Sometimes again the last sheaf is called the Grandmother, and is adorned with flowers, ribbons, and a woman's apron. In East Prussia, at the rye or wheat harvest, the reapers call out to the woman who binds the last sheaf, "You are getting the Old Grandmother." In the neighbourhood of Magdeburg the men and women servants strive who shall get the last sheaf, called the Grandmother. Whoever gets it will be married in the next year, but his or her spouse will be old; if a girl gets it, she will marry a widower; if a man gets it, he will marry an old crone. In Silesia the Grandmother—a huge bundle made up of three or four sheaves by the person who tied the last sheaf—was formerly fashioned into a rude likeness of the human form. In the neighbourhood of Belfast the last sheaf sometimes goes by the name of the Granny. It is not cut in the usual way, but all the reapers throw their sickles at it and try to bring it down. It is plaited and kept till the (next?) autumn. Whoever gets it will marry in the course of the year.

Oftener the last sheaf is called the Old Woman or the Old Man. In Germany it is frequently shaped and dressed as a woman, and the person who cuts it or binds it is said to "get the Old Woman." At Altisheim, in Swabia, when all the corn of a farm has been cut except a single strip, all the reapers stand in a row before the strip; each cuts his share rapidly, and he who gives the last cut "has the Old Woman." When the sheaves are being set up in heaps, the person who gets hold of the Old Woman, which is the largest and thickest of all the sheaves, is jeered at by the rest, who call out to him, "He has the Old Woman and must keep her." The woman who binds the last sheaf is sometimes herself called the Old Woman, and it is said that she will be married in the next year. In Neusaass, West Prussia, both the last sheaf—which is dressed up in jacket, hat, and ribbons—and the woman who binds it are called the Old Woman. Together they are brought home on the last waggon and are drenched with water. In various parts of North Germany the last sheaf at harvest is made up into a human effigy and called "the Old Man"; and the woman who bound it is said "to have the Old Man." At Hornkampe, near Tiegenhof (West Prussia), when a man or woman lags behind the rest in binding the corn, the other reapers dress up the last sheaf in the form of a man or woman, and this figure goes by the laggard's name, as "the old Michael," "the idle Trine." It is brought home on the last waggon, and, as it nears the house, the bystanders call out to the laggard, "You have got the Old Woman and must keep her." In Brandenburg the young folks on the harvest-field race towards a sheaf and jump over it. The last to jump over it has to carry a straw puppet, adorned with ribbons, to the farmer and deliver it to him while he recites some verses. Of the person who thus carries the puppet it is said that "he has the Old Man." Probably the puppet is or used to be made out of the last corn cut. In many districts of Saxony the last sheaf used to be adorned with ribbons and set upright so as to look like a man. It was then known as "the Old Man," and the young women brought it back in procession to the farm, singing as they went, "Now we are bringing the Old Man."

In West Prussia, when the last rye is being raked together, the women and girls hurry with the work, for none of them likes to be the last and to get "the Old Man," that is, a puppet made out of the last sheaf, which must be carried before the other reapers by the person who was the last to finish. In Silesia the last sheaf is called the Old Woman or the Old Man and is the theme of many jests; it is made unusually large and is sometimes weighted with a stone. At Girlachsdorf, near Reichenbach, when this heavy sheaf is lifted into the waggon, they

say, "That is the Old Man whom we sought for so long." Among the Germans of West Bohemia the man who cuts the last corn is said to "have the Old Man." In former times it used to be customary to put a wreath on his head and to play all kinds of pranks with him, and at the harvest supper he was given the largest portion. At Wolletz in Westphalia the last sheaf at harvest is called the Old Man, and being made up into the likeness of a man and decorated with flowers it is presented to the farmer, who in return prepares a feast for the reapers. About Unna, in Westphalia, the last sheaf at harvest is made unusually large, and stones are inserted to increase its weight. It is called *de greaute meaur* (the Grey Mother?), and when it is brought home on the waggon water is thrown on the harvesters who accompany it. Among the Wends the man or woman who binds the last sheaf at wheat harvest is said to "have the Old Man." A puppet is made out of the wheaten straw and ears in the likeness of a man and decked with flowers. The person who bound the last sheaf must carry the Old Man home, while the rest laugh and jeer at him. The puppet is hung up in the farmhouse and remains till a new Old Man is made at the next harvest. At the close of the harvest the Arabs of Moab bury the last sheaf in a grave in the cornfield, saying as they do so, "We are burying the Old Man," or "The Old Man is dead."

In some of these customs, as Mannhardt has remarked, the person who is called by the same name as the last sheaf and sits beside it on the last waggon is obviously identified with it; he or she represents the corn-spirit which has been caught in the last sheaf; in other words, the corn-spirit is represented in duplicate, by a human being and by a sheaf. The identification of the person with the sheaf is made still clearer by the custom of wrapping up in the last sheaf the person who cuts or binds it. Thus at Hermsdorf in Silesia it used to be the regular practice to tie up in the last sheaf the woman who had bound it. At Weiden, in Bavaria, it is the cutter, not the binder, of the last sheaf who is tied up in it. Here the person wrapt up in the corn represents the corn-spirit, exactly as a person wrapt in branches or leaves represents the tree-spirit.

The last sheaf, designated as the Old Woman, is often distinguished from the other sheaves by its size and weight. Thus in some villages of West Prussia the Old Woman is made twice as long and thick as a common sheaf, and a stone is fastened in the middle of it. Sometimes it is made so heavy that a man can barely lift it. At Alt-Pillau, in Samland, eight or nine sheaves are often tied together to make the Old Woman, and the man who sets it up grumbles at its weight. At Itzgrund, in Saxe-Coburg, the last sheaf, called the Old Woman, is made large with the express intention of thereby securing a good crop next year. Thus the custom of making the last sheaf unusually large or heavy is a charm, working by sympathetic magic, to ensure a large and heavy crop at the following harvest. In Denmark also the last sheaf is made larger than the others, and is called the Old Rye-woman or the Old Barley-woman. No one likes to bind it, because whoever does so will be sure, they think, to marry an old man or an old woman. Sometimes the last wheat-sheaf, called the Old Wheat-woman, is made up in human shape, with head, arms, and legs, and being dressed in clothes is carried home on the last waggon, while the harvesters sit beside it drinking and huzzaing. Of the person who binds the last sheaf it is said, "She or he is the Old Rye-woman."

In Scotland, when the last corn was cut after Hallowmas, the female figure made out of it was sometimes called the Carlin or Carline, that is, the Old Woman. But if cut before Hallowmas, it was called the Maiden; if cut after sunset, it was called the Witch, being supposed to bring bad luck. Among the Highlanders of Scotland the last corn cut at harvest is known either as the Old Wife (*Cailleach*) or as the Maiden; on the whole the former name seems to prevail in the western and the latter in the central and eastern districts. Of the Maiden we shall speak presently; here we are dealing with the Old Wife. The following general account of the custom is given by a careful and well-informed enquirer, the Rev. J. G. Campbell, minister of

the remote Hebridean island of Tiree: “The Harvest Old Wife (*a Chailleach*).—In harvest, there was a struggle to escape from being the last done with the shearing, and when tillage in common existed, instances were known of a ridge being left unshorn (no person would claim it) because of it being behind the rest. The fear entertained was that of having the ‘famine of the farm’ (*gort a bhaile*), in the shape of an imaginary old woman (*cailleach*), to feed till next harvest. Much emulation and amusement arose from the fear of this old woman.... The first done made a doll of some blades of corn, which was called the ‘old wife,’ and sent it to his nearest neighbour. He in turn, when ready, passed it to another still less expeditious, and the person it last remained with had ‘the old woman’ to keep for that year.”

To illustrate the custom by examples, in Bernera, on the west of Lewis, the harvest rejoicing goes by the name of the Old Wife (*Cailleach*) from the last sheaf cut, whether in a township, farm, or croft. Where there are a number of crofts beside each other, there is always great rivalry as to who shall first finish reaping, and so have the Old Wife before his neighbours. Some people even go out on a clear night to reap their fields after their neighbours have retired to rest, in order that they may have the Old Wife first. More neighbourly habits, however, usually prevail, and as each finishes his own fields he goes to the help of another, till the whole crop is cut. The reaping is still done with the sickle. When the corn has been cut on all the crofts, the last sheaf is dressed up to look as like an old woman as possible. She wears a white cap, a dress, an apron, and a little shawl over the shoulders fastened with a sprig of heather. The apron is tucked up to form a pocket, which is stuffed with bread and cheese. A sickle, stuck in the string of the apron at the back, completes her equipment. This costume and outfit mean that the Old Wife is ready to bear a hand in the work of harvesting. At the feast which follows, the Old Wife is placed at the head of the table, and as the whisky goes round each of the company drinks to her, saying, “Here's to the one that has helped us with the harvest.” When the table has been cleared away and dancing begins, one of the lads leads out the Old Wife and dances with her; and if the night is fine the party will sometimes go out and march in a body to a considerable distance, singing harvest-songs, while one of them carries the Old Wife on his back. When the Harvest-Home is over, the Old Wife is shorn of her gear and used for ordinary purposes. In the island of Islay the last corn cut also goes by the name of the Old Wife (*Cailleach*), and when she has done her duty at harvest she is hung up on the wall and stays there till the time comes to plough the fields for the next year's crop. Then she is taken down, and on the first day when the men go to plough she is divided among them by the mistress of the house. They take her in their pockets and give her to the horses to eat when they reach the field. This is supposed to secure good luck for the next harvest, and is understood to be the proper end of the Old Wife. In Kintyre also the name of the Old Wife is given to the last corn cut. On the shores of the beautiful Loch Awe, a long sheet of water, winding among soft green hills, above which the giant Ben Cruachan towers bold and rugged on the north, the harvest custom is somewhat different. The name of the Old Wife (*Cailleach*) is here bestowed, not on the last corn cut, but on the reaper who is the last to finish. He bears it as a term of reproach, and is not privileged to reap the last ears left standing. On the contrary, these are cut by the reaper who was the first to finish his *spagh* or strip (literally “claw”), and out of them is fashioned the Maiden, which is afterwards hung up, according to one statement, “for the purpose of preventing the death of horses in spring.” In the north-east of Scotland “the one who took the last of the grain from the field to the stackyard was called the ‘winter.’ Each one did what could be done to avoid being the last on the field, and when there were several on the field there was a race to get off. The unfortunate ‘winter’ was the subject of a good deal of teasing, and was dressed up in all the old clothes that could be gathered about the farm, and placed on the ‘bink’ to eat his supper.” So in Caithness the person who cuts the last sheaf is called Winter and retains the name till the next harvest.

Usages of the same sort are reported from Wales. Thus in North Pembrokeshire a tuft of the last corn cut, from six to twelve inches long, is plaited and goes by the name of the Hag (*wrach*); and quaint old customs used to be practised with it within the memory of many persons still alive. Great was the excitement among the reapers when the last patch of standing corn was reached. All in turn threw their sickles at it, and the one who succeeded in cutting it received a jug of home-brewed ale. The Hag (*wrach*) was then hurriedly made and taken to a neighbouring farm, where the reapers were still busy at their work. This was generally done by the ploughman; but he had to be very careful not to be observed by his neighbours, for if they saw him coming and had the least suspicion of his errand they would soon make him retrace his steps. Creeping stealthily up behind a fence he waited till the foreman of his neighbour's reapers was just opposite him and within easy reach. Then he suddenly threw the Hag over the fence and, if possible, upon the foreman's sickle, crying out

“*Boreu y codais i,
Hwyr y dilynais i,
Ar ei gwar hi.*”

On that he took to his heels and made off as fast as he could run, and he was a lucky man if he escaped without being caught or cut by the flying sickles which the infuriated reapers hurled after him. In other cases the Hag was brought home to the farmhouse by one of the reapers. He did his best to bring it home dry and without being observed; but he was apt to be roughly handled by the people of the house, if they suspected his errand. Sometimes they stripped him of most of his clothes, sometimes they would drench him with water which had been carefully stored in buckets and pans for the purpose. If, however, he succeeded in bringing the Hag in dry and unobserved, the master of the house had to pay him a small fine; or sometimes a jug of beer “from the cask next to the wall,” which seems to have commonly held the best beer, would be demanded by the bearer. The Hag was then carefully hung on a nail in the hall or elsewhere and kept there all the year. The custom of bringing in the Hag (*wrach*) into the house and hanging it up still exists in some farms of North Pembrokeshire, but the ancient ceremonies which have just been described are now discontinued.

Similar customs at harvest were observed in South Pembrokeshire within living memory. In that part of the country there used to be a competition between neighbouring farms to see which would finish reaping first. The foreman of the reapers planned so as to finish the reaping in a corner of the field out of sight of the people on the next farm. There, with the last handful of corn cut, he would make two Old Women or Hags (*wrachs*). One of them he would send by a lad or other messenger to be laid secretly in the field where the neighbours were still at work cutting their corn. The messenger would disguise himself to look like a stranger, and jumping the fence and creeping through the corn he would lay the Hag (*wrach*) in a place where the reapers in reaping would be sure to find it. Having done so he fled for dear life, for were the reapers to catch him they would shut him up in a dark room and not let him out till he had cleaned all the muddy boots, shoes, and clogs in the house. The second Hag (*wrach*) was sent or taken by the foreman of the reapers to his master's farmhouse. Generally he tried to pop into the house unseen and lay the Hag on the kitchen table; but if the people of the farm caught him before he laid it down, they used to drench him with water. If a foreman succeeded in getting both the Hags (*wrachs*) laid safe in their proper quarters, one at home, the other on a neighbour's farm, without interruption, it was deemed a great honour. In County Antrim, down to some years ago, when the sickle was finally expelled by the reaping machine, the few stalks of corn left standing last on the field were plaited together; then the reapers, blindfolded, threw their sickles at the plaited corn, and whoever happened to cut it through took it home with him and put it over his door. This bunch of corn was called the Carley—probably the same word as Carlin.

Similar customs are observed by Slavonic peoples. Thus in Poland the last sheaf is commonly called the Baba, that is, the Old Woman. "In the last sheaf," it is said, "sits the Baba." The sheaf itself is also called the Baba, and is sometimes composed of twelve smaller sheaves lashed together. In some parts of Bohemia the Baba, made out of the last sheaf, has the figure of a woman with a great straw hat. It is carried home on the last harvest-waggon and delivered, along with a garland, to the farmer by two girls. In binding the sheaves the women strive not to be last, for she who binds the last sheaf will have a child next year. The last sheaf is tied up with others into a large bundle, and a green branch is stuck on the top of it. Sometimes the harvesters call out to the woman who binds the last sheaf, "She has the Baba," or "She is the Baba." She has then to make a puppet, sometimes in female, sometimes in male form, out of the corn; the puppet is occasionally dressed with clothes, often with flowers and ribbons only. The cutter of the last stalks, as well as the binder of the last sheaf, was also called Baba; and a doll, called the Harvest-woman, was made out of the last sheaf and adorned with ribbons. The oldest reaper had to dance, first with this doll, and then with the farmer's wife. In the district of Cracow, when a man binds the last sheaf, they say, "The Grandfather is sitting in it"; when a woman binds it, they say, "The Baba is sitting in it," and the woman herself is wrapt up in the sheaf, so that only her head projects out of it. Thus encased in the sheaf, she is carried on the last harvest-waggon to the house, where she is drenched with water by the whole family. She remains in the sheaf till the dance is over, and for a year she retains the name of Baba.

In Lithuania the name for the last sheaf is Boba (Old Woman), answering to the Polish name Baba. The Boba is said to sit in the corn which is left standing last. The person who binds the last sheaf or digs the last potato is the subject of much banter, and receives and long retains the name of the Old Rye-woman or the Old Potato-woman. The last sheaf—the Boba—is made into the form of a woman, carried solemnly through the village on the last harvest-waggon, and drenched with water at the farmer's house; then every one dances with it.

In Russia also the last sheaf is often shaped and dressed as a woman, and carried with dance and song to the farmhouse. Out of the last sheaf the Bulgarians make a doll which they call the Corn-queen or Corn-mother; it is dressed in a woman's shirt, carried round the village, and then thrown into the river in order to secure plenty of rain and dew for the next year's crop. Or it is burned and the ashes strewn on the fields, doubtless to fertilise them. The name Queen, as applied to the last sheaf, has its analogies in central and northern Europe. Thus, in the Salzburg district of Austria, at the end of the harvest a great procession takes place, in which a Queen of the Corn-ears (*Ährenkönigin*) is drawn along in a little carriage by young fellows. The custom of the Harvest Queen appears to have been common in England. Brand quotes from Hutchinson's *History of Northumberland* the following: "I have seen, in some places, an image apparelled in great finery, crowned with flowers, a sheaf of corn placed under her arm, and a scycle in her hand, carried out of the village in the morning of the conclusive reaping day, with music and much clamour of the reapers, into the field, where it stands fixed on a pole all day, and when the reaping is done, is brought home in like manner. This they call the Harvest Queen, and it represents the Roman Ceres." Again, the traveller Dr. E. D. Clarke tells us that "even in the town of Cambridge, and centre of our University, such curious remains of antient customs may be noticed, in different seasons of the year, which pass without observation. The custom of blowing horns upon the first of May (Old Style) is derived from a festival in honour of Diana. At the *Hawkie*, as it is called, or Harvest Home, I have seen a clown dressed in woman's clothes, having his face painted, his head decorated with ears of corn, and bearing about him other symbols of Ceres, carried in a waggon, with great pomp and loud shouts, through the streets, the horses being covered with white sheets: and when I inquired the meaning of the ceremony, was answered by the people that they were

drawing the Morgay (MHTHP ΓΗ) or Harvest Queen." Milton must have been familiar with the custom of the Harvest Queen, for in *Paradise Lost* he says:—

*“Adam the while
Waiting desirous her return, had wove
Of choicest flow'rs a garland to adorn
Her tresses, and her rural labours crown,
As reapers oft are wont their harvest-queen.”*

Often customs of this sort are practised, not on the harvest-field but on the threshing-floor. The spirit of the corn, fleeing before the reapers as they cut down the ripe grain, quits the reaped corn and takes refuge in the barn, where it appears in the last sheaf threshed, either to perish under the blows of the flail or to flee thence to the still unthreshed corn of a neighbouring farm. Thus the last corn to be threshed is called the Mother-Corn or the Old Woman. Sometimes the person who gives the last stroke with the flail is called the Old Woman, and is wrapt in the straw of the last sheaf, or has a bundle of straw fastened on his back. Whether wrapt in the straw or carrying it on his back, he is carted through the village amid general laughter. In some districts of Bavaria, Thüringen, and elsewhere, the man who threshes the last sheaf is said to have the Old Woman or the Old Corn-woman; he is tied up in straw, carried or carted about the village, and set down at last on the dunghill, or taken to the threshing-floor of a neighbouring farmer who has not finished his threshing. In Poland the man who gives the last stroke at threshing is called Baba (Old Woman); he is wrapt in corn and wheeled through the village. Sometimes in Lithuania the last sheaf is not threshed, but is fashioned into female shape and carried to the barn of a neighbour who has not finished his threshing.

At Chorinchen, near Neustadt, the man who gives the last stroke at threshing is said to “get the Old Man.” In various parts of Austrian Silesia he is called the corn-fool, the oats-fool, and so forth according to the crop, and retains the name till the next kind of grain has been reaped. Sometimes he is called the *Klöppel* or mallet. He is much ridiculed and in the Bennisch district he is dressed out in the threshing-implements and obliged to carry them about the farmyard to the amusement of his fellows. In Dobischwald the man who gives the last stroke at threshing has to carry a log or puppet of wood wrapt in straw to a neighbour who has not yet finished his threshing. There he throws his burden into the barn, crying, “There you have the Mallet (*Klöppel*),” and makes off as fast as he can. If they catch him, they tie the puppet on his back, and he is known as the Mallet (*Klöppel*) for the whole of the year; he may be the Corn-mallet or the Wheat-mallet or so forth according to the particular crop.

About Berneck, in Upper Franken, the man who gives the last stroke at threshing runs away. If the others catch him, he gets “the Old Woman,” that is, the largest dumpling, which elsewhere is baked in human shape. The custom of setting a dumpling baked in the form of an old woman before the man who has given the last stroke at threshing is also observed in various parts of Middle Franken. Sometimes the excised genitals of a calf are served up to him at table. At Langenbielau in Silesia the last sheaf, which is called “the Old Man,” is threshed separately and the corn ground into meal and baked into a loaf. This loaf is believed to possess healing virtue and to bring a blessing; hence none but members of the family may partake of it. At Wittichenau, in the district of Hoyerswerda (Silesia), when the threshing is ended, some of the straw of “the Old Man” is carried to a neighbour who has not yet finished his threshing, and the bearer is rewarded with a gratuity. Among the Germans of the Falkenauer district in West Bohemia the man who gives the last stroke at threshing gets “the Old Man,” a hideous scarecrow, tied on his back. If threshing is still proceeding at another

farm, he may go thither and rid himself of his burden, but must take care not to be caught. In this way a farmer who is behind-hand with his threshing may receive several such scarecrows, and so become the target for many gibes. Among the Germans of the Planer district in West Bohemia, the man who gives the last stroke at threshing is himself called "the Old Man." Similarly at flax-dressing in Silberberg (West Bohemia), the woman who is the last to finish her task is said to get the Old Man, and a cake baked in human form is served up to her at supper. The Wends of Saxony say of the man who gives the last stroke at threshing that "he has struck the Old Man" (*wón je stareho bil*), and he is obliged to carry a straw puppet to a neighbour, who has not yet finished his threshing, where he throws the puppet unobserved over the fence. In some parts of Sweden, when a stranger woman appears on the threshing-floor, a flail is put round her body, stalks of corn are wound round her neck, a crown of ears is placed on her head, and the threshers call out, "Behold the Corn-woman." Here the stranger woman, thus suddenly appearing, is taken to be the corn-spirit who has just been expelled by the flails from the corn-stalks. In other cases the farmer's wife represents the corn-spirit. Thus in the Commune of Saligné, Canton de Poiret (Vendée), the farmer's wife, along with the last sheaf, is tied up in a sheet, placed on a litter, and carried to the threshing machine, under which she is shoved. Then the woman is drawn out and the sheaf is threshed by itself, but the woman is tossed in the sheet, as if she were being winnowed. It would be impossible to express more clearly the identification of the woman with the corn than by this graphic imitation of threshing and winnowing her. Mitigated forms of the custom are observed in various places. Thus among the Germans of Schüttarschen in West Bohemia it was customary at the close of the threshing to "throttle" the farmer's wife by squeezing her neck between the arms of a flail till she consented to bake a special kind of cake called a *drischala* (from *dreschen*, "to thresh"). A similar custom of "throttling" the farmer's wife at the threshing is practised in some parts of Bavaria, only there the pressure is applied by means of a straw rope instead of a flail.

In these customs the spirit of the ripe corn is regarded as old, or at least as of mature age. Hence the names of Mother, Grandmother, Old Woman, and so forth. But in other cases the corn-spirit is conceived as young. Thus at Saldern, near Wolfenbuttel, when the rye has been reaped, three sheaves are tied together with a rope so as to make a puppet with the corn ears for a head. This puppet is called the Maiden or the Corn-maiden (*Kornjungfer*). Sometimes the corn-spirit is conceived as a child who is separated from its mother by the stroke of the sickle. This last view appears in the Polish custom of calling out to the man who cuts the last handful of corn, "You have cut the navel-string." In some districts of West Prussia the figure made out of the last sheaf is called the Bastard, and a boy is wrapt up in it. The woman who binds the last sheaf and represents the Corn-mother is told that she is about to be brought to bed; she cries like a woman in travail, and an old woman in the character of grandmother acts as midwife. At last a cry is raised that the child is born; whereupon the boy who is tied up in the sheaf whimpers and squalls like an infant. The grandmother wraps a sack, in imitation of swaddling bands, round the pretended baby, who is carried joyfully to the barn, lest he should catch cold in the open air. In other parts of North Germany the last sheaf, or the puppet made out of it, is called the Child, the Harvest-Child, and so on, and they call out to the woman who binds the last sheaf, "you are getting the child."

In the north of England, particularly in the counties of Northumberland, Durham, and Yorkshire, the last corn cut on the field at harvest is or used to be variously known as the *mell* or the *kirn*, of which *kern* and *churn* are merely local or dialectical variations. The corn so cut is either plaited or made up into a doll-like figure, which goes by the name of the mell-doll or the kirn-doll, or the kirn-baby, and is brought home with rejoicings at the end of the harvest. In the North Riding of Yorkshire the last sheaf gathered in is called the Mell-

sheaf, and the expression “We've gotten wer mell” is as much as to say “The Harvest is finished.” Formerly a Mell-doll was made out of a sheaf of corn decked with flowers and wrapped in such of the reapers' garments as could be spared. It was carried with music and dancing to the scene of the harvest-supper, which was called the mell-supper. In the north of Yorkshire the mell-sheaf “was frequently made of such dimensions as to be a heavy load for a man, and, within a few years comparatively, was proposed as the prize to be won in a race of old women. In other cases it was carefully preserved and set up in some conspicuous place in the farmhouse.” Where the last sheaf of corn cut was called the *kirn* or *kern* instead of the *mell*, the customs concerned with it seem to have been essentially similar. Thus we are told that in the north it was common for the reapers, on the last day of the reaping, “to have a contention for superiority in quickness of dispatch, groups of three or four taking each a ridge, and striving which should soonest get to its termination. In Scotland, this was called a *kemping*, which simply means a striving. In the north of England, it was a *mell*.... As the reapers went on during the last day, they took care to leave a good handful of the grain uncut, but laid down flat, and covered over; and, when the field was done, the ‘bonniest lass’ was allowed to cut this final handful, which was presently dressed up with various sewings, tyings, and trimmings, like a doll, and hailed as a *Corn Baby*. It was brought home in triumph, with music of fiddles and bagpipes, was set up conspicuously that night at supper, and was usually preserved in the farmer's parlour for the remainder of the year. The bonny lass who cut this handful of grain was deemed the *Har'st Queen*”. To cut the last portion of standing corn in the harvest field was known as “to get the *kirn*” or “to win the *kirn*”; and as soon as this was done the reapers let the neighbours know that the harvest was finished by giving three cheers, which was called “to cry or shout the *kirn*.” Where the last handful of standing corn was called the *churn*, the stalks were roughly plaited together, and the reapers threw their sickles at it till some one cut it through, which was called “cutting the *churn*.” The severed *churn* (that is, the plaited corn) was then placed over the kitchen door or over the hob in the chimney for good luck, and as a charm against witchcraft. In Kent the Ivy Girl is, or used to be, “a figure composed of some of the best corn the field produces, and made as well as they can into a human shape; this is afterwards curiously dressed by the women, and adorned with paper trimmings, cut to resemble a cap, ruffles, handkerchief, etc., of the finest lace. It is brought home with the last load of corn from the field upon the waggon, and they suppose entitles them to a supper at the expense of the employer.”

In some parts of Scotland, as well as in the north of England, the last handful of corn cut on the harvest-field was called the *kirn*, and the person who carried it off was said “to win the *kirn*.” It was then dressed up like a child's doll and went by the name of the *kirn-baby*, the *kirn-doll*, or the *Maiden*. In Berwickshire down to about the middle of the nineteenth century there was an eager competition among the reapers to cut the last bunch of standing corn. They gathered round it at a little distance and threw their sickles in turn at it, and the man who succeeded in cutting it through gave it to the girl he preferred. She made the corn so cut into a *kirn-dolly* and dressed it, and the doll was then taken to the farmhouse and hung up there till the next harvest, when its place was taken by the new *kirn-dolly*. At Spottiswoode (Westruther Parish) in Berwickshire the reaping of the last corn at harvest was called “cutting the *Queen*” almost as often as “cutting the *kirn*.” The mode of cutting it was not by throwing sickles. One of the reapers consented to be blindfolded, and having been given a sickle in his hand and turned twice or thrice about by his fellows, he was bidden to go and cut the *kirn*. His groping about and making wild strokes in the air with his sickle excited much hilarity. When he had tired himself out in vain and given up the task as hopeless, another reaper was blindfolded and pursued the quest, and so on, one after the other, till at last the *kirn* was cut. The successful reaper was tossed up in the air with three cheers by his brother harvesters. To decorate the room in which the *kirn-supper* was held at Spottiswoode as well as the granary,

where the dancing took place, two women made kirk-dollies or Queens every year; and many of these rustic effigies of the corn-spirit might be seen hanging up together. At Lanfine in Ayrshire, down to near the end of the nineteenth century, the last bunch of standing corn at harvest was, occasionally at least, plaited together, and the reapers tried to cut it by throwing their sickles at it; when they failed in the attempt, a woman has been known to run in and sever the stalks at a blow. In Dumfriesshire also, within living memory, it used to be customary to cut the last standing corn by throwing the sickles at it.

In the north of Ireland the harvest customs were similar, but there, as in some parts of England, the last patch of standing corn bore the name of the *churn*, a dialectical variation of *kirk*. "The custom of 'Winning the Churn' was prevalent all through the counties of Down and Antrim fifty years ago. It was carried out at the end of the harvest, or reaping the grain, on each farm or holding, were it small or large. Oats are the main crop of the district, but the custom was the same for other kinds of grain. When the reapers had nearly finished the last field a handful of the best-grown stalks was selected, carefully plaited as it stood, and fastened at the top just under the ears to keep the plait in place. Then when all the corn was cut from about this, which was known as *The Churn*, and the sheaves about it had been removed to some distance, the reapers stood in a group about ten yards off it, and each whirled his sickle at the *Churn* till one lucky one succeeded in cutting it down, when he was cheered on his achievement. This person had then the right of presenting it to the master or mistress of the farm, who gave the reaper a shilling." A supper and a dance of the reapers in the farmhouse often concluded the day. The *Churn*, trimmed and adorned with ribbons, was hung up on a wall in the farmhouse and carefully preserved. It was no uncommon sight to see six or even twelve or more such *Churns* decorating the walls of a farmhouse in County Down or Antrim.

In some parts of the Highlands of Scotland the last handful of corn that is cut by the reapers on any particular farm is called the Maiden, or in Gaelic *Maidhdeanbuain*, literally "the shorn Maiden." Superstitions attach to the winning of the Maiden. If it is got by a young person, they think it an omen that he or she will be married before another harvest. For that or other reasons there is a strife between the reapers as to who shall get the Maiden, and they resort to various stratagems for the purpose of securing it. One of them, for example, will often leave a handful of corn uncut and cover it up with earth to hide it from the other reapers, till all the rest of the corn on the field is cut down. Several may try to play the same trick, and the one who is coolest and holds out longest obtains the coveted distinction. When it has been cut, the Maiden is dressed with ribbons into a sort of doll and affixed to a wall of the farmhouse. In the north of Scotland the Maiden is carefully preserved till Yule morning, when it is divided among the cattle "to make them thrive all the year round." In the island of Mull and some parts of the mainland of Argyleshire the last handful of corn cut is called the Maiden (*Maighdean-Bhuana*). Near Ardrishaig, in Argyleshire, the Maiden is made up in a fanciful three-cornered shape, decorated with ribbons, and hung from a nail on the wall.

The following account of the Maiden was obtained in the summer of 1897 from the manager of a farm near Kilmartin in Argyleshire: "The *Mhaighdean-Bhuana*, or *Reaping Maiden*, was the last sheaf of oats to be cut on a croft or farm. Before the reaping-machine and binder took the place of the sickle and the scythe, the young reapers of both sexes, when they neared the end of the last rig or field, used to manœuvre to gain possession of the *Mhaighdean-Bhuana*. The individual who was fortunate enough to obtain it was *ex officio* entitled to be the King or the Queen of the Harvest-Home festival. The sheaf so designated was carefully preserved and kept intact until the day they began leading home the corn. A tuft of it was then given to each of the horses, as they started from the corn-field with their first load. The rest of it was neatly made up, and hung in some conspicuous corner of the farmhouse, where it remained till it

was replaced by a younger sister next season. On the first day of ploughing a tuft of it was given (as on the first day of leading home the corn) as a *Sainnseal* or handsel for luck to the horses. The *Mhaighdean-Bhuana* so preserved and used was a symbol that the harvest had been duly secured, and that the spring work had been properly inaugurated. It was also believed to be a protection against fairies and witchcraft.”

In the parish of Longforgan, situated at the south-eastern corner of Perthshire, it used to be customary to give what was called the Maiden Feast at the end of the harvest. The last handful of corn reaped on the field was called the Maiden, and things were generally so arranged that it fell into the hands of a pretty girl. It was then decked out with ribbons and brought home in triumph to the music of bagpipes and fiddles. In the evening the reapers danced and made merry. Afterwards the Maiden was dressed out, generally in the form of a cross, and hung up, with the date attached to it, in a conspicuous part of the house. In the neighbourhood of Balquhiddy, Perthshire, the last handful of corn is cut by the youngest girl on the field, and is made into the rude form of a female doll, clad in a paper dress, and decked with ribbons. It is called the Maiden, and is kept in the farmhouse, generally above the chimney, for a good while, sometimes till the Maiden of the next year is brought in. The writer of this book witnessed the ceremony of cutting the Maiden at Balquhiddy in September 1888. A lady friend informed me that as a young girl she cut the Maiden several times at the request of the reapers in the neighbourhood of Perth. The name of the Maiden was given to the last handful of standing corn; a reaper held the top of the bunch while she cut it. Afterwards the bunch was plaited, decked with ribbons, and hung up in a conspicuous place on the wall of the kitchen till the next Maiden was brought in. The harvest-supper in this neighbourhood was also called the Maiden; the reapers danced at it.

In the Highland district of Lochaber dancing and merry-making on the last night of harvest used to be universal and are still generally observed. Here, we are told, the festivity without the Maiden would be like a wedding without the bride. The Maiden is carried home with tumultuous rejoicing, and after being suitably decorated is hung up in the barn, where the dancing usually takes place. When supper is over, one of the company, generally the oldest man present, drinks a glass of whisky, after turning to the suspended sheaf and saying, “Here's to the Maiden.” The company follow his example, each in turn drinking to the Maiden. Then the dancing begins. On some farms on the Gareloch, in Dumbartonshire, about the year 1830, the last handful of standing corn was called the Maiden. It was divided in two, plaited, and then cut with the sickle by a girl, who, it was thought, would be lucky and would soon be married. When it was cut the reapers gathered together and threw their sickles in the air. The Maiden was dressed with ribbons and hung in the kitchen near the roof, where it was kept for several years with the date attached. Sometimes five or six Maidens might be seen hanging at once on hooks. The harvest-supper was called the Kirn. In other farms on the Gareloch the last handful of corn was called the Maidenhead or the Head; it was neatly plaited, sometimes decked with ribbons, and hung in the kitchen for a year, when the grain was given to the poultry.

In the north-east of Aberdeenshire the customs connected with the last corn cut at harvest have been carefully collected and recorded by the late Rev. Walter Gregor of Pitsligo. His account runs as follows: “The last sheaf cut is the object of much care: the manner of cutting it, binding it, and carrying it to the house varies a little in the different districts. The following customs have been reported to me by people who have seen them or who have practised them, and some of the customs have now disappeared. The information comes from the parishes of Pitsligo, Aberdour, and Tyrie, situated in the north-east corner of the county of Aberdeen, but the customs are not limited to these parishes.

“Some particulars relating to the sheaf may be noted as always the same; thus (*a*) it is cut and gathered by the youngest person present in the field, the person who is supposed to be the purest; (*b*) the sheaf is not allowed to touch the ground; (*c*) it is made up and carried in triumph to the house; (*d*) it occupies a conspicuous place in the festivals which follow the end of the reaping; (*e*) it is kept till Christmas morning, and is then given to one or more of the horses or to the cattle of the farm.

“Before the introduction of the scythe, the corn was cut by the sickle or *heuck*, a kind of curved sickle. The last sheaf was shorn or cut by the youngest girl present. As the corn might not touch the ground, the master or ‘guedman’ sat down, placed the band on his knees, and received thereupon each handful as it was cut. The sheaf was bound, dressed as a woman, and when it had been brought to the house, it was placed in some part of the kitchen, where everybody could see it during the meal which followed the end of the reaping. This sheaf was called the *clyack* sheaf.

“The manner of receiving and binding the last sheaf is not always the same. Here is another: three persons hold the band in their hands, one of them at each end, while the third holds the knot in the middle. Each handful of corn is placed so that the cut end is turned to the breast of those who support the ears on the opposite side. When all is cut, the youngest boy ties the knot. Two other bands are fastened to the sheaf, one near the cut end, the other near the ears. The sheaf is carried to the house by those who have helped to cut or bind it (Aberdour).

“Since the introduction of the scythe, it is the youngest boy who cuts the last sheaf; my informant (a woman) told me that when he was not strong enough to wield the scythe, his hand was guided by another. The youngest girl gathers it. When it is bound with three bands, it is cut straight, and it is not allowed to touch the ground. The youngest girls carry it to the house. My informant (a woman) told me that she had seen it decked and placed at the head of the bed. Formerly, and still sometimes, there was always a bed in the kitchen (Tyrie).

“The corn is not allowed to fall on the ground: the young girls who gather it take it by the ear and convey it handful by handful, till the whole sheaf is cut. A woman who ‘has lost a feather of her wing,’ as an old woman put it to me, may not touch it. Sometimes also they merely put the two hands round the sheaf (New Deer).

“Generally a feast and dance follow when all the wheat is cut. This feast and dance bear the name of *clyack* or ‘meal and ale.’ However, some people do not give ‘meal and ale’ till all the cut corn has been got in: then the feast is called ‘the Winter’ and they say that a farmer ‘has the Winter’ when all his sheaves have been carried home.

“At this feast two things are indispensable: a cheese called the *clyack-kebback* and ‘meal and ale.’

“The cheese *clyack-kebback* must be cut by the master of the house. The first slice is larger than the rest; it is known by the name of ‘the *kanave's faang*,’—the young man's big slice—and is generally the share of the herd boy (Tyrie).

“The dish called ‘meal and ale’ is made as follows. You take a suitable vessel, whether an earthenware pot or a milk-bowl, if the crockery is scanty; but if on the contrary the family is well off, they use other special utensils. In each dish ale is poured and treacle is added to sweeten it. Then oatmeal is mixed with the sweetened ale till the whole is of a sufficient consistency. The cook adds whisky to the mixture in such proportion as she thinks fit. In each plate is put a ring. To allow the meal time to be completely absorbed, the dish is prepared on the morning of the feast. At the moment of the feast the dish or dishes containing the strong and savoury mixture are set on the middle of the table. But it is not served up till the end. Six or seven persons generally have a plate to themselves. Each of them plunges his spoon into

the plate as fast as possible in the hope of getting the ring; for he who is lucky enough to get it will be married within the year. Meantime some of the stuff is swallowed, but often in the struggle some of it is spilt on the table or the floor.

“In some districts there used to be and still is dancing in the evening of the feast. ‘The sheaf’ figured in the dances. It was dressed as a girl and carried on the back of the mistress of the house to the barn or granary which served as a ballroom. The mistress danced a reel with ‘the sheaf’ on her back.

“The woman who gave me this account had been a witness of what she described when she was a girl. The sheaf was afterwards carefully stored till the first day of Christmas, when it was given to eat to a mare in foal, if there was one on the farm, or, if there was not, to the oldest cow in calf. Elsewhere the sheaf was divided between all the cows and their calves or between all the horses and the cattle of the farm. (Related by an eye-witness.)”

In these Aberdeenshire customs the sanctity attributed to the last corn cut at harvest is clearly manifested, not merely by the ceremony with which it is treated on the field, in the house, and in the barn, but also by the great care taken to prevent it from touching the ground or being handled by any unchaste person. The reason why the youngest person on the field, whether a girl or a boy, is chosen to cut the last standing corn and sometimes to carry it to the house is no doubt a calculation that the younger the person the more likely is he or she to be sexually pure. We have seen that for this reason some negroes entrust the sowing of the seed to very young girls, and later on we shall meet with more evidence in Africa of the notion that the corn may be handled only by the pure. And in the gruel of oat-meal and ale, which the harvesters sup with spoons as an indispensable part of the harvest supper, have we not the Scotch equivalent of the gruel of barley-meal and water, flavoured with pennyroyal, which the initiates at Eleusis drank as a solemn form of communion with the Barley Goddess Demeter? May not that mystic sacrament have originated in a simple harvest supper held by Eleusinian farmers at the end of the reaping?

According to a briefer account of the Aberdeenshire custom, “the last sheaf cut, or ‘maiden,’ is carried home in merry procession by the harvesters. It is then presented to the mistress of the house, who dresses it up to be preserved till the first mare foals. The maiden is then taken down and presented to the mare as its first food. The neglect of this would have untoward effects upon the foal, and disastrous consequences upon farm operations generally for the season.” In Fifeshire the last handful of corn, known as the Maiden, is cut by a young girl and made into the rude figure of a doll, tied with ribbons, by which it is hung on the wall of the farm-kitchen till the next spring. The custom of cutting the Maiden at harvest was also observed in Inverness-shire and Sutherlandshire.

A somewhat maturer but still youthful age is assigned to the corn-spirit by the appellations of Bride, Oats-bride, and Wheat-bride, which in Germany are sometimes bestowed both on the last sheaf and on the woman who binds it. At wheat-harvest near Müglitz, in Moravia, a small portion of the wheat is left standing after all the rest has been reaped. This remnant is then cut, amid the rejoicing of the reapers, by a young girl who wears a wreath of wheaten ears on her head and goes by the name of the Wheat-bride. It is supposed that she will be a real bride that same year. In the upland valley of Alpach, in North Tyrol, the person who brings the last sheaf into the granary is said to have the Wheat-bride or the Rye-bride according to the crop, and is received with great demonstrations of respect and rejoicing. The people of the farm go out to meet him, bells are rung, and refreshments offered to him on a tray. In Austrian Silesia a girl is chosen to be the Wheat-bride, and much honour is paid to her at the harvest-festival. Near Roslin and Stonehaven, in Scotland, the last handful of corn cut “got the name

of 'the bride,' and she was placed over the *bress* or chimney-piece; she had a ribbon tied below her numerous *ears*, and another round her waist."

Sometimes the idea implied by the name of Bride is worked out more fully by representing the productive powers of vegetation as bride and bridegroom. Thus in the Vorharz an Oats-man and an Oats-woman, swathed in straw, dance at the harvest feast. In South Saxony an Oats-bridegroom and an Oats-bride figure together at the harvest celebration. The Oats-bridegroom is a man completely wrapt in oats-straw; the Oats-bride is a man dressed in woman's clothes, but not wrapt in straw. They are drawn in a waggon to the ale-house, where the dance takes place. At the beginning of the dance the dancers pluck the bunches of oats one by one from the Oats-bridegroom, while he struggles to keep them, till at last he is completely stript of them and stands bare, exposed to the laughter and jests of the company. In Austrian Silesia the ceremony of "the Wheat-bride" is celebrated by the young people at the end of the harvest. The woman who bound the last sheaf plays the part of the Wheat-bride, wearing the harvest-crown of wheat ears and flowers on her head. Thus adorned, standing beside her Bridegroom in a waggon and attended by bridesmaids, she is drawn by a pair of oxen, in full imitation of a marriage procession, to the tavern, where the dancing is kept up till morning. Somewhat later in the season the wedding of the Oats-bride is celebrated with the like rustic pomp. About Neisse, in Silesia, an Oats-king and an Oats-queen, dressed up quaintly as a bridal pair, are seated on a harrow and drawn by oxen into the village.

In these last instances the corn-spirit is personified in double form as male and female. But sometimes the spirit appears in a double female form as both old and young, corresponding exactly to the Greek Demeter and Persephone, if my interpretation of these goddesses is right. We have seen that in Scotland, especially among the Gaelic-speaking population, the last corn cut is sometimes called the Old Wife and sometimes the Maiden. Now there are parts of Scotland in which both an Old Wife (*Cailleach*) and a Maiden are cut at harvest. As the accounts of this custom are not quite clear and consistent, it may be well to give them first in the words of the original authorities. Thus the late Sheriff Alexander Nicolson tells us that there is a Gaelic proverb, "A balk (*léum-iochd*) in autumn is better than a sheaf the more"; and he explains it by saying that a *léum-iochd* or balk "is a strip of a corn-field left fallow. The fear of being left with the last sheaf of the harvest, called the *cailleach*, or *gobhar bhacach*, always led to an exciting competition among the reapers in the last field. The reaper who came on a *léum-iochd* would of course be glad to have so much the less to cut." In further explanation of the proverb the writer adds:

"The customs as to the *Cailleach* and *Maighdean-bhuana* seem to have varied somewhat. Two reapers were usually set to each rig, and according to one account, the man who was first done got the *Maighdean-bhuana* or 'Reaping-Maiden,' while the man who was last got the *Cailleach* or 'old woman.' The latter term is used in Argyleshire; the term *Gobhar-bhacach*, the lame goat, is used in Skye.

"According to what appears to be the better version, the competition to avoid the *Cailleach* was not between reapers but between neighbouring crofters, and the man who got his harvest done first sent a handful of corn called the *Cailleach* to his neighbour, who passed it on, till it landed with him who was latest. That man's penalty was to provide for the dearth of the township, *gort a' bhaile*, in the ensuing season.

"The *Maighdean-bhuana*, again, was the last cut handful of oats, on a croft or farm, and was an object of lively competition among the reapers. It was tastefully tied up with ribbons, generally dressed like a doll, and then hung up on a nail till spring. On the first day of ploughing it was solemnly taken down, and given as a *Sainnseal* (or handsel) to the horses for

luck. It was meant as a symbol that the harvest had been secured, and to ward off the fairies, representatives of the ethereal and unsubstantial, till the time came to provide for a new crop.” Again, the Rev. Mr. Campbell of Kilchrenan, on Loch Awe, furnished Dr. R. C. Maclagan with the following account of the Highland customs at harvest. The recollections of Mrs. MacCorquodale, then resident at Kilchrenan, refer to the customs practised about the middle of the nineteenth century in the wild and gloomy valley of Glencoe, infamous in history for the treacherous massacre perpetrated there by the Government troops in 1692. “Mrs. MacCorquodale says that the rivalry was for the Maiden, and for the privilege she gave of sending the Cailleach to the next neighbour. The Maiden was represented by the last stalks reaped; the Cailleach by a handful taken at random from the field, perhaps the last rig of the reaper last to finish. The Cailleach was not dressed but carried after binding to the neighbour's field. The Maiden was cut in the following manner. All the reapers gathered round her and kept a short distance from her. They then threw their hooks [sickles] at her. The person successful in cutting her down in this manner was the man whose possession she became. Mrs. MacCorquodale understood that the man of a township who got the Cailleach finally was supposed to be doomed to poverty for his want of energy. (Gaelic: *treubhantas*—valour.)

“A sample of the toast to the Cailleach at the harvest entertainment was as follows: ‘The Cailleach is with ... and is now with (me) since I was the last. I drink to her health. Since she assisted me in harvest, it is likely that it is with me she will abide during the winter.’ In explaining the above toast Mr. Campbell says that it signifies that the Cailleach is always with agriculturists. ‘She has been with others before and is now with me (the proposer of the toast). Though I did my best to avoid her I welcome her as my assistant, and am prepared to entertain her during the winter.’ Another form of the toast was as follows: ‘To your health, good wife, who for harvest has come to help us, and if I live I'll try to support you when winter comes.’

“John MacCorquodale, Kilchrenan, says that at Crianlarich in Strath Fillan, they make a Cailleach of sticks and a turnip, old clothes and a pipe. In this case the effigy passed in succession to seven farms, which he mentioned, and finally settled with an innkeeper. The list suggested that the upper farms stood a bad chance, and perhaps that a prosperous innkeeper could more easily bear up against the reproach and loss (?) of supporting the Cailleach.

