in the medicinal virtue of mistletoe is a pure superstition based on nothing better than the fanciful inferences which ignorance has drawn from the parasitic nature of the plant, its position high up on the branch of a tree seeming to protect it from the dangers to which plants and animals are subject on the surface of the ground. From this point of view we can perhaps understand why mistletoe has so long and so persistently been prescribed as a cure for the falling sickness. As mistletoe cannot fall to the ground because it is rooted on the branch of a tree high above the earth, it seems to follow as a necessary consequence that an epileptic patient cannot possibly fall down in a fit so long as he carries a piece of mistletoe in his pocket or a decoction of mistletoe in his stomach. Such a train of reasoning would probably be regarded even now as cogent by a large portion of the human species.

Again the ancient Italian opinion that mistletoe extinguishes fire appears to be shared by Swedish peasants, who hang up bunches of oak-mistletoe on the ceilings of their rooms as a protection against harm in general and conflagration in particular. A hint as to the way in which mistletoe comes to be possessed of this property is furnished by the epithet "thunder-besom," which people of the Aargau canton in Switzerland apply to the plant. For a thunder-besom is a shaggy, bushy excrescence on branches of trees, which is popularly believed to be produced by a flash of lightning; hence in Bohemia a thunder-besom burnt in the fire protects the house against being struck by a thunder-bolt. Being itself a product of lightning it naturally serves, on homoeopathic principles, as a protection against lightning, in fact as a kind of lightning-conductor. Hence the fire which mistletoe in Sweden is designed especially to avert from houses may be fire kindled by lightning; though no doubt the plant is equally effective against conflagration in general.

Again, mistletoe acts as a master-key as well as a lightning-conductor; for it is said to open all locks. However, in the Tyrol it can only exert this power "under certain circumstances," which are not specified. But perhaps the most precious of all the virtues of mistletoe is that it affords efficient protection against sorcery and witchcraft. That, no doubt, is the reason why in Austria a twig of mistletoe is laid on the threshold as a preventive of nightmare; and it may be the reason why in the north of England they say that if you wish your dairy to thrive you should give your bunch of mistletoe to the first cow that calves after New Year's Day, for it is well known that nothing is so fatal to milk and butter as witchcraft. Similarly in Wales, for the sake of ensuring good luck to the dairy, people used to give a branch of mistletoe to the first cow that gave birth to a calf after the first hour of the New Year; and in rural districts of Wales, where mistletoe abounded, there was always a profusion of it in the farmhouses. When mistletoe was scarce, Welsh farmers used to say, "No mistletoe, no luck"; but if there was a fine crop of mistletoe, they expected a fine crop of corn. In Sweden mistletoe is diligently sought after on St. John's Eve, the people "believing it to be, in a high degree, possessed of mystic qualities; and that if a sprig of it be attached to the ceiling of the dwelling-house, the horse's stall, or the cow's crib, the Troll will then be powerless to injure either man or beast."

With regard to the time when the mistletoe should be gathered opinions have varied. The Druids gathered it above all on the sixth day of the moon, the ancient Italians apparently on the first day of the moon. In modern times some have preferred the full moon of March and others the waning moon of winter when the sun is in Sagittarius. But the favourite time would seem to be Midsummer Eve or Midsummer Day. We have seen that both in France and Sweden special virtues are ascribed to mistletoe gathered at Midsummer. The rule in Sweden

is that “mistletoe must be cut on the night of Midsummer Eve when sun and moon stand in the sign of their might.” Again, in Wales it was believed that a sprig of mistletoe gathered on St. John's Eve (Midsummer Eve), or at any time before the berries appeared, would induce dreams of omen, both good and bad, if it were placed under the pillow of the sleeper. Thus mistletoe is one of the many plants whose magical or medicinal virtues are believed to culminate with the culmination of the sun on the longest day of the year. Hence it seems reasonable to conjecture that in the eyes of the Druids, also, who revered the plant so highly, the sacred mistletoe may have acquired a double portion of its mystic qualities at the solstice in June, and that accordingly they may have regularly cut it with solemn ceremony on Midsummer Eve.

Be that as it may, certain it is that the mistletoe, the instrument of Balder's death, has been regularly gathered for the sake of its mystic qualities on Midsummer Eve in Scandinavia, Balder's home. The plant is found commonly growing on pear-trees, oaks, and other trees in thick damp woods throughout the more temperate parts of Sweden. Thus one of the two main incidents of Balder's myth is reproduced in the great midsummer festival of Scandinavia. But the other main incident of the myth, the burning of Balder's body on a pyre, has also its counterpart in the bonfires which still blaze, or blazed till lately, in Denmark, Norway, and Sweden on Midsummer Eve. It does not appear, indeed, that any effigy is burned in these bonfires; but the burning of an effigy is a feature which might easily drop out after its meaning was forgotten. And the name of Balder's balefires (*Balder's Bålar*), by which these midsummer fires were formerly known in Sweden, puts their connexion with Balder beyond the reach of doubt, and makes it probable that in former times either a living representative or an effigy of Balder was annually burned in them. Midsummer was the season sacred to Balder, and the Swedish poet Tegner, in placing the burning of Balder at midsummer, may very well have followed an old tradition that the summer solstice was the time when the good god came to his untimely end.

Thus it has been shewn that the leading incidents of the Balder myth have their counterparts in those fire-festivals of our European peasantry which undoubtedly date from a time long prior to the introduction of Christianity. The pretence of throwing the victim chosen by lot into the Beltane fire, and the similar treatment of the man, the future Green Wolf, at the midsummer bonfire in Normandy, may naturally be interpreted as traces of an older custom of actually burning human beings on these occasions; and the green dress of the Green Wolf, coupled with the leafy envelope of the young fellow who trod out the midsummer fire at Moosheim, seems to hint that the persons who perished at these festivals did so in the character of tree-spirits or deities of vegetation. From all this we may reasonably infer that in the Balder myth on the one hand, and the fire-festivals and custom of gathering mistletoe on the other hand, we have, as it were, the two broken and dis severed halves of an original whole. In other words, we may assume with some degree of probability that the myth of Balder's death was not merely a myth, that is, a description of physical phenomena in imagery borrowed from human life, but that it was at the same time the story which people told to explain why they annually burned a human representative of the god and cut the mistletoe with solemn ceremony. If I am right, the story of Balder's tragic end formed, so to say, the text of the sacred drama which was acted year by year as a magical rite to cause the sun to shine, trees to grow, crops to thrive, and to guard man and beast from the baleful arts of fairies and trolls, of witches and warlocks. The tale belonged, in short, to that class of nature myths which are meant to be supplemented by ritual; here, as so often, myth stood to magic in the relation of theory to practice.

But if the victims—the human Balders—who died by fire, whether in spring or at midsummer, were put to death as living embodiments of tree-spirits or deities of vegetation, it

would seem that Balder himself must have been a tree-spirit or deity of vegetation. It becomes desirable, therefore, to determine, if we can, the particular kind of tree or trees, of which a personal representative was burned at the fire-festivals. For we may be quite sure that it was not as a representative of vegetation in general that the victim suffered death. The idea of vegetation in general is too abstract to be primitive. Most probably the victim at first represented a particular kind of sacred tree. Now of all European trees none has such claims as the oak to be considered as pre-eminently the sacred tree of the Aryans. Its worship is attested for all the great branches of the Aryan stock in Europe. We have seen that it was not only the sacred tree, but the principal object of worship of both Celts and Lithuanians. The roving Celts appear to have carried their worship of the oak with them even to Asia; for in the heart of Asia Minor the Galatian senate met in a place which bore the pure Celtic name of Drynemetum or "temple of the oak." Among the Slavs the oak seems to have been the sacred tree of the great god Perun. According to Grimm, the oak ranked first among the holy trees of the Germans. It is certainly known to have been adored by them in the age of heathendom, and traces of its worship have survived in various parts of Germany almost to the present day. Among the ancient Italians the oak was sacred above all other trees. The image of Jupiter on the Capitol at Rome seems to have been originally nothing but a natural oak-tree. At Dodona, perhaps the oldest of all Greek sanctuaries, Zeus was worshipped as immanent in the sacred oak, and the rustling of its leaves in the wind was his voice. If, then, the great god of both Greeks and Romans was represented in some of his oldest shrines under the form of an oak, and if the oak was the principal object of worship of Celts, Germans, and Lithuanians, we may certainly conclude that this tree was venerated by the Aryans in common before the dispersion; and that their primitive home must have lain in a land which was clothed with forests of oak.

Now, considering the primitive character and remarkable similarity of the fire-festivals observed by all the branches of the Aryan race in Europe, we may infer that these festivals form part of the common stock of religious observances which the various peoples carried with them in their wanderings from their old home. But, if I am right, an essential feature of those primitive fire-festivals was the burning of a man who represented the tree-spirit. In view, then, of the place occupied by the oak in the religion of the Aryans, the presumption is that the tree so represented at the fire-festivals must originally have been the oak. So far as the Celts and Lithuanians are concerned, this conclusion will perhaps hardly be contested. But both for them and for the Germans it is confirmed by a remarkable piece of religious conservatism. The most primitive method known to man of producing fire is by rubbing two pieces of wood against each other till they ignite; and we have seen that this method is still used in Europe for kindling sacred fires such as the need-fire, and that most probably it was formerly resorted to at all the fire-festivals under discussion. Now it is sometimes required that the need-fire, or other sacred fire, should be made by the friction of a particular kind of wood; and when the kind of wood is prescribed, whether among Celts, Germans, or Slavs, that wood appears to be generally the oak. Thus we have seen that amongst the Slavs of Masuren the new fire for the village is made on Midsummer Day by causing a wheel to revolve rapidly round an axle of oak till the axle takes fire. When the perpetual fire which the ancient Slavs used to maintain chanced to go out, it was rekindled by the friction of a piece of oak-wood, which had been previously heated by being struck with a grey (not a red) stone. In Germany and the Highlands of Scotland the need-fire was regularly, and in Russia and among the South Slavs it was sometimes, kindled by the friction of oak-wood; and both in Wales and the Highlands of Scotland the Beltane fires were lighted by similar means. Now, if the sacred fire was regularly kindled by the friction of oak-wood, we may infer that originally the fire was also fed with the same material. In point of fact, it appears that the perpetual fire of Vesta at Rome was fed with oak-wood, and that oak-wood was the fuel consumed in the

perpetual fire which burned under the sacred oak at the great Lithuanian sanctuary of Romove. Further, that oak-wood was formerly the fuel burned in the midsummer fires may perhaps be inferred from the custom, said to be still observed by peasants in many mountain districts of Germany, of making up the cottage fire on Midsummer Day with a heavy block of oak-wood. The block is so arranged that it smoulders slowly and is not finally reduced to charcoal till the expiry of a year. Then upon next Midsummer Day the charred embers of the old log are removed to make room for the new one, and are mixed with the seed-corn or scattered about the garden. This is believed to guard the food cooked on the hearth from witchcraft, to preserve the luck of the house, to promote the growth of the crops, and to preserve them from blight and vermin. Thus the custom is almost exactly parallel to that of the Yule-log, which in parts of Germany, France, England, Servia, and other Slavonic lands was commonly of oak-wood. At the Boeotian festival of the Daedala, the analogy of which to the spring and midsummer festivals of modern Europe has been already pointed out, the great feature was the felling and burning of an oak. The general conclusion is, that at those periodic or occasional ceremonies the ancient Aryans both kindled and fed the fire with the sacred oak-wood.

But if at these solemn rites the fire was regularly made of oak-wood, it follows that any man who was burned in it as a personification of the tree-spirit could have represented no tree but the oak. The sacred oak was thus burned in duplicate; the wood of the tree was consumed in the fire, and along with it was consumed a living man as a personification of the oak-spirit. The conclusion thus drawn for the European Aryans in general is confirmed in its special application to the Scandinavians by the relation in which amongst them the mistletoe appears to have stood to the burning of the victim in the midsummer fire. We have seen that among Scandinavians it has been customary to gather the mistletoe at midsummer. But so far as appears on the face of this custom, there is nothing to connect it with the midsummer fires in which human victims or effigies of them were burned. Even if the fire, as seems probable, was originally always made with oak-wood, why should it have been necessary to pull the mistletoe? The last link between the midsummer customs of gathering the mistletoe and lighting the bonfires is supplied by Balder's myth, which can hardly be disjoined from the customs in question. The myth suggests that a vital connexion may once have been believed to subsist between the mistletoe and the human representative of the oak who was burned in the fire. According to the myth, Balder could be killed by nothing in heaven or earth except the mistletoe; and so long as the mistletoe remained on the oak, he was not only immortal but invulnerable. Now, if we suppose that Balder was the oak, the origin of the myth becomes intelligible. The mistletoe was viewed as the seat of life of the oak, and so long as it was uninjured nothing could kill or even wound the oak. The conception of the mistletoe as the seat of life of the oak would naturally be suggested to primitive people by the observation that while the oak is deciduous, the mistletoe which grows on it is evergreen. In winter the sight of its fresh foliage among the bare branches must have been hailed by the worshippers of the tree as a sign that the divine life which had ceased to animate the branches yet survived in the mistletoe, as the heart of a sleeper still beats when his body is motionless. Hence when the god had to be killed—when the sacred tree had to be burnt—it was necessary to begin by breaking off the mistletoe. For so long as the mistletoe remained intact, the oak (so people might think) was invulnerable; all the blows of their knives and axes would glance harmless from its surface. But once tear from the oak its sacred heart—the mistletoe—and the tree nodded to its fall. And when in later times the spirit of the oak came to be represented by a living man, it was logically necessary to suppose that, like the tree he personated, he could neither be killed nor wounded so long as the mistletoe remained uninjured. The pulling of the mistletoe was thus at once the signal and the cause of his death.

On this view the invulnerable Balder is neither more nor less than a personification of a mistletoe-bearing oak. The interpretation is confirmed by what seems to have been an ancient Italian belief, that the mistletoe can be destroyed neither by fire nor water; for if the parasite is thus deemed indestructible, it might easily be supposed to communicate its own indestructibility to the tree on which it grows, so long as the two remain in conjunction. Or to put the same idea in mythical form we might tell how the kindly god of the oak had his life securely deposited in the imperishable mistletoe which grew among the branches; how accordingly so long as the mistletoe kept its place there, the deity himself remained invulnerable; and how at last a cunning foe, let into the secret of the god's invulnerability, tore the mistletoe from the oak, thereby killing the oak-god and afterwards burning his body in a fire which could have made no impression on him so long as the incombustible parasite retained its seat among the boughs.

But since the idea of a being whose life is thus, in a sense, outside himself, must be strange to many readers, and has, indeed, not yet been recognized in its full bearing on primitive superstition, it will be worth while to illustrate it by examples drawn both from story and custom. The result will be to shew that, in assuming this idea as the explanation of Balder's relation to the mistletoe, I assume a principle which is deeply engraved on the mind of primitive man.

X. The Eternal Soul in Folk-Tales

In a former part of this work we saw that, in the opinion of primitive people, the soul may temporarily absent itself from the body without causing death. Such temporary absences of the soul are often believed to involve considerable risk, since the wandering soul is liable to a variety of mishaps at the hands of enemies, and so forth. But there is another aspect to this power of disengaging the soul from the body. If only the safety of the soul can be ensured during its absence, there is no reason why the soul should not continue absent for an indefinite time; indeed a man may, on a pure calculation of personal safety, desire that his soul should never return to his body. Unable to conceive of life abstractly as a "permanent possibility of sensation" or a "continuous adjustment of internal arrangements to external relations," the savage thinks of it as a concrete material thing of a definite bulk, capable of being seen and handled, kept in a box or jar, and liable to be bruised, fractured, or smashed in pieces. It is not needful that the life, so conceived, should be in the man; it may be absent from his body and still continue to animate him by virtue of a sort of sympathy or action at a distance. So long as this object which he calls his life or soul remains unharmed, the man is well; if it is injured, he suffers; if it is destroyed, he dies. Or, to put it otherwise, when a man is ill or dies, the fact is explained by saying that the material object called his life or soul, whether it be in his body or out of it, has either sustained injury or been destroyed. But there may be circumstances in which, if the life or soul remains in the man, it stands a greater chance of sustaining injury than if it were stowed away in some safe and secret place. Accordingly, in such circumstances, primitive man takes his soul out of his body and deposits it for security in some snug spot, intending to replace it in his body when the danger is past. Or if he should discover some place of absolute security, he may be content to leave his soul there permanently. The advantage of this is that, so long as the soul remains unharmed in the place where he has deposited it, the man himself is immortal; nothing can kill his body, since his life is not in it.

Evidence of this primitive belief is furnished by a class of folk-tales of which the Norse story of "The giant who had no heart in his body" is perhaps the best-known example. Stories of this kind are widely diffused over the world, and from their number and the variety of incident and of details in which the leading idea is embodied, we may infer that the conception of an external soul is one which has had a powerful hold on the minds of men at an early stage of history. For folk-tales are a faithful reflection of the world as it appeared to the primitive mind; and we may be sure that any idea which commonly occurs in them, however absurd it may seem to us, must once have been an ordinary article of belief. This assurance, so far as it concerns the supposed power of disengaging the soul from the body for a longer or shorter time, is amply corroborated by a comparison of the folk-tales in question with the actual beliefs and practices of savages. To this we shall return after some specimens of the tales have been given. The specimens will be selected with a view of illustrating both the characteristic features and the wide diffusion of this class of tales.

In the first place, the story of the external soul is told, in various forms, by all Aryan peoples from Hindoostan to the Hebrides. A very common form of it is this: A warlock, giant, or other fairyland being is invulnerable and immortal because he keeps his soul hidden far away in some secret place; but a fair princess, whom he holds enthralled in his enchanted castle, wiles his secret from him and reveals it to the hero, who seeks out the warlock's soul, heart, life, or death (as it is variously called), and, by destroying it, simultaneously kills the warlock. Thus a Hindoo story tells how a magician called Punchkin held a queen captive for twelve

years, and would fain marry her, but she would not have him. At last the queen's son came to rescue her, and the two plotted together to kill Punchkin. So the queen spoke the magician fair, and pretended that she had at last made up her mind to marry him. "And do tell me," she said, "are you quite immortal? Can death never touch you? And are you too great an enchanter ever to feel human suffering?" "It is true," he said, "that I am not as others. Far, far away, hundreds of thousands of miles from this, there lies a desolate country covered with thick jungle. In the midst of the jungle grows a circle of palm trees, and in the centre of the circle stand six chattees full of water, piled one above another: below the sixth chattee is a small cage, which contains a little green parrot;—on the life of the parrot depends my life;—and if the parrot is killed I must die. It is, however," he added, "impossible that the parrot should sustain any injury, both on account of the inaccessibility of the country, and because, by my appointment, many thousand genii surround the palm trees, and kill all who approach the place." But the queen's young son overcame all difficulties, and got possession of the parrot. He brought it to the door of the magician's palace, and began playing with it. Punchkin, the magician, saw him, and, coming out, tried to persuade the boy to give him the parrot. "Give me my parrot!" cried Punchkin. Then the boy took hold of the parrot and tore off one of his wings; and as he did so the magician's right arm fell off. Punchkin then stretched out his left arm, crying, "Give me my parrot!" The prince pulled off the parrot's second wing, and the magician's left arm tumbled off. "Give me my parrot!" cried he, and fell on his knees. The prince pulled off the parrot's right leg, the magician's right leg fell off; the prince pulled off the parrot's left leg, down fell the magician's left. Nothing remained of him except the trunk and the head; but still he rolled his eyes, and cried, "Give me my parrot!" "Take your parrot, then," cried the boy; and with that he wrung the bird's neck, and threw it at the magician; and, as he did so, Punchkin's head twisted round, and, with a fearful groan, he died! In another Hindoo tale an ogre is asked by his daughter, "Papa, where do you keep your soul?" "Sixteen miles away from this place," he said, "is a tree. Round the tree are tigers, and bears, and scorpions, and snakes; on the top of the tree is a very great fat snake; on his head is a little cage; in the cage is a bird; and my soul is in that bird." The end of the ogre is like that of the magician in the previous tale. As the bird's wings and legs are torn off, the ogre's arms and legs drop off; and when its neck is wrung he falls down dead.

In another Hindoo story a princess called Sodewa Bai was born with a golden necklace about her neck, and the astrologer told her parents, "This is no common child; the necklace of gold about her neck contains your daughter's soul; let it therefore be guarded with the utmost care; for if it were taken off, and worn by another person, she would die." So her mother caused it to be firmly fastened round the child's neck, and, as soon as the child was old enough to understand, she told her its value, and warned her never to let it be taken off. In course of time Sodewa Bai was married to a prince who had another wife living. The first wife, jealous of her young rival, persuaded a negress to steal from Sodewa Bai the golden necklace which contained her soul. The negress did so, and, as soon as she put the necklace round her own neck, Sodewa Bai died. All day long the negress used to wear the necklace; but late at night, on going to bed, she would take it off and put it by till morning; and whenever she took it off, Sodewa Bai's soul returned to her and she lived. But when morning came, and the negress put on the necklace, Sodewa Bai died again. At last the prince discovered the treachery of his elder wife and restored the golden necklace to Sodewa Bai. In another Hindoo story a holy mendicant tells a queen that she will bear a son, adding, "As enemies will try to take away the life of your son, I may as well tell you that the life of the boy will be bound up in the life of a big *boal* fish which is in your tank, in front of the palace. In the heart of the fish is a small box of wood, in the box is a necklace of gold, that necklace is the life of your son." The boy was born and received the name of Dalim. His mother was the Suo or younger queen. But the Duo or elder queen hated the child, and learning the secret of his life, she caused

the *boal* fish, with which his life was bound up, to be caught. Dalim was playing near the tank at the time, but “the moment the *boal* fish was caught in the net, that moment Dalim felt unwell; and when the fish was brought up to land, Dalim fell down on the ground, and made as if he was about to breathe his last. He was immediately taken into his mother's room, and the king was astonished on hearing of the sudden illness of his son and heir. The fish was by the order of the physician taken into the room of the Duo queen, and as it lay on the floor striking its fins on the ground, Dalim in his mother's room was given up for lost. When the fish was cut open, a casket was found in it; and in the casket lay a necklace of gold. The moment the necklace was worn by the queen, that very moment Dalim died in his mother's room.” The queen used to put off the necklace every night, and whenever she did so, the boy came to life again. But every morning when the queen put on the necklace, he died again.

In a Cashmeer story a lad visits an old ogress, pretending to be her grandson, the son of her daughter who had married a king. So the old ogress took him into her confidence and shewed him seven cocks, a spinning wheel, a pigeon, and a starling. “These seven cocks,” said she, “contain the lives of your seven uncles, who are away for a few days. Only as long as the cocks live can your uncles hope to live; no power can hurt them as long as the seven cocks are safe and sound. The spinning-wheel contains my life; if it is broken, I too shall be broken, and must die; but otherwise I shall live on for ever. The pigeon contains your grandfather's life, and the starling your mother's; as long as these live, nothing can harm your grandfather or your mother.” So the lad killed the seven cocks and the pigeon and the starling, and smashed the spinning-wheel; and at the moment he did so the ogres and ogresses perished. In another story from Cashmeer an ogre cannot die unless a particular pillar in the verandah of his palace be broken. Learning the secret, a prince struck the pillar again and again till it was broken in pieces. And it was as if each stroke had fallen on the ogre, for he howled lamentably and shook like an aspen every time the prince hit the pillar, until at last, when the pillar fell down, the ogre also fell down and gave up the ghost. In another Cashmeer tale an ogre is represented as laughing very heartily at the idea that he might possibly die. He said that “he should never die. No power could oppose him; no years could age him; he should remain ever strong and ever young, for the thing wherein his life dwelt was most difficult to obtain.” It was in a queen bee, which was in a honeycomb on a tree. But the bees in the honeycomb were many and fierce, and it was only at the greatest risk that any one could catch the queen. However, the hero achieved the enterprise and crushed the queen bee; and immediately the ogre fell stone dead to the ground, so that the whole land trembled with the shock. In some Bengalee tales the life of a whole tribe of ogres is described as concentrated in two bees. The secret was thus revealed by an old ogress to a captive princess who pretended to fear lest the ogress should die. “Know, foolish girl,” said the ogress, “that we ogres never die. We are not naturally immortal, but our life depends on a secret which no human being can unravel. Let me tell you what it is, that you may be comforted. You know yonder tank; there is in the middle of it a crystal pillar, on the top of which in deep waters are two bees. If any human being can dive into the waters, and bring up to land the two bees from the pillar in one breath, and destroy them so that not a drop of their blood falls to the ground, then we ogres shall certainly die; but if a single drop of blood falls to the ground, then from it will start up a thousand ogres. But what human being will find out this secret, or, finding it, will be able to achieve the feat? You need not, therefore, darling, be sad; I am practically immortal.” As usual, the princess reveals the secret to the hero, who kills the bees, and that same moment all the ogres drop down dead, each on the spot where he happened to be standing. In another Bengalee story it is said that all the ogres dwell in Ceylon, and that all their lives are in a single lemon. A boy cuts the lemon in pieces, and all the ogres die.

In a Siamese or Cambodian story, probably derived from India, we are told that Thossakan or Ravana, the King of Ceylon, was able by magic art to take his soul out of his body and leave it in a box at home, while he went to the wars. Thus he was invulnerable in battle. When he was about to give battle to Rama, he deposited his soul with a hermit called Fire-eye, who was to keep it safe for him. So in the fight Rama was astounded to see that his arrows struck the king without wounding him. But one of Rama's allies, knowing the secret of the king's invulnerability, transformed himself by magic into the likeness of the king, and going to the hermit asked back his soul. On receiving it he soared up into the air and flew to Rama, brandishing the box and squeezing it so hard that all the breath left the King of Ceylon's body, and he died. In a Bengalee story a prince going into a far country planted with his own hands a tree in the courtyard of his father's palace, and said to his parents, "This tree is my life. When you see the tree green and fresh, then know that it is well with me; when you see the tree fade in some parts, then know that I am in an ill case; and when you see the whole tree fade, then know that I am dead and gone." In another Indian tale a prince, setting forth on his travels, left behind him a barley plant, with instructions that it should be carefully tended and watched; for if it flourished, he would be alive and well, but if it drooped, then some mischance was about to happen to him. And so it fell out. For the prince was beheaded, and as his head rolled off, the barley plant snapped in two and the ear of barley fell to the ground. In the legend of the origin of Gilgit there figures a fairy king whose soul is in the snows and who can only perish by fire.

In Greek tales, ancient and modern, the idea of an external soul is not uncommon. When Meleager was seven days old, the Fates appeared to his mother and told her that Meleager would die when the brand which was blazing on the hearth had burnt down. So his mother snatched the brand from the fire and kept it in a box. But in after-years, being enraged at her son for slaying her brothers, she burnt the brand in the fire and Meleager expired in agonies, as if flames were preying on his vitals. Again, Nisus King of Megara had a purple or golden hair on the middle of his head, and it was fated that whenever the hair was pulled out the king should die. When Megara was besieged by the Cretans, the king's daughter Scylla fell in love with Minos, their king, and pulled out the fatal hair from her father's head. So he died. Similarly Poseidon made Pterelaus immortal by giving him a golden hair on his head. But when Taphos, the home of Pterelaus, was besieged by Amphitryo, the daughter of Pterelaus fell in love with Amphitryo and killed her father by plucking out the golden hair with which his life was bound up. In a modern Greek folk-tale a man's strength lies in three golden hairs on his head. When his mother pulls them out, he grows weak and timid and is slain by his enemies. Another Greek story, in which we may perhaps detect a reminiscence of Nisus and Scylla, relates how a certain king, who was the strongest man of his time, had three long hairs on his breast. But when he went to war with another king, and his own treacherous wife had cut off the three hairs, he became the weakest of men. In another modern Greek story the life of an enchanter is bound up with three doves which are in the belly of a wild boar. When the first dove is killed, the magician grows sick; when the second is killed, he grows very sick; and when the third is killed, he dies. In another Greek story of the same sort an ogre's strength is in three singing birds which are in a wild boar. The hero kills two of the birds, and then coming to the ogre's house finds him lying on the ground in great pain. He shews the third bird to the ogre, who begs that the hero will either let it fly away or give it to him to eat. But the hero wrings the bird's neck, and the ogre dies on the spot. In a variant of the latter story the monster's strength is in two doves, and when the hero kills one of them, the monster cries out, "Ah, woe is me! Half my life is gone. Something must have happened to one of the doves." When the second dove is killed, he dies. In another Greek story the incidents of the three golden hairs and three doves are artificially combined. A monster has on his head three golden hairs which open the door of a chamber in which are three doves:

when the first dove is killed, the monster grows sick; when the second is killed, he grows worse; and when the third is killed, he dies. In another Greek tale an old man's strength is in a ten-headed serpent. When the serpent's heads are being cut off, he feels unwell; and when the last head is struck off, he expires. In another Greek story a dervish tells a queen that she will have three sons, that at the birth of each she must plant a pumpkin in the garden, and that in the fruit borne by the pumpkins will reside the strength of the children. In due time the infants are born and the pumpkins planted. As the children grow up, the pumpkins grow with them. One morning the eldest son feels sick, and on going into the garden they find that the largest pumpkin is gone. Next night the second son keeps watch in a summer-house in the garden. At midnight a negro appears and cuts the second pumpkin. At once the boy's strength goes out of him, and he is unable to pursue the negro. The youngest son, however, succeeds in slaying the negro and recovering the lost pumpkins.

Ancient Italian legend furnishes a close parallel to the Greek story of Meleager. Silvia, the young wife of Septimius Marcellus, had a child by the god Mars. The god gave her a spear, with which he said that the fate of the child would be bound up. When the boy grew up he quarrelled with his maternal uncles and slew them. So in revenge his mother burned the spear on which his life depended. In one of the stories of the *Pentamerone* a certain queen has a twin brother, a dragon. The astrologers declared at her birth that she would live just as long as the dragon and no longer, the death of the one involving the death of the other. If the dragon were killed, the only way to restore the queen to life would be to smear her temples, breast, pulses, and nostrils with the blood of the dragon. In a modern Roman version of "Aladdin and the Wonderful Lamp," the magician tells the princess, whom he holds captive in a floating rock in mid-ocean, that he will never die. The princess reports this to the prince her husband, who has come to rescue her. The prince replies, "It is impossible but that there should be some one thing or other that is fatal to him; ask him what that one fatal thing is." So the princess asked the magician, and he told her that in the wood was a hydra with seven heads; in the middle head of the hydra was a leveret, in the head of the leveret was a bird, in the bird's head was a precious stone, and if this stone were put under his pillow he would die. The prince procured the stone, and the princess laid it under the magician's pillow. No sooner did the enchanter lay his head on the pillow than he gave three terrible yells, turned himself round and round three times, and died.

Another Italian tale sets forth how a great cloud, which was really a fairy, used to receive a young girl as tribute every year from a certain city; and the inhabitants had to give the girls up, for if they did not, the cloud would throw things at them and kill them all. One year it fell to the lot of the king's daughter to be handed over to the cloud, and they took her in procession, to the roll of muffled drums, and attended by her weeping father and mother, to the top of a mountain, and left her sitting in a chair there all alone. Then the fairy cloud came down on the top of the mountain, set the princess in her lap, and began to suck her blood out of her little finger; for it was on the blood of girls that this wicked fairy lived. When the poor princess was faint with the loss of blood and lay like a log, the cloud carried her away up to her fairy palace in the sky. But a brave youth had seen all that happened from behind a bush, and no sooner did the fairy spirit away the princess to her palace than he turned himself into an eagle and flew after them. He lighted on a tree just outside the palace, and looking in at the window he beheld a room full of young girls all in bed; for these were the victims of former years whom the fairy cloud had half killed by sucking their blood; yet they called her mamma. When the fairy went away and left the girls, the brave young man had food drawn up for them by ropes, and he told them to ask the fairy how she might be killed and what was to become of them when she died. It was a delicate question, but the fairy answered it, saying, "I shall never die." However, when the girls pressed her, she took them out on a

terrace and said, "Do you see that mountain far off there? On that mountain is a tigress with seven heads. If you wish me to die, a lion must fight that tigress and tear off all seven of her heads. In her body is an egg, and if any one hits me with it in the middle of my forehead, I shall die; but if that egg falls into my hands, the tigress will come to life again, resume her seven heads, and I shall live." When the young girls heard this they pretended to be glad and said, "Good! certainly our mamma can never die," but naturally they were discouraged. However, when she went away again, they told it all to the young man, and he bade them have no fear. Away he went to the mountain, turned himself into a lion, and fought the tigress. Meantime the fairy came home, saying, "Alas! I feel ill!" For six days the fight went on, the young man tearing off one of the tigress's heads each day, and each day the strength of the fairy kept ebbing away. Then after allowing himself two days' rest the hero tore off the seventh head and secured the egg, but not till it had rolled into the sea and been brought back to him by a friendly dog-fish. When he returned to the fairy with the egg in his hand, she begged and prayed him to give it her, but he made her first restore the young girls to health and send them away in handsome carriages. When she had done so, he struck her on the forehead with the egg, and she fell down dead. Similarly in a story from the western Riviera a sorcerer called Body-without-Soul can only be killed by means of an egg which is in an eagle, which is in a dog, which is in a lion; and the egg must be broken on the sorcerer's forehead. The hero, who achieves the adventure, has received the power of changing himself into a lion, a dog, an eagle, and an ant from four creatures of these sorts among whom he had fairly divided the carcass of a dead ass.

Stories of the same sort are current among Slavonic peoples. In some of them, as in the biblical story of Samson and Delilah, the warlock is questioned by a treacherous woman as to the place where his strength resides or his life or death is stowed away; and his suspicions being roused by her curiosity, he at first puts her off with false answers, but is at last beguiled into telling her the truth, thereby incurring his doom through her treachery. Thus a Russian story tells how a certain warlock called Kashtshei or Koshchei the Deathless carried off a princess and kept her prisoner in his golden castle. However, a prince made up to her one day as she was walking alone and disconsolate in the castle garden, and cheered by the prospect of escaping with him she went to the warlock and coaxed him with false and flattering words, saying, "My dearest friend, tell me, I pray you, will you never die?" "Certainly not," says he. "Well," says she, "and where is your death? is it in your dwelling?" "To be sure it is," says he, "it is in the broom under the threshold." Thereupon the princess seized the broom and threw it on the fire, but although the broom burned, the deathless Koshchei remained alive; indeed not so much as a hair of him was singed. Balked in her first attempt, the artful hussy pouted and said, "You do not love me true, for you have not told me where your death is; yet I am not angry, but love you with all my heart." With these fawning words she besought the warlock to tell her truly where his death was. So he laughed and said, "Why do you wish to know? Well then, out of love I will tell you where it lies. In a certain field there stand three green oaks, and under the roots of the largest oak is a worm, and if ever this worm is found and crushed, that instant I shall die." When the princess heard these words, she went straight to her lover and told him all; and he searched till he found the oaks and dug up the worm and crushed it. Then he hurried to the warlock's castle, but only to learn from the princess that the warlock was still alive. Then she fell to wheedling and coaxing Koshchei once more, and this time, overcome by her wiles, he opened his heart to her and told her the truth. "My death," said he, "is far from here and hard to find, on the wide ocean. In that sea is an island, and on the island there grows a green oak, and beneath the oak is an iron chest, and in the chest is a small basket, and in the basket is a hare, and in the hare is a duck, and in the duck is an egg; and he who finds the egg and breaks it, kills me at the same time." The prince naturally procured the fateful egg and with it in his hands he confronted the deathless

warlock. The monster would have killed him, but the prince began to squeeze the egg. At that the warlock shrieked with pain, and turning to the false princess, who stood by smirking and smiling, "Was it not out of love for you," said he, "that I told you where my death was? And is this the return you make to me?" With that he grabbed at his sword, which hung from a peg on the wall; but before he could reach it, the prince had crushed the egg, and sure enough the deathless warlock found his death at the same moment.

In another version of the same story, when the cunning warlock deceives the traitress by telling her that his death is in the broom, she gilds the broom, and at supper the warlock sees it shining under the threshold and asks her sharply, "What's that?" "Oh," says she, "you see how I honour you." "Simpleton!" says he, "I was joking. My death is out there fastened to the oak fence." So next day when the warlock was out, the prince came and gilded the whole fence; and in the evening when the warlock was at supper he looked out of the window and saw the fence glittering like gold. "And pray what may that be?" said he to the princess. "You see," said she, "how I respect you. If you are dear to me, dear too is your death. That is why I have gilded the fence in which your death resides." The speech pleased the warlock, and in the fulness of his heart he revealed to her the fatal secret of the egg. When the prince, with the help of some friendly animals, obtained possession of the egg, he put it in his bosom and repaired to the warlock's house. The warlock himself was sitting at the window in a very gloomy frame of mind; and when the prince appeared and shewed him the egg, the light grew dim in the warlock's eyes and he became all of a sudden very meek and mild. But when the prince began to play with the egg and to throw it from one hand to the other, the deathless Koshchei staggered from one corner of the room to the other, and when the prince broke the egg, Koshchei the Deathless fell down and died. "In one of the descriptions of Koshchei's death, he is said to be killed by a blow on the forehead inflicted by the mysterious egg—that last link in the magic chain by which his life is darkly bound. In another version of the same story, but told of a snake, the fatal blow is struck by a small stone found in the yolk of an egg, which is inside a duck, which is inside a hare, which is inside a stone, which is on an island." In another Russian story the death of an enchantress is in a blue rose-tree in a blue forest. Prince Ivan uproots the rose-tree, whereupon the enchantress straightway sickens. He brings the rose-tree to her house and finds her at the point of death. Then he throws it into the cellar, crying, "Behold her death!" and at once the whole building shakes, "and becomes an island, on which are people who had been sitting in Hell, and who offer up thanks to Prince Ivan." In another Russian story a prince is grievously tormented by a witch who has got hold of his heart, and keeps it seething in a magic cauldron.

In a Bohemian tale a warlock's strength lies in an egg which is in a duck, which is in a stag, which is under a tree. A seer finds the egg and sucks it. Then the warlock grows as weak as a child, "for all his strength had passed into the seer." A Servian story relates how a certain warlock called True Steel carried off a prince's wife and kept her shut up in his cave. But the prince contrived to get speech of her and told her that she must persuade True Steel to reveal to her where his strength lay. So when True Steel came home, the prince's wife said to him, "Tell me, now, where is your great strength?" He answered, "My wife, my strength is in my sword." Then she began to pray and turned to his sword. When True Steel saw that, he laughed and said, "O foolish woman! my strength is not in my sword, but in my bow and arrows." Then she turned towards the bow and arrows and prayed. But True Steel said, "I see, my wife, you have a clever teacher who has taught you to find out where my strength lies. I could almost say that your husband is living, and it is he who teaches you." But she assured him that nobody had taught her. When she found he had deceived her again, she waited for some days and then asked him again about the secret of his strength. He answered, "Since you think so much of my strength, I will tell you truly where it is. Far away from here there is

a very high mountain; in the mountain there is a fox; in the fox there is a heart; in the heart there is a bird, and in this bird is my strength. It is no easy task, however, to catch the fox, for she can transform herself into a multitude of creatures." So next day, when True Steel went forth from the cave, the prince came and learned from his wife the true secret of the warlock's strength. So away he hied to the mountain, and there, though the fox, or rather the vixen, turned herself into various shapes, he managed with the help of certain friendly eagles, falcons, and dragons, to catch and kill her. Then he took out the fox's heart, and out of the heart he took the bird and burned it in a great fire. At that very moment True Steel fell down dead.

In another Servian story we read how a dragon resided in a water-mill and ate up two king's sons, one after the other. The third son went out to seek his brothers, and coming to the water-mill he found nobody in it but an old woman. She revealed to him the dreadful character of the being that kept the mill, and how he had devoured the prince's two elder brothers, and she implored him to go away home before the same fate should overtake him. But he was both brave and cunning, and he said to her, "Listen well to what I am going to say to you. Ask the dragon whither he goes and where his strength is; then kiss all that place where he tells you his strength is, as if from love, till you find it out, and afterwards tell me when I come." So when the dragon came in, the old woman began to question him, "Where in God's name have you been? Whither do you go so far? You will never tell me whither you go." The dragon replied, "Well, my dear old woman, I do go far." Then the old woman coaxed him, saying, "And why do you go so far? Tell me where your strength is. If I knew where your strength is, I don't know what I should do for love; I would kiss all that place." Thereupon the dragon smiled and said to her, "Yonder is my strength, in that fireplace." Then the old woman began to fondle and kiss the fireplace; and the dragon on seeing it burst into a laugh. "Silly old woman," he said, "my strength is not there. It is in the tree-fungus in front of the house." Then the old woman began to fondle and kiss the tree; but the dragon laughed again and said to her, "Away, old woman! my strength is not there." "Then where is it?" asked the old woman. "My strength," said he, "is a long way off, and you cannot go thither. Far in another kingdom under the king's city is a lake; in the lake is a dragon; in the dragon is a boar; in the boar is a pigeon, and in the pigeon is my strength." The murder was now out; so next morning when the dragon went away from the mill to attend to his usual business of eating people up, the prince came to the old woman and she let him into the secret of the dragon's strength. The prince accordingly set off to find the lake in the far country and the other dragon that lived in it. He found them both at last; the lake was a still and lonely water surrounded by green meadows, where flocks of sheep nibbled the sweet lush grass. The hero tucked up his hose and his sleeves, and wading out into the lake called aloud on the dragon to come forth and fight. Soon the monster emerged from the water, slimy and dripping, his scaly back glistening in the morning sun. The two grappled and wrestled from morning to afternoon of a long summer day. What with the heat of the weather and the violence of his exertions the dragon was quite exhausted, and said, "Let me go, prince, that I may moisten my parched head in the lake and toss you to the sky." But the prince sternly refused; so the dragon relaxed his grip and sank under the water, which bubbled and gurgled over the place where he plunged into the depths. When he had disappeared and the ripples had subsided on the surface, you would never have suspected that under that calm water, reflecting the green banks, the white, straying sheep, the blue sky, and the fleecy gold-flecked clouds of a summer evening, there lurked so ferocious and dangerous a monster. Next day the combat was renewed with the very same result. But on the third day the hero, fortified by a kiss from the fair daughter of the king of the land, tossed the dragon high in air, and when the monster fell with a most tremendous thud on the water he burst into little bits. Out of the pieces sprang a boar which ran away as fast as it could lay legs to the

ground. But the prince sent sheep-dogs after it which caught it up and rent it in pieces. Out of the pieces sprang a pigeon; but the prince let loose a falcon, which stooped on the pigeon, seized it in its talons, and brought it to the prince. In the pigeon was the life of the dragon who kept the mill, so before inflicting on the monster the doom he so richly merited, the prince questioned him as to the fate of his two elder brothers who had perished at the hands, or rather under the claws and fangs, of the dragon. Having ascertained how to restore them to life and to release a multitude of other victims whom the dragon kept prisoners in a vault under the water-mill, the prince wrung the pigeon's neck, and that of course was the end of the dragon and his unscrupulous career.

A Lithuanian story relates how a prince married a princess and got with her a kingdom to boot. She gave him the keys of the castle and told him he might enter every chamber except one small room, of which the key had a bit of twine tied to it. But one day, having nothing to do, he amused himself by rummaging in all the rooms of the castle, and amongst the rest he went into the little forbidden chamber. In it he found twelve heads and a man hanging on the hook of the door. The man said to the prince, "Oblige me by fetching me a glass of beer." The prince fetched it and the man drank it. Then the man said to the prince, "Oblige me by releasing me from the hook." The prince released him. Now the man was a king without a soul, and he at once availed himself of his liberty to come to an understanding with the coachman of the castle, and between them they put the prince's wife in the coach and drove off with her. The prince rode after them and coming up with the coach called out, "Halt, Soulless King! Step out and fight!" The King stepped out and the fight began. In a trice the King had sliced the buttons off the prince's coat and pinked him in the side. Then he stepped into the coach and drove off. The prince rode after him again, and when he came up with the coach he called out, "Halt, Soulless King! Step out and fight!" The King stepped out and they fought again, and again the King sliced off the prince's buttons and pinked him in the side. Then, after carefully wiping and sheathing his sword, he said to his discomfited adversary, "Now look here. I let you off the first time for the sake of the glass of beer you gave me, and I let you off the second time because you let me down from that infernal hook; but if you fight me a third time, by Gad I'll make mince meat of you." Then he stepped into the coach, told the coachman to drive on, jerked up the coach window with a bang, and drove away like anything. But the prince galloped after him and coming up with the coach for the third time he called out, "Halt, Soulless King! Step out and fight!" The King did step out, and at it the two of them went, tooth and nail. But the prince had no chance. Before he knew where he was, the King ran him through the body, whisked off his head, and left him lying a heap of raw mince beside the road. His wife, or rather his widow, said to the King, "Let me gather up the fragments that remain." The King said, "Certainly." So she made up the mince into a neat parcel, deposited it on the front seat of the coach, and away they drove to the King's castle. Well to cut a long story short, a brother-in-law of the deceased prince sent a hawk to fetch the water of life; the hawk brought it in his beak; the brother-in-law poured the water on the fragments of the prince, and the prince came to life again at once safe and sound. Then he went to the King's castle and played on a little pipe, and his wife heard it in the castle and said, "That is how my husband used to play, whom the King cut in bits." So she went out to the gate and said to him, "Are you my husband?" "That I am," said he, and he told her to find out from the King where he kept his soul and then to come and tell him. So she went to the King and said to him, "Where my husband's soul is, there must mine be too." The King was touched by this artless expression of her love, and he replied, "My soul is in yonder lake. In that lake lies a stone; in that stone is a hare; in the hare is a duck, in the duck is an egg, and in the egg is my soul." So the queen went and told her former husband, the prince, and gave him plenty of money and food for the journey, and off he set for the lake. But when he came to the lake, he did not know in which part of it the stone was; so he roamed about the banks,

and he was hungry, for he had eaten up all the food. Then he met a dog, and the dog said to him, "Don't shoot me dead. I will be a mighty helper to you in your time of need." So he let the dog live and went on his way. Next he saw a tree with two hawks on it, an old one and a young one, and he climbed up the tree to catch the young one. But the old hawk said to him, "Don't take my young one. He will be a mighty helper to you in your time of need." So the prince climbed down the tree and went on his way. Then he saw a huge crab and wished to break off one of his claws for something to eat, but the crab said to him, "Don't break off my claw. It will be a mighty helper to you in your time of need." So he left the crab alone and went on his way. And he came to people and got them to fish up the stone for him from the lake and to bring it to him on the bank. And there he broke the stone in two and out of the stone jumped a hare. But the dog seized the hare and tore him, and out of the hare flew a duck. The young hawk pounced on the duck and rent it, and out of the duck fell an egg, and the egg rolled into the lake. But the crab fetched the egg out of the lake and brought it to the prince. Then the King fell ill. So the prince went to the King and said, "You killed me. Now I will kill you." "Don't," said the King. "I will," said the prince. With that he threw the egg on the ground, and the King fell out of the bed as dead as a stone. So the prince went home with his wife and very happy they were, you may take my word for it.

Amongst peoples of the Teutonic stock stories of the external soul are not wanting. In a tale told by the Saxons of Transylvania it is said that a young man shot at a witch again and again. The bullets went clean through her but did her no harm, and she only laughed and mocked at him. "Silly earthworm," she cried, "shoot as much as you like. It does me no harm. For know that my life resides not in me but far, far away. In a mountain is a pond, on the pond swims a duck, in the duck is an egg, in the egg burns a light, that light is my life. If you could put out that light, my life would be at an end. But that can never, never be." However, the young man got hold of the egg, smashed it, and put out the light, and with it the witch's life went out also. In this last story, as in many other stories of the same type, the hero achieves his adventure by the help of certain grateful animals whom he had met and done a service to on his travels. The same incident occurs in another German tale of this class which runs thus. Once upon a time there was a young fellow called Body-without-Soul, or, for short, Soulless, and he was a cannibal who would eat nothing but young girls. Now it was a custom in that country that the girls drew lots every year, and the one on whom the lot fell was handed over to Soulless. In time it happened that the lot fell on the king's daughter. The king was exceedingly sorry, but what could he do? Law was law, and had to be obeyed. So they took the princess to the castle where Soulless resided; and he shut her up in the larder and fattened her for his dinner. But a brave soldier undertook to rescue her, and off he set for the cannibal's castle. Well, as he trudged along, what should he see but a fly, an eagle, a bear, and a lion sitting in a field by the side of the road, and quarrelling about their shares in a dead horse. So he divided the carcase fairly between them, and as a reward the fly and the eagle bestowed on him the power of changing himself at will into either of their shapes. That evening he made himself into an eagle, and flew up a high tree; there he looked about, but could see nothing but trees. Next morning he flew on till he came to a great castle, and at the gate was a big black board with these words chalked up on it: "Mr. Soulless lives here." When the soldier read that he was glad, and changed himself into a fly, and flew buzzing from window to window, looking in at every one till he came to the one where the fair princess sat a prisoner. He introduced himself at once and said, "I am come to free you, but first you must learn where the soul of Soulless really is." "I don't know," replied the princess, "but I will ask." So after much coaxing and entreaty she learned that the soul of Soulless was in a box, and that the box was on a rock in the middle of the Red Sea. When the soldier heard that, he turned himself into an eagle again, flew to the Red Sea, and came back with the soul of Soulless in the box. Arrived at the castle he knocked and banged at the door

as if the house was on fire. Soulless did not know what was the matter, and he came down and opened the door himself. When he saw the soldier standing at it, I can assure you he was in a towering rage. "What do you mean," he roared, "by knocking at my door like that? I'll gobble you up on the spot, skin and hair and all." But the soldier laughed in his face. "You'd better not do that," said he, "for here I've got your soul in the box." When the cannibal heard that, all his courage went down into the calves of his legs, and he begged and entreated the soldier to give him his soul. But the soldier would not hear of it; he opened the box, took out the soul, and flung it over his head; and that same instant down fell the cannibal, dead as a door-nail.

Another German story, which embodies the notion of the external soul in a somewhat different form, tells how once upon a time a certain king had three sons and a daughter, and for each of the king's four children there grew a flower in the king's garden, which was a life-flower; for it bloomed and flourished so long as the child lived, but drooped and withered away when the child died. Now the time came when the king's daughter married a rich man and went to live with him far away. But it was not long before her flower withered in the king's garden. So the eldest brother went forth to visit his brother-in-law and comfort him in his bereavement. But when he came to his brother-in-law's castle he saw the corpse of his murdered sister weltering on the ramparts. And his wicked brother-in-law set before him boiled human hands and feet for his dinner. And when the king's son refused to eat of them, his brother-in-law led him through many chambers to a murder-hole, where were all sorts of implements of murder, but especially a gallows, a wheel, and a pot of blood. Here he said to the prince, "You must die, but you may choose your kind of death." The prince chose to die on the gallows; and die he did even as he had said. So the eldest son's flower withered in the king's garden, and the second son went forth to learn the fate of his brother and sister. But it fared with him no better than with his elder brother, for he too died on the gallows in the murder-hole of his wicked brother-in-law's castle, and his flower also withered away in the king's garden at home. Now when the youngest son was also come to his brother-in-law's castle and saw the corpse of his murdered sister weltering on the ramparts, and the bodies of his two murdered brothers dangling from the gallows in the murder-hole, he said that for his part he had a fancy to die by the wheel, but he was not quite sure how the thing was done, and would his brother-in-law kindly shew him? "Oh, it's quite easy," said his brother-in-law, "you just put your head in, so," and with that he popped his head through the middle of the wheel. "Just so," said the king's youngest son, and he gave the wheel a twirl, and as it spun round and round, the wicked brother-in-law died a painful death, which he richly deserved. And when he was quite dead, the murdered brothers and sister came to life again, and their withered flowers bloomed afresh in the king's garden.

In another German story an old warlock lives with a damsel all alone in the midst of a vast and gloomy wood. She fears that being old he may die and leave her alone in the forest. But he reassures her. "Dear child," he said, "I cannot die, and I have no heart in my breast." But she importuned him to tell her where his heart was. So he said, "Far, far from here in an unknown and lonesome land stands a great church. The church is well secured with iron doors, and round about it flows a broad deep moat. In the church flies a bird and in the bird is my heart. So long as the bird lives, I live. It cannot die of itself, and no one can catch it; therefore I cannot die, and you need have no anxiety." However the young man, whose bride the damsel was to have been before the warlock spirited her away, contrived to reach the church and catch the bird. He brought it to the damsel, who stowed him and it away under the warlock's bed. Soon the old warlock came home. He was ailing, and said so. The girl wept and said, "Alas, daddy is dying; he has a heart in his breast after all." "Child," replied the warlock, "hold your tongue. I *can't* die. It will soon pass over." At that the young man under

the bed gave the bird a gentle squeeze; and as he did so, the old warlock felt very unwell and sat down. Then the young man gripped the bird tighter, and the warlock fell senseless from his chair. "Now squeeze him dead," cried the damsel. Her lover obeyed, and when the bird was dead, the old warlock also lay dead on the floor.

In the Norse tale of "the giant who had no heart in his body," the giant tells the captive princess, "Far, far away in a lake lies an island, on that island stands a church, in that church is a well, in that well swims a duck, in that duck there is an egg, and in that egg there lies my heart." The hero of the tale, with the help of some animals to whom he had been kind, obtains the egg and squeezes it, at which the giant screams piteously and begs for his life. But the hero breaks the egg in pieces and the giant at once bursts. In another Norse story a hill-ogre tells the captive princess that she will never be able to return home unless she finds the grain of sand which lies under the ninth tongue of the ninth head of a certain dragon; but if that grain of sand were to come over the rock in which the ogres live, they would all burst "and the rock itself would become a gilded palace, and the lake green meadows." The hero finds the grain of sand and takes it to the top of the high rock in which the ogres live. So all the ogres burst and the rest falls out as one of the ogres had foretold.

In a Danish tale a warlock carries off a princess to his wondrous subterranean palace; and when she anxiously enquires how long he is likely to live, he assures her that he will certainly survive her. "No man," he says, "can rob me of my life, for it is in my heart, and my heart is not here; it is in safer keeping." She urges him to tell her where it is, so he says: "Very far from here, in a land that is called Poland, there is a great lake, and in the lake is a dragon, and in the dragon is a hare, and in the hare is a duck, and in the duck is an egg, and in the egg is my heart. It is in good keeping, you may trust me. Nobody is likely to stumble upon it." However, the hero of the tale, who is also the husband of the kidnapped princess, has fortunately received the power of turning himself at will into a bear, a dog, an ant, or a falcon as a reward for having divided the carcass of a deer impartially between four animals of these species; and availing himself of this useful art he not only makes his way into the warlock's enchanted palace but also secures the egg on which the enchanter's life depends. No sooner has he smashed the egg on the enchanter's ugly face than that miscreant drops down as dead as a herring.

Another Danish story tells how a lad went out into the world to look for service. He met a man, who hired him for three years and said he would give him a bushel of money for the first year, two bushels of money for the second, and three bushels of money for the third. The lad was well content, as you may believe, to get such good wages. But the man was a magician, and it was not long before he turned the lad into a hare, by pronouncing over him some strange words. For a whole year the lad scoured the woods in the shape of a hare, and there was not a sportsman in all the country round about that had not a shot at him. But not one of them could hit him. At the end of the year the magician spoke some other words over him and turned him back into human form and gave him the bushel of money. But then the magician mumbled some other words, and the lad was turned into a raven and flew up into the sky. Again all the marksmen of the neighbourhood pointed their guns at him and banged away; but they only wasted powder and shot, for not one of them could hit him. At the end of the year the magician changed him back into a man and gave him two bushelfuls of money. But soon after he changed him into a fish, and in the form of a fish the young man jumped into the brook and swam down into the sea. There at the bottom of the ocean he saw a most beautiful castle all of glass and in it a lovely girl all alone. Round and round the castle he swam, looking into all the rooms and admiring everything. At last he remembered the words the magician had spoken when he turned him back into a man, and by repeating them he was at once transformed into a stripling again. He walked into the glass castle and introduced

himself to the girl, and though at first she was nearly frightened to death, she was soon very glad to have him with her. From her he learned that she was no other than the daughter of the magician, who kept her there for safety at the bottom of the sea. The two now laid their heads together, and she told him what to do. There was a certain king who owed her father money and had not the wherewithal to pay; and if he did not pay by such and such a day, his head was to be cut off. So the young man was to take service with the king, offer him the bushels of money which he had earned in the service of the magician, and go with him to the magician to pay his debt. But he was to dress up as the court Fool so that the magician would not know him, and in that character he was to indulge in horse-play, smashing windows and so on, till the magician would fall into such a rage that though the king had paid his debt to the last farthing he would nevertheless be condemned to instant execution unless he could answer the magician's questions. The questions would be these, "Where is my daughter?" "Would you know her if you saw her?" Now the magician would cause a whole line of phantom women to pass by, so that the young man would not be able to tell which of them was the sorcerer's daughter; but when her turn came to pass by she would give him a nudge as a sign, and so he would know her. Then the magician would ask, "And where is my heart?" And the young man was to say, "In a fish." And the magician would ask, "Would you know the fish if you saw it?" And he would cause all sorts of fishes to pass by, and the young man would have to say in which of them was the heart of the magician. He would never be able of himself to tell in which of them it was, but the girl would stand beside him, and when the right fish passed by, she would nudge him and he was to catch it and rip it up, and the magician would ask him no more questions. Everything turned out exactly as she had said. The king paid his debt to the last farthing; but the young man disguised as the court Fool cut such capers and smashed so many glass windows and doors that the heaps of broken glass were something frightful to contemplate. So there was nothing for it but that the king, who was of course responsible for the pranks of his Fool, should either answer the magician's questions or die the death. While they were getting the axe and the block ready in the courtyard, the trembling king was interrogated by the stern magician. "Where is my daughter?" asked the sorcerer. Here the court Fool cut in and said, "She is at the bottom of the sea." "Would you know her if you saw her?" enquired the magician. "To be sure I would," answered the Fool. So the magician caused a whole regiment of girls to defile before him, one after the other; but they were mere phantoms and apparitions. Almost the last of all came the magician's daughter, and when she passed the young man she pinched his arm so hard that he almost shrieked with pain. However, he dissembled his agony and putting his arm round her waist held her fast. The magician now played his last trump. "Where is my heart?" said he. "In a fish," said the Fool. "Would you know the fish if you saw it?" asked the magician. "To be sure I would," answered the Fool. Then all the fishes of the sea swam past, and when the right one came last of all, the girl nudged her lover; he seized the fish, and with one stroke of his knife slit it from end to end. Out tumbled the magician's heart; the young man seized it and cut it in two, and at the same moment the magician fell dead.

In Iceland they say that once a king's son was out hunting in a wood with the courtiers, when the mist came down so thick that his companions lost sight of the prince, and though they searched the woods till evening they could not find him. At the news the king was inconsolable, and taking to his bed caused proclamation to be made that he who could find and bring back his lost son should have half the kingdom. Now an old man and his old wife lived together in a wretched hut, and they had a daughter. She resolved to seek the lost prince and get the promised reward. So her parents gave her food for the journey and a pair of new shoes, and off she set. Well, she walked and better walked for days, and at last she came towards evening to a cave and going into it she saw two beds. One of them was covered with a cloth of silver and the other with a cloth of gold; and in the bed with the golden coverlet

was the king's son fast asleep. She tried to wake him, but all in vain. Then she noticed some runes carved on the bedsteads, but she could not read them. So she went back to the mouth of the cave and hid behind the door. Hardly had she time to conceal herself when she heard a loud noise and saw two giantesses, two great hulking louts they were, stride into the cave. No sooner were they in than one said to the other, "Ugh, what a smell of human flesh in our cave!" But the other thought the smell might come from the king's son. They went up to the bed where he was sleeping, and calling two swans, which the girl had not perceived in the dim light of the cave, they said:—

*"Sing, sing, my swans,
That the king's son may wake."*

So the swans sang and the king's son awoke. The younger of the two hags offered him food, but he refused it; then she asked him, if he would marry her, but he said "No, certainly not." Then she shrieked and said to the swans:—

*"Sing, sing, my swans,
That the king's son may sleep."*

The swans sang and the king's son fell fast asleep. Then the two giantesses lay down in the bed with the silver coverlet and slept till break of day. When they woke in the morning, they wakened the prince and offered him food again, but he again refused it; and the younger hag again asked him if he would have her to wife, but he would not hear of it. So they put him to sleep again to the singing of the swans and left the cave. When they were gone a while, the girl came forth from her hiding-place and waked the king's son to the song of the swans, and he was glad to see her and to get the news. She told him that, when the hag asked him again to marry her, he must say, "Yes, but you must first tell me what is written on the beds, and what you do by day." So when it drew to evening, the girl hid herself again, and soon the giantesses came, lit a fire in the cave, and cooked at it the game they had brought with them. And the younger hag wakened the king's son and asked him if he would have something to eat. This time he said "Yes." And when he had finished his supper, the giantess asked him if he would have her to wife. "That I will," said he, "but first you must tell me what the runes mean that are carved on the bed." She said that they meant:—

*"Run, run, my little bed,
Run whither I will."*

He said he was very glad to know it, but she must also tell him what they did all day long out there in the wood. The hag told him that they hunted beasts and birds, and that between whiles they sat down under an oak and threw their life-egg from one to the other, but they had to be careful, for if the egg were to break, they would both die. The king's son thanked her kindly, but next morning when the giantess asked him to go with them to the wood he said that he would rather stay at home. So away went the giantesses by themselves, after they had lulled him to sleep to the singing of the swans. But hardly were their backs turned when out came the girl and wakened the prince and told him to take his spear, and they would pursue the giantesses, and when they were throwing their life-egg to each other he was to hurl his spear at it and smash it to bits. "But if you miss," said she, "it is as much as your life is worth." So they came to the oak in the wood, and there they heard a loud laugh, and the king's son climbed up the tree, and there under the oak were the two giantesses, and one of them had a golden egg in her hand and threw it to the other. Just then the king's son hurled his spear and hit the egg so that it burst. At the same time the two hags fell dead to the ground and the slaver dribbled out of their mouths. In an Icelandic parallel to the story of Meleager the spae-wives or sibyls come and foretell the high destiny of the infant Gestr as he lies in his

cradle. Two candles were burning beside the child, and the youngest of the spae-wives, conceiving herself slighted, cried out, "I foretell that the child shall live no longer than this candle burns." Whereupon the chief sibyl put out the candle and gave it to Gestr's mother to keep, charging her not to light it again until her son should wish to die. Gestr lived three hundred years; then he kindled the candle and expired.

The conception of the external soul meets us also in Celtic stories. Thus a tale, told by a blind fiddler in the island of Islay, relates how a giant carried off a king's wife and his two horses and kept them in his den. But the horses attacked the giant and mauled him so that he could hardly crawl. He said to the queen, "If I myself had my soul to keep, those horses would have killed me long ago." "And where, my dear," said she, "is thy soul? By the books I will take care of it." "It is in the Bonnach stone," said he. So on the morrow when the giant went out, the queen set the Bonnach stone in order exceedingly. In the dusk of the evening the giant came back, and he said to the queen, "What made thee set the Bonnach stone in order like that?" "Because thy soul is in it," quoth she. "I perceive," said he, "that if thou didst know where my soul is, thou wouldst give it much respect." "That I would," said she. "It is not there," said he, "my soul is; it is in the threshold." On the morrow she set the threshold in order finely, and when the giant returned, he asked her, "What brought thee to set the threshold in order like that?" "Because thy soul is in it," said she. "I perceive," said he, "that if thou knewest where my soul is, thou wouldst take care of it." "That I would," said she. "It is not there that my soul is," said he. "There is a great flagstone under the threshold. There is a wether under the flag. There is a duck in the wether's belly, and an egg in the belly of the duck, and it is in the egg that my soul is." On the morrow when the giant was gone, they raised the flagstone and out came the wether. They opened the wether and out came the duck. They split the duck, and out came the egg. And the queen took the egg and crushed it in her hands, and at that very moment the giant, who was coming home in the dusk, fell down dead. In another Celtic tale, a sea beast has carried off a king's daughter, and an old smith declares that there is no way of killing the beast but one. "In the island that is in the midst of the loch is Eillid Chaisfhion—the white-footed hind, of the slenderest legs, and the swiftest step, and though she should be caught, there would spring a hoodie out of her, and though the hoodie should be caught, there would spring a trout out of her, but there is an egg in the mouth of the trout, and the soul of the beast is in the egg, and if the egg breaks, the beast is dead." As usual the egg is broken and the beast dies.

In these Celtic tales the helpful animals reappear and assist the hero in achieving the adventure, though for the sake of brevity I have omitted to describe the parts they play in the plot. They figure also in an Argyleshire story, which seems however to be of Irish origin; for the Cruachan of which we hear in it is not the rugged and lofty mountain Ben Cruachan which towers above the beautiful Loch Awe, but Roscommon Cruachan near Belanagare, the ancient palace of the kings of Connaught, long famous in Irish tradition. The story relates how a big giant, King of Sorcha, stole away the wife and the shaggy dun filly of the herdsman or king of Cruachan. So the herdsman baked a bannock to take with him by the way, and set off in quest of his wife and the filly. He went for a long, long time, till at last his soles were blackened and his cheeks were sunken, the yellow-headed birds were going to rest at the roots of the bushes and the tops of the thickets, and the dark clouds of night were coming and the clouds of day were departing; and he saw a house far from him, but though it was far from him he did not take long to reach it. He went in, and sat in the upper end of the house, but there was no one within; and the fire was newly kindled, the house newly swept, and the bed newly made; and who came in but the hawk of Glencuaich, and she said to him, "Are you here, young son of Cruachan?" "I am," said he. The hawk said to him, "Do you know who was here last night?" "I do not," said he. "There were here," said she, "the big

giant, King of Sorcha, your wife, and the shaggy dun filly; and the giant was threatening terribly that if he could get hold of you he would take the head off you." "I well believe it," said he. Then she gave him food and drink, and sent him to bed. She rose in the morning, made breakfast for him, and baked a bannock for him to take with him on his journey. And he went away and travelled all day, and in the evening he came to another house and went in, and was entertained by the green-headed duck, who told him that the giant had rested there the night before with the wife and shaggy dun filly of the herdsman of Cruachan. And next day the herdsman journeyed again, and at evening he came to another house and went in and was entertained by the fox of the scrubwood, who told him just what the hawk of Glencuaich and the green-headed duck had told him before. Next day the same thing happened, only it was the brown otter of the burn that entertained him at evening in a house where the fire was newly kindled, the floor newly swept, and the bed newly made. And next morning when he awoke, the first thing he saw was the hawk of Glencuaich, the green-headed duck, the fox of the scrubwood, and the brown otter of the burn all dancing together on the floor. They made breakfast for him, and partook of it all together, and said to him, "Should you be at any time in straits, think of us, and we will help you." Well, that very evening he came to the cave where the giant lived, and who was there before him but his own wife? She gave him food and hid him under clothes at the upper end of the cave. And when the giant came home he sniffed about and said, "The smell of a stranger is in the cave." But she said no, it was only a little bird she had roasted. "And I wish you would tell me," said she, "where you keep your life, that I might take good care of it." "It is in a grey stone over there," said he. So next day when he went away, she took the grey stone and dressed it well, and placed it in the upper end of the cave. When the giant came home in the evening he said to her, "What is it that you have dressed there?" "Your own life," said she, "and we must be careful of it." "I perceive that you are very fond of me, but it is not there," said he. "Where is it?" said she. "It is in a grey sheep on yonder hillside," said he. On the morrow, when he went away, she got the grey sheep, dressed it well, and placed it in the upper end of the cave. When he came home in the evening he said, "What is it that you have dressed there?" "Your own life, my love," said she. "It is not there as yet," said he. "Well!" said she, "you are putting me to great trouble taking care of it, and you have not told me the truth these two times." He then said, "I think that I may tell it to you now. My life is below the feet of the big horse in the stable. There is a place down there in which there is a small lake. Over the lake are seven grey hides, and over the hides are seven sods from the heath, and under all these are seven oak planks. There is a trout in the lake, and a duck in the belly of the trout, an egg in the belly of the duck, and a thorn of blackthorn inside of the egg, and till that thorn is chewed small I cannot be killed. Whenever the seven grey hides, the seven sods from the heath, and the seven oak planks are touched I shall feel it wherever I shall be. I have an axe above the door, and unless all these are cut through with one blow of it the lake will not be reached; and when it will be reached I shall feel it." Next day, when the giant had gone out hunting on the hill, the herdsman of Cruachan contrived, with the help of the friendly animals—the hawk, the duck, the fox, and the otter—to get possession of the fateful thorn and to chew it before the giant could reach him; and no sooner had he done so than the giant dropped stark and stiff, a corpse.

Another Argyleshire story relates how a certain giant, who lived in the Black Corrie of Ben Breck, carried off three daughters of a king, one after the other, at intervals of seven years. The bereaved monarch sent champions to rescue his lost daughters, but though they surprised the giant in his sleep and cut off his head, it was all to no purpose; for as fast as they cut it off he put it on again and made after them as if nothing had happened. So the champions fled away before him as fast as they could lay legs to the ground, and the more agile of them escaped, but the shorter-winded he caught, bared them to the skin, and hanged them on hooks against the turrets of his castle. So he went by the name of the Bare-Stripping Hangman. Now

this amiable man had announced his intention of coming to fetch away the fourth and last of the king's daughters, when another seven years should be up. The time was drawing near, and the king, with the natural instincts of a father, was in great tribulation, when as good luck would have it a son of the king of Ireland, by name Alastir, arrived in the king's castle and undertook to find out where the Bare-Stripping Hangman had hidden his soul. To cut a long story short, the artful Hangman had hidden his soul in an egg, which was in the belly of a duck, which was in the belly of a salmon, which was in the belly of a swift-footed hind of the cliffs. The prince wormed the secret from a little old man, and by the help of a dog, a brown otter, and a falcon he contrived to extract the egg from its various envelopes and crushed it to bits between his hands and knees. So when he came to the giant's castle he found the Bare-Stripping Hangman lying dead on the floor.

Another Highland story sets forth how Hugh, prince of Lochlin, was long held captive by a giant who lived in a cave overlooking the Sound of Mull. At last, after he had spent many years of captivity in that dismal cave, it came to pass that one night the giant and his wife had a great dispute, and Hugh overheard their talk, and learned that the giant's soul was in a precious gem which he always wore on his forehead. So the prince watched his opportunity, seized the gem, and having no means of escape or concealment, hastily swallowed it. Like lightning from the clouds, the giant's sword flashed from its scabbard and flew between Hugh's head and his body to intercept the gem before it could descend into the prince's stomach. But it was too late; and the giant fell down, sword in hand, and expired without a gasp. Hugh had now lost his head, it is true, but having the giant's soul in his body he felt none the worse for the accident. So he buckled the giant's sword at his side, mounted the grey filly, swifter than the east wind, that never had a bridle, and rode home. But the want of his head made a painful impression on his friends; indeed they maintained that he was a ghost and shut the door in his face, so now he wanders for ever in shades of darkness, riding the grey filly fleetier than the wind. On stormy nights, when the wind howls about the gables and among the trees, you may see him galloping along the shore of the sea "between wave and sand." Many a naughty little boy, who would not go quietly to bed, has been carried off by Headless Hugh on his grey filly and never seen again.

In Sutherlandshire at the present day there is a sept of Mackays known as "the descendants of the seal," who claim to be sprung from a mermaid, and the story they tell in explanation of their claim involves the notion of the external soul. They say that the laird of Borgie used to go down to the rocks under his castle to bathe. One day he saw a mermaid close in shore, combing her hair and swimming about, as if she were anxious to land. After watching her for a time, he noticed her cowl on the rocks beside him, and knowing that she could not go to sea without it, he carried the cowl up to the castle in the hope that she would follow him. She did so, but he refused to give up the cowl and detained the sea-maiden herself and made her his wife. To this she consented with great reluctance, and told him that her life was bound up with the cowl, and that if it rotted or was destroyed she would instantly die. So the cowl was placed for safety in the middle of a great hay-stack, and there it lay for years. One unhappy day, when the laird was from home, the servants were working among the hay and found the cowl. Not knowing what it was, they shewed it to the lady of the house. The sight revived memories of her old life in the depths of the sea, so she took the cowl, and leaving her child in its cot, plunged into the sea and never came home to Borgie any more. Only sometimes she would swim close in shore to see her boy, and then she wept because he was not of her own kind that she might take him to sea with her. The boy grew to be a man, and his descendants are famous swimmers. They cannot drown, and to this day they are known in the neighbourhood as *Sliochd an roin*, that is, "the descendants of the seal."

In an Irish story we read how a giant kept a beautiful damsel a prisoner in his castle on the top of a hill, which was white with the bones of the champions who had tried in vain to rescue the fair captive. At last the hero, after hewing and slashing at the giant all to no purpose, discovered that the only way to kill him was to rub a mole on the giant's right breast with a certain egg, which was in a duck, which was in a chest, which lay locked and bound at the bottom of the sea. With the help of some obliging salmon, rams, and eagles, the hero as usual made himself master of the precious egg and slew the giant by merely striking it against the mole on his right breast. Similarly in a Breton story there figures a giant whom neither fire nor water nor steel can harm. He tells his seventh wife, whom he has just married after murdering all her predecessors, "I am immortal, and no one can hurt me unless he crushes on my breast an egg, which is in a pigeon, which is in the belly of a hare; this hare is in the belly of a wolf, and this wolf is in the belly of my brother, who dwells a thousand leagues from here. So I am quite easy on that score." A soldier, the hero of the tale, had been of service to an ant, a wolf, and a sea-bird, who in return bestowed on him the power of turning himself into an ant, a wolf, or a sea-bird at will. By means of this magical power the soldier contrived to obtain the egg and crush it on the breast of the giant, who immediately expired. Another Breton story tells of a giant who was called Body-without-Soul because his life did not reside in his body. He himself dwelt in a beautiful castle which hung between heaven and earth, suspended by four golden chains; but his life was in an egg, and the egg was in a dove, and the dove was in a hare, and the hare was in a wolf, and the wolf was in an iron chest at the bottom of the sea. In his castle in the air he kept prisoner a beautiful princess whom he had swooped down upon and carried off in a magic chariot. But her lover turned himself into an ant and so climbed up one of the golden chains into the enchanted castle, for he had done a kindness to the king and queen of ants, and they rewarded him by transforming him into an ant in his time of need. When he had learned from the captive princess the secret of the giant's life, he procured the chest from the bottom of the sea by the help of the king of fishes, whom he had also obliged; and opening the chest he killed first the wolf, then the hare, and then the dove, and at the death of each animal the giant grew weaker and weaker as if he had lost a limb. In the stomach of the dove the hero found the egg on which the giant's life depended, and when he came with it to the castle he found Body-without-Soul stretched on his bed at the point of death. So he dashed the egg against the giant's forehead, the egg broke, and the giant straightway expired. In another Breton tale the life of a giant resides in an old box-tree which grows in his castle garden; and to kill him it is necessary to sever the tap-root of the tree at a single blow of an axe without injuring any of the lesser roots. This task the hero, as usual, successfully accomplishes, and at the same moment the giant drops dead.

The notion of an external soul has now been traced in folk-tales told by Aryan peoples from India to Brittany and the Hebrides. We have still to shew that the same idea occurs commonly in the popular stories of peoples who do not belong to the Aryan stock. In the first place it appears in the ancient Egyptian story of "The Two Brothers." This story was written down in the reign of Rameses II., about 1300 b.c. It is therefore older than our present redaction of Homer, and far older than the Bible. The outline of the story, so far as it concerns us here, is as follows. Once upon a time there were two brethren; the name of the elder was Anpu and the name of the younger was Bata. Now Anpu had a house and a wife, and his younger brother dwelt with him as his servant. It was Anpu who made the garments, and every morning when it grew light he drove the kine afield. As he walked behind them they used to say to him, "The grass is good in such and such a place," and he heard what they said and led them to the good pasture that they desired. So his kine grew very sleek and multiplied greatly. One day when the two brothers were at work in the field the elder brother said to the younger, "Run and fetch seed from the village." So the younger brother ran and said to the wife of his elder brother, "Give me seed that I may run to the field, for my brother sent me

saying, Tarry not." She said, "Go to the barn and take as much as thou wouldst." He went and filled a jar full of wheat and barley, and came forth bearing it on his shoulders. When the woman saw him her heart went out to him, and she laid hold of him and said, "Come, let us rest an hour together." But he said, "Thou art to me as a mother, and my brother is to me as a father." So he would not hearken to her, but took the load on his back and went away to the field. In the evening, when the elder brother was returning from the field, his wife feared for what she had said. So she took soot and made herself as one who had been beaten. And when her husband came home, she said, "When thy younger brother came to fetch seed, he said to me, Come, let us rest an hour together. But I would not, and he beat me." Then the elder brother became like a panther of the south; he sharpened his knife and stood behind the door of the cow-house. And when the sun set and the younger brother came laden with all the herbs of the field, as was his wont every day, the cow that walked in front of the herd said to him, "Behold, thine elder brother stands with a knife to kill thee. Flee before him." When he heard what the cow said, he looked under the door of the cow-house and saw the feet of his elder brother standing behind the door, his knife in his hand. So he fled and his brother pursued him with the knife. But the younger brother cried for help to the Sun, and the Sun heard him and caused a great water to spring up between him and his elder brother, and the water was full of crocodiles. The two brothers stood, the one on the one side of the water and the other on the other, and the younger brother told the elder brother all that had befallen. So the elder brother repented him of what he had done and he lifted up his voice and wept. But he could not come at the farther bank by reason of the crocodiles. His younger brother called to him and said, "Go home and tend the cattle thyself. For I will dwell no more in the place where thou art. I will go to the Valley of the Acacia. But this is what thou shalt do for me. Thou shalt come and care for me, if evil befalls me, for I will enchant my heart and place it on the top of the flower of the Acacia; and if they cut the Acacia and my heart falls to the ground, thou shalt come and seek it, and when thou hast found it thou shalt lay it in a vessel of fresh water. Then I shall come to life again. But this is the sign that evil has befallen me; the pot of beer in thine hand shall bubble." So he went away to the Valley of the Acacia, but his brother returned home with dust on his head and slew his wife and cast her to the dogs.

For many days afterwards the younger brother dwelt alone in the Valley of the Acacia. By day he hunted the beasts of the field, but at evening he came and laid him down under the Acacia, on the top of whose flower was his heart. And many days after that he built himself a house in the Valley of the Acacia. But the gods were grieved for him; and the Sun said to Khnumu, "Make a wife for Bata, that he may not dwell alone." So Khnumu made him a woman to dwell with him, who was perfect in her limbs more than any woman on earth, for all the gods were in her. So she dwelt with him. But one day a lock of her hair fell into the river and floated down to the land of Egypt, to the house of Pharaoh's washerwomen. The fragrance of the lock perfumed Pharaoh's raiment, and the washerwomen were blamed, for it was said, "An odour of perfume in the garments of Pharaoh!" So the heart of Pharaoh's chief washerman was weary of the complaints that were made every day, and he went to the wharf, and there in the water he spied the lock of hair. He sent one down into the river to fetch it, and, because it smelt sweetly, he took it to Pharaoh. Then Pharaoh's magicians were sent for and they said, "This lock of hair belongs to a daughter of the Sun, who has in her the essence of all the gods. Let messengers go forth to all foreign lands to seek her." So the woman was brought from the Valley of the Acacia with chariots and archers and much people, and all the land of Egypt rejoiced at her coming, and Pharaoh loved her. But when they asked her of her husband, she said to Pharaoh, "Let them cut down the Acacia and let them destroy it." So men were sent with tools to cut down the Acacia. They came to it and cut the flower upon which was the heart of Bata; and he fell down dead in that evil hour. But the next day, when the earth grew light and the elder brother of Bata was entered into his house and had sat

down, they brought him a pot of beer and it bubbled, and they gave him a jug of wine and it grew turbid. Then he took his staff and his sandals and hied him to the Valley of the Acacia, and there he found his younger brother lying dead in his house. So he sought for the heart of his brother under the Acacia. For three years he sought in vain, but in the fourth year he found it in the berry of the Acacia. So he threw the heart into a cup of fresh water. And when it was night and the heart had sucked in much water, Bata shook in all his limbs and revived. Then he drank the cup of water in which his heart was, and his heart went into its place, and he lived as before.

In the *Arabian Nights* we read how Seyf el-Mulook, after wandering for four months over mountains and hills and deserts, came to a lofty palace in which he found the lovely daughter of the King of India sitting alone on a golden couch in a hall spread with silken carpets. She tells him that she is held captive by a jinnee, who had swooped down on her and carried her off while she was disporting herself with her female slaves in a tank in the great garden of her father the king. Seyf el-Mulook then offers to smite the jinnee with the sword and slay him. "But," she replied, "thou canst not slay him unless thou kill his soul." "And in what place," said he, "is his soul?" She answered, "I asked him respecting it many times; but he would not confess to me its place. It happened, however, that I urged him, one day, and he was enraged against me, and said to me, 'How often wilt thou ask me respecting my soul? What is the reason of thy question respecting my soul?' So I answered him, 'O Hátim, there remaineth to me no one but thee, excepting God; and I, as long as I live, would not cease to hold thy soul in my embrace; and if I do not take care of thy soul, and put it in the midst of my eye, how can I live after thee? If I knew thy soul, I would take care of it as of my right eye.' And thereupon he said to me, 'When I was born, the astrologers declared that the destruction of my soul would be effected by the hand of one of the sons of the human kings. I therefore took my soul, and put it into the crop of a sparrow, and I imprisoned the sparrow in a little box, and put this into another small box, and this I put within seven other small boxes, and I put these within seven chests, and the chests I put into a coffer of marble within the verge of this circumambient ocean; for this part is remote from the countries of mankind, and none of mankind can gain access to it.' " But Seyf el-Mulook got possession of the sparrow and strangled it, and the jinnee fell upon the ground a heap of black ashes. In a modern Arabian tale a king marries an ogress, who puts out the eyes of the king's forty wives. One of the blinded queens gives birth to a son whom she names Mohammed the Prudent. But the ogress queen hated him and compassed his death. So she sent him on an errand to the house of her kinsfolk the ogres. In the house of the ogres he saw some things hanging from the roof, and on asking a female slave what they were, she said, "That is the bottle which contains the life of my lady the queen, and the other bottle beside it contains the eyes of the queens whom my mistress blinded." A little afterwards he spied a beetle and rose to kill it. "Don't kill it," cried the slave, "for that is my life." But Mohammed the Prudent watched the beetle till it entered a chink in the wall; and when the female slave had fallen asleep, he killed the beetle in its hole, and so the slave died. Then Mohammed took down the two bottles and carried them home to his father's palace. There he presented himself before the ogress queen and said, "See, I have your life in my hand, but I will not kill you till you have replaced the eyes which you took from the forty queens." The ogress did as she was bid, and then Mohammed the Prudent said, "There, take your life." But the bottle slipped from his hand and fell, the life of the ogress escaped from it, and she died.