“Duncan MacIntyre, Kilchrenan, says that in one case where the last field to be reaped was the most fertile land on the farm, the corn first cut in it, which was taken near the edge, was reserved to make a Cailleach, should the owner be so happy as to be able to pass her on to his neighbour. The last blades cut were generally in the middle or best part of the field. These in any event became the Maiden.” Lastly, Dr. Maclagan observes that “having directed the attention of Miss Kerr, Port Charlotte, Islay, to the practice of having two different bunches on the mainland of Argyle, she informs me that in Islay and Kintyre the last handful is the Cailleach, and they have no Maiden. The same is the custom in Bernara and other parts of the Western Isles, while in Mull the last handful is the Maiden, and they have no Cailleach. In North Uist the habit still prevails of putting the Cailleach over-night among the standing corn of lazy crofters.”

The general rule to which these various accounts point seems to be that, where both a Maiden and an Old Wife (*Cailleach*) are fashioned out of the reaped corn at harvest, the Maiden is always made out of the last stalks left standing, and is kept by the farmer on whose land it was cut; while the Old Wife is made out of other stalks, sometimes out of the first stalks cut, and is regularly passed on to a laggard farmer who happens to be still reaping after his brisker neighbour has cut all his corn. Thus while each farmer keeps his own Maiden, as the

embodiment of the young and fruitful spirit of the corn, he passes on the Old Wife as soon as he can to a neighbour, and so the old lady may make the round of all the farms in the district before she finds a place in which to lay her venerable head. The farmer with whom she finally takes up her abode is of course the one who has been the last of all the countryside to finish reaping his crops, and thus the distinction of entertaining her is rather an invidious one. Similarly we saw that in Pembrokeshire, where the last corn cut is called, not the Maiden, but the Hag, she is passed on hastily to a neighbour who is still at work in his fields and who receives his aged visitor with anything but a transport of joy. If the Old Wife represents the corn-spirit of the past year, as she probably does wherever she is contrasted with and opposed to a Maiden, it is natural enough that her faded charms should have less attractions for the husbandman than the buxom form of her daughter, who may be expected to become in her turn the mother of the golden grain when the revolving year has brought round another autumn. The same desire to get rid of the effete Mother of the Corn by palming her off on other people comes out clearly in some of the customs observed at the close of threshing, particularly in the practice of passing on a hideous straw puppet to a neighbour farmer who is still threshing his corn.

The harvest customs just described are strikingly analogous to the spring customs which we reviewed in the first part of this work. (1) As in the spring customs the tree-spirit is represented both by a tree and by a person, so in the harvest customs the corn-spirit is represented both by the last sheaf and by the person who cuts or binds or threshes it. The equivalence of the person to the sheaf is shewn by giving him or her the same name as the sheaf; by wrapping him or her in it; and by the rule observed in some places, that when the sheaf is called the Mother, it must be made up into human shape by the oldest married woman, but that when it is called the Maiden, it must be cut by the youngest girl. Here the age of the personal representative of the corn-spirit corresponds with that of the supposed age of the corn-spirit, just as the human victims offered by the Mexicans to promote the growth of the maize varied with the age of the maize. For in the Mexican, as in the European, custom the human beings were probably representatives of the corn-spirit rather than victims offered to it. (2) Again, the same fertilising influence which the tree-spirit is supposed to exert over vegetation, cattle, and even women is ascribed to the corn-spirit. Thus, its supposed influence on vegetation is shewn by the practice of taking some of the grain of the last sheaf (in which the corn-spirit is regularly supposed to be present), and scattering it among the young corn in spring or mixing it with the seed-corn. Its influence on animals is shewn by giving the last sheaf to a mare in foal, to a cow in calf, and to horses at the first ploughing. Lastly, its influence on women is indicated by the custom of delivering the Mother-sheaf, made into the likeness of a pregnant woman, to the farmer's wife; by the belief that the woman who binds the last sheaf will have a child next year; perhaps, too, by the idea that the person who gets it will soon be married.

Plainly, therefore, these spring and harvest customs are based on the same ancient modes of thought, and form parts of the same primitive heathendom, which was doubtless practised by our forefathers long before the dawn of history. Amongst the marks of a primitive ritual we may note the following:—

Marks of a primitive ritual.

1. No special class of persons is set apart for the performance of the rites; in other words, there are no priests. The rites may be performed by any one, as occasion demands.
2. No special places are set apart for the performance of the rites; in other words, there are no temples. The rites may be performed anywhere, as occasion demands.

3. Spirits, not gods, are recognised. (*a*) As distinguished from gods, spirits are restricted in their operations to definite departments of nature. Their names are general, not proper. Their attributes are generic, rather than individual; in other words, there is an indefinite number of spirits of each class, and the individuals of a class are all much alike; they have no definitely marked individuality; no accepted traditions are current as to their origin, life, adventures, and character. (*b*) On the other hand gods, as distinguished from spirits, are not restricted to definite departments of nature. It is true that there is generally some one department over which they preside as their special province; but they are not rigorously confined to it; they can exert their power for good or evil in many other spheres of nature and life. Again, they bear individual or proper names, such as Demeter, Persephone, Dionysus; and their individual characters and histories are fixed by current myths and the representations of art.

4. The rites are magical rather than propitiatory. In other words, the desired objects are attained, not by propitiating the favour of divine beings through sacrifice, prayer, and praise, but by ceremonies which, as I have already explained, are believed to influence the course of nature directly through a physical sympathy or resemblance between the rite and the effect which it is the intention of the rite to produce.

Judged by these tests, the spring and harvest customs of our European peasantry deserve to rank as primitive. For no special class of persons and no special places are set exclusively apart for their performance; they may be performed by any one, master or man, mistress or maid, boy or girl; they are practised, not in temples or churches, but in the woods and meadows, beside brooks, in barns, on harvest fields and cottage floors. The supernatural beings whose existence is taken for granted in them are spirits rather than deities: their functions are limited to certain well-defined departments of nature: their names are general, like the Barley-mother, the Old Woman, the Maiden, not proper names like Demeter, Persephone, Dionysus. Their generic attributes are known, but their individual histories and characters are not the subject of myths. For they exist in classes rather than as individuals, and the members of each class are indistinguishable. For example, every farm has its Corn-mother, or its Old Woman, or its Maiden; but every Corn-mother is much like every other Corn-mother, and so with the Old Women and Maidens. Lastly, in these harvest, as in the spring customs, the ritual is magical rather than propitiatory. This is shewn by throwing the Corn-mother into the river in order to secure rain and dew for the crops; by making the Old Woman heavy in order to get a heavy crop next year; by strewing grain from the last sheaf amongst the young crops in spring; and by giving the last sheaf to the cattle to make them thrive.

VI. The Corn-Mother in Many Lands

§ 1. The Corn-mother in America.

European peoples, ancient and modern, have not been singular in personifying the corn as a mother goddess. The same simple idea has suggested itself to other agricultural races in distant parts of the world, and has been applied by them to other indigenous cereals than barley and wheat. If Europe has its Wheat-mother and its Barley-mother, America has its Maize-mother and the East Indies their Rice-mother. These personifications I will now illustrate, beginning with the American personification of the maize.

We have seen that among European peoples it is a common custom to keep the plaited corn-stalks of the last sheaf, or the puppet which is formed out of them, in the farm-house from harvest to harvest. The intention no doubt is, or rather originally was, by preserving the representative of the corn-spirit to maintain the spirit itself in life and activity throughout the year, in order that the corn may grow and the crops be good. This interpretation of the custom is at all events rendered highly probable by a similar custom observed by the ancient Peruvians, and thus described by the old Spanish historian Acosta:—"They take a certain portion of the most fruitful of the maize that grows in their farms, the which they put in a certain granary which they do call *Pirua*, with certain ceremonies, watching three nights; they put this maize in the richest garments they have, and being thus wrapped and dressed, they worship this *Pirua*, and hold it in great veneration, saying it is the mother of the maize of their inheritances, and that by this means the maize augments and is preserved. In this month [the sixth month, answering to May] they make a particular sacrifice, and the witches demand of this *Pirua* if it hath strength sufficient to continue until the next year; and if it answers no, then they carry this maize to the farm to burn, whence they brought it, according to every man's power; then they make another *Pirua*, with the same ceremonies, saying that they renew it, to the end the seed of maize may not perish, and if it answers that it hath force sufficient to last longer, they leave it until the next year. This foolish vanity continueth to this day, and it is very common amongst the Indians to have these *Piruas*."

In this description of the custom there seems to be some error. Probably it was the dressed-up bunch of maize, not the granary (*Pirua*), which was worshipped by the Peruvians and regarded as the Mother of the Maize. This is confirmed by what we know of the Peruvian custom from another source. The Peruvians, we are told, believed all useful plants to be animated by a divine being who causes their growth. According to the particular plant, these divine beings were called the Maize-mother (*Zara-mama*), the Quinoa-mother (*Quinoa-mama*), the Coca-mother (*Coca-mama*), and the Potato-mother (*Axo-mama*). Figures of these divine mothers were made respectively of ears of maize and leaves of the quinoa and coca plants; they were dressed in women's clothes and worshipped. Thus the Maize-mother was represented by a puppet made of stalks of maize dressed in full female attire; and the Indians believed that "as mother, it had the power of producing and giving birth to much maize." Probably, therefore, Acosta misunderstood his informant, and the Mother of the Maize which he describes was not the granary (*Pirua*), but the bunch of maize dressed in rich vestments. The Peruvian Mother of the Maize, like the harvest-Maiden at Balquhiddy, was kept for a year in order that by her means the corn might grow and multiply. But lest her strength might not suffice to last till the next harvest, she was asked in the course of the year how she felt, and if she answered that she felt weak, she was burned and a fresh Mother of the Maize made, "to the end the seed of maize may not perish." Here, it may be observed, we have a strong confirmation of the explanation already given of the custom of killing the god,

both periodically and occasionally. The Mother of the Maize was allowed, as a rule, to live through a year, that being the period during which her strength might reasonably be supposed to last unimpaired; but on any symptom of her strength failing she was put to death, and a fresh and vigorous Mother of the Maize took her place, lest the maize which depended on her for its existence should languish and decay.

Hardly less clearly does the same train of thought come out in the harvest customs formerly observed by the Zapotecs of Mexico. At harvest the priests, attended by the nobles and people, went in procession to the maize fields, where they picked out the largest and finest sheaf. This they took with great ceremony to the town or village, and placed it in the temple upon an altar adorned with wild flowers. After sacrificing to the harvest god, the priests carefully wrapped up the sheaf in fine linen and kept it till seed-time. Then the priests and nobles met again at the temple, one of them bringing the skin of a wild beast, elaborately ornamented, in which the linen cloth containing the sheaf was enveloped. The sheaf was then carried once more in procession to the field from which it had been taken. Here a small cavity or subterranean chamber had been prepared, in which the precious sheaf was deposited, wrapt in its various envelopes. After sacrifice had been offered to the gods of the fields for an abundant crop the chamber was closed and covered over with earth. Immediately thereafter the sowing began. Finally, when the time of harvest drew near, the buried sheaf was solemnly disinterred by the priests, who distributed the grain to all who asked for it. The packets of grain so distributed were carefully preserved as talismans till the harvest. In these ceremonies, which continued to be annually celebrated long after the Spanish conquest, the intention of keeping the finest sheaf buried in the maize field from seed-time to harvest was undoubtedly to quicken the growth of the maize.

A fuller and to some extent different account of the ancient Mexican worship of the maize has been given us by the Franciscan monk Bernardino de Sahagun, who arrived in Mexico in 1529, only eight years after its conquest by the Spaniards, and devoted the remaining sixty-one years of his long life to labouring among the Indians for their moral and spiritual good. Uniting the curiosity of a scientific enquirer to the zeal of a missionary, and adorning both qualities with the humanity and benevolence of a good man, he obtained from the oldest and most learned of the Indians accounts of their ancient customs and beliefs, and embodied them in a work which, for combined interest of matter and fulness of detail, has perhaps never been equalled in the records of aboriginal peoples brought into contact with European civilisation. This great document, after lying neglected in the dust of Spanish archives for centuries, was discovered and published almost simultaneously in Mexico and England in the first half of the nineteenth century. It exists in the double form of an Aztec text and a Spanish translation, both due to Sahagun himself. Only the Spanish version has hitherto been published in full, but the original Aztec text, to judge by the few extracts of it which have been edited and translated, appears to furnish much more ample details on many points, and in the interest of learning it is greatly to be desired that a complete edition and translation of it should be given to the world.

Fortunately, among the sections of this great work which have been edited and translated from the Aztec original into German by Professor Eduard Seler of Berlin is a long one describing the religious festivals of the ancient Mexican calendar. From it we learn some valuable particulars as to the worship of the Maize-goddess and the ceremonies observed by the Mexicans for the purpose of ensuring a good crop of maize. The festival was the fourth of the Aztec year, and went by the name of the Great Vigil. It fell on a date which corresponds to the seventh of April. The name of the Maize-goddess was Chicome couatl, and the Mexicans conceived and represented her in the form of a woman, red in face and arms and legs, wearing a paper crown dyed vermilion, and clad in garments of the hue of ripe cherries.

No doubt the red colour of the goddess and her garments referred to the deep orange hue of the ripe maize; it was like the yellow hair of the Greek corn-goddess Demeter. She was supposed to make all kinds of maize, beans, and vegetables to grow. On the day of the festival the Mexicans sent out to the maize-fields and fetched from every field a plant of maize, which they brought to their houses and greeted as their maize-gods, setting them up in their dwellings, clothing them in garments, and placing food before them. And after sunset they carried the maize-plants to the temple of the Maize-goddess, where they snatched them from one another and fought and struck each other with them. Further, at this festival they brought to the temple of the Maize-goddess the maize-cobs which were to be used in the sowing. The cobs were carried by three maidens in bundles of seven wrapt in red paper. One of the girls was small with short hair, another was older with long hair hanging down, and the third was full-grown with her hair wound round her head. Red feathers were gummed to the arms and legs of the three maidens and their faces were painted, probably to resemble the red Maize-goddess, whom they may be supposed to have personated at various stages of the growth of the corn. The maize-cobs which they brought to the temple of the Maize-goddess were called by the name of the Maize-god Cinteotl, and they were afterwards deposited in the granary and kept there as "the heart of the granary" till the sowing time came round, when they were used as seed.

The eastern Indians of North America, who subsisted to a large extent by the cultivation of maize, generally conceived the spirit of the maize as a woman, and supposed that the plant itself had sprung originally from the blood drops or the dead body of the Corn Woman. In the sacred formulas of the Cherokee the corn is sometimes invoked as "the Old Woman," and one of their myths relates how a hunter saw a fair woman issue from a single green stalk of corn. The Iroquois believe the Spirit of the Corn, the Spirit of Beans, and the Spirit of Squashes to be three sisters clad in the leaves of their respective plants, very fond of each other, and delighting to dwell together. This divine trinity is known by the name of *De-o-ha'-ko*, which means "Our Life" or "Our Supporters." The three persons of the trinity have no individual names, and are never mentioned separately except by means of description. The Indians have a legend that of old the corn was easily cultivated, yielded abundantly, and had a grain exceedingly rich in oil, till the Evil One, envious of this good gift of the Great Spirit to man, went forth into the fields and blighted them. And still, when the wind rustles in the corn, the pious Indian fancies he hears the Spirit of the Corn bemoaning her blighted fruitfulness. The Huichol Indians of Mexico imagine maize to be a little girl, who may sometimes be heard weeping in the fields; so afraid is she of the wild beasts that eat the corn.

§ 2. The Mother-cotton in the Punjaub.

In the Punjaub, to the east of the Jumna, when the cotton boles begin to burst, it is usual to select the largest plant in the field, sprinkle it with butter-milk and rice-water, and then bind to it pieces of cotton taken from the other plants of the field. This selected plant is called Sirdar or *Bhogaldai*, that is "mother-cotton," from *bhogla*, a name sometimes given to a large cotton-pod, and *dai* (for *daiya*), "a mother," and after it has been saluted, prayers are offered that the other plants may resemble it in the richness of their produce.

§ 3. The Barley Bride among the Berbers.

The conception of the corn-spirit as a bride seems to come out clearly in a ceremony still practised by the Berbers near Tangier, in Morocco. When the women assemble in the fields to weed the green barley or reap the crops, they take with them a straw figure dressed like a woman, and set it up among the corn. Suddenly a group of horsemen from a neighbouring village gallops up and carries off the straw puppet amid the screams and cries of the women. However, the ravished effigy is rescued by another band of mounted men, and after a struggle

it remains, more or less dishevelled, in the hands of the women. That this pretended abduction is a mimic marriage appears from a Berber custom in accordance with which, at a real wedding, the bridegroom carries off his seemingly unwilling bride on horseback, while she screams and pretends to summon her friends to her rescue. No fixed date is appointed for the simulated abduction of the straw woman from the barley-field, the time depends upon the state of the crops, but the day and hour are made public before the event. Each village used to practise this mimic contest for possession of the straw woman, who probably represents the Barley Bride, but nowadays the custom is growing obsolete.

An earlier account of what seems to be the same practice runs as follows: "There is a curious custom which seems to be a relic of their pagan masters, who made this and the adjoining regions of North Africa the main granary of their Latin empire. When the young corn has sprung up, which it does about the middle of February, the women of the villages make up the figure of a female, the size of a very large doll, which they dress in the gaudiest fashion they can contrive, covering it with ornaments to which all in the village contribute something; and they give it a tall, peaked head-dress. This image they carry in procession round their fields, screaming and singing a peculiar ditty. The doll is borne by the foremost woman, who must yield it to any one who is quick enough to take the lead of her, which is the cause of much racing and squabbling. The men also have a similar custom, which they perform on horseback. They call the image Mata. These ceremonies are said by the people to bring good luck. Their efficacy ought to be great, for you frequently see crowds of men engaged in their performances running and galloping recklessly over the young crops of wheat and barley. Such customs are directly opposed to the faith of Islam, and I never met with a Moor who could in any way enlighten me as to their origin. The Berber tribes, the most ancient race now remaining in these regions, to which they give the name, are the only ones which retain this antique usage, and it is viewed by the Arabs and dwellers in the town as a remnant of idolatry." We may conjecture that this gaudily dressed effigy of a female, which the Berber women carry about their fields when the corn is sprouting, represents the Corn-mother, and that the procession is designed to promote the growth of the crops by imparting to them the quickening influence of the goddess. We can therefore understand why there should be a competition among the women for the possession of the effigy; each woman probably hopes to secure for herself and her crops a larger measure of fertility by appropriating the image of the Corn-mother. The competition on horseback among the men is no doubt to be explained similarly; they, too, race with each other in their eagerness to possess themselves of an effigy, perhaps of a male power of the corn, by whose help they expect to procure a heavy crop. Such contests for possession of the corn-spirit embodied in the corn-stalks are common, as we have seen, among the reapers on the harvest fields of Europe. Perhaps they help to explain some of the contests in the Eleusinian games, among which horse-races as well as foot-races were included.

§ 4. The Rice-mother in the East Indies.

If the reader still feels any doubts as to the meaning of the harvest customs which have been practised within living memory by European peasants, these doubts may perhaps be dispelled by comparing the customs observed at the rice-harvest by the Malays and Dyaks of the East Indies. For these Eastern peoples have not, like our peasantry, advanced beyond the intellectual stage at which the customs originated; their theory and their practice are still in unison; for them the quaint rites which in Europe have long dwindled into mere fossils, the pastime of clowns and the puzzle of the learned, are still living realities of which they can render an intelligible and truthful account. Hence a study of their beliefs and usages concerning the rice may throw some light on the true meaning of the ritual of the corn in ancient Greece and modern Europe.

Now the whole of the ritual which the Malays and Dyaks observe in connexion with the rice is founded on the simple conception of the rice as animated by a soul like that which these people attribute to mankind. They explain the phenomena of reproduction, growth, decay and death in the rice on the same principles on which they explain the corresponding phenomena in human beings. They imagine that in the fibres of the plant, as in the body of a man, there is a certain vital element, which is so far independent of the plant that it may for a time be completely separated from it without fatal effects, though if its absence be prolonged beyond certain limits the plant will wither and die. This vital yet separable element is what, for the want of a better word, we must call the soul of a plant, just as a similar vital and separable element is commonly supposed to constitute the soul of man; and on this theory or myth of the plant-soul is built the whole worship of the cereals, just as on the theory or myth of the human soul is built the whole worship of the dead,—a towering superstructure reared on a slender and precarious foundation.

The strict parallelism between the Indonesian ideas about the soul of man and the soul of rice is well brought out by Mr. R. J. Wilkinson in the following passage: “The spirit of life,—which, according to the ancient Indonesian belief, existed in all things, even in what we should now consider inanimate objects—is known as the *sēmangat*. It was not a ‘soul’ in the modern English sense, since it was not the exclusive possession of mankind, its separation from the body did not necessarily mean death, and its nature may possibly not have been considered immortal. At the present day, if a Malay feels faint, he will describe his condition by saying that his ‘spirit of life’ is weak or is ‘flying’ from his body; he sometimes appeals to it to return: ‘Hither, hither, bird of my soul.’ Or again, if a Malay lover wishes to influence the mind of a girl, he may seek to obtain control of her *sēmangat*, for he believes that this spirit of active and vigorous life must quit the body when the body sleeps and so be liable to capture by the use of magic arts. It is, however, in the ceremonies connected with the so-called ‘spirit of the rice-crops’ that the peculiar characteristics of the *sēmangat* come out most clearly. The Malay considers it essential that the spirit of life should not depart from the rice intended for next year’s sowing as otherwise the dead seed would fail to produce any crop whatever. He, therefore, approaches the standing rice-crops at harvest-time in a deprecatory manner; he addresses them in endearing terms; he offers propitiatory sacrifices; he fears that he may scare away the timorous ‘bird of life’ by the sight of a weapon or the least sign of violence. He must reap the seed-rice, but he does it with a knife of peculiar shape, such that the cruel blade is hidden away beneath the reaper’s fingers and does not alarm the ‘soul of the rice.’ When once the seed-rice has been harvested, more expeditious reaping-tools may be employed, since it is clearly unnecessary to retain the spirit of life in grain that is only intended for the cooking-pot. Similar rites attend all the processes of rice-cultivation—the sowing and the planting-out as well as the harvest,—for at each of these stages there is a risk that the vitality of the crop may be ruined if the bird of life is scared away. In the language used by the high-priests of these very ancient ceremonies we constantly find references to Sri (the Hindu Goddess of the Crops), to the fruit of the Tree of Knowledge, and to Adam who, according to Moslem tradition, was the first planter of cereals;—many of these references only represent the attempts of the conservative Malays to make their old religions harmonize with later beliefs. Beneath successive layers of religious veneer, we see the animism of the old Indonesians, the theory of a bird-spirit of life, and the characteristic view that the best protection against evil lies in gentleness and courtesy to all animate and inanimate things.”

“It is a familiar fact,” says another eminent authority on the East Indies, “that the Indonesian imagines rice to be animated, to be provided with ‘soul-stuff.’ Since rice is everywhere cultivated in the Indian Archipelago, and with some exceptions is the staple food, we need not wonder that the Indonesian conceives the rice to be not merely animated in the ordinary

sense but to be possessed of a soul-stuff which in strength and dignity ranks with that of man. Thus the Bataks apply the same word *tondi* to the soul-stuff of rice and the soul-stuff of human beings. Whereas the Dyaks of Poelopetak give the name of *gana* to the soul-stuff of things, animals, and plants, they give the name of *hambaruan* to the soul-stuff of rice as well as of man. So also the inhabitants of Halmahera call the soul-stuff of things and plants *giki* and *duhutu*, but in men and food they recognise a *gurumi*. Of the Javanese, Malays, Macassars, Buginese, and the inhabitants of the island of Buru we know that they ascribe a *sumangè*, *sumangat*, or *sēmangat* to rice as well as to men. So it is with the Toradjas of Central Celebes; while they manifestly conceive all things and plants as animated, they attribute a *tanoana* or soul-stuff only to men, animals, and rice. It need hardly be said that this custom originates in the very high value that is set on rice.”

Believing the rice to be animated by a soul like that of a man, the Indonesians naturally treat it with the deference and the consideration which they shew to their fellows. Thus they behave towards the rice in bloom as they behave towards a pregnant woman; they abstain from firing guns or making loud noises in the field, lest they should so frighten the soul of the rice that it would miscarry and bear no grain; and for the same reason they will not talk of corpses or demons in the rice-fields. Moreover, they feed the blooming rice with foods of various kinds which are believed to be wholesome for women with child; but when the rice-ears are just beginning to form, they are looked upon as infants, and women go through the fields feeding them with rice-pap as if they were human babes. In such natural and obvious comparisons of the breeding plant to a breeding woman, and of the young grain to a young child, is to be sought the origin of the kindred Greek conception of the Corn-mother and the Corn-daughter, Demeter and Persephone, and we need not go further afield to search for it in a primitive division of labour between the sexes. But if the timorous feminine soul of the rice can be frightened into a miscarriage even by loud noises, it is easy to imagine what her feelings must be at harvest, when people are under the sad necessity of cutting down the rice with the knife. At so critical a season every precaution must be used to render the necessary surgical operation of reaping as inconspicuous and as painless as possible. For that reason, as we have seen, the reaping of the seed-rice is done with knives of a peculiar pattern, such that the blades are hidden in the reapers' hands and do not frighten the rice-spirit till the very last moment, when her head is swept off almost before she is aware; and from a like delicate motive the reapers at work in the fields employ a special form of speech, which the rice-spirit cannot be expected to understand, so that she has no warning or inkling of what is going forward till the heads of rice are safely deposited in the basket.

Among the Indonesian peoples who thus personify the rice we may take the Kayans or Bahaus of Central Borneo as typical. As we have already seen, they are essentially an agricultural people devoted to the cultivation of rice, which furnishes their staple food; their religion is deeply coloured by this main occupation of their lives, and it presents many analogies to the Eleusinian worship of the corn-goddesses Demeter and Persephone. And just as the Greeks regarded corn as a gift of the goddess Demeter, so the Kayans believe that rice, maize, sweet potatoes, tobacco, and all the other products of the earth which they cultivate, were originally created for their benefit by the spirits.

In order to secure and detain the volatile soul of the rice the Kayans resort to a number of devices. Among the instruments employed for this purpose are a miniature ladder, a spatula, and a basket containing hooks, thorns, and cords. With the spatula the priestess strokes the soul of the rice down the little ladder into the basket, where it is naturally held fast by the hooks, the thorn, and the cord; and having thus captured and imprisoned the soul she conveys it into the rice-granary. Sometimes a bamboo box and a net are used for the same purpose. And in order to ensure a good harvest for the following year it is necessary not only to detain

the soul of all the grains of rice which are safely stored in the granary, but also to attract and recover the soul of all the rice that has been lost through falling to the earth or being eaten by deer, apes, and pigs. For this purpose instruments of various sorts have been invented by the priests. One, for example, is a bamboo vessel provided with four hooks made from the wood of a fruit-tree, by means of which the absent rice-soul may be hooked and drawn back into the vessel, which is then hung up in the house. Sometimes two hands carved out of the wood of a fruit-tree are used for the same purpose. And every time that a Kayan housewife fetches rice from the granary for the use of her household, she must propitiate the souls of the rice in the granary, lest they should be angry at being robbed of their substance. To keep them in good humour a bundle of shavings of a fruit-tree and a little basket are always hung in the granary. An egg and a small vessel containing the juice of sugar-cane are attached as offerings to the bundle of shavings, and the basket contains a sacred mat, which is used at fetching the rice. When the housewife comes to fetch rice from the granary, she pours juice of the sugar-cane on the egg, takes the sacred mat from the basket, spreads it on the ground, lays a stalk of rice on it, and explains to the souls of the rice the object of her coming. Then she kneels before the mat, mutters some prayers or spells, eats a single grain from the rice-stalk, and having restored the various objects to their proper place, departs from the granary with the requisite amount of rice, satisfied that she has discharged her religious duty to the spirits of the rice. At harvest the spirits of the rice are propitiated with offerings of food and water, which are carried by children to the rice-fields. At evening the first rice-stalks which have been cut are solemnly brought home in a consecrated basket to the beating of a gong, and all cats and dogs are driven from the house before the basket with its precious contents is brought in.

Among the Kayans of the Mahakam river in Central Borneo the sowing of the rice is immediately preceded by a performance of masked men, which is intended to attract the soul or rather souls of the rice and so to make sure that the harvest will be a good one. The performers represent spirits; for, believing that spirits are mightier than men, the Kayans imagine that they can acquire and exert superhuman power by imitating the form and actions of spirits. To support their assumed character they wear grotesque masks with goggle eyes, great teeth, huge ears, and beards of white goat's hair, while their bodies are so thickly wrapt up in shredded banana-leaves that to the spectator they present the appearance of unwieldy masses of green foliage. The leader of the band carries a long wooden hook or rather crook, the shaft of which is partly whittled into loose fluttering shavings. These disguises they don at a little distance from the village, then dropping down the river in boats they land and march in procession to an open space among the houses, where the people, dressed out in all their finery, are waiting to witness the performance. Here the maskers range themselves in a circle and dance for some time under the burning rays of the midday sun, waving their arms, shaking and turning their heads, and executing a variety of steps to the sound of a gong, which is beaten according to a rigidly prescribed rhythm. After the dance they form a line, one behind the other, to fetch the vagrant soul of the rice from far countries. At the head of the procession marches the leader holding high his crook and behind him follow all the other masked men in their leafy costume, each holding his fellow by the hand. As he strides along, the leader makes a motion with his crook as if he were hooking something and drawing it to himself, and the gesture is imitated by all his followers. What he is thus catching are the souls of the rice, which sometimes wander far away, and by drawing them home to the village he is believed to ensure that the seed of the rice which is about to be sown will produce a plentiful harvest. As the spirits are thought not to possess the power of speech, the actors who personate them may not utter a word, else they would run the risk of falling down dead. The great field of the chief is sown by representatives of all the families, both free and slaves, on the day after the masquerade. On the same day the free families sacrifice on their fields and

begin their sowing on one or other of the following days. Every family sets up in its field a sacrificial stage or altar, with which the sowers must remain in connexion during the time of sowing. Therefore no stranger may pass between them and the stage; indeed the Kayans are not allowed to have anything to do with strangers in the fields; above all they may not speak with them. If such a thing should accidentally happen, the sowing must cease for that day. At the sowing festival, but at no other time, Kayan men of the Mahakam river, like their brethren of the Mendalam river, amuse themselves with spinning tops. For nine days before the masquerade takes place the people are bound to observe certain taboos: no stranger may enter the village: no villager may pass the night out of his own house: they may not hunt, nor pluck fruits, nor fish with the casting-net or the drag-net. In this tribe the proper day for sowing is officially determined by a priest from an observation of the sun setting behind the hills in a line with two stones which the priest has set up, one behind the other. However, the official day often does not coincide with the actual day of sowing.

The masquerade thus performed by the Kayans of the Mahakam river before sowing the rice is an instructive example of a religious or rather magical drama acted for the express purpose of ensuring a good crop. As such it may be compared to the drama of Demeter and Persephone, the Corn-mother and the Corn-maiden, which was annually played at the Eleusinian mysteries shortly before the autumnal sowing of the corn. If my interpretation of these mysteries is correct, the intention of the Greek and of the Kayan drama was one and the same.

At harvest the Dyaks of Northern Borneo have a special feast, the object of which is "to secure the soul of the rice, which if not so detained, the produce of their farms would speedily rot and decay. At sowing time, a little of the principle of life of the rice, which at every harvest is secured by their priests, is planted with their other seeds, and is thus propagated and communicated." The mode of securing the soul of the rice varies in different tribes. In the Quop district the ceremony is performed by the chief priest alone, first in the long broad verandah of the common house and afterwards in each separate family apartment. As a preparation for the ceremony a bamboo altar, decorated with green boughs and red and white streamers, is erected in the verandah, and presents a very gay appearance. Here the people, old and young, assemble, the priestesses dressed in gorgeous array and the elder men wearing bright-coloured jackets and trousers of purple, yellow, or scarlet hue, while the young men and lads beat gongs and drums. When the priest, with a bundle of charms in either hand, is observed to be gazing earnestly in the air at something invisible to common eyes, the band strikes up with redoubled energy, and the elderly men in the gay breeches begin to shriek and revolve round the altar in the dance. Suddenly the priest starts up and makes a rush at the invisible object; men run to him with white cloths, and as he shakes his charms over the cloths a few grains of rice fall into them. These grains are the soul of the rice; they are carefully folded up in the cloths and laid at the foot of the altar. The same performance is afterwards repeated in every family apartment. In some tribes the soul of the rice is secured at midnight. Outside the village a lofty altar is erected in an open space surrounded by the stately forms of the tropical palms. Huge bonfires cast a ruddy glow over the scene and light up the dusky but picturesque forms of the Dyaks as they move in slow and solemn dance round the altar, some bearing lighted tapers in their hands, others brass salvers with offerings of rice, others covered baskets, of which the contents are hidden from all but the initiated. The corner-posts of the altar are lofty bamboos, whose leafy tops are yet green and rustle in the wind; and from one of them a long narrow streamer of white cloth hangs down. Suddenly elders and priests rush at this streamer, seize the end of it, and amid the crashing music of drums and gongs and the yells of the spectators begin dancing and swaying themselves backwards and forwards, and to and fro. A priest or elder mounts the altar amid the shouts of

the bystanders and shakes the tall bamboos violently; and in the midst of all this excitement and hubbub small stones, bunches of hair, and grains of rice fall at the feet of the dancers, and are carefully picked up by watchful attendants. These grains are the soul of the rice. The ceremony ends with several of the oldest priestesses falling, or pretending to fall, senseless to the ground, where, till they come to themselves, their heads are supported and their faces fanned by their younger colleagues. At the end of the harvest, when the year's crop has been garnered, another feast is held. A pig and fowls are killed, and for four days gongs are beaten and dancing kept up. For eight days the village is tabooed and no stranger may enter it. At this festival the ceremony of catching the soul of the rice is repeated to prevent the crop from rotting; and the soul so obtained is mixed with the seed-rice of the next year.

The same need of securing the soul of the rice, if the crop is to thrive, is keenly felt by the Karens of Burma. When a rice-field does not flourish, they suppose that the soul (*kelah*) of the rice is in some way detained from the rice. If the soul cannot be called back, the crop will fail. The following formula is used in recalling the *kelah* (soul) of the rice: "O come, rice-*kelah*, come! Come to the field. Come to the rice. With seed of each gender, come. Come from the river Kho, come from the river Kaw; from the place where they meet, come. Come from the West, come from the East. From the throat of the bird, from the maw of the ape, from the throat of the elephant. Come from the sources of rivers and their mouths. Come from the country of the Shan and Burman. From the distant kingdoms come. From all granaries come. O rice-*kelah*, come to the rice."

Among the Taungthu of Upper Burma it is customary, when all the rice-fields have been reaped, to make a trail of unhusked rice (paddy) and husks all the way from the fields to the farm-house in order to guide the spirit or butterfly, as they call it, of the rice home to the granary. Care is taken that there should be no break in the trail, and the butterfly of the rice is invited with loud cries to come to the house. Were the spirit of the rice not secured in this manner, next year's harvest would be bad. Similarly among the Cherokee Indians of North America "care was always taken to keep a clean trail from the field to the house, so that the corn might be encouraged to stay at home and not go wandering elsewhere," and "seven ears from the last year's crop were always put carefully aside, in order to *attract the corn*, until the new crop was ripened." In Hsa Mōng Hkam, a native state of Upper Burma, when two men work rice-fields in partnership, they take particular care as to the division of the grain between them. Each partner has a basket made, of which both top and bottom are carefully closed with wood to prevent the butterfly spirit of the rice from escaping; for if it were to flutter away, the next year's crop would be but poor. Among the Talaings of Lower Burma "the last sheaf is larger than the rest; it is brought home separately, usually if not invariably on the morning after the remainder of the harvest has been carted to the threshing-floor. The cultivators drive out in their bullock-cart, taking with them a woman's comb, a looking-glass, and a woman's skirt. The sheaf is dressed in the skirt, and apparently the form is gone through of presenting it with the glass and comb. It is then brought home in triumph, the people decking the cart with their silk kerchiefs, and cheering and singing the whole way. On their arrival home they celebrate the occasion with a feast. Strictly speaking the sheaf should be kept apart from the rest of the harvest; owing, however, to the high price of paddy it often finds its way to the threshing-floor. Even when this is not the case it is rarely tended so carefully as it is said to have been in former days, and if not threshed with the remaining crop is apt to be eaten by the cattle. So far as I could ascertain it had never been the custom to keep it throughout the year; but on the first ploughing of the ensuing season there was some ceremony in connection with it. The name of the sheaf was *Bonmagyi*; at first I was inclined to fancy that this was a contraction of *thelinbon ma gyi*, 'the old woman of the threshing-floor.' There are, however, various reasons for discarding this derivation, and I am unable to

suggest any other." In this custom the personification of the last sheaf of rice as a woman comes out clearly in the practice of dressing it up in female attire.

The Corn-mother of our European peasants has her match in the Rice-mother of the Minangkabauers of Sumatra. The Minangkabauers definitely attribute a soul to rice, and will sometimes assert that rice pounded in the usual way tastes better than rice ground in a mill, because in the mill the body of the rice was so bruised and battered that the soul has fled from it. Like the Javanese they think that the rice is under the special guardianship of a female spirit called Saning Sari, who is conceived as so closely knit up with the plant that the rice often goes by her name, as with the Romans the corn might be called Ceres. In particular Saning Sari is represented by certain stalks or grains called *indoea padi*, that is, literally, "Mother of Rice," a name that is often given to the guardian spirit herself. This so-called Mother of Rice is the occasion of a number of ceremonies observed at the planting and harvesting of the rice as well as during its preservation in the barn. When the seed of the rice is about to be sown in the nursery or bedding-out ground, where under the wet system of cultivation it is regularly allowed to sprout before being transplanted to the fields, the best grains are picked out to form the Rice-mother. These are then sown in the middle of the bed, and the common seed is planted round about them. The state of the Rice-mother is supposed to exert the greatest influence on the growth of the rice; if she droops or pines away, the harvest will be bad in consequence. The woman who sows the Rice-mother in the nursery lets her hair hang loose and afterwards bathes, as a means of ensuring an abundant harvest. When the time comes to transplant the rice from the nursery to the field, the Rice-mother receives a special place either in the middle or in a corner of the field, and a prayer or charm is uttered as follows: "Saning Sari, may a measure of rice come from a stalk of rice and a basketful from a root; may you be frightened neither by lightning nor by passers-by! Sunshine make you glad; with the storm may you be at peace; and may rain serve to wash your face!" While the rice is growing, the particular plant which was thus treated as the Rice-mother is lost sight of; but before harvest another Rice-mother is found. When the crop is ripe for cutting, the oldest woman of the family or a sorcerer goes out to look for her. The first stalks seen to bend under a passing breeze are the Rice-mother, and they are tied together but not cut until the first-fruits of the field have been carried home to serve as a festal meal for the family and their friends, nay even for the domestic animals; since it is Saning Sari's pleasure that the beasts also should partake of her good gifts. After the meal has been eaten, the Rice-mother is fetched home by persons in gay attire, who carry her very carefully under an umbrella in a neatly worked bag to the barn, where a place in the middle is assigned to her. Every one believes that she takes care of the rice in the barn and even multiplies it not uncommonly.

When the Tomori of Central Celebes are about to plant the rice, they bury in the field some betel as an offering to the spirits who cause the rice to grow. Over the spot where the offering is buried a small floor of wood is laid, and the family sits on it and consumes betel together as a sort of silent prayer or charm to ensure the growth of the crop. The rice that is planted round this spot is the last to be reaped at harvest. At the commencement of the reaping the stalks of this patch of rice are tied together into a sheaf, which is called "the Mother of the Rice" (*ineno pae*), and offerings in the shape of rice, fowl's liver, eggs, and other things are laid down before it. When all the rest of the rice in the field has been reaped, "the Mother of the Rice" is cut down and carried with due honour to the rice-barn, where it is laid on the floor, and all the other sheaves are piled upon it. The Tomori, we are told, regard the Mother of the Rice as a special offering made to the rice-spirit Omonga, who dwells in the moon. If that spirit is not treated with proper respect, for example if the people who fetch rice from the barn are not decently clad, he is angry and punishes the offenders by eating up twice as much rice in the barn as they have taken out of it; some people have heard him smacking his lips in

the barn, as he devoured the rice. On the other hand the Toradjas of Central Celebes, who also practise the custom of the Rice-mother at harvest, regard her as the actual mother of the whole harvest, and therefore keep her carefully, lest in her absence the garnered store of rice should all melt away and disappear. Among the Tomori, as among other Indonesian peoples, reapers at work in the field make use of special words which differ from the terms in ordinary use; the reason for adopting this peculiar form of speech at reaping appears to be, as I have already pointed out, a fear of alarming the timid soul of the rice by revealing the fate in store for it. To the same motive is perhaps to be ascribed the practice observed by the Tomori of asking each other riddles at harvest. Similarly among the Alfoors or Toradjas of Poso, in Central Celebes, while the people are watching the crops in the fields they amuse themselves with asking each other riddles and telling stories, and when any one guesses a riddle aright, the whole company cries out, "Let our rice come up, let fat ears come up both in the lowlands and on the heights." But all the time between harvest and the laying out of new fields the asking of riddles and the telling of stories is strictly forbidden. Thus among these people it seems that the asking of riddles is for some reason regarded as a charm which may make or mar the crops.

Among some of the Toradjas of Celebes the ceremony of cutting and bringing home the Mother of the Rice is observed as follows. When the crop is ripe in the fields, the Mother of the Rice (*ânrong pâre*) must be fetched before the rest of the harvest is reaped. The ceremony is performed on a lucky day by a woman, who knows the rites. For three days previously she observes certain precautions to prevent the soul (*soemangâna âse*) of the rice from escaping out of the field, as it might be apt to do, if it got wind that the reapers with their cruel knives were so soon to crop the ripe ears. With this view she ties up a handful of standing stalks of the rice into a bunch in each corner of the field, while she recites an invocation to the spirits of the rice, bidding them gather in the field from the four quarters of the heaven. As a further precaution she stops the sluices, lest with the outrush of the water from the rice-field the sly soul of the rice should make good its escape. And she ties knots in the leaves of the rice-plants, all to hinder the soul of the rice from running away. This she does in the afternoon of three successive days. On the morning of the fourth day she comes again to the field, sits down in a corner of it, and kisses the rice three times, again inviting the souls of the rice to come thither and assuring them of her affection and care. Then she cuts the bunch of rice-stalks which she had tied together on one of the previous days. The stalks in the bunch must be nine in number, and their leaves must be cut with them, not thrown away. As she cuts, she may not look about her, nor cry out, nor speak to any one, nor be spoken to; but she says to the rice, "The prophet reaps you. I take you, but you diminish not; I hold you in my hand and you increase. You are the links of my soul, the support of my body, my blessing, my salvation. There is no God but God." Then she passes to another corner of the field to cut the bunch of standing rice in it with the same ceremony; but before coming to it she stops half way to pluck another bunch of five stalks in like manner. Thus from the four sides of the field she collects in all fifty-six stalks of rice, which together make up the Mother of the Rice (*ânrong pâre*). Then in a corner of the field she makes a little stage and lays the Mother of the Rice on it, with the ears turned towards the standing rice and the cut stalks towards the dyke which encloses the field. After that she binds the fifty-six stalks of the Rice-mother into a sheaf with the bark of a particular kind of tree. As she does so, she says, "The prophet binds you into a sheaf; the angel increases you; the *awâlli* cares for you. We loved and cared for each other." Then, after anointing the sheaf and fumigating it with incense, she lays it on the little stage. On this stage she had previously placed several kinds of rice, betel, one or more eggs, sweetmeats, and young coco-nuts, all as offerings to the Mother of the Rice, who, if she did not receive these attentions, would be offended and visit people with sickness or even vanish away altogether. Sometimes on large farms a fowl is killed and its blood deposited in

the half of a coco-nut on the stage. The standing rice round about the stage is the last of the whole field to be reaped. When it has been cut, it is bound up with the Mother of the Rice into a single sheaf and carried home. Any body may carry the sheaf, but in doing so he or she must take care not to let it fall, or the Rice-mother would be angry and might disappear.

Among the Battas or Bataks of Sumatra the rice appears to be personified as a young unmarried woman rather than as a mother. On the first day of reaping the crop only a few ears of rice are plucked and made up into a little sheaf. After that the reaping may begin, and while it is going forward offerings of rice and betel are presented in the middle of the field to the spirit of the rice, who is personified under the name of Miss Dajang. The offering is accompanied by a common meal shared by the reapers. When all the rice has been reaped, threshed and garnered, the little sheaf which was first cut is brought in and laid on the top of the heap in the granary, together with an egg or a stone, which is supposed to watch over the rice. Though we are not told, we may assume that the personified spirit of the rice is supposed to be present in the first sheaf cut and in that form to keep guard over the rice in the granary. Another writer, who has independently described the customs of the Karo-Bataks at the rice-harvest, tells us that the largest sheaf, which is usually the one first made up, is regarded as the seat of the rice-soul and is treated exactly like a person; at the trampling of the paddy to separate the grain from the husks the sheaf in question is specially entrusted to a girl who has a lucky name, and whose parents are both alive.

In Mandeling, a district of Sumatra, contrary to what seems to be the usual practice, the spirit of the rice is personified as a male instead of as a female and is called the Rajah or King of the Rice. He is supposed to be immanent in certain rice-plants, which are recognised by their peculiar formation, such as a concealment of the ears in the sheath, an unusual arrangement of the leaves, or a stunted growth. When one or more such plants have been discovered in the field, they are sprinkled with lime-juice, and the spirits are invoked by name and informed that they are expected at home and that all is ready for their reception. Then the King of the Rice is plucked with the hand and seven neighbouring rice-stalks cut with a knife. He and his seven companions are then carefully brought home; the bearer may not speak a word, and the children in the house may make no noise till the King of the Rice has been safely lodged in the granary and tethered, for greater security, with a grass rope to one of the posts. As soon as that is done, the doors are shut to prevent the spirits of the rice from escaping. The person who fetches the King of the Rice from the field should prepare himself for the important duty by eating a hearty meal, for it would be an omen of a bad harvest if he presented himself before the King of the Rice with an empty stomach. For the same reason the sower of rice should sow the seed on a full stomach, in order that the ears which spring from the seed may be full also.