A Basque story, which closely resembles some of the stories told among Aryan peoples, relates how a monster—a Body-without-Soul—detains a princess in captivity, and is questioned by her as to how he might be slain. With some reluctance he tells her, "You must kill a terrible wolf which is in the forest, and inside him is a fox, in the fox is a pigeon; this

pigeon has an egg in his head, and whoever should strike me on the forehead with this egg would kill me.” The hero of the story, by name Malbrouk, has learned, in the usual way, the art of turning himself at will into a wolf, an ant, a hawk, or a dog, and on the strength of this accomplishment he kills the animals, one after the other, and extracts the precious egg from the pigeon's head. When the wolf is killed, the monster feels it and says despondently, “I do not know if anything is going to happen to me. I am much afraid of it.” When the fox and the pigeon have been killed, he cries that it is all over with him, that they have taken the egg out of the pigeon, and that he knows not what is to become of him. Finally the princess strikes the monster on the forehead with the egg, and he falls a corpse. In a Kabyle story an ogre declares that his fate is far away in an egg, which is in a pigeon, which is in a camel, which is in the sea. The hero procures the egg and crushes it between his hands, and the ogre dies. In a Magyar folk-tale, an old witch detains a young prince called Ambrose in the bowels of the earth. At last she confided to him that she kept a wild boar in a silken meadow, and if it were killed, they would find a hare inside, and inside the hare a pigeon, and inside the pigeon a small box, and inside the box one black and one shining beetle: the shining beetle held her life, and the black one held her power; if these two beetles died, then her life would come to an end also. When the old hag went out, Ambrose killed the wild boar, and took out the hare; from the hare he took the pigeon, from the pigeon the box, and from the box the two beetles; he killed the black beetle, but kept the shining one alive. So the witch's power left her immediately, and when she came home, she had to take to her bed. Having learned from her how to escape from his prison to the upper air, Ambrose killed the shining beetle, and the old hag's spirit left her at once. In another Hungarian story the safety of the Dwarf-king resides in a golden cockchafer, inside a golden cock, inside a golden sheep, inside a golden stag, in the ninety-ninth island. The hero overcomes all these golden animals and so recovers his bride, whom the Dwarf-king had carried off.

A Lapp story tells of a giant who slew a man and took away his wife. When the man's son grew up, he tried to rescue his mother and kill the giant, but fire and sword were powerless to harm the monster; it seemed as if he had no life in his body. “Dear mother,” at last enquired the son, “don't you know where the giant has hidden away his life?” The mother did not know, but promised to ask. So one day, when the giant chanced to be in a good humour, she asked him where he kept his life. He said to her, “Out yonder on a burning sea is an island, in the island is a barrel, in the barrel is a sheep, in the sheep is a hen, in the hen is an egg, and in the egg is my life.” When the woman's son heard this, he hired a bear, a wolf, a hawk, and a diver-bird and set off in a boat to sail to the island in the burning sea. He sat with the hawk and the diver-bird under an iron tent in the middle of the boat, and he set the bear and the wolf to row. That is why to this day the bear's hair is dark brown and the wolf has dark-brown spots; for as they sat at the oars without any screen they were naturally scorched by the tossing tongues of flame on the burning sea. However, they made their way over the fiery billows to the island, and there they found the barrel. In a trice the bear had knocked the bottom out of it with his claws, and forth sprang a sheep. But the wolf soon pulled the sheep down and rent it in pieces. From out the sheep flew a hen, but the hawk stooped on it and tore it with his talons. In the hen was an egg, which dropped into the sea and sank; but the diver-bird dived after it. Twice he dived after it in vain and came up to the surface gasping and spluttering; but the third time he brought up the egg and handed it to the young man. Great was the young man's joy. At once he kindled a great bonfire on the shore, threw the egg into it, and rowed away back across the sea. On landing he went away straight to the giant's abode, and found the monster burning, just as he had left the egg burning on the island. “Fool that I was,” lamented the dying giant, “to betray my life to a wicked old woman,” and with that he snatched at an iron tube through which in happier days he had been wont to suck the blood of his human victims. But the woman was too subtle for him, for she had taken the

precaution of inserting one end of the tube in the glowing embers of the hearth; and so, when the giant sucked hard at the other end, he imbibed only fire and ashes. Thus he burned inside as well as outside, and when the fire went out the giant's life went out with it.

A Samoyed story tells how seven warlocks killed a certain man's mother and carried off his sister, whom they kept to serve them. Every night when they came home the seven warlocks used to take out their hearts and place them in a dish which the woman hung on the tent-poles. But the wife of the man whom they had wronged stole the hearts of the warlocks while they slept, and took them to her husband. By break of day he went with the hearts to the warlocks, and found them at the point of death. They all begged for their hearts; but he threw six of their hearts to the ground, and six of the warlocks died. The seventh and eldest warlock begged hard for his heart and the man said, "You killed my mother. Make her alive again, and I will give you back your heart." The warlock said to his wife, "Go to the place where the dead woman lies. You will find a bag there. Bring it to me. The woman's spirit is in the bag." So his wife brought the bag; and the warlock said to the man, "Go to your dead mother, shake the bag and let the spirit breathe over her bones; so she will come to life again." The man did as he was bid, and his mother was restored to life. Then he hurled the seventh heart to the ground, and the seventh warlock died. In a Kalmuck tale we read how a certain khan challenged a wise man to shew his skill by stealing a precious stone on which the khan's life depended. The sage contrived to purloin the talisman while the khan and his guards slept; but not content with this he gave a further proof of his dexterity by bonneting the slumbering potentate with a bladder. This was too much for the khan. Next morning he informed the sage that he could overlook everything else, but that the indignity of being bonneted with a bladder was more than he could stand; and he ordered his facetious friend to instant execution. Pained at this exhibition of royal ingratitude, the sage dashed to the ground the talisman which he still held in his hand; and at the same instant blood flowed from the nostrils of the khan, and he gave up the ghost.

In a Tartar poem two heroes named Ak Molot and Bulat engage in mortal combat. Ak Molot pierces his foe through and through with an arrow, grapples with him, and dashes him to the ground, but all in vain, Bulat could not die. At last when the combat has lasted three years, a friend of Ak Molot sees a golden casket hanging by a white thread from the sky, and bethinks him that perhaps this casket contains Bulat's soul. So he shot through the white thread with an arrow, and down fell the casket. He opened it, and in the casket sat ten white birds, and one of the birds was Bulat's soul. Bulat wept when he saw that his soul was found in the casket. But one after the other the birds were killed, and then Ak Molot easily slew his foe. In another Tartar poem, two brothers going to fight two other brothers take out their souls and hide them in the form of a white herb with six stalks in a deep pit. But one of their foes sees them doing so and digs up their souls, which he puts into a golden ram's horn, and then sticks the ram's horn in his quiver. The two warriors whose souls have thus been stolen know that they have no chance of victory, and accordingly make peace with their enemies. In another Tartar poem a terrible demon sets all the gods and heroes at defiance. At last a valiant youth fights the demon, binds him hand and foot, and slices him with his sword. But still the demon is not slain. So the youth asked him, "Tell me, where is your soul hidden? For if your soul had been hidden in your body, you must have been dead long ago." The demon replied, "On the saddle of my horse is a bag. In the bag is a serpent with twelve heads. In the serpent is my soul. When you have killed the serpent, you have killed me also." So the youth took the saddle-bag from the horse and killed the twelve-headed serpent, whereupon the demon expired. In another Tartar poem a hero called Kök Chan deposits with a maiden a golden ring, in which is half his strength. Afterwards when Kök Chan is wrestling long with a hero

and cannot kill him, a woman drops into his mouth the ring which contains half his strength. Thus inspired with fresh force he slays his enemy.

In a Mongolian story the hero Joro gets the better of his enemy the lama Tschoridong in the following way. The lama, who is an enchanter, sends out his soul in the form of a wasp to sting Joro's eyes. But Joro catches the wasp in his hand, and by alternately shutting and opening his hand he causes the lama alternately to lose and recover consciousness. In a Tartar poem two youths cut open the body of an old witch and tear out her bowels, but all to no purpose, she still lives. On being asked where her soul is, she answers that it is in the middle of her shoe-sole in the form of a seven-headed speckled snake. So one of the youths slices her shoe-sole with his sword, takes out the speckled snake, and cuts off its seven heads. Then the witch dies. Another Tartar poem describes how the hero Kartaga grappled with the Swan-woman. Long they wrestled. Moons waxed and waned and still they wrestled; years came and went, and still the struggle went on. But the piebald horse and the black horse knew that the Swan-woman's soul was not in her. Under the black earth flow nine seas; where the seas meet and form one, the sea comes to the surface of the earth. At the mouth of the nine seas rises a rock of copper; it rises to the surface of the ground, it rises up between heaven and earth, this rock of copper. At the foot of the copper rock is a black chest, in the black chest is a golden casket, and in the golden casket is the soul of the Swan-woman. Seven little birds are the soul of the Swan-woman; if the birds are killed the Swan-woman will die straightway. So the horses ran to the foot of the copper rock, opened the black chest, and brought back the golden casket. Then the piebald horse turned himself into a bald-headed man, opened the golden casket, and cut off the heads of the seven birds. So the Swan-woman died. In a Tartar story a chief called Tash Kan is asked where his soul is. He answers that there are seven great poplars, and under the poplars a golden well; seven *Maralen* (?) come to drink the water of the well, and the belly of one of them trails on the ground; in this *Maral* is a golden box, in the golden box is a silver box, in the silver box are seven quails, the head of one of the quails is golden and its tail silver; that quail is Tash Kan's soul. The hero of the story gets possession of the seven quails and wrings the necks of six of them. Then Tash Kan comes running and begs the hero to let his soul go free. But the hero wrings the last quail's neck, and Tash Kan drops dead. In another Tartar poem the hero, pursuing his sister who has driven away his cattle, is warned to desist from the pursuit because his sister has carried away his soul in a golden sword and a golden arrow, and if he pursues her she will kill him by throwing the golden sword or shooting the golden arrow at him.

A modern Chinese story tells how an habitual criminal used to take his soul out of his own body for the purpose of evading the righteous punishment of his crimes. This bad man lived in Khien (Kwei-cheu), and the sentences that had been passed on him formed a pile as high as a hill. The mandarins had flogged him to death with sticks and flung his mangled corpse into the river, but three days afterwards the scoundrel got his soul back again, and on the fifth day he resumed his career of villainy as if nothing had happened. The thing occurred again and again, till at last it reached the ears of the Governor of the province, who flew into a violent passion and proposed to the Governor-General to have the rascal beheaded. And beheaded he was; but in three days the wretch was alive again with no trace of decapitation about him except a slender red thread round his neck. And now, like a giant refreshed, he began a fresh series of enormities. He even went so far as to beat his own mother. This was more than she could bear, and she brought the matter before the magistrate. She produced in court a vase and said, "In this vase my refractory son has hidden his soul. Whenever he was conscious of having committed a serious crime, or a misdeed of the most heinous kind, he remained at home, took his soul out of his body, purified it, and put it in the vase. Then the authorities only punished or executed his body of flesh and blood, and not his soul. With his soul,

refined by a long process, he then cured his freshly mutilated body, which thus became able in three days to recommence in the old way. Now, however, his crimes have reached a climax, for he has beaten me, an old woman, and I cannot bear it. I pray you, smash this vase, and scatter his soul by fanning it away with a windwheel; and if then you castigate his body anew, it is probable that bad son of mine will really die." The mandarin took the hint. He had the rogue cudgelled to death, and when they examined the corpse they found that decay had set in within ten days.

The Khasis of Assam tell of a certain Kyllong, king of Madur, who pursued his conquests on a remarkable principle. He needed few or no soldiers, because he himself was a very strong man and nobody could kill him permanently; they could, it is true, put him to death, but then he came to life again immediately. The king of Synteng, who was much afraid of him, once chopped him in pieces and threw the severed hands and feet far away, thinking thus to get rid of him for good and all; but it was to no purpose. The very next morning Kyllong came to life again and stalked about as brisk as ever. So the king of Synteng was very anxious to learn how his rival contrived thus to rise from the dead; and he hit on a plan for worming out the secret. He chose the fairest girl of the whole country, clad her in royal robes, put jewels of gold and silver upon her, and said, "All these will I give thee and more besides, if thou canst obtain for me King Kyllong's secret, and canst inform me how he brings himself to life again after being killed." So he sent the girl to the slave-market in King Kyllong's country; and the king saw and loved her and took her to wife. So she caressed him and coaxed him to tell her his secret, and in a fatal hour he was beguiled into revealing it. He said, "My life depends upon these things. I must bathe every day and must wash my entrails. After that, I take my food, and there is no one on earth who can kill me unless he obtains possession of my entrails. Thus my life hangs only on my entrails." His treacherous wife at once sent word to the king of Synteng, who caused men to lie in wait while Kyllong was bathing. As usual, Kyllong had laid his entrails on one side of the bathing-place, while he disported himself in the water, intending afterwards to wash them and replace them in his body. But before he could do so, one of the liers-in-wait had seized the entrails and killed him. The entrails he cut in pieces and gave to the dogs to eat. That was the end of King Kyllong. He was never able to come to life again; his country was conquered, and the members of the royal family were scattered far and wide. Seven generations have passed since then.

A Malay poem relates how once upon a time in the city of Indrapoora there was a certain merchant who was rich and prosperous, but he had no children. One day as he walked with his wife by the river they found a baby girl, fair as an angel. So they adopted the child and called her Bidasari. The merchant caused a golden fish to be made, and into this fish he transferred the soul of his adopted daughter. Then he put the golden fish in a golden box full of water, and hid it in a pond in the midst of his garden. In time the girl grew to be a lovely woman. Now the King of Indrapoora had a fair young queen, who lived in fear that the king might take to himself a second wife. So, hearing of the charms of Bidasari, the queen resolved to put her out of the way. She lured the girl to the palace and tortured her cruelly; but Bidasari could not die, because her soul was not in her. At last she could stand the torture no longer and said to the queen, "If you wish me to die, you must bring the box which is in the pond in my father's garden." So the box was brought and opened, and there was the golden fish in the water. The girl said, "My soul is in that fish. In the morning you must take the fish out of the water, and in the evening you must put it back into the water. Do not let the fish lie about, but bind it round your neck. If you do this, I shall soon die." So the queen took the fish out of the box and fastened it round her neck; and no sooner had she done so, than Bidasari fell into a swoon. But in the evening, when the fish was put back into the water, Bidasari came to herself again. Seeing that she thus had the girl in her power, the queen sent

her home to her adopted parents. To save her from further persecution her parents resolved to remove their daughter from the city. So in a lonely and desolate spot they built a house and brought Bidasari thither. There she dwelt alone, undergoing vicissitudes that corresponded with the vicissitudes of the golden fish in which was her soul. All day long, while the fish was out of the water, she remained unconscious; but in the evening, when the fish was put into the water, she revived. One day the king was out hunting, and coming to the house where Bidasari lay unconscious, was smitten with her beauty. He tried to waken her, but in vain. Next day, towards evening, he repeated his visit, but still found her unconscious. However, when darkness fell, she came to herself and told the king the secret of her life. So the king returned to the palace, took the fish from the queen, and put it in water. Immediately Bidasari revived, and the king took her to wife.

Another story of an external soul comes from Nias, an island to the west of Sumatra. Once on a time a chief was captured by his enemies, who tried to put him to death but failed. Water would not drown him nor fire burn him nor steel pierce him. At last his wife revealed the secret. On his head he had a hair as hard as a copper wire; and with this wire his life was bound up. So the hair was plucked out, and with it his spirit fled.

A Hausa story from Northern Nigeria closely resembles some of the European tales which we have noticed; for it contains not only the incident of the external soul, but also the incident of the helpful animals, by whose assistance the hero is able to slay the Soulless King and obtain possession of the kingdom. The story runs thus. A certain man and his wife had four daughters born to them in succession, but every one of the baby girls mysteriously disappeared on the day when she was to be weaned; so the parents fell under the suspicion of having devoured them. Last of all there was born to them a son, who to avoid accidents was left to wean himself. One day, as he grew up, the son received a magic lotion from an old woman, who told him to rub his eyes with it. He did so, and immediately he saw a large house and entering it he found his eldest sister married to a bull. She bade him welcome and so did her husband the bull; and when he went away, the bull very kindly presented him with a lock of his hair as a keepsake. In like manner the lad discovered his other three sisters, who were living in wedlock with a ram, a dog, and a hawk respectively. All of them welcomed him and from the ram, the dog, and the hawk he received tokens of regard in the shape of hair or feathers. Then he returned home and told his parents of his adventure and how he had found his sisters alive and married. Next day he went to a far city, where he made love to the Queen and persuaded her to plot with him against the life of the King her husband. So she coaxed the King to shew his affection for her by "taking his own life, and joining it to hers." The unsuspecting husband, as usual, fell into the trap set for him by his treacherous wife. He confided to her the secret of his life. "My life," said he, "is behind the city, behind the city in a thicket. In this thicket there is a lake; in the lake is a rock; in the rock is a gazelle; in the gazelle is a dove; and in the dove is a small box." The Queen divulged the secret to her lover, who kindled a fire behind the city and threw into it the hair and feathers which he had received from the friendly animals, his brothers-in-law. Immediately the animals themselves appeared and readily gave their help in the enterprise. The bull drank up the lake; the ram broke up the rock; the dog caught the gazelle; the hawk captured the dove. So the youth extracted the precious box from the dove and repaired to the palace, where he found the King already dead. His Majesty had been ailing from the moment when the young man left the city, and he grew steadily worse with every fresh success of the adventurer who was to supplant him. So the hero became King and married the false Queen; and his sisters' husbands were changed from animals into men and received subordinate posts in the government. The hero's parents, too, came to live in the city over which he reigned.

A West African story from Southern Nigeria relates how a king kept his soul in a little brown bird, which perched on a tall tree beside the gate of the palace. The king's life was so bound up with that of the bird that whoever should kill the bird would simultaneously kill the king and succeed to the kingdom. The secret was betrayed by the queen to her lover, who shot the bird with an arrow and thereby slew the king and ascended the vacant throne. A tale told by the Ba-Ronga of South Africa sets forth how the lives of a whole family were contained in one cat. When a girl of the family, named Titishan, married a husband, she begged her parents to let her take the precious cat with her to her new home. But they refused, saying, "You know that our life is attached to it"; and they offered to give her an antelope or even an elephant instead of it. But nothing would satisfy her but the cat. So at last she carried it off with her and shut it up in a place where nobody saw it; even her husband knew nothing about it. One day, when she went to work in the fields, the cat escaped from its place of concealment, entered the hut, put on the warlike trappings of the husband, and danced and sang. Some children, attracted by the noise, discovered the cat at its antics, and when they expressed their astonishment, the animal only capered the more and insulted them besides. So they went to the owner and said, "There is somebody dancing in your house, and he insulted us." "Hold your tongues," said he, "I'll soon put a stop to your lies." So he went and hid behind the door and peeped in, and there sure enough was the cat prancing about and singing. He fired at it, and the animal dropped down dead. At the same moment his wife fell to the ground in the field where she was at work; said she, "I have been killed at home." But she had strength enough left to ask her husband to go with her to her parents' village, taking with him the dead cat wrapt up in a mat. All her relatives assembled, and bitterly they reproached her for having insisted on taking the animal with her to her husband's village. As soon as the mat was unrolled and they saw the dead cat, they all fell down lifeless one after the other. So the Clan of the Cat was destroyed; and the bereaved husband closed the gate of the village with a branch, and returned home, and told his friends how in killing the cat he had killed the whole clan, because their lives depended on the life of the cat. In another Ronga story the lives of a whole clan are attached to a buffalo, which a girl of the clan in like manner insists on taking with her.

Ideas of the same sort meet us in stories told by the North American Indians. Thus in one Indian tale the hero pounds his enemy to pieces, but cannot kill him because his heart is not in his body. At last the champion learns that his foe's heart is in the sky, at the western side of the noonday sun; so he reaches up, seizes the heart, and crushes it, and straightway his enemy expires. In another Indian myth there figures a personage Winter whose song brings frost and snow, but his heart is hidden away at a distance. However, his foe finds the heart and burns it, and so the Snow-maker perishes. A Pawnee story relates how a wounded warrior was carried off by bears, who healed him of his hurts. When the Indian was about to return to his village, the old he-bear said to him, "I shall look after you. I shall give you a part of myself. If I am killed, you shall be killed. If I grow old, you shall be old." And the bear gave him a cap of bearskin, and at parting he put his arms round the Indian and hugged him, and put his mouth against the man's mouth and held the man's hands in his paws. The Indian who told the tale conjectured that when the man died, the old bear died also. The Navajoes tell of a certain mythical being called "the Maiden that becomes a Bear," who learned the art of turning herself into a bear from the prairie wolf. She was a great warrior and quite invulnerable; for when she went to war she took out her vital organs and hid them, so that no one could kill her; and when the battle was over she put the organs back in their places again. The Kwakiutl Indians of British Columbia tell of an ogress, who could not be killed because her life was in a hemlock branch. A brave boy met her in the woods, smashed her head with a stone, scattered her brains, broke her bones, and threw them into the water. Then, thinking he had disposed of the ogress, he went into her house. There he saw a woman rooted to the floor,

who warned him, saying, "Now do not stay long. I know that you have tried to kill the ogress. It is the fourth time that somebody has tried to kill her. She never dies; she has nearly come to life. There in that covered hemlock branch is her life. Go there, and as soon as you see her enter, shoot her life. Then she will be dead." Hardly had she finished speaking when sure enough in came the ogress, singing as she walked:—

*"I have the magical treasure,
I have the supernatural power,
I can return to life."*

Such was her song. But the boy shot at her life, and she fell dead to the floor.

XI. The External Soul in Folk-Custom

§ 1. The External Soul in Inanimate Things.

Thus the idea that the soul may be deposited for a longer or shorter time in some place of security outside the body, or at all events in the hair, is found in the popular tales of many races. It remains to shew that the idea is not a mere figment devised to adorn a tale, but is a real article of primitive faith, which has given rise to a corresponding set of customs.

We have seen that in the tales the hero, as a preparation for battle, sometimes removes his soul from his body, in order that his body may be invulnerable and immortal in the combat. With a like intention the savage removes his soul from his body on various occasions of real or imaginary peril. Thus among the people of Minahassa in Celebes, when a family moves into a new house, a priest collects the souls of the whole family in a bag, and afterwards restores them to their owners, because the moment of entering a new house is supposed to be fraught with supernatural danger. In Southern Celebes, when a woman is brought to bed, the messenger who fetches the doctor or the midwife always carries with him something made of iron, such as a chopping-knife, which he delivers to the doctor. The doctor must keep the thing in his house till the confinement is over, when he gives it back, receiving a fixed sum of money for doing so. The chopping-knife, or whatever it is, represents the woman's soul, which at this critical time is believed to be safer out of her body than in it. Hence the doctor must take great care of the object; for were it lost, the woman's soul would assuredly, they think, be lost with it. But in Celebes the convenience of occasionally depositing the soul in some external object is apparently not limited to human beings. The Alfoors, or Toradjas, who inhabit the central district of that island, and among whose industries the working of iron occupies a foremost place, attribute to the metal a soul which would be apt to desert its body under the blows of the hammer, if some means were not found to detain it. Accordingly in every smithy of Poso—for that is the name of the country of these people—you may see hanging up a bundle of wooden instruments, such as chopping-knives, swords, spear-heads, and so forth. This bundle goes by the name of *lamo*, which is the general word for “gods,” and in it the soul of the iron that is being wrought in the smithy is, according to one account, supposed to reside. “If we did not hang the *lamo* over the anvil,” they say, “the iron would flow away and be unworkable,” on account of the absence of the soul. However, according to another interpretation these wooden models are substitutes offered to the gods in room of the iron, whose soul the covetous deities might otherwise abstract for their own use, thus making the metal unmalleable.

Among the Dyaks of Pinoeh, a district of South-Eastern Borneo, when a child is born, a medicine-man is sent for, who conjures the soul of the infant into half a coco-nut, which he thereupon covers with a cloth and places on a square platter or charger suspended by cords from the roof. This ceremony he repeats at every new moon for a year. The intention of the ceremony is not explained by the writer who describes it, but we may conjecture that it is to place the soul of the child in a safer place than its own frail little body. This conjecture is confirmed by the reason assigned for a similar custom observed elsewhere in the Indian Archipelago. In the Kei Islands, when there is a newly-born child in a house, an empty coco-nut, split and spliced together again, may sometimes be seen hanging beside a rough wooden image of an ancestor. The soul of the infant is believed to be temporarily deposited in the coco-nut in order that it may be safe from the attacks of evil spirits; but when the child grows bigger and stronger, the soul will take up its permanent abode in its own body. Similarly among the Esquimaux of Alaska, when a child is sick, the medicine-man will sometimes

extract its soul from its body and place it for safe-keeping in an amulet, which for further security he deposits in his own medicine-bag. It seems probable that many amulets have been similarly regarded as soul-boxes, that is, as safes in which the souls of the owners are kept for greater security. An old Mang'anje woman in the West Shire district of British Central Africa used to wear round her neck an ivory ornament, hollow, and about three inches long, which she called her life or soul (*moyo wanga*). Naturally, she would not part with it; a planter tried to buy it of her, but in vain. When Mr. James Macdonald was one day sitting in the house of a Hlubi chief, awaiting the appearance of that great man, who was busy decorating his person, a native pointed to a pair of magnificent ox-horns, and said, "Ntame has his soul in these horns." The horns were those of an animal which had been sacrificed, and they were held sacred. A magician had fastened them to the roof to protect the house and its inmates from the thunder-bolt. "The idea," adds Mr. Macdonald, "is in no way foreign to South African thought. A man's soul there may dwell in the roof of his house, in a tree, by a spring of water, or on some mountain scaur." Among the natives of the Gazelle Peninsula in New Britain there is a secret society which goes by the name of Ingnet or Ingiet. On his entrance into it every man receives a stone in the shape either of a human being or of an animal, and henceforth his soul is believed to be knit up in a manner with the stone. If it breaks, it is an evil omen for him; they say that the thunder has struck the stone and that he who owns it will soon die. If nevertheless the man survives the breaking of his soul-stone, they say that it was not a proper soul-stone and he gets a new one instead. The emperor Romanus Lecapenus was once informed by an astronomer that the life of Simeon, prince of Bulgaria, was bound up with a certain column in Constantinople, so that if the capital of the column were removed, Simeon would immediately die. The emperor took the hint and removed the capital, and at the same hour, as the emperor learned by enquiry, Simeon died of heart disease in Bulgaria. The deified kings of ancient Egypt appear to have enjoyed the privilege of depositing their spiritual doubles or souls (*ka*) during their lifetime in a number of portrait statues, properly fourteen for each king, which stood in the chamber of adoration (*pa douait*) of the temple and were revered as the equivalents or representatives of the monarchs themselves. Among the Karens of Burma "the knife with which the navel string is cut is carefully preserved for the child. The life of the child is supposed to be in some way connected with it, for, if lost or destroyed, it is said the child will not be long lived." Among the Shawnee Indians of North America it once happened that an eminent man was favoured with a special revelation by the Great Spirit. Wisely refusing to hide the sacred light of revelation under a bushel, he generously communicated a few sparks of the illumination to John Tanner, a white man who lived for many years as an Indian among the Indians. "Henceforth," said the inspired sage, "the fire must never be suffered to go out in your lodge. Summer and winter, day and night, in the storm, or when it is calm, you must remember that the life in your body, and the fire in your lodge, are the same, and of the same date. If you suffer your fire to be extinguished, at that moment your life will be at its end."

Again, we have seen that in folk-tales a man's soul or strength is sometimes represented as bound up with his hair, and that when his hair is cut off he dies or grows weak. So the natives of Amboyna used to think that their strength was in their hair and would desert them if it were shorn. A criminal under torture in a Dutch Court of that island persisted in denying his guilt till his hair was cut off, when he immediately confessed. One man, who was tried for murder, endured without flinching the utmost ingenuity of his torturers till he saw the surgeon standing with a pair of shears. On asking what this was for, and being told that it was to cut his hair, he begged they would not do it, and made a clean breast. In subsequent cases, when torture failed to wring a confession from a prisoner, the Dutch authorities made a practice of cutting off his hair. In Ceram it is still believed that if young people have their hair cut they will be weakened and enervated thereby.

Here in Europe it used to be thought that the maleficent powers of witches and wizards resided in their hair, and that nothing could make any impression on these miscreants so long as they kept their hair on. Hence in France it was customary to shave the whole bodies of persons charged with sorcery before handing them over to the torturer. Millaeus witnessed the torture of some persons at Toulouse, from whom no confession could be wrung until they were stripped and completely shaven, when they readily acknowledged the truth of the charge. A woman also, who apparently led a pious life, was put to the torture on suspicion of witchcraft, and bore her agonies with incredible constancy, until complete depilation drove her to admit her guilt. The noted inquisitor Sprenger contented himself with shaving the head of the suspected witch or wizard; but his more thorough-going colleague Cumanus shaved the whole bodies of forty-one women before committing them all to the flames. He had high authority for this rigorous scrutiny, since Satan himself, in a sermon preached from the pulpit of North Berwick church, comforted his many servants by assuring them that no harm could befall them “sa lang as their hair wes on, and sould newir latt ane teir fall fra thair ene.” Similarly in Bastar, a province of India, “if a man is adjudged guilty of witchcraft, he is beaten by the crowd, his hair is shaved, the hair being supposed to constitute his power of mischief, his front teeth are knocked out, in order, it is said, to prevent him from muttering incantations.... Women suspected of sorcery have to undergo the same ordeal; if found guilty, the same punishment is awarded, and after being shaved, their hair is attached to a tree in some public place.” So among the Bhils of India, when a woman was convicted of witchcraft and had been subjected to various forms of persuasion, such as hanging head downwards from a tree and having pepper put into her eyes, a lock of hair was cut from her head and buried in the ground, “that the last link between her and her former powers of mischief might be broken.” In like manner among the Aztecs of Mexico, when wizards and witches “had done their evil deeds, and the time came to put an end to their detestable life, some one laid hold of them and cropped the hair on the crown of their heads, which took from them all their power of sorcery and enchantment, and then it was that by death they put an end to their odious existence.”

§ 2. The External Soul in Plants.

Further it has been shewn that in folk-tales the life of a person is sometimes so bound up with the life of a plant that the withering of the plant will immediately follow or be followed by the death of the person. Similarly among the natives of the Pennefather River in Queensland, when a visiter has made himself very agreeable and taken his departure, an effigy of him about three or four feet long is cut on some soft tree, such as the *Canarium australasicum*, so as to face in the direction taken by the popular stranger. Afterwards from observing the state of the tree the natives infer the corresponding state of their absent friend, whose illness or death are apparently supposed to be portended by the fall of the leaves or of the tree. In Uganda, when a new royal enclosure with its numerous houses was built for a new king, barkcloth trees used to be planted at the main entrance by priests of each principal deity and offerings were laid under each tree for its particular god. Thenceforth “the trees were carefully guarded and tended, because it was believed that as they grew and flourished, so the king's life and power would increase.” Among the M'Bengas in Western Africa, about the Gaboon, when two children are born on the same day, the people plant two trees of the same kind and dance round them. The life of each of the children is believed to be bound up with the life of one of the trees; and if the tree dies or is thrown down, they are sure that the child will soon die. In Sierra Leone also it is customary at the birth of a child to plant a shoot of a *malep*-tree, and they think that the tree will grow with the child and be its god. If a tree which has been thus planted withers away, the people consult a sorcerer on the subject. Among the Wajagga of German East Africa, when a child is born, it is usual to plant

a cultivated plant of some sort behind the house. The plant is thenceforth carefully tended, for they believe that were it to wither away the child would die. When the navel-string drops from the infant, it is buried under the plant. The species of birth-plant varies with the clan; members of one clan, for example, plant a particular sort of banana, members of another clan plant a sugar-cane, and so on. Among the Swahili of East Africa, when a child is born, the afterbirth and navel-string are buried in the courtyard and a mark is made on the spot. Seven days afterwards, the hair of the child is shaved and deposited, along with the clippings of its nails, in the same place. Then over all these relics of the infant's person a coco-nut is planted. As the tree grows up from the nut, the child likes to point it out to his playfellows and tell them, "This coco-nut palm is my navel." In planting the coco-nut the parents say, "May God cause our child to grow up, that he or she may one day enjoy the coco-nut milk of the tree which we plant here." Though it is not expressly affirmed, we may perhaps assume that such a birth-tree is supposed to stand in a sympathetic relation with the life of the person. In the Cameroons, also, the life of a person is believed to be sympathetically bound up with that of a tree. The chief of Old Town in Calabar kept his soul in a sacred grove near a spring of water. When some Europeans, in frolic or ignorance, cut down part of the grove, the spirit was most indignant and threatened the perpetrators of the deed, according to the king, with all manner of evil. Among the Fans of the French Congo, when a chief's son is born, the remains of the navel-string are buried under a sacred fig-tree, and "thenceforth great importance is attached to the growth of the tree; it is strictly forbidden to touch it. Any attempt on the tree would be considered as an attack on the human being himself." Among the Boloki of the Upper Congo a family has a plant with red leaves (called *nkungu*) for its totem. When a woman of the family is with child for the first time, one of the totemic plants is planted near the hearth outside the house and is never destroyed, otherwise it is believed that the child would be born thin and weak and would remain puny and sickly. "The healthy life of the children and family is bound up with the healthiness and life of the totem tree as respected and preserved by the family." Among the Baganda of Central Africa a child's afterbirth was called the second child and was believed to be animated by a spirit, which at once became a ghost. The afterbirth was usually buried at the root of a banana tree, and afterwards the tree was carefully guarded by old women, who prevented any one from going near it; they tied ropes of fibre from tree to tree to isolate it, and all the child's excretions were thrown into this enclosure. When the fruit ripened, it was cut by the old woman in charge. The reason for guarding the tree thus carefully was a belief that if any stranger were to eat of the fruit of the tree or to drink beer brewed from it, he would carry off with him the ghost of the child's afterbirth, which had been buried at the root of the banana-tree, and the living child would then die in order to follow its twin ghost. Whereas a grandparent of the child, by eating the fruit or drinking the beer, averted this catastrophe and ensured the health of the child. Among the Wakondyo, at the north-western corner of Lake Albert Nyanza, it is customary to bury the afterbirth at the foot of a young banana-tree, and the fruit of this particular tree may be eaten by no one but the woman who assisted at the birth. The reason for the custom is not mentioned, but probably, as among the Baganda, the life of the child is supposed to be bound up with the life of the tree, since the afterbirth, regarded as a spiritual double of the infant, has been buried at the root of the tree.

Some of the Papuans unite the life of a new-born child sympathetically with that of a tree by driving a pebble into the bark of the tree. This is supposed to give them complete mastery over the child's life; if the tree is cut down, the child will die. After a birth the Maoris used to bury the navel-string in a sacred place and plant a young sapling over it. As the tree grew, it was a *tohu orangea* or sign of life for the child; if it flourished, the child would prosper; if it withered and died, the parents augured the worst for their child. In the Chatham Islands, when the child of a leading man received its name, it was customary to plant a tree, "the growth of

which was to be as the growth of the child," and during the planting priests chanted a spell. In some parts of Fiji the navel-string of a male child is planted together with a coco-nut or the slip of a breadfruit-tree, and the child's life is supposed to be intimately connected with that of the tree. With certain Malayo-Siamese families of the Patani States it is customary to bury the afterbirth under a banana-tree, and the condition of the tree is afterwards regarded as ominous of the child's fate for good or evil. In Southern Celebes, when a child is born, a coco-nut is planted and watered with the water in which the afterbirth and navel-string have been washed. As it grows up, the tree is called the "contemporary" of the child. So in Bali a coco-palm is planted at the birth of a child. It is believed to grow up equally with the child, and is called its "life-plant." On certain occasions the Dyaks of Borneo plant a palm-tree, which is believed to be a complete index of their fate. If it flourishes, they reckon on good fortune; but if it withers or dies, they expect misfortune. Amongst the Dyaks of Landak and Tajan, districts of Dutch Borneo, it is customary to plant a fruit-tree for a child, and henceforth in the popular belief the fate of the child is bound up with that of the tree. If the tree shoots up rapidly, it will go well with the child; but if the tree is dwarfed or shrivelled, nothing but misfortune can be expected for its human counterpart. According to another account, at the naming of children and certain other festivals the Dyaks are wont to set a *sawang*-plant, roots and all, before a priestess; and when the festival is over, the plant is replaced in the ground. Such a plant becomes thenceforth a sort of prophetic index for the person in whose honour the festival was held. If the plant thrives, the man will be fortunate; if it fades or perishes, some evil will befall him. The Dyaks also believe that at the birth of every person on earth a flower grows up in the spirit world and leads a life parallel to his. If the flower flourishes, the man enjoys good health, but if it droops, so does he. Hence when he has dreamed bad dreams or has felt unwell for several days, he infers that his flower in the other world is neglected or sickly, and accordingly he employs a medicine-man to tend the precious plant, weed the soil, and sweep it up, in order that the earthly and unearthly life may prosper once more.

It is said that there are still families in Russia, Germany, England, France, and Italy who are accustomed to plant a tree at the birth of a child. The tree, it is hoped, will grow with the child, and it is tended with special care. The custom is still pretty general in the canton of Aargau in Switzerland; an apple-tree is planted for a boy and a pear-tree for a girl, and the people think that the child will flourish or dwindle with the tree. In Mecklenburg the afterbirth is thrown out at the foot of a young tree, and the child is then believed to grow with the tree. In Bosnia, when the children of a family have died one after the other, the hair of the next child is cut with some ceremony by a stranger, and the mother carries the shorn tresses into the garden, where she ties them to a fine young tree, in order that her child may grow and flourish like the tree. At Muskau, in Lausitz, it used to be customary for bride and bridegroom on the morning of their wedding-day to plant a pair of young oaks side by side, and as each of the trees flourished or withered, so the good luck of the person who planted it was believed to wax or wane. On a promontory in Lake Keitele, in Finland, there used to stand an old fir-tree, which according to tradition had been planted by the first colonists to serve as a symbol or token of their fortune. First-fruits of the harvest used to be offered to the tree before any one would taste of the new crop; and whenever a branch fell, it was deemed a sign that some one would die. More and more the crown of the tree withered away, and in the same proportion the family whose ancestors had planted the fir dwindled away, till only one old woman was left. At last the tree fell, and soon afterwards the old woman departed this life. When Lord Byron first visited his ancestral estate of Newstead "he planted, it seems, a young oak in some part of the grounds, and had an idea that as *it* flourished so should *he*." On a day when the cloud that settled on the later years of Sir Walter Scott lifted a little, and he heard that *Woodstock* had sold for over eight thousand pounds, he wrote in his journal: "I

have a curious fancy; I will go set two or three acorns, and judge by their success in growing whether I shall succeed in clearing my way or not." Near the Castle of Dalhousie, not far from Edinburgh, there grows an oak-tree, called the Edgewell Tree, which is popularly believed to be linked to the fate of the family by a mysterious tie; for they say that when one of the family dies, or is about to die, a branch falls from the Edgewell Tree. Thus, on seeing a great bough drop from the tree on a quiet, still day in July 1874, an old forester exclaimed, "The laird's deid noo!" and soon after news came that Fox Maule, eleventh Earl of Dalhousie, was dead. At Howth Castle in Ireland there is an old tree with which the fortunes of the St. Lawrence family are supposed to be connected. The branches of the tree are propped on strong supports, for tradition runs that when the tree falls the direct line of the Earls of Howth will become extinct. On the old road from Hanover to Osnabrück, at the village of Oster-Kappeln, there used to stand an ancient oak, which put out its last green shoot in the year 1849. The tree was conjecturally supposed to be contemporary with the Guelphs; and in the year 1866, so fatal for the house of Hanover, on a calm summer afternoon, without any visible cause, the veteran suddenly fell with a crash and lay stretched across the highroad. The peasants regarded its fall as an ill omen for the reigning family, and when King George V. heard of it he gave orders that the giant trunk should be set up again, and it was done with much trouble and at great expense, the stump being supported in position by iron chains clamped to the neighbouring trees. But the king's efforts to prop the falling fortunes of his house were vain; a few months after the fall of the oak Hanover formed part of the Prussian monarchy.