Again, just as in Scotland the old and the young spirit of the corn are represented as an Old Wife (*Cailleach*) and a Maiden respectively, so in the Malay Peninsula we find both the Rice-mother and her child represented by different sheaves or bundles of ears on the harvest-field. The following directions for obtaining both are translated from a native Malay work on the cultivation of rice: "When the rice is ripe all over, one must first take the 'soul' out of all the plots of one's field. You choose the spot where the rice is best and where it is 'female' (that is to say, where the bunch of stalks is big) and where there are seven joints in the stalk. You begin with a bunch of this kind and clip seven stems to be the 'soul of the rice'; and then you clip yet another handful to be the 'mother-seed' for the following year. The 'soul' is wrapped in a white cloth tied with a cord of *těrap* bark, and made into the shape of a little child in swaddling clothes, and put into the small basket. The 'mother-seed' is put into another basket, and both are fumigated with benzoin, and then the two baskets are piled the one on the other and taken home, and put into the *kěpuk* (the receptacle in which rice is stored)." The

ceremony of cutting and bringing home the Soul of the Rice was witnessed by Mr. W. W. Skeat at Chodoi in Selangor on the twenty-eighth of January 1897. The particular bunch or sheaf which was to serve as the Mother of the Rice-soul had previously been sought and identified by means of the markings or shape of the ears. From this sheaf an aged sorceress, with much solemnity, cut a little bundle of seven ears, anointed them with oil, tied them round with parti-coloured thread, fumigated them with incense, and having wrapt them in a white cloth deposited them in a little oval-shaped basket. These seven ears were the infant Soul of the Rice and the little basket was its cradle. It was carried home to the farmer's house by another woman, who held up an umbrella to screen the tender infant from the hot rays of the sun. Arrived at the house the Rice-child was welcomed by the women of the family, and laid, cradle and all, on a new sleeping-mat with pillows at the head. After that the farmer's wife was instructed to observe certain rules of taboo for three days, the rules being in many respects identical with those which have to be observed for three days after the birth of a real child. For example, perfect quiet must be observed, as in a house where a baby has just been born; a light was placed near the head of the Rice-child's bed and might not go out at night, while the fire on the hearth had to be kept up both day and night till the three days were over; hair might not be cut; and money, rice, salt, oil, and so forth were forbidden to go out of the house, though of course these valuable articles were quite free to come in. Something of the same tender care which is thus bestowed on the newly-born Rice-child is naturally extended also to its parent, the sheaf from whose body it was taken. This sheaf, which remains standing in the field after the Rice-soul has been carried home and put to bed, is treated as a newly-made mother; that is to say, young shoots of trees are pounded together and scattered broadcast every evening for three successive days, and when the three days are up you take the pulp of a coco-nut and what are called "goat-flowers," mix them up, eat them with a little sugar, and spit some of the mixture out among the rice. So after a real birth the young shoots of the jack-fruit, the rose-apple, certain kinds of banana, and the thin pulp of young coco-nuts are mixed with dried fish, salt, acid, prawn-condiment, and the like dainties to form a sort of salad, which is administered to mother and child for three successive days. The last sheaf is reaped by the farmer's wife, who carries it back to the house, where it is threshed and mixed with the Rice-soul. The farmer then takes the Rice-soul and its basket and deposits it, together with the product of the last sheaf, in the big circular rice-bin used by the Malays. Some grains from the Rice-soul are mixed with the seed which is to be sown in the following year. In this Rice-mother and Rice-child of the Malay Peninsula we may see the counterpart and in a sense the prototype of the Demeter and Persephone of ancient Greece.

Once more, the European custom of representing the corn-spirit in the double form of bride and bridegroom has its parallel in a ceremony observed at the rice-harvest in Java. Before the reapers begin to cut the rice, the priest or sorcerer picks out a number of ears of rice, which are tied together, smeared with ointment, and adorned with flowers. Thus decked out, the ears are called the *padi-pěngantèn*, that is, the Rice-bride and the Rice-bridegroom; their wedding feast is celebrated, and the cutting of the rice begins immediately afterwards. Later on, when the rice is being got in, a bridal chamber is partitioned off in the barn, and furnished with a new mat, a lamp, and all kinds of toilet articles. Sheaves of rice, to represent the wedding guests, are placed beside the Rice-bride and the Rice-bridegroom. Not till this has been done may the whole harvest be housed in the barn. And for the first forty days after the rice has been housed, no one may enter the barn, for fear of disturbing the newly-wedded pair.

Another account of the Javanese custom runs as follows. When the rice at harvest is to be brought home, two handfuls of common unhusked rice (paddy) are tied together into a sheaf, and two handfuls of a special kind of rice (*kleeфриjst*) are tied up into another sheaf; then the two sheaves are fastened together in a bundle which goes by the name of "the bridal

pair” (*pěn-gantenan*). The special rice is the bridegroom, the common rice is the bride. At the barn “the bridal pair” is received on a winnowing-fan by a wizard, who removes them from the fan and lays them on the floor with a couch of *kloewih* leaves under them “in order that the rice may increase,” and beside them he places a *kěmiri* nut, tamarind pips, and a top and string as playthings with which the young couple may divert themselves. The bride is called Emboq Sri and the bridegroom Sadana, and the wizard addresses them by name, saying: “Emboq Sri and Sadana, I have now brought you home and I have prepared a place for you. May you sleep agreeably in this agreeable place! Emboq Sri and Sadana, you have been received by So-and-So (the owner), let So-and-So lead a life free from care. May Emboq Sri’s luck continue in this very agreeable place!”

The same idea of the rice-spirit as a husband and wife meets us also in the harvest customs of Bali and Lombok, two islands which lie immediately to the east of Java. “The inhabitants of Lombok,” we are told, “think of the rice-plant as animated by a soul. They regard it as one with a divinity and treat it with the distinction and honour that are shewn to a very important person. But as it is impossible to treat all the rice-stalks in a field ceremoniously, the native, feeling the need of a visible and tangible representative of the rice-deity and taking a part for the whole, picks out some stalks and conceives them as the visible abode of the rice-soul, to which he can pay his homage and from which he hopes to derive advantage. These few stalks, the foremost among their many peers, form what is called the *ninin pantun* by the people of Bali and the *inan paré* by the Sassaks” of Lombok. The name *ina paré* is sometimes translated Rice-mother, but the more correct translation is said to be “the principal rice.” The stalks of which this “principal rice” consists are the first nine shoots which the husbandman himself takes with his own hands from the nursery or bedding-out ground and plants at the upper end of the rice-field beside the inlet of the irrigation water. They are planted with great care in a definite order, one of them in the middle and the other eight in a circle about it. When the whole field has been planted, an offering, which usually consists of rice in many forms, is made to “the principal rice” (*inan paré*). When the rice-stalks begin to swell the rice is said to be pregnant, and the “principal rice” is treated with the delicate attentions which are paid to a woman with child. Thus rice-pap and eggs are laid down beside it, and sour fruits are often presented to it, because pregnant women are believed to long for sour fruit. Moreover the fertilisation of the rice by the irrigation water is compared to the union of the goddess Batari Sri with her husband Ida Batara (Vishnu), who is identified with the flowing water. Some people sprinkle the pregnant rice with water in which cooling drugs have been infused or with water which has stood on a holy grave, in order that the ears may fill out well. When the time of harvest has come, the owner of the field himself makes a beginning by cutting “the principal rice” (*inan paré* or *ninin pantun*) with his own hands and binding it into two sheaves, each composed of one hundred and eight stalks with their leaves attached to them. One of the sheaves represents a man and the other a woman, and they are called “husband and wife” (*istri kakung*). The male sheaf is wound about with thread so that none of the leaves are visible, whereas the female sheaf has its leaves bent over and tied so as to resemble the roll of a woman’s hair. Sometimes, for further distinction, a necklace of rice-straw is tied round the female sheaf. The two sheaves are then fastened together and tied to a branch of a tree, which is stuck in the ground at the inlet of the irrigation water. There they remain while all the rest of the rice is being reaped. Sometimes, instead of being tied to a bough, they are laid on a little bamboo altar. The reapers at their work take great care to let no grains of rice fall on the ground, otherwise the Rice-goddess would grieve and weep at being parted from her sisters, who are carried to the barn. If any portion of the field remains unreaped at nightfall, the reapers make loops in the leaves of some of the standing stalks to prevent the evil spirits from proceeding with the harvest during the hours of darkness, or, according to another account, lest the Rice-goddess should go astray. When the rice is

brought home from the field, the two sheaves representing the husband and wife are carried by a woman on her head, and are the last of all to be deposited in the barn. There they are laid to rest on a small erection or on a cushion of rice-straw along with three lumps of *nasi*, which are regarded as the attendants or watchers of the bridal pair. The whole arrangement, we are informed, has for its object to induce the rice to increase and multiply in the granary, so that the owner may get more out of it than he put in. Hence when the people of Bali bring the two sheaves, the husband and wife, into the barn, they say "Increase ye and multiply without ceasing." When a woman fetches rice from the granary for the use of her household, she has to observe a number of rules, all of which are clearly dictated by respect for the spirit of the rice. She should not enter the barn in the dark or at noon perhaps because the spirit may then be supposed to be sleeping. She must enter with her right foot first. She must be decently clad with her breasts covered. She must not chew betel, and she would do well to rinse her mouth before repairing to the barn, just as she would do if she waited on a person of distinction or on a divinity. No sick or menstruous woman may enter the barn, and there must be no talking in it, just as there must be no talking when shelled rice is being scooped up. When all the rice in the barn has been used up, the two sheaves representing the husband and wife remain in the empty building till they have gradually disappeared or been devoured by mice. The pinch of hunger sometimes drives individuals to eat up the rice of these two sheaves, but the wretches who do so are viewed with disgust by their fellows and branded as pigs and dogs. Nobody would ever sell these holy sheaves with the rest of their profane brethren.

The same notion of the propagation of the rice by a male and female power finds expression amongst the Szis of Upper Burma. When the paddy, that is, the rice with the husks still on it, has been dried and piled in a heap for threshing, all the friends of the household are invited to the threshing-floor, and food and drink are brought out. The heap of paddy is divided and one half spread out for threshing, while the other half is left piled up. On the pile food and spirits are set, and one of the elders, addressing "the father and mother of the paddy-plant," prays for plenteous harvests in future, and begs that the seed may bear many fold. Then the whole party eat, drink, and make merry. This ceremony at the threshing-floor is the only occasion when these people invoke "the father and mother of the paddy."

§ 5. The Spirit of the Corn embodied in Human Beings.

Thus the theory which recognises in the European Corn-mother, Corn-maiden, and so forth, the embodiment in vegetable form of the animating spirit of the crops is amply confirmed by the evidence of peoples in other parts of the world, who, because they have lagged behind the European races in mental development, retain for that very reason a keener sense of the original motives for observing those rustic rites which among ourselves have sunk to the level of meaningless survivals. The reader may, however, remember that according to Mannhardt, whose theory I am expounding, the spirit of the corn manifests itself not merely in vegetable but also in human form; the person who cuts the last sheaf or gives the last stroke at threshing passes for a temporary embodiment of the corn-spirit, just as much as the bunch of corn which he reaps or threshes. Now in the parallels which have been hitherto adduced from the customs of peoples outside Europe the spirit of the crops appears only in vegetable form. It remains, therefore, to prove that other races besides our European peasantry have conceived the spirit of the crops as incorporate in or represented by living men and women. Such a proof, I may remind the reader, is germane to the theme of this book; for the more instances we discover of human beings representing in themselves the life or animating spirit of plants, the less difficulty will be felt at classing amongst them the King of the Wood at Nemi.

The Mandans and Minnitarees of North America used to hold a festival in spring which they called the corn-medicine festival of the women. They thought that a certain Old Woman who

Never Dies made the crops to grow, and that, living somewhere in the south, she sent the migratory waterfowl in spring as her tokens and representatives. Each sort of bird represented a special kind of crop cultivated by the Indians: the wild goose stood for the maize, the wild swan for the gourds, and the wild duck for the beans. So when the feathered messengers of the Old Woman began to arrive in spring the Indians celebrated the corn-medicine festival of the women. Scaffolds were set up, on which the people hung dried meat and other things by way of offerings to the Old Woman; and on a certain day the old women of the tribe, as representatives of the Old Woman who Never Dies, assembled at the scaffolds each bearing in her hand an ear of maize fastened to a stick. They first planted these sticks in the ground, then danced round the scaffolds, and finally took up the sticks again in their arms. Meanwhile old men beat drums and shook rattles as a musical accompaniment to the performance of the old women. Further, young women came and put dried flesh into the mouths of the old women, for which they received in return a grain of the consecrated maize to eat. Three or four grains of the holy corn were also placed in the dishes of the young women, to be afterwards carefully mixed with the seed-corn, which they were supposed to fertilise. The dried flesh hung on the scaffold belonged to the old women, because they represented the Old Woman who Never Dies. A similar corn-medicine festival was held in autumn for the purpose of attracting the herds of buffaloes and securing a supply of meat. At that time every woman carried in her arms an uprooted plant of maize. They gave the name of the Old Woman who Never Dies both to the maize and to those birds which they regarded as symbols of the fruits of the earth, and they prayed to them in autumn saying, "Mother, have pity on us! send us not the bitter cold too soon, lest we have not meat enough! let not all the game depart, that we may have something for the winter!" In autumn, when the birds were flying south, the Indians thought that they were going home to the Old Woman and taking to her the offerings that had been hung up on the scaffolds, especially the dried meat, which she ate. Here then we have the spirit or divinity of the corn conceived as an Old Woman and represented in bodily form by old women, who in their capacity of representatives receive some at least of the offerings which are intended for her.

The Miamis, another tribe of North American Indians, tell a tale in which the spirit of the corn figures as a broken-down old man. They say that corn, that is, maize, first grew in heaven, and that the Good Spirit commanded it to go down and dwell with men on earth. At first it was reluctant to do so, but the Good Spirit prevailed on it to go by promising that men would treat it well in return for the benefit they derived from it. "So corn came down from heaven to benefit the Indian, and this is the reason why they esteem it, and are bound to take good care of it, and to nurture it, and not raise more than they actually require, for their own consumption." But once a whole town of the Miamis was severely punished for failing in respect for the corn. They had raised a great crop and stored much of it under ground, and much of it they packed for immediate use in bags. But the corn was so plentiful that much of it still remained on the stalks, and the young men grew reckless and played with the shelled cobs, throwing them at each other, and at last they even broke the cobs from the growing stalks and pelted each other with them too. But a judgment soon followed on such wicked conduct. For when the hunters went out to hunt, though the deer seemed to abound, they could kill nothing. So the corn was gone and they could get no meat, and the people were hungry. Well, one of the hunters, roaming by himself in the woods to find something to eat for his aged father, came upon a small lodge in the wilderness where a decrepit old man was lying with his back to the fire. Now the old man was no other than the Spirit of the Corn. He said to the young hunter, "My grandson, the Indians have afflicted me much, and reduced me to the sad state in which you see me. In the side of the lodge you will find a small kettle. Take it and eat, and when you have satisfied your hunger, I will speak to you." But the kettle was full of such fine sweet corn as the hunter had never in his life seen before. When he had eaten

his fill, the old man resumed the thread of his discourse, saying, "Your people have wantonly abused and reduced me to the state you now see me in: my back-bone is broken in many places; it was the foolish young men of your town who did me this evil, for I am Mondamin, or corn, that came down from heaven. In their play they threw corn-cobs and corn-ears at one another, treating me with contempt. I am the corn-spirit whom they have injured. That is why you experience bad luck and famine. I am the cause; you feel my just resentment, therefore your people are punished. Other Indians do not treat me so. They respect me, and so it is well with them. Had you no elders to check the youths at their wanton sport? You are an eye-witness of my sufferings. They are the effect of what you did to my body." With that he groaned and covered himself up. So the young hunter returned and reported what he had seen and heard; and since then the Indians have been very careful not to play with corn in the ear.

In some parts of India the harvest-goddess Gauri is represented at once by an unmarried girl and by a bundle of wild balsam plants, which is made up into the figure of a woman and dressed as such with mask, garments, and ornaments. Both the human and the vegetable representative of the goddess are worshipped, and the intention of the whole ceremony appears to be to ensure a good crop of rice.

§ 6. The Double Personification of the Corn as Mother and Daughter.

Compared with the Corn-mother of Germany and the Harvest-maiden of Scotland, the Demeter and Persephone of Greece are late products of religious growth. Yet as members of the Aryan family the Greeks must at one time or another have observed harvest customs like those which are still practised by Celts, Teutons, and Slavs, and which, far beyond the limits of the Aryan world, have been practised by the Indians of Peru, the Dyaks of Borneo, and many other natives of the East Indies—a sufficient proof that the ideas on which these customs rest are not confined to any one race, but naturally suggest themselves to all untutored peoples engaged in agriculture. It is probable, therefore, that Demeter and Persephone, those stately and beautiful figures of Greek mythology, grew out of the same simple beliefs and practices which still prevail among our modern peasantry, and that they were represented by rude dolls made out of the yellow sheaves on many a harvest-field long before their breathing images were wrought in bronze and marble by the master hands of Phidias and Praxiteles. A reminiscence of that olden time—a scent, so to say, of the harvest-field—lingered to the last in the title of the Maiden (*Kore*) by which Persephone was commonly known. Thus if the prototype of Demeter is the Corn-mother of Germany, the prototype of Persephone is the Harvest-maiden, which, autumn after autumn, is still made from the last sheaf on the Braes of Balquhiddy. Indeed, if we knew more about the peasant-farmers of ancient Greece, we should probably find that even in classical times they continued annually to fashion their Corn-mothers (Demeters) and Maidens (Persephones) out of the ripe corn on the harvest-fields. But unfortunately the Demeter and Persephone whom we know were the denizens of towns, the majestic inhabitants of lordly temples; it was for such divinities alone that the refined writers of antiquity had eyes; the uncouth rites performed by rustics amongst the corn were beneath their notice. Even if they noticed them, they probably never dreamed of any connexion between the puppet of corn-stalks on the sunny stubble-field and the marble divinity in the shady coolness of the temple. Still the writings even of these town-bred and cultured persons afford us an occasional glimpse of a Demeter as rude as the rudest that a remote German village can shew. Thus the story that Iasion begat a child Plutus ("wealth," "abundance") by Demeter on a thrice-ploughed field, may be compared with the West Prussian custom of the mock birth of a child on the harvest-field. In this Prussian custom the pretended mother represents the Corn-mother (*Żytniamatka*); the pretended child represents the Corn-baby, and the whole ceremony is a charm to ensure a crop next year. The custom and the legend alike point to an older practice

of performing, among the sprouting crops in spring or the stubble in autumn, one of those real or mimic acts of procreation by which, as we have seen, primitive man often seeks to infuse his own vigorous life into the languid or decaying energies of nature. Another glimpse of the savage under the civilised Demeter will be afforded farther on, when we come to deal with another aspect of these agricultural divinities.

The reader may have observed that in modern folk-customs the corn-spirit is generally represented either by a Corn-mother (Old Woman, etc.) or by a Maiden (Harvest-child, etc.), not both by a Corn-mother and by a Maiden. Why then did the Greeks represent the corn both as a mother and a daughter?

In the Breton custom the mother-sheaf—a large figure made out of the last sheaf with a small corn-doll inside of it—clearly represents both the Corn-mother and the Corn-daughter, the latter still unborn. Again, in the Prussian custom just referred to, the woman who plays the part of Corn-mother represents the ripe grain; the child appears to represent next year's corn, which may be regarded, naturally enough, as the child of this year's corn, since it is from the seed of this year's harvest that next year's crop will spring. Further, we have seen that among the Malays of the Peninsula and sometimes among the Highlanders of Scotland the spirit of the grain is represented in double female form, both as old and young, by means of ears taken alike from the ripe crop: in Scotland the old spirit of the corn appears as the Carline or *Cailleach*, the young spirit as the Maiden; while among the Malays of the Peninsula the two spirits of the rice are definitely related to each other as mother and child. Judged by these analogies Demeter would be the ripe crop of this year; Persephone would be the seed-corn taken from it and sown in autumn, to reappear in spring. The descent of Persephone into the lower world would thus be a mythical expression for the sowing of the seed; her reappearance in spring would signify the sprouting of the young corn. In this way the Persephone of one year becomes the Demeter of the next, and this may very well have been the original form of the myth. But when with the advance of religious thought the corn came to be personified, no longer as a being that went through the whole cycle of birth, growth, reproduction, and death within a year, but as an immortal goddess, consistency required that one of the two personifications, the mother or the daughter, should be sacrificed. However, the double conception of the corn as mother and daughter may have been too old and too deeply rooted in the popular mind to be eradicated by logic, and so room had to be found in the reformed myth both for mother and daughter. This was done by assigning to Persephone the character of the corn sown in autumn and sprouting in spring, while Demeter was left to play the somewhat vague part of the heavy mother of the corn, who laments its annual disappearance underground, and rejoices over its reappearance in spring. Thus instead of a regular succession of divine beings, each living a year and then giving birth to her successor, the reformed myth exhibits the conception of two divine and immortal beings, one of whom annually disappears into and reappears from the ground, while the other has little to do but to weep and rejoice at the appropriate seasons.

This theory of the double personification of the corn in Greek myth assumes that both personifications (Demeter and Persephone) are original. But if we suppose that the Greek myth started with a single personification, the after-growth of a second personification may perhaps be explained as follows. On looking over the harvest customs which have been passed under review, it may be noticed that they involve two distinct conceptions of the corn-spirit. For whereas in some of the customs the corn-spirit is treated as immanent in the corn, in others it is regarded as external to it. Thus when a particular sheaf is called by the name of the corn-spirit, and is dressed in clothes and handled with reverence, the spirit is clearly regarded as immanent in the corn. But when the spirit is said to make the crops grow by passing through them, or to blight the grain of those against whom she has a grudge, she is

apparently conceived as distinct from, though exercising power over, the corn. Conceived in the latter way the corn-spirit is in a fair way to become a deity of the corn, if she has not become so already. Of these two conceptions, that of the corn-spirit as immanent in the corn is doubtless the older, since the view of nature as animated by indwelling spirits appears to have generally preceded the view of it as controlled by external deities; to put it shortly, animism precedes deism. In the harvest customs of our European peasantry the corn-spirit seems to be conceived now as immanent in the corn and now as external to it. In Greek mythology, on the other hand, Demeter is viewed rather as the deity of the corn than as the spirit immanent in it. The process of thought which leads to the change from the one mode of conception to the other is anthropomorphism, or the gradual investment of the immanent spirits with more and more of the attributes of humanity. As men emerge from savagery the tendency to humanise their divinities gains strength; and the more human these become the wider is the breach which severs them from the natural objects of which they were at first merely the animating spirits or souls. But in the progress upwards from savagery men of the same generation do not march abreast; and though the new anthropomorphic gods may satisfy the religious wants of the more developed intelligences, the backward members of the community will cling by preference to the old animistic notions. Now when the spirit of any natural object such as the corn has been invested with human qualities, detached from the object, and converted into a deity controlling it, the object itself is, by the withdrawal of its spirit, left inanimate; it becomes, so to say, a spiritual vacuum. But the popular fancy, intolerant of such a vacuum, in other words, unable to conceive anything as inanimate, immediately creates a fresh mythical being, with which it peoples the vacant object. Thus the same natural object comes to be represented in mythology by two distinct beings: first by the old spirit now separated from it and raised to the rank of a deity; second, by the new spirit, freshly created by the popular fancy to supply the place vacated by the old spirit on its elevation to a higher sphere. For example, in Japanese religion the solar character of Amaterasu, the great goddess of the Sun, has become obscured, and accordingly the people have personified the sun afresh under the name of *Nichi-rin sama*, "sun-wheeling personage," and *O tentō sama*, "august-heaven-path-personage"; to the lower class of Japanese at the present day, especially to women and children, *O tentō sama* is the actual sun, sexless, mythless, and unencumbered by any formal worship, yet looked up to as a moral being who rewards the good, punishes the wicked, and enforces oaths made in his name. In such cases the problem for mythology is, having got two distinct personifications of the same object, what to do with them? How are their relations to each other to be adjusted, and room found for both in the mythological system? When the old spirit or new deity is conceived as creating or producing the object in question, the problem is easily solved. Since the object is believed to be produced by the old spirit, and animated by the new one, the latter, as the soul of the object, must also owe its existence to the former; thus the old spirit will stand to the new one as producer to produced, that is, in mythology, as parent to child, and if both spirits are conceived as female, their relation will be that of mother and daughter. In this way, starting from a single personification of the corn as female, mythic fancy might in time reach a double personification of it as mother and daughter. It would be very rash to affirm that this was the way in which the myth of Demeter and Persephone actually took shape; but it seems a legitimate conjecture that the reduplication of deities, of which Demeter and Persephone furnish an example, may sometimes have arisen in the way indicated. For example, among the pairs of deities dealt with in a former part of this work, it has been shewn that there are grounds for regarding both Isis and her companion god Osiris as personifications of the corn. On the hypothesis just suggested, Isis would be the old corn-spirit, and Osiris would be the newer one, whose relationship to the old spirit was variously explained as that of brother, husband, and son; for of course mythology would always be free to account for the

coexistence of the two divinities in more ways than one. It must not, however, be forgotten that this proposed explanation of such pairs of deities as Demeter and Persephone or Isis and Osiris is purely conjectural, and is only given for what it is worth.

VII. Lityerses

§ 1. Songs of the Corn Reapers.

In the preceding pages an attempt has been made to shew that in the Corn-mother and Harvest-maiden of Northern Europe we have the prototypes of Demeter and Persephone. But an essential feature is still wanting to complete the resemblance. A leading incident in the Greek myth is the death and resurrection of Persephone; it is this incident which, coupled with the nature of the goddess as a deity of vegetation, links the myth with the cults of Adonis, Attis, Osiris, and Dionysus; and it is in virtue of this incident that the myth finds a place in our discussion of the Dying God. It remains, therefore, to see whether the conception of the annual death and resurrection of a god, which figures so prominently in these great Greek and Oriental worships, has not also its origin or its analogy in the rustic rites observed by reapers and vine-dressers amongst the corn-shocks and the vines.

Our general ignorance of the popular superstitions and customs of the ancients has already been confessed. But the obscurity which thus hangs over the first beginnings of ancient religion is fortunately dissipated to some extent in the present case. The worships of Osiris, Adonis, and Attis had their respective seats, as we have seen, in Egypt, Syria, and Phrygia; and in each of these countries certain harvest and vintage customs are known to have been observed, the resemblance of which to each other and to the national rites struck the ancients themselves, and, compared with the harvest customs of modern peasants and barbarians, seems to throw some light on the origin of the rites in question.

It has been already mentioned, on the authority of Diodorus, that in ancient Egypt the reapers were wont to lament over the first sheaf cut, invoking Isis as the goddess to whom they owed the discovery of corn. To the plaintive song or cry sung or uttered by Egyptian reapers the Greeks gave the name of Maneros, and explained the name by a story that Maneros, the only son of the first Egyptian king, invented agriculture, and, dying an untimely death, was thus lamented by the people. It appears, however, that the name Maneros is due to a misunderstanding of the formula *mââ-ne-hra*, "Come to the house," which has been discovered in various Egyptian writings, for example in the dirge of Isis in the Book of the Dead. Hence we may suppose that the cry *mââ-ne-hra* was chanted by the reapers over the cut corn as a dirge for the death of the corn-spirit (Isis or Osiris) and a prayer for its return. As the cry was raised over the first ears reaped, it would seem that the corn-spirit was believed by the Egyptians to be present in the first corn cut and to die under the sickle. We have seen that in the Malay Peninsula and Java the first ears of rice are taken to represent either the Soul of the Rice or the Rice-bride and the Rice-bridegroom. In parts of Russia the first sheaf is treated much in the same way that the last sheaf is treated elsewhere. It is reaped by the mistress herself, taken home and set in the place of honour near the holy pictures; afterwards it is threshed separately, and some of its grain is mixed with the next year's seed-corn. In Aberdeenshire, while the last corn cut was generally used to make the *chyack* sheaf, it was sometimes, though rarely, the first corn cut that was dressed up as a woman and carried home with ceremony.

In Phoenicia and Western Asia a plaintive song, like that chanted by the Egyptian corn-reapers, was sung at the vintage and probably (to judge by analogy) also at harvest. This Phoenician song was called by the Greeks Linus or Ailinus and explained, like Maneros, as a lament for the death of a youth named Linus. According to one story Linus was brought up by a shepherd, but torn to pieces by his dogs. But, like Maneros, the name Linus or Ailinus

appears to have originated in a verbal misunderstanding, and to be nothing more than the cry *ai lanu*, that is "Woe to us," which the Phoenicians probably uttered in mourning for Adonis; at least Sappho seems to have regarded Adonis and Linus as equivalent.

In Bithynia a like mournful ditty, called Bormus or Borimus, was chanted by Mariandynian reapers. Bormus was said to have been a handsome youth, the son of King Upias or of a wealthy and distinguished man. One summer day, watching the reapers at work in his fields, he went to fetch them a drink of water and was never heard of more. So the reapers sought for him, calling him in plaintive strains, which they continued to chant at harvest ever afterwards.

§ 2. Killing the Corn-spirit.

In Phrygia the corresponding song, sung by harvesters both at reaping and at threshing, was called Lityerses. According to one story, Lityerses was a bastard son of Midas, King of Phrygia, and dwelt at Celaenae. He used to reap the corn, and had an enormous appetite. When a stranger happened to enter the corn-field or to pass by it, Lityerses gave him plenty to eat and drink, then took him to the corn-fields on the banks of the Maeander and compelled him to reap along with him. Lastly, it was his custom to wrap the stranger in a sheaf, cut off his head with a sickle, and carry away his body, swathed in the corn stalks. But at last Hercules undertook to reap with him, cut off his head with the sickle, and threw his body into the river. As Hercules is reported to have slain Lityerses in the same way that Lityerses slew others (as Theseus treated Sinis and Sciron), we may infer that Lityerses used to throw the bodies of his victims into the river. According to another version of the story, Lityerses, a son of Midas, was wont to challenge people to a reaping match with him, and if he vanquished them he used to thrash them; but one day he met with a stronger reaper, who slew him.

There are some grounds for supposing that in these stories of Lityerses we have the description of a Phrygian harvest custom in accordance with which certain persons, especially strangers passing the harvest field, were regularly regarded as embodiments of the corn-spirit, and as such were seized by the reapers, wrapt in sheaves, and beheaded, their bodies, bound up in the corn-stalks, being afterwards thrown into water as a rain-charm. The grounds for this supposition are, first, the resemblance of the Lityerses story to the harvest customs of European peasantry, and, second, the frequency of human sacrifices offered by savage races to promote the fertility of the fields. We will examine these grounds successively, beginning with the former.

In comparing the story with the harvest customs of Europe, three points deserve special attention, namely: I. the reaping match and the binding of persons in the sheaves; II. the killing of the corn-spirit or his representatives; III. the treatment of visitors to the harvest field or of strangers passing it.

I. In regard to the first head, we have seen that in modern Europe the person who cuts or binds or threshes the last sheaf is often exposed to rough treatment at the hands of his fellow-labourers. For example, he is bound up in the last sheaf, and, thus encased, is carried or carted about, beaten, drenched with water, thrown on a dunghill, and so forth. Or, if he is spared this horseplay, he is at least the subject of ridicule or is thought to be destined to suffer some misfortune in the course of the year. Hence the harvesters are naturally reluctant to give the last cut at reaping or the last stroke at threshing or to bind the last sheaf, and towards the close of the work this reluctance produces an emulation among the labourers, each striving to finish his task as fast as possible, in order that he may escape the invidious distinction of being last. For example, in the neighbourhood of Danzig, when the winter corn is cut and mostly bound up in sheaves, the portion which still remains to be bound is divided amongst the women binders, each of whom receives a swath of equal length to bind. A crowd of

reapers, children, and idlers gather round to witness the contest, and at the word, "Seize the Old Man," the women fall to work, all binding their allotted swaths as hard as they can. The spectators watch them narrowly, and the woman who cannot keep pace with the rest and consequently binds the last sheaf has to carry the Old Man (that is, the last sheaf made up in the form of a man) to the farmhouse and deliver it to the farmer with the words, "Here I bring you the Old Man." At the supper which follows, the Old Man is placed at the table and receives an abundant portion of food, which, as he cannot eat it, falls to the share of the woman who carried him. Afterwards the Old Man is placed in the yard and all the people dance round him. Or the woman who bound the last sheaf dances for a good while with the Old Man, while the rest form a ring round them; afterwards they all, one after the other, dance a single round with him. Further, the woman who bound the last sheaf goes herself by the name of the Old Man till the next harvest, and is often mocked with the cry, "Here comes the Old Man." In the Mittelmark district of Prussia, when the rye has been reaped, and the last sheaves are about to be tied up, the binders stand in two rows facing each other, every woman with her sheaf and her straw rope before her. At a given signal they all tie up their sheaves, and the one who is the last to finish is ridiculed by the rest. Not only so, but her sheaf is made up into human shape and called the Old Man, and she must carry it home to the farmyard, where the harvesters dance in a circle round her and it. Then they take the Old Man to the farmer and deliver it to him with the words, "We bring the Old Man to the Master. He may keep him till he gets a new one." After that the Old Man is set up against a tree, where he remains for a long time, the butt of many jests. At Aschbach in Bavaria, when the reaping is nearly finished, the reapers say, "Now, we will drive out the Old Man." Each of them sets himself to reap a patch of corn as fast as he can; he who cuts the last handful or the last stalk is greeted by the rest with an exulting cry, "You have the Old Man." Sometimes a black mask is fastened on the reaper's face and he is dressed in woman's clothes; or if the reaper is a woman, she is dressed in man's clothes. A dance follows. At the supper the Old Man gets twice as large a portion of food as the others. The proceedings are similar at threshing; the person who gives the last stroke is said to have the Old Man. At the supper given to the threshers he has to eat out of the cream-ladle and to drink a great deal. Moreover, he is quizzed and teased in all sorts of ways till he frees himself from further annoyance by treating the others to brandy or beer.

These examples illustrate the contests in reaping, threshing, and binding which take place amongst the harvesters, from their unwillingness to suffer the ridicule and discomfort incurred by the one who happens to finish his work last. It will be remembered that the person who is last at reaping, binding, or threshing, is regarded as the representative of the corn-spirit, and this idea is more fully expressed by binding him or her in corn-stalks. The latter custom has been already illustrated, but a few more instances may be added. At Kloxin, near Stettin, the harvesters call out to the woman who binds the last sheaf, "You have the Old Man, and must keep him." The Old Man is a great bundle of corn decked with flowers and ribbons, and fashioned into a rude semblance of the human form. It is fastened on a rake or strapped on a horse, and brought with music to the village. In delivering the Old Man to the farmer, the woman says:—

*"Here, dear Sir, is the Old Man.
He can stay no longer on the field,
He can hide himself no longer,
He must come into the village.
Ladies and gentlemen, pray be so kind
As to give the Old Man a present."*

As late as the first half of the nineteenth century the custom was to tie up the woman herself in pease-straw, and bring her with music to the farmhouse, where the harvesters danced with her till the pease-straw fell off. In other villages round Stettin, when the last harvest-waggon is being loaded, there is a regular race amongst the women, each striving not to be last. For she who places the last sheaf on the waggon is called the Old Man, and is completely swathed in corn-stalks; she is also decked with flowers, and flowers and a helmet of straw are placed on her head. In solemn procession she carries the harvest-crown to the squire, over whose head she holds it while she utters a string of good wishes. At the dance which follows, the Old Man has the right to choose his, or rather her, partner; it is an honour to dance with him. At Blankenfelde, in the district of Potsdam, the woman who binds the last sheaf at the rye-harvest is saluted with the cry, "You have the Old Man." A woman is then tied up in the last sheaf in such a way that only her head is left free; her hair also is covered with a cap made of rye-stalks, adorned with ribbons and flowers. She is called the Harvest-man, and must keep dancing in front of the last harvest-waggon till it reaches the squire's house, where she receives a present and is released from her envelope of corn. At Gommern, near Magdeburg, the reaper who cuts the last ears of corn is often wrapt up in corn-stalks so completely that it is hard to see whether there is a man in the bundle or not. Thus wrapt up he is taken by another stalwart reaper on his back, and carried round the field amidst the joyous cries of the harvesters. At Neuhausen, near Merseburg, the person who binds the last sheaf is wrapt in ears of oats and saluted as the Oats-man, whereupon the others dance round him. At Brie, Isle de France, the farmer himself is tied up in the *first* sheaf. At the harvest-home at Udvarhely, Transylvania, a person is encased in corn-stalks, and wears on his head a crown made out of the last ears cut. On reaching the village he is soused with water over and over. At Dingelstedt, in the district of Erfurt, down to the first half of the nineteenth century it was the custom to tie up a man in the last sheaf. He was called the Old Man, and was brought home on the last waggon, amid huzzas and music. On reaching the farmyard he was rolled round the barn and drenched with water. At Nördlingen in Bavaria the man who gives the last stroke at threshing is wrapt in straw and rolled on the threshing-floor. In some parts of Oberpfalz, Bavaria, he is said to "get the Old Man," is wrapt in straw, and carried to a neighbour who has not yet finished his threshing. In Silesia the woman who binds the last sheaf has to submit to a good deal of horse-play. She is pushed, knocked down, and tied up in the sheaf, after which she is called the corn-puppet (*Kornpopel*). In Thüringen a sausage is stuck in the last sheaf at threshing, and thrown, with the sheaf, on the threshing-floor. It is called the *Barrenwurst* or *Bazenwurst*, and is eaten by all the threshers. After they have eaten it a man is encased in pease-straw, and thus attired is led through the village.

"In all these cases the idea is that the spirit of the corn—the Old Man of vegetation—is driven out of the corn last cut or last threshed, and lives in the barn during the winter. At sowing-time he goes out again to the fields to resume his activity as animating force among the sprouting corn."

Ideas of the same sort appear to attach to the last corn in India. At Hoshangábád, in Central India, when the reaping is nearly done, a patch of corn, about a rood in extent, is left standing in the cultivator's last field, and the reapers rest a little. Then they rush at this remnant, tear it up, and cast it into the air, shouting victory to one or other of the local gods, according to their religious persuasion. A sheaf is made out of this corn, tied to a bamboo, set up in the last harvest cart, and carried home in triumph. Here it is fastened up in the threshing-floor or attached to a tree or to the cattle-shed, where its services are held to be essential for the purpose of averting the evil-eye. A like custom prevails in the eastern districts of the North-Western Provinces of India. Sometimes a little patch is left untilled as a refuge for the field-

spirit; sometimes it is sown, and when the corn of this patch has been reaped with a rush and a shout, it is presented to the priest, who offers it to the local gods or bestows it on a beggar.

II. Passing to the second point of comparison between the Lityerses story and European harvest customs, we have now to see that in the latter the corn-spirit is often believed to be killed at reaping or threshing. In the Romsdal and other parts of Norway, when the haymaking is over, the people say that "the Old Hay-man has been killed." In some parts of Bavaria the man who gives the last stroke at threshing is said to have killed the Corn-man, the Oats-man, or the Wheat-man, according to the crop. In the Canton of Tillot, in Lothringen, at threshing the last corn the men keep time with their flails, calling out as they thresh, "We are killing the Old Woman! We are killing the Old Woman!" If there is an old woman in the house she is warned to save herself, or she will be struck dead. Near Ragnit, in Lithuania, the last handful of corn is left standing by itself, with the words, "The Old Woman (*Boba*) is sitting in there." Then a young reaper whets his scythe, and, with a strong sweep, cuts down the handful. It is now said of him that "he has cut off the Boba's head"; and he receives a gratuity from the farmer and a jugful of water over his head from the farmer's wife. According to another account, every Lithuanian reaper makes haste to finish his task; for the Old Rye-woman lives in the last stalks, and whoever cuts the last stalks kills the Old Rye-woman, and by killing her he brings trouble on himself. In Wilkischken, in the district of Tilsit, the man who cuts the last corn goes by the name of "the killer of the Rye-woman." In Lithuania, again, the corn-spirit is believed to be killed at threshing as well as at reaping. When only a single pile of corn remains to be threshed, all the threshers suddenly step back a few paces, as if at the word of command. Then they fall to work, plying their flails with the utmost rapidity and vehemence, till they come to the last bundle. Upon this they fling themselves with almost frantic fury, straining every nerve, and raining blows on it till the word "Halt!" rings out sharply from the leader. The man whose flail is the last to fall after the command to stop has been given is immediately surrounded by all the rest, crying out that "he has struck the Old Rye-woman dead." He has to expiate the deed by treating them to brandy; and, like the man who cuts the last corn, he is known as "the killer of the Old Rye-woman." Sometimes in Lithuania the slain corn-spirit was represented by a puppet. Thus a female figure was made out of corn-stalks, dressed in clothes, and placed on the threshing-floor, under the heap of corn which was to be threshed last. Whoever thereafter gave the last stroke at threshing "struck the Old Woman dead." We have already met with examples of burning the figure which represents the corn-spirit. In the East Riding of Yorkshire a custom called "burning the Old Witch" is observed on the last day of harvest. A small sheaf of corn is burnt on the field in a fire of stubble; peas are parched at the fire and eaten with a liberal allowance of ale; and the lads and lasses romp about the flames and amuse themselves by blackening each other's faces. Sometimes, again, the corn-spirit is represented by a man, who lies down under the last corn; it is threshed upon his body, and the people say that "the Old Man is being beaten to death." We saw that sometimes the farmer's wife is thrust, together with the last sheaf, under the threshing-machine, as if to thresh her, and that afterwards a pretence is made of winnowing her. At Volders, in the Tyrol, husks of corn are stuck behind the neck of the man who gives the last stroke at threshing, and he is throttled with a straw garland. If he is tall, it is believed that the corn will be tall next year. Then he is tied on a bundle and flung into the river. In Carinthia, the thresher who gave the last stroke, and the person who untied the last sheaf on the threshing-floor, are bound hand and foot with straw bands, and crowns of straw are placed on their heads. Then they are tied, face to face, on a sledge, dragged through the village, and flung into a brook. The custom of throwing the representative of the corn-spirit into a stream, like that of drenching him with water, is, as usual, a rain-charm.

III. Thus far the representatives of the corn-spirit have generally been the man or woman who cuts, binds, or threshes the last corn. We now come to the cases in which the corn-spirit is represented either by a stranger passing the harvest-field (as in the Lityerses tale), or by a visitor entering it for the first time. All over Germany it is customary for the reapers or threshers to lay hold of passing strangers and bind them with a rope made of corn-stalks, till they pay a forfeit; and when the farmer himself or one of his guests enters the field or the threshing-floor for the first time, he is treated in the same way. Sometimes the rope is only tied round his arm or his feet or his neck. But sometimes he is regularly swathed in corn. Thus at Solör in Norway, whoever enters the field, be he the master or a stranger, is tied up in a sheaf and must pay a ransom. In the neighbourhood of Soest, when the farmer visits the flax-pullers for the first time, he is completely enveloped in flax. Passers-by are also surrounded by the women, tied up in flax, and compelled to stand brandy. At Nördlingen strangers are caught with straw ropes and tied up in a sheaf till they pay a forfeit. Among the Germans of Haselberg, in West Bohemia, as soon as a farmer had given the last corn to be threshed on the threshing-floor, he was swathed in it and had to redeem himself by a present of cakes. In Anhalt, when the proprietor or one of his family, the steward, or even a stranger enters the harvest-field for the first time after the reaping has begun, the wife of the chief reaper ties a rope twisted of corn-ears, or a nosegay made of corn-ears and flowers, to his arm, and he is obliged to ransom himself by the payment of a fine. In the canton of Putanges, in Normandy, a pretence of tying up the owner of the land in the last sheaf of wheat is still practised, or at least was still practised some quarter of a century ago. The task falls to the women alone. They throw themselves on the proprietor, seize him by the arms, the legs, and the body, throw him to the ground, and stretch him on the last sheaf. Then a show is made of binding him, and the conditions to be observed at the harvest-supper are dictated to him. When he has accepted them, he is released and allowed to get up. At Brie, Isle de France, when any one who does not belong to the farm passes by the harvest-field, the reapers give chase. If they catch him, they bind him in a sheaf and bite him, one after the other, in the forehead, crying, "You shall carry the key of the field." "To have the key" is an expression used by harvesters elsewhere in the sense of to cut or bind or thresh the last sheaf; hence, it is equivalent to the phrases "You have the Old Man," "You are the Old Man," which are addressed to the cutter, binder, or thresher of the last sheaf. Therefore, when a stranger, as at Brie, is tied up in a sheaf and told that he will "carry the key of the field," it is as much as to say that he is the Old Man, that is, an embodiment of the corn-spirit. In hop-picking, if a well-dressed stranger passes the hop-yard, he is seized by the women, tumbled into the bin, covered with leaves, and not released till he has paid a fine. In some parts of Scotland, particularly in the counties of Fife and Kinross, down to recent times the reapers used to seize and dump, as it was called, any stranger who happened to visit or pass by the harvest field. The custom was to lay hold of the stranger by his ankles and armpits, lift him up, and bring the lower part of his person into violent contact with the ground. Women as well as men were liable to be thus treated. The practice of interposing a sheaf between the sufferer and the ground is said to be a modern refinement. Comparing this custom with the one practised at Putanges in Normandy, which has just been described, we may conjecture that in Scotland the "dumping" of strangers on the harvest-field was originally a preliminary to wrapping them up in sheaves of corn.

Ceremonies of a somewhat similar kind are performed by the Tarahumare Indians of Mexico not only at harvest but also at hoeing and ploughing. "When the work of hoeing and weeding is finished, the workers seize the master of the field, and, tying his arms crosswise behind him, load all the implements, that is to say, the hoes, upon his back, fastening them with ropes. Then they form two single columns, the landlord in the middle between them, and all facing the house. Thus they start homeward. Simultaneously the two men at the heads of the

columns begin to run rapidly forward some thirty yards, cross each other, then turn back, run along the two columns, cross each other again at the rear and take their places each at the end of his row. As they pass each other ahead and in the rear of the columns they beat their mouths with the hollow of their hands and yell. As soon as they reach their places at the foot, the next pair in front of the columns starts off, running in the same way, and thus pair after pair performs the tour, the procession all the time advancing toward the house. A short distance in front of it they come to a halt, and are met by two young men who carry red handkerchiefs tied to sticks like flags. The father of the family, still tied up and loaded with the hoes, steps forward alone and kneels down in front of his house-door. The flag-bearers wave their banners over him, and the women of the household come out and kneel on their left knees, first toward the east, and after a little while toward each of the other cardinal points, west, south, and north. In conclusion the flags are waved in front of the house. The father then rises and the people untie him, whereupon he first salutes the women with the usual greeting, '*Kwīra!*' or '*Kwirevā!*' Now they all go into the house, and the man makes a short speech thanking them all for the assistance they have given him, for how could he have gotten through his work without them? They have provided him with a year's life (that is, with the wherewithal to sustain it), and now he is going to give them tesvino. He gives a drinking-gourd full to each one in the assembly, and appoints one man among them to distribute more to all. The same ceremony is performed after the ploughing and after the harvesting. On the first occasion the tied man may be made to carry the yoke of the oxen, on the second he does not carry anything." The meaning of these Mexican ceremonies is not clear. Perhaps the custom of tying up the farmer at hoeing, ploughing, and reaping is a form of expiation or apology offered to the spirits of the earth, who are naturally disturbed by agricultural operations. When the Yabim of Simbang in German New Guinea see that the taro plants in their fields are putting forth leaves, they offer sacrifice of sago-broth and pork to the spirits of the former owners of the land, in order that they may be kindly disposed and not do harm but let the fruits ripen. Similarly when the Alfoors or Toradjas of Central Celebes are planting a new field, they offer rice, eggs, and so forth to the souls of the former owners of the land, hoping that, mollified by these offerings, the souls will make the crops to grow and thrive. However, this explanation of the Mexican ceremonies at hoeing, ploughing, and reaping is purely conjectural. In these ceremonies there is no evidence that, as in the parallel European customs, the farmer is identified with the corn-spirit, since he is not wrapt up in the sheaves.

Be that as it may, the evidence adduced above suffices to prove that, like the ancient Lityerses, modern European reapers have been wont to lay hold of a passing stranger and tie him up in a sheaf. It is not to be expected that they should complete the parallel by cutting off his head; but if they do not take such a strong step, their language and gestures are at least indicative of a desire to do so. For instance, in Mecklenburg on the first day of reaping, if the master or mistress or a stranger enters the field, or merely passes by it, all the mowers face towards him and sharpen their scythes, clashing their whet-stones against them in unison, as if they were making ready to mow. Then the woman who leads the mowers steps up to him and ties a band round his left arm. He must ransom himself by payment of a forfeit. Near Ratzeburg, when the master or other person of mark enters the field or passes by it, all the harvesters stop work and march towards him in a body, the men with their scythes in front. On meeting him they form up in line, men and women. The men stick the poles of their scythes in the ground, as they do in whetting them; then they take off their caps and hang them on the scythes, while their leader stands forward and makes a speech. When he has done, they all whet their scythes in measured time very loudly, after which they put on their caps. Two of the women binders then come forward; one of them ties the master or stranger (as the case may be) with corn-ears or with a silken band; the other delivers a rhyming

address. The following are specimens of the speeches made by the reaper on these occasions. In some parts of Pomerania every passer-by is stopped, his way being barred with a corn-rope. The reapers form a circle round him and sharpen their scythes, while their leader says:—

*“The men are ready,
The scythes are bent,
The corn is great and small,
The gentleman must be mowed.”*

Then the process of whetting the scythes is repeated. At Ramin, in the district of Stettin, the stranger, standing encircled by the reapers, is thus addressed:—

*“We'll stroke the gentleman
With our naked sword,
Wherewith we shear meadows and fields.
We shear princes and lords.
Labourers are often athirst;
If the gentleman will stand beer and brandy
The joke will soon be over.
But, if our prayer he does not like,
The sword has a right to strike.”*

That in these customs the whetting of the scythes is really meant as a preliminary to mowing appears from the following variation of the preceding customs. In the district of Lüneburg, when any one enters the harvest-field, he is asked whether he will engage a good fellow. If he says yes, the harvesters mow some swaths, yelling and screaming, and then ask him for drink-money.

On the threshing-floor strangers are also regarded as embodiments of the corn-spirit, and are treated accordingly. At Wiedingharde in Schleswig when a stranger comes to the threshing-floor he is asked, “Shall I teach you the flail-dance?” If he says yes, they put the arms of the threshing-flail round his neck as if he were a sheaf of corn, and press them together so tight that he is nearly choked. In some parishes of Wermland (Sweden), when a stranger enters the threshing-floor where the threshers are at work, they say that “they will teach him the threshing-song.” Then they put a flail round his neck and a straw rope about his body. Also, as we have seen, if a stranger woman enters the threshing-floor, the threshers put a flail round her body and a wreath of corn-stalks round her neck, and call out, “See the Corn-woman! See! that is how the Corn-maiden looks!”

In these customs, observed both on the harvest-field and on the threshing-floor, a passing stranger is regarded as a personification of the corn, in other words, as the corn-spirit; and a show is made of treating him like the corn by mowing, binding, and threshing him. If the reader still doubts whether European peasants can really regard a passing stranger in this light, the following custom should set his doubts at rest. During the madder-harvest in the Dutch province of Zeeland a stranger passing by a field, where the people are digging the madder-roots, will sometimes call out to them *Koortspillers* (a term of reproach). Upon this, two of the fleetest runners make after him, and, if they catch him, they bring him back to the madder-field and bury him in the earth up to his middle at least, jeering at him the while; then they ease nature before his face.

This last act is to be explained as follows. The spirit of the corn and of other cultivated plants is sometimes conceived, not as immanent in the plant, but as its owner; hence the cutting of the corn at harvest, the digging of the roots, and the gathering of fruit from the fruit-trees are

each and all of them acts of spoliation, which strip him of his property and reduce him to poverty. Hence he is often known as “the Poor Man” or “the Poor Woman.” Thus in the neighbourhood of Eisenach a small sheaf is sometimes left standing on the field for “the Poor Old Woman.” At Marksuhl, near Eisenach, the puppet formed out of the last sheaf is itself called “the Poor Woman.” At Alt Lest in Silesia the man who binds the last sheaf is called the Beggar-man. In a village near Roeskilde, in Zealand (Denmark), old-fashioned peasants sometimes make up the last sheaf into a rude puppet, which is called the Rye-beggar. In Southern Schonen the sheaf which is bound last is called the Beggar; it is made bigger than the rest and is sometimes dressed in clothes. In the district of Olmütz the last sheaf is called the Beggar; it is given to an old woman, who must carry it home, limping on one foot. Sometimes a little of the crop is left on the field for the spirit, under other names than “the Poor Old Woman.” Thus at Szagmanten, a village of the Tilsit district, the last sheaf was left standing on the field “for the Old Rye-woman.” In Neftenbach (Canton of Zurich) the first three ears of corn reaped are thrown away on the field “to satisfy the Corn-mother and to make the next year's crop abundant.” At Kupferberg, in Bavaria, some corn is left standing on the field when the rest has been cut. Of this corn left standing they say that “it belongs to the Old Woman,” to whom it is dedicated in the following words:—

*“We give it to the Old Woman;
She shall keep it.
Next year may she be to us
As kind as this time she has been.”*

These words clearly shew that the Old Woman for whom the corn is left on the field is not a real personage, poor and hungry, but the mythical Old Woman who makes the corn to grow. At Schüttarschen, in West Bohemia, after the crop has been reaped, a few stalks are left standing and a garland is attached to them. “That belongs to the Wood-woman,” they say, and offer a prayer. In this way the Wood-woman, we are told, has enough to live on through the winter and the corn will thrive the better next year. The same thing is done for all the different kinds of corn-crop. So in Thüringen, when the after-grass (*Grummet*) is being got in, a little heap is left lying on the field; it belongs to “the Little Wood-woman” in return for the blessing she has bestowed. In the Frankenwald of Bavaria three handfuls of flax were left on the field “for the Wood-woman.” At Lindau in Anhalt the reapers used to leave some stalks standing in the last corner of the last field for “the Corn-woman to eat.” In some parts of Silesia it was till lately the custom to leave a few corn-stalks standing in the field, “in order that the next harvest should not fail.” In Russia it is customary to leave patches of unreaped corn in the fields and to place bread and salt on the ground near them. “These ears are eventually knotted together, and the ceremony is called ‘the plaiting of the beard of Volos,’ and it is supposed that after it has been performed no wizard or other evilly-disposed person will be able to hurt the produce of the fields. The unreaped patch is looked upon as tabooed; and it is believed that if any one meddles with it he will shrivel up, and become twisted like the interwoven ears. Similar customs are kept up in various parts of Russia. Near Kursk and Voroneje, for instance, a patch of rye is usually left in honour of the Prophet Elijah, and in another district one of oats is consecrated to St. Nicholas. As it is well known that both the Saint and the Prophet have succeeded to the place once held in the estimation of the Russian people by Perun, it seems probable that Volos really was, in ancient times, one of the names of the thunder-god.” In the north-east of Scotland a few stalks were sometimes left unreaped on the field for the benefit of “the aul' man.” Here “the aul' man” is probably the equivalent of the harvest Old Man of Germany. Among the Mohammedans of Zanzibar it is customary at sowing a field to reserve a certain portion of it for the guardian spirits, who at harvest are invited, to the tuck of drum, to come and take their share; tiny huts are also built

in which food is deposited for their use. In the island of Nias, to prevent the depredations of wandering spirits among the rice at harvest, a miniature field is dedicated to them and in it are sown all the plants that grow in the real fields. The Hos, a Ewe tribe of negroes in Togoland, observe a similar custom for a similar reason. At the entrance to their yam-fields the traveller may see on both sides of the path small mounds on which yams, stock-yams, beans, and maize are planted and appear to flourish with more than usual luxuriance. These little gardens, tended with peculiar care, are dedicated to the "guardian gods" of the owner of the land; there he cultivates for their benefit the same plants which he cultivates for his own use in the fields; and the notion is that the "guardian gods" will content themselves with eating the fruits which grow in their little private preserves and will not poach on the crops which are destined for human use.

These customs suggest that the little sacred rice-fields on which the Kayans of Borneo perform the various operations of husbandry in mimicry before they address themselves to the real labours of the field, may be dedicated to the spirits of the rice to compensate them for the loss they sustain by allowing men to cultivate all the rest of the land for their own benefit. Perhaps the Rarian plain at Eleusis was a spiritual preserve of the same kind set apart for the exclusive use of the corn-goddesses Demeter and Persephone. It may even be that the law which forbade the Hebrews to reap the corners and gather the gleanings of the harvest-fields and to strip the vines of their last grapes was originally intended for the benefit, not of the human poor, but of the poor spirits of the corn and the vine, who had just been despoiled by the reapers and the vintagers, and who, if some provision were not made for their subsistence, would naturally die of hunger before another year came round. In providing for their wants the prudent husbandman was really consulting his own interests; for how could he expect to reap wheat and barley and to gather grapes next year if he suffered the spirits of the corn and of the vine to perish of famine in the meantime? This train of thought may possibly explain the wide-spread custom of offering the first-fruits of the crops to gods or spirits: such offerings may have been originally not so much an expression of gratitude for benefits received as a means of enabling the benefactors to continue their benefactions in time to come. Primitive man has generally a shrewd eye to the main chance: he is more prone to provide for the future than to sentimentalise over the past.

Thus when the spirit of vegetation is conceived as a being who is robbed of his store and impoverished by the harvesters, it is natural that his representative—the passing stranger—should upbraid them; and it is equally natural that they should seek to disable him from pursuing them and recapturing the stolen property. Now, it is an old superstition that by easing nature on the spot where a robbery is committed, the robbers secure themselves, for a certain time, against interruption. Hence when madder-diggers resort to this proceeding in presence of the stranger whom they have caught and buried in the field, we may infer that they consider themselves robbers and him as the person robbed. Regarded as such, he must be the natural owner of the madder-roots, that is, their spirit or demon; and this conception is carried out by burying him, like the madder-roots, in the ground. The Greeks, it may be observed, were quite familiar with the idea that a passing stranger may be a god. Homer says that the gods in the likeness of foreigners roam up and down cities. Once in Poso, a district of Celebes, when a new missionary entered a house where a number of people were gathered round a sick man, one of them addressed the newcomer in these words: "Well, sir, as we had never seen you before, and you came suddenly in, while we sat here by ourselves, we thought it was a spirit."

Thus in these harvest-customs of modern Europe the person who cuts, binds, or threshes the last corn is treated as an embodiment of the corn-spirit by being wrapt up in sheaves, killed in mimicry by agricultural implements, and thrown into the water. These coincidences with the

Lityerses story seem to prove that the latter is a genuine description of an old Phrygian harvest-custom. But since in the modern parallels the killing of the personal representative of the corn-spirit is necessarily omitted or at most enacted only in mimicry, it is desirable to shew that in rude society human beings have been commonly killed as an agricultural ceremony to promote the fertility of the fields. The following examples will make this plain.

§ 3. Human Sacrifices for the Crops.

The Indians of Guayaquil, in Ecuador, used to sacrifice human blood and the hearts of men when they sowed their fields. The people of Cañar (now Cuenca in Ecuador) used to sacrifice a hundred children annually at harvest. The kings of Quito, the Incas of Peru, and for a long time the Spaniards were unable to suppress the bloody rite. At a Mexican harvest-festival, when the first-fruits of the season were offered to the sun, a criminal was placed between two immense stones, balanced opposite each other, and was crushed by them as they fell together. His remains were buried, and a feast and dance followed. This sacrifice was known as "the meeting of the stones." "Tlaloc was worshipped in Mexico as the god of the thunder and the storm which precedes the fertilising rain; elsewhere his wife Xochiquetzal, who at Tlaxcallan was called Matlalcuéyé or the Lady of the Blue Petticoats, shared these honours, and it was to her that many countries in Central America particularly paid their devotions. Every year, at the time when the cobs of the still green and milky maize are about to coagulate and ripen, they used to sacrifice to the goddess four young girls, chosen among the noblest families of the country; they were decked out in festal attire, crowned with flowers, and conveyed in rich palanquins to the brink of the hallowed waters, where the sacrifice was to be offered. The priests, clad in long floating robes, their heads encircled with feather crowns, marched in front of the litters carrying censers with burning incense. The town of Elopango, celebrated for its temple, was near the lake of the same name, the etymology of which refers to the sheaves of tender maize (*elotl*, 'sheaf of tender maize'). It was dedicated to the goddess Xochiquetzal, to whom the young victims were offered by being hurled from the top of a rock into the abyss. At the moment of consummating this inhuman rite, the priests addressed themselves in turn to the four virgins in order to banish the fear of death from their minds. They drew for them a bright picture of the delights they were about to enjoy in the company of the gods, and advised them not to forget the earth which they had left behind, but to entreat the divinity, to whom they despatched them, to bless the forthcoming harvest." We have seen that the ancient Mexicans also sacrificed human beings at all the various stages in the growth of the maize, the age of the victims corresponding to the age of the corn; for they sacrificed new-born babes at sowing, older children when the grain had sprouted, and so on till it was fully ripe, when they sacrificed old men. No doubt the correspondence between the ages of the victims and the state of the corn was supposed to enhance the efficacy of the sacrifice.

The Pawnees annually sacrificed a human victim in spring when they sowed their fields. The sacrifice was believed to have been enjoined on them by the Morning Star, or by a certain bird which the Morning Star had sent to them as its messenger. The bird was stuffed and preserved as a powerful talisman. They thought that an omission of this sacrifice would be followed by the total failure of the crops of maize, beans, and pumpkins. The victim was a captive of either sex. He was clad in the gayest and most costly attire, was fattened on the choicest food, and carefully kept in ignorance of his doom. When he was fat enough, they bound him to a cross in the presence of the multitude, danced a solemn dance, then cleft his head with a tomahawk and shot him with arrows. According to one trader, the squaws then cut pieces of flesh from the victim's body, with which they greased their hoes; but this was denied by another trader who had been present at the ceremony. Immediately after the sacrifice the people proceeded to plant their fields. A particular account has been preserved of the sacrifice of a Sioux girl by the Pawnees in April 1837 or 1838. The girl was fourteen or

fifteen years old and had been kept for six months and well treated. Two days before the sacrifice she was led from wigwam to wigwam, accompanied by the whole council of chiefs and warriors. At each lodge she received a small billet of wood and a little paint, which she handed to the warrior next to her. In this way she called at every wigwam, receiving at each the same present of wood and paint. On the twenty-second of April she was taken out to be sacrificed, attended by the warriors, each of whom carried two pieces of wood which he had received from her hands. Her body having been painted half red and half black, she was attached to a sort of gibbet and roasted for some time over a slow fire, then shot to death with arrows. The chief sacrificer next tore out her heart and devoured it. While her flesh was still warm it was cut in small pieces from the bones, put in little baskets, and taken to a neighbouring corn-field. There the head chief took a piece of the flesh from a basket and squeezed a drop of blood upon the newly-deposited grains of corn. His example was followed by the rest, till all the seed had been sprinkled with the blood; it was then covered up with earth. According to one account the body of the victim was reduced to a kind of paste, which was rubbed or sprinkled not only on the maize but also on the potatoes, the beans, and other seeds to fertilise them. By this sacrifice they hoped to obtain plentiful crops.

A West African queen used to sacrifice a man and woman in the month of March. They were killed with spades and hoes, and their bodies buried in the middle of a field which had just been tilled. At Lagos in Guinea it was the custom annually to impale a young girl alive soon after the spring equinox in order to secure good crops. Along with her were sacrificed sheep and goats, which, with yams, heads of maize, and plantains, were hung on stakes on each side of her. The victims were bred up for the purpose in the king's seraglio, and their minds had been so powerfully wrought upon by the fetish men that they went cheerfully to their fate. A similar sacrifice used to be annually offered at Benin, in Guinea. The Marimos, a Bechuana tribe, sacrifice a human being for the crops. The victim chosen is generally a short, stout man. He is seized by violence or intoxicated and taken to the fields, where he is killed amongst the wheat to serve as "seed" (so they phrase it). After his blood has coagulated in the sun, it is burned along with the frontal bone, the flesh attached to it, and the brain; the ashes are then scattered over the ground to fertilise it. The rest of the body is eaten. The Wamegi of the Usagara hills in German East Africa used to offer human sacrifices of a peculiar kind once a year about the time of harvest, which was also the time of sowing; for the Wamegi have two crops annually, one in September and one in February. The festival was usually held in September or October. The victim was a girl who had attained the age of puberty. She was taken to a hill where the festival was to be celebrated, and there she was crushed to death between two branches. The sacrifice was not performed in the fields, and my informant could not ascertain its object, but we may conjecture that it was to ensure good crops in the following year.

The Bagobos of Mindanao, one of the Philippine Islands, offer a human sacrifice before they sow their rice. The victim is a slave, who is hewn to pieces in the forest. The natives of Bontoc, a province in the interior of Luzon, one of the Philippine Islands, are passionate head-hunters. Their principal seasons for head-hunting are the times of planting and reaping the rice. In order that the crop may turn out well, every farm must get at least one human head at planting and one at sowing. The head-hunters go out in twos or threes, lie in wait for the victim, whether man or woman, cut off his or her head, hands, and feet, and bring them back in haste to the village, where they are received with great rejoicings. The skulls are at first exposed on the branches of two or three dead trees which stand in an open space of every village surrounded by large stones which serve as seats. The people then dance round them and feast and get drunk. When the flesh has decayed from the head, the man who cut it off takes it home and preserves it as a relic, while his companions do the same with the hands

and the feet. Similar customs are observed by the Apoyaos, another tribe in the interior of Luzon.

The Wild Wa, an agricultural tribe on the north-eastern frontier of Upper Burma, still hunt for human heads as a means of promoting the welfare of the crops. The Wa regards his skulls as a protection against the powers of evil. "Without a skull his crops would fail; without a skull his kine might die; without a skull the father and mother spirits would be shamed and might be enraged; if there were no protecting skull the other spirits who are all malignant, might gain entrance and kill the inhabitants, or drink all the liquor." The Wa country is a series of mountain ranges shelving rapidly down to narrow valleys from two to five thousand feet deep. The villages are all perched high on the slopes, some just under the crest of the ridge, some lower down on a small projecting spur of flat ground. Industrious cultivation has cleared away the jungle, and the villages stand out conspicuously in the landscape as yellowish-brown blotches on the hillsides. Each village is fortified by an earthen rampart so thickly overgrown with cactuses and other shrubs as to be impenetrable. The only entrance is through a narrow, low and winding tunnel, the floor of which, for additional security, is thickly studded with pegs to wound the feet of enemies who might attempt to force a way in. The Wa depend for their subsistence mainly on their crops of buckwheat, beans, and maize; rice they cultivate only to distil a strong spirituous liquor from it. They had need be industrious, for no field can be reached without a climb up or down the steep mountain-side. Sometimes the rice-fields lie three thousand feet or more below the village, and they require constant attention. But the chief crop raised by the Wa is the poppy, from which they make opium. In February and March the hill-tops for miles are white with the blossom, and you may travel for days through nothing but fields of poppies. Then, too, is the proper season for head-hunting. It opens in March and lasts through April. Parties of head-hunters at that time go forth to prowl for human prey. As a rule they will not behead people of a neighbouring village nor even of any village on the same range of hills. To find victims they go to the next range or at any rate to a distance, and the farther the better, for the heads of strangers are preferred. The reason is that the ghosts of strangers, being unfamiliar with the country, are much less likely to stray away from their skulls; hence they make more vigilant sentinels than the ghosts of people better acquainted with the neighbourhood, who are apt to go off duty without waiting for the tedious formality of relieving guard. When head-hunters return to a village with human heads, the rejoicing is uproarious. Then the great drum is beaten frantically, and its deep hollow boom resounding far and wide through the hills announces to the neighbourhood the glad tidings of murder successfully perpetrated. Then the barrels, or rather the bamboos, of rice-spirit are tapped, and while the genial stream flows and the women and children dance and sing for glee, the men drink themselves blind and mad drunk. The ghastly head, which forms the centre of all this rejoicing, is first taken to the spirit-house, a small shed which usually stands on the highest point of the village site. There, wrapt in grass or leaves, it is hung up in a basket to ripen and bleach. When all the flesh and sinews have mouldered away and nothing remains but the blanched and grinning skull, it is put to rest in the village Golgotha. This is an avenue of huge old trees, whose interlacing boughs form a verdant archway overhead and, with the dense undergrowth, cast a deep shadow on the ground below. Every village has such an avenue stretching along the hillside sometimes for a long distance, or even till it meets the avenue of the neighbouring village. In the solemn gloom of this verdurous canopy is the Place of Skulls. On one side of the avenue stands a row of wooden posts, usually mere trunks of trees with the bark peeled off, but sometimes rudely carved and painted with designs in red and black. A little below the top of each post is cut a niche, and in front of the niche is a ledge. On this ledge the skull is deposited, sometimes so that it is in full view of passers-by in the avenue, sometimes so that it only grins at them through a slit. Most villages count their skulls by tens or twenties, but some of them have

hundreds of these trophies, especially when the avenue forms an unbroken continuity of shade between the villages. The old skulls ensure peace to the village, but at least one new one should be taken every year, that the rice may grow green far down in the depths of the valley, that the maize may tinge with its golden hue the steep mountain-sides, and that the hilltops may be white for miles and miles with the bloom of the poppy.

The Shans of Indo-China still believe in the efficacy of human sacrifice to procure a good harvest, though they act on the belief less than some other tribes of this region. Their practice now is to poison somebody at the state festival, which is generally held at some time between March and May. Among the Lhota Naga, one of the many savage tribes who inhabit the deep rugged labyrinthine glens which wind into the mountains from the rich valley of Brahmapootra, it used to be a common custom to chop off the heads, hands, and feet of people they met with, and then to stick up the severed extremities in their fields to ensure a good crop of grain. They bore no ill-will whatever to the persons upon whom they operated in this unceremonious fashion. Once they flayed a boy alive, carved him in pieces, and distributed the flesh among all the villagers, who put it into their corn-bins to avert bad luck and ensure plentiful crops of grain. The Angami, another tribe of the same region, used also to relieve casual passers-by of their heads, hands, and feet, with the same excellent intention. The hill tribe Kudulu, near Vizagapatam in the Madras Presidency, offered human sacrifices to the god Jankari for the purpose of obtaining good crops. The ceremony was generally performed on the Sunday before or after the Pongal feast. For the most part the victim was purchased, and until the time for the sacrifice came he was free to wander about the village, to eat and drink what he liked, and even to lie with any woman he met. On the appointed day he was carried before the idol drunk; and when one of the villagers had cut a hole in his stomach and smeared the blood on the idol, the crowds from the neighbouring villages rushed upon him and hacked him to pieces. All who were fortunate enough to secure morsels of his flesh carried them away and presented them to their village idols. The Gonds of India, a Dravidian race, kidnapped Brahman boys, and kept them as victims to be sacrificed on various occasions. At sowing and reaping, after a triumphal procession, one of the lads was slain by being punctured with a poisoned arrow. His blood was then sprinkled over the ploughed field or the ripe crop, and his flesh was devoured. The Oraons or Uraons of Chota Nagpur worship a goddess called Anna Kuari, who can give good crops and make a man rich, but to induce her to do so it is necessary to offer human sacrifices. In spite of the vigilance of the British Government these sacrifices are said to be still secretly perpetrated. The victims are poor waifs and strays whose disappearance attracts no notice. April and May are the months when the catchpoles are out on the prowl. At that time strangers will not go about the country alone, and parents will not let their children enter the jungle or herd the cattle. When a catchpole has found a victim, he cuts his throat and carries away the upper part of the ring finger and the nose. The goddess takes up her abode in the house of any man who has offered her a sacrifice, and from that time his fields yield a double harvest. The form she assumes in the house is that of a small child. When the householder brings in his unhusked rice, he takes the goddess and rolls her over the heap to double its size. But she soon grows restless and can only be pacified with the blood of fresh human victims.

But the best known case of human sacrifices, systematically offered to ensure good crops, is supplied by the Khonds or Kandhs, another Dravidian race in Bengal. Our knowledge of them is derived from the accounts written by British officers who, about the middle of the nineteenth century, were engaged in putting them down. The sacrifices were offered to the Earth Goddess, Tari Pennu or Bera Pennu, and were believed to ensure good crops and immunity from all disease and accidents. In particular, they were considered necessary in the cultivation of turmeric, the Khonds arguing that the turmeric could not have a deep red colour

without the shedding of blood. The victim or Meriah, as he was called, was acceptable to the goddess only if he had been purchased, or had been born a victim—that is, the son of a victim father, or had been devoted as a child by his father or guardian. Khonds in distress often sold their children for victims, “considering the beatification of their souls certain, and their death, for the benefit of mankind, the most honourable possible.” A man of the Panua tribe was once seen to load a Khond with curses, and finally to spit in his face, because the Khond had sold for a victim his own child, whom the Panua had wished to marry. A party of Khonds, who saw this, immediately pressed forward to comfort the seller of his child, saying, “Your child has died that all the world may live, and the Earth Goddess herself will wipe that spittle from your face.” The victims were often kept for years before they were sacrificed. Being regarded as consecrated beings, they were treated with extreme affection, mingled with deference, and were welcomed wherever they went. A Meriah youth, on attaining maturity, was generally given a wife, who was herself usually a Meriah or victim; and with her he received a portion of land and farm-stock. Their offspring were also victims. Human sacrifices were offered to the Earth Goddess by tribes, branches of tribes, or villages, both at periodical festivals and on extraordinary occasions. The periodical sacrifices were generally so arranged by tribes and divisions of tribes that each head of a family was enabled, at least once a year, to procure a shred of flesh for his fields, generally about the time when his chief crop was laid down.

The mode of performing these tribal sacrifices was as follows. Ten or twelve days before the sacrifice, the victim was devoted by cutting off his hair, which, until then, had been kept unshorn. Crowds of men and women assembled to witness the sacrifice; none might be excluded, since the sacrifice was declared to be for all mankind. It was preceded by several days of wild revelry and gross debauchery. On the day before the sacrifice the victim, dressed in a new garment, was led forth from the village in solemn procession, with music and dancing, to the Meriah grove, a clump of high forest trees standing a little way from the village and untouched by the axe. There they tied him to a post, which was sometimes placed between two plants of the sankissar shrub. He was then anointed with oil, ghee, and turmeric, and adorned with flowers; and “a species of reverence, which it is not easy to distinguish from adoration,” was paid to him throughout the day. A great struggle now arose to obtain the smallest relic from his person; a particle of the turmeric paste with which he was smeared, or a drop of his spittle, was esteemed of sovereign virtue, especially by the women. The crowd danced round the post to music, and, addressing the earth, said, “O God, we offer this sacrifice to you; give us good crops, seasons, and health”; then speaking to the victim they said, “We bought you with a price, and did not seize you; now we sacrifice you according to custom, and no sin rests with us.”

On the last morning the orgies, which had been scarcely interrupted during the night, were resumed, and continued till noon, when they ceased, and the assembly proceeded to consummate the sacrifice. The victim was again anointed with oil, and each person touched the anointed part, and wiped the oil on his own head. In some places they took the victim in procession round the village, from door to door, where some plucked hair from his head, and others begged for a drop of his spittle, with which they anointed their heads. As the victim might not be bound nor make any show of resistance, the bones of his arms and, if necessary, his legs were broken; but often this precaution was rendered unnecessary by stupefying him with opium. The mode of putting him to death varied in different places. One of the commonest modes seems to have been strangulation, or squeezing to death. The branch of a green tree was cleft several feet down the middle; the victim's neck (in other places, his chest) was inserted in the cleft, which the priest, aided by his assistants, strove with all his force to close. Then he wounded the victim slightly with his axe, whereupon the crowd rushed at the wretch and hewed the flesh from the bones, leaving the head and bowels untouched.

Sometimes he was cut up alive. In Chinna Kimedya he was dragged along the fields, surrounded by the crowd, who, avoiding his head and intestines, hacked the flesh from his body with their knives till he died. Another very common mode of sacrifice in the same district was to fasten the victim to the proboscis of a wooden elephant, which revolved on a stout post, and, as it whirled round, the crowd cut the flesh from the victim while life remained. In some villages Major Campbell found as many as fourteen of these wooden elephants, which had been used at sacrifices. In one district the victim was put to death slowly by fire. A low stage was formed, sloping on either side like a roof; upon it they laid the victim, his limbs wound round with cords to confine his struggles. Fires were then lighted and hot brands applied, to make him roll up and down the slopes of the stage as long as possible; for the more tears he shed the more abundant would be the supply of rain. Next day the body was cut to pieces.

The flesh cut from the victim was instantly taken home by the persons who had been deputed by each village to bring it. To secure its rapid arrival, it was sometimes forwarded by relays of men, and conveyed with postal fleetness fifty or sixty miles. In each village all who stayed at home fasted rigidly until the flesh arrived. The bearer deposited it in the place of public assembly, where it was received by the priest and the heads of families. The priest divided it into two portions, one of which he offered to the Earth Goddess by burying it in a hole in the ground with his back turned, and without looking. Then each man added a little earth to bury it, and the priest poured water on the spot from a hill gourd. The other portion of flesh he divided into as many shares as there were heads of houses present. Each head of a house rolled his shred of flesh in leaves, and buried it in his favourite field, placing it in the earth behind his back without looking. In some places each man carried his portion of flesh to the stream which watered his fields, and there hung it on a pole. For three days thereafter no house was swept; and, in one district, strict silence was observed, no fire might be given out, no wood cut, and no strangers received. The remains of the human victim (namely, the head, bowels, and bones) were watched by strong parties the night after the sacrifice; and next morning they were burned, along with a whole sheep, on a funeral pile. The ashes were scattered over the fields, laid as paste over the houses and granaries, or mixed with the new corn to preserve it from insects. Sometimes, however, the head and bones were buried, not burnt. After the suppression of the human sacrifices, inferior victims were substituted in some places; for instance, in the capital of Chinna Kimedya a goat took the place of a human victim. Others sacrifice a buffalo. They tie it to a wooden post in a sacred grove, dance wildly round it with brandished knives, then, falling on the living animal, hack it to shreds and tatters in a few minutes, fighting and struggling with each other for every particle of flesh. As soon as a man has secured a piece he makes off with it at full speed to bury it in his fields, according to ancient custom, before the sun has set, and as some of them have far to go they must run very fast. All the women throw clods of earth at the rapidly retreating figures of the men, some of them taking very good aim. Soon the sacred grove, so lately a scene of tumult, is silent and deserted except for a few people who remain to guard all that is left of the buffalo, to wit, the head, the bones, and the stomach, which are burned with ceremony at the foot of the stake.

In these Khond sacrifices the Meriahs are represented by our authorities as victims offered to propitiate the Earth Goddess. But from the treatment of the victims both before and after death it appears that the custom cannot be explained as merely a propitiatory sacrifice. A part of the flesh certainly was offered to the Earth Goddess, but the rest was buried by each householder in his fields, and the ashes of the other parts of the body were scattered over the fields, laid as paste on the granaries, or mixed with the new corn. These latter customs imply that to the body of the Meriah there was ascribed a direct or intrinsic power of making the

crops to grow, quite independent of the indirect efficacy which it might have as an offering to secure the good-will of the deity. In other words, the flesh and ashes of the victim were believed to be endowed with a magical or physical power of fertilising the land. The same intrinsic power was ascribed to the blood and tears of the Meriah, his blood causing the redness of the turmeric and his tears producing rain; for it can hardly be doubted that, originally at least, the tears were supposed to bring down the rain, not merely to prognosticate it. Similarly the custom of pouring water on the buried flesh of the Meriah was no doubt a rain-charm. Again, magical power as an attribute of the Meriah appears in the sovereign virtue believed to reside in anything that came from his person, as his hair or spittle. The ascription of such power to the Meriah indicates that he was much more than a mere man sacrificed to propitiate a deity. Once more, the extreme reverence paid him points to the same conclusion. Major Campbell speaks of the Meriah as "being regarded as something more than mortal," and Major Macpherson says, "A species of reverence, which it is not easy to distinguish from adoration, is paid to him." In short, the Meriah seems to have been regarded as divine. As such, he may originally have represented the Earth Goddess or, perhaps, a deity of vegetation; though in later times he came to be regarded rather as a victim offered to a deity than as himself an incarnate god. This later view of the Meriah as a victim rather than a divinity may perhaps have received undue emphasis from the European writers who have described the Khond religion. Habituated to the later idea of sacrifice as an offering made to a god for the purpose of conciliating his favour, European observers are apt to interpret all religious slaughter in this sense, and to suppose that wherever such slaughter takes place, there must necessarily be a deity to whom the carnage is believed by the slayers to be acceptable. Thus their preconceived ideas may unconsciously colour and warp their descriptions of savage rites.

The same custom of killing the representative of a god, of which strong traces appear in the Khond sacrifices, may perhaps be detected in some of the other human sacrifices described above. Thus the ashes of the slaughtered Marimo were scattered over the fields; the blood of the Brahman lad was put on the crop and field; the flesh of the slain Naga was stowed in the corn-bin; and the blood of the Sioux girl was allowed to trickle on the seed. Again, the identification of the victim with the corn, in other words, the view that he is an embodiment or spirit of the corn, is brought out in the pains which seem to be taken to secure a physical correspondence between him and the natural object which he embodies or represents. Thus the Mexicans killed young victims for the young corn and old ones for the ripe corn; the Marimos sacrifice, as "seed," a short, fat man, the shortness of his stature corresponding to that of the young corn, his fatness to the condition which it is desired that the crops may attain; and the Pawnees fattened their victims probably with the same view. Again, the identification of the victim with the corn comes out in the African custom of killing him with spades and hoes, and the Mexican custom of grinding him, like corn, between two stones.

One more point in these savage customs deserves to be noted. The Pawnee chief devoured the heart of the Sioux girl, and the Marimos and Gonds ate the victim's flesh. If, as we suppose, the victim was regarded as divine, it follows that in eating his flesh his worshippers believed themselves to be partaking of the body of their god.

§ 4. The Corn-spirit slain in his Human Representatives.

The barbarous rites just described offer analogies to the harvest customs of Europe. Thus the fertilising virtue ascribed to the corn-spirit is shewn equally in the savage custom of mixing the victim's blood or ashes with the seed-corn and the European custom of mixing the grain from the last sheaf with the young corn in spring. Again, the identification of the person with the corn appears alike in the savage custom of adapting the age and stature of the victim to

the age and stature, whether actual or expected, of the crop; in the Scotch and Styrian rules that when the corn-spirit is conceived as the Maiden the last corn shall be cut by a young maiden, but when it is conceived as the Corn-mother it shall be cut by an old woman; in the Lothringian warning given to old women to save themselves when the Old Woman is being killed, that is, when the last corn is being threshed; and in the Tyrolese expectation that if the man who gives the last stroke at threshing is tall, the next year's corn will be tall also. Further, the same identification is implied in the savage custom of killing the representative of the corn-spirit with hoes or spades or by grinding him between stones, and in the European custom of pretending to kill him with the scythe or the flail. Once more the Khond custom of pouring water on the buried flesh of the victim is parallel to the European customs of pouring water on the personal representative of the corn-spirit or plunging him into a stream. Both the Khond and the European customs are rain-charms.

To return now to the Lityerses story. It has been shewn that in rude society human beings have been commonly killed to promote the growth of the crops. There is therefore no improbability in the supposition that they may once have been killed for a like purpose in Phrygia and Europe; and when Phrygian legend and European folk-custom, closely agreeing with each other, point to the conclusion that men were so slain, we are bound, provisionally at least, to accept the conclusion. Further, both the Lityerses story and European harvest-customs agree in indicating that the victim was put to death as a representative of the corn-spirit, and this indication is in harmony with the view which some savages appear to take of the victim slain to make the crops flourish. On the whole, then, we may fairly suppose that both in Phrygia and in Europe the representative of the corn-spirit was annually killed upon the harvest-field. Grounds have been already shewn for believing that similarly in Europe the representative of the tree-spirit was annually slain. The proofs of these two remarkable and closely analogous customs are entirely independent of each other. Their coincidence seems to furnish fresh presumption in favour of both.

To the question, How was the representative of the corn-spirit chosen? one answer has been already given. Both the Lityerses story and European folk-custom shew that passing strangers were regarded as manifestations of the corn-spirit escaping from the cut or threshed corn, and as such were seized and slain. But this is not the only answer which the evidence suggests. According to the Phrygian legend the victims of Lityerses were not simply passing strangers, but persons whom he had vanquished in a reaping contest and afterwards wrapt up in corn-sheaves and beheaded. This suggests that the representative of the corn-spirit may have been selected by means of a competition on the harvest-field, in which the vanquished competitor was compelled to accept the fatal honour. The supposition is countenanced by European harvest-customs. We have seen that in Europe there is sometimes a contest amongst the reapers to avoid being last, and that the person who is vanquished in this competition, that is, who cuts the last corn, is often roughly handled. It is true we have not found that a pretence is made of killing him; but on the other hand we have found that a pretence is made of killing the man who gives the last stroke at threshing, that is, who is vanquished in the threshing contest. Now, since it is in the character of representative of the corn-spirit that the thresher of the last corn is slain in mimicry, and since the same representative character attaches (as we have seen) to the cutter and binder as well as to the thresher of the last corn, and since the same repugnance is evinced by harvesters to be last in any one of these labours, we may conjecture that a pretence has been commonly made of killing the reaper and binder as well as the thresher of the last corn, and that in ancient times this killing was actually carried out. This conjecture is corroborated by the common superstition that whoever cuts the last corn must die soon. Sometimes it is thought that the person who binds the last sheaf on the field will die in the course of next year. The reason for fixing on the reaper, binder, or thresher of

the last corn as the representative of the corn-spirit may be this. The corn-spirit is supposed to lurk as long as he can in the corn, retreating before the reapers, the binders, and the threshers at their work. But when he is forcibly expelled from his refuge in the last corn cut or the last sheaf bound or the last grain threshed, he necessarily assumes some other form than that of the corn-stalks which had hitherto been his garment or body. And what form can the expelled corn-spirit assume more naturally than that of the person who stands nearest to the corn from which he (the corn-spirit) has just been expelled? But the person in question is necessarily the reaper, binder, or thresher of the last corn. He or she, therefore, is seized and treated as the corn-spirit himself.

Thus the person who was killed on the harvest-field as the representative of the corn-spirit may have been either a passing stranger or the harvester who was last at reaping, binding, or threshing. But there is a third possibility, to which ancient legend and modern folk-custom alike point. Lityerses not only put strangers to death; he was himself slain, and apparently in the same way as he had slain others, namely, by being wrapt in a corn-sheaf, beheaded, and cast into the river; and it is implied that this happened to Lityerses on his own land. Similarly in modern harvest-customs the pretence of killing appears to be carried out quite as often on the person of the master (farmer or squire) as on that of strangers. Now when we remember that Lityerses was said to have been a son of the King of Phrygia, and that in one account he is himself called a king, and when we combine with this the tradition that he was put to death, apparently as a representative of the corn-spirit, we are led to conjecture that we have here another trace of the custom of annually slaying one of those divine or priestly kings who are known to have held ghostly sway in many parts of Western Asia and particularly in Phrygia. The custom appears, as we have seen, to have been so far modified in places that the king's son was slain in the king's stead. Of the custom thus modified the story of Lityerses would be, in one version at least, a reminiscence.

Turning now to the relation of the Phrygian Lityerses to the Phrygian Attis, it may be remembered that at Pessinus—the seat of a priestly kingship—the high-priest appears to have been annually slain in the character of Attis, a god of vegetation, and that Attis was described by an ancient authority as “a reaped ear of corn.” Thus Attis, as an embodiment of the corn-spirit, annually slain in the person of his representative, might be thought to be ultimately identical with Lityerses, the latter being simply the rustic prototype out of which the state religion of Attis was developed. It may have been so; but, on the other hand, the analogy of European folk-custom warns us that amongst the same people two distinct deities of vegetation may have their separate personal representatives, both of whom are slain in the character of gods at different times of the year. For in Europe, as we have seen, it appears that one man was commonly slain in the character of the tree-spirit in spring, and another in the character of the corn-spirit in autumn. It may have been so in Phrygia also. Attis was especially a tree-god, and his connexion with corn may have been only such an extension of the power of a tree-spirit as is indicated in customs like the Harvest-May. Again, the representative of Attis appears to have been slain in spring; whereas Lityerses must have been slain in summer or autumn, according to the time of the harvest in Phrygia. On the whole, then, while we are not justified in regarding Lityerses as the prototype of Attis, the two may be regarded as parallel products of the same religious idea, and may have stood to each other as in Europe the Old Man of harvest stands to the Wild Man, the Leaf Man, and so forth, of spring. Both were spirits or deities of vegetation, and the personal representatives of both were annually slain. But whereas the Attis worship became elevated into the dignity of a State religion and spread to Italy, the rites of Lityerses seem never to have passed the limits of their native Phrygia, and always retained their character of rustic ceremonies performed by peasants on the harvest-field. At most a few villages may have clubbed together, as amongst

the Khonds, to procure a human victim to be slain as representative of the corn-spirit for their common benefit. Such victims may have been drawn from the families of priestly kings or kinglets, which would account for the legendary character of Lityerses as the son of a Phrygian king or as himself a king. When villages did not so club together, each village or farm may have procured its own representative of the corn-spirit by dooming to death either a passing stranger or the harvester who cut, bound, or threshed the last sheaf. Perhaps in the olden time the practice of head-hunting as a means of promoting the growth of the corn may have been as common among the rude inhabitants of Europe and Western Asia as it still is, or was till lately, among the primitive agricultural tribes of Assam, Burma, the Philippine Islands, and the Indian Archipelago. It is hardly necessary to add that in Phrygia, as in Europe, the old barbarous custom of killing a man on the harvest-field or the threshing-floor had doubtless passed into a mere pretence long before the classical era, and was probably regarded by the reapers and threshers themselves as no more than a rough jest which the license of a harvest-home permitted them to play off on a passing stranger, a comrade, or even on their master himself.

I have dwelt on the Lityerses song at length because it affords so many points of comparison with European and savage folk-custom. The other harvest songs of Western Asia and Egypt, to which attention has been called above, may now be dismissed much more briefly. The similarity of the Bithynian Bormus to the Phrygian Lityerses helps to bear out the interpretation which has been given of the latter. Bormus, whose death or rather disappearance was annually mourned by the reapers in a plaintive song, was, like Lityerses, a king's son or at least the son of a wealthy and distinguished man. The reapers whom he watched were at work on his own fields, and he disappeared in going to fetch water for them; according to one version of the story he was carried off by the nymphs, doubtless the nymphs of the spring or pool or river whither he went to draw water. Viewed in the light of the Lityerses story and of European folk-custom, this disappearance of Bormus may be a reminiscence of the custom of binding the farmer himself in a corn-sheaf and throwing him into the water. The mournful strain which the reapers sang was probably a lamentation over the death of the corn-spirit, slain either in the cut corn or in the person of a human representative; and the call which they addressed to him may have been a prayer that he might return in fresh vigour next year.

The Phoenician Linus song was sung at the vintage, at least in the west of Asia Minor, as we learn from Homer; and this, combined with the legend of Syleus, suggests that in ancient times passing strangers were handled by vintagers and vine-diggers in much the same way as they are said to have been handled by the reaper Lityerses. The Lydian Syleus, so ran the legend, compelled passers-by to dig for him in his vineyard, till Hercules came and killed him and dug up his vines by the roots. This seems to be the outline of a legend like that of Lityerses; but neither ancient writers nor modern folk-custom enable us to fill in the details. But, further, the Linus song was probably sung also by Phoenician reapers, for Herodotus compares it to the Maneros song, which, as we have seen, was a lament raised by Egyptian reapers over the cut corn. Further, Linus was identified with Adonis, and Adonis has some claims to be regarded as especially a corn-deity. Thus the Linus lament, as sung at harvest, would be identical with the Adonis lament; each would be the lamentation raised by reapers over the dead spirit of the corn. But whereas Adonis, like Attis, grew into a stately figure of mythology, adored and mourned in splendid cities far beyond the limits of his Phoenician home, Linus appears to have remained a simple ditty sung by reapers and vintagers among the corn-sheaves and the vines. The analogy of Lityerses and of folk-custom, both European and savage, suggests that in Phoenicia the slain corn-spirit—the dead Adonis—may formerly have been represented by a human victim; and this suggestion is

possibly supported by the Harran legend that Tammuz (Adonis) was slain by his cruel lord, who ground his bones in a mill and scattered them to the wind. For in Mexico, as we have seen, the human victim at harvest was crushed between two stones; and both in Africa and India the ashes or other remains of the victim were scattered over the fields. But the Harran legend may be only a mythical way of expressing the grinding of corn in the mill and the scattering of the seed. It seems worth suggesting that the mock king who was annually killed at the Babylonian festival of the Sacaea on the sixteenth day of the month Lous may have represented Tammuz himself. For the historian Berosus, who records the festival and its date, probably used the Macedonian calendar, since he dedicated his history to Antiochus Soter; and in his day the Macedonian month Lous appears to have corresponded to the Babylonian month Tammuz. If this conjecture is right, the view that the mock king at the Sacaea was slain in the character of a god would be established. But to this point we shall return later on.

There is a good deal more evidence that in Egypt the slain corn-spirit—the dead Osiris—was represented by a human victim, whom the reapers slew on the harvest-field, mourning his death in a dirge, to which the Greeks, through a verbal misunderstanding, gave the name of Maneros. For the legend of Busiris seems to preserve a reminiscence of human sacrifices once offered by the Egyptians in connexion with the worship of Osiris. Busiris was said to have been an Egyptian king who sacrificed all strangers on the altar of Zeus. The origin of the custom was traced to a dearth which afflicted the land of Egypt for nine years. A Cyprian seer informed Busiris that the dearth would cease if a man were annually sacrificed to Zeus. So Busiris instituted the sacrifice. But when Hercules came to Egypt, and was being dragged to the altar to be sacrificed, he burst his bonds and slew Busiris and his son. Here then is a legend that in Egypt a human victim was annually sacrificed to prevent the failure of the crops, and a belief is implied that an omission of the sacrifice would have entailed a recurrence of that infertility which it was the object of the sacrifice to prevent. So the Pawnees, as we have seen, believed that an omission of the human sacrifice at planting would have been followed by a total failure of their crops. The name Busiris was in reality the name of a city, *pe-Asar*, “the house of Osiris,” the city being so called because it contained the grave of Osiris. Indeed some high modern authorities believe that Busiris was the original home of Osiris, from which his worship spread to other parts of Egypt. The human sacrifices were said to have been offered at his grave, and the victims were red-haired men, whose ashes were scattered abroad by means of winnowing-fans. This tradition of human sacrifices offered at the tomb of Osiris is confirmed by the evidence of the monuments; for “we find in the temple of Denderah a human figure with a hare's head and pierced with knives, tied to a stake before Osiris Khenti-Amentiu, and Horus is shown in a Ptolemaic sculpture at Karnak killing a bound hare-headed figure before the bier of Osiris, who is represented in the form of Harpocrates. That these figures are really human beings with the head of an animal fastened on is proved by another sculpture at Denderah, where a kneeling man has the hawk's head and wings over his head and shoulders, and in another place a priest has the jackal's head on his shoulders, his own head appearing through the disguise. Besides, Diodorus tells us that the Egyptian kings in former times had worn on their heads the fore-part of a lion, or of a bull, or of a dragon, showing that this method of disguise or transformation was a well-known custom.”

In the light of the foregoing discussion the Egyptian tradition of Busiris admits of a consistent and fairly probable explanation. Osiris, the corn-spirit, was annually represented at harvest by a stranger, whose red hair made him a suitable representative of the ripe corn. This man, in his representative character, was slain on the harvest-field, and mourned by the reapers, who prayed at the same time that the corn-spirit might revive and return (*mââ-ne-rha*, Maneros) with renewed vigour in the following year. Finally, the victim, or some part of him, was

burned, and the ashes scattered by winnowing-fans over the fields to fertilise them. Here the choice of the victim on the ground of his resemblance to the corn which he was to represent agrees with the Mexican and African customs already described. Similarly the woman who died in the character of the Corn-mother at the Mexican midsummer sacrifice had her face painted red and yellow in token of the colours of the corn, and she wore a pasteboard mitre surmounted by waving plumes in imitation of the tassel of the maize. On the other hand, at the festival of the Goddess of the White Maize the Mexicans sacrificed lepers. The Romans sacrificed red-haired puppies in spring to avert the supposed blighting influence of the Dog-star, believing that the crops would thus grow ripe and ruddy. The heathen of Harran offered to the sun, moon, and planets human victims who were chosen on the ground of their supposed resemblance to the heavenly bodies to which they were sacrificed; for example, the priests, clothed in red and smeared with blood, offered a red-haired, red-cheeked man to "the red planet Mars" in a temple which was painted red and draped with red hangings. These and the like cases of assimilating the victim to the god, or to the natural phenomenon which he represents, are based ultimately on the principle of homoeopathic or imitative magic, the notion being that the object aimed at will be most readily attained by means of a sacrifice which resembles the effect that it is designed to bring about.