In the midst of the "Forbidden City" at Peking there is a tiny private garden, where the emperors of the now fallen Manchu dynasty used to take the air and refresh themselves after the cares of state. In accordance with Chinese taste the garden is a labyrinth of artificial rockeries, waterfalls, grottoes, and kiosks, in which everything is as unlike nature as art can make it. The trees in particular (*Arbor vitae*), the principal ornament of the garden, exhibit the last refinement of the gardener's skill, being clipped and distorted into a variety of grotesque shapes. Only one of the trees remained intact and had been spared these deformations for centuries. Far from being stunted by the axe or the shears, the tree was carefully tended and encouraged to shoot up to its full height. "It was the 'Life-tree of the Dynasty,' and according to legend the prosperity or fall of the present dynasty went hand in hand with the welfare or death of the tree. Certainly, if we accept the tradition, the days of the present reigning house must be numbered, for all the care and attention lavished on the tree have been for some years in vain. A glance at our illustration shews the tree as it still surpasses all its fellows in height and size; but it owes its pre-eminence only to the many artificial props which hold it up. In reality the 'Life-tree of the Dynasty' is dying, and might fall over night, if one of its artificial props were suddenly to give way. For the superstitious Chinese—and superstitious they certainly are—it is a very, very evil omen." Some twelve years have passed since this passage was written, and in the interval the omen has been fulfilled—the Manchu dynasty has fallen. We may conjecture that the old tree in the quaint old garden has fallen too. So vain are all human efforts to arrest the decay of royal houses by underpropping trees on which nature herself has passed a sentence of death.

At Rome in the ancient sanctuary of Quirinus there grew two old myrtle-trees, one named the Patrician and the other the Plebeian. For many years, so long as the patricians were in the ascendant, their myrtle-tree flourished and spread its branches abroad, while the myrtle of the plebeians was shrivelled and shrunken; but from the time of the Marsian war, when the power of the nobles declined, their myrtle in like manner drooped and withered, whereas that of the popular party held up its head and grew strong. Thrice when Vespasia was with child, an old oak in the garden of the Flavian family near Rome suddenly put forth branches. The first

branch was puny and soon withered away, and the girl who was born accordingly died within the year; the second branch was long and sturdy; and the third was like a tree. So on the third occasion the happy father reported to his mother that a future emperor was born to her as a grandchild. The old lady only laughed to think that at her age she should keep her wits about her, while her son had lost his; yet the omen of the oak came true, for the grandson was afterwards the emperor Vespasian.

In England children are sometimes passed through a cleft ash-tree as a cure for rupture or rickets, and thenceforward a sympathetic connexion is supposed to exist between them and the tree. An ash-tree which had been used for this purpose grew at the edge of Shirley Heath, on the road from Hockly House to Birmingham. "Thomas Chillingworth, son of the owner of an adjoining farm, now about thirty-four, was, when an infant of a year old, passed through a similar tree, now perfectly sound, which he preserves with so much care that he will not suffer a single branch to be touched, for it is believed the life of the patient depends on the life of the tree, and the moment that it is cut down, be the patient ever so distant, the rupture returns, and a mortification ensues, and terminates in death, as was the case in a man driving a waggon on the very road in question." "It is not uncommon, however," adds the writer, "for persons to survive for a time the felling of the tree." The ordinary mode of effecting the cure is to split a young ash-sapling longitudinally for a few feet and pass the child, naked, either three times or three times three through the fissure at sunrise. In the West of England it is said that the passage should be "against the sun." As soon as the ceremony has been performed, the tree is bound tightly up and the fissure plastered over with mud or clay. The belief is that just as the cleft in the tree closes up, so the rupture in the child's body will be healed; but that if the rift in the tree remains open, the rupture in the child will remain too, and if the tree were to die, the death of the child would surely follow.

Down to the second half of the nineteenth century the remedy was still in common use at Fittleworth and many other places in Sussex. The account of the Sussex practice and belief is notable because it brings out very clearly the sympathetic relation supposed to exist between the ruptured child and the tree through which it has been passed. We are told that the patient "must be passed nine times every morning on nine successive days at sunrise through a cleft in a sapling ash-tree, which has been so far given up by the owner of it to the parents of the child, as that there is an understanding it shall not be cut down during the life of the infant who is to be passed through it. The sapling must be sound at heart, and the cleft must be made with an axe. The child on being carried to the tree must be attended by nine persons, each of whom must pass it through the cleft from west to east. On the ninth morning the solemn ceremony is concluded by binding the tree lightly with a cord, and it is supposed that as the cleft closes the health of the child will improve. In the neighbourhood of Petworth some cleft ash-trees may be seen, through which children have very recently been passed. I may add, that only a few weeks since, a person who had lately purchased an ash-tree standing in this parish, intending to cut it down, was told by the father of a child, who had some time before been passed through it, that the infirmity would be sure to return upon his son if it were felled. Whereupon the good man said, he knew that such would be the case; and therefore he would not fell it for the world."

A similar cure for various diseases, but especially for rupture and rickets, has been commonly practised in other parts of Europe, as Germany, France, Denmark, and Sweden; but in these countries the tree employed for the purpose is usually not an ash but an oak; sometimes a willow-tree is allowed or even prescribed instead. With these exceptions the practice and the belief are nearly the same on the Continent as in England: a young oak is split longitudinally and the two sides held forcibly apart while the sick child is passed through the cleft; then the opening in the tree is closed, and bound up, and it is believed that as the cleft in the tree heals

by the parts growing together again, so the rupture in the child will be simultaneously cured. It is often laid down that the ceremony must be performed in the strictest silence; sometimes the time prescribed is before sunrise, and sometimes the child must be passed thrice through the cleft. In Oldenburg and Mecklenburg they say that the cure should be performed on St. John's Eve (Midsummer Eve) by three men named John, who assist each other in holding the split oak-sapling open and passing the child through it. Some people, however, prefer Good Friday or Christmas Eve as the season for the performance of the ceremony. In Denmark copper coins are laid as an offering at the foot of the tree through which sick persons have been passed; and threads, ribbons, or bandages which have been worn by the sufferers are tied to a branch of the tree. In the Greek island of Ceos, when a child is sickly, the parents carry it out into the country "and the father selects a young oak; this they split up from the root, then the father is assisted by another man in holding the tree open whilst the mother passes the child three times through, and then they bind up the tree well, cover it all over with manure, and carefully water it for forty days. In the same fashion they bind up the child for a like period, and after the lapse of this time they expect that it will be quite well."

In Mecklenburg, as in England, the sympathetic relation thus established between the tree and the child is so close that if the tree is cut down the child will die. In the island of Rügen people believe that when a person who has been thus cured of rupture dies, his soul passes into the same oak-tree through which his body was passed in his youth. Thus it seems that in ridding himself of the disease the sufferer is supposed to transfer a certain vital part of his person to the tree so that it is impossible to injure the tree without at the same time injuring the man; and in Rügen this partial union is thought to be completed by the transmigration of the man's soul at death into the tree. Apparently the disease is conceived as something physical, which clings to the patient but can be stripped off him and left behind on the farther side of the narrow aperture through which he has forced his way; when the aperture is closed by the natural growth of the tree, the door is as it were shut against the disease, which is then unable to pursue and overtake the sufferer. Hence the idea at the root of the custom is not so much that the patient has transferred his ailment to the tree, as that the tree forms an impervious barrier between him and the malady which had hitherto afflicted him. This interpretation is confirmed by the following parallels.

In those parts of Armenia which are covered with forests, many great and ancient trees are revered as sacred and receive marks of homage. The people burn lights before them, fumigate them with incense, sacrifice cocks and wethers to them, and creep through holes in their trunks or push lean and sickly children through them "in order to put a stop to the influence of evil spirits." Apparently, they think that evil spirits cannot creep through the cleft in the holy tree, and therefore that the sick who have effected the passage are safe from their demoniacal pursuers. The same conception of a fissure in a tree as an obstacle placed in the path of pursuing spirits meets us in a number of savage customs. Thus in the island of Nias, when a man is in training for the priesthood, he has to be introduced to the various spirits between whom and mankind it will be his office to mediate. A priest takes him to an open window, and while the drums are beating points out to him the great spirit in the sun who calls away men to himself through death; for it is needful that the future priest should know him from whose grasp he will often be expected to wrest the sick and dying. In the evening twilight he is led to the graves and shewn the envious spirits of the dead, who also are ever drawing away the living to their own shadowy world. Next day he is conducted to a river and shewn the spirit of the waters; and finally they take him up to a mountain and exhibit to him the spirits of the mountains, who have diverse shapes, some appearing like swine, others like buffaloes, others like goats, and others again like men with long hair on their bodies. When he has seen all this, his education is complete, but on his return from the mountain the new

priest may not at once enter his own house. For the people think that, were he to do so, the dangerous spirits by whom he is still environed would stay in the house and visit both the family and the pigs with sickness. Accordingly he betakes himself to other villages and passes several nights there, hoping that the spirits will leave him and settle on the friends who receive him into their houses; but naturally he does not reveal the intention of his visits to his hosts. Lastly, before he enters his own dwelling, he looks out for some young tree by the way, splits it down the middle, and then creeps through the fissure, in the belief that any spirit which may still be clinging to him will thus be left sticking to the tree. Again, among the Bilqula or Bella Coola Indians of British Columbia "the bed of a mourner must be protected against the ghost of the deceased. His male relatives stick a thorn-bush into the ground at each corner of their beds. After four days these are thrown into the water. Mourners must rise early and go into the woods, where they stick four thorn-bushes into the ground, at the corners of a square, in which they cleanse themselves by rubbing their bodies with cedar branches. They also swim in ponds. After swimming they cleave four small trees and creep through the clefts, following the course of the sun. This they do on four subsequent mornings, cleaving new trees every day. Mourners cut their hair short. The hair that has been cut off is burnt. If they should not observe these regulations, it is believed that they would dream of the deceased." To the savage, who fails to distinguish the visions of sleep from the appearances of waking life, the apparition of a dead man in a dream is equivalent to the actual presence of the ghost; and accordingly he seeks to keep off the spiritual intruder, just as he might a creature of flesh and blood, by fencing his bed with thorn-bushes. Similarly the practice of creeping through four cleft trees is clearly an attempt to shake off the clinging ghost and leave it adhering to the trees, just as in Nias the future priest hopes to rid himself in like manner of the dangerous spirits who have dogged his steps from the mountains and the graves.

This interpretation of the custom is strongly confirmed by a funeral ceremony which Dr. Charles Hose witnessed at the chief village of the Madangs, a tribe of Kayans who occupy a hitherto unexplored district in the heart of Borneo. "Just across the river from where we were sitting," says Dr. Hose, "was the graveyard, and there I witnessed a funeral procession as the day was drawing to a close. The coffin, which was a wooden box made from a tree-trunk, was decorated with red and black patterns in circles, with two small wooden figures of men placed at either end; it was lashed with rattans to a long pole, and by this means was lifted to the shoulders of the bearers, who numbered thirteen in all, and who then carried it to the burying-ground. After the mourners had all passed over to the graveyard, a man quickly cut a couple of small sticks, each five feet long and about an inch in diameter. One of these he split almost the whole way down, and forced the unsplit end into the ground, when the upper part opened like a V, leaving sufficient room for each person to pass through. He next split the top of the other stick, and, placing another short stick in the cleft, made a cross, which he also forced into the ground. The funeral procession climbed the mound on which the cemetery was situated, passing through the V of the cleft stick in single file. As soon as the coffin had been placed on the stage erected for the purpose, the people commenced their return, following on one another's heels as quickly as possible, each spitting out the words, '*Pit balli krat balli jat tesip bertatip!*' ('Keep back, and close out all things evil, and sickness') as they passed through the V-shaped stick. The whole party having left the graveyard, the gate was closed by the simple process of tying the cleft ends of the stick together, and a few words were then said to the cross-stick, which they call *ngring*, or the wall that separates the living from the dead. All who had taken part in the ceremony then went and bathed before returning to their homes, rubbing their skins with rough pebbles, the old Mosaic idea of the uncleanness of the dead, as mentioned in Numbers (chap. xix.), evidently finding a place among their religious beliefs. It is apparently a great relief to their minds to think that they

can shut out the spirit of the deceased. They believe that the spirit of the dead is not aware that life has left the body until a short time after the coffin has been taken to the graveyard, and then not until the spirit has had leisure to notice the clothes, weapons, and other articles belonging to its earthly estate, which are placed with the coffin. But before this takes place the gate has been closed.”

Here the words uttered by the mourners in passing through the cloven stick shew clearly that they believe the stick to act as a barrier or fence, on the further side of which they leave behind the ghost or other dangerous spirit whose successful pursuit might entail sickness and death on the survivors. Thus the passage of these Madang mourners through the cleft stick is strictly analogous to the passage of ruptured English children through a cleft ash-tree. Both are simply ways of leaving an evil thing behind. Similarly the subsequent binding up of the cloven stick in Borneo is analogous to the binding up of the cloven ash-tree in England. Both are ways of barricading the road against the evil which is dogging your steps; having passed through the doorway you slam the door in the face of your pursuer. Yet it seems probable that the intention of binding up the cleft in a tree through which a ruptured patient has been passed is not merely that of shutting the door on the malady conceived as a personal being; combined with this idea is perhaps the notion that in virtue of the law of magical homoeopathy the rupture in the body of the sufferer will close up exactly in the same measure as the cleft in the tree closes up through the force of bandages and of natural growth. That this shade of meaning attaches to the custom is rendered probable by a comparison of an ancient Roman cure for dislocation, which has been preserved for us by the grave authority of the elder Cato. He recommended that a green reed, four or five feet long, should be taken, split down the middle, and held by two men to the dislocated bones while a curious and now unintelligible spell was recited; then, when the spell had been recited and the aperture in the reed had closed, the reed was to be tied to the dislocated limb, and a perfect cure might be expected. Apparently it was supposed that just as the two sides of the split reed came together and coalesced after being held apart, so the dislocated bones would come together and fit into their proper places.

But the usual idea in passing through a narrow aperture as a cure or preventive of evil would seem to be simply that of giving the slip to a dangerous pursuer. With this intention, doubtless, the savage Thays of Tonquin repair after a burial to the banks of a stream and there creep through a triangle formed by leaning two reeds against each other, while the sorcerer souses them with dirty water. All the relations of the deceased must wash their garments in the stream before they return home, and they may not set foot in the house till they have shorn their hair at the foot of the ladder. Afterwards the sorcerer comes and sprinkles the whole house with water for the purpose of expelling evil spirits. Here again we cannot doubt that the creeping through the triangle of reeds is intended to rid the mourners of the troublesome ghost. So when the Kamtchatkans had disposed of a corpse after their usual fashion by throwing it to the dogs to be devoured, they purified themselves as follows. They went into the forest and cut various roots which they bent into rings, and through these rings they crept twice. Afterwards they carried the rings back to the forest and flung them away westward. The Koryaks, a people of the same region, burn their dead and hold a festival in honour of the departed a year after the death. At this festival, which takes place on the spot where the corpse was burned, or, if that is too far off, on a neighbouring height, they sacrifice two young reindeer which have never been in harness, and the sorcerer sticks a great many reindeer horns in the earth, believing that thereby he is dispatching a whole herd of these animals to their deceased friend in the other world. Then they all hasten home, and purify themselves by passing between two poles planted in the ground, while the sorcerer strikes them with a stick and adjures death not to carry them off. The Tokoelawi in the interior of

Central Celebes hold a great sacrificial festival on the eighth day after the death of a man or the ninth day after the death of a woman. When the guests return homewards after the festival they pass under two poles placed in a slanting direction against each other, and they may not look round at the house where the death occurred. "In this way they take a final leave of the soul of the deceased. Afterwards no more sacrifices are offered to the soul." Among the Toboengkoe, another tribe in the interior of Central Celebes, when a man buries his wife, he goes to the grave by a different road from that along which the corpse is carried; and on certain days afterwards he bathes, and on returning from the bath must pass through a teepee-shaped erection, which is formed by splitting a pole up the middle and separating the two split pieces except at the top. "This he must do in order that his second wife, if he has one, may not soon die." Here the notion probably is that the jealous ghost of the dead wife seeks to avenge herself on her living rival by carrying off her soul with her to deadland. Hence to prevent this catastrophe the husband tries to evade the ghost, first by going to the grave along a different path, and second by passing under a cleft stick, through which as usual the spirit cannot follow him.

In the light of the foregoing customs, as well as of a multitude of ceremonies observed for a similar purpose in all parts of the world, we may safely assume that when people creep through rings after a death or pass between poles after a sacrifice to the dead, their intention simply is to interpose a barrier between themselves and the ghost; they make their way through a narrow pass or aperture through which they hope that the ghost will not be able to follow them. To put it otherwise, they conceive that the spirit of the dead is sticking to them like a burr, and that like a burr it may be rubbed or scraped off and left adhering to the sides of the opening through which they have squeezed themselves.

Similarly, when a pestilence is raging among the Koryaks, they kill a dog, wind its guts about two poles, and pass between the poles, doubtless for the sake of giving the slip to the demon of the plague in the same way that they give the slip to the ghost. When the Kayans of Borneo have been dogged by an evil spirit on a journey and are nearing their destination, they fashion a small archway of boughs, light a fire under it, and pass in single file under the archway and over the fire, spitting into the fire as they pass. By this ceremony, we are told, "they thoroughly exorcise the evil spirits and emerge on the other side free from all baleful influences." Here, to make assurance doubly sure, a fire as well as an archway is interposed between the travellers and the dreadful beings who are walking unseen behind. To crawl under a bramble which has formed an arch by sending down a second root into the ground, is an English and Welsh cure for whooping-cough, rheumatism, boils, and other complaints. In some parts of the west of England they say that to get rid of boils the thing to do is to crawl through such a natural arch nine times against the sun; but in Devonshire the patient should creep through the arch thrice with the sun, that is from east to west. When a child is passed through it for whooping-cough, the operators ought to say:

*"In bramble, out cough,
Here I leave the whooping-cough."*

In Perigord and other parts of France the same cure is employed for boils. In Bulgaria, when a person suffers from a congenital malady such as scrofula, a popular cure is to take him to a neighbouring village and there make him creep naked thrice through an arch, which is formed by inserting the lower ends of two vine branches in the ground and joining their upper ends together. When he has done so, he hangs his clothes on a tree, and dons other garments. On his way home the patient must also crawl under a ploughshare, which is held high enough to let him pass. Further, when whooping-cough is prevalent in a Bulgarian village, an old woman will scrape the earth from under the root of a willow-tree. Then all the children of the

village creep through the opening thus made, and a thread from the garment of each of them is hung on the willow. Adults sometimes go through the same ceremony after recovering from a dangerous illness. Similarly, when sickness is rife among some of the villages to the east of Lake Nyassa, the inhabitants crawl through an arch formed by bending a wand and inserting the two ends in the ground. By way of further precaution they wash themselves on the spot with medicine and water, and then bury the medicine and the evil influence together in the earth. The same ceremony is resorted to as a means of keeping off evil spirits, wild beasts, and enemies.

In Uganda “sometimes a medicine-man directed a sick man to provide an animal, promising that he would come and transfer the sickness to the animal. The medicine-man would then select a plantain-tree near the house, kill the animal by it, and anoint the sick man with its blood, on his forehead, on each side of his chest, and on his legs above the knees. The plantain-tree selected had to be one that was about to bear fruit, and the medicine-man would split the stem from near the top to near the bottom, leaving a few inches not split both at the top and at the bottom; the split stem would be held open so that the sick man could step through it, and in doing so he would leave his clothing at the plantain-tree, and would run into the house without looking back. When he entered the house, new clothes would be given him to wear. The plantain, the clothing, and meat would be carried away by the medicine-man, who would deposit the plantain-tree on waste land, but would take the meat and clothing for himself. Sometimes the medicine-man would kill the animal near the hut, lay a stout stick across the threshold, and narrow the doorway by partially filling it with branches of trees; he would then put some of the blood on either side of the narrow entrance, and some on the stick across the threshold, and would also anoint with it the sick man, who would be taken outside for the purpose. The patient would then re-enter the house, letting his clothing fall off, as he passed through the doorway. The medicine-man would carry away the branches, the stick, the clothing, and the meat. The branches and the stick he would cast upon waste land, but the meat and the clothing he would keep for himself.” Here the notion of transferring the sickness to the animal is plainly combined with, we may almost say overshadowed by the notion that the ailment is left behind adhering to the cleft plantain-stem or to the stick and branches of the narrow opening through which the patient has made his way. That obviously is why the plantain-stem or the stick and branches are thrown away on waste land, lest they should infect other people with the sickness which has been transferred to them.

The Kai of German New Guinea attribute sickness to the agency either of ghosts or of sorcerers, but suspicion always falls at first on ghosts, who are deemed even worse than the sorcerers. To cure a sick man they will sometimes cleave a stick in the middle, leaving the two ends intact, and then oblige the sufferer to insert his head through the cleft. After that they stroke his whole body with the stick from head to foot. “The stick with the soul-stuff of the ghosts is then hurled away or otherwise destroyed, whereupon the sick man is supposed to recover.” Here the ghosts who cause the sickness are clearly supposed to be scraped from the patient's body by means of the cleft stick, and to be thrown away or destroyed with the implement. The Looboos, a primitive tribe in the Mandailing district of Sumatra, stand in great fear of the wandering spirits of the dead (*soemangots*). But “they know all sorts of means of protecting themselves against the unwelcome visits of the spirits. For example, if a man has lost his way in the forest, he thinks that this is the work of such a spirit (*soemangot*), who dogs the wanderer and bedims his sight. So in order to throw the malignant spirit off the track he takes a rattan and splits it through the middle. By bending the rattan an opening is made, through which he creeps. After that the rattan is quickly stretched and the opening closes. By this procedure the spirit (so they think) cannot find the opening again and so

cannot further follow his victim." Here therefore, the passage through a cleft stick is conceived in the clearest way as an escape from a spiritual pursuer, and the closing of the aperture when the fugitive has passed through it is nothing but the slamming of the door in the face of his invisible foe.

A similar significance is probably to be attached to other cases of ceremonially passing through a cleft stick even where the intention of the rite is not expressly alleged. Thus among the Ovambo of German South-West Africa young women who have become marriageable perform a variety of ceremonies; among other things they dance in the large and the small cattle-kraal. On quitting the large cattle-kraal after the dance, and on entering and quitting the small cattle-kraal, they are obliged to pass, one after the other, through the fork of a cleft stick, of which the two sides are held wide open by an old man. Among the Washamba of German East Africa, when a boy has been circumcised, two women bring a long sugar-cane, which still bears its leaves. The cane is split at some distance from its upper and lower ends and the two sides are held apart so as to form a cleft or opening; at the lower end of the cleft a *danga* ring is fastened. The father and mother of the circumcised youth now place the sugar-cane between them, touch the ring with their feet, and then slip through the cleft; and after them the lad's aunt must also pass through the cleft sugar-cane. In both these cases the passage through the cleft stick is probably intended to give the slip to certain dangerous spirits, which are apt to molest people at such critical seasons as puberty and circumcision.

Again, the passage through a ring or hoop is resorted to for like reasons as a mode of curing or preventing disease. Thus in Sweden, when a natural ring has been found in a tree, it is carefully removed and treasured in the family; for sick and especially rickety children are healed by merely passing through it. A young married woman in Sweden, who suffered from an infirmity, was advised by a wise woman to steal three branches of willow, make them into a hoop, and creep through it naked, taking care not to touch the hoop and to keep perfectly silent. The hoop was afterwards to be burnt. She carried out the prescription faithfully, and her faith was rewarded by a perfect cure. No doubt her infirmity was thought to adhere to the hoop and to be burnt with it. Similarly in Scotland children who suffered from hectic fever and consumptive patients used to be healed by passing thrice through a circular wreath of woodbine, which was cut during the increase of the March moon and was let down over the body of the sufferer from the head to the feet. Thus Jonet Stewart cured sundry women by "taking ane garland of grene woodbynd, and causing the patient pas thryis throw it, quhilk thairefter scho cut in nyne pieces, and cast in the fyre." Another wise woman transmitted the sick "throw are girth of woodbind thryis thre times, saying, 'I do this in name of the Father, the Sone, and the Halie Ghaist.'" The Highlanders of Strathspey used to force all their sheep and lambs to pass through a hoop of rowan-tree on All Saints' Day and Beltane (the first of November and the first of May), probably as a means of warding off the witches and fairies, who are especially dreaded at these seasons, and against whose malignant arts the rowan-tree affords an efficient protection. In Oldenburg when a cow gives little or no milk, they milk her through a hole in a branch. In Eversten they say that this should be done through a ring which an oak-tree has formed round the scar where a branch has been sawn off. Others say the beast should be milked through a "witch's nest," that is, through the boughs of a birch-tree which have grown in a tangle. Such a "witch's nest" is also hung up in a pig's sty to protect the pig against witchcraft. Hence the aim of milking a cow through a "witch's nest" or through a natural wooden ring is no doubt to deliver the poor creature from an artful witch who has been draining away the milk into her own pail, as witches are too apt to do. Again, in Oldenburg sick children, and also adults and animals, are passed through a ring of rough unwashed yarn, just as it comes from the reel. To complete the cure you should throw a hot coal thrice through the ring, then spit through it thrice, and finally bury the yarn under a

stone, where you leave it to rot. The writer who reports these remedies explains them as intended to strip the witchcraft, as you might say, from the bodies of the victims, whether human or animal, on whom the witch has cast her spell. Among the Lushais of Assam “five to ten days after the child is born its body is said to be covered with small pimples, its lips become black and its strength decreases. The family then obtain a particular kind of creeping plant called *vawm*, which they make into a coil. In the evening everything in the house that has a lid or covering is uncovered, and the child is thrice passed through this coil, which act is supposed to clear the child's skin and restore its strength. After this is finished, the parents go to bed and the pots or other receptacles are covered again by any of the other members of the family. The parents themselves must not replace any of these lids for fear that they might shut up the spirit of the child in them.” When the Kwakiutl Indians of British Columbia fear the outbreak of an epidemic, a medicine-man takes a large ring of hemlock branches and causes every member of the tribe to pass through it. Each person puts his head through the ring and then moves the ring downwards over his body till it has almost reached his feet, when he steps out of it, right foot first. They think that this prevents the epidemic from breaking out. In Asia Minor, “if a person is believed to be possessed by an evil spirit, one form of treatment is to heat an iron-chain red-hot, form it into a ring and pass the afflicted person through the opening, on the theory that the evil spirit cannot pass the hot chain, and so is torn from his victim and left behind.” Here the intention of the passage through the aperture is avowedly to shake off a spiritual pursuer, who is deterred from further pursuit not only by the narrowness of the opening but by the risk of burning himself in the attempt to make his way through it.

But if the intention of these ceremonies is essentially to rid the performer of some harmful thing, whether a disease or a ghost or a demon, which is supposed to be clinging to him, we should expect to find that any narrow hole or opening would serve the purpose as well as a cleft tree or stick, an arch or ring of boughs, or a couple of posts fixed in the ground. And this expectation is not disappointed. On the coast of Morven and Mull thin ledges of rock may be seen pierced with large holes near the sea. Consumptive people used to be brought thither, and after the tops of nine waves had been caught in a dish and thrown on the patient's head, he was made to pass through one of the rifted rocks thrice in the direction of the sun. “On the farm of Crossapol in Coll there is a stone called *Clach Thuill*, that is, the Hole Stone, through which persons suffering from consumption were made to pass three times in the name of the Father, Son, and Holy Ghost. They took meat with them each time, and left some on the stone. The bird that took the food away had the consumption laid upon it. Similar stones, under which the patient can creep, were made use of in other islands.” Here it is manifest that the patient left his disease behind him on the stone, since the bird which carried off the food from the stone caught the disease. In the Aberdeenshire river Dee, at Cambus o' May, near Ballater, there is a rock with a hole in it large enough to let a person pass through. Legend runs that childless women used to wade out to the stone and squeeze themselves through the hole. It is said that a certain noble lady tried the effect of the charm not very many years ago with indifferent success. In the parish of Madern in Cornwall, near the village of Lanyon, there is a perforated stone called the *Mên-an-tol* or “holed stone,” through which people formerly crept as a remedy for pains in the back and limbs; and at certain times of the year parents drew their children through the hole to cure them of the rickets. The passage through the stone was also deemed a cure for scrofula, provided it was made against the sun and repeated three times or three times three.

Near the little town of Dourgne, not far from Castres, in Southern France, there is a mountain, and on the top of the mountain is a tableland, where a number of large stones may be seen planted in the ground about a cross and rising to a height of two to five feet above the ground.

Almost all of them are pierced with holes of different sizes. From time immemorial people used to assemble at Dourgne and the neighbourhood every year on the sixth of August, the festival of St. Estapin. The palsied, the lame, the blind, the sick of all sorts, flocked thither to seek and find a cure for their various infirmities. Very early in the morning they set out from the villages where they had lodged or from the meadows where for want of better accommodation they had been forced to pass the night, and went on pilgrimage to the chapel of St. Estapin, which stands in a gorge at the southern foot of the mountain. Having gone nine times in procession round the chapel, they hobbled, limped, or crawled to the tableland on the top of the mountain. There each of them chose a stone with a hole of the requisite size and thrust his ailing member through the hole. For there are holes to suit every complaint; some for the head, some for the arm, some for the leg, and so on. Having performed this simple ceremony they were cured; the lame walked, the blind saw, the palsied recovered the use of their limbs, and so on. The chapel of the saint is adorned with the crutches and other artificial aids, now wholly superfluous, which the joyful pilgrims left behind them in token of their gratitude and devotion. About two miles from Gisors, in the French department of Oise, there is a dolmen called Trie or Trie- Chateau, consisting of three upright stones with a fourth and larger stone laid horizontally on their tops. The stone which forms the back wall of the dolmen is pierced about the middle by an irregularly shaped hole, through which the people of the neighbourhood used from time immemorial to pass their sickly children in the firm belief that the passage through the stone would restore them to health.

In the church of St. Corona at the village of Koppenwal, in Lower Bavaria, there is a hole in the stone on which the altar rests. Through this hole, while service was going on, the peasants used to creep, believing that having done so they would not suffer from pains in their back at harvest. In the crypt of the old cathedral at Freising in Bavaria there is a tomb which is reputed to contain the relics of St. Nonnosius. Between a pillar of the tomb and the wall there is a narrow opening, through which persons afflicted with pains in the back creep in order to obtain thereby some mitigation of their pangs. In Upper Austria, above the Lake of Aber, which is a sheet of dark-green water nestling among wooded mountains, there stands the Falkenstein chapel of St. Wolfgang built close to the face of a cliff that rises from a little green dale. A staircase leads up from the chapel to a narrow, dark, dripping cleft in the rock, through which pilgrims creep in a stooping posture "in the belief that they can strip off their bodily sufferings or sins on the face of the rock." Women with child also crawl through the hole, hoping thus to obtain an easy delivery. In the Greek island of Cythnos, when a child is sickly, the mother will take it to a hole in a rock about half an hour distant from Messaria. There she strips the child naked and pushes it through the hole in the rock, afterwards throwing away the old garments and clothing the child in new ones.

Near Everek, on the site of the ancient Caesarea in Asia Minor, there is a rifted rock through which persons pass to rid themselves of a cough. A writer well acquainted with Asia Minor has described how he visited "a well-known pool of water tucked away in a beautiful nook high up among the Anatolian mountains, and with a wide reputation for sanctity and healing powers. We arrived just as the last of a flock of three hundred sheep were being passed through a peculiar hole in the thin ledge of a huge rock to deliver them from a disease of the liver supposed to prevent the proper laying on of fat." Among the Kawars of the Central Provinces in India a man who suffers from intermittent fever will try to cure it by walking through a narrow passage between two houses. In a ruined church of St. Brandon, about ten miles from Dingle, in the west of Ireland, there is a narrow window, through which sick women pass thrice in order to be cured. The Hindoos of the Punjaub think that the birth of a son after three girls is unlucky for the parents, and in order to avert the ill-luck they resort to a number of devices. Amongst other things they break the centre of a bronze plate and remove

all but the rim; then they pass the luckless child through the bronze rim. Moreover, they make an opening in the roof of the room where the birth took place, and then pull the infant out through the opening; and further they pass the child under the sill of the door. By these passages through narrow apertures they apparently hope to rid the child of the ill-luck which is either pursuing it or sticking to it like a burr. For in this case, as in many similar ones, it might be hard to say whether the riddance is conceived as an escape from the pursuit of a maleficent spirit or as the abrasion of a dangerous substance which adheres to the person of the sufferer.

Another way of ridding man and beast of the clinging infection of disease is to pass them through a hole dug in the ground. This mode of cure was practised in Europe during the Middle Ages, and has survived in Denmark down to modern times. In a sermon preached by St. Eloi, Bishop of Noyon, in the sixth century, he forbade the faithful to practise lustrations and to drive their sheep through hollow trees and holes in the earth, "because by this they seem to consecrate them to the devil." Theodore, Archbishop of Canterbury, who died in 690 a.d., decreed that "if any one for the health of his little son shall pass through a hole in the ground and then close it behind him with thorns, let him do penance for eleven days on bread and water." Here the closing of the hole with thorns after the patient or his representative has passed through is plainly intended to barricade the narrow way against the pursuit of sickness personified as a demon; hence it confirms the general interpretation here given of these customs. Again, Burchard, Bishop of Worms, who died in a.d. 1025, repeated the same condemnation: "Hast thou done what certain women are wont to do? I mean those who have squalling babes; they dig the earth and pierce it, and through that hole they drag the babe, and they say that thus the squalling babe ceases to squall. If thou has done this or consented unto it, thou shalt do penance for fifteen days on bread and water." At Fünen in Denmark, as late as the latter part of the nineteenth century, a cure for childish ailments was to dig up several sods, arrange them so as to form a hole, and then to pass the sick child through it. A simplified form of this cure is adopted in Jutland. At twelve o'clock on a Thursday night you go to a churchyard, dig up a circular piece of turf, and make a hole in it large enough to permit the passage through it of your infant progeny. Taking the sod with you, go home, salute nobody on the way, and speak to nobody. On getting to your house, take the child and pass it thrice through the turf from right to left; then take the turf back to the churchyard and replace it in position. If the turf takes root and grows afresh, the child will recover; but if the turf withers, there is no hope. Elsewhere it is at the hour of sunset rather than of midnight that people cut the turf in the churchyard. The same cure is applied to cattle which have been bewitched; though naturally in that case you must cut a much bigger turf and make a much bigger hole in it to let a horse or a cow through than is necessary for an infant. Here, again, the conception of a sympathetic relation, established between the sufferer and the thing which has rid him of his ailment, comes out clearly in the belief, that if the turf through which the child has been passed thrives, the child will thrive also, but that if the turf withers, the child will die. Among the Corannas, a people of the Hottentot race on the Orange River, "when a child recovers from a dangerous illness, a trench is dug in the ground, across the middle of which an arch is thrown, and an ox made to stand upon it; the child is then dragged under the arch. After this ceremony the animal is killed, and eaten by married people who have children, none else being permitted to participate of the feast." Here the attempt to leave the sickness behind in the hole, which is probably the essence of the ceremony, may perhaps be combined with an endeavour to impart to the child the strength and vigour of the animal. Ancient India seems also to have been familiar with the same primitive notion that sickness could, as it were, be stripped off the person of the sufferer by passing him through a narrow aperture; for in the Rigveda it is said that Indra cured Apala of a disease of the skin by

drawing her through the yoke of the chariot; “thus the god made her to have a golden skin, purifying her thrice.”

At the small village of Damun, on the Kabenau river, in German New Guinea, a traveller witnessed the natives performing a ceremony of initiation, of which the following rite formed part. The candidates for initiation, six in number, were boys and lads of various ages from about four years of age to sixteen or seventeen. The company betook themselves to the bed of a small stream, where at the end of a gully a hollow in the rocks formed a natural basin. At the entrance to the gully a sort of yoke, so the traveller calls it, was erected by means of some poles, and from the cross-piece plants were hung so as to make an arch. One of the men took up his station in front of the arch, and as each candidate came up, the man seized him, spat on his breast and back a clot of red spittle, and gave him several severe blows with the stock of a plant. After that the candidate, who had previously stripped himself naked, passed under the leafy arch and bathed in the rocky pool at the other end of the gully. All the time that this solemnity was proceeding another man sat perched on a neighbouring rock, beating a drum and singing. Only men took part in the ceremony. Though no explanation of the ceremony is given by the observer who witnessed it, we may suppose that by passing under the yoke or arch the novices were supposed to rid themselves of certain evil influences, whether conceived as spiritual or not, which they left behind them on the further side of the barrier. This interpretation is confirmed by the bath which each candidate took immediately afterwards. In short the whole purpose of the rite would seem to have been purificatory.

With the preceding examples before us, it seems worth while to ask whether the ancient Italian practice of making conquered enemies to pass under a yoke may not in its origin have been a purificatory ceremony, designed to rid the foe of some uncanny powers before dismissing him to his home. For apparently the ceremony was only observed with prisoners who were about to be released; had it been a mere mark of ignominy, there seems to be no reason why it should not have been inflicted also on men who were doomed to die. This conjectural explanation of the ceremony is confirmed by the tradition that the Roman Horatius was similarly obliged by his fellow-countrymen to pass under a yoke as a form of purification for the murder of his sister. The yoke by passing under which he cleansed himself from his sister's blood was still to be seen in Rome when Livy was writing his history under the emperor Augustus. It was an ancient wooden beam spanning a narrow lane in an old quarter of the city, the two ends of the beam being built into the masonry of the walls on either side; it went by the name of the Sister's Beam, and whenever the wood decayed and threatened to fall, the venerable monument, which carried back the thoughts of passers-by to the kingly age of Rome, was repaired at the public expense. If our interpretation of these customs is right, it was the ghost of his murdered sister whom the Roman hero gave the slip to by passing under the yoke; and it may have been the angry ghosts of slaughtered Romans from whom the enemy's soldiers were believed to be delivered when they marched under the yoke before being dismissed by their merciful conquerors to their homes.

In a former part of this work we saw that homicides in general and victorious warriors in particular are often obliged to perform a variety of ceremonies for the purpose of ridding them of the dangerous ghosts of their victims. If the ceremony of passing under the yoke was primarily designed, as I have suggested, to free the soldiers from the angry ghosts of the men whom they had slain, we should expect to find that the victorious Romans themselves observed a similar ceremony after a battle for a similar purpose. Was this the original meaning of passing under a triumphal arch? In other words, may not the triumphal arch have been for the victors what the yoke was for the vanquished, a barrier to protect them against the pursuit of the spirits of the slain? That the Romans felt the need of purification from the taint of bloodshed after a battle appears from the opinion of Masurius, mentioned by Pliny,

that the laurel worn by soldiers in a triumphal procession was intended to purge them from the slaughter of the enemy. A special gate, the *Porta Triumphalis*, was reserved for the entrance of a victorious army into Rome; and it would be in accordance with ancient religious views if this distinction was originally not so much an honour conferred as a precaution enforced to prevent the ordinary gates from being polluted by the passage of thousands of blood-guilty men.

§ 3. The External Soul in Animals.

But in practice, as in folk-tales, it is not merely with inanimate objects and plants that a person is occasionally believed to be united by a bond of physical sympathy. The same bond, it is supposed, may exist between a man and an animal, so that the welfare of the one depends on the welfare of the other, and when the animal dies the man dies also. The analogy between the custom and the tales is all the closer because in both of them the power of thus removing the soul from the body and stowing it away in an animal is often a special privilege of wizards and witches. Thus the Yakuts of Siberia believe that every shaman or wizard keeps his soul, or one of his souls, incarnate in an animal which is carefully concealed from all the world. "Nobody can find my external soul," said one famous wizard, "it lies hidden far away in the stony mountains of Edzhigansk." Only once a year, when the last snows melt and the earth turns black, do these external souls of wizards appear in the shape of animals among the dwellings of men. They wander everywhere, yet none but wizards can see them. The strong ones sweep roaring and noisily along, the weak steal about quietly and furtively. Often they fight, and then the wizard whose external soul is beaten, falls ill or dies. The weakest and most cowardly wizards are they whose souls are incarnate in the shape of dogs, for the dog gives his human double no peace, but gnaws his heart and tears his body. The most powerful wizards are they whose external souls have the shape of stallions, elks, black bears, eagles, or boars. Again, the Samoyeds of the Turukhinsk region hold that every shaman has a familiar spirit in the shape of a boar, which he leads about by a magic belt. On the death of the boar the shaman himself dies; and stories are told of battles between wizards, who send their spirits to fight before they encounter each other in person. In Yorkshire witches are thought to stand in such peculiarly close relations to hares, that if a particular hare is killed or wounded, a certain witch will at the same moment be killed or receive a hurt in her body exactly corresponding to the wound in the hare. However, this fancy is probably a case of the general European belief that witches have the power of temporarily transforming themselves into certain animals, particularly hares and cats, and that any hurts inflicted on such transformed animals are felt by the witches who are concealed in the animals. But the notion that a person can temporarily transform himself into an animal differs from the notion that he can deposit his soul for a longer or shorter period in an animal, while he himself retains the human form; though in the cloudy mind of the peasant and the savage the two ideas may not always be sharply distinguished. The Malays believe that "the soul of a person may pass into another person or into an animal, or rather that such a mysterious relation can arise between the two that the fate of the one is wholly dependent on that of the other."