Again, the scattering of the Egyptian victim's ashes over the fields resembles the Marimo and Khond custom, and the use of winnowing-fans for the purpose is another hint of his identification with the corn. So in Vendée a pretence is made of threshing and winnowing the farmer's wife, regarded as an embodiment of the corn-spirit; in Mexico the victim was ground between stones; and in Africa he was slain with spades and hoes. The story that the fragments of Osiris's body were scattered up and down the land, and buried by Isis on the spots where they lay, may very well be a reminiscence of a custom, like that observed by the Khonds, of dividing the human victim in pieces and burying the pieces, often at intervals of many miles from each other, in the fields. However, it is possible that the story of the dismemberment of Osiris, like the similar story told of Tammuz, may have been simply a mythical expression for the scattering of the seed. Once more, the legend that the body of Osiris enclosed in a coffer was thrown by Typhon into the Nile, perhaps points to a custom of casting the body of the victim, or at least a portion of it, into the Nile as a rain-charm, or rather to make the river rise. For a similar purpose Phrygian reapers seem to have flung the headless bodies of their victims, wrapt in corn-sheaves, into a river, and the Khonds poured water on the buried flesh of the human victim. Probably when Osiris ceased to be represented by a human victim, an image of him was annually thrown into the Nile, just as the effigy of his Syrian counterpart, Adonis, used to be cast into the sea at Alexandria. Or water may have been simply poured over it, as on the monument already mentioned a priest is seen pouring water over the body of Osiris, from which corn-stalks are sprouting. The accompanying legend, "This is Osiris of the mysteries, who springs from the returning waters," bears out the view that at the mysteries of Osiris a charm to make rain fall or the river rise was regularly wrought by pouring water on his effigy or flinging it into the Nile.

It may be objected that the red-haired victims were slain as representatives, not of Osiris, but of his enemy Typhon; for the victims were called Typhonian, and red was the colour of Typhon, black the colour of Osiris. The answer to this objection must be reserved for the present. Meantime it may be pointed out that if Osiris is often represented on the monuments as black, he is still more commonly depicted as green, appropriately enough for a corn-god, who may be conceived as black while the seed is under ground, but as green after it has sprouted. So the Greeks recognised both a Green and a Black Demeter, and sacrificed to the Green Demeter in spring with mirth and gladness.

Thus, if I am right, the key to the mysteries of Osiris is furnished by the melancholy cry of the Egyptian reapers, which down to Roman times could be heard year after year sounding across the fields, announcing the death of the corn-spirit, the rustic prototype of Osiris. Similar cries, as we have seen, were also heard on all the harvest-fields of Western Asia. By the ancients they are spoken of as songs; but to judge from the analysis of the names Linus and Maneros, they probably consisted only of a few words uttered in a prolonged musical note which could be heard for a great distance. Such sonorous and long-drawn cries, raised by a number of strong voices in concert, must have had a striking effect, and could hardly fail to arrest the attention of any wayfarer who happened to be within hearing. The sounds, repeated again and again, could probably be distinguished with tolerable ease even at a distance; but to a Greek traveller in Asia or Egypt the foreign words would commonly convey no meaning, and he might take them, not unnaturally, for the name of some one (Maneros, Linus, Lityerses, Bormus) upon whom the reapers were calling. And if his journey led him through more countries than one, as Bithynia and Phrygia, or Phoenicia and Egypt, while the corn was being reaped, he would have an opportunity of comparing the various harvest cries of the different peoples. Thus we can readily understand why these harvest cries were so often noted and compared with each other by the Greeks. Whereas, if they had been regular songs, they could not have been heard at such distances, and therefore could not have attracted the attention of so many travellers; and, moreover, even if the wayfarer were within hearing of them, he could not so easily have picked out the words.

Down to recent times Devonshire reapers uttered cries of the same sort, and performed on the field a ceremony exactly analogous to that in which, if I am not mistaken, the rites of Osiris originated. The cry and the ceremony are thus described by an observer who wrote in the first half of the nineteenth century. "After the wheat is all cut, on most farms in the north of Devon, the harvest people have a custom of 'crying the neck.' I believe that this practice is seldom omitted on any large farm in that part of the country. It is done in this way. An old man, or some one else well acquainted with the ceremonies used on the occasion (when the labourers are reaping the last field of wheat), goes round to the shocks and sheaves, and picks out a little bundle of all the best ears he can find; this bundle he ties up very neat and trim, and plats and arranges the straws very tastefully. This is called 'the neck' of wheat, or wheaten-ears. After the field is cut out, and the pitcher once more circulated, the reapers, binders, and the women stand round in a circle. The person with 'the neck' stands in the centre, grasping it with both his hands. He first stoops and holds it near the ground, and all the men forming the ring take off their hats, stooping and holding them with both hands towards the ground. They then all begin at once in a very prolonged and harmonious tone to cry 'The neck!' at the same time slowly raising themselves upright, and elevating their arms and hats above their heads; the person with 'the neck' also raising it on high. This is done three times. They then change their cry to 'Wee yen!'—'Way yen!'—which they sound in the same prolonged and slow manner as before, with singular harmony and effect, three times. This last cry is accompanied by the same movements of the body and arms as in crying 'the neck.'... After having thus repeated 'the neck' three times, and 'wee yen,' or 'way yen' as often, they all burst out into a kind of loud and joyous laugh, flinging up their hats and caps into the air, capering about and perhaps kissing the girls. One of them then gets 'the neck' and runs as hard as he can down to the farmhouse, where the dairymaid, or one of the young female domestics, stands at the door prepared with a pail of water. If he who holds 'the neck' can manage to get into the house, in any way unseen, or openly, by any other way than the door at which the girl stands with the pail of water, then he may lawfully kiss her; but, if otherwise, he is regularly soused with the contents of the bucket. On a fine still autumn evening the 'crying of the neck' has a wonderful effect at a distance, far finer than that of the Turkish muezzin, which Lord Byron eulogises so much, and which he says is preferable to all

the bells in Christendom. I have once or twice heard upwards of twenty men cry it, and sometimes joined by an equal number of female voices. About three years back, on some high grounds, where our people were harvesting, I heard six or seven ‘necks’ cried in one night, although I know that some of them were four miles off. They are heard through the quiet evening air at a considerable distance sometimes.” Again, Mrs. Bray tells how, travelling in Devonshire, “she saw a party of reapers standing in a circle on a rising ground, holding their sickles aloft. One in the middle held up some ears of corn tied together with flowers, and the party shouted three times (what she writes as) ‘Arnack, arnack, arnack, *we haven, we haven, we haven.*’ They went home, accompanied by women and children carrying boughs of flowers, shouting and singing. The manservant who attended Mrs. Bray said ‘it was only the people making their games, as they always did, *to the spirit of harvest.*’” Here, as Miss Burne remarks, “‘arnack, we haven!’ is obviously in the Devon dialect, ‘a neck (or nack)! we have un!’” “The neck” is generally hung up in the farmhouse, where it sometimes remains for two or three years. A similar custom is still observed in some parts of Cornwall, as I was told by my lamented friend J. H. Middleton. “The last sheaf is decked with ribbons. Two strong-voiced men are chosen and placed (one with the sheaf) on opposite sides of a valley. One shouts, ‘I’ve gotten it.’ The other shouts, ‘What hast gotten?’ The first answers, ‘I’se gotten the neck.’”

Another account of this old custom, written at Truro in 1839, runs thus: “Now, when all the corn was cut at Heligan, the farming men and maidens come in front of the house, and bring with them a small sheaf of corn, the last that has been cut, and this is adorned with ribbons and flowers, and one part is tied quite tight, so as to look like a neck. Then they cry out ‘Our (my) side, my side,’ as loud as they can; then the dairymaid gives the neck to the head farming-man. He takes it, and says, very loudly three times, ‘I have him, I have him, I have him.’ Then another farming-man shouts very loudly, ‘What have ye? what have ye? what have ye?’ Then the first says, ‘A neck, a neck, a neck.’ And when he has said this, all the people make a very great shouting. This they do three times, and after one famous shout go away and eat supper, and dance, and sing songs.” According to another account, “all went out to the field when the last corn was cut, the ‘neck’ was tied with ribbons and plaited, and they danced round it, and carried it to the great kitchen, where by-and-by the supper was. The words were as given in the previous account, and ‘Hip, hip, hack, heck, I have ‘ee, I have ‘ee, I have ‘ee.’ It was hung up in the hall.” Another account relates that one of the men rushed from the field with the last sheaf, while the rest pursued him with vessels of water, which they tried to throw over the sheaf before it could be brought into the barn.

Similar customs appear to have been formerly observed in Pembrokeshire, as appears from the following account, in which, however, nothing is said of the sonorous cries raised by the reapers when their work was done: “At harvest-time, in South Pembrokeshire, the last ears of corn left standing in the field were tied together, and the harvesters then tried to cut this neck by throwing their hatchets at it. What happened afterwards appears to have varied somewhat. I have been told by one old man that the one who got possession of the neck would carry it over into some neighbouring field, leave it there, and take to his heels as fast as he could; for, if caught, he had a rough time of it. The men who caught him would shut him up in a barn without food, or belabour him soundly, or perhaps shoe him, as it was called, beating the soles of his feet with rods—a very severe and much-dreaded punishment. On my grandfather’s farm the man used to make for the house as fast as possible, and try to carry in the neck. The maids were on the look-out for him, and did their best to drench him with water. If they succeeded, they got the present of half-a-crown, which my grandfather always gave, and which was considered a very liberal present indeed. If the man was successful in dodging the maids, and getting the neck into the house without receiving the wetting, the

half-crown became his. The neck was then hung up, and kept until the following year, at any rate, like the bunches of flowers or boughs gathered at the St. Jean, in the south of France. Sometimes the necks of many successive years were to be found hanging up together. In these two ways of disposing of the neck one sees the embodiment, no doubt, of the two ways of looking at the corn-spirit, as good (to be kept) or as bad (to be passed on to the neighbour).”

In the foregoing customs a particular bunch of ears, generally the last left standing, is conceived as the neck of the corn-spirit, who is consequently beheaded when the bunch is cut down. Similarly in Shropshire the name “neck,” or “the gander's neck,” used to be commonly given to the last handful of ears left standing in the middle of the field when all the rest of the corn was cut. It was plaited together, and the reapers, standing ten or twenty paces off, threw their sickles at it. Whoever cut it through was said to have cut off the gander's neck. The “neck” was taken to the farmer's wife, who was supposed to keep it in the house for good luck till the next harvest came round. Near Trèves, the man who reaps the last standing corn “cuts the goat's neck off.” At Faslane, on the Gareloch (Dumbartonshire), the last handful of standing corn was sometimes called the “head.” At Aurich, in East Friesland, the man who reaps the last corn “cuts the hare's tail off.” In mowing down the last corner of a field French reapers sometimes call out, “We have the cat by the tail.” In Bresse (Bourgogne) the last sheaf represented the fox. Beside it a score of ears were left standing to form the tail, and each reaper, going back some paces, threw his sickle at it. He who succeeded in severing it “cut off the fox's tail,” and a cry of “*You cou cou!*” was raised in his honour. These examples leave no room to doubt the meaning of the Devonshire and Cornish expression “the neck,” as applied to the last sheaf. The corn-spirit is conceived in human or animal form, and the last standing corn is part of its body—its neck, its head, or its tail. Sometimes, as we have seen, the last corn is regarded as the navel-string. Lastly, the Devonshire custom of drenching with water the person who brings in “the neck” is a rain-charm, such as we have had many examples of. Its parallel in the mysteries of Osiris was the custom of pouring water on the image of Osiris or on the person who represented him.

In Germany cries of *Waul!* or *Wol!* or *Wôld!* are sometimes raised by the reapers at cutting the last corn. Thus in some places the last patch of standing rye was called the *Waul*-rye; a stick decked with flowers was inserted in it, and the ears were fastened to the stick. Then all the reapers took off their hats and cried thrice, “*Waul! Waul! Waul!*” Sometimes they accompanied the cry by clashing with their whetstones on their scythes.

VIII. The Corn-Spirit as an Animal

§ 1. Animal Embodiments of the Corn-spirit.

In some of the examples which I have cited to establish the meaning of the term "neck" as applied to the last sheaf, the corn-spirit appears in animal form as a gander, a goat, a hare, a cat, and a fox. This introduces us to a new aspect of the corn-spirit, which we must now examine. By doing so we shall not only have fresh examples of killing the god, but may hope also to clear up some points which remain obscure in the myths and worship of Adonis, Attis, Osiris, Dionysus, Demeter, and Virbius.

Amongst the many animals whose forms the corn-spirit is supposed to take are the wolf, dog, hare, fox, cock, goose, quail, cat, goat, cow (ox, bull), pig, and horse. In one or other of these shapes the corn-spirit is often believed to be present in the corn, and to be caught or killed in the last sheaf. As the corn is being cut the animal flees before the reapers, and if a reaper is taken ill on the field, he is supposed to have stumbled unwittingly on the corn-spirit, who has thus punished the profane intruder. It is said "the Rye-wolf has got hold of him," "the Harvest-goat has given him a push." The person who cuts the last corn or binds the last sheaf gets the name of the animal, as the Rye-wolf, the Rye-sow, the Oats-goat, and so forth, and retains the name sometimes for a year. Also the animal is frequently represented by a puppet made out of the last sheaf or of wood, flowers, and so on, which is carried home amid rejoicings on the last harvest-waggon. Even where the last sheaf is not made up in animal shape, it is often called the Rye-wolf, the Hare, Goat, and so forth. Generally each kind of crop is supposed to have its special animal, which is caught in the last sheaf, and called the Rye-wolf, the Barley-wolf, the Oats-wolf, the Pea-wolf, or the Potato-wolf, according to the crop; but sometimes the figure of the animal is only made up once for all at getting in the last crop of the whole harvest. Sometimes the creature is believed to be killed by the last stroke of the sickle or scythe. But oftener it is thought to live so long as there is corn still unthreshed, and to be caught in the last sheaf threshed. Hence the man who gives the last stroke with the flail is told that he has got the Corn-sow, the Threshing-dog, or the like. When the threshing is finished, a puppet is made in the form of the animal, and this is carried by the thresher of the last sheaf to a neighbouring farm, where the threshing is still going on. This again shews that the corn-spirit is believed to live wherever the corn is still being threshed. Sometimes the thresher of the last sheaf himself represents the animal; and if the people of the next farm, who are still threshing, catch him, they treat him like the animal he represents, by shutting him up in the pig-sty, calling him with the cries commonly addressed to pigs, and so forth. These general statements will now be illustrated by examples.

§ 2. The Corn-spirit as a Wolf or a Dog.

We begin with the corn-spirit conceived as a wolf or a dog. This conception is common in France, Germany, and Slavonic countries. Thus, when the wind sets the corn in wave-like motion the peasants often say, "The Wolf is going over, or through, the corn," "the Rye-wolf is rushing over the field," "the Wolf is in the corn," "the mad Dog is in the corn," "the big Dog is there." When children wish to go into the corn-fields to pluck ears or gather the blue corn-flowers, they are warned not to do so, for "the big Dog sits in the corn," or "the Wolf sits in the corn, and will tear you in pieces," "the Wolf will eat you." The wolf against whom the children are warned is not a common wolf, for he is often spoken of as the Corn-wolf, Rye-wolf, or the like; thus they say, "The Rye-wolf will come and eat you up, children," "the Rye-wolf will carry you off," and so forth. Still he has all the outward appearance of a wolf.

For in the neighbourhood of Feilenhof (East Prussia), when a wolf was seen running through a field, the peasants used to watch whether he carried his tail in the air or dragged it on the ground. If he dragged it on the ground, they went after him, and thanked him for bringing them a blessing, and even set tit-bits before him. But if he carried his tail high, they cursed him and tried to kill him. Here the wolf is the corn-spirit whose fertilising power is in his tail.

Both dog and wolf appear as embodiments of the corn-spirit in harvest-customs. Thus in some parts of Silesia the person who cuts or binds the last sheaf is called the Wheat-dog or the Peas-pug. But it is in the harvest-customs of the north-east of France that the idea of the Corn-dog comes out most clearly. Thus when a harvester, through sickness, weariness, or laziness, cannot or will not keep up with the reaper in front of him, they say, "The White Dog passed near him," "he has the White Bitch," or "the White Bitch has bitten him." In the Vosges the Harvest-May is called the "Dog of the harvest," and the person who cuts the last handful of hay or wheat is said to "kill the Dog." About Lons-le-Saulnier, in the Jura, the last sheaf is called the Bitch. In the neighbourhood of Verdun the regular expression for finishing the reaping is, "They are going to kill the Dog"; and at Epinal they say, according to the crop, "We will kill the Wheat-dog, or the Rye-dog, or the Potato-dog." In Lorraine it is said of the man who cuts the last corn, "He is killing the Dog of the harvest." At Dux, in the Tyrol, the man who gives the last stroke at threshing is said to "strike down the Dog"; and at Ahnebergen, near Stade, he is called, according to the crop, Corn-pug, Rye-pug, Wheat-pug.

So with the wolf. In Silesia, when the reapers gather round the last patch of standing corn to reap it they are said to be about "to catch the Wolf." In various parts of Mecklenburg, where the belief in the Corn-wolf is particularly prevalent, every one fears to cut the last corn, because they say that the Wolf is sitting in it; hence every reaper exerts himself to the utmost in order not to be the last, and every woman similarly fears to bind the last sheaf because "the Wolf is in it." So both among the reapers and the binders there is a competition not to be the last to finish. And in Germany generally it appears to be a common saying that "the Wolf sits in the last sheaf." In some places they call out to the reaper, "Beware of the Wolf"; or they say, "He is chasing the Wolf out of the corn." In Mecklenburg the last bunch of standing corn is itself commonly called the Wolf, and the man who reaps it "has the Wolf," the animal being described as the Rye-wolf, the Wheat-wolf, the Barley-wolf, and so on according to the particular crop. The reaper of the last corn is himself called Wolf or the Rye-wolf, if the crop is rye, and in many parts of Mecklenburg he has to support the character by pretending to bite the other harvesters or by howling like a wolf. The last sheaf of corn is also called the Wolf or the Rye-wolf or the Oats-wolf according to the crop, and of the woman who binds it they say, "The Wolf is biting her," "She has the Wolf," "She must fetch the Wolf" (out of the corn). Moreover, she herself is called Wolf; they cry out to her, "Thou art the Wolf," and she has to bear the name for a whole year; sometimes, according to the crop, she is called the Rye-wolf or the Potato-wolf. In the island of Rügen not only is the woman who binds the last sheaf called Wolf, but when she comes home she bites the lady of the house and the stewardess, for which she receives a large piece of meat. Yet nobody likes to be the Wolf. The same woman may be Rye-wolf, Wheat-wolf, and Oats-wolf, if she happens to bind the last sheaf of rye, wheat, and oats. At Buir, in the district of Cologne, it was formerly the custom to give to the last sheaf the shape of a wolf. It was kept in the barn till all the corn was threshed. Then it was brought to the farmer and he had to sprinkle it with beer or brandy. At Brunshaupten in Mecklenburg the young woman who bound the last sheaf of wheat used to take a handful of stalks out of it and make "the Wheat-wolf" with them; it was the figure of a wolf about two feet long and half a foot high, the legs of the animal being represented by stiff stalks and its tail and mane by wheat-ears. This Wheat-wolf she carried back at the head of the harvesters to the village, where it was set up on a high place in the parlour of the farm and

remained there for a long time. In many places the sheaf called the Wolf is made up in human form and dressed in clothes. This indicates a confusion of ideas between the corn-spirit conceived in human and in animal form. Generally the Wolf is brought home on the last waggon with joyful cries. Hence the last waggon-load itself receives the name of the Wolf.

Again, the Wolf is supposed to hide himself amongst the cut corn in the granary, until he is driven out of the last bundle by the strokes of the flail. Hence at Wanzleben, near Magdeburg, after the threshing the peasants go in procession, leading by a chain a man who is enveloped in the threshed-out straw and is called the Wolf. He represents the corn-spirit who has been caught escaping from the threshed corn. In the district of Treves it is believed that the Corn-wolf is killed at threshing. The men thresh the last sheaf till it is reduced to chopped straw. In this way they think that the Corn-wolf, who was lurking in the last sheaf, has been certainly killed.

In France also the Corn-wolf appears at harvest. Thus they call out to the reaper of the last corn, "You will catch the Wolf." Near Chambéry they form a ring round the last standing corn, and cry, "The Wolf is in there." In Finisterre, when the reaping draws near an end, the harvesters cry, "There is the Wolf; we will catch him." Each takes a swath to reap, and he who finishes first calls out, "I've caught the Wolf." In Guyenne, when the last corn has been reaped, they lead a wether all round the field. It is called "the Wolf of the field." Its horns are decked with a wreath of flowers and corn-ears, and its neck and body are also encircled with garlands and ribbons. All the reapers march, singing, behind it. Then it is killed on the field. In this part of France the last sheaf is called the *coujoulage*, which, in the patois, means a wether. Hence the killing of the wether represents the death of the corn-spirit, considered as present in the last sheaf; but two different conceptions of the corn-spirit—as a wolf and as a wether—are mixed up together.

Sometimes it appears to be thought that the Wolf, caught in the last corn, lives during the winter in the farmhouse, ready to renew his activity as corn-spirit in the spring. Hence at midwinter, when the lengthening days begin to herald the approach of spring, the Wolf makes his appearance once more. In Poland a man, with a wolf's skin thrown over his head, is led about at Christmas; or a stuffed wolf is carried about by persons who collect money. There are facts which point to an old custom of leading about a man enveloped in leaves and called the Wolf, while his conductors collected money.

§ 3. The Corn-spirit as a Cock.

Another form which the corn-spirit often assumes is that of a cock. In Austria children are warned against straying in the corn-fields, because the Corn-cock sits there, and will peck their eyes out. In North Germany they say that "the Cock sits in the last sheaf"; and at cutting the last corn the reapers cry, "Now we will chase out the Cock." When it is cut they say, "We have caught the Cock." At Braller, in Transylvania, when the reapers come to the last patch of corn, they cry, "Here we shall catch the Cock." At Fürstenwalde, when the last sheaf is about to be bound, the master releases a cock, which he has brought in a basket, and lets it run over the field. All the harvesters chase it till they catch it. Elsewhere the harvesters all try to seize the last corn cut; he who succeeds in grasping it must crow, and is called Cock. Among the Wends it is or used to be customary for the farmer to hide a live cock under the last sheaf as it lay on the field; and when the corn was being gathered up, the harvester who lighted upon this sheaf had a right to keep the cock, provided he could catch it. This formed the close of the harvest-festival and was known as "the Cock-catching," and the beer which was served out to the reapers at this time went by the name of "Cock-beer." The last sheaf is called Cock, Cock-sheaf, Harvest-cock, Harvest-hen, Autumn-hen. A distinction is made between a Wheat-cock, Bean-cock, and so on, according to the crop. At Wünschensuhl,

in Thüringen, the last sheaf is made into the shape of a cock, and called the Harvest-cock. A figure of a cock, made of wood, pasteboard, ears of corn, or flowers, is borne in front of the harvest-waggon, especially in Westphalia, where the cock carries in his beak fruits of the earth of all kinds. Sometimes the image of the cock is fastened to the top of a May-tree on the last harvest-waggon. Elsewhere a live cock, or a figure of one, is attached to a harvest-crown and carried on a pole. In Galicia and elsewhere this live cock is fastened to the garland of corn-ears or flowers, which the leader of the women-reapers carries on her head as she marches in front of the harvest procession. In Silesia a live cock is presented to the master on a plate. The harvest-supper is called Harvest-cock, Stubble-cock, etc., and a chief dish at it, at least in some places, is a cock. If a waggoner upsets a harvest-waggon, it is said that "he has spilt the Harvest cock," and he loses the cock, that is, the harvest-supper. The harvest-waggon, with the figure of the cock on it, is driven round the farmhouse before it is taken to the barn. Then the cock is nailed over or at the side of the house-door, or on the gable, and remains there till next harvest. In East Friesland the person who gives the last stroke at threshing is called the Clucking-hen, and grain is strewed before him as if he were a hen.

Again, the corn-spirit is killed in the form of a cock. In parts of Germany, Hungary, Poland, and Picardy the reapers place a live cock in the corn which is to be cut last, and chase it over the field, or bury it up to the neck in the ground; afterwards they strike off its head with a sickle or scythe. In many parts of Westphalia, when the harvesters bring the wooden cock to the farmer, he gives them a live cock, which they kill with whips or sticks, or behead with an old sword, or throw into the barn to the girls, or give to the mistress to cook. If the harvest-cock has not been spilt—that is, if no waggon has been upset—the harvesters have the right to kill the farmyard cock by throwing stones at it or beheading it. Where this custom has fallen into disuse, it is still common for the farmer's wife to make cockie-leekie for the harvesters, and to shew them the head of the cock which has been killed for the soup. In the neighbourhood of Klausenburg, Transylvania, a cock is buried on the harvest-field in the earth, so that only its head appears. A young man then takes a scythe and cuts off the cock's head at a single sweep. If he fails to do this, he is called the Red Cock for a whole year, and people fear that next year's crop will be bad. Near Udvarhely, in Transylvania, a live cock is bound up in the last sheaf and killed with a spit. It is then skinned. The flesh is thrown away, but the skin and feathers are kept till next year; and in spring the grain from the last sheaf is mixed with the feathers of the cock and scattered on the field which is to be tilled. Nothing could set in a clearer light the identification of the cock with the spirit of the corn. By being tied up in the last sheaf and killed, the cock is identified with the corn, and its death with the cutting of the corn. By keeping its feathers till spring, then mixing them with the seed-corn taken from the very sheaf in which the bird had been bound, and scattering the feathers together with the seed over the field, the identity of the bird with the corn is again emphasised, and its quickening and fertilising power, as an embodiment of the corn-spirit, is intimated in the plainest manner. Thus the corn-spirit, in the form of a cock, is killed at harvest, but rises to fresh life and activity in spring. Again, the equivalence of the cock to the corn is expressed, hardly less plainly, in the custom of burying the bird in the ground, and cutting off its head (like the ears of corn) with the scythe.

§ 4. The Corn-spirit as a Hare.

Another common embodiment of the corn-spirit is the hare. In Galloway the reaping of the last standing corn is called "cutting the Hare." The mode of cutting it is as follows. When the rest of the corn has been reaped, a handful is left standing to form the Hare. It is divided into three parts and plaited, and the ears are tied in a knot. The reapers then retire a few yards and each throws his or her sickle in turn at the Hare to cut it down. It must be cut below the knot, and the reapers continue to throw their sickles at it, one after the other, until one of them

succeeds in severing the stalks below the knot. The Hare is then carried home and given to a maidservant in the kitchen, who places it over the kitchen-door on the inside. Sometimes the Hare used to be thus kept till the next harvest. In the parish of Minnigaff, when the Hare was cut, the unmarried reapers ran home with all speed, and the one who arrived first was the first to be married. In Southern Ayrshire the last corn cut is also called the Hare, and the mode of cutting it seems to be the same as in Galloway; at least in the neighbourhood of Kilmarnock the last corn left standing in the middle of the field is plaited, and the reapers used to try to cut it by throwing their sickles at it. When cut, it was carried home and hung up over the door. In the Vosges Mountains the person who cuts the last handful of hay or wheat is sometimes said to have caught the Hare; he is congratulated by his comrades and has the honour of carrying the nosegay or the small fir-tree decorated with ribbons which marks the conclusion of the harvest. In Germany also one of the names for the last sheaf is the Hare. Thus in some parts of Anhalt, when the corn has been reaped and only a few stalks are left standing, they say, "The Hare will soon come," or the reapers cry to each other, "Look how the Hare comes jumping out." In East Prussia they say that the Hare sits in the last patch of standing corn, and must be chased out by the last reaper. The reapers hurry with their work, each being anxious not to have "to chase out the Hare"; for the man who does so, that is, who cuts the last corn, is much laughed at. At Birk, in Transylvania, when the reapers come to the last patch, they cry out, "We have the Hare." At Aurich, as we have seen, an expression for cutting the last corn is "to cut off the Hare's tail." "He is killing the Hare" is commonly said of the man who cuts the last corn in Germany, Sweden, Holland, France, and Italy. In Norway the man who is thus said to "kill the Hare" must give "hare's blood" in the form of brandy, to his fellows to drink. In Lesbos, when the reapers are at work in two neighbouring fields, each party tries to finish first in order to drive the Hare into their neighbour's field; the reapers who succeed in doing so believe that next year the crop will be better. A small sheaf of corn is made up and kept beside the holy picture till next harvest.

§ 5. The Corn-spirit as a Cat.

Again, the corn-spirit sometimes takes the form of a cat. Near Kiel children are warned not to go into the corn-fields because "the Cat sits there." In the Eisenach Oberland they are told "the Corn-cat will come and fetch you," "the Corn-cat goes in the corn." In some parts of Silesia at mowing the last corn they say, "The Cat is caught"; and at threshing, the man who gives the last stroke is called the Cat. In the neighbourhood of Lyons the last sheaf and the harvest-supper are both called the Cat. About Vesoul when they cut the last corn they say, "We have the Cat by the tail." At Briançon, in Dauphiné, at the beginning of reaping a cat is decked out with ribbons, flowers, and ears of corn. It is called the Cat of the ball-skin (*le chat de peau de balle*). If a reaper is wounded at his work, they make the cat lick the wound. At the close of the reaping the cat is again decked out with ribbons and ears of corn; then they dance and make merry. When the dance is over the girls solemnly strip the cat of its finery. At Grüneberg, in Silesia, the reaper who cuts the last corn goes by the name of the Tom-cat. He is enveloped in rye-stalks and green withes, and is furnished with a long plaited tail. Sometimes as a companion he has a man similarly dressed, who is called the (female) Cat. Their duty is to run after people whom they see and to beat them with a long stick. Near Amiens the expression for finishing the harvest is, "They are going to kill the Cat"; and when the last corn is cut they kill a cat in the farmyard. At threshing, in some parts of France, a live cat is placed under the last bundle of corn to be threshed, and is struck dead with the flails. Then on Sunday it is roasted and eaten as a holiday dish. In the Vosges Mountains the close of haymaking or harvest is called "catching the cat," "killing the dog," or more rarely "catching the hare." The cat, the dog, or the hare is said to be fat or lean according as the crop is good or bad. The man who cuts the last handful of hay or of wheat is said to catch

the cat or the hare or to kill the dog. He is congratulated by his comrades and has the honour of carrying the nosegay or rather the small fir-tree decked with ribbons which marks the end of the haymaking or of the harvest. In Franche-Comté also the close of harvest is called "catching or killing the cat."

§ 6. The Corn-spirit as a Goat.

Further, the corn-spirit often appears in the form of a goat. In some parts of Prussia, when the corn bends before the wind, they say, "The Goats are chasing each other," "the wind is driving the Goats through the corn," "the Goats are browsing there," and they expect a very good harvest. Again they say, "The Oats-goat is sitting in the oats-field," "the Corn-goat is sitting in the rye-field." Children are warned not to go into the corn-fields to pluck the blue corn-flowers, or amongst the beans to pluck pods, because the Rye-goat, the Corn-goat, the Oats-goat, or the Bean-goat is sitting or lying there, and will carry them away or kill them. When a harvester is taken sick or lags behind his fellows at their work, they call out, "The Harvest-goat has pushed him," "he has been pushed by the Corn-goat." In the neighbourhood of Braunsberg (East Prussia) at binding the oats every harvester makes haste "lest the Corn-goat push him." At Oefoten, in Norway, each reaper has his allotted patch to reap. When a reaper in the middle has not finished reaping his piece after his neighbours have finished theirs, they say of him, "He remains on the island." And if the laggard is a man, they imitate the cry with which they call a he-goat; if a woman, the cry with which they call a she-goat. Near Straubing, in Lower Bavaria, it is said of the man who cuts the last corn that "he has the Corn-goat, or the Wheat-goat, or the Oats-goat," according to the crop. Moreover, two horns are set up on the last heap of corn, and it is called "the horned Goat." At Kreutzburg, East Prussia, they call out to the woman who is binding the last sheaf, "The Goat is sitting in the sheaf." At Gablingen, in Swabia, when the last field of oats upon a farm is being reaped, the reapers carve a goat out of wood. Ears of oats are inserted in its nostrils and mouth, and it is adorned with garlands of flowers. It is set up on the field and called the Oats-goat. When the reaping approaches an end, each reaper hastens to finish his piece first; he who is the last to finish gets the Oats-goat. Again, the last sheaf is itself called the Goat. Thus, in the valley of the Wiesent, Bavaria, the last sheaf bound on the field is called the Goat, and they have a proverb, "The field must bear a goat." At Spachbrücken, in Hesse, the last handful of corn which is cut is called the Goat, and the man who cuts it is much ridiculed. At Dürrenbüchig and about Mosbach in Baden the last sheaf is also called the Goat. Sometimes the last sheaf is made up in the form of a goat, and they say, "The Goat is sitting in it." Again, the person who cuts or binds the last sheaf is called the Goat. Thus, in parts of Mecklenburg they call out to the woman who binds the last sheaf, "You are the Harvest-goat." Near Uelzen, in Hanover, the harvest festival begins with "the bringing of the Harvest-goat"; that is, the woman who bound the last sheaf is wrapt in straw, crowned with a harvest-wreath, and brought in a wheelbarrow to the village, where a round dance takes place. About Luneburg, also, the woman who binds the last corn is decked with a crown of corn-ears and is called the Corn-goat. At Münzesheim in Baden the reaper who cuts the last handful of corn or oats is called the Corn-goat or the Oats-goat. In the Canton St. Gall, Switzerland, the person who cuts the last handful of corn on the field, or drives the last harvest-waggon to the barn, is called the Corn-goat or the Rye-goat, or simply the Goat. In the Canton Thurgau he is called Corn-goat; like a goat he has a bell hung round his neck, is led in triumph, and drenched with liquor. In parts of Styria, also, the man who cuts the last corn is called Corn-goat, Oats-goat, or the like. As a rule, the man who thus gets the name of Corn-goat has to bear it a whole year till the next harvest.

According to one view, the corn-spirit, who has been caught in the form of a goat or otherwise, lives in the farmhouse or barn over winter. Thus, each farm has its own

embodiment of the corn-spirit. But, according to another view, the corn-spirit is the genius or deity, not of the corn of one farm only, but of all the corn. Hence when the corn on one farm is all cut, he flees to another where there is still corn left standing. This idea is brought out in a harvest-custom which was formerly observed in Skye. The farmer who first finished reaping sent a man or woman with a sheaf to a neighbouring farmer who had not finished; the latter in his turn, when he had finished, sent on the sheaf to his neighbour who was still reaping; and so the sheaf made the round of the farms till all the corn was cut. The sheaf was called the *goabbir bhacagh*, that is, the Cripple Goat. The custom appears not to be extinct at the present day, for it was reported from Skye only a few years ago. We are told that when the crofters and small farmers are cutting down their corn, each tries his best to finish before his neighbour. The first to finish goes to his neighbour's field and makes up at one end of it a bundle of sheaves in a fanciful shape which goes by the name of the *gobhar bhacach* or Lamé Goat. As each man in succession finishes reaping his field, he proceeds to set up a lame goat of this sort in his neighbour's field where there is still corn standing. No one likes to have the Lamé Goat put in his field, "not from any ill-luck it brings, but because it is humiliating to have it standing there visible to all neighbours and passers-by, and of course he cannot retaliate." The corn-spirit was probably thus represented as lame because he had been crippled by the cutting of the corn. We have seen that sometimes the old woman who brings home the last sheaf must limp on one foot. In the Böhmer Wald mountains, between Bohemia and Bavaria, when two peasants are driving home their corn together, they race against each other to see who shall get home first. The village boys mark the loser in the race, and at night they come and erect on the roof of his house the Oats-goat, which is a colossal figure of a goat made of straw.

But sometimes the corn-spirit, in the form of a goat, is believed to be slain on the harvest-field by the sickle or scythe. Thus, in the neighbourhood of Bernkastel, on the Moselle, the reapers determine by lot the order in which they shall follow each other. The first is called the fore-reaper, the last the tail-bearer. If a reaper overtakes the man in front he reaps past him, bending round so as to leave the slower reaper in a patch by himself. This patch is called the Goat; and the man for whom "the Goat is cut" in this way, is laughed and jeered at by his fellows for the rest of the day. When the tail-bearer cuts the last ears of corn, it is said, "He is cutting the Goat's neck off." In the neighbourhood of Grenoble, before the end of the reaping, a live goat is adorned with flowers and ribbons and allowed to run about the field. The reapers chase it and try to catch it. When it is caught, the farmer's wife holds it fast while the farmer cuts off its head. The goat's flesh serves to furnish the harvest-supper. A piece of the flesh is pickled and kept till the next harvest, when another goat is killed. Then all the harvesters eat of the flesh. On the same day the skin of the goat is made into a cloak, which the farmer, who works with his men, must always wear at harvest-time if rain or bad weather sets in. But if a reaper gets pains in his back, the farmer gives him the goat-skin to wear. The reason for this seems to be that the pains in the back, being inflicted by the corn-spirit, can also be healed by it. Similarly, we saw that elsewhere, when a reaper is wounded at reaping, a cat, as the representative of the corn-spirit, is made to lick the wound. Esthonian reapers in the island of Mon think that the man who cuts the first ears of corn at harvest will get pains in his back, probably because the corn-spirit is believed to resent especially the first wound; and, in order to escape pains in the back, Saxon reapers in Transylvania gird their loins with the first handful of ears which they cut. Here, again, the corn-spirit is applied to for healing or protection, but in his original vegetable form, not in the form of a goat or a cat.

Further, the corn-spirit under the form of a goat is sometimes conceived as lurking among the cut corn in the barn, till he is driven from it by the threshing-flail. Thus in Baden the last sheaf to be threshed is called the Corn-goat, the Spelt-goat, or the Oats-goat according to the

kind of grain. Again, near Marktl, in Upper Bavaria, the sheaves are called Straw-goats or simply Goats. They are laid in a great heap on the open field and threshed by two rows of men standing opposite each other, who, as they ply their flails, sing a song in which they say that they see the Straw-goat amongst the corn-stalks. The last Goat, that is, the last sheaf, is adorned with a wreath of violets and other flowers and with cakes strung together. It is placed right in the middle of the heap. Some of the threshers rush at it and tear the best of it out; others lay on with their flails so recklessly that heads are sometimes broken. In threshing this last sheaf, each man casts up to the man opposite him the misdeeds of which he has been guilty throughout the year. At Oberinntal, in the Tyrol, the last thresher is called Goat. So at Haselberg, in West Bohemia, the man who gives the last stroke at threshing oats is called the Oats-goat. At Tettwang, in Württemberg, the thresher who gives the last stroke to the last bundle of corn before it is turned goes by the name of the He-goat, and it is said, "He has driven the He-goat away." The person who, after the bundle has been turned, gives the last stroke of all, is called the She-goat. In this custom it is implied that the corn is inhabited by a pair of corn-spirits, male and female.

Further, the corn-spirit, captured in the form of a goat at threshing, is passed on to a neighbour whose threshing is not yet finished. In Franche Comté, as soon as the threshing is over, the young people set up a straw figure of a goat on the farmyard of a neighbour who is still threshing. He must give them wine or money in return. At Ellwangen, in Württemberg, the effigy of a goat is made out of the last bundle of corn at threshing; four sticks form its legs, and two its horns. The man who gives the last stroke with the flail must carry the Goat to the barn of a neighbour who is still threshing and throw it down on the floor; if he is caught in the act, they tie the goat on his back. A similar custom is observed at Indersdorf, in Upper Bavaria; the man who throws the straw Goat into the neighbour's barn imitates the bleating of a goat; if they catch him, they blacken his face and tie the Goat on his back. At Zabern, in Elsass, when a farmer is a week or more behind his neighbours with his threshing, they set a real stuffed goat or fox before his door.

Sometimes the spirit of the corn in goat form is believed to be killed at threshing. In the district of Traunstein, Upper Bavaria, they think that the Oats-goat is in the last sheaf of oats. He is represented by an old rake set up on end, with an old pot for a head. The children are then told to kill the Oats-goat. Elsewhere, however, the corn-spirit in the form of a goat is apparently thought to live in the field throughout the winter. Hence at Wannefeld near Gardelegen, and also between Calbe and Salzwedel, in the Altmark, the last stalks used to be left uncut on the harvest-field with the words, "That shall the He-goat keep!" Evidently the last corn was here left as a provision for the corn-spirit, lest, robbed of all his substance, he should die of hunger. A stranger passing a harvest-field is sometimes taken for the Corn-goat escaping in human shape from the cut or threshed grain. Thus, when a stranger passes a harvest-field, all the labourers stop and shout as with one voice, "He-goat! He-goat!" At rape-seed threshing in Schleswig, which is generally done on the field, the same cry is raised if the stranger does not take off his hat.

At sowing their winter corn the old Prussians used to kill a goat, consume its flesh with many superstitious ceremonies, and hang the skin on a high pole near an oak and a large stone. There it remained till harvest, when a great bunch of corn and herbs was fastened to the pole above the goat-skin. Then, after a prayer had been offered by a peasant who acted as priest (*Weidulut*), the young folks joined hands and danced round the oak and the pole. Afterwards they scrambled for the bunch of corn, and the priest distributed the herbs with a sparing hand. Then he placed the goat-skin on the large stone, sat down on it, and preached to the people about the history of their forefathers and their old heathen customs and beliefs. The goat-skin thus suspended on the field from sowing time to harvest perhaps represents the corn-spirit

superintending the growth of the corn. The Tomori of Central Celebes imagine that the spirits which cause rice to grow have the form of great goats with long hair and long lips.

§ 7. The Corn-spirit as a Bull, Cow, or Ox.

Another form which the corn-spirit often assumes is that of a bull, cow, or ox. When the wind sweeps over the corn they say at Conitz, in West Prussia, "The Steer is running in the corn"; when the corn is thick and strong in one spot, they say in some parts of East Prussia, "The Bull is lying in the corn." When a harvester has overstrained and lamed himself, they say in the Graudenz district of West Prussia, "The Bull pushed him"; in Lothringen they say, "He has the Bull." The meaning of both expressions is that he has unwittingly lighted upon the divine corn-spirit, who has punished the profane intruder with lameness. So near Chambéry when a reaper wounds himself with his sickle, it is said that he has "the wound of the Ox." In the district of Bunzlau (Silesia) the last sheaf is sometimes made into the shape of a horned ox, stuffed with tow and wrapt in corn-ears. This figure is called the Old Man. In some parts of Bohemia the last sheaf is made up in human form and called the Buffalo-bull. These cases shew a confusion of the human with the animal shape of the corn-spirit. The confusion is like that of killing a wether under the name of a wolf. In the Canton of Thurgau, Switzerland, the last sheaf, if it is a large one, is called the Cow. All over Swabia the last bundle of corn on the field is called the Cow; the man who cuts the last ears "has the Cow," and is himself called Cow or Barley-cow or Oats-cow, according to the crop; at the harvest-supper he gets a nosegay of flowers and corn-ears and a more liberal allowance of drink than the rest. But he is teased and laughed at; so no one likes to be the Cow. The Cow was sometimes represented by the figure of a woman made out of ears of corn and corn-flowers. It was carried to the farmhouse by the man who had cut the last handful of corn. The children ran after him and the neighbours turned out to laugh at him, till the farmer took the Cow from him. Here again the confusion between the human and the animal form of the corn-spirit is apparent. In various parts of Switzerland the reaper who cuts the last ears of corn is called Wheat-cow, Corn-cow, Oats-cow, or Corn-steer, and is the butt of many a joke. In some parts of East Prussia, when a few ears of corn have been left standing by inadvertence on the last swath, the foremost reaper seizes them and cries, "Bull! Bull!" On the other hand, in the district of Rosenheim, Upper Bavaria, when a farmer is later of getting in his harvest than his neighbours, they set up on his land a Straw-bull, as it is called. This is a gigantic figure of a bull made of stubble on a framework of wood and adorned with flowers and leaves. Attached to it is a label on which are scrawled doggerel verses in ridicule of the man on whose land the Straw-bull is set up.

Again, the corn-spirit in the form of a bull or ox is killed on the harvest-field at the close of the reaping. At Pouilly, near Dijon, when the last ears of corn are about to be cut, an ox adorned with ribbons, flowers, and ears of corn is led all round the field, followed by the whole troop of reapers dancing. Then a man disguised as the Devil cuts the last ears of corn and immediately slaughters the ox. Part of the flesh of the animal is eaten at the harvest-supper; part is pickled and kept till the first day of sowing in spring. At Pont à Mousson and elsewhere on the evening of the last day of reaping, a calf adorned with flowers and ears of corn is led thrice round the farmyard, being allured by a bait or driven by men with sticks, or conducted by the farmer's wife with a rope. The calf chosen for this ceremony is the calf which was born first on the farm in the spring of the year. It is followed by all the reapers with their tools. Then it is allowed to run free; the reapers chase it, and whoever catches it is called King of the Calf. Lastly, it is solemnly killed; at Lunéville the man who acts as butcher is the Jewish merchant of the village.

Sometimes again the corn-spirit hides himself amongst the cut corn in the barn to reappear in bull or cow form at threshing. Thus at Wümlingen, in Thüringen, the man who gives the last stroke at threshing is called the Cow, or rather the Barley-cow, Oats-cow, Peas-cow, or the like, according to the crop. He is entirely enveloped in straw; his head is surmounted by sticks in imitation of horns, and two lads lead him by ropes to the well to drink. On the way thither he must low like a cow, and for a long time afterwards he goes by the name of the Cow. At Obermedlingen, in Swabia, when the threshing draws near an end, each man is careful to avoid giving the last stroke. He who does give it "gets the Cow," which is a straw figure dressed in an old ragged petticoat, hood, and stockings. It is tied on his back with a straw-rope; his face is blackened, and being bound with straw-ropes to a wheelbarrow he is wheeled round the village. Here, again, we meet with that confusion between the human and animal shape of the corn-spirit which we have noted in other customs. In Canton Schaffhausen the man who threshes the last corn is called the Cow; in Canton Thurgau, the Corn-bull; in Canton Zurich, the Thresher-cow. In the last-mentioned district he is wrapt in straw and bound to one of the trees in the orchard. At Arad, in Hungary, the man who gives the last stroke at threshing is enveloped in straw and a cow's hide with the horns attached to it. At Pessnitz, in the district of Dresden, the man who gives the last stroke with the flail is called Bull. He must make a straw-man and set it up before a neighbour's window. Here, apparently, as in so many cases, the corn-spirit is passed on to a neighbour who has not finished threshing. So at Herbrechtingen, in Thüringen, the effigy of a ragged old woman is flung into the barn of the farmer who is last with his threshing. The man who throws it in cries, "There is the Cow for you." If the threshers catch him they detain him over night and punish him by keeping him from the harvest-supper. In these latter customs the confusion between the human and the animal shape of the corn-spirit meets us again.

Further, the corn-spirit in bull form is sometimes believed to be killed at threshing. At Auxerre, in threshing the last bundle of corn, they call out twelve times, "We are killing the Bull." In the neighbourhood of Bordeaux, where a butcher kills an ox on the field immediately after the close of the reaping, it is said of the man who gives the last stroke at threshing that "he has killed the Bull." At Chambéry the last sheaf is called the sheaf of the Young Ox, and a race takes place to it in which all the reapers join. When the last stroke is given at threshing they say that "the Ox is killed"; and immediately thereupon a real ox is slaughtered by the reaper who cut the last corn. The flesh of the ox is eaten by the threshers at supper.

We have seen that sometimes the young corn-spirit, whose task it is to quicken the corn of the coming year, is believed to be born as a Corn-baby on the harvest-field. Similarly in Berry the young corn-spirit is sometimes supposed to be born on the field in calf form; for when a binder has not rope enough to bind all the corn in sheaves, he puts aside the wheat that remains over and imitates the lowing of a cow. The meaning is that "the sheaf has given birth to a calf." In Puy-de-Dôme when a binder cannot keep up with the reaper whom he or she follows, they say "He (or she) is giving birth to the Calf." In some parts of Prussia, in similar circumstances, they call out to the woman, "The Bull is coming," and imitate the bellowing of a bull. In these cases the woman is conceived as the Corn-cow or old corn-spirit, while the supposed calf is the Corn-calf or young corn-spirit. In some parts of Austria a mythical calf (*Muhkälbchen*) is believed to be seen amongst the sprouting corn in spring and to push the children; when the corn waves in the wind they say, "The Calf is going about." Clearly, as Mannhardt observes, this calf of the spring-time is the same animal which is afterwards believed to be killed at reaping.

§ 8. The Corn-spirit as a Horse or Mare.

Sometimes the corn-spirit appears in the shape of a horse or mare. Between Kalw and Stuttgart, when the corn bends before the wind, they say, "There runs the Horse." At Bohlingen, near Radolfzell in Baden, the last sheaf of oats is called the Oats-stallion. In Hertfordshire, at the end of the reaping, there is or used to be observed a ceremony called "crying the Mare." The last blades of corn left standing on the field are tied together and called the Mare. The reapers stand at a distance and throw their sickles at it; he who cuts it through "has the prize, with acclamations and good cheer." After it is cut the reapers cry thrice with a loud voice, "I have her!" Others answer thrice, "What have you?"—"A Mare! a Mare! a Mare!"—"Whose is she?" is next asked thrice. "A. B.'s," naming the owner thrice. "Whither will you send her?"—"To C. D.," naming some neighbour who has not reaped all his corn. In this custom the corn-spirit in the form of a mare is passed on from a farm where the corn is all cut to another farm where it is still standing, and where therefore the corn-spirit may be supposed naturally to take refuge. In Shropshire the custom is similar. "Crying, calling, or shouting the mare is a ceremony performed by the men of that farm which is the first in any parish or district to finish the harvest. The object of it is to make known their own prowess, and to taunt the laggards by a pretended offer of the 'owd mar' [old mare] to help out their 'chem' [team]. All the men assemble (the wooden harvest-bottle being of course one of the company) in the stackyard, or, better, on the highest ground on the farm, and there shout the following dialogue, preceding it by a grand 'Hip, hip, hip, hurrah!'

" 'I 'ave 'er, I 'ave 'er, I 'ave 'er!'

" 'Whad 'ast thee, whad 'ast thee, whad 'ast thee?'

" 'A mar! a mar! a mar!'

" 'Whose is 'er, whose is 'er, whose is 'er?'

" 'Maister A.'s, Maister A.'s, Maister A.'s!' (naming the farmer whose harvest is finished).

" 'W'eer sha't the' send 'er? w'eer sha't the' send 'er? w'eer sha't the' send 'er?'

" 'To Maister B.'s, to Maister B.'s, to Maister B.'s' (naming one whose harvest is *not* finished).

" 'Uth a hip, hip, hip, hurrah!' (in chorus)."

The farmer who finishes his harvest last, and who therefore cannot send the Mare to any one else, is said "to keep her all winter." The mocking offer of the Mare was sometimes responded to by a mocking acceptance of her help. Thus an old man told an enquirer, "While we wun at supper, a mon cumm'd wi' a autar [halter] to fatch her away." But at one place (Longnor, near Leebotwood), down to about 1850, the Mare used really to be sent. "The head man of the farmer who had finished harvest first was mounted on the best horse of the team—the leader—both horse and man being adorned with ribbons, streamers, etc. Thus arrayed, a boy on foot led the pair in triumph to the neighbouring farmhouses. Sometimes the man who took the 'mare' received, as well as plenty of harvest-ale, some rather rough, though good-humoured, treatment, coming back minus his decorations, and so on."

In the neighbourhood of Lille the idea of the corn-spirit in horse form is clearly preserved. When a harvester grows weary at his work, it is said, "He has the fatigue of the Horse." The first sheaf, called the "Cross of the Horse," is placed on a cross of boxwood in the barn, and the youngest horse on the farm must tread on it. The reapers dance round the last blades of corn, crying, "See the remains of the Horse." The sheaf made out of these last blades is given to the youngest horse of the parish (*commune*) to eat. This youngest horse of the parish clearly represents, as Mannhardt says, the corn-spirit of the following year, the Corn-foal,

which absorbs the spirit of the old Corn-horse by eating the last corn cut; for, as usual, the old corn-spirit takes his final refuge in the last sheaf. The thresher of the last sheaf is said to “beat the Horse.” Again, a trace of the horse-shaped corn-spirit is reported from Berry. The harvesters there are accustomed to take a noonday nap in the field. This is called “seeing the Horse.” The leader or “King” of the harvesters gives the signal for going to sleep. If he delays giving the signal, one of the harvesters will begin to neigh like a horse, the rest imitate him, and then they all go “to see the Horse.”

§ 9. The Corn-spirit as a Bird.

Sometimes the corn-spirit assumes the form of a bird. Thus among the Saxons of the Bistritz district in Transylvania there is a saying that the quail is sitting in the last standing stalks on the harvest-field, and all the reapers rush at these stalks in order, as they say, to catch the quail. Exactly the same expression is used by reapers in Austrian Silesia when they are about to cut the last standing corn, whatever the kind of grain may be. In the Bocage of Normandy, when the reapers have come to the last ears of the last rig, they surround them for the purpose of catching the quail, which is supposed to have taken refuge there. They run about the corn crying, “Mind the Quail!” and make believe to grab at the bird amid shouts and laughter. Connected with this identification of the corn-spirit with a quail is probably the belief that the cry of the bird in spring is prophetic of the price of corn in the autumn; in Germany they say that corn will sell at as many gulden a bushel as the quail uttered its cry over the fields in spring. Similar prognostications are drawn from the note of the bird in central and western France, in Switzerland and in Tuscany. Perhaps one reason for identifying the quail with the corn-spirit is that the bird lays its eggs on the ground, without making much of a nest. Similarly the Toradjas of Central Celebes think that the soul of the rice is embodied in a pretty little blue bird which builds its nest in the rice-field at the time when the rice is beginning to germinate, and which disappears again after the harvest. Thus both the place and the time of the appearance of the bird suggest to the natives the notion that the blue bird is the rice incarnate. And like the note of the quail in Europe the note of this little bird in Celebes is believed to prognosticate the state of the harvest, foretelling whether the rice will be abundant or scarce. Nobody may drive the bird away; to do so would not merely injure the rice, it would hurt the eyes of the sacrilegious person and might even strike him blind. In Minahassa, a district in the north of Celebes, a similar though less definite belief attaches to a sort of small quail which loves to haunt the rice-fields before the rice is reaped; and when the Galelareeze of Halmahera hear a certain kind of bird, which they call *togè*, croaking among the rice in ear, they say that the bird is putting the grain into the rice, so they will not kill it.

§ 10. The Corn-spirit as a Fox.

Another animal whose shape the corn-spirit is sometimes thought to assume is the fox. The conception is recorded at various places in Germany and France. Thus at Nördlingen in Bavaria, when the corn waves to and fro in the wind, they say, “The fox goes through the corn,” and at Usingen in Nassau they say, “The foxes are marching through the corn.” At Ravensberg, in Westphalia, and at Steinau, in Kurhessen, children are warned against straying in the corn, “because the Fox is there.” At Campe, near Stade, when they are about to cut the last corn, they call out to the reaper, “The Fox is sitting there, hold him fast!” In the Department of the Moselle they say, “Watch whether the Fox comes out.” In Bourbonnais the expression is, “You will catch the Fox.” When a reaper wounds himself or is sick at reaping, they say in the Lower Loire that “He has the Fox.” In Côte-d'or they say, “He has killed the Fox.” At Louhans, in Saône-et-Loire, when the reapers are cutting the last corn they leave a handful standing and throw their sickles at it. He who hits it is called the Fox, and two girls

deck his bonnet with flowers. In the evening there is a dance, at which the Fox dances with all the girls. The supper which follows is also called the Fox; they say, "We have eaten the Fox," meaning that they have partaken of the harvest-supper. In the Canton of Zurich the last sheaf is called the Fox. At Bourgogne, in Ain, they cry out, "The Fox is sitting in the last sheaf," and having made the figure of an animal out of white cloth and some ears of the last corn, they dub it the Fox and throw it into the house of a neighbour who has not yet got in all his harvest. In Poitou, when the corn is being reaped in a district, all the reapers strive to finish as quickly as possible in order that they may send "the Fox" to the fields of a farmer who has not yet garnered his sheaves. The man who cuts the last handful of standing corn is said to "have the Fox." This last handful is carried to the farmer's house and occupies a place on the table during the harvest-supper; and the custom is to drench it with water. After that it is set up on the chimney-piece and remains there the whole year. At threshing, also, in Sâone-et-Loire, the last sheaf is called the Fox; in Lot they say, "We are going to beat the Fox"; and at Zabern in Alsace they set a stuffed fox before the door of the threshing-floor of a neighbour who has not finished his threshing. With this conception of the fox as an embodiment of the corn-spirit may possibly be connected an old custom, observed in Holstein and Westphalia, of carrying a dead or living fox from house to house in spring; the intention of the custom was perhaps to diffuse the refreshing and invigorating influence of the reawakened spirit of vegetation. In Japan the rice-god Inari is represented as an elderly man with a long beard riding on a white fox, and the fox is always associated with this deity. In front of his shrines may usually be seen a pair of foxes carved in wood or stone.

§ 11. The Corn-spirit as a Pig (Boar or Sow).

The last animal embodiment of the corn-spirit which we shall notice is the pig (boar or sow). In Thüringen, when the wind sets the young corn in motion, they sometimes say, "The Boar is rushing through the corn." Amongst the Esthonians of the island of Oesel the last sheaf is called the Rye-boar, and the man who gets it is saluted with a cry of "You have the Rye-boar on your back!" In reply he strikes up a song, in which he prays for plenty. At Kohlerwinkel, near Augsburg, at the close of the harvest, the last bunch of standing corn is cut down, stalk by stalk, by all the reapers in turn. He who cuts the last stalk "gets the Sow," and is laughed at. In other Swabian villages also the man who cuts the last corn "has the Sow," or "has the Rye-sow." In the Traunstein district, Upper Bavaria, the man who cuts the last handful of rye or wheat "has the Sow," and is called Sow-driver. At Bohlingen, near Radolfzell in Baden, the last sheaf is called the Rye-sow or the Wheat-sow, according to the crop; and at Röhrenbach in Baden the person who brings the last armful for the last sheaf is called the Corn-sow or the Oats-sow. And in the south-east of Baden the thresher who gives the last stroke at threshing, or is the last to hang up his flail on the wall, is called the Sow or the Rye-sow. At Friedingen, in Swabia, the thresher who gives the last stroke is called Sow—Barley-sow, Corn-sow, or the like, according to the crop. At Onstmettingen the man who gives the last stroke at threshing "has the Sow"; he is often bound up in a sheaf and dragged by a rope along the ground. And, generally, in Swabia the man who gives the last stroke with the flail is called Sow. He may, however, rid himself of this invidious distinction by passing on to a neighbour the straw-rope, which is the badge of his position as Sow. So he goes to a house and throws the straw-rope into it, crying, "There, I bring you the Sow." All the inmates give chase; and if they catch him they beat him, shut him up for several hours in the pig-sty, and oblige him to take the "Sow" away again. In various parts of Upper Bavaria the man who gives the last stroke at threshing must "carry the Pig"—that is, either a straw effigy of a pig or merely a bundle of straw-ropes. This he carries to a neighbouring farm where the threshing is not finished, and throws it into the barn. If the threshers catch him they handle him roughly, beating him, blackening or dirtying his face, throwing him into filth, binding the

Sow on his back, and so on; if the bearer of the Sow is a woman they cut off her hair. At the harvest supper or dinner the man who "carried the Pig" gets one or more dumplings made in the form of pigs; sometimes he gets a large dumpling and a number of small ones, all in pig form, the large one being called the sow and the small ones the sucking-pigs. Sometimes he has the right to be the first to put his hand into the dish and take out as many small dumplings ("sucking-pigs") as he can, while the other threshers strike at his hand with spoons or sticks. When the dumplings are served up by the maid-servant, all the people at table cry "Süz, süz, süz!" that being the cry used in calling pigs. Sometimes after dinner the man who "carried the Pig" has his face blackened, and is set on a cart and drawn round the village by his fellows, followed by a crowd crying "Süz, süz, süz!" as if they were calling swine. Sometimes, after being wheeled round the village, he is flung on the dunghill.

Again, the corn-spirit in the form of a pig plays his part at sowing-time as well as at harvest. At Neuautz, in Courland, when barley is sown for the first time in the year, the farmer's wife boils the chine of a pig along with the tail, and brings it to the sower on the field. He eats of it, but cuts off the tail and sticks it in the field; it is believed that the ears of corn will then grow as long as the tail. Here the pig is the corn-spirit, whose fertilising power is sometimes supposed to lie especially in his tail. As a pig he is put in the ground at sowing-time, and as a pig he reappears amongst the ripe corn at harvest. For amongst the neighbouring Esthonians, as we have seen, the last sheaf is called the Rye-boar. Somewhat similar customs are observed in Germany. In the Salza district, near Meiningen, a certain bone in the pig is called "the Jew on the winnowing-fan." The flesh of this bone is boiled on Shrove Tuesday, but the bone is put amongst the ashes which the neighbours exchange as presents on St. Peter's Day (the twenty-second of February), and then mix with the seed-corn. In the whole of Hesse, Meiningen, and other districts, people eat pea-soup with dried pig-ribs on Ash Wednesday or Candlemas. The ribs are then collected and hung in the room till sowing-time, when they are inserted in the sown field or in the seed-bag amongst the flax seed. This is thought to be an infallible specific against earth-fleas and moles, and to cause the flax to grow well and tall. In many parts of White Russia people eat a roast lamb or sucking-pig at Easter, and then throw the bones backwards upon the fields, to preserve the corn from hail.

But the idea of the corn-spirit as embodied in pig form is nowhere more clearly expressed than in the Scandinavian custom of the Yule Boar. In Sweden and Denmark at Yule (Christmas) it is the custom to bake a loaf in the form of a boar-pig. This is called the Yule Boar. The corn of the last sheaf is often used to make it. All through Yule the Yule Boar stands on the table. Often it is kept till the sowing-time in spring, when part of it is mixed with the seed-corn and part given to the ploughmen and plough-horses or plough-oxen to eat, in the expectation of a good harvest. In this custom the corn-spirit, immanent in the last sheaf, appears at midwinter in the form of a boar made from the corn of the last sheaf; and his quickening influence on the corn is shewn by mixing part of the Yule Boar with the seed-corn, and giving part of it to the ploughman and his cattle to eat. Similarly we saw that the Corn-wolf makes his appearance at midwinter, the time when the year begins to verge towards spring. We may conjecture that the Yule straw, which Swedish peasants turn to various superstitious uses, comes, in part at least, from the sheaf out of which the Yule Boar is made. The Yule straw is long rye-straw, a portion of which is always set apart for this season. It is strewn over the floor at Christmas, and the peasants attribute many virtues to it. For example, they think that some of it scattered on the ground will make a barren field productive. Again, the peasant at Christmas seats himself on a log; and his eldest son or daughter, or the mother herself, if the children are not old enough, places a wisp of the Yule straw on his knee. From this he draws out single straws, and throws them, one by one, up to the ceiling; and as many as lodge in the rafters, so many will be the sheaves of rye he will

have to thresh at harvest. Again, it is only the Yule straw which may be used in binding the fruit-trees as a charm to fertilise them. These uses of the Yule straw shew that it is believed to possess fertilising virtues analogous to those ascribed to the Yule Boar; we may therefore fairly conjecture that the Yule straw is made from the same sheaf as the Yule Boar. Formerly a real boar was sacrificed at Christmas, and apparently also a man in the character of the Yule Boar. This, at least, may perhaps be inferred from a Christmas custom still observed in Sweden. A man is wrapt up in a skin, and carries a wisp of straw in his mouth, so that the projecting straws look like the bristles of a boar. A knife is brought, and an old woman, with her face blackened, pretends to sacrifice him.

On Christmas Eve in some parts of the Esthonian island of Oesel they bake a long cake with the two ends turned up. It is called the Christmas Boar, and stands on the table till the morning of New Year's Day, when it is distributed among the cattle. In other parts of the island the Christmas Boar is not a cake but a little pig born in March, which the housewife fattens secretly, often without the knowledge of the other members of the family. On Christmas Eve the little pig is secretly killed, then roasted in the oven, and set on the table standing on all fours, where it remains in this posture for several days. In other parts of the island, again, though the Christmas cake has neither the name nor the shape of a boar, it is kept till the New Year, when half of it is divided among all the members and all the quadrupeds of the family. The other half of the cake is kept till sowing-time comes round, when it is similarly distributed in the morning among human beings and beasts. In other parts of Esthonia, again, the Christmas Boar, as it is called, is baked of the first rye cut at harvest; it has a conical shape and a cross is impressed on it with a pig's bone or a key, or three dints are made in it with a buckle or a piece of charcoal. It stands with a light beside it on the table all through the festal season. On New Year's Day and Epiphany, before sunrise, a little of the cake is crumbled with salt and given to the cattle. The rest is kept till the day when the cattle are driven out to pasture for the first time in spring. It is then put in the herdsman's bag, and at evening is divided among the cattle to guard them from magic and harm. In some places the Christmas Boar is partaken of by farm-servants and cattle at the time of the barley sowing, for the purpose of thereby producing a heavier crop.

§ 12. On the Animal Embodiments of the Corn-spirit.

So much for the animal embodiments of the corn-spirit as they are presented to us in the folk-customs of Northern Europe. These customs bring out clearly the sacramental character of the harvest-supper. The corn-spirit is conceived as embodied in an animal; this divine animal is slain, and its flesh and blood are partaken of by the harvesters. Thus, the cock, the goose, the hare, the cat, the goat, and the ox are eaten sacramentally by the harvesters, and the pig is eaten sacramentally by ploughmen in spring. Again, as a substitute for the real flesh of the divine being, bread or dumplings are made in his image and eaten sacramentally; thus, pig-shaped dumplings are eaten by the harvesters, and loaves made in boar-shape (the Yule Boar) are eaten in spring by the ploughman and his cattle.

The reader has probably remarked the complete parallelism between the conceptions of the corn-spirit in human and in animal form. The parallel may be here briefly resumed. When the corn waves in the wind it is said either that the Corn-mother or that the Corn-wolf, etc., is passing through the corn. Children are warned against straying in corn-fields either because the Corn-mother or because the Corn-wolf, etc., is there. In the last corn cut or the last sheaf threshed either the Corn-mother or the Corn-wolf, etc., is supposed to be present. The last sheaf is itself called either the Corn-mother or the Corn-wolf, etc., and is made up in the shape either of a woman or of a wolf, etc. The person who cuts, binds, or threshes the last sheaf is called either the Old Woman or the Wolf, etc., according to the name bestowed on

the sheaf itself. As in some places a sheaf made in human form and called the Maiden, the Mother of the Maize, etc., is kept from one harvest to the next in order to secure a continuance of the corn-spirit's blessing; so in some places the Harvest-cock and in others the flesh of the goat is kept for a similar purpose from one harvest to the next. As in some places the grain taken from the Corn-mother is mixed with the seed-corn in spring to make the crop abundant; so in some places the feathers of the cock, and in Sweden the Yule Boar, are kept till spring and mixed with the seed-corn for a like purpose. As part of the Corn-mother or Maiden is given to the cattle at Christmas or to the horses at the first ploughing, so part of the Yule Boar is given to the ploughing horses or oxen in spring. Lastly, the death of the corn-spirit is represented by killing or pretending to kill either his human or his animal representative; and the worshippers partake sacramentally either of the actual body and blood of the representative of the divinity, or of bread made in his likeness.

Other animal forms assumed by the corn-spirit are the stag, roe, sheep, bear, ass, mouse, stork, swan, and kite. If it is asked why the corn-spirit should be thought to appear in the form of an animal and of so many different animals, we may reply that to primitive man the simple appearance of an animal or bird among the corn is probably enough to suggest a mysterious link between the creature and the corn; and when we remember that in the old days, before fields were fenced in, all kinds of animals must have been free to roam over them, we need not wonder that the corn-spirit should have been identified even with large animals like the horse and cow, which nowadays could not, except by a rare accident, be found straying in an English corn-field. This explanation applies with peculiar force to the very common case in which the animal embodiment of the corn-spirit is believed to lurk in the last standing corn. For at harvest a number of wild animals, such as hares, rabbits, and partridges, are commonly driven by the progress of the reaping into the last patch of standing corn, and make their escape from it as it is being cut down. So regularly does this happen that reapers and others often stand round the last patch of corn armed with sticks or guns, with which they kill the animals as they dart out of their last refuge among the stalks. Now, primitive man, to whom magical changes of shape seem perfectly credible, finds it most natural that the spirit of the corn, driven from his home in the ripe grain, should make his escape in the form of the animal which is seen to rush out of the last patch of corn as it falls under the scythe of the reaper. Thus the identification of the corn-spirit with an animal is analogous to the identification of him with a passing stranger. As the sudden appearance of a stranger near the harvest-field or threshing-floor is, to the primitive mind, enough to identify him as the spirit of the corn escaping from the cut or threshed corn, so the sudden appearance of an animal issuing from the cut corn is enough to identify it with the corn-spirit escaping from his ruined home. The two identifications are so analogous that they can hardly be dissociated in any attempt to explain them. Those who look to some other principle than the one here suggested for the explanation of the latter identification are bound to shew that their theory covers the former identification also.

Note. The Pleiades in Primitive Calendars

The constellation of the Pleiades plays an important part in the calendar of primitive peoples, both in the northern and in the southern hemisphere; indeed for reasons which at first sight are not obvious savages appear to have paid more attention to this constellation than to any other group of stars in the sky, and in particular they have commonly timed the various operations of the agricultural year by observation of its heliacal rising or setting. Some evidence on the subject was adduced by the late Dr. Richard Andree, but much more exists, and it may be worth while to put certain of the facts together.

In the first place it deserves to be noticed that great attention has been paid to the Pleiades by savages in the southern hemisphere who do not till the ground, and who therefore lack that incentive to observe the stars which is possessed by peoples in the agricultural stage of society; for we can scarcely doubt that in early ages the practical need of ascertaining the proper seasons for sowing and planting has done more than mere speculative curiosity to foster a knowledge of astronomy by compelling savages to scrutinise the great celestial clock for indications of the time of year. Now amongst the rudest of savages known to us are the Australian aborigines, none of whom in their native state ever practised agriculture. Yet we are told that "they do, according to their manner, worship the hosts of heaven, and believe particular constellations rule natural causes. For such they have names, and sing and dance to gain the favour of the Pleiades (*Mormodellick*), the constellation worshipped by one body as the giver of rain; but if it should be deferred, instead of blessings curses are apt to be bestowed upon it." According to a writer, whose evidence on other matters of Australian beliefs is open to grave doubt, some of the aborigines of New South Wales denied that the sun is the source of heat, because he shines also in winter when the weather is cold; the real cause of warm weather they held to be the Pleiades, because as the summer heat increases, that constellation rises higher and higher in the sky, reaching its greatest elevation in the height of summer, and gradually sinking again in autumn as the days grow cooler, till in winter it is either barely visible or lost to view altogether. Another writer, who was well acquainted with the natives of Victoria in the early days of the colony and whose testimony can be relied upon, tells us that an old chief of the Spring Creek tribe "taught the young people the names of the favourite planets and constellations, as indications of the seasons. For example, when Canopus is a very little above the horizon in the east at daybreak, the season for emu eggs has come; when the Pleiades are visible in the east an hour before sunrise, the time for visiting friends and neighbouring tribes is at hand."

Again, the Abipones of Paraguay, who neither sowed nor reaped, nevertheless regarded the Pleiades as an image of their ancestor. As that constellation is invisible in the sky of South America for several months every year, the Abipones believed that their ancestor was then sick, and they were dreadfully afraid that he would die. But when the constellation reappeared in the month of May, they saluted the return of their ancestor with joyous shouts and the glad music of flutes and horns, and they congratulated him on his recovery from sickness. Next day they all went out to collect wild honey, from which they brewed a favourite beverage. Then at sunset they feasted and kept up the revelry all night by the light of torches, while a sorceress, who presided at the festivity, shook her rattle and danced. But the proceedings were perfectly decorous; the sexes did not mix with each other. The Mocobis of Paraguay also looked upon the Pleiades as their father and creator. The Guaycurus of the Gran Chaco used to rejoice greatly at the reappearance of the Pleiades. On this occasion they held a festival at which men and women, boys and girls all beat each other soundly, believing

that this brought them health, abundance, and victory over their enemies. Amongst the Lengua Indians of Paraguay at the present day the rising of the Pleiades is connected with the beginning of spring, and feasts are held at this time, generally of a markedly immoral character. The Guaranis of Paraguay knew the time of sowing by observation of the Pleiades; they are said to have revered the constellation and to have dated the beginning of their year from the rising of the constellation in May. The Tapuiyas, formerly a numerous and warlike tribe of Brazil, hailed the rising of the Pleiades with great respect, and worshipped the constellation with songs and dances. The Indians of north-western Brazil, an agricultural people who subsist mainly by the cultivation of manioc, determine the time for their various field labours by the position of certain constellations, especially the Pleiades; when that constellation has sunk beneath the horizon, the regular, heavy rains set in. The Omagua Indians of Brazil ascribe to the Pleiades a special influence on human destiny. A Brazilian name for the Pleiades is *Cyiuce*, that is, "Mother of those who are thirsty." The constellation, we are told, "is known to the Indians of the whole of Brasil and appears to be even worshipped by some tribes in Matto Grosso. In the valley of the Amazon a number of popular sayings are current about it. Thus they say that in the first days of its appearance in the firmament, while it is still low, the birds and especially the fowls sleep on the lower branches or perches, and that just as it rises so do they; that it brings much cold and rain; that when the constellation vanishes, the serpents lose their venom; that the reeds used in making arrows must be cut before the appearance of the Pleiades, else they will be worm-eaten. According to the legend the Pleiades disappear in May and reappear in June. Their reappearance coincides with the renewal of vegetation and of animal life. Hence the legend relates that everything which appears before the constellation is renewed, that is, the appearance of the Pleiades, marks the beginning of spring." The Indians of the Orinoco called the Pleiades *Ucasu* or *Cacasau*, according to their dialect, and they dated the beginning of their year from the time when these stars are visible in the east after sunset.

By the Indians of Peru "the Pleiades were called *Colca* (the maize-heap): in this constellation the Peruvians both of the sierra and the coast beheld the prototype of their cherished stores of corn. It made their maize to grow, and was worshipped accordingly." When the Pleiades appeared above the horizon on or about Corpus Christi Day, these Indians celebrated their chief festival of the year and adored the constellation "in order that the maize might not dry up." Adjoining the great temple of the Sun at Cuzco there was a cloister with halls opening off it. One of these halls was dedicated to the Moon, and another to the planet Venus, the Pleiades, and all the other stars. The Incas venerated the Pleiades because of their curious position and the symmetry of their shape. The tribes of Vera Cruz, on the coast of Mexico, dated the beginning of their year from the heliacal setting of the Pleiades, which in the latitude of Vera Cruz (19° N.) in the year 1519 fell on the first of May of the Gregorian calendar. The Aztecs appear to have attached great importance to the Pleiades, for they timed the most solemn and impressive of all their religious ceremonies so as to coincide with the moment when that constellation was in the middle of the sky at midnight. The ceremony consisted in kindling a sacred new fire on the breast of a human victim on the last night of a great period of fifty-two years. They expected that at the close of one of these periods the stars would cease to revolve and the world itself would come to an end. Hence, when the critical moment approached, the priests watched from the top of a mountain the movement of the stars, and especially of the Pleiades, with the utmost anxiety. When that constellation was seen to cross the meridian, great was the joy; for they knew that the world was respited for another fifty-two years. Immediately the bravest and handsomest of the captives was thrown down on his back; a board of dry wood was placed on his breast, and one of the priests made fire by twirling a stick between his hands on the board. As soon as the flame burst forth, the breast of the victim was cut open, his heart was torn out, and together with the rest of his

body was thrown into the fire. Runners carried the new fire at full speed to all parts of the kingdom to rekindle the cold hearths; for every fire throughout the country had been extinguished as a preparation for this solemn rite.

The Blackfeet Indians of North America “know and observe the Pleiades, and regulate their most important feast by those stars. About the first and the last days of the occultation of the Pleiades there is a sacred feast among the Blackfeet. The mode of observance is national, the whole of the tribe turning out for the celebration of its rites, which include two sacred vigils, the solemn blessing and planting of the seed. It is the opening of the agricultural season.... In all highly religious feasts the calumet, or pipe, is always presented towards the Pleiades, with invocation for life-giving goods. The women swear by the Pleiades as the men do by the sun or the morning star.” At the general meeting of the nation there is a dance of warriors, which is supposed to represent the dance of the seven young men who are identified with the Pleiades. For the Indians say that the seven stars of the constellation were seven brothers, who guarded by night the field of sacred seed and danced round it to keep themselves awake during the long hours of darkness. According to another legend told by the Blackfeet, the Pleiades are six children, who were so ashamed because they had no little yellow hides of buffalo calves that they wandered away on the plains and were at last taken up into the sky. “They are not seen during the moon, when the buffalo calves are yellow (spring, the time of their shame), but, every year, when the calves turn brown (autumn), the lost children can be seen in the sky every night.” This version of the myth, it will be observed, recognises only six stars in the constellation, and many savages apparently see no more, which speaks ill for the keenness of their vision; since among ourselves persons endowed with unusually good sight are able, I understand, to discern seven. Among the Pueblo Indians of Tusayan, an ancient province of Arizona, the culmination of the Pleiades is often used to determine the proper time for beginning a sacred nocturnal rite, especially an invocation addressed to the six deities who are believed to rule the six quarters of the world. The writer who records this fact adds: “I cannot explain its significance, and why of all stellar objects this minute cluster of stars of a low magnitude is more important than other stellar groups is not clear to me.” If the Pueblo Indians see only six stars in the cluster, as to which I cannot speak, it might seem to them a reason for assigning one of the stars to each of the six quarters, namely, north, south, east, west, above, and below.

The Society Islanders in the South Pacific divided the year into two seasons, which they determined by observation of the Pleiades. “The first they called *Matarii i nia*, Pleiades above. It commenced when, in the evening, these stars appeared on or near the horizon; and the half year, during which, immediately after sunset, they were seen above the horizon, was called *Matarii i nia*. The other season commenced when, at sunset, the stars were invisible, and continued until at that hour they appeared again above the horizon. This season was called *Matarii i raro*, Pleiades below.” In the Hervey Islands of the South Pacific it is said that the constellation was originally a single star, which was shattered into six fragments by the god Tane. “This cluster of little stars is appropriately named Mata-riki or *little-eyes*, on account of their brightness. It is also designated Tau-ono, or *the-six*, on account of the apparent number of the fragments; the presence of the seventh star not having been detected by the unassisted native eye.” Among these islanders the arrival of the new year was indicated by the appearance of the constellation on the eastern horizon just after sunset, that is, about the middle of December. “Hence the idolatrous worship paid to this beautiful cluster of stars in many of the South Sea Islands. The Pleiades were worshipped at Danger Island, and at the Penrhyns, down to the introduction of Christianity in 1857. In many islands extravagant joy is still manifested at the rising of this constellation out of the ocean.” For example, in Manahiki or Humphrey's Island, South Pacific, “when the constellation Pleiades

was seen there was unusual joy all over the month, and expressed by singing, dancing, and blowing-shell trumpets.” So the Maoris of New Zealand, another Polynesian people of the South Pacific, divided the year into moons and determined the first moon by the rising of the Pleiades, which they called *Matariki*. Indeed throughout Polynesia the rising of the Pleiades (variously known as Matariki, Mataliki, Matalii, Makalii, etc.) seems to have marked the beginning of the year.

Among some of the Melanesians also the Pleiades occupy an important position in the calendar. “The Banks' islanders and Northern New Hebrides people content themselves with distinguishing the Pleiades, by which the approach of yam harvest is marked.” “Amongst the constellations, the Pleiades and Orion's belt seem to be those which are most familiar to the natives of Bougainville Straits. The former, which they speak of as possessing six stars, they name *Vuhu*; the latter *Matatala*. They have also names for a few other stars. As in the case of many other savage races, the Pleiades is a constellation of great significance with the inhabitants of these straits. The Treasury Islanders hold a great feast towards the end of October, to celebrate, as far as I could learn, the approaching appearance of the constellation above the eastern horizon soon after sunset. Probably, as in many of the Pacific Islands, this event marks the beginning of their year. I learned from Mr. Stephens that, in Ugi, where of all the constellations the Pleiades alone receives a name, the natives are guided by it in selecting the times for planting and taking up the yams.”

The natives of the Torres Straits islands observe the appearance of the Pleiades (*Usiam*) on the horizon at sunset; and when they see it, they say that the new yam time has come. The Kai and the Bukaua, two agricultural tribes of German New Guinea, also determine the season of their labour in the fields by observation of the Pleiades: the Kai say that the time for such labours is when the Pleiades are visible above the horizon at night. In some districts of northern Celebes the rice-fields are similarly prepared for cultivation when the Pleiades are seen at a certain height above the horizon. As to the Dyaks of Sarawak we read that “the Pleiades themselves tell them when to farm; and according to their position in the heavens, morning and evening, do they cut down the forest, burn, plant, and reap. The Malays are obliged to follow their example, or their lunar year would soon render their farming operations unprofitable.” When the season for clearing fresh land in the forest approaches, a wise man is appointed to go out before dawn and watch for the Pleiades. As soon as the constellation is seen to rise while it is yet dark, they know that the time has come to begin. But not until the Pleiades are at the zenith before dawn do the Dyaks think it desirable to burn the fallen timber and to sow the rice. However, the Kenyahs and Kayans, two other tribes of Sarawak, determine the agricultural seasons by observation of the sun rather than of the stars; and for this purpose they have devised certain simple but ingenious mechanisms. The Kenyahs measure the length of the shadow cast by an upright pole at noon; and the Kayans let in a beam of light through a hole in the roof and measure the distance from the point immediately below the hole to the place where the light reaches the floor. But the Kayans of the Mahakam river, in Dutch Borneo, determine the time for sowing by observing when the sun sets in a line with two upright stones. In Bali, an island to the east of Java, the appearance of the Pleiades at sunset in March marks the end of the year. The Pleiades and Orion are the only constellations which the people of Bali observe for the purpose of correcting their lunar calendar by intercalation. For example, they bring the lunar year into harmony with the solar by prolonging the month Asada until the Pleiades are visible at sunset. The natives of Nias, an island to the south of Sumatra, pay little heed to the stars, but they have names for the Morning Star and for the Pleiades; and when the Pleiades appear in the sky, the people assemble to till their fields, for they think that to do so before the rising of the constellation would be useless. In some districts of Sumatra “much confusion in regard to the period of

sowing is said to have arisen from a very extraordinary cause. Anciently, say the natives, it was regulated by the stars, and particularly by the appearance (heliacal rising) of the *bintang baniak* or Pleiades; but after the introduction of the Mahometan religion, they were induced to follow the returns of the *puāsa* or great annual fast, and forgot their old rules. The consequence of this was obvious; for the lunar year of the *hejrah* being eleven days short of the sidereal or solar year, the order of the seasons was soon inverted; and it is only astonishing that its inaptness to the purposes of agriculture should not have been immediately discovered." The Battas or Bataks of central Sumatra date the various operations of the agricultural year by the positions of Orion and the Pleiades. When the Pleiades rise before the sun at the beginning of July, the Achinese of northern Sumatra know that the time has come to sow the rice.

Scattered and fragmentary as these notices are, they suffice to shew that the Pleiades have received much attention from savages in the tropical regions of the world from Brasil in the east to Sumatra in the west. Far to the north of the tropics the rude Kamchatkans are said to know only three constellations, the Great Bear, the Pleiades, and three stars in Orion. When we pass to Africa we again find the Pleiades employed by tribes in various parts of the continent to mark the seasons of the agricultural year. We have seen that the Caffres of South Africa date their new year from the rising of the Pleiades just before sunrise and fix the time for sowing by observation of that constellation. "They calculate only twelve lunar months for the year, for which they have descriptive names, and this results in frequent confusion and difference of opinion as to which month it really is. The confusion is always rectified by the first appearance of Pleiades just before sunrise, and a fresh start is made and things go on smoothly till once more the moons get out of place, and reference has again to be made to the stars." According to another authority on the Bantu tribes of South Africa, "the rising of the Pleiades shortly after sunset was regarded as indicating the planting season. To this constellation, as well as to several of the prominent stars and planets, they gave expressive names. They formed no theories concerning the nature of the heavenly bodies and their motions, and were not given to thinking of such things." The Amazulu call the Pleiades *Isilimela*, which means "The digging-for (stars)," because when the Pleiades appear the people begin to dig. They say that "*Isilimela* (the Pleiades) dies, and is not seen. It is not seen in winter; and at last, when the winter is coming to an end, it begins to appear—one of its stars first, and then three, until going on increasing it becomes a cluster of stars, and is perfectly clear when the sun is about to rise. And we say *Isilimela* is renewed, and the year is renewed, and so we begin to dig." The Bechuanas "are directed by the position of certain stars in the heavens, that the time has arrived, in the revolving year, when particular roots can be dug up for use, or when they may commence their labours of the field. This is their *likhakologo* (turnings or revolvings), or what we should call the spring time of the year. The Pleiades they call *seleméla*, which may be translated 'cultivator,' or the precursor of agriculture, from *leméla*, the relative verb to cultivate *for*; and *se*, a pronominal prefix, distinguishing them as the actors. Thus, when this constellation assumes a certain position in the heavens, it is the signal to commence cultivating their fields and gardens." Among some of these South African tribes the period of seclusion observed by lads after circumcision comes to an end with the appearance of the Pleiades, and accordingly the youths are said to long as ardently for the rising of the constellation as Mohammedans for the rising of the moon which will put an end to the fast of Ramadan. The Hottentots date the seasons of the year by the rising and setting of the Pleiades. An early Moravian missionary settled among the Hottentots, reports that "at the return of the Pleiades these natives celebrate an anniversary; as soon as these stars appear above the eastern horizon mothers will lift their little ones on their arms, and running up to elevated spots, will show to them those friendly stars, and teach them to stretch their little hands towards them. The people of a kraal will

assemble to dance and to sing according to the old custom of their ancestors. The chorus always sings: ‘O Tiqua, our Father above our heads, give rain to us, that the fruits (bulbs, etc.), *uientjes*, may ripen, and that we may have plenty of food, send us a good year.’” With some tribes of British Central Africa the rising of the Pleiades early in the evening is the signal for the hoeing to begin. To the Masai of East Africa the appearance of the Pleiades in the west is the sign of the beginning of the rainy season, which takes its name from the constellation. In Masailand the Pleiades are above the horizon from September till about the seventeenth of May; and the people, as they express it themselves, “know whether it will rain or not according to the appearance or non-appearance of the six stars, called The Pleiades, which follow after one another like cattle. When the month which the Masai call ‘Of the Pleiades’ arrives, and the Pleiades are no longer visible, they know that the rains are over. For the Pleiades set in that month and are not seen again until the season of showers has come to an end: it is then that they reappear.” The only other groups of stars for which the Masai appear to have names are Orion's sword and Orion's belt. The Nandi of British East Africa have a special name (*Koremerik*) for the Pleiades, “and it is by the appearance or non-appearance of these stars that the Nandi know whether they may expect a good or a bad harvest.” The Kikuyu of the same region say that “the Pleiades is the mark in the heavens to show the people when to plant their crops; they plant when this constellation is in a certain position early in the night.” In Sierra Leone “the proper time for preparing the plantations is shewn by the particular situation in which the Pleiades, called by the Bulloms *a-warrang*, the only stars which they observe or distinguish by peculiar names, are to be seen at sunset.” We have seen that ancient Greek farmers reaped their corn when the Pleiades rose at sunrise in May, and that they ploughed their fields when the constellation set at sunrise in November. The interval between the two dates is about six months. Both the Greeks and the Romans dated the beginning of summer from the heliacal rising of the Pleiades and the beginning of winter from their heliacal setting. Pliny regarded the autumnal setting of the Pleiades as the proper season for sowing the corn, particularly the wheat and the barley, and he tells us that in Greece and Asia all the crops were sown at the setting of that constellation.

So widespread over the world has been and is the association of the Pleiades with agriculture, especially with the sowing or planting of the crops. The reason for the association seems to be the coincidence of the rising or setting of the constellation with the commencement of the rainy season; since men must very soon have learned that the best, if not the only, season to sow and plant is the time of year when the newly-planted seeds or roots will be quickened by abundant showers. The same association of the Pleiades with rain seems sufficient to explain their importance even for savages who do not till the ground; for ignorant though such races are, they yet can hardly fail to observe that wild fruits grow more plentifully, and therefore that they themselves have more to eat after a heavy fall of rain than after a long drought. In point of fact we saw that some of the Australian aborigines, who are wholly ignorant of agriculture, look on the Pleiades as the givers of rain, and curse the constellation if its appearance is not followed by the expected showers. On the other side of the world, and at the opposite end of the scale of culture, the civilised Greeks similarly supposed that the autumnal setting of the Pleiades was the cause of the rains which followed it; and the astronomical writer Geminus thought it worth while to argue against the supposition, pointing out that the vicissitudes of the weather and of the seasons, though they may coincide with the risings and settings of the constellations, are not produced by them, the stars being too distant from the earth to exercise any appreciable influence on our atmosphere. Hence, he says, though the constellations serve as the signals, they must not be regarded as the causes, of atmospheric changes; and he aptly illustrates the distinction by a reference to beacon-fires, which are the signals, but not the causes, of war.

IX. Ancient Deities of Vegetation as Animals

§ 1. Dionysus, the Goat and the Bull.

However we may explain it, the fact remains that in peasant folk-lore the corn-spirit is very commonly conceived and represented in animal form. May not this fact explain the relation in which certain animals stood to the ancient deities of vegetation, Dionysus, Demeter, Adonis, Attis, and Osiris?

To begin with Dionysus. We have seen that he was represented sometimes as a goat and sometimes as a bull. As a goat he can hardly be separated from the minor divinities, the Pans, Satyrs, and Silenuses, all of whom are closely associated with him and are represented more or less completely in the form of goats. Thus, Pan was regularly portrayed in sculpture and painting with the face and legs of a goat. The Satyrs were depicted with pointed goat-ears, and sometimes with sprouting horns and short tails. They were sometimes spoken of simply as goats; and in the drama their parts were played by men dressed in goatskins. Silenus is represented in art clad in a goatskin. Further, the Fauns, the Italian counterpart of the Greek Pans and Satyrs, are described as being half goats, with goat-feet and goat-horns. Again, all these minor goat-formed divinities partake more or less clearly of the character of woodland deities. Thus, Pan was called by the Arcadians the Lord of the Wood. The Silenuses associated with the tree-nymphs. The Fauns are expressly designated as woodland deities; and their character as such is still further brought out by their association, or even identification, with Silvanus and the Silvanuses, who, as their name of itself indicates, are spirits of the woods. Lastly, the association of the Satyrs with the Silenuses, Fauns, and Silvanuses, proves that the Satyrs also were woodland deities. These goat-formed spirits of the woods have their counterparts in the folk-lore of Northern Europe. Thus, the Russian wood-spirits, called *Ljeschie* (from *ljes*, "wood") are believed to appear partly in human shape, but with the horns, ears, and legs of goats. The *Ljeschi* can alter his stature at pleasure; when he walks in the wood he is as tall as the trees; when he walks in the meadows he is no higher than the grass. Some of the *Ljeschie* are spirits of the corn as well as of the wood; before harvest they are as tall as the corn-stalks, but after it they shrink to the height of the stubble. This brings out—what we have remarked before—the close connexion between tree-spirits and corn-spirits, and shews how easily the former may melt into the latter. Similarly the Fauns, though wood-spirits, were believed to foster the growth of the crops. We have already seen how often the corn-spirit is represented in folk-custom as a goat. On the whole, then, as Mannhardt argues, the Pans, Satyrs, and Fauns perhaps belong to a widely diffused class of wood-spirits conceived in goat-form. The fondness of goats for straying in woods and nibbling the bark of trees, to which indeed they are most destructive, is an obvious and perhaps sufficient reason why wood-spirits should so often be supposed to take the form of goats. The inconsistency of a god of vegetation subsisting upon the vegetation which he personifies is not one to strike the primitive mind. Such inconsistencies arise when the deity, ceasing to be immanent in the vegetation, comes to be regarded as its owner or lord; for the idea of owning the vegetation naturally leads to that of subsisting on it. We have already seen that the corn-spirit, originally conceived as immanent in the corn, afterwards comes to be regarded as its owner, who lives on it and is reduced to poverty and want by being deprived of it.

Thus the representation of wood-spirits in the form of goats appears to be both widespread and, to the primitive mind, natural. Therefore when we find, as we have done, that Dionysus—a tree-god—is sometimes represented in goat-form, we can hardly avoid

concluding that this representation is simply a part of his proper character as a tree-god and is not to be explained by the fusion of two distinct and independent worships, in one of which he originally appeared as a tree-god and in the other as a goat. If such a fusion took place in the case of Dionysus, it must equally have taken place in the case of the Pans and Satyrs of Greece, the Fauns of Italy, and the *Ljeschie* of Russia. That such a fusion of two wholly disconnected worships should have occurred once is possible; that it should have occurred twice independently is improbable; that it should have occurred thrice independently is so unlikely as to be practically incredible.

Dionysus was also figured, as we have seen, in the shape of a bull. After what has gone before we are naturally led to expect that his bull form must have been only another expression for his character as a deity of vegetation, especially as the bull is a common embodiment of the corn-spirit in Northern Europe; and the close association of Dionysus with Demeter and Persephone in the mysteries of Eleusis shews that he had at least strong agricultural affinities. The other possible explanation of the bull-shaped Dionysus would be that the conception of him as a bull was originally entirely distinct from the conception of him as a deity of vegetation, and that the fusion of the two conceptions was due to some such circumstance as the union of two tribes, one of which had previously worshipped a bull-god and the other a tree-god. This appears to be the view taken by Mr. Andrew Lang, who suggests that the bull-formed Dionysus "had either been developed out of, or had succeeded to, the worship of a bull-totem." Of course this is possible. But it is not yet certain that the Aryans ever had totemism. On the other hand, it is quite certain that many Aryan peoples have conceived deities of vegetation as embodied in animal forms. Therefore when we find amongst an Aryan people like the Greeks a deity of vegetation represented as an animal, the presumption must be in favour of explaining this by a principle which is certainly known to have influenced the Aryan race rather than by one which is not certainly known to have done so. In the present state of our knowledge, therefore, it is safer to regard the bull form of Dionysus as being, like his goat form, an expression of his proper character as a deity of vegetation.