Among the Melanesians of Mota, one of the New Hebrides islands, the conception of an external soul is carried out in the practice of daily life. The Mota word for soul is *atai*. "The use of the word *atai* in Mota seems properly and originally to have been to signify something peculiarly and intimately connected with a person and sacred to him, something that he has set his fancy upon when he has seen it in what has seemed to him a wonderful manner, or some one has shewn it to him as such. Whatever the thing might be the man believed it to be the reflection of his own personality; he and his *atai* flourished, suffered, lived, and died together. But the word must not be supposed to have been borrowed from this use and applied secondarily to describe the soul; the word carries a sense with it which is

applicable alike to that second self, the visible object so mysteriously connected with the man, and to this invisible second self which we call the soul. There is another Mota word, *tamaniu*, which has almost if not quite the same meaning as *atai* has when it describes something animate or inanimate which a man has come to believe to have an existence intimately connected with his own. The word *tamaniu* may be taken to be properly 'likeness,' and the noun form of the adverb *tama*, as, like. It was not every one in Mota who had his *tamaniu*; only some men fancied that they had this relation to a lizard, a snake, or it might be a stone; sometimes the thing was sought for and found by drinking the infusion of certain leaves and heaping together the dregs; then whatever living thing was first seen in or upon the heap was the *tamaniu*. It was watched but not fed or worshipped; the natives believed that it came at call, and that the life of the man was bound up with the life of his *tamaniu*, if a living thing, or with its safety; should it die, or if not living get broken or be lost, the man would die. Hence in case of sickness they would send to see if the *tamaniu* was safe and well. This word has never been used apparently for the soul in Mota; but in Aurora in the New Hebrides it is the accepted equivalent. It is well worth observing that both the *atai* and the *tamaniu*, and it may be added the Motlav *talegi*, is something which has a substantial existence of its own, as when a snake or stone is a man's *atai* or *tamaniu*; a soul then when called by these names is conceived of as something in a way substantial."

From this account, which we owe to the careful and accurate researches of the Rev. Dr. Codrington, we gather that while every person in Mota has a second self or external soul in a visible object called an *atai*, only some people have, it may be, a second external soul in another visible object called a *tamaniu*. We may conjecture that persons who have a *tamaniu* in addition to an *atai* are more than usually anxious as to the state of their soul, and that they seek to put it in perfect security by what we may call a system of double insurance, calculating that if one of their external souls should die or be broken, they themselves may still survive by virtue of the survival of the other. Be that as it may, the *tamaniu* discharges two functions, one of them defensive and the other offensive. On the one hand, so long as it lives or remains unbroken, it preserves its owner in life; and on the other hand it helps him to injure his enemies. In its offensive character, if the *tamaniu* happens to be an eel, it will bite its owner's enemy; if it is a shark, it will swallow him. In its defensive character, the state of the *tamaniu* is a symptom or life-token of the state of the man; hence when he is ill he will visit and examine it, or if he cannot go himself he will send another to inspect it and report. In either case the man turns the animal, if animal it be, carefully over in order to see what is the matter with it; should something be found sticking to its skin, it is removed, and through the relief thus afforded to the creature the sick man recovers. But if the animal should be found dying, it is an omen of death for the man; for whenever it dies he dies also.

In Melanesia a native doctor was once attending to a sick man. Just then "a large eagle-hawk came soaring past the house, and Kaplen, my hunter, was going to shoot it; but the doctor jumped up in evident alarm, and said, 'Oh, don't shoot; that is my spirit' (*niog*, literally, my shadow); 'if you shoot that, I will die.' He then told the old man, 'If you see a rat to-night, don't drive it away, 'tis my spirit (*niog*), or a snake which will come to-night, that also is my spirit.' " It does not appear whether the doctor in this case, like the giant or warlock in the tales, kept his spirit permanently in the bird or in the animal, or whether he only transferred it temporarily to the creature for the purpose of enabling him the better to work the cure, perhaps by sending out his own soul in a bird or beast to find and bring back the lost soul of the patient. In either case he seems to have thought, like the giant or warlock in the stories, that the death of the bird or the animal would simultaneously entail his own. A family in Nauru, one of the Marshall Islands, apparently imagine that their lives are bound up with a species of large fish, which has a huge mouth and devours human beings; for when one of

these fish was killed, the members of the family cried, "Our guardian spirit is killed, now we must all die!"

The theory of an external soul deposited in an animal appears to be very prevalent in West Africa, particularly in Nigeria, the Cameroons, and the Gaboon. In the latter part of the nineteenth century two English missionaries, established at San Salvador, the capital of the King of Congo, asked the natives repeatedly whether any of them had seen the strange, big, East African goat which Stanley had given to a chief at Stanley Pool in 1877. But their enquiries were fruitless; no native would admit that he had seen the goat. Some years afterwards the missionaries discovered why they could obtain no reply to their enquiry. All the people, it turned out, imagined that the missionaries believed the spirit of the King of Salvador to be contained in the goat, and that they wished to obtain possession of the animal in order to exercise an evil influence on his majesty. The belief from the standpoint of the Congo savages was natural enough, since in that region some chiefs regularly link their fate to that of an animal. Thus the Chief Bankwa of Ndolo, on the Moeko River, had conferred this honour on a certain hippopotamus of the neighbourhood, at which he would allow nobody to shoot. At the village of Ongek, in the Gaboon, a French missionary slept in the hut of an old Fan chief. Awakened about two in the morning by a rustling of dry leaves, he lit a torch, when to his horror he perceived a huge black serpent of the most dangerous sort, coiled in a corner, with head erect, shining eyes, and hissing jaws, ready to dart at him. Instinctively he seized his gun and pointed it at the reptile, when suddenly his arm was struck up, the torch was extinguished, and the voice of the old chief said, "Don't fire! don't fire! I beg of you. In killing the serpent, it is me that you would kill. Fear nothing. The serpent is my *elangela*." So saying he flung himself on his knees beside the reptile, put his arms about it, and clasped it to his breast. The serpent received his caresses quietly, manifesting neither anger nor fear, and the chief carried it off and laid it down beside him in another hut, exhorting the missionary to have no fear and never to speak of the subject. His curiosity being excited by this adventure, the missionary, Father Trilles, pursued his enquiries and ascertained that among the Fans of the Gaboon every wizard is believed at initiation to unite his life with that of some particular wild animal by a rite of blood-brotherhood; he draws blood from the ear of the animal and from his own arm, and inoculates the animal with his own blood, and himself with the blood of the beast. Henceforth such an intimate union is established between the two that the death of the one entails the death of the other. The alliance is thought to bring to the wizard or sorcerer a great accession of power, which he can turn to his advantage in various ways. In the first place, like the warlock in the fairy tales who has deposited his life outside of himself in some safe place, the Fan wizard now deems himself invulnerable. Moreover, the animal with which he has exchanged blood has become his familiar, and will obey any orders he may choose to give it; so he makes use of it to injure and kill his enemies. For that reason the creature with whom he establishes the relation of blood-brotherhood is never a tame or domestic animal, but always a ferocious and dangerous wild beast, such as a leopard, a black serpent, a crocodile, a hippopotamus, a wild boar, or a vulture. Of all these creatures the leopard is by far the commonest familiar of Fan wizards, and next to it comes the black serpent; the vulture is the rarest. Witches as well as wizards have their familiars; but the animals with which the lives of women are thus bound up generally differ from those to which men commit their external souls. A witch never has a panther for her familiar, but often a venomous species of serpent, sometimes a horned viper, sometimes a black serpent, sometimes a green one that lives in banana-trees; or it may be a vulture, an owl, or other bird of night. In every case the beast or bird with which the witch or wizard has contracted this mystic alliance is an individual, never a species; and when the individual animal dies the alliance is naturally at an end, since the death of the animal is supposed to entail the death of the man.

Similar beliefs are held by the natives of the Cross River valley within the German provinces of the Cameroons. Groups of people, generally the inhabitants of a village, have chosen various animals, with which they believe themselves to stand on a footing of intimate friendship or relationship. Amongst such animals are hippopotamuses, elephants, leopards, crocodiles, gorillas, fish, and serpents, all of them creatures which are either very strong or can easily hide themselves in the water or a thicket. This power of concealing themselves is said to be an indispensable condition of the choice of animal familiars, since the animal friend or helper is expected to injure his owner's enemy by stealth; for example, if he is a hippopotamus, he will bob up suddenly out of the water and capsize the enemy's canoe. Between the animals and their human friends or kinsfolk such a sympathetic relation is supposed to exist that the moment the animal dies the man dies also, and similarly the instant the man perishes so does the beast. From this it follows that the animal kinsfolk may never be shot at or molested for fear of injuring or killing the persons whose lives are knit up with the lives of the brutes. This does not, however, prevent the people of a village, who have elephants for their animal friends, from hunting elephants. For they do not respect the whole species but merely certain individuals of it, which stand in an intimate relation to certain individual men and women; and they imagine that they can always distinguish these brother elephants from the common herd of elephants which are mere elephants and nothing more. The recognition indeed is said to be mutual. When a hunter, who has an elephant for his friend, meets a human elephant, as we may call it, the noble animal lifts up a paw and holds it before his face, as much as to say, "Don't shoot." Were the hunter so inhuman as to fire on and wound such an elephant, the person whose life was bound up with the elephant would fall ill.

The Balong of the Cameroons think that every man has several souls, of which one is in his body and another in an animal, such as an elephant, a wild pig, a leopard, and so forth. When a man comes home, feeling ill, and says, "I shall soon die," and dies accordingly, the people aver that one of his souls has been killed in a wild pig or a leopard, and that the death of the external soul has caused the death of the soul in his body. Hence the corpse is cut open, and a diviner determines, from an inspection of the inwards, whether the popular surmise is correct or not.

A similar belief in the external souls of living people is entertained by the Ibos, an important tribe of the Niger delta, who inhabit a country west of the Cross River. They think that a man's spirit can quit his body for a time during life and take up its abode in an animal. This is called *ishi anu*, "to turn animal." A man who wishes to acquire this power procures a certain drug from a wise man and mixes it with his food. After that his soul goes out and enters into the animal. If it should happen that the animal is killed while the man's soul is lodged in it, the man dies; and if the animal be wounded, the man's body will presently be covered with boils. This belief instigates to many deeds of darkness; for a sly rogue will sometimes surreptitiously administer the magical drug to his enemy in his food, and having thus smuggled the other's soul into an animal will destroy the creature, and with it the man whose soul is lodged in it. A like belief is reported to prevail among the tribes of the Obubura Hill district on the Cross River in Southern Nigeria. Once when Mr. Partridge's canoe-men wished to catch fish near a town of the Assiga tribe, the people objected, saying, "Our souls live in those fish, and if you kill them we shall die."

The negroes of Calabar, at the mouth of the Niger, believe that every person has four souls, one of which always lives outside of his or her body in the form of a wild beast in the forest. This external soul, or bush soul, as Miss Kingsley calls it, may be almost any animal, for example, a leopard, a fish, or a tortoise; but it is never a domestic animal and never a plant. Unless he is gifted with second sight, a man cannot see his own bush soul, but a diviner will

often tell him what sort of creature his bush soul is, and after that the man will be careful not to kill any animal of that species, and will strongly object to any one else doing so. A man and his sons have usually the same sort of animals for their bush souls, and so with a mother and her daughters. But sometimes all the children of a family take after the bush soul of their father; for example, if his external soul is a leopard, all his sons and daughters will have leopards for their external souls. And on the other hand, sometimes they all take after their mother; for instance, if her external soul is a tortoise, all the external souls of her sons and daughters will be tortoises too. So intimately bound up is the life of the man with that of the animal which he regards as his external or bush soul, that the death or injury of the animal necessarily entails the death or injury of the man. And, conversely, when the man dies, his bush soul can no longer find a place of rest, but goes mad and rushes into the fire or charges people and is knocked on the head, and that is an end of it. When a person is sick, the diviner will sometimes tell him that his bush soul is angry at being neglected; thereupon the patient will make an offering to the offended spirit and deposit it in a tiny hut in the forest at the spot where the animal, which is his external soul, was last seen. If the bush soul is appeased, the patient recovers; but if it is not, he dies. Yet the foolish bush soul does not understand that in injuring the man it injures itself, and that it cannot long survive his decease.

Such is the account which Miss Kingsley gives of the bush souls of the Calabar negroes. Some fresh particulars are furnished by Mr. Richard Henshaw, Agent for Native Affairs at Calabar. He tells us that a man may only marry a woman who has the same sort of bush soul as himself; for example, if his bush soul is a leopard, his wife also must have a leopard for her bush soul. Further, we learn from Mr. Henshaw that a person's bush soul need not be that either of his father or of his mother. For example, a child with a hippopotamus for his bush soul may be born into a family, all the members of which have wild pigs for their bush souls; this happens when the child is a reincarnation of a man whose external soul was a hippopotamus. In such a case, if the parents object to the intrusion of an alien soul, they may call in a medicine-man to check its growth and finally abolish it altogether, after which they will give the child their own bush soul. Or they may leave the matter over till the child comes of age, when he will choose a bush soul for himself with the help of a medicine-man, who will also select the piece of bush or water in which the chosen animal lives. When a man dies, then the animal which contains his external soul "becomes insensible and quite unconscious of the approach of danger. Thus a hunter can capture or kill him with perfect ease." Sacrifices are often offered to prevent other people from killing the animal in which a man's bush soul resides. The tribes of Calabar which hold these beliefs as to the bush soul are the Efik and Ekoi. The belief of the Calabar negroes in the external soul has been described as follows by a missionary: "*Ukpong* is the native word we have taken to translate our word *soul*. It primarily signifies the shadow of a person. It also signifies that which dwells within a man on which his life depends, but which may detach itself from the body, and visiting places and persons here and there, again return to its abode in the man.... Besides all this, the word is used to designate an animal possessed of an *ukpong*, so connected with a person's *ukpong*, that they mutually act upon each other. When the leopard, or crocodile, or whatever animal may be a man's *ukpong*, gets sick or dies, the like thing happens to him. Many individuals, it is believed, have the power of changing themselves into the animals which are their *ukpong*."

Among the Ekoi of the Oban district, in Southern Nigeria, it is usual to hear a person say of another that he or she "possesses" such and such an animal, meaning that the person has the power to assume the shape of that particular creature. It is their belief that by constant practice and by virtue of certain hereditary secrets a man can quit his human body and put on that of a wild beast. They say that in addition to the soul which animates his human body everybody has a bush soul which at times he can send forth to animate the body of the

creature which he “possesses.” When he wishes his bush soul to go out on its rambles, he drinks a magic potion, the secret of which has been handed down from time immemorial, and some of which is always kept ready for use in an ancient earthen pot set apart for the purpose. No sooner has he drunk the mystic draught than his bush soul escapes from him and floats away invisible through the town into the forest. There it begins to swell and, safe in the shadow of the trees, takes on the shape of the man's animal double, it may be an elephant, a leopard, a buffalo, a wild boar, or a crocodile. Naturally the potion differs according to the kind of animal into which a man is temporarily converted. It would be absurd, for example, to expect that the dose which turns you into an elephant should also be able to turn you into a crocodile; the thing is manifestly impossible. A great advantage of these temporary conversions of a man into a beast is that it enables the convert in his animal shape to pay out his enemy without being suspected. If, for example, you have a grudge at a man who is a well-to-do farmer, all that you have to do is to turn yourself by night into a buffalo, an elephant, or a wild boar, and then, bursting into his fields, stamp about in them till you have laid the standing crops level with the ground. That is why in the neighbourhood of large well-tilled farms, people prefer to keep their bush souls in buffaloes, elephants, and wild boars, because these animals are the most convenient means of destroying a neighbour's crops. Whereas where the farms are small and ill-kept, as they are round about Oban, it is hardly worth a man's while to take the trouble of turning into a buffalo or an elephant for the paltry satisfaction of rooting up a few miserable yams or such like trash. So the Oban people keep their bush souls in leopards and crocodiles, which, though of little use for the purpose of destroying a neighbour's crops, are excellent for the purpose of killing the man himself first and eating him afterwards. But the power of turning into an animal has this serious disadvantage that it lays you open to the chance of being wounded or even slain in your animal skin before you have time to put it off and scramble back into your human integument. A remarkable case of this sort happened only a few miles from Oban not long ago. To understand it you must know that the chiefs of the Ododop tribe, who live about ten miles from Oban, keep their bush souls, whenever they are out on a ramble, in the shape of buffaloes. Well, one day the District Commissioner at Oban saw a buffalo come down to drink at a stream which runs through his garden. He shot at the beast and hit it, and it ran away badly wounded. At the very same moment the head chief of the Ododop tribe, ten miles away, clapped his hand to his side and said, “They have killed me at Oban.” Death was not instantaneous, for the buffalo lingered in pain for a couple of days in the forest, but an hour or two before its dead body was discovered by the trackers the chief expired. Just before he died, with touching solicitude he sent a message warning all people who kept their external souls in buffaloes to profit by his sad fate and beware of going near Oban, which was not a safe place for them. Naturally, when a man keeps his external soul from time to time in a beast, say in a wild cow, he is not so foolish as to shoot an animal of that particular sort, for in so doing he might perhaps be killing himself. But he may kill animals in which other people keep their external souls. For example, a wild cow man may freely shoot an antelope or a wild boar; but should he do so and then have reason to suspect that the dead beast is the animal double of somebody with whom he is on friendly terms, he must perform certain ceremonies over the carcass and then hurry home, running at the top of his speed, to administer a particular medicine to the man whom he has unintentionally injured. In this way he may possibly be in time to save the life of his friend from the effects of the deplorable accident.

Near Eket in North Calabar there is a sacred lake, the fish of which are carefully preserved because the people believe that their own souls are lodged in the fish, and that with every fish killed a human life would be simultaneously extinguished. In the Calabar River not very many years ago there used to be a huge old crocodile, popularly supposed to contain the

external soul of a chief who resided in the flesh at Duke Town. Sporting vice-consuls used from time to time to hunt the animal, and once a peculiarly energetic officer contrived to hit it. Forthwith the chief was laid up with a wound in his leg. He gave out that a dog had bitten him, but no doubt the wise shook their heads and refused to be put off with so flimsy a pretext. Again, among several tribes on the banks of the Niger between Lokoja and the delta there prevails "a belief in the possibility of a man possessing an *alter ego* in the form of some animal such as a crocodile or a hippopotamus. It is believed that such a person's life is bound up with that of the animal to such an extent that, whatever affects the one produces a corresponding impression upon the other, and that if one dies the other must speedily do so too. It happened not very long ago that an Englishman shot a hippopotamus close to a native village; the friends of a woman who died the same night in the village demanded and eventually obtained five pounds as compensation for the murder of the woman." Among the Montols of Northern Nigeria, "in many of the compounds there will be found a species of snake, of a non-poisonous sort, which, when full grown, attains a length of about five feet and a girth of eight or nine inches. These snakes live in and about the compound. They are not specially fed by the people of the place, nor are places provided for them to nest in. They live generally in the roofs of the small granaries and huts that make up the compound. They feed upon small mammals, and no doubt serve a useful purpose in destroying vermin which might otherwise eat the stored grain. They are not kept for the purpose of destroying vermin, however. The Montols believe that at the birth of every individual of their race, male and female, one of these snakes, of the same sex, is also born. If the snake be killed, his human partner in life dies also and at the same time. If the wife of a compound-owner gives birth to a son, shortly after the interesting event, the snake of the establishment will be seen with a young one of corresponding sex. From the moment of birth, these two, the snake and the man, share a life of common duration, and the measure of the one is the measure of the other. Hence every care is taken to protect these animals from injury, and no Montol would in any circumstances think of injuring or killing one. It is said that a snake of this kind never attempts any injury to a man. There is only one type of snake thus regarded." Among the Angass, of the Kanna District in Northern Nigeria, "when a man is born, he is endowed with two distinct entities, life and a *kurua* (Arabic *rin*).... When the *rin* enters a man, its counterpart enters some beast or snake at the same time, and if either dies, so also does the body containing the counterpart. This, however, in no wise prevents a man from killing any game, etc., he may see, though he knows full well that he is causing thereby the death of some man or woman. When a man dies, his life and *rin* both leave him, though the latter is asserted sometimes to linger near the place of death for a day or two." Again, at the town of Paha, in the northern territory of the Gold Coast, there are pools inhabited by crocodiles which are worshipped by the people. The natives believe that for every death or birth in the town a similar event takes place among the crocodiles.

In South Africa the conception of an external soul deposited in an animal, which is so common in West Africa, appears to be almost unknown; at least I have met with no clear traces of it in literature. The Bechuanas, indeed, commonly believe that if a man wounds a crocodile, the man will be ill as long as the crocodile is ill of its wound, and that if the crocodile dies, the man dies too. This belief is not, apparently, confined to the Bechuana clan which has the crocodile for its totem, but is shared by all the other clans; all of them certainly hold the crocodile in respect. It does not appear whether the sympathetic relation between a man and a crocodile is supposed by the Bechuanas to be lifelong, or only to arise at the moment when the man wounds the animal; in the latter case the shedding of the crocodile's blood might perhaps be thought to establish a relationship of affinity or sympathy between the two. The Zulus believe that every man is attended by an ancestral spirit (*ihlozi*, or rather *idhlozi*) in the form of a serpent, "which specially guards and helps him, lives with

him, wakes with him, sleeps and travels with him, but always under ground. If it ever makes its appearance, great is the joy, and the man must seek to discover the meaning of its appearance. He who has no *ihlozi* must die. Therefore if any one kills an *ihlozi* serpent, the man whose *ihlozi* it was dies, but the serpent comes to life again." But the conception of a dead ancestor incarnate in a snake, on which the welfare or existence of one of his living descendants depends, is rather that of a guardian spirit than of an external soul.

Amongst the Zapotecs of Central America, when a woman was about to be confined, her relations assembled in the hut, and began to draw on the floor figures of different animals, rubbing each one out as soon as it was completed. This went on till the moment of birth, and the figure that then remained sketched upon the ground was called the child's *tona* or second self. "When the child grew old enough, he procured the animal that represented him and took care of it, as it was believed that health and existence were bound up with that of the animal's, in fact that the death of both would occur simultaneously," or rather that when the animal died the man would die too. Among the Indians of Guatemala and Honduras the *nagual* or *naual* is "that animate or inanimate object, generally an animal, which stands in a parallel relation to a particular man, so that the weal and woe of the man depend on the fate of the *nagual*." According to an old writer, many Indians of Guatemala "are deluded by the devil to believe that their life dependeth upon the life of such and such a beast (which they take unto them as their familiar spirit), and think that when that beast dieth they must die; when he is chased, their hearts pant; when he is faint, they are faint; nay, it happeneth that by the devil's delusion they appear in the shape of that beast (which commonly by their choice is a buck, or doe, a lion, or tigre, or dog, or eagle) and in that shape have been shot at and wounded." Herrera's account of the way in which the Indians of Honduras acquired their *naguals*, runs thus: "The devil deluded them, appearing in the shape of a lion or a tiger, or a coyote, a beast like a wolf, or in the shape of an alligator, a snake, or a bird, that province abounding in creatures of prey, which they called *naguales*, signifying keepers or guardians, and when the bird died the Indian that was in league with him died also, which often happened and was looked upon as infallible. The manner of contracting this alliance was thus. The Indian repaired to the river, wood, hill, or most obscure place, where he called upon the devils by such names as he thought fit, talked to the rivers, rocks, or woods, said he went to weep that he might have the same his predecessors had, carrying a cock or a dog to sacrifice. In that melancholy fit he fell asleep, and either in a dream or waking saw some one of the aforesaid birds or other creatures, whom he entreated to grant him profit in salt, cacao, or any other commodity, drawing blood from his own tongue, ears, and other parts of his body, making his contract at the same time with the said creature, the which either in a dream or waking told him, 'Such a day you shall go abroad asporting, and I will be the first bird or other animal you shall meet, and will be your *nagual* and companion at all times.' Whereupon such friendship was contracted between them, that when one of them died the other did not survive, and they fancied that he who had no *nagual* could not be rich." The Indians were persuaded that the death of their *nagual* would entail their own. Legend affirms that in the first battles with the Spaniards on the plateau of Quetzaltenango the *naguals* of the Indian chiefs fought in the form of serpents. The *nagual* of the highest chief was especially conspicuous, because it had the form of a great bird, resplendent in green plumage. The Spanish general Pedro de Alvarado killed the bird with his lance, and at the same moment the Indian chief fell dead to the ground.

In many tribes of South-Eastern Australia each sex used to regard a particular species of animals in the same way that a Central American Indian regarded his *nagual*, but with this difference, that whereas the Indian apparently knew the individual animal with which his life was bound up, the Australians only knew that each of their lives was bound up with some one

animal of the species, but they could not say with which. The result naturally was that every man spared and protected all the animals of the species with which the lives of the men were bound up; and every woman spared and protected all the animals of the species with which the lives of the women were bound up; because no one knew but that the death of any animal of the respective species might entail his or her own; just as the killing of the green bird was immediately followed by the death of the Indian chief, and the killing of the parrot by the death of Punchkin in the fairy tale. Thus, for example, the Wotjobaluk tribe of South-Eastern Australia “held that ‘the life of Ngününgүнüt (the Bat) is the life of a man, and the life of Yártatgürk (the Nightjar) is the life of a woman,’ and that when either of these creatures is killed the life of some man or of some woman is shortened. In such a case every man or every woman in the camp feared that he or she might be the victim, and from this cause great fights arose in this tribe. I learn that in these fights, men on one side and women on the other, it was not at all certain which would be victorious, for at times the women gave the men a severe drubbing with their yamsticks, while often women were injured or killed by spears.” The Wotjobaluk said that the bat was the man's “brother” and that the nightjar was his “wife.” The particular species of animals with which the lives of the sexes were believed to be respectively bound up varied somewhat from tribe to tribe. Thus whereas among the Wotjobaluk the bat was the animal of the men, at Gunbower Creek on the Lower Murray the bat seems to have been the animal of the women, for the natives would not kill it for the reason that “if it was killed, one of their lubras [women] would be sure to die in consequence.” In the Kurnai tribe of Gippsland the emu-wren (*Stipiturus malachurus*) was the “man's brother” and the superb warbler (*Malurus cyaneus*) was the “woman's sister”; at the initiation of young men into the tribal mysteries the name of the emu-wren was invoked over the novices for the purpose of infusing manly virtue into them. Among the Yuin on the south-eastern coast of Australia, the “woman's sister” was the tree-creeper (*Climacteris scandens*), and the men had both the bat and the emu-wren for their “brothers.” In the Kulin nation each sex had a pair of “brothers” and “sisters”; the men had the bat and the emu-wren for their “brothers,” and the women had the superb warbler and the small nightjar for their “sisters.” It is notable that in South-Eastern Australia the animals thus associated with the lives of men and women were generally flying creatures, either birds or bats. However, in the Port Lincoln tribe of South Australia the man's “brother” and the woman's “sister” seem to have been identified with the male and female respectively of a species of lizard; for we read that “a small kind of lizard, the male of which is called *ibirri*, and the female *waka*, is said to have divided the sexes in the human species; an event that would appear not to be much approved of by the natives, since either sex has a mortal hatred against the opposite sex of these little animals, the men always destroying the *waka* and the women the *ibirri*.” But whatever the particular sorts of creature with which the lives of men and women were believed to be bound up, the belief itself and the fights to which it gave rise are known to have prevailed over a large part of South-Eastern Australia, and probably they extended much farther. The belief was a very serious one, and so consequently were the fights which sprang from it. Thus among some tribes of Victoria “the common bat belongs to the men, who protect it against injury, even to the half-killing of their wives for its sake. The fern owl, or large goatsucker, belongs to the women, and, although a bird of evil omen, creating terror at night by its cry, it is jealously protected by them. If a man kills one, they are as much enraged as if it was one of their children, and will strike him with their long poles.”

The jealous protection thus afforded by Australian men and women to bats and owls respectively (for bats and owls seem to be the creatures usually allotted to the two sexes) is not based upon purely selfish considerations. For each man believes that not only his own life but the lives of his father, brothers, sons, and so on are bound up with the lives of particular bats, and that therefore in protecting the bat species he is protecting the lives of all his male

relations as well as his own. Similarly, each woman believes that the lives of her mother, sisters, daughters, and so forth, equally with her own, are bound up with the lives of particular owls, and that in guarding the owl species she is guarding the lives of all her female relations besides her own. Now, when men's lives are thus supposed to be contained in certain animals, it is obvious that the animals can hardly be distinguished from the men, or the men from the animals. If my brother John's life is in a bat, then, on the one hand, the bat is my brother as well as John; and, on the other hand, John is in a sense a bat, since his life is in a bat. Similarly, if my sister Mary's life is in an owl, then the owl is my sister and Mary is an owl. This is a natural enough conclusion, and the Australians have not failed to draw it. When the bat is the man's animal, it is called his brother; and when the owl is the woman's animal, it is called her sister. And conversely a man addresses a woman as an owl, and she addresses him as a bat. So with the other animals allotted to the sexes respectively in other tribes. For example, among the Kurnai all emu-wrens were "brothers" of the men, and all the men were emu-wrens; all superb warblers were "sisters" of the women, and all the women were superb warblers.

§ 4. A Suggested Theory of Totemism.

But when a savage names himself after an animal, calls it his brother, and refuses to kill it, the animal is said to be his totem. Accordingly in the tribes of South-Eastern Australia which we have been considering the bat and the owl, the emu-wren and the superb warbler, may properly be described as totems of the sexes. But the assignation of a totem to a sex is comparatively rare, and has hitherto been discovered nowhere but in Australia. Far more commonly the totem is appropriated not to a sex, but to a clan, and is hereditary either in the male or female line. The relation of an individual to the clan totem does not differ in kind from his relation to the sex totem; he will not kill it, he speaks of it as his brother, and he calls himself by its name. Now if the relations are similar, the explanation which holds good of the one ought equally to hold good of the other. Therefore the reason why a clan revere a particular species of animals or plants (for the clan totem may be a plant) and call themselves after it, would seem to be a belief that the life of each individual of the clan is bound up with some one animal or plant of the species, and that his or her death would be the consequence of killing that particular animal, or destroying that particular plant. This explanation of totemism squares very well with Sir George Grey's definition of a totem or *kobong* in Western Australia. He says: "A certain mysterious connection exists between a family and its *kobong*, so that a member of the family will never kill an animal of the species to which his *kobong* belongs, should he find it asleep; indeed he always kills it reluctantly, and never without affording it a chance to escape. This arises from the family belief that some one individual of the species is their nearest friend, to kill whom would be a great crime, and to be carefully avoided. Similarly, a native who has a vegetable for his *kobong* may not gather it under certain circumstances, and at a particular period of the year." Here it will be observed that though each man spares all the animals or plants of the species, they are not all equally precious to him; far from it, out of the whole species there is only one which is specially dear to him; but as he does not know which the dear one is, he is obliged to spare them all from fear of injuring the one. Again, this explanation of the clan totem harmonizes with the supposed effect of killing one of the totem species. "One day one of the blacks killed a crow. Three or four days afterwards a Boortwa (crow) [*i.e.* a man of the Crow clan] named Larry died. He had been ailing for some days, but the killing of his *wingong* [totem] hastened his death." Here the killing of the crow caused the death of a man of the Crow clan, exactly as, in the case of the sex-totems, the killing of a bat causes the death of a Bat-man or the killing of an owl causes the death of an Owl-woman. Similarly, the killing of his *nagual* causes the death of a Central American Indian, the killing of his bush soul causes the death of a Calabar

negro, the killing of his *tamaniu* causes the death of a Banks Islander, and the killing of the animal in which his life is stowed away causes the death of the giant or warlock in the fairy tale.

Thus it appears that the story of "The giant who had no heart in his body" may perhaps furnish the key to the relation which is supposed to subsist between a man and his totem. The totem, on this theory, is simply the receptacle in which a man keeps his life, as Punchkin kept his life in a parrot, and Bidasari kept her soul in a golden fish. It is no valid objection to this view that when a savage has both a sex totem and a clan totem his life must be bound up with two different animals, the death of either of which would entail his own. If a man has more vital places than one in his body, why, the savage may think, should he not have more vital places than one outside it? Why, since he can put his life outside himself, should he not transfer one portion of it to one animal and another to another? The divisibility of life, or, to put it otherwise, the plurality of souls, is an idea suggested by many familiar facts, and has commended itself to philosophers like Plato, as well as to savages. It finds favour also with the sages of China, who tell us that every human being is provided with what may be called a male soul (*shen*) and a female soul (*kwei*), which by their harmonious co-operation compose an organic unity. However, some Chinese philosophers will have it that each of the five viscera has its own separate male soul (*shen*); and a Taoist treatise written about the end of the tenth or beginning of the eleventh century has even enriched science with a list of about three dozen souls distributed over the various parts of the human frame; indeed, not content with a bare catalogue of these souls, the learned author has annexed to the name and surname of each a brief description of its size and stature, of the kind of dress in which it is clothed and the shape of hat it wears. It is only when the notion of a soul, from being a quasi-scientific hypothesis, becomes a theological dogma that its unity and indivisibility are insisted upon as essential. The savage, unshackled by dogma, is free to explain the facts of life by the assumption of as many souls as he thinks necessary. Hence, for example, the Caribs supposed that there was one soul in the head, another in the heart, and other souls at all the places where an artery is felt pulsating. Some of the Hidatsa Indians explain the phenomena of gradual death, when the extremities appear dead first, by supposing that man has four souls, and that they quit the body, not simultaneously, but one after the other, dissolution being only complete when all four have departed. Some of the Dyaks of Borneo and the Malays of the Peninsula believe that every man has seven souls. The Alfoors of Poso in Celebes are of opinion that he has three. The natives of Laos suppose that the body is the seat of thirty spirits, which reside in the hands, the feet, the mouth, the eyes, and so on. Hence, from the primitive point of view, it is perfectly possible that a savage should have one soul in his sex totem and another in his clan totem. However, as I have observed, sex totems have been found nowhere but in Australia; so that as a rule the savage who practises totemism need not have more than one soul out of his body at a time.

If this explanation of the totem as a receptacle in which a man keeps his soul or one of his souls is correct, we should expect to find some totemic people of whom it is expressly said that every man amongst them is believed to keep at least one soul permanently out of his body, and that the destruction of this external soul is supposed to entail the death of its owner. Such a people are the Battas of Sumatra. The Battas are divided into exogamous clans (*margas*) with descent in the male line; and each clan is forbidden to eat the flesh of a particular animal. One clan may not eat the tiger, another the ape, another the crocodile, another the dog, another the cat, another the dove, another the white buffalo, and another the locust. The reason given by members of a clan for abstaining from the flesh of the particular animal is either that they are descended from animals of that species, and that their souls after death may transmigrate into the animals, or that they or their forefathers have been under

certain obligations to the creatures. Sometimes, but not always, the clan bears the name of the animal. Thus the Battas have totemism in full. But, further, each Batta believes that he has seven or, on a more moderate computation, three souls. One of these souls is always outside the body, but nevertheless whenever it dies, however far away it may be at the time, that same moment the man dies also. The writer who mentions this belief says nothing about the Batta totems; but on the analogy of the Australian, Central American, and African evidence we may conjecture that the external soul, whose death entails the death of the man, is housed in the totemic animal or plant.

Against this view it can hardly be thought to militate that the Batta does not in set terms affirm his external soul to be in his totem, but alleges other grounds for respecting the sacred animal or plant of his clan. For if a savage seriously believes that his life is bound up with an external object, it is in the last degree unlikely that he will let any stranger into the secret. In all that touches his inmost life and beliefs the savage is exceedingly suspicious and reserved; Europeans have resided among savages for years without discovering some of their capital articles of faith, and in the end the discovery has often been the result of accident. Above all, the savage lives in an intense and perpetual dread of assassination by sorcery; the most trifling relics of his person—the clippings of his hair and nails, his spittle, the remnants of his food, his very name—all these may, he fancies, be turned by the sorcerer to his destruction, and he is therefore anxiously careful to conceal or destroy them. But in matters such as these, which are but the outposts and outworks of his life, he is so shy and secretive, how close must be the concealment, how impenetrable the reserve in which he enshrouds the inner keep and citadel of his being! When the princess in the fairy tale asks the giant where he keeps his soul, he often gives false or evasive answers, and it is only after much coaxing and wheedling that the secret is at last wrung from him. In his jealous reticence the giant resembles the timid and furtive savage; but whereas the exigencies of the story demand that the giant should at last reveal his secret, no such obligation is laid on the savage; and no inducement that can be offered is likely to tempt him to imperil his soul by revealing its hiding-place to a stranger. It is therefore no matter for surprise that the central mystery of the savage's life should so long have remained a secret, and that we should be left to piece it together from scattered hints and fragments and from the recollections of it which linger in fairy tales.

§ 5. The Ritual of Death and Resurrection.

This view of totemism throws light on a class of religious rites of which no adequate explanation, so far as I am aware, has yet been offered. Amongst many savage tribes, especially such as are known to practise totemism, it is customary for lads at puberty to undergo certain initiatory rites, of which one of the commonest is a pretence of killing the lad and bringing him to life again. Such rites become intelligible if we suppose that their substance consists in extracting the youth's soul in order to transfer it to his totem. For the extraction of his soul would naturally be supposed to kill the youth or at least to throw him into a death-like trance, which the savage hardly distinguishes from death. His recovery would then be attributed either to the gradual recovery of his system from the violent shock which it had received, or, more probably, to the infusion into him of fresh life drawn from the totem. Thus the essence of these initiatory rites, so far as they consist in a simulation of death and resurrection, would be an exchange of life or souls between the man and his totem. The primitive belief in the possibility of such an exchange of souls comes clearly out in the story of the Basque hunter who affirmed that he had been killed by a bear, but that the bear had, after killing him, breathed its own soul into him, so that the bear's body was now dead, but he himself was a bear, being animated by the bear's soul. This revival of the dead hunter as a bear is exactly analogous to what, on the theory here suggested, is supposed to take place in

the ceremony of killing a lad at puberty and bringing him to life again. The lad dies as a man and comes to life again as an animal; the animal's soul is now in him, and his human soul is in the animal. With good right, therefore, does he call himself a Bear or a Wolf, etc., according to his totem; and with good right does he treat the bears or the wolves, etc., as his brethren, since in these animals are lodged the souls of himself and his kindred.

Examples of this supposed death and resurrection at initiation are as follows. In the Wonghi or Wonghibon tribe of New South Wales "the youths on approaching manhood attend a meeting of the tribe. The ceremonies of initiation are secret, and at them none but the men of the tribe who have been initiated attend with the novices. At the spot where the ceremonies are to be performed, a large oval space is cleared. The old men of the tribe conduct the ceremonies, and the 'medicine man' of the tribe is the master of them. Part of the proceedings consists in knocking out a tooth and giving a new designation to the novice, indicating the change from youth to manhood. When the tooth is knocked out, a loud humming noise is heard, which is made with an instrument of the following description: a flat piece of wood is made with serrated edges, and having a hole at one end, to which a string is attached, and this swung round produces a humming noise. The uninitiated are not even allowed to see this instrument. Women are forbidden to be present at these ceremonies, and should one, by accident or otherwise, witness them, the penalty is death. The penalty for revealing the secrets is probably the same. When everything is prepared the women and children are covered with boughs, and the men retire, with the young fellows who are to be initiated, to a little distance. It is said that the youths are sent away a short distance one by one, and that they are each met in turn by a Being, who, so far as I can understand, is believed to be something between a blackfellow and a spirit. This Being, called Thuremlin, it is said, takes the youth to a distance, kills him, and in some instances cuts him up, after which he restores him to life and knocks out a tooth. Their belief in the power of Thuremlin is undoubted."

The foregoing account, while it applies strictly to one tribe only, may be regarded as typical of the initiation ceremonies performed on young men throughout the tribes of South-Eastern and Central Australia, except that among the Central tribes the practice of knocking out a tooth on these occasions is replaced by the equally mysterious and much severer bodily mutilations of circumcision and subincision, which are not practised by the tribes of the South-East. The instrument whose humming or booming sound accompanies the critical operation of knocking out the tooth of the novice, is the now well-known bull-roarer, which figures in many savage rites of initiation. Its true nature is concealed from the women and uninitiated lads, who are taught to believe that its sonorous and long-drawn notes are the voice of the mythical being, often called Daramulun, who lives in the sky, instituted the rites, and superintends their performance. The hollow roar of the slat of wood, as it is swung round and round, "represents the muttering of thunder, and the thunder is the voice of Daramulun, and therefore its sound is of the most sacred character. Umbara once said to me, 'Thunder is the voice of him (pointing upward to the sky) calling on the rain to fall and make everything grow up new.' " This supposed resemblance of the sound to thunder probably explains a certain use which the Dieri, a tribe of Central Australia, made of the instrument. When a young man had passed through an initiatory rite, which consisted in cutting a row of gashes in his back, he was given a bull-roarer, and when he went out in search of game, he used to twirl the implement in the belief that by doing so, while his wounds were still unhealed, he created a good harvest of snakes, lizards, and other reptiles, which the natives employ as food; but on the contrary they imagined that these supplies of food would be cut off for ever, if a woman were to see a bull-roarer which had been swung at the rites of initiation. No doubt these savages, living in a parched wilderness where the existence of plants and animals depends on rare and irregular showers, have observed that the fall of rain is regularly

followed by a great and sudden increase in the food supply, and that this increase is most marked after violent thunder-storms. Hence by making a noise like thunder with the help of bull-roarers they probably hope, on the principle of imitative magic, to bring on a thunder-storm and with it a fertilizing deluge of rain.