The probability of this view will be somewhat increased if it can be shewn that in other rites than those of Dionysus the ancients slew an ox as a representative of the spirit of vegetation. This they appear to have done in the Athenian sacrifice known as "the murder of the ox" (*bouphonia*). It took place about the end of June or beginning of July, that is, about the time when the threshing is nearly over in Attica. According to tradition the sacrifice was instituted to procure a cessation of drought and dearth which had afflicted the land. The ritual was as follows. Barley mixed with wheat, or cakes made of them, were laid upon the bronze altar of Zeus Polieus on the Acropolis. Oxen were driven round the altar, and the ox which went up to the altar and ate the offering on it was sacrificed. The axe and knife with which the beast was slain had been previously wetted with water brought by maidens called "water-carriers." The weapons were then sharpened and handed to the butchers, one of whom felled the ox with the axe and another cut its throat with the knife. As soon as he had felled the ox, the former threw the axe from him and fled; and the man who cut the beast's throat apparently imitated his example. Meantime the ox was skinned and all present partook of its flesh. Then the hide was stuffed with straw and sewed up; next the stuffed animal was set on its feet and yoked to a plough as if it were ploughing. A trial then took place in an ancient law-court presided over by the King (as he was called) to determine who had murdered the ox. The maidens who had brought the water accused the men who had sharpened the axe and knife; the men who had sharpened the axe and knife blamed the men who had handed these implements to the butchers; the men who had handed the implements to the butchers blamed

the butchers; and the butchers laid the blame on the axe and knife, which were accordingly found guilty, condemned and cast into the sea.

The name of this sacrifice,—“the *murder* of the ox,”—the pains taken by each person who had a hand in the slaughter to lay the blame on some one else, together with the formal trial and punishment of the axe or knife or both, prove that the ox was here regarded not merely as a victim offered to a god, but as itself a sacred creature, the slaughter of which was sacrilege or murder. This is borne out by a statement of Varro that to kill an ox was formerly a capital crime in Attica. The mode of selecting the victim suggests that the ox which tasted the corn was viewed as the corn-deity taking possession of his own. This interpretation is supported by the following custom. In Beauce, in the district of Orleans, on the twenty-fourth or twenty-fifth of April they make a straw-man called “the great *mondard*.” For they say that the old *mondard* is now dead and it is necessary to make a new one. The straw-man is carried in solemn procession up and down the village and at last is placed upon the oldest apple-tree. There he remains till the apples are gathered, when he is taken down and thrown into the water, or he is burned and his ashes cast into water. But the person who plucks the first fruit from the tree succeeds to the title of “the great *mondard*,” Here the straw figure, called “the great *mondard*” and placed on the oldest apple-tree in spring, represents the spirit of the tree, who, dead in winter, revives when the apple-blossoms appear on the boughs. Thus the person who plucks the first fruit from the tree and thereby receives the name of “the great *mondard*” must be regarded as a representative of the tree-spirit. Primitive peoples are usually reluctant to taste the annual first-fruits of any crop, until some ceremony has been performed which makes it safe and pious for them to do so. The reason of this reluctance appears to be a belief that the first-fruits either belong to or actually contain a divinity. Therefore when a man or animal is seen boldly to appropriate the sacred first-fruits, he or it is naturally regarded as the divinity himself in human or animal form taking possession of his own. The time of the Athenian sacrifice, which fell about the close of the threshing, suggests that the wheat and barley laid upon the altar were a harvest offering; and the sacramental character of the subsequent repast—all partaking of the flesh of the divine animal—would make it parallel to the harvest-suppers of modern Europe, in which, as we have seen, the flesh of the animal who stands for the corn-spirit is eaten by the harvesters. Again, the tradition that the sacrifice was instituted in order to put an end to drought and famine is in favour of taking it as a harvest festival. The resurrection of the corn-spirit, enacted by setting up the stuffed ox and yoking it to the plough, may be compared with the resurrection of the tree-spirit in the person of his representative, the Wild Man.

Still more clearly, perhaps, does the identification of the corn-spirit with an ox come out in the sacrificial ritual which the Greeks of Magnesia on the Maeander observed in honour of Zeus Sosipolis, a god whose title of Sosipolis (“Saviour of the City”) marks him as the equivalent of Zeus Polieus (“Zeus of the City”). The details of the ritual are happily preserved in an inscription, which records a decree of the council and of the people for the regulation of the whole proceedings. Every year at a festival in the month of Heraeon the magistrates bought the finest bull that could be had for money, and at the new moon of the month of Cronion, at the time when the sowing was about to begin, they and the priests dedicated the animal to Zeus Sosipolis, while solemn prayers were offered by the voice of a sacred herald for the welfare of the city, of the land, and of the people, for peace and wealth, for the corn-crops and all other fruits, and for the cattle. Thereafter the sacred animal was kept throughout the winter, its keep being undertaken by a contractor, who was bound by law to drive the bull to the market and there collect contributions for its maintenance from all the hucksters and in particular from the corn-chandlers; and a prospect was held out to such as contributed that it would go well with them. Finally, after having been thus maintained at the public cost for

some months, the bull was led forth with great pomp and sacrificed in the market-place on the twelfth day of the month Artemision, which is believed to have been equivalent to the Attic month of Thargelion and to the English month of May, the season when the corn is reaped in the Greek lowlands. In the procession which attended the animal to the place of sacrifice the senators, the priests, the magistrates, the young people, and the victors in the games all bore a part, and at the head of the procession were borne the images of the Twelve Gods attired in festal array, while a fluteplayer, a piper, and a harper discoursed solemn music. Now in the bull, which was thus dedicated at the time of sowing and kept at the cost of the pious, and especially of corn-chandlers, to be finally sacrificed at harvest, it is reasonable to see an embodiment of the corn-spirit. Regarded as such the animal was consecrated when the seed was committed to the earth; it was fed and kept all the time the corn was growing in order that by its beneficent energies it might foster that growth; and at last, to complete the parallel, when the corn was reaped the animal was slain, the cutting of the stalks being regarded as the death of the corn-spirit. Similarly we have seen that in the harvest-fields and on the threshing-floors of modern Europe the corn-spirit is often conceived in the form of a bull, an ox, or a calf, which is supposed to be killed at reaping or threshing; and, further, we saw that the conception is sometimes carried out in practice by slaughtering a real ox or a real calf on the harvest-field. Thus the parallelism between the ancient Greek and the modern European idea of the corn-spirit embodied in the form of a bull appears to be very close.

On the interpretation which I have adopted of the sacrifices offered to Zeus Polieus and Zeus Sosipolis the corn-spirit is conceived as a male, not as a female, as Zeus, not as Demeter or Persephone. In this there is no inconsistency. At the stage of thought which the Greeks had reached long before the dawn of history they supposed the processes of reproduction in nature to be carried on by a male and a female principle in conjunction; they did not believe, like some backward savages, that the female principle alone suffices for that purpose, and that the aid of the male principle is superfluous. Hence, as we have seen, they imagined that the goddesses of the corn, the mother Demeter and the daughter Persephone, had each her male partner with whom she united for the production of the crops. The partner of Demeter was Zeus, the partner of Persephone was his brother Pluto, the Subterranean Zeus, as he was called; and reasons have been shewn for thinking that the marriage of one or other of these divine pairs was solemnised at Eleusis as part of the Great Mysteries in order to promote the growth of the corn.

The ox appears as a representative of the corn-spirit in other parts of the world. At Great Bassam, in Guinea, two oxen are slain annually to procure a good harvest. If the sacrifice is to be effectual, it is necessary that the oxen should weep. So all the women of the village sit in front of the beasts, chanting, "The ox will weep; yes, he will weep!" From time to time one of the women walks round the beasts, throwing manioc meal or palm wine upon them, especially into their eyes. When tears roll down from the eyes of the oxen, the people dance, singing, "The ox weeps! the ox weeps!" Then two men seize the tails of the beasts and cut them off at one blow. It is believed that a great misfortune will happen in the course of the year if the tails are not severed at one blow. The oxen are afterwards killed, and their flesh is eaten by the chiefs. Here the tears of the oxen, like those of the human victims amongst the Khonds and the Aztecs, are probably a rain-charm. We have already seen that the virtue of the corn-spirit, embodied in animal form, is sometimes supposed to reside in the tail, and that the last handful of corn is sometimes conceived as the tail of the corn spirit. In the Mithraic religion this conception is graphically set forth in some of the numerous sculptures which represent Mithras kneeling on the back of a bull and plunging a knife into its flank; for on certain of these monuments the tail of the bull ends in three stalks of corn, and in one of them

corn-stalks instead of blood are seen issuing from the wound inflicted by the knife. Such representations certainly suggest that the bull, whose sacrifice appears to have formed a leading feature in the Mithraic ritual, was conceived, in one at least of its aspects, as an incarnation of the corn-spirit.

Still more clearly does the ox appear as a personification of the corn-spirit in a ceremony which is observed in all the provinces and districts of China to welcome the approach of spring. On the first day of spring, usually on the third or fourth of February, which is also the beginning of the Chinese New Year, the governor or prefect of the city goes in procession to the east gate of the city, and sacrifices to the Divine Husbandman, who is represented with a bull's head on the body of a man. A large effigy of an ox, cow, or buffalo has been prepared for the occasion, and stands outside of the east gate, with agricultural implements beside it. The figure is made of differently-coloured pieces of paper pasted on a framework either by a blind man or according to the directions of a necromancer. The colours of the paper prognosticate the character of the coming year; if red prevails, there will be many fires; if white, there will be floods and rain; and so with the other colours. The mandarins walk slowly round the ox, beating it severely at each step with rods of various hues. It is filled with five kinds of grain, which pour forth when the effigy is broken by the blows of the rods. The paper fragments are then set on fire, and a scramble takes place for the burning fragments, because the people believe that whoever gets one of them is sure to be fortunate throughout the year. A live buffalo is next killed, and its flesh is divided among the mandarins. According to one account, the effigy of the ox is made of clay, and, after being beaten by the governor, is stoned by the people till they break it in pieces, "from which they expect an abundant year." But the ceremony varies somewhat in the different provinces. According to another account the effigy of the cow, made of earthenware, with gilded horns, is borne in procession, and is of such colossal dimensions that forty or fifty men can hardly carry it. Behind this monstrous cow walks a boy with one foot shod and the other bare, personifying the Genius of Industry. He beats the effigy with a rod, as if to drive it forward. A great many little clay cows are afterwards taken out of the large one and distributed among the people. Both the big cow and the little ones are then broken in pieces, and the people take the sherds home with them in order to grind them to powder and strew the powder on their fields, for they think thus to secure a plentiful harvest. In the cities nearest to Weihaiwei, in northern China, the ceremony of "the Beginning of Spring" is a moveable feast, which falls usually in the first moon. The local magistrate and his attendants go in procession to the eastern suburbs of the city to "meet the Spring." A great pasteboard effigy of an ox is carried in the procession, together with another pasteboard image of a man called Mang-Shen, "who represents either the typical ox-driver or ploughman or the god of Agriculture." On the return of the procession to the magistrate's court, that dignitary himself and his principal colleagues beat and prod the pasteboard ox with wands, after which the effigy is burned along with the image of its attendant. The colours and apparel of the two effigies correspond with the forecasts of the Chinese almanack. Thus if the head of the ox is yellow, the summer will be very hot; if it is green, the spring will be sickly; if it is red, there will be a drought; if it is black, there will be much rain; if it is white, there will be high winds. If Mang-Shen wears a hat, the year will be dry; if he is bareheaded, it will be rainy; and so on with the other articles of his apparel. Besides the pasteboard ox a miniature ox made of clay is also supposed to be provided. In Chinese the ceremony is called indifferently "beating the ox" and "beating the spring," which seems to prove that the ox is identified with the vernal energies of nature. We may suppose that originally the ox which figures in the rite was a living animal, but ever since the beginning of our era, when the custom first appears in history, it has been an effigy of terra-cotta or pasteboard. To this day the Chinese calendar devotes a page to a picture of "the ox of spring" with Mang, the tutelary genius of spring, standing beside it and grasping

a willow-bough, with which he is about to beat the animal for the purpose of stimulating its reproductive virtue. In one form of this Chinese custom the corn-spirit appears to be plainly represented by the corn-filled ox, whose fragments may therefore be supposed to bring fertility with them. We may compare the Silesian custom of burning the effigy of Death, scrambling for the burning fragments, and burying them in the fields to secure a good crop, and the Florentine custom of sawing the Old Woman and scrambling for the dried fruits with which she was filled. Both these customs, like their Chinese counterpart, are observed in spring.

The practice of beating an earthenware or pasteboard image of an ox in spring is not confined to China proper, but seems to be widely spread in the east of Asia; for example, it has been recorded at Kashgar and in Annam. Thus a French traveller has described how at Kashgar, on the third of February 1892, a mandarin, clad in his finest robes and borne in a magnificent palanquin, conducted solemnly through the streets the pasteboard image of an ox, "a sacred animal devoted to the deity of spring who gives life to the fields. It is thus carried to some distance outside of the town on the eastern side. The official who acts as pontiff ceremoniously offers food and libations to it in order to obtain a fruitful year, and next day it is demolished by the lashes of a whip." Again, in Annam, every year at the approach of spring the Department of Rites publishes instructions to the provincial governors as to the manner in which the festival of the inauguration of spring is to be celebrated. Among the indispensable features of the festival are the figures of an ox and its warder made of terracotta. The attitudes of the two and the colours to be applied to them are carefully prescribed every year in the Chinese calendar. Popular opinion attributes to the colour of the ox and the accoutrement of its warder, who is called Mang Than, a certain influence on the crops of the year: a green, yellow, and black buffalo prognosticates an abundant harvest: a red or white buffalo foretells wretched crops and great droughts or hurricanes. If Mang Than is represented wearing a large hat, the year will be rainy; if on the other hand he is bareheaded, long barren droughts are to be feared. Nay, the public credulity goes so far as to draw good or evil omens from the cheerfulness or ill humour which may be detected on the features of the Warder of the Ox. Having been duly prepared in accordance with the directions of the almanack, the ox and its warder are carried in procession, followed by the mandarins and the people, to the altar of Spring, which is usually to be found in every provincial capital. There the provincial governor offers fruits, flowers, and incense to the Genius of Spring (*Xuan Quan*), and gold and silver paper money are burnt on the altar in profusion. Lastly the ox and his warder are buried in a spot which has been indicated by a geomancer. It is interesting to observe that the three colours of the ox which are taken to prognosticate good crops, to wit, green, yellow, and black, are precisely the colours which the ancients attributed to Demeter, the goddess of the corn.

The great importance which the Chinese attach to the performance of rites for the fertility of the ground is proved by an ancient custom which is, or was till lately, observed every year in spring. On an appointed day the emperor himself, attended by the highest dignitaries of the state, guides with his own hand the ox-drawn plough down several furrows and scatters the seed in a sacred field, or "field of God," as it is called, the produce of which is afterwards examined from time to time with anxious care by the Governor of Peking, who draws omens from the appearance of the ears; it is a very happy omen if he should chance to find thirteen ears growing on one stalk. To prepare himself for the celebration of this solemn rite the emperor is expected to fast and remain continent for three days previously, and the princes and mandarins who accompany him to the field are bound to observe similar restrictions. The corn grown on the holy field which has thus been ploughed by the imperial hands is collected in yellow sacks and stored in a special granary to be used by the emperor in certain solemn

sacrifices which he offers to the god Chan Ti and to his own ancestors. In the provinces of China the season of ploughing is similarly inaugurated by the provincial governors as representatives of the emperor.

The sacred field, or "field of God," in which the emperor of China thus ceremonially opens the ploughing for the year, and of which the produce is employed in sacrifice, reminds us of the Rarian plain at Eleusis, in which a sacred ploughing similarly took place every year, and of which the produce was in like manner devoted to sacrifice. Further, it recalls the little sacred rice-fields on which the Kayans of central Borneo inaugurate the various operations of the agricultural year by performing them in miniature. As I have already pointed out, all such consecrated enclosures were probably in origin what we may call spiritual preserves, that is, patches of ground which men set apart for the exclusive use of the corn-spirit to console him for the depredations they committed on all the rest of his domains. Again, the rule of fasting and continence observed by the Emperor of China and his august colleagues before they put their hands to the plough resembles the similar customs of abstinence practised by many savages as a preparation for engaging in the various labours of the field.

On the whole we may perhaps conclude that both as a goat and as a bull Dionysus was essentially a god of vegetation. The Chinese and European customs which I have cited may perhaps shed light on the custom of rending a live bull or goat at the rites of Dionysus. The animal was torn in fragments, as the Khond victim was cut in pieces, in order that the worshippers might each secure a portion of the life-giving and fertilising influence of the god. The flesh was eaten raw as a sacrament, and we may conjecture that some of it was taken home to be buried in the fields, or otherwise employed so as to convey to the fruits of the earth the quickening influence of the god of vegetation. The resurrection of Dionysus, related in his myth, may have been enacted in his rites by stuffing and setting up the slain ox, as was done at the Athenian *bouphonia*.

§ 2. Demeter, the Pig and the Horse.

Passing next to the corn-goddess Demeter, and remembering that in European folk-lore the pig is a common embodiment of the corn-spirit, we may now ask whether the pig, which was so closely associated with Demeter, may not have been originally the goddess herself in animal form? The pig was sacred to her; in art she was portrayed carrying or accompanied by a pig; and the pig was regularly sacrificed in her mysteries, the reason assigned being that the pig injures the corn and is therefore an enemy of the goddess. But after an animal has been conceived as a god, or a god as an animal, it sometimes happens, as we have seen, that the god sloughs off his animal form and becomes purely anthropomorphic; and that then the animal, which at first had been slain in the character of the god, comes to be viewed as a victim offered to the god on the ground of its hostility to the deity; in short, the god is sacrificed to himself on the ground that he is his own enemy. This happened to Dionysus, and it may have happened to Demeter also. And in fact the rites of one of her festivals, the Thesmophoria, bear out the view that originally the pig was an embodiment of the corn-goddess herself, either Demeter or her daughter and double Persephone. The Attic Thesmophoria was an autumn festival, celebrated by women alone in October, and appears to have represented with mourning rites the descent of Persephone (or Demeter) into the lower world, and with joy her return from the dead. Hence the name Descent or Ascent variously applied to the first, and the name *Kalligeneia* (fair-born) applied to the third day of the festival. Now from an old scholium on Lucian we learn some details about the mode of celebrating the Thesmophoria, which shed important light on the part of the festival called the Descent or the Ascent. The scholiast tells us that it was customary at the Thesmophoria to throw pigs, cakes of dough, and branches of pine-trees into "the chasms of Demeter and

Persephone," which appear to have been sacred caverns or vaults. In these caverns or vaults there were said to be serpents, which guarded the caverns and consumed most of the flesh of the pigs and dough-cakes which were thrown in. Afterwards—apparently at the next annual festival—the decayed remains of the pigs, the cakes, and the pine-branches were fetched by women called "drawers," who, after observing rules of ceremonial purity for three days, descended into the caverns, and, frightening away the serpents by clapping their hands, brought up the remains and placed them on the altar. Whoever got a piece of the decayed flesh and cakes, and sowed it with the seed-corn in his field, was believed to be sure of a good crop. With the feeding of the serpents in the vaults by the women we may compare an ancient Italian ritual. At Lanuvium a serpent lived in a sacred cave within a grove of Juno. On certain appointed days a number of holy maidens, with their eyes bandaged, entered the grove carrying cakes of barley in their hands. Led, as it was believed, by the divine spirit, they walked straight to the serpent's den and offered him the cakes. If they were chaste, the serpent ate the cakes, the parents of the girls rejoiced, and farmers prognosticated an abundant harvest. But if the girls were unchaste, the serpent left the cakes untasted, and ants came and crumbled the rejected viands and so removed them bit by bit from the sacred grove, thereby purifying the hallowed spot from the stain it had contracted by the presence of a defiled maiden.

To explain the rude and ancient ritual of the Thesmophoria the following legend was told. At the moment when Pluto carried off Persephone, a swineherd called Eubuleus chanced to be herding his swine on the spot, and his herd was engulfed in the chasm down which Pluto vanished with Persephone. Accordingly at the Thesmophoria pigs were annually thrown into caverns to commemorate the disappearance of the swine of Eubuleus. It follows from this that the casting of the pigs into the vaults at the Thesmophoria formed part of the dramatic representation of Persephone's descent into the lower world; and as no image of Persephone appears to have been thrown in, we may infer that the descent of the pigs was not so much an accompaniment of her descent as the descent itself, in short, that the pigs were Persephone. Afterwards when Persephone or Demeter (for the two are equivalent) took on human form, a reason had to be found for the custom of throwing pigs into caverns at her festival; and this was done by saying that when Pluto carried off Persephone, there happened to be some swine browsing near, which were swallowed up along with her. The story is obviously a forced and awkward attempt to bridge over the gulf between the old conception of the corn-spirit as a pig and the new conception of her as an anthropomorphic goddess. A trace of the older conception survived in the legend that when the sad mother was searching for traces of the vanished Persephone, the footprints of the lost one were obliterated by the footprints of a pig; originally, we may conjecture, the footprints of the pig were the footprints of Persephone and of Demeter herself. A consciousness of the intimate connexion of the pig with the corn lurks in the legend that the swineherd Eubuleus was a brother of Triptolemus, to whom Demeter first imparted the secret of the corn. Indeed, according to one version of the story, Eubuleus himself received, jointly with his brother Triptolemus, the gift of the corn from Demeter as a reward for revealing to her the fate of Persephone. Further, it is to be noted that at the Thesmophoria the women appear to have eaten swine's flesh. The meal, if I am right, must have been a solemn sacrament or communion, the worshippers partaking of the body of the god.

As thus explained, the Thesmophoria has its analogies in the folk-customs of Northern Europe which have been already described. Just as at the Thesmophoria—an autumn festival in honour of the corn-goddess—swine's flesh was partly eaten, partly kept in caverns till the following year, when it was taken up to be sown with the seed-corn in the fields for the purpose of securing a good crop; so in the neighbourhood of Grenoble the goat killed on the

harvest-field is partly eaten at the harvest-supper, partly pickled and kept till the next harvest; so at Pouilly the ox killed on the harvest-field is partly eaten by the harvesters, partly pickled and kept till the first day of sowing in spring, probably to be then mixed with the seed, or eaten by the ploughmen, or both; so at Udvarhely the feathers of the cock which is killed in the last sheaf at harvest are kept till spring, and then sown with the seed on the field; so in Hesse and Meiningen the flesh of pigs is eaten on Ash Wednesday or Candlemas, and the bones are kept till sowing-time, when they are put into the field sown or mixed with the seed in the bag; so, lastly, the corn from the last sheaf is kept till Christmas, made into the Yule Boar, and afterwards broken and mixed with the seed-corn at sowing in spring. Thus, to put it generally, the corn-spirit is killed in animal form in autumn; part of his flesh is eaten as a sacrament by his worshippers; and part of it is kept till next sowing-time or harvest as a pledge and security for the continuance or renewal of the corn-spirit's energies. Whether in the interval between autumn and spring he is conceived as dead, or whether, like the ox in the *bouphonia*, he is supposed to come to life again immediately after being killed, is not clear. At the Thesmophoria, according to Clement and Pausanias, as emended by Lobeck, the pigs were thrown in alive, and were supposed to reappear at the festival of the following year. Here, therefore, if we accept Lobeck's emendations, the corn-spirit is conceived as alive throughout the year; he lives and works under ground, but is brought up each autumn to be renewed and then replaced in his subterranean abode.

If persons of fastidious taste should object that the Greeks never could have conceived Demeter and Persephone to be embodied in the form of pigs, it may be answered that in the cave of Phigalia in Arcadia the Black Demeter was portrayed with the head and mane of a horse on the body of a woman. Between the portrait of a goddess as a pig, and the portrait of her as a woman with a horse's head, there is little to choose in respect of barbarism. The legend told of the Phigalian Demeter indicates that the horse was one of the animal forms assumed in ancient Greece, as in modern Europe, by the corn-spirit. It was said that in her search for her daughter, Demeter assumed the form of a mare to escape the addresses of Poseidon, and that, offended at his importunity, she withdrew in dudgeon to a cave not far from Phigalia in the highlands of Western Arcadia. The very cavern, now turned into a little Christian chapel with its holy pictures, is still shewn to the curious traveller far down the side of that profound ravine through which the brawling Neda winds under overhanging woods to the sea. There, robed in black, she tarried so long that the fruits of the earth were perishing, and mankind would have died of famine if Pan had not soothed the angry goddess and persuaded her to quit the cave. In memory of this event, the Phigalians set up an image of the Black Demeter in the cave; it represented a woman dressed in a long robe, with the head and mane of a horse. The Black Demeter, in whose absence the fruits of the earth perish, is plainly a mythical expression for the bare wintry earth stripped of its summer mantle of green.

§ 3. Attis, Adonis, and the Pig.

Passing now to Attis and Adonis, we may note a few facts which seem to shew that these deities of vegetation had also, like other deities of the same class, their animal embodiments. The worshippers of Attis abstained from eating the flesh of swine. This appears to indicate that the pig was regarded as an embodiment of Attis. And the legend that Attis was killed by a boar points in the same direction. For after the examples of the goat Dionysus and the pig Demeter it may almost be laid down as a rule that an animal which is said to have injured a god was originally the god himself. Perhaps the cry of "Hyes Attes! Hyes Attes!" which was raised by the worshippers of Attis, may be neither more nor less than "Pig Attis! Pig Attis!"—*hyes* being possibly a Phrygian form of the Greek *hḗs*, "a pig."

In regard to Adonis, his connexion with the boar was not always explained by the story that he had been killed by the animal. According to another story, a boar rent with his tusk the bark of the tree in which the infant Adonis was born. According to yet another story, he perished at the hands of Hephaestus on Mount Lebanon while he was hunting wild boars. These variations in the legend serve to shew that, while the connexion of the boar with Adonis was certain, the reason of the connexion was not understood, and that consequently different stories were devised to explain it. Certainly the pig ranked as a sacred animal among the Syrians. At the great religious metropolis of Hierapolis on the Euphrates pigs were neither sacrificed nor eaten, and if a man touched a pig he was unclean for the rest of the day. Some people said this was because the pigs were unclean; others said it was because the pigs were sacred. This difference of opinion points to a hazy state of religious thought in which the ideas of sanctity and uncleanness are not yet sharply distinguished, both being blent in a sort of vaporous solution to which we give the name of taboo. It is quite consistent with this that the pig should have been held to be an embodiment of the divine Adonis, and the analogies of Dionysus and Demeter make it probable that the story of the hostility of the animal to the god was only a late misapprehension of the old view of the god as embodied in a pig. The rule that pigs were not sacrificed or eaten by worshippers of Attis and presumably of Adonis, does not exclude the possibility that in these rituals the pig was slain on solemn occasions as a representative of the god and consumed sacramentally by the worshippers. Indeed, the sacramental killing and eating of an animal implies that the animal is sacred, and that, as a general rule, it is spared.

The attitude of the Jews to the pig was as ambiguous as that of the heathen Syrians towards the same animal. The Greeks could not decide whether the Jews worshipped swine or abominated them. On the one hand they might not eat swine; but on the other hand they might not kill them. And if the former rule speaks for the uncleanness, the latter speaks still more strongly for the sanctity of the animal. For whereas both rules may, and one rule must, be explained on the supposition that the pig was sacred; neither rule must, and one rule cannot, be explained on the supposition that the pig was unclean. If, therefore, we prefer the former supposition, we must conclude that, originally at least, the pig was revered rather than abhorred by the Israelites. We are confirmed in this opinion by observing that down to the time of Isaiah some of the Jews used to meet secretly in gardens to eat the flesh of swine and mice as a religious rite. Doubtless this was a very ancient ceremony, dating from a time when both the pig and the mouse were venerated as divine, and when their flesh was partaken of sacramentally on rare and solemn occasions as the body and blood of gods. And in general it may be said that all so-called unclean animals were originally sacred; the reason for not eating them was that they were divine.

§ 4. Osiris, the Pig and the Bull.

In ancient Egypt, within historical times, the pig occupied the same dubious position as in Syria and Palestine, though at first sight its uncleanness is more prominent than its sanctity. The Egyptians are generally said by Greek writers to have abhorred the pig as a foul and loathsome animal. If a man so much as touched a pig in passing, he stepped into the river with all his clothes on, to wash off the taint. To drink pig's milk was believed to cause leprosy to the drinker. Swineherds, though natives of Egypt, were forbidden to enter any temple, and they were the only men who were thus excluded. No one would give his daughter in marriage to a swineherd, or marry a swineherd's daughter; the swineherds married among themselves. Yet once a year the Egyptians sacrificed pigs to the moon and to Osiris, and not only sacrificed them, but ate of their flesh, though on any other day of the year they would neither sacrifice them nor taste of their flesh. Those who were too poor to offer a pig on this day baked cakes of dough, and offered them instead. This can hardly be explained except by

the supposition that the pig was a sacred animal which was eaten sacramentally by his worshippers once a year.

The view that in Egypt the pig was sacred is borne out by the very facts which, to moderns, might seem to prove the contrary. Thus the Egyptians thought, as we have seen, that to drink pig's milk produced leprosy. But exactly analogous views are held by savages about the animals and plants which they deem most sacred. Thus in the island of Wetar (between New Guinea and Celebes) people believe themselves to be variously descended from wild pigs, serpents, crocodiles, turtles, dogs, and eels; a man may not eat an animal of the kind from which he is descended; if he does so, he will become a leper, and go mad. Amongst the Omaha Indians of North America men whose totem is the elk, believe that if they ate the flesh of the male elk they would break out in boils and white spots in different parts of their bodies. In the same tribe men whose totem is the red maize, think that if they ate red maize they would have running sores all round their mouths. The Bush negroes of Surinam, who practise totemism, believe that if they ate the *capiai* (an animal like a pig) it would give them leprosy; perhaps the *capiai* is one of their totems. The Syrians, in antiquity, who esteemed fish sacred, thought that if they ate fish their bodies would break out in ulcers, and their feet and stomach would swell up. The Nyanja-speaking tribes of Central Angoniland, in British Central Africa, believe that if a person eats his totemic animal, his body will break out in spots. The cure for this eruption of the skin is to bathe the body in a decoction made from the bone of the animal, the eating of which caused the malady. The Wagogo of German East Africa imagine that the sin of eating the totemic animal is visited not on the sinner himself but on his innocent kinsfolk. Thus when they see a child with a scald head, they say at once that its father has been eating his totem and that is why the poor child has scabs on its pate. Among the Wahehe, another tribe of German East Africa, a man who suffers from scab or other skin disease will often set the trouble down to his having unwittingly partaken of his totemic animal. Similarly among the Waheia, another tribe of the same region, if a man kills or eats the totemic animal of his clan, he is supposed to suffer from an eruption of the skin. In like manner the Bantu tribes of Kavirondo, in Central Africa, hold that the eating of the totem produces a severe cutaneous eruption, which can however be cured by mixing an extract of certain herbs with the fat of a black ox and rubbing the body of the sufferer all over with the mixture. The Chasas of Orissa believe that if they were to injure their totemic animal, they would be attacked by leprosy and their line would die out. These examples prove that the eating of a sacred animal is often believed to produce leprosy or other skin-diseases; so far, therefore, they support the view that the pig must have been sacred in Egypt, since the effect of drinking its milk was believed to be leprosy. Such fancies may perhaps have been sometimes suggested by the observation that the eating of semi-putrid flesh, to which some savages are addicted, is apt to be followed by eruptions on the skin. Indeed, many modern authorities attribute leprosy to this cause, particularly to the eating of half rotten fish. It seems not impossible that the abhorrence which the Hebrews entertained of leprosy, and the pains which they took to seclude lepers from the community, may have been based on religious as well as on purely sanitary grounds; they may have imagined that the disfigurement of the sufferers was a penalty which they had incurred by some infraction of taboo. Certainly we read in the Old Testament of cases of leprosy which the historian regarded as the direct consequence of sin.

Again, the rule that, after touching a pig, a man had to wash himself and his clothes, also favours the view of the sanctity of the pig. For it is a common belief that the effect of contact with a sacred object must be removed, by washing or otherwise, before a man is free to mingle with his fellows. Thus the Jews wash their hands after reading the sacred scriptures. Before coming forth from the tabernacle after the sin-offering, the high priest had to wash

himself, and put off the garments which he had worn in the holy place. It was a rule of Greek ritual that, in offering an expiatory sacrifice, the sacrificer should not touch the sacrifice, and that, after the offering was made, he must wash his body and his clothes in a river or spring before he could enter a city or his own house. The Parjas, a small tribe of the Central Provinces in India, are divided into clans which have for their respective totems the tiger, the tortoise, the goat, a big lizard, a dove, and so on. If a man accidentally kills his totemic animal, "the earthen cooking-pots of his household are thrown away, the clothes are washed, and the house is purified with water in which the bark of the mango or *jamun* tree (*Eugenia jambolana*) has been steeped. This is in sign of mourning, as it is thought that such an act will bring misfortune." If a Chadwar of the Central Provinces who has the pig for his totem should even see a pig killed by somebody else, he will throw away the household crockery and clean the house as if on the death of a member of his family. The Polynesians felt strongly the need of ridding themselves of the sacred contagion, if it may be so called, which they caught by touching sacred objects. Various ceremonies were performed for the purpose of removing this contagion. We have seen, for example, how in Tonga a man who happened to touch a sacred chief, or anything personally belonging to him, had to perform a certain ceremony before he could feed himself with his hands; otherwise it was believed that he would swell up and die, or at least be afflicted with scrofula or some other disease. We have seen, too, what fatal effects are supposed to follow, and do actually follow, from contact with a sacred object in New Zealand. In short, primitive man believes that what is sacred is dangerous; it is pervaded by a sort of electrical sanctity which communicates a shock to, even if it does not kill, whatever comes in contact with it. Hence the savage is unwilling to touch or even to see that which he deems peculiarly holy. Thus Bechuanas, of the Crocodile clan, think it "hateful and unlucky" to meet or see a crocodile; the sight is thought to cause inflammation of the eyes. Yet the crocodile is their most sacred object; they call it their father, swear by it, and celebrate it in their festivals. The goat is the sacred animal of the Madenassana Bushmen; yet "to look upon it would be to render the man for the time impure, as well as to cause him undefined uneasiness." The Elk clan, among the Omaha Indians, believe that even to touch the male elk would be followed by an eruption of boils and white spots on the body. Members of the Reptile clan in the same tribe think that if one of them touches or smells a snake, it will make his hair white. In Samoa people whose god was a butterfly believed that if they caught a butterfly it would strike them dead. Again, in Samoa the reddish-seared leaves of the banana-tree were commonly used as plates for handing food; but if any member of the Wild Pigeon family had used banana leaves for this purpose, it was supposed that he would suffer from rheumatic swellings or an eruption all over the body like chicken-pox. The Mori clan of the Bhils in Central India worship the peacock as their totem and make offerings of grain to it; yet members of the clan believe that were they even to set foot on the tracks of a peacock they would afterwards suffer from some disease, and if a woman sees a peacock she must veil her face and look away. Thus the primitive mind seems to conceive of holiness as a sort of dangerous virus, which a prudent man will shun as far as possible, and of which, if he should chance to be infected by it, he will carefully disinfect himself by some form of ceremonial purification.

In the light of these parallels the beliefs and customs of the Egyptians touching the pig are probably to be explained as based upon an opinion of the extreme sanctity rather than of the extreme uncleanness of the animal; or rather, to put it more correctly, they imply that the animal was looked on, not simply as a filthy and disgusting creature, but as a being endowed with high supernatural powers, and that as such it was regarded with that primitive sentiment of religious awe and fear in which the feelings of reverence and abhorrence are almost equally blended. The ancients themselves seem to have been aware that there was another side to the horror with which swine seemed to inspire the Egyptians. For the Greek

astronomer and mathematician Eudoxus, who resided fourteen months in Egypt and conversed with the priests, was of opinion that the Egyptians spared the pig, not out of abhorrence, but from a regard to its utility in agriculture; for, according to him, when the Nile had subsided, herds of swine were turned loose over the fields to tread the seed down into the moist earth. But when a being is thus the object of mixed and implicitly contradictory feelings, he may be said to occupy a position of unstable equilibrium. In course of time one of the contradictory feelings is likely to prevail over the other, and according as the feeling which finally predominates is that of reverence or abhorrence, the being who is the object of it will rise into a god or sink into a devil. The latter, on the whole, was the fate of the pig in Egypt. For in historical times the fear and horror of the pig seem certainly to have outweighed the reverence and worship of which he may once have been the object, and of which, even in his fallen state, he never quite lost trace. He came to be looked on as an embodiment of Set or Typhon, the Egyptian devil and enemy of Osiris. For it was in the shape of a black pig that Typhon injured the eye of the god Horus, who burned him and instituted the sacrifice of the pig, the sun-god Ra having declared the beast abominable. Again, the story that Typhon was hunting a boar when he discovered and mangled the body of Osiris, and that this was the reason why pigs were sacrificed once a year, is clearly a modernised version of an older story that Osiris, like Adonis and Attis, was slain or mangled by a boar, or by Typhon in the form of a boar. Thus, the annual sacrifice of a pig to Osiris might naturally be interpreted as vengeance inflicted on the hostile animal that had slain or mangled the god. But, in the first place, when an animal is thus killed as a solemn sacrifice once and once only in the year, it generally or always means that the animal is divine, that he is spared and respected the rest of the year as a god and slain, when he is slain, also in the character of a god. In the second place, the examples of Dionysus and Demeter, if not of Attis and Adonis, have taught us that the animal which is sacrificed to a god on the ground that he is the god's enemy may have been, and probably was, originally the god himself. Therefore, the annual sacrifice of a pig to Osiris, coupled with the alleged hostility of the animal to the god, tends to shew, first, that originally the pig was a god, and, second, that he was Osiris. At a later age, when Osiris became anthropomorphic and his original relation to the pig had been forgotten, the animal was first distinguished from him, and afterwards opposed as an enemy to him by mythologists who could think of no reason for killing a beast in connexion with the worship of a god except that the beast was the god's enemy; or, as Plutarch puts it, not that which is dear to the gods, but that which is the contrary, is fit to be sacrificed. At this later stage the havoc which a wild boar notoriously makes amongst the corn would supply a plausible reason for regarding him as the foe of the corn-spirit, though originally, if I am right, the very freedom with which the boar ranged at will through the corn led people to identify him with the corn-spirit, to whom he was afterwards opposed as an enemy.

As the depredations committed by wild swine on the growing crops in countries where these creatures abound are necessarily unfamiliar to most English readers, it may be well to illustrate them by examples. Thus, for instance, in Palestine the wild boar "is eagerly chased and destroyed on account of the frightful ravages it makes among the crops. Not only does it devour any fruits within reach, but in a single night a party of wild boars will uproot a whole field, and destroy the husbandman's hopes for the year. The places they love to frequent are the reedy marshes and thickets by rivers and lakes, and they swarm in the thickets all along the banks of the Jordan from Jericho to the Lake of Gennesaret. From these fastnesses, whence neither dog nor man can dislodge them, they make nightly forays upon the corn-fields and root-crops of the villagers, returning at daybreak to their coverts. About Jericho they are especially destructive, and when the barley crop is ripening, the husbandmen have to keep nightly watch to drive them away. Their presence can always be detected by the

crashing noise they make in forcing their way through the thickets, when the men fire, guided by the sound." Wild pigs are the special enemies of the crops in South Africa; the fences constructed by the Zulus round their gardens are mainly designed to guard against the devastating depredations of these brutes, though porcupines, baboons, hippopotamuses, and elephants also make havoc of the ripe grain. Sometimes small huts are erected on platforms in the gardens, and in these huts watchers are set to scare away the nocturnal invaders. So in British Central Africa sentinels are posted day and night in huts raised on platforms to protect the maize fields from the inroads of baboons and of wild pigs, which are still more destructive than the baboons, for they grub up the plants as well as devour the grain; and the watchers drum continually on any metal they have at hand to keep the marauders at bay. In the island of Nias whole fields are sometimes trampled down by these pests between sunset and sunrise. Often the stillness of the serene equatorial night is broken by the strident cries of the watchers of the fields; the sound goes echoing through the wooded valleys for a long time, and here and there a dull grunting tells that the efforts of the sentinels have not been in vain. In Northern Luzon, of the Philippine Archipelago, the rice-fields are similarly exposed to the depredations of wild hogs, and watchers remain on guard day and night in outlooks, sometimes in commodious structures of stone erected for the purpose, who burn fires at night to frighten the animals away. At the beginning of their annual agricultural labours the Banars of Cambodia pray to Yang-Seri that he would be pleased to give them plenty of rice and to prevent the wild boars from eating it up. In Gayo-land, a district of Sumatra, the worst enemies of the rice crops are wild swine and field mice; the whole of the harvest is sometimes destroyed by their inroads. Among the Kai of German New Guinea people who are engaged in the labour of the fields will on no account eat pork. The reason is that pigs, both wild and tame, are the most dangerous foes of the crops; therefore it seems clear to the mind of the Kai that if a field labourer were to eat pork, the flesh of the dead pig in his stomach would attract the living pigs into the field. Perhaps this superstition, based on the principle of sympathetic magic, may explain the aversion to pork which was entertained by some of the agricultural peoples of the Eastern Mediterranean in antiquity.

To people thus familiarised with the ravages of wild boars among the ripe crops the idea might naturally present itself that the animal is either the enemy of the corn-god or perhaps the corn-god himself come in person to enjoy his own despite all the efforts of mankind to keep him out of his rights. Hence we can understand how an agricultural people like the ancient Egyptians may have identified the wild boar either with their corn-god Osiris or with his enemy Typhon. The view which identifies the pig with Osiris derives not a little support from the sacrifice of pigs to him on the very day on which, according to tradition, Osiris himself was killed; for thus the killing of the pig was the annual representation of the killing of Osiris, just as the throwing of the pigs into the caverns at the Thesmophoria was an annual representation of the descent of Persephone into the lower world; and both customs are parallel to the European practice of killing a goat, cock, and so forth, at harvest as a representative of the corn-spirit.

Again, the theory that the pig, originally Osiris himself, afterwards came to be regarded as an embodiment of his enemy Typhon, is supported by the similar relation of red-haired men and red oxen to Typhon. For in regard to the red-haired men who were burned and whose ashes were scattered with winnowing-fans, we have seen fair grounds for believing that originally, like the red-haired puppies killed at Rome in spring, they were representatives of the corn-spirit himself, that is, of Osiris, and were slain for the express purpose of making the corn turn red or golden. Yet at a later time these men were explained to be representatives, not of Osiris, but of his enemy Typhon, and the killing of them was regarded as an act of vengeance inflicted on the enemy of the god. Similarly, the red oxen sacrificed by the Egyptians were

said to be offered on the ground of their resemblance to Typhon; though it is more likely that originally they were slain on the ground of their resemblance to the corn-spirit Osiris. We have seen that the ox is a common representative of the corn-spirit and is slain as such on the harvest-field.

Osiris was regularly identified with the bull Apis of Memphis and the bull Mnevis of Heliopolis. But it is hard to say whether these bulls were embodiments of him as the corn-spirit, as the red oxen appear to have been, or whether they were not in origin entirely distinct deities who came to be fused with Osiris at a later time. The universality of the worship of these two bulls seems to put them on a different footing from the ordinary sacred animals whose worships were purely local. Hence if the latter were evolved from totems, as they may have been, some other origin would have to be found for the worship of Apis and Mnevis. If these bulls were not originally embodiments of the corn-god Osiris, they may possibly be descendants of the sacred cattle worshipped by a pastoral people. If this were so, ancient Egypt would exhibit a stratification of three great types of religion or superstition corresponding to three great stages of society. Totemism, which may be roughly described as a species of superstitious respect paid to wild animals and plants by many tribes in the hunting stage of society, would be represented by the worship of the local sacred animals; the worship of cattle, which belongs to society in the pastoral stage, would be represented by the cults of Apis and Mnevis; and the worship of cultivated plants, which is peculiar to society in the agricultural stage, would be represented by the religion of Osiris and Isis. The Egyptian reverence for cows, which were never killed, might belong either to the second or the third of these stages. The consecration of cows to Isis, who was portrayed with cow's horns and may have been supposed to be incarnate in the animals, would indicate that they, like the red oxen, were embodiments of the corn-spirit. However, this identification of Isis with the cow, like that of Osiris with the bulls Apis and Mnevis, may be only an effect of syncretism. But whatever the original relation of Apis to Osiris may have been, there is one fact about the former which ought not to be passed over in a disquisition on the custom of killing a god. Although the bull Apis was worshipped as a god with much pomp and profound reverence, he was not suffered to live beyond a certain length of time which was prescribed by the sacred books, and on the expiry of which he was drowned in a holy spring. The limit, according to Plutarch, was twenty-five years; but it cannot always have been enforced, for the tombs of the Apis bulls have been discovered in modern times, and from the inscriptions on them it appears that in the twenty-second dynasty two of the holy steers lived more than twenty-six years.

To prevent misunderstandings it may be well to add that what I have just said as to the stratification of three great types of religion or superstition corresponding to three great types of society is not meant to sketch, even in outline, the evolution of religion as a whole. I by no means wish to suggest that the reverence for wild animals and plants, the reverence for domestic cattle, and the reverence for cultivated plants are the only forms of religion or superstition which prevail at the corresponding stages of social development; all that I desire to convey is that they are characteristic of these stages respectively. The elements which make up any religious system are far too numerous and their interaction far too complex to be adequately summed up in a few simple formulas. To mention only a single factor of which I have taken no account in indicating roughly a certain correspondence between the strata of religion and of society, the fear of the spirits of the dead appears to have been one of the most powerful factors, perhaps, indeed, the most powerful of all, in shaping the course of religious evolution at every stage of social development from the lowest to the highest; and for that very reason it is not specially characteristic of any one form of society. And the three types of religion or superstition which I have selected as characteristic of three stages of society are

far from being strictly limited each to its corresponding step in the social ladder. For example, although totemism, or a particular species of reverence paid by groups of men to wild animals and plants, probably always originated in the hunting stage of society, it has by no means been confined to that primitive phase of human development but has often survived not only into the pastoral but into the agricultural stage, as we may see for example by the case of many tribes in Africa, India, and America; and it seems likely that a similar overlapping of the various strata takes place in every instance. In short, we cannot really dissect the history of mankind as it were with a knife into a series of neat sections each sharply marked off from all the rest by a texture and colour of its own; we may indeed do so theoretically for the convenience of exposition, but practically the textures interlace, the colours melt and run into each other by insensible gradations that defy the edge of the finest instrument of analysis which we can apply to them. It is a mere truism to say that the abstract generalisations of science can never adequately comprehend all the particulars of concrete reality. The facts of nature will always burst the narrow bonds of human theories.