For the same reason in the parched and torrid regions of Arizona and New Mexico the Indians make great use of the bull-roarer in their ceremonies for procuring rain. For example, when Captain Bourke was at the Pueblo Indian village of Walpi in the month of August, 1881, he saw the instrument in use at the snake dance. "The medicine-men twirled it rapidly, and with a uniform motion, about the head and from front to rear, and succeeded in faithfully imitating the sound of a gust of rain-laden wind. As explained to me by one of the medicine-men, by making this sound they compelled the wind and rain to come to the aid of the crops. At a later date I found it in use among the Apache, and for the same purpose." The Zuñi Indians of New Mexico whirl bull-roarers "to create enthusiasm" among the mythical beings who are supposed to cause rain, or for the purpose of making them gather in the air over the village. In a Zuñi rain-making ceremony, while one medicine-man whirls a bull-roarer, another whips up a mixture of water and meal into frothy suds symbolic of clouds, and a third plays a flute. "All this is an invocation to the gods for rain—the one great and perpetual prayer of the people of this arid land." This supposed connexion of the instrument with thunder-storms explains why the Navajos of the same torrid country say that the bull-roarer should always be made of wood from a pine-tree that has been struck by lightning; and why the Bakairi of Brazil call the unpretentious instrument by a name that means "thunder and lightning." The resemblance of the sound of the bull-roarer to the roaring of the wind is doubtless the reason why in the Torres Straits Islands wizards whirled bull-roarers in order to make the wind to blow, and why, when Caffres wish for calm weather, they forbid boys to play with bull-roarers, because they think that the booming noise attracts a gale of wind. Hence, as an instrument whose sound resembles the rumbling of thunder, the roar of wind, and the patter of rain, the bull-roarer is naturally swung by agricultural savages as a powerful means of promoting the growth of the crops. In the island of Kiwai, off the mouth of the Fly River in British New Guinea, bull-roarers are whirled in order to ensure a good crop of yams, sweet potatoes, and bananas. Similarly the Yabim of German New Guinea imagine that by twirling bull-roarers while they mention the names of the dead they produce a fine crop of taro.

But why among the Dieri of Central Australia should the power of attracting rain and so ensuring a supply of food be specially attributed to a young man whose back has just been scored and whose wounds are still raw? Perhaps the reason may be that the blood dripping from the gashes is thought to resemble rain and therefore to be endowed with a magical potency of drawing showers from the clouds. The conjecture is confirmed by the observation that the Dieri actually do bleed themselves avowedly for the purpose of making rain, and they are not the only people in Australia and elsewhere who have resorted to this singular mode of putting an end to a drought. Altogether the foregoing evidence seems to hint that the whole virtue of the bull-roarer resides, as its English name implies, in its voice, and that its original significance was simply that of a magical instrument for causing thunder, wind, and rain. When these natural phenomena came to be personified as spirits, the sound of the bull-roarer was naturally interpreted as their voice.

Among the tribes on the Brisbane River in Queensland the weird sound of the bull-roarers swung at initiation was believed by the women and children to be made by the wizards in swallowing the boys and bringing them up again as young men. The Ualaroi of the Upper Darling River said that the boy met a ghost, who killed him and brought him to life again as a young man. Among the natives on the Lower Lachlan and Murray Rivers it was Thrumalun

(Daramulun) who was thought to slay and resuscitate the novices. In the Arunta tribe of Central Australia, at the moment when the lads are being circumcised, the bull-roarer sounds in the darkness all round the ceremonial ground; and the awestruck women, listening in the distance, believe that it is the voice of a spirit called Twanyirika, who lives in wild and inaccessible regions and only comes out when a youth is initiated. They think that the spirit enters the body of the lad after the operation of circumcision has been performed and carries him away into the bush, keeping him there till his wound is healed. While the newly circumcised youth is out in the wilds, carefully secluded from the sight of the women and children, he constantly sounds the bull-roarer. When he has recovered from the wound, the spirit leaves him and he returns to camp an initiated, or rather partially initiated, man. He has learned, at all events, the secret of Twanyirika; for no sooner is he circumcised than an elder brother comes up to him, and placing in his hands a bundle of sacred sticks or stones (*churinga*), says, "Here is Twanyirika, of whom you have heard so much. They are *churinga* and will help you to heal quickly; guard them well, or else you and your mothers and sisters will be killed."

In this account nothing is said about killing the lad and bringing him to life again; but a belief in the death and resurrection of the novices at initiation is expressly affirmed to be part of the feminine creed in other tribes of Central Australia. Thus in the Unmatjera tribe both women and children believe that Twanyirika kills the youth and afterwards brings him to life again during the period of initiation. The rites of initiation in this tribe, as in the other Central tribes, comprise the operations of circumcision and subincision; and as soon as the second of these has been performed on him, the young man receives from his father a sacred stick (*churinga*), with which, he is told, his spirit was associated in the remotest past. While he is out in the bush recovering from his wounds, he must swing the bull-roarer, or a being who lives up in the sky will swoop down and carry him off. In the Urabunna tribe of Central Australia a lad at initiation receives a bull-roarer, the very name of which (*chimbali*) is never heard by women and children. They are taught to believe that the sound of it is the voice of a spirit called Witurna, who takes the boy away, cuts out all his bowels, provides him with a new set, and brings him back an initiated youth. The lad is warned that on no account may he allow a woman or a child to see the sacred stick, else he and his mother and sisters will fall down as dead as stones. In the Binbinga tribe, on the western coast of the Gulf of Carpentaria, the women and children believe that the noise of the bull-roarer at initiation is made by a spirit named Katajalina, who lives in an ant-hill and comes out and eats up the boy, afterwards restoring him to life. Similarly among their neighbours the Anula the women imagine that the droning sound of the bull-roarer is produced by a spirit called Gnabaia, who swallows the lads at initiation and afterwards disgorges them in the form of initiated men. In this tribe, after a lad has been subincised as well as circumcised, he is presented with a bull-roarer and informed that the instrument was originally made by the whirlwind, that it is sacred or tabooed, and that it may on no account be shewn to women or children.

Among the tribes settled on the southern coast of New South Wales, of which the Coast Murring tribe may be regarded as typical, the drama of resurrection from the dead was exhibited in a graphic form to the novices at initiation. Before they were privileged to witness this edifying spectacle they had been raised to the dignity of manhood by an old man, who promoted them to their new status by the simple process of knocking a tooth out of the mouth of each with the help of a wooden chisel and hammer. The ceremony of the resurrection has been described for us in detail by an eye-witness, the late Dr. A. W. Howitt, one of the best authorities on the customs of the Australian aborigines. The scene selected for the sacred drama was the bottom of a deep valley, where a sluggish stream wound through a bed of tall sharp-edged sedge. Though the hour was between ten and eleven o'clock in the morning, the

sun had but just peeped over the mountains which enclosed the valley like a wall on the east; and while the upper slopes, clothed with a forest of tall rowan trees, looked warm and bright in sunshine, which shot between the grey stems and under the light feathery foliage of the trees, all the bottom of the dell was still in deep shadow and dank with the moisture of the night's rain. While the novices rested and warmed themselves at a crackling fire, the initiated men laid their heads together, prepared a stock of decorations made of stringy bark, and dug a grave. There was some discussion as to the shape of the grave, but the man who was to be buried in it decided the question by declaring that he would be laid in it on his back at full length. He was a man of the eagle-hawk totem and belonged to the tribal subdivision called Yibai. So while two men under his directions were digging the grave with sticks in the friable granitic soil, he superintended the costume of the other actors in the drama. Sheets of bark were beaten out into fleeces of stringy fibre, and in these garments six performers were clothed from head to foot so that not even a glimpse could be obtained of their faces. Four of them were tied together by a cord which was fastened to the back of their heads, and each of them carried two pieces of bark in his hands. The other two walked free, but hobbled along bent double and supporting their tottery steps on staves to mark the weight of years; for they played the part of two medicine-men of venerable age and great magical power. By this time the grave was ready, and the eagle-hawk man stretched himself in it at full length on a bed of leaves, his head resting on a rolled-up blanket, just as if he were a corpse. In his two hands, crossed on his chest, he held the stem of a young tree (*Persoonia linearis*), which had been pulled up by the roots and now stood planted on his chest, so that the top of it rose several feet above the level of the ground. A light covering of dried sticks filled the grave, and dead leaves, tufts of grass, and small plants were artistically arranged over them so as to complete the illusion. All being now ready, the novices were led by their sisters' husbands to the grave and placed in a row beside it, while a singer, perched on the trunk of a fallen tree at the head of the grave, crooned a melancholy ditty, the song of Yibai. Though the words of the song consisted merely of a monotonous repetition of the words *Burrin-burrin Yibai*, that is, Stringy-bark Yibai, they were understood to refer to the eagle-hawk totem, as well as to the tribal subdivision of the buried man. Then to the slow, plaintive but well-marked air of the song the actors began to move forward, winding among the trees, logs, and rocks. On came the four disguised men, stepping in time to the music, swaying from side to side, and clashing their bark clappers together at every step, while beside them hobbled the two old men keeping a little aloof to mark their superior dignity. They represented a party of medicine-men, guided by two reverend seniors, who had come on pilgrimage to the grave of a brother medicine-man, him of the eagle-hawk totem, who lay buried here in the lonely valley, now illumined by the warm rays of the sun; for by this time the morning was wearing on to noon. When the little procession, chanting an invocation to Daramulun, had defiled from among the rocks and trees into the open, it drew up on the side of the grave opposite to the novices, the two old men taking up a position in the rear of the dancers. For some time the dance and song went on till the tree that seemed to grow from the grave began to quiver. "Look there!" cried the sisters' husbands to the novices, pointing to the trembling leaves. As they looked, the tree quivered more and more, then was violently agitated and fell to the ground, while amid the excited dancing of the dancers and the chanting of the tuneful choir the supposed dead man spurned from him the superincumbent mass of sticks and leaves, and springing to his feet danced his magic dance in the grave itself, and exhibited in his mouth the magic substances which he was supposed to have received from Daramulun in person.

In some tribes of Central and Northern Australia the initiation of a medicine-man into the mysteries of his craft is supposed to be accomplished by certain spirits, who kill him, cut out his internal organs, and having provided him with a new set bring him to life again. Sometimes the spirits kindly replace the man's human organs by their own spiritual organs;

sometimes along with the new organs they insert magical stones in his body or even a serpent, and the stones or the serpents naturally endow the new wizards with marvellous powers. In some tribes the initiation takes place in a cave, where the spirits dwell. After the man has been restored to life with a new heart, a new pair of lungs, and so forth, he returns to his people in a more or less dazed condition, which his friends may at first mistake for insanity, though afterwards they recognize its true character as inspiration. One eminent medical practitioner in the Unmatjera tribe assured Messrs. Spencer and Gillen that when he came to himself after the operation, which in his case was performed by an aged doctor, he had completely forgotten who he was and all about his past life. After a time his venerable friend led him back to the camp and shewed it to him, and said, "That woman there is your wife," for she had gone clean out of his head. We shall see presently that this temporary oblivion, a natural effect of the shock to the nervous system produced by resuscitation from the dead, is characteristic of novices under similar circumstances in other lands. Among the Arunta of Alice Springs the cave where the mystic initiation takes place is a limestone cavern in a range of hills which rises to the north of the wide level expanse known as the Emily plain. None of the ordinary natives would dare to set foot in the awful grotto, which they believe to extend for miles into the bowels of the earth and to be tenanted by certain ancestral spirits, who live there in perpetual sunshine and amid streams of running water, an earthly paradise by contrast with the arid sun-scorched steppes and barren mountains outside. White men have explored the cave, and if they perceived no spirits, they found bats in plenty. The man who aspires to the rank of a wizard lies down at the mouth of the cave and falls asleep; and as he sleeps one of the ancestral spirits steals up to him and drives an invisible spear through his neck from back to front. The point of the spear comes out through the man's tongue, leaving a hole through which you could put your little finger, and this hole the man retains for the rest of his natural life, or at least so long as he retains his magical powers; for if the hole should close up, these spiritual gifts and graces would depart from him. A second thrust from the invisible spear transfixes the man's head from ear to ear; he drops down dead, and is immediately transported into the depths of the cavern, where the spirits dissect his dead body, extract the old viscera, and replace them with a new set in the manner already described.

In this account of the manner in which medicine-men obtain their magical powers not only are the supposed death and resurrection of the novice worthy of attention, but also the exchange of internal organs which in the Binbinga and Mara tribes is supposed to be effected between the man and the spirit; for this exchange resembles that which, on the theory I have suggested, may be thought to take place between a lad and his totem at the ceremonies of initiation which mark the momentous transition from boyhood to manhood. Further, the bodily mutilation which is the visible sign of the medicine-man's initiation (for however the hole may be made it certainly exists in the tongues of regular Arunta practitioners) corresponds to the bodily mutilations of other sorts, which in many savage tribes attest to the world that the mutilated persons are fullgrown men. What the precise meaning of such mutilations may be, still remains very obscure; but they seem in some cases to be directly associated with the conception of death and resurrection.

This association certainly comes out plainly in the rites of initiation through which in some parts of New Guinea all lads must pass before they attain to the status of adults. The rites are observed by a group of tribes who occupy contiguous territories about Finsch Harbour and Huon Gulf in German New Guinea. The tribes in question are the Yabim, the Bukaua, the Kai, and the Tami. All of them except the Kai belong to the Melanesian stock and are therefore presumably immigrants from the adjoining islands; but the Kai, who inhabit the rugged, densely wooded, and rainy mountains inland from Finsch Harbour, belong to the

aboriginal Papuan stock and differ from their neighbours in speech as well as in appearance. Yet the rites of initiation which all these tribes celebrate and the beliefs which they associate with them are so similar that a single description will apply accurately enough to them all. All of them, like many Australian tribes, require every male member of the tribe to be circumcised before he ranks as a full-grown man; and the tribal initiation, of which circumcision is the central feature, is conceived by them, as by some Australian tribes, as a process of being swallowed and disgorged by a mythical monster, whose voice is heard in the humming sound of the bull-roarer. Indeed the New Guinea tribes not only impress this belief on the minds of women and children, but enact it in a dramatic form at the actual rites of initiation, at which no woman or uninitiated person may be present. For this purpose a hut about a hundred feet long is erected either in the village or in a lonely part of the forest. It is modelled in the shape of the mythical monster; at the end which represents his head it is high, and it tapers away at the other end. A betel-palm, grubbed up with the roots, stands for the backbone of the great being and its clustering fibres for his hair; and to complete the resemblance the butt end of the building is adorned by a native artist with a pair of goggle eyes and a gaping mouth. When after a tearful parting from their mothers and women folk, who believe or pretend to believe in the monster that swallows their dear ones, the awe-struck novices are brought face to face with this imposing structure, the huge creature emits a sullen growl, which is in fact no other than the humming note of bull-roarers swung by men concealed in the monster's belly. The actual process of deglutition is variously enacted. Among the Tami it is represented by causing the candidates to defile past a row of men who hold bull-roarers over their heads; among the Kai it is more graphically set forth by making them pass under a scaffold on which stands a man, who makes a gesture of swallowing and takes in fact a gulp of water as each trembling novice passes beneath him. But the present of a pig, opportunely offered for the redemption of the youth, induces the monster to relent and disgorge his victim; the man who represents the monster accepts the gift vicariously, a gurgling sound is heard, and the water which had just been swallowed descends in a jet on the novice. This signifies that the young man has been released from the monster's belly. However, he has now to undergo the more painful and dangerous operation of circumcision. It follows immediately, and the cut made by the knife of the operator is explained to be a bite or scratch which the monster inflicted on the novice in spewing him out of his capacious maw. While the operation is proceeding, a prodigious noise is made by the swinging of bull-roarers to represent the roar of the dreadful being who is in the act of swallowing the young men.

When, as sometimes happens, a lad dies from the effect of the operation, he is buried secretly in the forest, and his sorrowing mother is told that the monster has a pig's stomach as well as a human stomach, and that unfortunately her son slipped into the wrong stomach, from which it was impossible to extricate him. After they have been circumcised the lads must remain for some months in seclusion, shunning all contact with women and even the sight of them. They live in the long hut which represents the monster's belly; among the Yabim they beguile the tedium of this enforced leisure by weaving baskets and playing on certain sacred flutes, which are never used except on these occasions. The instruments are of two patterns. One is called the male and the other the female; and they are believed to be married to each other. No woman may see these mysterious flutes; if she did, she would die. When the long seclusion is over, the lads, now ranking as initiated men, are brought back with great pomp and ceremony to the village, where they are received with sobs and tears of joy by the women, as if the grave had given up its dead. At first the young men keep their eyes rigidly closed or even sealed with a plaster of chalk, and they appear not to understand the words of command which are given them by an elder. Gradually, however, they come to themselves as

if awaking from a stupor, and next day they bathe and wash off the crust of white chalk with which their bodies had been coated.

It is highly significant that all these tribes of New Guinea apply the same word to the bull-roarer and to the monster, who is supposed to swallow the novices at circumcision, and whose fearful roar is represented by the hum of the harmless wooden instruments. The word in the speech of the Yabim and Bukaua is *balum*; in that of the Kai it is *ngosa*; and in that of the Tami it is *kani*. Further, it deserves to be noted that in three languages out of the four the same word which is applied to the bull-roarer and to the monster means also a ghost or spirit of the dead, while in the fourth language (the Kai) it signifies "grandfather." From this it seems to follow that the being who swallows and disgorges the novices at initiation is believed to be a powerful ghost or ancestral spirit, and that the bull-roarer, which bears his name, is his material representative. That would explain the jealous secrecy with which the sacred implement is kept from the sight of women. While they are not in use, the bull-roarers are stowed away in the men's club-houses, which no woman may enter; indeed no woman or uninitiated person may set eyes on a bull-roarer under pain of death. Similarly among the Tugeri or Kaya-Kaya, a large Papuan tribe on the south coast of Dutch New Guinea, the name of the bull-roarer, which they call *sosom*, is given to a mythical giant, who is supposed to appear every year with the south-east monsoon. When he comes, a festival is held in his honour and bull-roarers are swung. Boys are presented to the giant, and he kills them, but considerately brings them to life again.

In certain districts of Viti Levu, the largest of the Fijian Islands, the drama of death and resurrection used to be acted with much solemnity before the eyes of young men at initiation. The ceremonies were performed in certain sacred precincts of oblong shape, enclosed by low walls or rows of stones but open to the sky. Such a precinct was called a *Nanga*, and it might be described as a temple dedicated to the worship of ancestors; for in it sacrifices and prayers were offered to the ancestral spirits. For example, the first-fruits of the yam harvest were regularly presented with great ceremony to the souls of the dead in the temple before the bulk of the crop was dug for the people's use, and no man might taste of the new yams until this solemn offering had been made. The yams so offered were piled up in the sacred enclosure and left to rot there; if any man were so bold as to eat of these dedicated fruits, it was believed that he would go mad. Any initiated man had the right of approaching the ancestral spirits at any time in their holy place, where he would pray to them for help and protection and propitiate them by laying down his offering of a pig, or yams, or eels, or cloth, or what not. Of these offerings perhaps the most curious was that of the foreskins of young men, who were circumcised as a sort of vicarious sacrifice or atonement for the recovery of a sick relative, it might be either their father or one of their father's brothers. The bloody foreskins, stuck in the cleft of a split reed, were presented to the ancestral gods in the temple by the chief priest, who prayed for the sick man's recovery. The temple or sacred enclosure was divided into two or three compartments by cross walls of stones, and the inmost of these compartments was the *Nanga-tambu-tambu*, or Holy of Holies.

In these open-air temples of the dead the ceremony of initiating young men was performed as a rule every year at the end of October or the beginning of November, which was the commencement of the Fijian New Year; hence the novices who were initiated at that season went by the name of *Vilavou* or New Year's Men. The exact time for celebrating the rite was determined by the flowering of the *ndrala* tree (*Erythrina*); but it roughly coincided with the New Year of the Tahitians and Hawaiians, who dated the commencement of the year by observation of the Pleiades. The highlanders of Fiji, who alone celebrated these rites, did not trouble their heads about the stars. As a preparation for the solemnity the heads of the novices were shaved and their beards, if they had any, were carefully eradicated. On four successive

days they went in procession to the temple and there deposited in the Holy of Holies their offerings of cloth and weapons to the ancestral spirits. But on the fifth and great day of the festival, when they again entered the sacred ground, they beheld a sight which froze their souls with horror. Stretched on the ground was a row of dead or seemingly dead and murdered men, their bodies cut open and covered with blood, their entrails protruding. At the further end sat the High Priest, regarding them with a stony glare, and to reach him the trembling novices had to crawl on hands and knees over the ghastly blood-bedabbled corpses that lay between. Having done so they drew up in a line before him. Suddenly he blurted out a piercing yell, at which the counterfeit dead men started to their feet and ran down to the river to cleanse themselves from the blood and guts of pigs with which they were beslobbered. The High Priest now unbent his starched dignity, and skipping from side to side cried in stridulous tones, "Where are the people of my enclosure? Are they gone to Tonga Levu? Are they gone to the deep sea?" He was soon answered by a deep-mouthed chant, and back from the river marched the dead men come to life, clean, fresh, and garlanded, swaying their bodies in time to the music of their solemn hymn. They took their places in front of the novices and a religious silence ensued. Such was the drama of death and resurrection. It was immediately followed by a sacramental meal. Four old men of the highest order of initiates now entered the Holy of Holies. The first bore a cooked yam carefully wrapt up in leaves so that no part of it should touch the hands of the bearer: the second carried a piece of baked pork similarly enveloped: the third held a drinking-cup full of water and wrapt round with native cloth; and the fourth bore a napkin of the same stuff. The first elder passed along the row of novices putting the end of the yam into each of their mouths, and as he did so each of them nibbled a morsel of the sacred food: the second elder did the same with the hallowed pork: the third elder followed with the holy water, with which each novice merely wetted his lips; and the fourth elder wiped all their mouths with his napkin. Then the high priest or one of the elders addressed the young men, warning them solemnly against the sacrilege of betraying to the profane vulgar any of the high mysteries which they had witnessed, and threatening all such traitors with the vengeance of the gods. The general intention of the initiatory rites seems to have been to introduce the young men to the worshipful spirits of the dead at their temple, and to cement the bond between them by a sacramental meal.

The people of Rook, an island between New Guinea and New Britain, hold festivals at which one or two disguised men, their heads covered with wooden masks, go dancing through the village, followed by all the other men. They demand that the circumcised boys who have not yet been swallowed by Marsaba (the devil) shall be given up to them. The boys, trembling and shrieking, are delivered to them, and must creep between the legs of the disguised men. Then the procession moves through the village again, and announces that Marsaba has eaten up the boys, and will not disgorge them till he receives a present of pigs, taro, and so forth. So all the villagers, according to their means, contribute provisions, which are then consumed in the name of Marsaba. In New Britain all males are members of an association called the Duk-duk. The boys are admitted to it very young, but are not fully initiated till their fourteenth year, when they receive from the Tubuvan or Tubuan a terrible blow with a cane, which is supposed to kill them. The Tubuan and the Duk-duk are two disguised men who represent cassowaries. They dance with a short hopping step in imitation of the cassowary. Each of them wears a huge hat like an extinguisher, woven of grass or palm-fibres; it is six feet high, and descends to the wearer's shoulders, completely concealing his head and face. From the neck to the knees the man's body is hidden by a crinoline made of the leaves of a certain tree fastened on hoops, one above the other. The Tubuan is regarded as a female, the Duk-duk as a male. The former is supposed to breed and give birth to the novices, who are accordingly looked upon as newly born. The female masks are very plain compared with the male masks. Two of them are regularly kept from year to year in order that they may annually

breed new Duk-duks. When they are wanted for this purpose they are brought forth, decorated afresh, and provided with new leaf dresses to match. According to one account, women and children may not look upon one of these disguised men or they would die. So strong is this superstition among them that they will run away and hide as soon as they hear him coming, for they are aware of his approach through a peculiar shrieking noise he utters as he goes along. In the district of Berara, where red is the Duk-duk colour, the mere sight of a red cloth is enough to make the women take to their heels. The common herd are not allowed to know who the masker is. If he stumbles and his hat falls to the ground, disclosing his face, or his crinoline is torn to tatters by the bushes, his attendants immediately surround him to hide his person from the vulgar eye. According to one writer, indeed, the performer who drops his mask, or lets it fall so that the sharp point at the top sticks in the ground, is put to death. The institution of the Duk-duk is common to the neighbouring islands of New Ireland and the Duke of York.

Among the Galelareese and Tobelorese of Halmahera, an island to the west of New Guinea, boys go through a form of initiation, part of which seems to consist in a pretence of begetting them anew. When a number of boys have reached the proper age, their parents agree to celebrate the ceremony at their common expense, and they invite others to be present at it. A shed is erected, and two long tables are placed in it, with benches to match, one for the men and one for the women. When all the preparations have been made for a feast, a great many skins of the rayfish, and some pieces of a wood which imparts a red colour to water, are taken to the shed. A priest or elder causes a vessel to be placed in the sight of all the people, and then begins, with significant gestures, to rub a piece of the wood with the ray-skin. The powder so produced is put in the vessel, and at the same time the name of one of the boys is called out. The same proceeding is repeated for each boy. Then the vessels are filled with water, after which the feast begins. At the third cock-crow the priest smears the faces and bodies of the boys with the red water, which represents the blood shed at the perforation of the *hymen*. Towards daybreak the boys are taken to the wood, and must hide behind the largest trees. The men, armed with sword and shield, accompany them, dancing and singing. The priest knocks thrice on each of the trees behind which a boy is hiding. All day the boys stay in the wood, exposing themselves to the heat of the sun as much as possible. In the evening they bathe and return to the shed, where the women supply them with food.

In the west of Ceram boys at puberty are admitted to the Kakian association. Modern writers have commonly regarded this association as primarily a political league instituted to resist foreign domination. In reality its objects are purely religious and social, though it is possible that the priests may have occasionally used their powerful influence for political ends. The society is in fact merely one of those widely-diffused primitive institutions, of which a chief object is the initiation of young men. In recent years the true nature of the association has been duly recognized by the distinguished Dutch ethnologist, J. G. F. Riedel. The Kakian house is an oblong wooden shed, situated under the darkest trees in the depth of the forest, and is built to admit so little light that it is impossible to see what goes on in it. Every village has such a house. Thither the boys who are to be initiated are conducted blindfold, followed by their parents and relations. Each boy is led by the hand by two men, who act as his sponsors or guardians, looking after him during the period of initiation. When all are assembled before the shed, the high priest calls aloud upon the devils. Immediately a hideous uproar is heard to proceed from the shed. It is made by men with bamboo trumpets, who have been secretly introduced into the building by a back door, but the women and children think it is made by the devils, and are much terrified. Then the priests enter the shed, followed by the boys, one at a time. As soon as each boy has disappeared within the precincts, a dull chopping sound is heard, a fearful cry rings out, and a sword or spear, dripping with blood, is

thrust through the roof of the shed. This is a token that the boy's head has been cut off, and that the devil has carried him away to the other world, there to regenerate and transform him. So at sight of the bloody sword the mothers weep and wail, crying that the devil has murdered their children. In some places, it would seem, the boys are pushed through an opening made in the shape of a crocodile's jaws or a cassowary's beak, and it is then said that the devil has swallowed them. The boys remain in the shed for five or nine days. Sitting in the dark, they hear the blast of the bamboo trumpets, and from time to time the sound of musket shots and the clash of swords. Every day they bathe, and their faces and bodies are smeared with a yellow dye, to give them the appearance of having been swallowed by the devil. During his stay in the Kakian house each boy has one or two crosses tattooed with thorns on his breast or arm. When they are not sleeping, the lads must sit in a crouching posture without moving a muscle. As they sit in a row cross-legged, with their hands stretched out, the chief takes his trumpet, and placing the mouth of it on the hands of each lad, speaks through it in strange tones, imitating the voice of the spirits. He warns the lads, under pain of death, to observe the rules of the Kakian society, and never to reveal what has passed in the Kakian house. The novices are also told by the priests to behave well to their blood relations, and are taught the traditions and secrets of the tribe.

Meantime the mothers and sisters of the lads have gone home to weep and mourn. But in a day or two the men who acted as guardians or sponsors to the novices return to the village with the glad tidings that the devil, at the intercession of the priests, has restored the lads to life. The men who bring this news come in a fainting state and daubed with mud, like messengers freshly arrived from the nether world. Before leaving the Kakian house, each lad receives from the priest a stick adorned at both ends with cock's or cassowary's feathers. The sticks are supposed to have been given to the lads by the devil at the time when he restored them to life, and they serve as a token that the youths have been in the spirit land. When they return to their homes they totter in their walk, and enter the house backward, as if they had forgotten how to walk properly; or they enter the house by the back door. If a plate of food is given to them, they hold it upside down. They remain dumb, indicating their wants by signs only. All this is to shew that they are still under the influence of the devil or the spirits. Their sponsors have to teach them all the common acts of life, as if they were new-born children. Further, upon leaving the Kakian house the boys are strictly forbidden to eat of certain fruits until the next celebration of the rites has taken place. And for twenty or thirty days their hair may not be combed by their mothers or sisters. At the end of that time the high priest takes them to a lonely place in the forest, and cuts off a lock of hair from the crown of each of their heads. After these initiatory rites the lads are deemed men, and may marry; it would be a scandal if they married before.

In the region of the Lower Congo a simulation of death and resurrection is, or rather used to be, practised by the members of a guild or secret society called *ndembo*. The society had nothing to do with puberty or circumcision, though the custom of circumcision is common in the country. Young people and adults of both sexes might join the guild; after initiation they were called "the Knowing Ones" (*nganga*). To found a branch of the society it was necessary to have an albino, who, whether a child, lad, or adult, was the acknowledged head of the society. The ostensible reason for starting a branch of the guild in a district was commonly an epidemic of sickness, "and the idea was to go into *ndembo* to die, and after an indefinite period, from a few months to two or three years, to be resurrected with a new body not liable to the sickness then troubling the countryside. Another reason for starting a *ndembo* was a dearth of children in a district. It was believed that good luck in having children would attend those who entered or died *ndembo*. But the underlying idea was the same, *i.e.* to get a 'new body' that would be healthy and perform its functions properly." The quarters of the society

were always a stockaded enclosure in a great thick forest; a gate of planks painted yellow and red gave access to it, and within there was an assemblage of huts. The place was fenced to keep intruders from prying into the mysteries of the guild, and it was near water. Uninitiated persons might walk on the public roads through the forest, but if they were caught in bye-paths or hunting in the woods, they were flogged, fined, and sometimes killed. They might not even look upon the persons of those who had "died *ndembo*"; hence when these sanctified persons were roving about the forest or going to the river, the booming notes of a drum warned the profane vulgar to keep out of their way.

When the stockade and the huts in the forest were ready to receive all who wished to put off the old man or woman and to put on the new, one of the initiates gave the sign and the aspirant after the higher life dropped down like dead in some public place, it might be the market or the centre of the town where there were plenty of people to witness the edifying spectacle. The initiates immediately spread a pall over him or her, beat the earth round about the pretended corpse with plantain stalks, chanted incantations, fired guns, and cut capers. Then they carried the seemingly dead body away into the forest and disappeared with it into the stockade. The spectacle proved infectious; one after another in the emotional, excitable crowd of negroes followed the example, dropped down like dead, and were carried off, sometimes in a real cataleptic state. In this way fifty to a hundred or more novices might feign death and be transported into the sacred enclosure. There they were supposed not only to die but to rot till only a single bone of their body remained, of which the initiated had to take the greatest care in expectation of the joyful resurrection that was soon to follow. However, though they were both dead and rotten, they consumed a large quantity of food, which their credulous relatives brought to them in baskets, toiling with the loads on their backs over the long paths through the forest in the sweltering heat of the tropical day. If the relations failed to discharge this pious and indispensable duty, their kinsman in the sacred enclosure ran a risk of dying in good earnest, or rather of being spirited away to a distant town and sold as a slave.

Shut up within the stockade for months or years, the men and women, boys and girls, dispensed with the superfluity of clothes, rubbed their naked bodies with red ochre or powdered camwood instead, and gave themselves up to orgies of unbridled lust. Some feeble attempts were made to teach them the rudiments of a secret language, but the vocabulary was small and its principles lacking in ingenuity. The time during which this seclusion lasted might vary from three months to three years. When the circumstances which had furnished the pretext for instituting the society had passed away, whether it was that the epidemic had died out or that the birth-rate had sensibly increased, murmurs would begin to be heard among friends and relatives in the town, who did not see why they should be taxed any longer to support a set of idle and dissolute ruffians in the forest, and why they should trudge day after day in the sweat of their brow to carry provisions to them. So the supplies would begin to run short, and whenever that happened the mystery of the resurrection was sure to follow very soon after.

Accordingly it would be announced that on a certain market-day the new initiates, now raised from the dead, would reveal themselves in all their glory to the astonished gaze of the public. The glad tidings were received with enthusiasm, and crowds assembled from all the country round about to welcome those who had come back from the world beyond the grave. When all were gathered in eager expectancy in the market-place, the sounds of distant music would be heard, and soon the gay procession would defile into the open square and march round it, while the dusky skins, reddened with camwood powder, glistened in the sunshine, the gay garments fluttered in the wind, and the tassels of palm-leaf fibre dangled at every arm. In the crowd of spectators many parents would recognize their children in the marching figures of

the procession, and girls and boys would point out their brothers and sisters and eagerly call out their names. But in the stolid faces of the initiates not an eye would gleam with recognition, not a muscle would twitch with an involuntary expression of delight; for having just been raised from the dead they were supposed to know nothing of their former life, of friends and relations, of home and country. There might be in the crowd a mother or a sister not seen for years; or, more moving still, the novice might look in vain for loved and remembered faces that would never be seen in the market-place again. But whatever his feelings might be, he must rigidly suppress them under pain of a flogging, a fine, or even death. At last the parade was over and the procession broke up. Then the old hands introduced the new hands to their own parents and brothers and sisters, to their old homes and haunts. For still the novices kept up the pretence that everything was new and strange to them, that they could not speak their mother tongue, that they did not know their own fathers and mothers, their own town and their own houses; nay that they had forgotten even how to eat their food. So everything and everybody had to be shewn to them and their names and meanings explained. Their guides would lead them about the town, pointing out the various roads and telling where they led to—this one to the watering-place on the river, this to the forest, that to the farms, and so on: they would take up the commonest domestic utensils and shew what they were used for: they would even chew the food and put it into the mouths of the novices, like mother birds feeding their callow young. For some time afterwards the resuscitated persons, attended by their mentors, would go about the town and the neighbourhood acting in a strange way like children or mad folk, seizing what they wanted and trying to beat or even kill such as dared to refuse them anything. Their guardian would generally restrain these sallies; but sometimes he would arrange with his hopeful pupils to be out of sight when two or three of them clubbed together to assault and rob an honest man, and would only return in time to share the booty. After a while, however, the excitement created by the resurrection would wear off; the dead folk come to life were expected to have learned their lessons, and if they forgot themselves, their memory was promptly refreshed by the law.

The following account of the rites, as practised in this part of Africa, was given to Adolf Bastian by an interpreter. "The great fetish lives in the interior of the forest-land, where nobody sees him and nobody can see him. When he dies, the fetish priests carefully collect his bones in order to bring them to life again, and they nourish them, that he may be clothed anew in flesh and blood. But it is not good to speak of it. In the land of Ambamba every one must die once, and when the fetish priest shakes his calabash against a village, all the men and lads whose hour is come fall into a state of lifeless torpidity, from which they generally arise after three days. But if the fetish loves a man he carries him away into the bush and buries him in the fetish house, often for many years. When he comes to life again, he begins to eat and drink as before, but his understanding is gone and the fetish man must teach him and direct him in every motion, like the smallest child. At first this can only be done with a stick, but gradually his senses return, so that it is possible to talk with him, and when his education is complete, the priest brings him back to his parents. They would seldom recognize their son but for the express assurances of the fetish priest, who moreover recalls previous events to their memory. He who has not gone through the ceremony of the new birth in Ambamba is universally looked down upon and is not admitted to the dances."

In the same part of Africa we hear of a fetish called Malassi, the votaries of which form a secret order of the usual sort with a variety of ranks to which the initiates are promoted. "The candidate is plunged into a magic sleep within the temple-hut, and while he sleeps he beholds a bird or other object with which his existence is henceforth sympathetically bound up, just as the life of the young Indian is bound up with the animal which he sees in his dream at puberty. All who have been born again at initiation, after their return to a normal state, bear

the name of Swamie (a sacred designation also in India) or, if they are women, Sumbo (Tembo), and wear as a token the ring called *sase*, which consists of an iron hoop with a fruit attached to it." Similarly among the Fans of the Gaboon a young warrior acquires his guardian spirit by dreaming. He is secluded in the forest, drinks a fermented and intoxicating liquor, and smokes hemp. Then he falls into a heavy sleep, and next morning he must describe exactly to the fetish priest the animal, tree, mineral, or whatever it may have been which he saw in his dream. This magical dream is repeated on three successive nights; and after that the young man is sent forth by the priest to seek and bring back the beast, bird, reptile, or whatever it was of which he dreamed. The youth obeys, reduces the animal or thing to cinders or ashes, and preserves these calcined remains as a talisman which will protect him against many dangers. However, in these rites there is no clear simulation of dying and coming to life again.

Rites of death and resurrection were formerly observed in Quoja, on the west coast of Africa, to the north of the Congo. They are thus described by an old writer:—"They have another ceremony which they call Belli-Paaro, but it is not for everybody. For it is an incorporation in the assembly of the spirits, and confers the right of entering their groves, that is to say, of going and eating the offerings which the simple folk bring thither. The initiation or admission to the Belli-Paaro is celebrated every twenty or twenty-five years. The initiated recount marvels of the ceremony, saying that they are roasted, that they entirely change their habits and life, and that they receive a spirit quite different from that of other people and quite new lights. The badge of membership consists in some lines traced on the neck between the shoulders; the lines seem to be pricked with a needle. Those who have this mark pass for persons of spirit, and when they have attained a certain age they are allowed a voice in all public assemblies; whereas the uninitiated are regarded as profane, impure, and ignorant persons, who dare not express an opinion on any subject of importance. When the time for the ceremony has come, it is celebrated as follows. By order of the king a place is appointed in the forest, whither they bring the youths who have not been marked, not without much crying and weeping; for it is impressed upon the youths that in order to undergo this change it is necessary to suffer death. So they dispose of their property, as if it were all over with them. There are always some of the initiated beside the novices to instruct them. They teach them to dance a certain dance called *killiing*, and to sing verses in praise of Belli. Above all, they are very careful not to let them die of hunger, because if they did so, it is much to be feared that the spiritual resurrection would profit them nothing. This manner of life lasts five or six years, and is comfortable enough, for there is a village in the forest, and they amuse themselves with hunting and fishing. Other lads are brought thither from time to time, so that the last comers have not long to stay. No woman or uninitiated person is suffered to pass within four or five leagues of the sacred wood. When their instruction is completed, they are taken from the wood and shut up in small huts made for the purpose. Here they begin once more to hold communion with mankind and to talk with the women who bring them their food. It is amusing to see their affected simplicity. They pretend to know no one, and to be ignorant of all the customs of the country, such as the customs of washing themselves, rubbing themselves with oil, and so forth. When they enter these huts, their bodies are all covered with the feathers of birds, and they wear caps of bark which hang down before their faces. But after a time they are dressed in clothes and taken to a great open place, where all the people of the neighbourhood are assembled. Here the novices give the first proof of their capacity by dancing a dance which is called the dance of Belli. After the dance is over, the novices are taken to the houses of their parents by their instructors."

Miss Kingsley informs us that "the great point of agreement between all these West African secret societies lies in the methods of initiation. The boy, if he belongs to a tribe that goes in

for tattooing, is tattooed, and is handed over to instructors in the societies' secrets and formulae. He lives, with the other boys of his tribe undergoing initiation, usually under the rule of several instructors, and for the space of one year. He lives always in the forest, and is naked and smeared with clay. The boys are exercised so as to become inured to hardship; in some districts, they make raids so as to perfect themselves in this useful accomplishment. They always take a new name, and are supposed by the initiation process to become new beings in the magic wood, and on their return to their village at the end of their course, they pretend to have entirely forgotten their life before they entered the wood; but this pretence is not kept up beyond the period of festivities given to welcome them home. They all learn, to a certain extent, a new language, a secret language only understood by the initiated. The same removal from home and instruction from initiated members is observed also with the girls. However, in their case, it is not always a forest-grove they are secluded in, sometimes it is done in huts. Among the Grain Coast tribes, however, the girls go into a magic wood until they are married. Should they have to leave the wood for any temporary reason, they must smear themselves with white clay. A similar custom holds good in Okyon, Calabar district, where, should a girl have to leave the fattening-house, she must be covered with white clay.”

Among the natives of the Sherbro, an island lying close to the coast of Sierra Leone, there is a secret society called the *purra* or *poro*, “which is partly of a religious, but chiefly of a political nature. It resembles free-masonry in excluding females, and in obliging every member by a solemn oath, which I believe is seldom violated, not to divulge the sacred mysteries, and to yield a prompt and implicit obedience to every order of their superiors. Boys of seven or eight years of age are admitted, or rather serve a novitiate until they arrive at a proper age; for it is difficult to procure exact information, and even somewhat dangerous to make many inquiries. Every person on entering the society lays aside his former name and assumes a new one; to call him by his old name would produce a dispute. They have a superior or head *purra* man, assisted by a grand council, whose commands are received with the most profound reverence and absolute submission, both by the subordinate councils and by individuals. Their meetings are held in the most retired spots, amid the gloom of night, and carried on with inquisitorial secrecy. When the *purra* comes into a town, which is always at night, it is accompanied with the most dreadful howlings, screams, and other horrid noises. The inhabitants, who are not members of the society, are obliged to secure themselves within doors; should any one be discovered without, or attempting to peep at what is going forward, he would inevitably be put to death. To restrain the curiosity of the females, they are ordered to continue within doors, clapping their hands incessantly, so long as the *purra* remains. Like the secret tribunal, which formerly existed in Germany, it takes cognizance of offences, particularly of witchcraft and murder, but above all of contumacy and disobedience in any of its own members, and punishes the guilty with death in so secret and sudden a manner, that the perpetrators are never known: indeed, such is the dread created by this institution, that they are never even inquired after.” When the members of the *purra* or *poro* society visit a town, the leader of the troop, whom an English writer calls “the Poro devil,” draws discordant notes from a sort of reed flute, the holes of which are covered with spiders' webs. The only time when this devil and his rout make a prolonged stay in the town is on the evening before the day on which the newly initiated lads are to be brought back from the forest. Then the leader and his satellites parade the streets for hours, while all the uninitiated men, women, and children remain shut up in their houses, listening to the doleful strains of the flute, which signify that the devil is suffering the pangs of childbirth before he brings forth the initiated lads; for he is supposed to have been pregnant with them the whole of the rainy season ever since they entered into the forest. When they come forth from the wood, they wear four or five coils of twisted ferns round their waists in token of their being initiated members of the order. Among the Soosos of Senegambia there is a similar secret society called *semo*: “the

natives who speak English call it African masonry. As the whole ceremonies are kept very private, it is difficult to discover in what they consist: but it is said that the novices are met in the woods by the old men, who cut marks on several parts of their bodies, but most commonly on the belly; they are also taught a language peculiar to the *semo*, and swear dreadful oaths never to divulge the secrets revealed to them. The young men are then made to live in the woods for twelve months, and are supposed to be at liberty to kill any one who approaches and does not understand the language of the *semo*.... It is said, when women are so unfortunate as to intrude upon the *semo*, they kill them, cut off their breasts, and hang them up by the side of the paths as a warning to others. This circumstance is perhaps less deserving of credit, because the Soosoos are fond of telling wonderful and horrid stories respecting this institution. They say, for instance, that when first initiated their throats are cut, and they continue dead for some time; at length they are reanimated and initiated into the mysteries of the institution, and are enabled to ramble about with much more vigour than they possessed before.”

While the belief or the pretence of death and resurrection at initiation is common among the negroes of West Africa, few traces of it appear to be found among the tribes in the southern, central, and eastern parts of that continent; and it is notable that in these regions secret societies, which flourish in the West, are also conspicuously absent. However, the Akikuyu of British East Africa “have a curious custom which requires that every boy just before circumcision must be born again. The mother stands up with the boy crouching at her feet; she pretends to go through all the labour pains, and the boy on being reborn cries like a babe and is washed. He lives on milk for some days afterwards.” A fuller description of the ceremony was given by a member of the Kikuyu tribe as follows: “A day is appointed, any time of year, by father and mother. If the father is dead another elder is called in to act as proxy in his stead, or if the mother is not living another woman to act in her place. Any woman thus acting as representative is looked upon in future by the boy as his own mother. A goat or sheep is killed in the afternoon by any one, usually not by the father, and the stomach and intestines reserved. The ceremony begins in the evening. A piece of skin is cut in a circle, and passed over one shoulder of the candidate and under the other arm. The stomach of the goat is similarly treated and passed over the other shoulder and under the other arm. All the boy's ornaments are removed, but not his clothes. No men are allowed inside the hut, but women are present. The mother sits on a hide on the floor with the boy between her knees. The sheep's gut is passed round the woman and brought in front of the boy. The woman groans as in labour, another woman cuts the gut, and the boy imitates the cry of a new-born infant. The women present all applaud, and afterwards the assistant and the mother wash the boy. That night the boy sleeps in the same hut as the mother.” Here the cutting of the sheep's gut, which unites the mother to the boy, is clearly an imitation of severing the navel string. Nor is it boys alone who are born again among the Akikuyu. “Girls go through the rite of second birth as well as boys. It is sometimes administered to infants. At one time the new birth was combined with circumcision, and so the ceremony admitted to the privileges and religious rites of the tribe. Afterwards trouble took place on account of mere boys wishing to take their place alongside of the young men and maintaining they were justified in doing so. The old men then settled the matter by separating the two. Unless the new birth has been administered the individual is not in a position to be admitted to circumcision, which is the outward sign of admittance to the nation. Any who have not gone through the rite cannot inherit property, nor take any part in the religious rites of the country.” For example, a man who has not been born again is disqualified for carrying his dying father out into the wilds and for disposing of his body after death. The new birth seems to take place usually about the tenth year, but the age varies with the ability of the father to provide a goat, whose guts are necessary to enable the boy or girl to be born again in due form.

Among the Bondeis, a tribe on the coast of German East Africa, opposite to the island of Pemba, one of the rites of initiation into manhood consists in a pretence of slaying one of the lads with a sword; the entrails of a fowl are placed on the boy's stomach to make the pretence seem more real. Among the Bushongo, who inhabit a district of the Belgian Congo bounded on the north and east by the Sankuru River and on the west by the Kasai, young boys had formerly to undergo certain rites of initiation, amongst which a simulation of killing them would seem to have had a place, though in recent times the youths have been allowed to escape the ordeal by the payment of a fine. The supreme chief of the tribe, who in old days bore the title of God on Earth (*Chembe Kunji*), used to assemble all the lads who had just reached puberty and send them away into the forest, where they remained for several months under the care of one of his sons. During their seclusion they were deemed unclean and might see no one; if they chanced to meet a woman, she had to flee before them. By night the old men marched round the quarters of the novices, raising hideous cries and whirling bull-roarers, the noise of which the frightened lads took to be the voices of ghosts. They wore nothing but a comb, and passed their leisure hours in learning to make mats and baskets. After about a month they had to submit to the first ordeal. A trench about ten feet deep was dug in the ground and roofed over with sticks and earth so as to form a dark tunnel. In the sides of the tunnel were cut niches, and in each niche a man took post, whose business it was to terrify the novices. For this purpose one of them was disguised in the skin of a leopard, a second was dressed as a warrior with a knife in his hand, a third was a smith with his furnace and red-hot irons, and a fourth was masked to look like an ugly ape, while he too gripped a knife in his hand. The novices generally recoiled in dismay from each of these apparitions, and it was only by means of reiterated taunts and threats that the elders forced them to traverse the whole length of the tunnel. After the lapse of another month the youths had to face another ordeal of a similar character. A low tunnel, about three feet deep, was dug in the earth, and sticks were inserted in it so that their tops projected from the surface of the ground. At the end of the tunnel a calabash was set full of goat's blood. By way of encouraging the timid novices the master of the ceremonies himself crawled through the tunnel, his progress under ground being revealed to the novices above ground by the vibrations of the sticks with which he collided in the dark passage. Then having bedabbled his nose, his mouth, and all the rest of his body with the goat's blood, he emerged from the tunnel on hands and knees, dripping with gore and to all appearance in the last stage of exhaustion. Then he lay prostrate on his stomach in a state of collapse; the elders declared him to be dead and carried him off. The chief now ordered the lads to imitate the example set them by the master of the ceremonies, but they begged and prayed to be excused. At first the chief was inexorable, but in time he relented and agreed to accept a fine of so many cowries as a ransom paid by the youths for exemption from the ordeal. A month later the last of the ordeals took place. A great trunk of a tree was buried with its lower end in the earth and surrounded for three-quarters of its circumference with arrows stuck in the ground so that the barbs were pointed towards the tree. The chief and the leading men sat down at the gap in the circle of arrows, so as to conceal the gap from the eyes of the novices and other spectators, among whom the women were allowed to be present. To the eyes of the uninitiated it now seemed that the tree was surrounded by a bristling hedge of arrows, to fall upon which would be death. All being ready the master of the ceremonies climbed the tree amid breathless silence, and having reached the top, which was decorated with a bunch of leaves, he looked about him and asked the women, "Shall I come down?" "No! no!" they shrieked, "you will be killed by the arrows." Then, turning disdainfully from these craven souls, the gallant man addressed himself to the youths and repeated his question, "Shall I come down?" A shout of "Yes!" gave the answer that might have been expected from these heroic spirits. In response the master of the ceremonies at once slid down the tree and, dropping neatly to the

ground just at the gap in the hedge of arrows, presented himself unscathed to the gaze of the excited assembly. The chief now ordered the young men to go up and do likewise. But the dauntless courage with which they had contemplated the descent of the master of the ceremonies entirely forsook them when it came to their turn to copy his shining example. Their mothers, too, raised a loud cry of protest, joining their prayers and entreaties to those of their hopeful sons. After some discussion the chief consented to accept a ransom, and the novices were dispensed from the ordeal. Then they bathed and were deemed to have rid themselves of their uncleanness, but they had still to work for the chief for three months before they ranked as full-grown men and might return to their villages.

Among the Indians of Virginia, an initiatory ceremony, called *Huskanaw*, took place every sixteen or twenty years, or oftener, as the young men happened to grow up. The youths were kept in solitary confinement in the woods for several months, receiving no food but an infusion of some intoxicating roots, so that they went raving mad, and continued in this state eighteen or twenty days. "Upon this occasion it is pretended that these poor creatures drink so much of the water of Lethe that they perfectly lose the remembrance of all former things, even of their parents, their treasure, and their language. When the doctors find that they have drunk sufficiently of the Wysocan (so they call this mad potion), they gradually restore them to their senses again by lessening the intoxication of their diet; but before they are perfectly well they bring them back into their towns, while they are still wild and crazy through the violence of the medicine. After this they are very fearful of discovering anything of their former remembrance; for if such a thing should happen to any of them, they must immediately be *Huskanaw'd* again; and the second time the usage is so severe that seldom any one escapes with life. Thus they must pretend to have forgot the very use of their tongues, so as not to be able to speak, nor understand anything that is spoken, till they learn it again. Now, whether this be real or counterfeit, I don't know; but certain it is that they will not for some time take notice of anybody nor anything with which they were before acquainted, being still under the guard of their keepers, who constantly wait upon them everywhere till they have learnt all things perfectly over again. Thus they unlive their former lives, and commence men by forgetting that they ever have been boys."

Among some of the Indian tribes of North America there exist certain religious associations which are only open to candidates who have gone through a pretence of being killed and brought to life again. In 1766 or 1767 Captain Jonathan Carver witnessed the admission of a candidate to an association called "the friendly society of the Spirit" (*Wakon-Kitchewah*) among the Naudowessies, a Siouan or Dacotan tribe in the region of the great lakes. The candidate knelt before the chief, who told him that "he himself was now agitated by the same spirit which he should in a few moments communicate to him; that it would strike him dead, but that he would instantly be restored again to life; to this he added, that the communication, however terrifying, was a necessary introduction to the advantages enjoyed by the community into which he was on the point of being admitted. As he spoke this, he appeared to be greatly agitated; till at last his emotions became so violent, that his countenance was distorted, and his whole frame convulsed. At this juncture he threw something that appeared both in shape and colour like a small bean, at the young man, which seemed to enter his mouth, and he instantly fell as motionless as if he had been shot." For a time the man lay like dead, but under a shower of blows he shewed signs of consciousness, and finally, discharging from his mouth the bean, or whatever it was that the chief had thrown at him, he came to life. In other tribes, for example, the Ojebways, Winnebagoes, and Dacotas or Sioux, the instrument by which the candidate is apparently slain is the medicine-bag. The bag is made of the skin of an animal (such as the otter, wild cat, serpent, bear, raccoon, wolf, owl, weasel), of which it roughly preserves the shape. Each member of the society has one of these bags, in

which he keeps the odds and ends that make up his “medicine” or charms. “They believe that from the miscellaneous contents in the belly of the skin bag or animal there issues a spirit or breath, which has the power, not only to knock down and kill a man, but also to set him up and restore him to life.” The mode of killing a man with one of these medicine-bags is to thrust it at him; he falls like dead, but a second thrust of the bag restores him to life. Among the Dacotas the institution of the medicine-bag or mystery-sack was attributed to Onktehi, the great spirit of the waters, who ordained that the bag should consist of the skin of the otter, raccoon, weasel, squirrel, or loon, or a species of fish and of serpents. Further, he decreed that the bag should contain four sorts of medicines of magical qualities, which should represent fowls, quadrupeds, herbs, and trees. Accordingly, swan's down, buffalo hair, grass roots, and bark from the roots of trees are kept by the Dacotas in their medicine-bags. From this combination there proceeds a magical influence (*tonwan*) so powerful that no human being can of his own strength withstand it. When the god of the waters had prepared the first medicine-bag, he tested its powers on four candidates for initiation, who all perished under the shock. So he consulted with his wife, the goddess of the earth, and by holding up his left hand and pattering on the back of it with the right, he produced myriads of little shells, whose virtue is to restore life to those who have been slain by the medicine-bag. Having taken this precaution, the god chose four other candidates and repeated the experiment of initiation with success, for after killing them with the bag he immediately resuscitated them by throwing one of the shells into their vital parts, while he chanted certain words assuring them that it was only sport and bidding them rise to their feet. That is why to this day every initiated Dacota has one of these shells in his body. Such was the divine origin of the medicine-dance of the Dacotas. The initiation takes place in a special tent. The candidate, after being steamed in a vapour-bath for four successive days, plants himself on a pile of blankets, and behind him stands an aged member of the order. “Now the master of the ceremonies, with the joints of his knees and hips considerably bent, advances with an unsteady, uncouth hitching, sack in hand, wearing an aspect of desperate energy, and uttering his ‘Heen, heen, heen’ with frightful emphasis, while all around are enthusiastic demonstrations of all kinds of wild passions. At this point the sack is raised near a painted spot on the breast of the candidate, at which the *tonwan* is discharged. At the instant the brother from behind gives him a push and he falls dead, and is covered with blankets. Now the frenzied dancers gather around, and in the midst of bewildering and indescribable noises, chant the words uttered by the god at the institution of the ceremony, as already recorded. Then the master throws off the covering, and chewing a piece of the bone of the Onktehi, spirts it over him, and he begins to show signs of returning life. Then as the master pats energetically upon the breast of the initiated person, he, convulsed, strangling, struggling, and agonizing, heaves up the shell which falls from his mouth on a sack placed in readiness to receive it. Life is restored and entrance effected into the awful mysteries. He belongs henceforth to the medicine-dance, and has a right to enjoy the medicine-feast.”

A ceremony witnessed by the castaway John R. Jewitt during his captivity among the Indians of Nootka Sound doubtless belongs to this class of customs. The Indian king or chief “discharged a pistol close to his son's ear, who immediately fell down as if killed, upon which all the women of the house set up a most lamentable cry, tearing handfuls of hair from their heads, and exclaiming that the prince was dead; at the same time a great number of the inhabitants rushed into the house armed with their daggers, muskets, etc., enquiring the cause of their outcry. These were immediately followed by two others dressed in wolf skins, with masks over their faces representing the head of that animal. The latter came in on their hands and feet in the manner of a beast, and taking up the prince, carried him off upon their backs, retiring in the same manner they entered.” In another place Jewitt mentions that the young prince—a lad of about eleven years of age—wore a mask in imitation of a wolf's head. Now,

as the Indians of this part of America are divided into totem clans, of which the Wolf clan is one of the principal, and as the members of each clan are in the habit of wearing some portion of the totem animal about their person, it is probable that the prince belonged to the Wolf clan, and that the ceremony described by Jewitt represented the killing of the lad in order that he might be born anew as a wolf, much in the same way that the Basque hunter supposed himself to have been killed and to have come to life again as a bear.

This conjectural explanation of the ceremony has, since it was first put forward, been confirmed by the researches of Dr. Franz Boas among these Indians; though it would seem that the community to which the chief's son thus obtained admission was not so much a totem clan as a secret society called Tlokoala, whose members imitated wolves. The name Tlokoala is a foreign word among the Nootka Indians, having been borrowed by them from the Kwakiutl Indians, in whose language the word means the finding of a *manitoo* or personal totem. The Nootka tradition runs that this secret society was instituted by wolves who took away a chief's son and tried to kill him, but, failing to do so, became his friends, taught him the rites of the society, and ordered him to teach them to his friends on his return home. Then they carried the young man back to his village. They also begged that whenever he moved from one place to another he would kindly leave behind him some red cedar-bark to be used by them in their own ceremonies; and to this custom the Nootka tribes still adhere. Every new member of the society must be initiated by the wolves. At night a pack of wolves, personated by Indians dressed in wolf-skins and wearing wolf-masks, make their appearance, seize the novice, and carry him into the woods. When the wolves are heard outside the village, coming to fetch away the novice, all the members of the society blacken their faces and sing, "Among all the tribes is great excitement, because I am Tlokoala." Next day the wolves bring back the novice dead, and the members of the society have to revive him. The wolves are supposed to have put a magic stone into his body, which must be removed before he can come to life. Till this is done the pretended corpse is left lying outside the house. Two wizards go and remove the stone, which appears to be quartz, and then the novice is resuscitated. Among the Niska Indians of British Columbia, who are divided into four principal clans with the raven, the wolf, the eagle, and the bear for their respective totems, the novice at initiation is always brought back by an artificial totem animal. Thus when a man was about to be initiated into a secret society called Olala, his friends drew their knives and pretended to kill him. In reality they let him slip away, while they cut off the head of a dummy which had been adroitly substituted for him. Then they laid the decapitated dummy down and covered it over, and the women began to mourn and wail. His relations gave a funeral banquet and solemnly burnt the effigy. In short, they held a regular funeral. For a whole year the novice remained absent and was seen by none but members of the secret society. But at the end of that time he came back alive, carried by an artificial animal which represented his totem.

In these ceremonies the essence of the rite appears to be the killing of the novice in his character of a man and his restoration to life in the form of the animal which is thenceforward to be, if not his guardian spirit, at least linked to him in a peculiarly intimate relation. It is to be remembered that the Indians of Guatemala, whose life was bound up with an animal, were supposed to have the power of appearing in the shape of the particular creature with which they were thus sympathetically united. Hence it seems not unreasonable to conjecture that in like manner the Indians of British Columbia may imagine that their life depends on the life of some one of that species of creature to which they assimilate themselves by their costume. At least if that is not an article of belief with the Columbian Indians of the present day, it may very well have been so with their ancestors in the past, and thus may have helped to mould the rites and ceremonies both of the totem clans and of the secret societies. For though these two sorts of communities differ in respect of the mode in which membership of them is

obtained—a man being born into his totem clan but admitted into a secret society later in life—we can hardly doubt that they are near akin and have their root in the same mode of thought. That thought, if I am right, is the possibility of establishing a sympathetic relation with an animal, a spirit, or other mighty being, with whom a man deposits for safe-keeping his soul or some part of it, and from whom he receives in return a gift of magical powers.

The Carrier Indians, who dwell further inland than the tribes we have just been considering, are divided into four clans with the grouse, the beaver, the toad, and the grizzly bear for their totems. But in addition to these clan totems the tribe recognized a considerable number of what Father Morice calls honorific totems, which could be acquired, through the performance of certain rites, by any person who wished to improve his social position. Each totem clan had a certain number of honorific totems or crests, and these might be assumed by any member of the clan who fulfilled the required conditions; but they could not be acquired by members of another clan. Thus the Grouse clan had for its honorific totems or crests the owl, the moose, the weasel, the crane, the wolf, the full moon, the wind, and so on; the Toad clan had the sturgeon, the porcupine, the wolverine, the red-headed woodpecker, the “darding knife,” and so forth; the Beaver clan had the mountain-goat for one of its honorific totems; and the goose was a honorific totem of the Grizzly Bear clan. But the common bear, as a honorific totem or crest, might be assumed by anybody, whatever his clan. The common possession of a honorific totem appears to have constituted the same sort of bond among the Carrier Indians as the membership of a secret society does among the coast tribes of British Columbia; certainly the rites of initiation were similar. This will be clear from Father Morice's account of the performances, which I will subjoin in his own words. “The connection of the individual with his crest appeared more especially during ceremonial dances, when the former, attired, if possible, with the spoils of the latter, was wont to personate it in the gaze of an admiring assemblage. On all such occasions, man and totem were also called by the same name. The adoption of any such 'rite' or crest was usually accompanied by initiatory ceremonies or observances corresponding to the nature of the crest, followed in all cases by a distribution of clothes to all present. Thus whenever anybody resolved upon getting received as *Lulem* or Bear, he would, regardless of the season, divest himself of all his wearing apparel and don a bear-skin, whereupon he would dash into the woods there to remain for the space of three or four days and nights in deference to the wonts of his intended totem animal. Every night a party of his fellow-villagers would sally out in search of the missing ‘bear.’ To their loud calls: *Yi! Kelulem* (Come on, Bear!) he would answer by angry growls in imitation of the bear. The searching party making for the spot where he had been heard, would find by a second call followed by a similar answer that he had dexterously shifted to some opposite quarter in the forest. As a rule, he could not be found, but had to come back of himself, when he was speedily apprehended and conducted to the ceremonial lodge, where he would commence his first bear-dance in conjunction with all the other totem people, each of whom would then personate his own particular totem. Finally would take place the *potlatch* [distribution of property] of the newly initiated ‘bear,’ who would not forget to present his captor with at least a whole dressed skin. The initiation to the ‘Darding Knife’ was quite a theatrical performance. A lance was prepared which had a very sharp point so arranged that the slightest pressure on its tip would cause the steel to gradually sink into the shaft. In the sight of the multitude crowding the lodge, this lance was pressed on the bare chest of the candidate and apparently sunk in his body to the shaft, when he would tumble down simulating death. At the same time a quantity of blood—previously kept in the mouth—would issue from the would-be corpse, making it quite clear to the uninitiated gazers-on that the terrible knife had had its effect, when lo! upon one of the actors striking up one of the chants specially made for the circumstance and richly paid for, the candidate would gradually rise up a new man, the particular *protégé* of the ‘Darding Knife.’ ”

In the former of these two initiatory rites of the Carrier Indians the prominent feature is the transformation of the man into his totem animal; in the latter it is his death and resurrection. But in substance, probably, both are identical. In both the novice dies as a man and revives as his totem, whether that be a bear, a “darding” knife, or what not; in other words, he has deposited his life or some portion of it in his totem, with which accordingly for the future he is more or less completely identified. Hard as it may be for us to conceive why a man should choose to identify himself with a knife, whether “darding” or otherwise, we have to remember that in Celebes it is to a chopping-knife or other iron tool that the soul of a woman in labour is transferred for safety; and the difference between a chopping-knife and a “darding” knife, considered as a receptacle for a human soul, is perhaps not very material. Among the Thompson Indians of British Columbia warriors who had a knife, an arrow, or any other weapon for their personal totem or guardian spirit, enjoyed this signal advantage over their fellows that they were for all practical purposes invulnerable. If an arrow did hit them, which seldom happened, they vomited the blood up, and the hurt soon healed. Hence these arrow-proof warriors rarely wore armour, which would indeed have been superfluous, and they generally took the most dangerous posts in battle. So convinced were the Thompson Indians of the power of their personal totem or guardian spirit to bring them back to life, that some of them killed themselves in the sure hope that the spirit would immediately raise them up from the dead. Others, more prudently, experimented on their friends, shooting them dead and then awaiting more or less cheerfully their joyful resurrection. We are not told that success crowned these experimental demonstrations of the immortality of the soul.

The Toukaway Indians of Texas, one of whose totems is the wolf, have a ceremony in which men, dressed in wolf-skins, run about on all fours, howling and mimicking wolves. At last they scratch up a living tribesman, who has been buried on purpose, and putting a bow and arrows in his hands, bid him do as the wolves do—rob, kill, and murder. The ceremony probably forms part of an initiatory rite like the resurrection from the grave of the old man in the Australian rites.

The simulation of death and resurrection or of a new birth at initiation appears to have lingered on, or at least to have left traces of itself, among peoples who have advanced far beyond the stage of savagery. Thus, after his investiture with the sacred thread—the symbol of his order—a Brahman is called “twice born.” *Manu* says, “According to the injunction of the revealed texts the first birth of an Aryan is from his natural mother, the second happens on the tying of the girdle of *Muñga* grass, and the third on the initiation to the performance to a *Srauta* sacrifice.” A pretence of killing the candidate perhaps formed part of the initiation to the Mithraic mysteries.

Thus, on the theory here suggested, wherever totemism is found, and wherever a pretence is made of killing and bringing to life again the novice at initiation, there may exist or have existed not only a belief in the possibility of permanently depositing the soul in some external object—animal, plant, or what not—but an actual intention of so doing. If the question is put, why do men desire to deposit their life outside their bodies? the answer can only be that, like the giant in the fairy tale, they think it safer to do so than to carry it about with them, just as people deposit their money with a banker rather than carry it on their persons. We have seen that at critical periods the life or soul is sometimes temporarily stowed away in a safe place till the danger is past. But institutions like totemism are not resorted to merely on special occasions of danger; they are systems into which every one, or at least every male, is obliged to be initiated at a certain period of life. Now the period of life at which initiation takes place is regularly puberty; and this fact suggests that the special danger which totemism and systems like it are intended to obviate is supposed not to arise till sexual maturity has been attained, in fact, that the danger apprehended is believed to attend the relation of the sexes to

each other. It would be easy to prove by a long array of facts that the sexual relation is associated in the primitive mind with many serious perils; but the exact nature of the danger apprehended is still obscure. We may hope that a more exact acquaintance with savage modes of thought will in time disclose this central mystery of primitive society, and will thereby furnish the clue, not only to totemism, but to the origin of the marriage system.

XII. The Golden Bough

Thus the view that Balder's life was in the mistletoe is entirely in harmony with primitive modes of thought. It may indeed sound like a contradiction that, if his life was in the mistletoe, he should nevertheless have been killed by a blow from the plant. But when a person's life is conceived as embodied in a particular object, with the existence of which his own existence is inseparably bound up, and the destruction of which involves his own, the object in question may be regarded and spoken of indifferently as his life or his death, as happens in the fairy tales. Hence if a man's death is in an object, it is perfectly natural that he should be killed by a blow from it. In the fairy tales Koshchei the Deathless is killed by a blow from the egg or the stone in which his life or death is secreted; the ogres burst when a certain grain of sand—doubtless containing their life or death—is carried over their heads; the magician dies when the stone in which his life or death is contained is put under his pillow; and the Tartar hero is warned that he may be killed by the golden arrow or golden sword in which his soul has been stowed away.

The idea that the life of the oak was in the mistletoe was probably suggested, as I have said, by the observation that in winter the mistletoe growing on the oak remains green while the oak itself is leafless. But the position of the plant—growing not from the ground but from the trunk or branches of the tree—might confirm this idea. Primitive man might think that, like himself, the oak-spirit had sought to deposit his life in some safe place, and for this purpose had pitched on the mistletoe, which, being in a sense neither on earth nor in heaven, might be supposed to be fairly out of harm's way. In the first chapter we saw that primitive man seeks to preserve the life of his human divinities by keeping them poised between earth and heaven, as the place where they are least likely to be assailed by the dangers that encompass the life of man on earth. We can therefore understand why it has been a rule both of ancient and of modern folk-medicine that the mistletoe should not be allowed to touch the ground; were it to touch the ground, its healing virtue would be gone. This may be a survival of the old superstition that the plant in which the life of the sacred tree was concentrated should not be exposed to the risk incurred by contact with the earth. In an Indian legend, which offers a parallel to the Balder myth, Indra swore to the demon Namuci that he would slay him neither by day nor by night, neither with staff nor with bow, neither with the palm of the hand nor with the fist, neither with the wet nor with the dry. But he killed him in the morning twilight by sprinkling over him the foam of the sea. The foam of the sea is just such an object as a savage might choose to put his life in, because it occupies that sort of intermediate or nondescript position between earth and sky or sea and sky in which primitive man sees safety. It is therefore not surprising that the foam of the river should be the totem of a clan in India.

Again, the view that the mistletoe owes its mystic character partly to its not growing on the ground is confirmed by a parallel superstition about the mountain-ash or rowan-tree. In Jutland a rowan that is found growing out of the top of another tree is esteemed “exceedingly effective against witchcraft: since it does not grow on the ground witches have no power over it; if it is to have its full effect it must be cut on Ascension Day.” Hence it is placed over doors to prevent the ingress of witches. In Sweden and Norway, also, magical properties are ascribed to a “flying-rowan” (*flögrönn*), that is to a rowan which is found growing not in the ordinary fashion on the ground but on another tree, or on a roof, or in a cleft of the rock, where it has sprouted from seed scattered by birds. They say that a man who is out in the dark should have a bit of “flying-rowan” with him to chew; else he runs a risk of being bewitched

and of being unable to stir from the spot. A Norwegian story relates how once on a time a Troll so bewitched some men who were ploughing in a field that they could not drive a straight furrow; only one of the ploughmen was able to resist the enchantment because by good luck his plough was made out of a "flying-rowan." In Sweden, too, the "flying-rowan" is used to make the divining rod, which discovers hidden treasures. This useful art has nowadays unfortunately been almost forgotten, but three hundred years ago it was in full bloom, as we gather from the following contemporary account. "If in the woods or elsewhere, on old walls or on high mountains or rocks you perceive a rowan-tree (*runn*) which has sprung from a seed that a bird has dropped from its bill, you must either knock or break off that rod or tree in the twilight between the third day and the night after Ladyday. But you must take care that neither iron nor steel touches it and that in carrying it home you do not let it fall on the ground. Then place it under the roof on a spot under which you have laid various metals, and you will soon be surprised to see how that rod under the roof gradually bends in the direction of the metals. When your rod has sat there in the same spot for fourteen days or more, you take a knife or an awl, which has been stroked with a magnet, and with it you slit the bark on all sides, and pour or drop the blood of a cock (best of all the blood from the comb of a cock which is all of one colour) on the said slits in the bark; and when the blood has dried, the rod is ready and will give public proof of the efficacy of its marvellous properties." Just as in Scandinavia the parasitic rowan is deemed a countercharm to sorcery, so in Germany the parasitic mistletoe is still commonly considered a protection against witchcraft, and in Sweden, as we saw, the mistletoe which is gathered on Midsummer Eve is attached to the ceiling of the house, the horse's stall or the cow's crib, in the belief that this renders the Troll powerless to injure man or beast.

The view that the mistletoe was not merely the instrument of Balder's death, but that it contained his life, is countenanced by the analogy of a Scottish superstition. Tradition ran that the fate of the Hays of Errol, an estate in Perthshire, near the Firth of Tay, was bound up with the mistletoe that grew on a certain great oak. A member of the Hay family has recorded the old belief as follows: "Among the low country families the badges are now almost generally forgotten; but it appears by an ancient MS. and the tradition of a few old people in Perthshire, that the badge of the Hays was the mistletoe. There was formerly in the neighbourhood of Errol, and not far from the Falcon stone, a vast oak of an unknown age, and upon which grew a profusion of the plant: many charms and legends were considered to be connected with the tree, and the duration of the family of Hay was said to be united with its existence. It was believed that a sprig of the mistletoe cut by a Hay on Allhallowmas eve, with a new dirk, and after surrounding the tree three times sunwise, and pronouncing a certain spell, was a sure charm against all glamour or witchery, and an infallible guard in the day of battle. A spray gathered in the same manner was placed in the cradle of infants, and thought to defend them from being changed for elf-bairns by the fairies. Finally, it was affirmed, that when the root of the oak had perished, 'the grass should grow in the hearth of Errol, and a raven should sit in the falcon's nest.' The two most unlucky deeds which could be done by one of the name of Hay were, to kill a white falcon, and to cut down a limb from the oak of Errol. When the old tree was destroyed I could never learn. The estate has been some time sold out of the family of Hay, and of course it is said that the fatal oak was cut down a short time before." The old superstition is recorded in verses which are traditionally ascribed to Thomas the Rhymer:—

*"While the mistletoe bats on Errol's aik,
And that aik stands fast,
The Hays shall flourish, and their good grey hawk
Shall nocht flinch before the blast.
But when the root of the aik decays,*

*And the mistletoe dwines on its withered breast,
The grass shall grow on Errol's hearthstane,
And the corbie roup in the falcon's nest."*

The idea that the fate of a family, as distinct from the lives of its members, is bound up with a particular plant or tree, is no doubt comparatively modern. The older view may have been that the lives of all the Hays were in this particular mistletoe, just as in the Indian story the lives of all the ogres are in a lemon; to break a twig of the mistletoe would then have been to kill one of the Hays. Similarly in the island of Rum, whose bold mountains the voyager from Oban to Skye observes to seaward, it was thought that if one of the family of Lachlin shot a deer on the mountain of Finchra, he would die suddenly or contract a distemper which would soon prove fatal. Probably the life of the Lachlins was bound up with the deer on Finchra, as the life of the Hays was bound up with the mistletoe on Errol's oak, and the life of the Dalhousie family with the Edgewell Tree.

It is not a new opinion that the Golden Bough was the mistletoe. True, Virgil does not identify but only compares it with mistletoe. But this may be only a poetical device to cast a mystic glamour over the humble plant. Or, more probably, his description was based on a popular superstition that at certain times the mistletoe blazed out into a supernatural golden glory. The poet tells how two doves, guiding Aeneas to the gloomy vale in whose depth grew the Golden Bough, alighted upon a tree, "whence shone a flickering gleam of gold. As in the woods in winter cold the mistletoe—a plant not native to its tree—is green with fresh leaves and twines its yellow berries about the boles; such seemed upon the shady holm-oak the leafy gold, so rustled in the gentle breeze the golden leaf." Here Virgil definitely describes the Golden Bough as growing on a holm-oak, and compares it with the mistletoe. The inference is almost inevitable that the Golden Bough was nothing but the mistletoe seen through the haze of poetry or of popular superstition.

Now grounds have been shewn for believing that the priest of the Arician grove—the King of the Wood—personified the tree on which grew the Golden Bough. Hence if that tree was the oak, the King of the Wood must have been a personification of the oak-spirit. It is, therefore, easy to understand why, before he could be slain, it was necessary to break the Golden Bough. As an oak-spirit, his life or death was in the mistletoe on the oak, and so long as the mistletoe remained intact, he, like Balder, could not die. To slay him, therefore, it was necessary to break the mistletoe, and probably, as in the case of Balder, to throw it at him. And to complete the parallel, it is only necessary to suppose that the King of the Wood was formerly burned, dead or alive, at the midsummer fire festival which, as we have seen, was annually celebrated in the Arician grove. The perpetual fire which burned in the grove, like the perpetual fire which burned in the temple of Vesta at Rome and under the oak at Romove, was probably fed with the sacred oak-wood; and thus it would be in a great fire of oak that the King of the Wood formerly met his end. At a later time, as I have suggested, his annual tenure of office was lengthened or shortened, as the case might be, by the rule which allowed him to live so long as he could prove his divine right by the strong hand. But he only escaped the fire to fall by the sword.

Thus it seems that at a remote age in the heart of Italy, beside the sweet Lake of Nemi, the same fiery tragedy was annually enacted which Italian merchants and soldiers were afterwards to witness among their rude kindred, the Celts of Gaul, and which, if the Roman eagles had ever swooped on Norway, might have been found repeated with little difference among the barbarous Aryans of the North. The rite was probably an essential feature in the ancient Aryan worship of the oak.

It only remains to ask, Why was the mistletoe called the Golden Bough? The whitish-yellow of the mistletoe berries is hardly enough to account for the name, for Virgil says that the bough was altogether golden, stem as well as leaves. Perhaps the name may be derived from the rich golden yellow which a bough of mistletoe assumes when it has been cut and kept for some months; the bright tint is not confined to the leaves, but spreads to the stalks as well, so that the whole branch appears to be indeed a Golden Bough. Breton peasants hang up great bunches of mistletoe in front of their cottages, and in the month of June these bunches are conspicuous for the bright golden tinge of their foliage. In some parts of Brittany, especially about Morbihan, branches of mistletoe are hung over the doors of stables and byres to protect the horses and cattle, probably against witchcraft.

The yellow colour of the withered bough may partly explain why the mistletoe has been sometimes supposed to possess the property of disclosing treasures in the earth; for on the principles of homoeopathic magic there is a natural affinity between a yellow bough and yellow gold. This suggestion is confirmed by the analogy of the marvellous properties popularly ascribed to the mythical fern-seed or fern-bloom. We saw that fern-seed is popularly supposed to bloom like gold or fire on Midsummer Eve. Thus in Bohemia it is said that "on St. John's Day fern-seed blooms with golden blossoms that gleam like fire." Now it is a property of this mythical fern-seed that whoever has it, or will ascend a mountain holding it in his hand on Midsummer Eve, will discover a vein of gold or will see the treasures of the earth shining with a bluish flame. In Russia they say that if you succeed in catching the wondrous bloom of the fern at midnight on Midsummer Eve, you have only to throw it up into the air, and it will fall like a star on the very spot where a treasure lies hidden. In Brittany treasure-seekers gather fern-seed at midnight on Midsummer Eve, and keep it till Palm Sunday of the following year; then they strew the seed on ground where they think a treasure is concealed. Tyrolese peasants imagine that hidden treasures can be seen glowing like flame on Midsummer Eve, and that fern-seed, gathered at this mystic season, with the usual precautions, will help to bring the buried gold to the surface. In the Swiss canton of Freiburg people used to watch beside a fern on St. John's night in the hope of winning a treasure, which the devil himself sometimes brought to them. In Bohemia they say that he who procures the golden bloom of the fern at this season has thereby the key to all hidden treasures; and that if maidens will spread a cloth under the fast-fading bloom, red gold will drop into it. And in the Tyrol and Bohemia if you place fern-seed among money, the money will never decrease, however much of it you spend. Sometimes the fern-seed is supposed to bloom on Christmas night, and whoever catches it will become very rich. In Styria they say that by gathering fern-seed on Christmas night you can force the devil to bring you a bag of money. In Swabia likewise you can, by taking the proper precautions, compel Satan himself to fetch you a packet of fern-seed on Christmas night. But for four weeks previously, and during the whole of the Advent season, you must be very careful never to pray, never to go to church, and never to use holy water; you must busy yourself all day long with devilish thoughts, and cherish an ardent wish that the devil would help you to get money. Thus prepared you take your stand, between eleven and twelve on Christmas night, at the meeting of two roads, over both of which corpses have been carried to the churchyard. Here many people meet you, some of them dead and buried long ago, it may be your parents or grandparents, or old friends and acquaintances, and they stop and greet you, and ask, "What are you doing here?" And tiny little goblins hop and dance about and try to make you laugh. But if you smile or utter a single word, the devil will tear you to shreds and tatters on the spot. If, however, you stand glum and silent and solemn, there will come, after all the ghostly train has passed by, a man dressed as a hunter, and that is the devil. He will hand you a paper cornet full of fern-seed, which you must keep and carry about with you as long as you live. It will give you the power of doing as much work at your trade in a day as twenty or thirty

ordinary men could do in the same time. So you will grow very rich. But few people have the courage to go through with the ordeal. The people of Rotenburg tell of a weaver of their town, who lived some two hundred and fifty years ago and performed prodigies of weaving by a simple application of fern-seed which he had been so fortunate as to obtain, no doubt from the devil, though that is not expressly alleged by tradition. Rich in the possession of this treasure, the lazy rascal worked only on Saturdays and spent all the rest of the week playing and drinking; yet in one day he wove far more cloth than any other skilled weaver who sat at his loom from morning to night every day of the week. Naturally he kept his own counsel, and nobody might ever have known how he did it, if it had not been for what, humanly speaking, you might call an accident, though for my part I cannot but regard it as the manifest finger of Providence. One day—it was the octave of a festival—the fellow had woven a web no less than a hundred ells long, and his mistress resolved to deliver it to her customer the same evening. So she put the cloth in a basket and away she trudged with it. Her way led her past a church, and as she passed the sacred edifice, she heard the tinkle of the holy bell which announced the elevation of the Host. Being a good woman she put her basket down, knelt beside it, and there, with the shadows gathering round her, committed herself to the care of God and his good angels and received, along with the kneeling congregation in the lighted church, the evening benediction, which kept her and them from all the perils and dangers of the night. Then rising refreshed she took up her basket. But what was her astonishment on looking into it to find the whole web reduced to a heap of yarn! The blessed words of the priest at the altar had undone the cursed spell of the Enemy of Mankind.

Thus, on the principle of like by like, fern-seed is supposed to discover gold because it is itself golden; and for a similar reason it enriches its possessor with an unfailing supply of gold. But while the fern-seed is described as golden, it is equally described as glowing and fiery. Hence, when we consider that two great days for gathering the fabulous seed are Midsummer Eve and Christmas—that is, the two solstices (for Christmas is nothing but an old heathen celebration of the winter solstice)—we are led to regard the fiery aspect of the fern-seed as primary, and its golden aspect as secondary and derivative. Fern-seed, in fact, would seem to be an emanation of the sun's fire at the two turning-points of its course, the summer and winter solstices. This view is confirmed by a German story in which a hunter is said to have procured fern-seed by shooting at the sun on Midsummer Day at noon; three drops of blood fell down, which he caught in a white cloth, and these blood-drops were the fern-seed. Here the blood is clearly the blood of the sun, from which the fern-seed is thus directly derived. Thus it may be taken as probable that fern-seed is golden, because it is believed to be an emanation of the sun's golden fire.

Now, like fern-seed, the mistletoe is gathered either at Midsummer or Christmas—that is, at the summer and winter solstices—and, like fern-seed, it is supposed to possess the power of revealing treasures in the earth. On Midsummer Eve people in Sweden make divining-rods of mistletoe, or of four different kinds of wood one of which must be mistletoe. The treasure-seeker places the rod on the ground after sun-down, and when it rests directly over treasure, the rod begins to move as if it were alive. Now, if the mistletoe discovers gold, it must be in its character of the Golden Bough; and if it is gathered at the solstices, must not the Golden Bough, like the golden fern-seed, be an emanation of the sun's fire? The question cannot be answered with a simple affirmative. We have seen that the old Aryans perhaps kindled the solstitial and other ceremonial fires in part as sun-charms, that is, with the intention of supplying the sun with fresh fire; and as these fires were usually made by the friction or combustion of oak-wood, it may have appeared to the ancient Aryan that the sun was periodically recruited from the fire which resided in the sacred oak. In other words, the oak may have seemed to him the original storehouse or reservoir of the fire which was from time

to time drawn out to feed the sun. But if the life of the oak was conceived to be in the mistletoe, the mistletoe must on that view have contained the seed or germ of the fire which was elicited by friction from the wood of the oak. Thus, instead of saying that the mistletoe was an emanation of the sun's fire, it might be more correct to say that the sun's fire was regarded as an emanation of the mistletoe. No wonder, then, that the mistletoe shone with a golden splendour, and was called the Golden Bough. Probably, however, like fern-seed, it was thought to assume its golden aspect only at those stated times, especially midsummer, when fire was drawn from the oak to light up the sun. At Pulverbatch, in Shropshire, it was believed within living memory that the oak-tree blooms on Midsummer Eve and the blossom withers before daylight. A maiden who wishes to know her lot in marriage should spread a white cloth under the tree at night, and in the morning she will find a little dust, which is all that remains of the flower. She should place the pinch of dust under her pillow, and then her future husband will appear to her in her dreams. This fleeting bloom of the oak, if I am right, was probably the mistletoe in its character of the Golden Bough. The conjecture is confirmed by the observation that in Wales a real sprig of mistletoe gathered on Midsummer Eve is similarly placed under the pillow to induce prophetic dreams; and further the mode of catching the imaginary bloom of the oak in a white cloth is exactly that which was employed by the Druids to catch the real mistletoe when it dropped from the bough of the oak, severed by the golden sickle. As Shropshire borders on Wales, the belief that the oak blooms on Midsummer Eve may be Welsh in its immediate origin, though probably the belief is a fragment of the primitive Aryan creed. In some parts of Italy, as we saw, peasants still go out on Midsummer morning to search the oak-trees for the "oil of St. John," which, like the mistletoe, heals all wounds, and is, perhaps, the mistletoe itself in its glorified aspect. Thus it is easy to understand how a title like the Golden Bough, so little descriptive of its usual appearance on the tree, should have been applied to the seemingly insignificant parasite. Further, we can perhaps see why in antiquity mistletoe was believed to possess the remarkable property of extinguishing fire, and why in Sweden it is still kept in houses as a safeguard against conflagration. Its fiery nature marks it out, on homoeopathic principles, as the best possible cure or preventive of injury by fire.

These considerations may partially explain why Virgil makes Aeneas carry a glorified bough of mistletoe with him on his descent into the gloomy subterranean world. The poet describes how at the very gates of hell there stretched a vast and gloomy wood, and how the hero, following the flight of two doves that lured him on, wandered into the depths of the immemorial forest till he saw afar off through the shadows of the trees the flickering light of the Golden Bough illuminating the matted boughs overhead. If the mistletoe, as a yellow withered bough in the sad autumn woods, was conceived to contain the seed of fire, what better companion could a forlorn wanderer in the nether shades take with him than a bough that would be a lamp to his feet as well as a rod and staff to his hands? Armed with it he might boldly confront the dreadful spectres that would cross his path on his adventurous journey. Hence when Aeneas, emerging from the forest, comes to the banks of Styx, winding slow with sluggish stream through the infernal marsh, and the surly ferryman refuses him passage in his boat, he has but to draw the Golden Bough from his bosom and hold it up, and straightway the blusterer quails at the sight and meekly receives the hero into his crazy bark, which sinks deep in the water under the unusual weight of the living man. Even in recent times, as we have seen, mistletoe has been deemed a protection against witches and trolls, and the ancients may well have credited it with the same magical virtue. And if the parasite can, as some of our peasants believe, open all locks, why should it not have served as an "open Sesame" in the hands of Aeneas to unlock the gates of death? There is some reason to suppose that when Orpheus in like manner descended alive to hell to rescue the soul of his dead wife Eurydice from the shades, he carried with him a willow bough to serve as a

passport on his journey to and from the land of the dead; for in the great frescoes representing the nether world, with which the master hand of Polygnotus adorned the walls of a loggia at Delphi, Orpheus was depicted sitting pensively under a willow, holding his lyre, now silent and useless, in his left hand, while with his right he grasped the drooping boughs of the tree. If the willow in the picture had indeed the significance which an ingenious scholar has attributed to it, the painter meant to represent the dead musician dreaming wistfully of the time when the willow had carried him safe back across the Stygian ferry to that bright world of love and music which he was now to see no more. Again, on an ancient sarcophagus, which exhibits in sculptured relief the parting of Adonis from Aphrodite, the hapless youth, reclining in the lap of his leman, holds a branch, which has been taken to signify that he, too, by the help of the mystic bough, might yet be brought back from the gates of death to life and love.

Now, too, we can conjecture why Virbius at Nemi came to be confounded with the sun. If Virbius was, as I have tried to shew, a tree-spirit, he must have been the spirit of the oak on which grew the Golden Bough; for tradition represented him as the first of the Kings of the Wood. As an oak-spirit he must have been supposed periodically to rekindle the sun's fire, and might therefore easily be confounded with the sun itself. Similarly we can explain why Balder, an oak-spirit, was described as "so fair of face and so shining that a light went forth from him," and why he should have been so often taken to be the sun. And in general we may say that in primitive society, when the only known way of making fire is by the friction of wood, the savage must necessarily conceive of fire as a property stored away, like sap or juice, in trees, from which he has laboriously to extract it. The Senal Indians of California "profess to believe that the whole world was once a globe of fire, whence that element passed up into the trees, and now comes out whenever two pieces of wood are rubbed together." Similarly the Maidu Indians of California hold that "the earth was primarily a globe of molten matter, and from that the principle of fire ascended through the roots into the trunk and branches of trees, whence the Indians can extract it by means of their drill." In Namuluk, one of the Caroline Islands, they say that the art of making fire was taught men by the gods. Olofaet, the cunning master of flames, gave fire to the bird *mwi* and bade him carry it to earth in his bill. So the bird flew from tree to tree and stored away the slumbering force of the fire in the wood, from which men can elicit it by friction. In the ancient Vedic hymns of India the fire-god Agni "is spoken of as born in wood, as the embryo of plants, or as distributed in plants. He is also said to have entered into all plants or to strive after them. When he is called the embryo of trees or of trees as well as plants, there may be a side-glance at the fire produced in forests by the friction of the boughs of trees." In some Australian languages the words for wood and fire are said to be the same.

A tree which has been struck by lightning is naturally regarded by the savage as charged with a double or triple portion of fire; for has he not seen the mighty flash enter into the trunk with his own eyes? Hence perhaps we may explain some of the many superstitious beliefs concerning trees that have been struck by lightning. Thus in the opinion of the Cherokee Indians "mysterious properties attach to the wood of a tree which has been struck by lightning, especially when the tree itself still lives, and such wood enters largely into the secret compounds of the conjurers. An ordinary person of the laity will not touch it, for fear of having cracks come upon his hands and feet, nor is it burned for fuel, for fear that lye made from the ashes will cause consumption. In preparing ballplayers for the contest, the medicine-man sometimes burns splinters of it to coal, which he gives to the players to paint themselves with, in order that they may be able to strike their opponents with all the force of a thunderbolt. Bark or wood from a tree struck by lightning, but still green, is beaten up and put into the water in which seeds are soaked before planting, to insure a good crop, but, on

the other hand, any lightning-struck wood thrown into the field will cause the crop to wither, and it is believed to have a bad effect even to go into the field immediately after having been near such a tree." Apparently the Cherokees imagine that when wood struck by lightning is soaked in water the fierce heat of the slumbering fire in its veins is tempered to a genial warmth, which promotes the growth of the crops; but that when the force of the fire has not been thus diluted it blasts the growing corn. When the Thompson Indians of British Columbia wished to set fire to the houses of their enemies, they shot at them arrows which were either made from a tree that had been struck by lightning or had splinters of such wood attached to them. They seem to have thought that wood struck by lightning was so charged with fire that it would ignite whatever it struck, the mere concussion sufficing to explode it like gunpowder. Yet curiously enough these Indians supposed that if they burned the wood of trees that had been struck by lightning, the weather would immediately turn cold. Perhaps they conceived such trees as reservoirs of heat, and imagined that by using them up they would exhaust the supply and thus lower the temperature of the atmosphere. Wendish peasants of Saxony similarly refuse to burn in their stoves the wood of trees that have been struck by lightning; but the reason they give for their refusal is different. They say that with such fuel the house would be burnt down. No doubt they think that the electric flash, inherent in the wood, would send such a roaring flame up the chimney that nothing could stand before it. In like manner the Thonga of South Africa will not use such wood as fuel nor warm themselves at a fire which has been kindled with it; but what danger they apprehend from the wood we are not told. On the contrary, when lightning sets fire to a tree, the Winamwanga of Northern Rhodesia put out all the fires in the village and plaster the fireplaces afresh, while the head men convey the lightning-kindled fire to the chief, who prays over it. The chief then sends out the new fire to all his villages, and the villagers reward his messengers for the boon. This shews that they look upon fire kindled by lightning with reverence, and the reverence is intelligible, for they speak of thunder and lightning as God himself coming down to earth. Similarly the Maidu Indians of California believe that a Great Man created the world and all its inhabitants, and that lightning is nothing but the Great Man himself descending swiftly out of heaven and rending the trees with his flaming arm.

It is a plausible theory that the reverence which the ancient peoples of Europe paid to the oak, and the connexion which they traced between the tree and their sky-god, were derived from the much greater frequency with which the oak appears to be struck by lightning than any other tree of our European forests. Some remarkable statistics have been adduced in support of this view by Mr. W. Warde Fowler. Observations, annually made in the forests of Lippe-Detmold for seventeen years, yielded the result that while the woods were mainly stocked with beech and only to a small extent with oak and Scotch pine, yet far more oaks and Scotch pines were struck by lightning than beeches, the number of stricken Scotch pines exceeding the number of stricken beeches in the proportion of thirty-seven to one, and the number of stricken oaks exceeding the number of stricken beeches in the proportion of no less than sixty to one. Similar results have been obtained from observations made in French and Bavarian forests. In short, it would seem from statistics compiled by scientific observers, who have no mythological theories to maintain, that the oak suffers from the stroke of lightning far oftener than any other forest tree in Europe. However we may explain it, whether by the easier passage of electricity through oakwood than through any other timber, or in some other way, the fact itself may well have attracted the notice of our rude forefathers, who dwelt in the vast forests which then covered a large part of Europe; and they might naturally account for it in their simple religious way by supposing that the great sky-god, whom they worshipped and whose awful voice they heard in the roll of thunder, loved the oak above all the trees of the wood and often descended into it from the murky cloud in a flash of lightning, leaving a token of his presence or of his passage in the riven and blackened trunk and the blasted

foliage. Such trees would thenceforth be encircled by a nimbus of glory as the visible seats of the thundering sky-god. Certain it is that, like some savages, both Greeks and Romans identified their great god of the sky and of the oak with the lightning flash which struck the ground; and they regularly enclosed such a stricken spot and treated it thereafter as sacred. It is not rash to suppose that the ancestors of the Celts and Germans in the forests of Central Europe paid a like respect for like reasons to a blasted oak.

This explanation of the Aryan reverence for the oak and of the association of the tree with the great god of the thunder and the sky, was suggested or implied long ago by Jacob Grimm, and has been of late powerfully reinforced by Mr. W. Warde Fowler. It appears to be simpler and more probable than the explanation which I formerly adopted, namely, that the oak was worshipped primarily for the many benefits which our rude forefathers derived from the tree, particularly for the fire which they drew by friction from its wood; and that the connexion of the oak with the sky was an after-thought based on the belief that the flash of lightning was nothing but the spark which the sky-god up aloft elicited by rubbing two pieces of oak wood against each other, just as his savage worshipper kindled fire in the forest on earth. On that theory the god of the thunder and the sky was derived from the original god of the oak; on the present theory, which I now prefer, the god of the sky and the thunder was the great original deity of our Aryan ancestors, and his association with the oak was merely an inference based on the frequency with which the oak was seen to be struck by lightning. If the Aryans, as some think, roamed the wide steppes of Russia or Central Asia with their flocks and herds before they plunged into the gloom of the European forests, they may have worshipped the god of the blue or cloudy firmament and the flashing thunderbolt long before they thought of associating him with the blasted oaks in their new home.

Perhaps the new theory has the further advantage of throwing light on the special sanctity ascribed to mistletoe which grows on an oak. The mere rarity of such a growth on an oak hardly suffices to explain the extent and the persistence of the superstition. A hint of its real origin is possibly furnished by the statement of Pliny that the Druids worshipped the plant because they believed it to have fallen from heaven and to be a token that the tree on which it grew was chosen by the god himself. Can they have thought that the mistletoe dropped on the oak in a flash of lightning? The conjecture is confirmed by the name *thunder-besom* which is applied to mistletoe in the Swiss canton of Aargau, for the epithet clearly implies a close connexion between the parasite and the thunder; indeed "*thunder-besom*" is a popular name in Germany for any bushy nest-like excrescence growing on a branch, because such a parasitic growth is actually believed by the ignorant to be a product of lightning. If there is any truth in this conjecture, the real reason why the Druids worshipped a mistletoe-bearing oak above all other trees of the forest was a belief that every such oak had not only been struck by lightning but bore among its branches a visible emanation of the celestial fire; so that in cutting the mistletoe with mystic rites they were securing for themselves all the magical properties of a thunderbolt. If that was so, we must apparently conclude that the mistletoe was deemed an emanation of the lightning rather than, as I have thus far argued, of the midsummer sun. Perhaps, indeed, we might combine the two seemingly divergent views by supposing that in the old Aryan creed the mistletoe descended from the sun on Midsummer Day in a flash of lightning. But such a combination is artificial and unsupported, so far as I know, by any positive evidence. Whether on mythical principles the two interpretations can really be reconciled with each other or not, I will not presume to say; but even should they prove to be discrepant, the inconsistency need not have prevented our rude forefathers from embracing both of them at the same time with an equal fervour of conviction; for like the great majority of mankind the savage is above being hidebound by the trammels of a pedantic logic. In attempting to track his devious thought through the jungle of

crass ignorance and blind fear, we must always remember that we are treading enchanted ground, and must beware of taking for solid realities the cloudy shapes that cross our path or hover and gibber at us through the gloom. We can never completely replace ourselves at the standpoint of primitive man, see things with his eyes, and feel our hearts beat with the emotions that stirred his. All our theories concerning him and his ways must therefore fall far short of certainty; the utmost we can aspire to in such matters is a reasonable degree of probability.

To conclude these enquiries we may say that if Balder was indeed, as I have conjectured, a personification of a mistletoe-bearing oak, his death by a blow of the mistletoe might on the new theory be explained as a death by a stroke of lightning. So long as the mistletoe, in which the flame of the lightning smouldered, was suffered to remain among the boughs, so long no harm could befall the good and kindly god of the oak, who kept his life stowed away for safety between earth and heaven in the mysterious parasite; but when once that seat of his life, or of his death, was torn from the branch and hurled at the trunk, the tree fell—the god died—smitten by a thunderbolt.

And what we have said of Balder in the oak forests of Scandinavia may perhaps, with all due diffidence in a question so obscure and uncertain, be applied to the priest of Diana, the King of the Wood, at Aricia in the oak forests of Italy. He may have personated in flesh and blood the great Italian god of the sky, Jupiter, who had kindly come down from heaven in the lightning flash to dwell among men in the mistletoe—the thunder-besom—the Golden Bough—growing on the sacred oak beside the still waters of the lake of Nemi. If that was so, we need not wonder that the priest guarded with drawn sword the mystic bough which contained the god's life and his own. The goddess whom he served and married was herself, if I am right, no other than the Queen of Heaven, the true wife of the sky-god. For she, too, loved the solitude of the woods and the lonely hills, and sailing overhead on clear nights in the likeness of the silver moon she looked down with pleasure on her own fair image reflected on the calm, the burnished surface of the lake, Diana's Mirror.

XIII. Farewell to Nemi

We are at the end of our enquiry, but as often happens in the search after truth, if we have answered one question, we have raised many more; if we have followed one track home, we have had to pass by others that opened off it and led, or seemed to lead, to far other goals than the sacred grove at Nemi. Some of these paths we have followed a little way; others, if fortune should be kind, the writer and the reader may one day pursue together. For the present we have journeyed far enough together, and it is time to part. Yet before we do so, we may well ask ourselves whether there is not some more general conclusion, some lesson, if possible, of hope and encouragement, to be drawn from the melancholy record of human error and folly which has engaged our attention in these volumes.

If then we consider, on the one hand, the essential similarity of man's chief wants everywhere and at all times, and on the other hand, the wide difference between the means he has adopted to satisfy them in different ages, we shall perhaps be disposed to conclude that the movement of the higher thought, so far as we can trace it, has on the whole been from magic through religion to science. In magic man depends on his own strength to meet the difficulties and dangers that beset him on every side. He believes in a certain established order of nature on which he can surely count, and which he can manipulate for his own ends. When he discovers his mistake, when he recognizes sadly that both the order of nature which he had assumed and the control which he had believed himself to exercise over it were purely imaginary, he ceases to rely on his own intelligence and his own unaided efforts, and throws himself humbly on the mercy of certain great invisible beings behind the veil of nature, to whom he now ascribes all those far-reaching powers which he once arrogated to himself. Thus in the acuter minds magic is gradually superseded by religion, which explains the succession of natural phenomena as regulated by the will, the passion, or the caprice of spiritual beings like man in kind, though vastly superior to him in power.

But as time goes on this explanation in its turn proves to be unsatisfactory. For it assumes that the succession of natural events is not determined by immutable laws, but is to some extent variable and irregular, and this assumption is not borne out by closer observation. On the contrary, the more we scrutinize that succession the more we are struck by the rigid uniformity, the punctual precision with which, wherever we can follow them, the operations of nature are carried on. Every great advance in knowledge has extended the sphere of order and correspondingly restricted the sphere of apparent disorder in the world, till now we are ready to anticipate that even in regions where chance and confusion appear still to reign, a fuller knowledge would everywhere reduce the seeming chaos to cosmos. Thus the keener minds, still pressing forward to a deeper solution of the mysteries of the universe, come to reject the religious theory of nature as inadequate, and to revert in a measure to the older standpoint of magic by postulating explicitly, what in magic had only been implicitly assumed, to wit, an inflexible regularity in the order of natural events, which, if carefully observed, enables us to foresee their course with certainty and to act accordingly. In short, religion, regarded as an explanation of nature, is displaced by science.

But while science has this much in common with magic that both rest on a faith in order as the underlying principle of all things, readers of this work will hardly need to be reminded that the order presupposed by magic differs widely from that which forms the basis of science. The difference flows naturally from the different modes in which the two orders have been reached. For whereas the order on which magic reckons is merely an extension, by false analogy, of the order in which ideas present themselves to our minds, the order laid

down by science is derived from patient and exact observation of the phenomena themselves. The abundance, the solidity, and the splendour of the results already achieved by science are well fitted to inspire us with a cheerful confidence in the soundness of its method. Here at last, after groping about in the dark for countless ages, man has hit upon a clue to the labyrinth, a golden key that opens many locks in the treasury of nature. It is probably not too much to say that the hope of progress—moral and intellectual as well as material—in the future is bound up with the fortunes of science, and that every obstacle placed in the way of scientific discovery is a wrong to humanity.

Yet the history of thought should warn us against concluding that because the scientific theory of the world is the best that has yet been formulated, it is necessarily complete and final. We must remember that at bottom the generalizations of science or, in common parlance, the laws of nature are merely hypotheses devised to explain that ever-shifting phantasmagoria of thought which we dignify with the high-sounding names of the world and the universe. In the last analysis magic, religion, and science are nothing but theories of thought; and as science has supplanted its predecessors, so it may hereafter be itself superseded by some more perfect hypothesis, perhaps by some totally different way of looking at the phenomena—of registering the shadows on the screen—of which we in this generation can form no idea. The advance of knowledge is an infinite progression towards a goal that for ever recedes. We need not murmur at the endless pursuit:—

*“Fatti non foste a viver come bruti
Ma per seguir virtute e conoscenza.”*

Great things will come of that pursuit, though we may not enjoy them. Brighter stars will rise on some voyager of the future—some great Ulysses of the realms of thought—than shine on us. The dreams of magic may one day be the waking realities of science. But a dark shadow lies athwart the far end of this fair prospect. For however vast the increase of knowledge and of power which the future may have in store for man, he can scarcely hope to stay the sweep of those great forces which seem to be making silently but relentlessly for the destruction of all this starry universe in which our earth swims as a speck or mote. In the ages to come man may be able to predict, perhaps even to control, the wayward courses of the winds and clouds, but hardly will his puny hands have strength to speed afresh our slackening planet in its orbit or rekindle the dying fire of the sun. Yet the philosopher who trembles at the idea of such distant catastrophes may console himself by reflecting that these gloomy apprehensions, like the earth and the sun themselves, are only parts of that unsubstantial world which thought has conjured up out of the void, and that the phantoms which the subtle enchantress has evoked to-day she may ban to-morrow. They too, like so much that to common eyes seems solid, may melt into air, into thin air.

Without dipping so far into the future, we may illustrate the course which thought has hitherto run by likening it to a web woven of three different threads—the black thread of magic, the red thread of religion, and the white thread of science, if under science we may include those simple truths, drawn from observation of nature, of which men in all ages have possessed a store. Could we then survey the web of thought from the beginning, we should probably perceive it to be at first a chequer of black and white, a patchwork of true and false notions, hardly tinged as yet by the red thread of religion. But carry your eye further along the fabric and you will remark that, while the black and white chequer still runs through it, there rests on the middle portion of the web, where religion has entered most deeply into its texture, a dark crimson stain, which shades off insensibly into a lighter tint as the white thread of science is woven more and more into the tissue. To a web thus chequered and stained, thus shot with threads of diverse hues, but gradually changing colour the farther it is

unrolled, the state of modern thought, with all its divergent aims and conflicting tendencies, may be compared. Will the great movement which for centuries has been slowly altering the complexion of thought be continued in the near future? or will a reaction set in which may arrest progress and even undo much that has been done? To keep up our parable, what will be the colour of the web which the Fates are now weaving on the humming loom of time? will it be white or red? We cannot tell. A faint glimmering light illumines the backward portion of the web. Clouds and thick darkness hide the other end.

Our long voyage of discovery is over and our bark has drooped her weary sails in port at last. Once more we take the road to Nemi. It is evening, and as we climb the long slope of the Appian Way up to the Alban Hills, we look back and see the sky aflame with sunset, its golden glory resting like the aureole of a dying saint over Rome and touching with a crest of fire the dome of St. Peter's. The sight once seen can never be forgotten, but we turn from it and pursue our way darkling along the mountain side, till we come to Nemi and look down on the lake in its deep hollow, now fast disappearing in the evening shadows. The place has changed but little since Diana received the homage of her worshippers in the sacred grove. The temple of the sylvan goddess, indeed, has vanished and the King of the Wood no longer stands sentinel over the Golden Bough. But Nemi's woods are still green, and as the sunset fades above them in the west, there comes to us, borne on the swell of the wind, the sound of the church bells of Ariccia ringing the Angelus. *Ave Maria!* Sweet and solemn they chime out from the distant town and die lingeringly away across the wide Campagnan marshes. *Le roi est mort, vive le roi! Ave Maria!*

Notes

I. Snake Stones.

The belief of the Scottish Highlanders as to the so-called Snake Stones has been recorded as follows by a good authority at the end of the nineteenth century:—

“A product called *clach-nathrach*, serpent stone, is found on the root of the long ling. It is of steel-grey colour, has the consistency of soft putty when new and of hard putty when old, and is as light as pumice-stone, which it resembles. It is of a globular form, and from one to three inches in diameter. There is a circular hole, about a quarter of an inch in width, through the centre. This substance is said to be produced by the serpent emitting spume round the root of a twig of heather. The *clach-nathrach* is greatly prized by the people, who transmit it as a talisman to their descendants.”

II. The Transformation of Witches Into Cats.

The European belief that witches can turn themselves into cats, and that any wounds inflicted on the witch-cat will afterwards be found on the body of the witch herself, has its exact parallel among the Oraons or Uraons, a primitive hill tribe of Bengal. The following is the account given of the Oraon belief by a Jesuit missionary, who laboured for years among these savages and was intimately acquainted with their superstitions:—

“*Chordewa* is a witch rather than a *bhut* [demon]. It is believed that some women have the power to change their soul into a black cat, who then goes about in the houses where there are sick people. Such a cat has a peculiar way of mewling quite different from its brethren, and is easily recognised. It steals quietly into the house, licks the lips of the sick man and eats of the food that has been prepared for him. The sick man soon gets worse and dies. They say it is very difficult to catch the cat, as it has all the nimbleness of its nature and the cleverness of a *bhut*. However, they sometimes succeed, and then something wonderful happens. The woman out of whom the cat has come remains insensible, as it were in a state of temporary death, until the cat re-enters her body. Any wound inflicted on the cat will be inflicted on her; if they cut its ears or break its legs or put out its eyes the woman will suffer the same mutilation. The Uraons say that formerly they used to burn any woman that was suspected to be a *Chordewa*.”

III. African Balders.

In various parts of Africa stories are told of men who could only be killed, like Balder, by the stroke of an apparently insignificant weapon; and some at least of these men were not mythical beings but real men of flesh and blood who lived not long ago and whose memory is still comparatively fresh among their people. The Wadoe of German East Africa tell such a story of a great sorcerer, whom they now worship as a dispenser of sunshine and rain. The legend and the worship are reported as follows by a native African traveller:—

“If drought sets in, all the chiefs meet in council and resolve: ‘This year we have had nothing but sunshine; when we plant, the fruits will not ripen; therefore we must betake ourselves to our spirits of the dead (*mizimu*).’ Then they take some woollen stuff dyed blue and a red cloth, and set out together on the way and go to the district Nguu, where their principal ghost (*mzimu*) resides, in order to lay the matter before him. The ghost dwells in a very spacious cave. On their coming the chiefs greet him. His answer consists in a humming noise, which sounds like the patter of rain. If one among them is a bad man, the ghost says to them, ‘There is come with you in the caravan a rascal who wears such and such clothes.’ If such a man

there is, he is driven away. Now they tell the ghost all that they wish to say, to wit: 'This year thou hast given us much sunshine; the fruits in the fields do not grow tall, everywhere there is sickness, therefore we beg thee, give us rain.' Thereupon the ghost hums a second time, and all are glad, because he has answered them. But if the ghost is angry, he does not answer but holds his peace. If he has made them glad and given an answer, much rain will fall; otherwise they return as they went in sunshine.

"Originally this ghost was a man, a village elder (*jumbe*) of Ukami. He was a great sorcerer. One day people wished to conquer him, but they could do him no harm, for neither lead nor sword nor arrow could pierce his body. But he lived at strife with his wife. She said to his enemies, 'If you would kill my husband, I will tell you how it can be done.' They asked her, 'How can it be done?' She answered, 'My husband is a great sorcerer; you all know that.' They answered, 'That is true.' Then she said further, 'If you would kill him so that he dies on the spot, seek a stalk of a gourd and smite him with it; then he will die at once, for that has always been to him a forbidden thing.' They sought the stalk of a gourd, and when they smote him with it, he died at once without so much as setting one foot from the spot. But of him and his departure there was nothing more to be seen, for suddenly a great storm blew, and no man knew whither he had gone. The storm is said to have carried him to that cave which is still there to this day. After some days people saw in the cave his weapons, clothes, and turban lying, and they brought word to the folk in the town, 'We have seen the clothes of the elder in the cave, but of himself we have perceived nothing.' The folk went thither to look about, and they found that it was so. So the news of this ghost spread, all the more because people had seen the marvel that a man died and nobody knew where he had gone. The wonderful thing in this wood is that the spirits dwell in the midst of the wood and that everywhere a bright white sand lies on the ground, as if people had gone thither for the purpose of keeping everything clean. On many days they hear a drumming and shouts of joy in this wood, as if a marriage feast were being held there. That is the report about the ghost of Kolelo. All village elders, who dwell in the interior, see in this ghost the greatest ghost of all. All the chiefs (*mwene*) and headmen (*pazi*) and the village elders (*jumben*) of the clan Kingaru respect that ghost."

Miss Alice Werner, who kindly called my attention to this and the following cases of African Balders, tells me that this worshipful ghost in the cave appears to have been in his time a real man. Again, she was assured by some natives that "Chikumbu, a Yao chief, who at one time gave the Administration some trouble, was invulnerable by shot or steel; the only thing that could kill him—since he had not been fortified against it by the proper medicine—was a sharp splinter of bamboo. This reminds one of Balder and the mistletoe." Again, a Nyanja chief named Chibisa, who was a great man in this part of Africa when Livingstone travelled in it, "stood firm upon his ant-heap, while his men fell round him, shouting his war-song, until one who knew the secret of a sand-bullet brought him down."

Once more the Swahili tell a story of an African Samson named Liongo who lived in Shanga, while it was a flourishing city. By reason of his great strength he oppressed the people exceedingly, and they sought to kill him, but all in vain. At last they bribed his nephew, saying, "Go and ask your father what it is that will kill him. When you know, come and tell us, and when he is dead we will give you the kingdom." So the treacherous nephew went to his uncle and asked him, "Father, what is it that can kill you?" And his uncle said, "A copper needle. If any one stabs me in the navel, I die." So the nephew went to the town and said to the people, "It is a copper needle that will kill him." And they gave him a needle, and he went back to his uncle; and while his uncle slept the wicked nephew stabbed him with the needle in the navel. So he died, and they buried him, and his grave is to be seen at Ozi to this day.

But they seized the nephew and killed him; they did not give the kingdom to that bad young man.

When we compare the story of Balder with these African stories, the heroes of which were probably all real men, and when further we remember the similar tale told of the Persian hero Isfendiyar, who may well have been an historical personage, we are confirmed in the suspicion that Balder himself may have been a real man, admired and beloved in his lifetime and deified after his death, like the African sorcerer, who is now worshipped in a cave and bestows rain or sunshine on his votaries. On the whole I incline to regard this solution of the Balder problem as more probable than the one I have advocated in the text, namely that Balder was a mythical personification of a mistletoe-bearing oak. The facts which seem to incline the balance to the side of Euhemerism reached me as my book was going to press and too late to be embodied in their proper place in the volumes. The acceptance of this hypothesis would not necessarily break the analogy which I have traced between Balder in his sacred grove on the Sogne fiord of Norway and the priest of Diana in the sacred grove of Nemi; indeed, it might even be thought rather to strengthen the resemblance between the two, since there is no doubt at all that the priests of Diana at Nemi were men who lived real lives and died real deaths.

IV. The Mistletoe and the Golden Bough.

That Virgil compares the Golden Bough to the mistletoe is certain and admitted on all hands. The only doubt that can arise is whether the plant to which he compares the mystic bough is the ordinary species of mistletoe (*Viscum album*) or the species known to botanists as *Loranthus europaeus*. The common mistletoe (*Viscum album*, L.) "lives as a semi-parasite (obtaining carbon from the air, but water, nitrogen, and mineral matter from the sap of its host) on many conifers and broadleaved trees, and chiefly on their branches. The hosts, or trees on which it lives, are, *most frequently*, the apple tree, both wild and cultivated varieties; next, the silver-fir; *frequently*, birches, poplars (except aspen), limes, willows, Scots pine, mountain-ash, and hawthorn; *occasionally*, robinia, maples, horse-chestnut, hornbeam, and aspen. It is very rarely found on oaks, but has been observed on pedunculate oak at Thornbury, Gloucestershire, and elsewhere in Europe, also on *Quercus coccinea*, Moench., and *Q. palustris*, Moench. The alders, beech and spruce appear to be always free from mistletoe, and it very rarely attacks pear-trees. It is commoner in Southern Europe than in the North, and is extremely abundant where cider is made. In the N.-W. Himalayan districts, it is frequently found on apricot-trees, which are the commonest fruit-trees there. Its white berries are eaten by birds, chiefly by the missel-thrush (*Turdus viscivorus*, L.), and the seeds are either rubbed by the beak against branches of trees, or voided on to them; the seeds, owing to the viscous nature of the pulp surrounding them, then become attached to the branches." The large smooth pale-green tufts of the parasite, clinging to the boughs of trees, are most conspicuous in winter, when they assume a yellowish hue. In Greece at the present time mistletoe grows most commonly on firs, especially at a considerable elevation (three thousand feet or more) above the level of the sea. Throughout Italy mistletoe now grows on fruit-trees, almond-trees, hawthorn, limes, willows, black poplars, and firs, but never, it is said, on oaks. In England seven authentic cases of mistletoe growing on oaks are said to be reported. In Gloucestershire mistletoe grows on the Badham Court oak, Sedbury Park, Chepstow, and on the Frampton-on-Severn oak. Branches of oak with mistletoe growing on them were exhibited to more than one learned society in France during the nineteenth century; one of the branches was cut in the forest of Jeugny. It is a popular French superstition that mandragora or "the hand of glory," as it is called by the people, may be found by digging at the root of a mistletoe-bearing oak.

The species of mistletoe known as *Loranthus europaeus* resembles the ordinary mistletoe in general appearance, but its berries are bright yellow instead of white. "This species attacks chiefly oaks, *Quercus cerris*, L., *Q. sessiliflora*, Salisb., less frequently, *Q. pedunculata*, Ehrh., and *Castanea vulgaris*, Lam.; also lime. It is found throughout Southern Europe and as far north as Saxony, not in Britain. It grows chiefly on the branches of standards over coppice." The injury which it inflicts on its hosts is even greater than that inflicted by the ordinary mistletoe; it often kills the branch on which it settles. The seeds are carried to the trees by birds, chiefly by the missel-thrush. In India many kinds of *Loranthus* grow on various species of forest trees, for example, on teak; one variety (*Loranthus vestitus*) grows on two species of oak, the *Quercus dilatata*, Lindl., and the *Quercus incana*, Roxb. A marked distinction between the two sorts of mistletoe is that whereas ordinary mistletoe (*Viscum album*) is evergreen, the *Loranthus* is deciduous. In Greece the *Loranthus* has been observed on many old chestnut-trees at Stheni, near Delphi. In Italy it grows chiefly on the various species of oaks and also on chestnut-trees. So familiar is it on oaks that it is known as "oak mistletoe" both in popular parlance (*visco quercino*) and in druggists' shops (*viscum quernum*). Bird-lime is made from it in Italy.

Both sorts of mistletoe were known to the ancient Greeks and Romans, though the distinctive terms which they applied to each appear not to be quite certain. Theophrastus, and Pliny after him, seem to distinguish three sorts of mistletoe, to which Theophrastus gives the names of *ixia*, *hyphear*, and *stelis* respectively. He says that the *hyphear* and the *stelis* grow on firs and pines, and that the *ixia* grows on the oak (δρῦς), the terebinth, and many other kinds of trees. He also observes that both the *ixia* and the *hyphear* grow on the ilex or holm-oak (πρῖνος), the same tree sometimes bearing both species at the same time, the *ixia* on the north and the *hyphear* on the south. He expressly distinguishes the evergreen species of *ixia* from the deciduous, which seems to prove that he included both the ordinary mistletoe (*Viscum album*) and the *Loranthus* under the general name of *ixia*.

Modern writers are not agreed as to the identification of the various species of mistletoe designated by the names *ixia*, *hyphear*, and *stelis*. F. Wimmer, the editor of Theophrastus in the Didot edition, takes *hyphear* to be common mistletoe (*Viscum album*), *stelis* to be *Loranthus europaeus*, and *ixia* to be a general name which includes the two species. On the other hand F. Fraas, while he agrees as to the identification of *hyphear* and *stelis* with common mistletoe and *Loranthus* respectively, inclines somewhat hesitatingly to regard *ixia* or *ixos* (as Dioscorides has it) as a synonym for *stelis* (the *Loranthus*). H. O. Lenz, again, regards both *hyphear* and *stelis* as synonyms for common mistletoe (*Viscum album*), while he would restrict *ixia* to the *Loranthus*. But both these attempts to confine *ixia* to the single deciduous species *Loranthus* seem incompatible with the statement of Theophrastus, that *ixia* includes an evergreen as well as a deciduous species.

We have now to ask, Did Virgil compare the Golden Bough to the common mistletoe (*Viscum album*) or to the *Loranthus europaeus*? Some modern enquirers decide in favour of the *Loranthus*. Many years ago Sir Francis Darwin wrote to me: "I wonder whether *Loranthus europaeus* would do for your Golden Bough. It is a sort of mistletoe growing on oaks and chestnuts in S. Europe. In the autumn it produces what are described as bunches of pretty yellow berries. It is not evergreen like the mistletoe, but deciduous, and as its leaves appear at the same time as the oak leaves and drop at the same time in autumn, it must look like a branch of the oak, more especially as it has rough bark with lichens often growing on it. *Loranthus* is said to be a hundred years old sometimes." Professor P. J. Veth, after quoting the passage from Virgil, writes that "almost all translators (including Vondel) and commentators of the Mantuan bard think that the mistletoe is here meant, probably for the simple reason that it was better known to them than *Loranthus europaeus*. I am convinced

that Virgil can only have thought of the latter. On the other side of the Alps the *Loranthus* is much commoner than the mistletoe; on account of its splendid red blossoms, sometimes twenty centimetres long, it is a far larger and more conspicuous ornament of the trees; it bears really golden yellow fruit (*Croceus fetus*), whereas the berries of the mistletoe are almost white; and it attaches itself by preference to the oak, whereas the mistletoe is very seldom found on the oak.” Again, Mr. W. R. Paton writes to me from Mount Athos: “The oak is here called *dendron*, the tree. As for the mistletoe there are two varieties, both called *axo* (ancient ἰξός). Both are used to make bird-lime. The real *Golden Bough* is the variety with yellow berries and no leaves. It is the parasite of the oak and rarely grows on other trees. It is very abundant, and now in winter the oak-trees which have adopted it seem from a distance to be draped in a golden tissue. The other variety is our own mistletoe and is strictly a parasite of the fir (a spruce fir, I don't know its scientific name). It is also very abundant.”

Thus in favour of identifying Virgil's mistletoe (*viscum*) with *Loranthus* rather than with common mistletoe it has been urged, first, that the berries of *Loranthus* are bright yellow, whereas those of the mistletoe are of a greenish white; and, second, that the *Loranthus* commonly grows on oaks, whereas mistletoe seldom does so, indeed in Italy mistletoe is said never to be found on an oak. Both these circumstances certainly speak strongly in favour of *Loranthus*; since Virgil definitely describes the berries as of a saffron-yellow (*croceus*) and says that the plant grew on a holm-oak. Yet on the other hand Virgil tells us that the plant put forth fresh leaves in the depths of winter (*brumali frigore*, strictly speaking, “the cold of the winter solstice”); and this would best apply to the common mistletoe, which is evergreen, whereas *Loranthus* is deciduous. Accordingly, if we must decide between the two species, this single circumstance appears to incline the balance in favour of common mistletoe. But is it not possible that Virgil, whether consciously or unconsciously, confused the two plants and combined traits from both in his description? Both parasites are common in Italy and in appearance they are much alike except for the colour of the berries. As a loving observer of nature, Virgil was probably familiar by sight with both, but he may not have examined them closely; and he might be excused if he thought that the parasite which he saw growing, with its clusters of bright yellow berries, on oaks in winter, was identical with the similar parasite which he saw growing, with its bunches of greenish white berries and its pale green leaves, on many other trees of the forest. The confusion would be all the more natural if the Celts of northern Italy, in whose country the poet was born, resembled the modern Celts of Brittany in attaching bunches of the common mistletoe to their cottages and leaving them there till the revolving months had tinged the pale berries, leaves, and twigs with a golden yellow, thereby converting the branch of mistletoe into a true Golden Bough.

THE END

I'm Julie, the woman who runs [Global Grey](#) - the website where this ebook was published. These are my own formatted editions, and I hope you enjoyed reading this particular one.

If you have this book because you bought it as part of a collection – thank you so much for your support.

If you downloaded it for free – please consider (if you haven't already) making a small [donation](#) to help keep the site running.

If you bought this from Amazon or anywhere else, you have been ripped off by someone taking free ebooks from my site and selling them as their own. You should definitely get a refund :/

Thanks for reading this and I hope you visit the site again - new books are added regularly so you'll always find something of interest :)