Before quitting this part of our subject it may be well to illustrate by one or two examples the reverence which primitive pastoral tribes pay to their cattle, since, as I have just indicated, the worship of sacred bulls by the ancient Egyptians, like the modern Hindoo worship of cows, may very well have been directly derived from a similar respect paid by their remote ancestors to their cattle. A good instance is supplied by the Dinka, a large cattle-breeding tribe, or rather nation, of the White Nile. "Every idea and thought of the Dinka," says Schweinfurth, "is how to acquire and maintain cattle: a kind of reverence would seem to be paid to them; even their offal is considered of high importance; the dung, which is burnt to ashes for sleeping in and for smearing their persons, and the urine, which is used for washing and as a substitute for salt, are their daily requisites. It must be owned that it is hard to reconcile this latter usage with our ideas of cleanliness. A cow is never slaughtered, but when sick it is segregated from the rest, and carefully tended in the large huts built for the purpose. Only those that die naturally or by an accident are used as food. All this, which exists among most of the pastoral tribes of Africa, may perchance appear to be a lingering remnant of an exploded cattle-worship; but I may draw attention to the fact that the Dinka are by no means disinclined to partake of any feast of their flesh, provided that the slaughtered animal was not their own property. It is thus more the delight of actual possession, than any superstitious estimate, that makes the cow to them an object of reverence. Indescribable is the grief when either death or rapine has robbed a Dinka of his cattle. He is prepared to redeem their loss by the heaviest sacrifices, for they are dearer to him than wife or child. A dead cow is not, however, wantonly buried; the negro is not sentimental enough for that; such an occurrence is soon bruited abroad, and the neighbours institute a carousal, which is quite an epoch in their monotonous life. The bereaved owner himself is, however, too much afflicted at the loss to be able to touch a morsel of the carcass of his departed beast. Not unfrequently in their sorrow the Dinka remain for days silent and abstracted, as though their trouble were too heavy for them to bear." A rich Dinka will sometimes keep a favourite ox and treat it with such marks of respect that an observer has compared the animal to the Apis of the ancient Egyptians. "Here and there," we are told, "beside the hut of a wealthy negro is set up a great withered tree. From its boughs hang vessels containing food and perhaps trophies of war; to its trunk is fastened the great drum (*Noqara*), which summons to war or to the dance. To this tree, separated from the rest of the cattle, is tethered a great fat ox. It is of a white colour passing into a slaty grey on the shoulders and legs: its long horns are artificially bent to opposite sides and adorned with bunches of hair: the tuft of the tail is cut off. This is the *makwi*, the Apis of the negro. His master, who has singled him out from his youth for his colour and certain marks, has cherished and reared him in order that he may one day be his pride in the eyes of the village. He has gelded him, adorned him, trained him to walk at the

head of the herd, to dance, and to fight. His *makwi* is always an object of his tenderest attention; he never fails to bring him a bundle of the finest herbs; if he can procure a bell, he hangs it round the animal's neck; and at evening, if he has milk or *meriṣa* enough for guests, the drum is beaten to summon the youth to come and dance round the deified ox."

Again, speaking of the Nuehr, another pastoral tribe of the Upper Nile, a traveller tells us that "as among the Dinka, so among the Nuehr-negroes the cattle enjoy a respect, indeed we may say a veneration, which reminds us of the animal worship of the ancient Egyptians, especially of that of the holy steer Apis, though the respect may be grounded on the simple fact that cattle are the only possession of these negroes. The largest and handsomest bull is the leader of the herd; he is decked with bunches of hair and small bells, marked out from the rest in every way, and regarded as the guardian genius of the herd as well as of the family. His loss is the greatest misfortune that can befall his owner. At night his master drives the animal round the herd, couched about the smoky fire, and sings of his beauty and courage, while the bull signifies his contentment by a complacent lowing. To him his master every morning commits the herd, in order that he may guide them to the best pastures and guard them from danger; in him he reveres his ideal of all that is beautiful and strong; nay he designates him by the same name which he applies to his own dim conception of a Supreme Being, *Nyeledit*, and to the thunder."

§ 5. Virbius and the Horse.

We are now in a position to hazard a conjecture as to the meaning of the tradition that Virbius, the first of the divine Kings of the Wood at Aricia, had been killed in the character of Hippolytus by horses. Having found, first, that spirits of the corn are not infrequently represented in the form of horses; and, second, that the animal which in later legends is said to have injured the god was sometimes originally the god himself, we may conjecture that the horses by which Virbius or Hippolytus was said to have been slain were really embodiments of him as a deity of vegetation. The myth that he had been killed by horses was probably invented to explain certain features in his worship, amongst others the custom of excluding horses from his sacred grove. For myth changes while custom remains constant; men continue to do what their fathers did before them, though the reasons on which their fathers acted have been long forgotten. The history of religion is a long attempt to reconcile old custom with new reason, to find a sound theory for an absurd practice. In the case before us we may be sure that the myth is more modern than the custom and by no means represents the original reason for excluding horses from the grove. From their exclusion it might be inferred that horses could not be the sacred animals or embodiments of the god of the grove. But the inference would be rash. The goat was at one time a sacred animal or embodiment of Athena, as may be inferred from the practice of representing the goddess clad in a goat-skin (*aegis*). Yet the goat was neither sacrificed to her as a rule, nor allowed to enter her great sanctuary, the Acropolis at Athens. The reason alleged for this was that the goat injured the olive, the sacred tree of Athena. So far, therefore, the relation of the goat of Athena is parallel to the relation of the horse to Virbius, both animals being excluded from the sanctuary on the ground of injury done by them to the god. But from Varro we learn that there was an exception to the rule which excluded the goat from the Acropolis. Once a year, he says, the goat was driven on to the Acropolis for a necessary sacrifice. Now, as has been remarked before, when an animal is sacrificed once and once only in the year, it is probably slain, not as a victim offered to the god, but as a representative of the god himself. Therefore we may infer that if a goat was sacrificed on the Acropolis once a year, it was sacrificed in the character of Athena herself; and it may be conjectured that the skin of the sacrificed animal was placed on the statue of the goddess and formed the *aegis*, which would thus be renewed annually. Similarly at Thebes in Egypt rams were sacred and were not sacrificed. But on one

day in the year a ram was killed, and its skin was placed on the statue of the god Ammon. Now, if we knew the ritual of the Arician grove better, we might find that the rule of excluding horses from it, like the rule of excluding goats from the Acropolis at Athens, was subject to an annual exception, a horse being once a year taken into the grove and sacrificed as an embodiment of the god Virbius. By the usual misunderstanding the horse thus killed would come in time to be regarded as an enemy offered up in sacrifice to the god whom he had injured, like the pig which was sacrificed to Demeter and Osiris or the goat which was sacrificed to Dionysus, and possibly to Athena. It is so easy for a writer to record a rule without noticing an exception that we need not wonder at finding the rule of the Arician grove recorded without any mention of an exception such as I suppose. If we had had only the statements of Athenaeus and Pliny, we should have known only the rule which forbade the sacrifice of goats to Athena and excluded them from the Acropolis, without being aware of the important exception which the fortunate preservation of Varro's work has revealed to us.

The conjecture that once a year a horse may have been sacrificed in the Arician grove as a representative of the deity of the grove derives some support from the similar sacrifice of a horse which took place once a year at Rome. On the fifteenth of October in each year a chariot-race was run on the Field of Mars. Stabbed with a spear, the right-hand horse of the victorious team was then sacrificed to Mars for the purpose of ensuring good crops, and its head was cut off and adorned with a string of loaves. Thereupon the inhabitants of two wards—the Sacred Way and the Subura—contended with each other who should get the head. If the people of the Sacred Way got it, they fastened it to a wall of the king's house; if the people of the Subura got it, they fastened it to the Mamilian tower. The horse's tail was cut off and carried to the king's house with such speed that the blood dripped on the hearth of the house. Further, it appears that the blood of the horse was caught and preserved till the twenty-first of April, when the Vestal virgins mixed it with the blood of the unborn calves which had been sacrificed six days before. The mixture was then distributed to shepherds, and used by them for fumigating their flocks.

In this ceremony the decoration of the horse's head with a string of loaves, and the alleged object of the sacrifice, namely, to procure a good harvest, seem to indicate that the horse was killed as one of those animal representatives of the corn-spirit of which we have found so many examples. The custom of cutting off the horse's tail is like the African custom of cutting off the tails of the oxen and sacrificing them to obtain a good crop. In both the Roman and the African custom the animal apparently stands for the corn-spirit, and its fructifying power is supposed to reside especially in its tail. The latter idea occurs, as we have seen, in European folk-lore. Again, the practice of fumigating the cattle in spring with the blood of the horse may be compared with the practice of giving the Old Wife, the Maiden, or the *chyaek* sheaf as fodder to the horses in spring or the cattle at Christmas, and giving the Yule Boar to the ploughing oxen or horses to eat in spring. All these usages aim at ensuring the blessing of the corn-spirit on the homestead and its inmates and storing it up for another year.

The Roman sacrifice of the October horse, as it was called, carries us back to the early days when the Subura, afterwards a low and squalid quarter of the great metropolis, was still a separate village, whose inhabitants engaged in a friendly contest on the harvest-field with their neighbours of Rome, then a little rural town. The Field of Mars on which the ceremony took place lay beside the Tiber, and formed part of the king's domain down to the abolition of the monarchy. For tradition ran that at the time when the last of the kings was driven from Rome, the corn stood ripe for the sickle on the crown lands beside the river; but no one would eat the accursed grain and it was flung into the river in such heaps that, the water being low

with the summer heat, it formed the nucleus of an island. The horse sacrifice was thus an old autumn custom observed upon the king's corn-fields at the end of the harvest. The tail and blood of the horse, as the chief parts of the corn-spirit's representative, were taken to the king's house and kept there; just as in Germany the harvest-cock is nailed on the gable or over the door of the farmhouse; and as the last sheaf, in the form of the Maiden, is carried home and kept over the fireplace in the Highlands of Scotland. Thus the blessing of the corn-spirit was brought to the king's house and hearth and, through them, to the community of which he was the head. Similarly in the spring and autumn customs of Northern Europe the Maypole is sometimes set up in front of the house of the mayor or burgomaster, and the last sheaf at harvest is brought to him as the head of the village. But while the tail and blood fell to the king, the neighbouring village of the Subura, which no doubt once had a similar ceremony of its own, was gratified by being allowed to compete for the prize of the horse's head. The Mamilian tower, to which the Suburans nailed the horse's head when they succeeded in carrying it off, appears to have been a peel-tower or keep of the old Mamilian family, the magnates of the village. The ceremony thus performed on the king's fields and at his house on behalf of the whole town and of the neighbouring village presupposes a time when each township performed a similar ceremony on its own fields. In the rural districts of Latium the villages may have continued to observe the custom, each on its own land, long after the Roman hamlets had merged their separate harvest-homes in the common celebration on the king's lands. There is no intrinsic improbability in the supposition that the sacred grove of Aricia, like the Field of Mars at Rome, may have been the scene of a common harvest celebration, at which a horse was sacrificed with the same rude rites on behalf of the neighbouring villages. The horse would represent the fructifying spirit both of the tree and of the corn, for the two ideas melt into each other, as we see in customs like the Harvest-May.

However, it should be borne in mind that the evidence for thus interpreting the relation of horses to Virbius is exceedingly slender, and that the custom of excluding horses from the sacred Arician grove may have been based on some other superstitious motive which entirely escapes us. At the city of Ialysus in Rhodes there was a sanctuary of Alectrona, one of the daughters of the Sun, into which no horse, ass, mule, or beast of burden of any kind might enter. Any person who broke the law by introducing one of these animals into the holy precinct, had to purify the place by a sacrifice; and the same atonement had to be made by any man who brought shoes or any portion of a pig within the sacred boundaries. And whoever drove or suffered his sheep to stray into the precinct was obliged to pay a fine of one obol for every sheep that set foot in it. The reasons for these prohibitions are quite unknown; and the taboo on horses is particularly remarkable, since the Rhodians were in the habit of offering a chariot and horses every year to the Sun, the father of Alectrona, doubtless in order that he might ride on them through the sky. Did they think that it was not for the daughter of the Sun to meddle with horses, which were the peculiar property of her father? The conjecture may perhaps be supported by an analogy drawn from West Africa. The Ewe negroes of the Slave Coast conceive the Rain-god Nyikplā as a man who rides a horse, and who may be seen galloping on it through the sky in the form of a shooting star. Hence in the town of Angla, where he generally resides when he is at home, no person may appear on horseback in the streets, that being apparently regarded as an impious usurpation of the style of the deity. In former days even Europeans were forbidden to ride on horseback in Angla; and missionaries who attempted to set the local prejudice at defiance have been pelted with sticks and dirt by the outraged natives. Another deity who suffered not horses to enter his sacred place was Rakelimalaza, a Malagasy god whose name signifies "renowned, although diminutive." His residence was a village situated on the top of a hill about seven miles east of Tananarivo. But horses were not the only animal or thing to which this fastidious being entertained a rooted aversion. "Within the limits of the ground which is considered sacred,

and which embraces a wide circumference in the immediate vicinity of the idol's residence, it is strictly forbidden to bring, or to suffer to come, certain animals and certain objects, which are carefully specified by the keepers of the idol. Things thus forbidden are called *fady*; a term of similar import with the well-known tabu of the South Sea Islands. Every idol has its own particular *fady*. The things prohibited by Rakelimalaza are, guns, gunpowder, pigs, onions, sifotra (a shell-fish resembling a snail), sitry (a small animal resembling the young crocodile), striped or spotted robes, anything of a black colour, goats, horses, meat distributed at funerals or at the *tangena*, and cats and owls. Its keepers are forbidden to enter any house where there is a corpse; and in crossing a river they are not permitted to say, 'Carry me,' otherwise they place themselves in danger of being seized by the crocodiles; and in war they must not talk, or they are in danger of being shot." To attempt to discover the particular reasons for all these numerous and varied taboos would obviously be futile; many of them may be based on accidental circumstances which for us are lost past recovery. But it may be worth while to observe that a variety of taboos was enforced at other ancient Greek shrines besides the sanctuary of Alectrona at Ialysus. For example, no person was allowed to enter the sanctuary of the Mistress at Lycosura in Arcadia clad in black, purple, or flowered vestments, or wearing shoes or a ring, or with his or her hair plaited or covered, or carrying flowers in his hand; and no pomegranates might be brought into the sanctuary, though all other fruits of the orchard were free to enter. These instances may warn us against the danger of arguing too confidently in favour of any one of the many possible reasons which may have moved the old Latins to exclude horses from the sacred Arician grove. The domain of primitive superstition, in spite of the encroachments of science, is indeed still to a great extent a trackless wilderness, a tangled maze, in the gloomy recesses of which the forlorn explorer may wander for ever without a light and without a clue.

X. Eating The God

§ 1. The Sacrament of First-Fruits.

We have now seen that the corn-spirit is represented sometimes in human, sometimes in animal form, and that in both cases he is killed in the person of his representative and eaten sacramentally. To find examples of actually killing the human representative of the corn-spirit we had naturally to go to savage races; but the harvest-suppers of our European peasants have furnished unmistakable examples of the sacramental eating of animals as representatives of the corn-spirit. But further, as might have been anticipated, the new corn is itself eaten sacramentally, that is, as the body of the corn-spirit. In Wernland, Sweden, the farmer's wife uses the grain of the last sheaf to bake a loaf in the shape of a little girl; this loaf is divided amongst the whole household and eaten by them. Here the loaf represents the corn-spirit conceived as a maiden; just as in Scotland the corn-spirit is similarly conceived and represented by the last sheaf made up in the form of a woman and bearing the name of the Maiden. As usual, the corn-spirit is believed to reside in the last sheaf; and to eat a loaf made from the last sheaf is, therefore, to eat the corn-spirit itself. Similarly at La Palisse, in France, a man made of dough is hung upon the fir-tree which is carried on the last harvest-waggon. The tree and the dough-man are taken to the mayor's house and kept there till the vintage is over. Then the close of the harvest is celebrated by a feast at which the mayor breaks the dough-man in pieces and gives the pieces to the people to eat.

In these examples the corn-spirit is represented and eaten in human shape. In other cases, though the new corn is not baked in loaves of human shape, still the solemn ceremonies with which it is eaten suffice to indicate that it is partaken of sacramentally, that is, as the body of the corn-spirit. For example, the following ceremonies used to be observed by Lithuanian peasants at eating the new corn. About the time of the autumn sowing, when all the corn had been got in and the threshing had begun, each farmer held a festival called Sabarios, that is, "the mixing or throwing together." He took nine good handfuls of each kind of crop—wheat, barley, oats, flax, beans, lentils, and the rest; and each handful he divided into three parts. The twenty-seven portions of each grain were then thrown on a heap and all mixed up together. The grain used had to be that which was first threshed and winnowed and which had been set aside and kept for this purpose. A part of the grain thus mixed was employed to bake little loaves, one for each of the household; the rest was mixed with more barley or oats and made into beer. The first beer brewed from this mixture was for the drinking of the farmer, his wife, and children; the second brew was for the servants. The beer being ready, the farmer chose an evening when no stranger was expected. Then he knelt down before the barrel of beer, drew a jugful of the liquor and poured it on the bung of the barrel, saying, "O fruitful earth, make rye and barley and all kinds of corn to flourish." Next he took the jug to the parlour, where his wife and children awaited him. On the floor of the parlour lay bound a black or white or speckled (not a red) cock and a hen of the same colour and of the same brood, which must have been hatched within the year. Then the farmer knelt down, with the jug in his hand, and thanked God for the harvest and prayed for a good crop next year. Next all lifted up their hands and said, "O God, and thou, O earth, we give you this cock and hen as a free-will offering." With that the farmer killed the fowls with the blows of a wooden spoon, for he might not cut their heads off. After the first prayer and after killing each of the birds he poured out a third of the beer. Then his wife boiled the fowls in a new pot which had never been used before. After that, a bushel was set, bottom upwards, on the floor, and on it were placed the little loaves mentioned above and the boiled fowls. Next the new beer was

fetches, together with a ladle and three mugs, none of which was used except on this occasion. When the farmer had ladled the beer into the mugs, the family knelt down round the bushel. The father then uttered a prayer and drank off the three mugs of beer. The rest followed his example. Then the loaves and the flesh of the fowls were eaten, after which the beer went round again, till every one had emptied each of the three mugs nine times. None of the food should remain over; but if anything did happen to be left, it was consumed next morning with the same ceremonies. The bones were given to the dog to eat; if he did not eat them all up, the remains were buried under the dung in the cattle-stall. This ceremony was observed at the beginning of December. On the day on which it took place no bad word might be spoken.

Such was the custom about two hundred years or more ago. At the present day in Lithuania, when new potatoes or loaves made from the new corn are being eaten, all the people at table pull each other's hair. The meaning of this last custom is obscure, but a similar custom was certainly observed by the heathen Lithuanians at their solemn sacrifices. Many of the Esthonians of the island of Oesel will not eat bread baked of the new corn till they have first taken a bite at a piece of iron. The iron is here plainly a charm, intended to render harmless the spirit that is in the corn. In Sutherlandshire at the present day, when the new potatoes are dug all the family must taste them, otherwise "the spirits in them [the potatoes] take offence, and the potatoes would not keep." In one part of Yorkshire it is still customary for the clergyman to cut the first corn; and my informant believes that the corn so cut is used to make the communion bread. If the latter part of the custom is correctly reported (and analogy is all in its favour), it shews how the Christian communion has absorbed within itself a sacrament which is doubtless far older than Christianity.

Among the heathen Cheremiss on the left bank of the Volga, when the first bread baked from the new corn is to be eaten, the villagers assemble in the house of the oldest inhabitant, the eastern door is opened, and all pray with their faces towards it. Then the sorcerer or priest gives to each of them a mug of beer, which they drain; next he cuts and hands to every person a morsel of the loaf, which they partake of. Finally, the young people go to the elders and bowing down to the earth before them say, "We pray God that you may live, and that God may let us pray next year for new corn." The rest of the day is passed in mirth and dancing. The whole ceremony, observes the writer who has described it, looks almost like a caricature of the Eucharist. According to another account, each Cheremiss householder on this occasion, after bathing, places some of each kind of grain, together with malt, cakes, and drink, in a vessel, which he holds up to the sun, at the same time thanking the gods for the good things which they have bestowed upon him. But this part of the ceremony is a sacrifice rather than a sacrament of the new corn.

The Aino or Ainu of Japan are said to distinguish various kinds of millet as male and female respectively, and these kinds, taken together, are called "the divine husband and wife cereal" (*Umurek haru kamui*). "Therefore before millet is pounded and made into cakes for general eating, the old men have a few made for themselves first to worship. When they are ready they pray to them very earnestly and say:—'O thou cereal deity, we worship thee. Thou hast grown very well this year, and thy flavour will be sweet. Thou art good. The goddess of fire will be glad, and we also shall rejoice greatly. O thou god, O thou divine cereal, do thou nourish the people. I now partake of thee. I worship thee and give thee thanks.' After having thus prayed, they, the worshippers, take a cake and eat it, and from this time the people may all partake of the new millet. And so with many gestures of homage and words of prayer this kind of food is dedicated to the well-being of the Ainu. No doubt the cereal offering is regarded as a tribute paid to god, but that god is no other than the seed itself; and it is only a god in so far as it is beneficial to the human body."

The natives of the Reef Islands in Melanesia describe as follows the ceremonies which they observe at eating new fruits: "When the fruit of trees that are eatable, such as bread-fruit, or *ninas* (nuts) is nearly ripe, about a month before the time that people eat it, they all go together into the bush. They must all go together for this 'holy eating,' and when they return they all assemble in one place, and no one will be absent; they sit down and cook bread-fruit. While it is being cooked no one will eat beforehand, but they set it in order and cook it with reverence, and with the belief that the spirit has granted that food to them and they return thanks to him for it. When it is cooked a certain man takes a bread-fruit and climbs up a tree, and all the people stand on the ground and they all look up, and when he has reached the top they shout out, and when they have shouted they call out, 'This is the bread-fruit of the whole land'; then he throws down the bread-fruit and they pick it up and shout out again and give thanks, for they think that the spirit who protects the fruit will hear. Their thoughts are thus also with regard to the yam, there is no difference, it is all the same; they think that a spirit gives them food, and the people assemble together and thank the spirit. In every island they think that there is a spirit presiding over food."

At Bourail, in New Caledonia, the eating of the first yams of the season is a solemn ceremony. The women may take no part in it; indeed for five days previously they may not even shew themselves on any pretext, and must hide in the forest. But the men of other tribes are invited to share in the festivity. On the day of the ceremony seven or eight yams are dug up with the greatest precaution, wrapt in leaves, and carried before the great wooden images, ten or twelve feet high, rudely carved in human form and painted black, red, and white, which represent the ancestors of the tribe. Special pots, only used on these occasions, are then disinterred by boys, who cook the new yams in them, eat them, and afterwards bury the pots in the places where they found them. Thereupon the chief or the oldest man mounts a ladder and addresses the crowd in a long and voluble harangue, telling them how their forefathers always respected the feast of the first yams, and exhorting the young men of the tribe to do the same in the time to come. After that, turning towards the ancestral images, he prays them to give a good crop of yams every year to the people and their descendants, adjuring them to remember how, while they were still on earth, they always ate to their heart's content, and beseeching them to reflect that their sons and grandsons naturally desire to do the same. When the orator has finished his discourse, and his hearers have signified their approval of his eloquence by a loud grunt, the new yams are dressed and eaten, each family cooking them in a pot of its own.

At the close of the rice harvest in the East Indian island of Buru, each clan (*fenna*) meets at a common sacramental meal, to which every member of the clan is bound to contribute a little of the new rice. This meal is called "eating the soul of the rice," a name which clearly indicates the sacramental character of the repast. Some of the rice is also set apart and offered to the spirits. Amongst the Alfoors of Minahassa, in the north of Celebes, the priest sows the first rice-seed and plucks the first ripe rice in each field. This rice he roasts and grinds into meal, and gives some of it to each of the household. Shortly before the rice-harvest in Bolang Mongondo, another district of Celebes, an offering is made of a small pig or a fowl. Then the priest plucks a little rice, first on his own field and next on those of his neighbours. All the rice thus plucked by him he dries along with his own, and then gives it back to the respective owners, who have it ground and boiled. When it is boiled the women take it back, with an egg, to the priest, who offers the egg in sacrifice and returns the rice to the women. Of this rice every member of the family, down to the youngest child, must partake. After this ceremony every one is free to get in his rice.

On the north coast of Ceram every owner of a rice-field begins planting by making six holes in the middle of the field and depositing rice-seed in them. When the crop is ripe, the rice

which has sprouted from these six holes must be the first to be reaped and the first to be eaten by the owner at the common harvest-feast of the village. When all the owners of the fields have thus partaken of the rice that was first planted and first reaped in their fields, the other villagers may help themselves to rice out of the pot. Not till this feast has been held may the owners of rice-fields sell their rice. Among the Kayans of Central Borneo, who, as we have seen, believe rice to be animated by a soul, before a family partakes of the new rice at harvest, a priestess must touch the face and breast of every person with a magical instrument (*kahe parei*) consisting of the husk of a certain fruit adorned with strings of beads. After this ceremony has been performed on every member of the family, he or she eats a few grains of the new rice and drinks a little water. When all have complied with this ritual, the feast begins.

Amongst the Burghers or Badagas, a tribe of the Neilgherry Hills in Southern India, the first handful of seed is sown and the first sheaf reaped by a Curumbar—a man of a different tribe, the members of which the Burghers regard as sorcerers. The grain contained in the first sheaf “is that day reduced to meal, made into cakes, and, being offered as a first-fruit oblation, is, together with the remainder of the sacrificed animal, partaken of by the Burgher and the whole of his family, as the meat of a federal offering and sacrifice.” Amongst the Coorgs of Southern India the man who is to cut the first sheaf of rice at harvest is chosen by an astrologer. At sunset the whole household takes a hot bath and then goes to the rice-field, where the chosen reaper cuts an armful of rice with a new sickle, and distributes two or more stalks to all present. Then all return to the threshing-floor. A bundle of leaves is adorned with a stalk of rice and fastened to the post in the centre of the threshing-floor. Enough of the new rice is now threshed, cleaned, and ground to provide flour for the dough-cakes which each member of the household is to eat. Then they go to the door of the house, where the mistress washes the feet of the sheaf-cutter, and presents to him, and after him to all the rest, a brass vessel full of milk, honey, and sugar, from which each person takes a draught. Next the man who cut the sheaf kneads a cake of rice-meal, plantains, milk, honey, seven new rice corns, seven pieces of coco-nut, and so on. Every one receives a little of his cake on an Ashvatha leaf, and eats it. The ceremony is then over and the sheaf-cutter mixes with the company. When he was engaged in cutting the rice no one might touch him. Among the Hindoos of Southern India the eating of the new rice is the occasion of a family festival called Pongol. The new rice is boiled in a new pot on a fire which is kindled at noon on the day when, according to Hindoo astrologers, the sun enters the tropic of Capricorn. The boiling of the pot is watched with great anxiety by the whole family, for as the milk boils, so will the coming year be. If the milk boils rapidly, the year will be prosperous; but it will be the reverse if the milk boils slowly. Some of the new boiled rice is offered to the image of Ganeṣa; then every one partakes of it. In some parts of Northern India the festival of the new crop is known as *Navan*, that is, “new grain.” When the crop is ripe, the owner takes the omens, goes to the field, plucks five or six ears of barley in the spring crop and one of the millets in the autumn harvest. This is brought home, parched, and mixed with coarse sugar, butter, and curds. Some of it is thrown on the fire in the name of the village gods and deceased ancestors; the rest is eaten by the family. At Gilgit, in the Hindoo Koosh, before wheat-harvest begins, a member of every household gathers a handful of ears of corn secretly at dusk. A few of the ears are hung up over the door of the house, and the rest are roasted next morning, and eaten steeped in milk. The day is spent in rejoicings, and next morning the harvest begins.

The Chams of Binh-Thuan, in Indo-China, may not reap the rice-harvest until they have offered the first-fruits to Po-Nagar, the goddess of agriculture, and have consumed them sacramentally. These first-fruits are gathered from certain sacred fields called *Hamou-Klêk-Laoa* or “fields of secret tillage,” which are both sown and reaped with peculiar ceremonies.

Apparently the tilling of the earth is considered a crime which must be perpetrated secretly and afterwards atoned for. On a lucky day in June, at the first cock-crow, two men lead the buffaloes and the plough to the sacred field, round which they draw three furrows in profound silence and then retire. Afterwards at dawn the owner of the land comes lounging by, as if by the merest chance. At sight of the furrows he stops, pretends to be much surprised, and cries out, "Who has been secretly ploughing my field this night?" Hastening home, he kills a kid or some fowls, cooks the victuals, and prepares five quids of betel, some candles, a flask of oil, and lustral water of three different sorts. With these offerings and the plough drawn by the buffaloes, he returns to the field, where he lights the candles and spreading out the victuals worships Po-Nagar and the other deities, saying: "I know not who has secretly ploughed my field this night. Pardon, ye gods, those who have done this wrong. Accept these offerings. Bless us. Suffer us to proceed with this work." Then, speaking in the name of the deities, he gives the reassuring answer, "All right. Plough away!" With the lustral water he washes or sprinkles the buffaloes, the yoke, and the plough. The oil serves to anoint the plough and to pour libations on the ground. The five quids of betel are buried in the field. Thereupon the owner sows a handful of rice on the three furrows that have been traced, and eats the victuals with his people. After all these rites have been duly performed, he may plough and sow his land as he likes. When the rice has grown high enough in this "field of secret tillage" to hide pigeons, offerings of ducks, eggs, and fowls are made to the deities; and fresh offerings, which generally consist of five plates of rice, two boiled fowls, a bottle of spirits, and five quids of betel, are made to Po-Nagar and the rest at the time when the rice is in bloom. Finally, when the rice in "the field of secret tillage" is ripe, it has to be reaped before any of the rest. Offerings of food, such as boiled fowls, plates of rice, cakes, and so forth, are spread out on the field; a candle is lit, and a priest or, in his absence, the owner prays to the guardian deities to come and partake of the food set before them. After that the owner of the land cuts three stalks of rice with a sickle in the middle of the field, then he cuts three handfuls at the side, and places the whole in a napkin. These are the first-fruits offered to Po-Nagar, the goddess of agriculture. On being taken home the rice from the three handfuls is husked, pounded in a mortar, and presented to the goddess with these words: "Taste, O goddess, these first-fruits which have just been reaped." This rice is afterwards eaten, while the straw and husks are burned. Having eaten the first-fruits of the rice, the owner takes the three stalks cut in the middle of the field, passes them through the smoke of the precious eagle-wood, and hangs them up in his house, where they remain till the next sowing-time comes round. The grain from these three stalks will form the seed of the three furrows in "the field of secret tillage." Not till these ceremonies have been performed is the proprietor at liberty to reap the rest of that field and all the others.

The ceremony of eating the new yams at Onitsha, on the Niger, is thus described: "Each headman brought out six yams, and cut down young branches of palm-leaves and placed them before his gate, roasted three of the yams, and got some kola-nuts and fish. After the yam is roasted, the *Libia*, or country doctor, takes the yam, scrapes it into a sort of meal, and divides it into halves; he then takes one piece, and places it on the lips of the person who is going to eat the new yam. The eater then blows up the steam from the hot yam, and afterwards pokes the whole into his mouth, and says, 'I thank God for being permitted to eat the new yam'; he then begins to chew it heartily, with fish likewise."

Among the Ewe negroes of West Africa the eating of the new yams is the greatest festival of the year; it usually falls at the beginning of September, and its character is predominantly religious. We possess a native account of the festival as it is celebrated by the tribe of the Hos in Togoland. When the yams are ripe and ready to be dug up and brought home, two days are devoted to cleansing the town of all ills, whether spiritual or material, as a solemn preparation

for the ensuing celebration. When these rites of purification, which will be described in a later part of this work, have been accomplished, then, in the words of the native account, “the people make ready to eat the new yams. And the manner of making ready consists in going to the fields and digging the yams. However, they do not bring them home but lay them down somewhere on the way. The reason why they do not bring them home is that the people have not yet been on the place where they sacrifice to the deity. When they wish to go thither, the way to the sacrificial place of Agbasia must first be cleared of grass. Afterwards the people come with their drums, which they beat loudly. When they are come to the place of sacrifice, they first raise two great mounds of earth, and they bring to the place of sacrifice palm wine, uncooked and cooked yams, and meal mixed with oil. First of all the uncooked yams are cut in two through the middle, and then this prayer is offered: ‘Agbasia, thou art he who has given the yams; therefore here is thine own! We thank thee sincerely. May the eating of the yams be a great joy, and may no quarrel intervene!’ Thereupon they lay down on the ground yams mixed with oil and not mixed with oil. In doing so they say to Agbasia, ‘He who eats not the white yams, to him belong the yams mixed with oil; and he who eats not the yams mixed with oil, to him belong the white yams.’ They do the same with the meal that is mixed with oil and with the meal that is not mixed with oil. Thereby they say: ‘Here we bring thee all that thou hast given us. Eat thereof what thou pleasest!’ After that they pour palm wine into one pot and water into another, and say, ‘When one has eaten, one drinks water.’ Thereby the drums sound, songs are sung, and the priest says: ‘Our father Agbasia, we pray thee, let us hear no more evil but good only! When women are with child, let them bear twins and triplets, that we may increase and multiply! When the time for sowing the yams comes again, make it to rain upon them even more than hitherto, in order that we may come again and thank thee more sincerely than hitherto!’ Thereupon the priest pours water on one of the mounds, makes a paste with it, and calls the people thither. Then he dips his finger in the slime and smears it on their brows, temples, and breasts, saying, ‘This is the slime of Agbasia, wherewith I smear you, that ye may remain in life.’ After that they disperse and go home. Further, the prayers and offerings of the individual peasants on the occasion of the yam festival are described as follows. “In the evening, when the town is swept clean, the people go to the fields to fetch yams, which, however, they may not yet bring into the town and therefore they hide them in the forest. As soon as the high priest quits the town next morning to go to the sacrificial place of his god, the women set out to fetch the yams which they had deposited. Now they begin to cook. Many people kill fowls or goats, and others buy fish for the festival. When the yams are sodden, a little is broken off, mixed with oil, and laid, together with uncooked yams, on the ground at the entrance to the homestead. Thereby the house-father says: ‘That belongs to all those (gods) who abide at the fence.’ He does the same under the door of the house and says: ‘That belongs to all those (gods) who dwell with me.’ Then he goes to the loom, and brings it its offering, and says: ‘That belongs to all the “Artificers” who have helped me in weaving.’ After that he lays all his charms on a mat spread in the house, and brings them also their offering, and speaks with them.”

“Another account describes the priestly functions of the house-father still more fully. Every house-father takes a raw piece of yam and goes with it to his loom (*agbati*) and prays: ‘May the Artificers take this yam and eat! When they practise their art, may it prosper!’ Again he takes a raw yam and goes with it under the house-door and prays: ‘O my guardian-spirit (*aklama*) and all ye gods who pay heed to this house, come and eat yams! When I also eat of them, may I remain healthy and nowhere feel pain! May my housemates all remain healthy!’ After he has invoked their protection on his family, he takes a cooked yam, crumbles it on a stone, and mixes it with red oil. With this mixture he goes again to the loom and prays as before. But even that is not the end of the worship of the Artificers. He again crumbles a cooked yam, but this time he does not mix it with red oil; he goes to the entrance

of the homestead and prays again to the loom: 'He among the Artificers who does not relish yams mixed with oil, let him come and take the white yam and eat it!' From there he goes again under the house-door and prays: 'He of my guardian gods and he of the watchers of the house who likes not yams mixed with oil, let him come and take the white yam from my hand and eat!' From the house-door he steps into the midst of the chamber and says: 'He who relishes not the yams mixed with oil, may eat the white; he who relishes not the white may eat the red; and he who relishes not the red may eat the uncooked!' With this prayer he has completed his duties as house-priest. Just as the weaver prays to his loom, so the hunter prays to his musket, the smith to his hammer and anvil, and the carpenter to his plane and saw.

"Now, while the free people begin to cook the yams so soon as the priest has left the town, the slaves of the Earth Gods, the *Trõkluwo*, must first as children perform their duties to the priest of their gods. Each of these children receives from his parents on the morning of the Yam Festival two pieces of yam, which he brings to the priest of his god. The priest cuts off a small piece of the yam and divides the piece again into four pieces. The child kneels before him and lolls out his tongue. Holding two of these pieces of yam in his hands, the priest utters a prayer over the child and touches his tongue five times with the pieces of yam. Then the child stretches his hands out, each of which the priest touches five times with the same pieces of yam and prays as before. Then he touches both feet of the child five times and prays for the third time. He takes half of the cowry-shells which the child has brought, fastens them on a string, and hangs it round the child's neck. Thereby the child gets leave to eat new yams.

"After all these preparations the yams are pounded into a mash, and every one calls his brother, that he may eat with him. When the meal is over, the people are called together to amuse themselves and to drink palm wine. In the afternoon every one bathes, puts on a new garment, and girds himself with a new loin-cloth."

The Ashantees celebrate the festival of the new yams early in September; until it is over none of the people may taste of the new yams. "The Yam Custom," we are told, "is like the Saturnalia; neither theft, intrigue, nor assault are punishable during the continuance, but the grossest liberty prevails, and each sex abandons itself to its passions." An eye-witness has described the scene at Coomassie, the capital: "The next morning the King ordered a large quantity of rum to be poured into brass pans, in various parts of the town; the crowd pressing around, and drinking like hogs; freemen and slaves, women and children, striking, kicking, and trampling each other under foot, pushed head foremost into the pans, and spilling much more than they drank. In less than an hour, excepting the principal men, not a sober person was to be seen, parties of four, reeling and rolling under the weight of another, whom they affected to be carrying home; strings of women covered with red paint, hand in hand, falling down like rows of cards; the commonest mechanics and slaves furiously declaiming on state palavers; the most discordant music, the most obscene songs, children of both sexes prostrate in insensibility. All wore their handsomest cloths, which they trailed after them to a great length, in a drunken emulation of extravagance and dirtiness." About a hundred persons, mostly culprits reserved for the purpose, used to be sacrificed at this festival in Coomassie. All the chiefs killed several slaves that their blood might flow into the hole from which the new yam was taken. Such as could not afford to kill slaves took the head of a slave who had already been sacrificed and placed it in the hole. About ten days after these ceremonies the whole of the royal household ate new yams for the first time in the market-place, the King himself being in attendance. Next day he and his captains set off before sunrise to perform their annual ablutions in the river Dah; almost all the inhabitants of the capital followed him, so that the streets appeared to be deserted. The following day the King, attended by his suite, washed in the marsh at the south-east end of the town and laved the water not only over himself but also over the chairs, stools, gold and silver plate, and the articles of furniture

which were set aside for his special use. From another account it appears that the King of Ashantee must eat the new yams before any of his subjects was at liberty to do so. Similarly in the West African kingdom of Assinie, which forms part of the French possessions of Senegal, the king must eat the new yams eight full days before the people may taste them.

A second festival of yams used to be celebrated at Coomassie in December, when the king or a fetish priest consecrated the new yams before they could be eaten by common folk. On one of the days of this December celebration all the laws were suspended, and every man might do what seemed good in his own eyes: he might even, contrary to custom, look at the king's wives, to the number of several hundreds, when they returned with the king and his suite from washing in the fetish water of Tana. All that day drinking went on, and the noise and uproar were prolonged far into the night. Early in the morning a human victim was sacrificed: the first man found near the gates of the palace was seized, butchered, and cut in pieces, and the executioners danced with the bleeding fragments of the victim in their hands or fastened round their necks. Before he ate of the new yams the king washed himself in fetish water brought from distant springs, and the chiefs performed similar ablutions. In Benin the new yams might not be eaten until the king had performed certain ceremonies, among which one is said to have been a pretence of making a yam to grow in a pot. Dancing, merrymaking, and farces or plays formed part of the festival; the city was crowded with people, and they indulged in a regular orgie.

Among the Nandi of British East Africa, when the eleusine grain is ripening in autumn, every woman who owns a cornfield goes out into it with her daughters, and they all pluck some of the ripe grain. Each of the women then fixes one grain in her necklace and chews another, which she rubs on her forehead, throat, and breast. No mark of joy escapes them; sorrowfully they cut a basketful of the new corn, and carrying it home place it in the loft to dry. As the ceiling is of wickerwork, a good deal of the grain drops through the crevices and falls into the fire, where it explodes with a crackling noise. The people make no attempt to prevent this waste; for they regard the crackling of the grain in the fire as a sign that the souls of the dead are partaking of it. A few days later porridge is made from the new grain and served up with milk at the evening meal. All the members of the family take some of the porridge and dab it on the walls and roofs of the huts; also they put a little in their mouths and spit it out towards the east and on the outside of the huts. Then, holding up some of the grain in his hand, the head of the family prays to God for health and strength, and likewise for milk, and everybody present repeats the words of the prayer after him. Amongst the Baganda, when the beans were ripe, a woman would call her eldest son to eat some of the first which she cooked; if she neglected to do so, it was believed that she would incur the displeasure of the gods and fall ill. After the meal her husband jumped over her, and the beans might thereafter be eaten by all.

Amongst the Caffres of Natal and Zululand, no one may eat of the new fruits till after a festival which marks the beginning of the Caffre year and falls at the end of December or the beginning of January. All the people assemble at the king's kraal, where they feast and dance. Before they separate the "dedication of the people" takes place. Various fruits of the earth, as corn, mealies, and pumpkins, mixed with the flesh of a sacrificed animal and with "medicine," are boiled in great pots, and a little of this food is placed in each man's mouth by the king himself. After thus partaking of the sanctified fruits, a man is himself sanctified for the whole year, and may immediately get in his crops. It is believed that if any man were to partake of the new fruits before the festival, he would die; if he were detected, he would be put to death, or at least all his cattle would be taken from him. The holiness of the new fruits is well marked by the rule that they must be cooked in a special pot which is used only for this purpose, and on a new fire kindled by a magician through the friction of

two sticks which are called "husband and wife." These sticks are prepared by the sorcerers from the wood of the *Uzwati* tree and belong exclusively to the chief. The "wife" is the shorter of the two. When the magician has kindled the new fire on which the new fruits are to be cooked, he hands the fire-sticks back to the chief, for no other hand may touch them; and they are then put away till they are required next season. The sticks are regarded as in a measure sacred, and no one, except the chief's personal servant, may go to the side of the hut where they are kept. No pot but the one used for the preparation of this feast may be set on a fire made by the friction of the "husband and wife." When the feast is over, the fire is carefully extinguished, and the pot is put away with the fire-sticks, where it remains untouched for another year.

A remarkable feature of the festival, as it is observed at the court of the Zulu king, is a dance performed by the king himself in a mantle of grass or, according to another account, of herbs and corn-leaves. This mantle is afterwards burnt and its ashes are scattered and trodden into the ground by cattle. Further, it is worthy of notice that the festival is described as a saturnalia, and we are told that "a great deal of noise and dancing goes on, and people are not supposed to be responsible for what they say or do." Thus, for example, among the Pondos the festival includes a period of license, during the continuance of which the chief abdicates his functions and any crime may be committed with impunity. The description of the Pondo festival comprises so many interesting features that I will reproduce it entire. "When a Pondo chief is to hold the feast of first-fruits, some of his people procure a ripe plant of the gourd family, pumpkin or calabash, from another tribe. This is cooked; the inside cleaned out, and the rind made ready for use as a vessel. It is then presented to the chief with much ceremony. The first-fruits are now brought forward, and a sacrifice, generally a young bull, is offered, after which the feast commences. The chief issues certain orders for the conduct of the proceedings, tastes the fruits which are served in the gourd-dish with which he has been presented, and then abdicates all his functions while the festival lasts. The cattle from all the neighbouring villages are collected in the vicinity, and now they are brought together, and the bulls incited to fight to determine which is to be king among them for the next year. The young people engage in games and dances, feats of strength and running. After these are over the whole community give themselves over to disorder, debauchery, and riot. In their bull-fights and games they but did honour to the powers of nature, and now, as they eat and drink, the same powers are honoured in another form and by other rites. There is no one in authority to keep order, and every man does what seems good in his own eyes. Should a man stab his neighbour he escapes all punishment, and so too with all other crimes against the person, property, and morality. People are even permitted to abuse the chief to his face, an offence which at any other time would meet with summary vengeance and an unceremonious dispatch to join the ancestors. While the feast continues, a deafening noise is kept up by drumming, shouting, hand-clapping, and every kind of instrument that can be made to emit sound. Men advance to the chief and explain their origin, and also the object they hold sacred, by imitating the sounds and movements of their most sacred animal. This is the person's totem. Others imitate the gurgling made by an enemy when stabbed in the throat. Those who adopt this latter emblem are known as 'children of the spear.' When the ceremonies, revels, and mummeries are ended, the chief repairs to his accustomed place, and sitting down there, by that act resumes his kingly functions. He calls the bravest of his braves before him, who is immediately clothed and decorated with skins of animals suggestive of courage and strategy. He performs a dance amid the frenzied shouting of the multitude, after which the chief declares the festival at an end and harvest commenced." Another writer, speaking of the Zulu festival of first-fruits as it was celebrated in the time of the ferocious despot Chaka, says that "at this period the chiefs are allowed to converse unreservedly with the king, speaking with great freedom, and in some measure to be dictatorial." Again, another

traveller, who visited the Zulus in the reign of King Panda, tells us that “in spite of the practice of the most absolute despotism there are three days in the year when the nation in its turn has the right to call the king to a severe account for his acts. It is at the general assembly of the warriors, when the maize is ripe, that the lively discussions take place and the questions are put to which the king must answer at once in a manner satisfactory to the people. I have then seen simple warriors come leaping from the ranks, assume the style of fluent and excessively energetic orators, and not only confront the fiery glare of Panda, but even attack him before everybody, blame his acts, call them infamous and base, compel him to vindicate his conduct, and then refute his vindication by dissecting it and exposing its falsehood, finally proceeding to haughty threats and winding up the harangue with a gesture of contempt.” Such liberties taken with the despotic Zulu kings seem to point to a time when they too, like the Pondo chiefs, abdicated or were deposed during the festival. Perhaps we may even go a step further. We have seen that on this occasion the Zulu king dances in a mantle of grass or of herbs and corn-leaves, which is afterwards burnt and the ashes scattered and trodden into the ground. This custom seems clearly intended to promote the fertility of the earth, and in earlier times the same end may have been compassed by burning the king himself and dispersing his ashes; for we have seen that a Bechuana tribe, of the same Bantu stock as the Zulus, were wont to sacrifice a human victim for the good of the crops and to scatter his ashes over the ground. In this connexion it should be borne in mind that we have found independent evidence of a custom of putting the Zulu king to death whenever his bodily strength began to fail.

Among the Bechuanas it is a rule that before they partake of the new crops they must purify themselves. The purification takes place at the commencement of the new year on a day in January which is fixed by the chief. It begins in the great kraal of the tribe, where all the adult males assemble. Each of them takes in his hand leaves of a gourd called by the natives *lerotse* (described as something between a pumpkin and a vegetable marrow); and having crushed the leaves he anoints with the expressed juice his big toes and his navel; many people indeed apply the juice to all the joints of their body, but the better-informed say that this is a vulgar departure from ancient custom. After this ceremony in the great kraal every man goes home to his own kraal, assembles all the members of his family, men, women, and children, and smears them all with the juice of the *lerotse* leaves. Some of the leaves are also pounded, mixed with milk in a large wooden dish, and given to the dogs to lap up. Then the porridge plate of each member of the family is rubbed with the *lerotse* leaves. When this purification has been completed, but not before, the people are free to eat of the new crops. On the night after the purification every man was bound, as a matter of ritual, to sleep with his chief wife. If she had been unfaithful to him during the past year, it was incumbent on her to confess her sin before she fulfilled her part of the ceremony. Having confessed she was purified by a medicine-man, who fumigated her with the smoke produced by burning a bean plant. Thereupon husband and wife cut each other slightly under the navel, and each of them rubbed his or her blood, mixed with “medicine,” into the other's wound. That completed the purification of the woman, and the pair might now proceed with the rest of the rite. Should a married man be from home at the time when the annual purification ceremony is performed, he is thought to be in a very sad plight; indeed his chances of surviving for another year are supposed to be small. On his return home, he dare not enter his own house, for he would pollute it, and if even his shadow were to fall on one of his children, the child would die. He must wait till his wife comes to him and brings him a calabash of water to drink, which is a sign that she has waited for his return to perform the rite of purification together. But if she does not bring the water, he knows that in his absence she has performed the rite with some other man, and it becomes necessary to purge her by means of fumigation and blood-letting, as described before. But even when that purgation is completed, husband and wife may not

indulge in connubial intercourse for the rest of the year, that is, until the next annual purification has taken place. The Bechuanas think that “any breach of this rule will be punished with supernatural penalties—the husband, wife, or child will die.”

Among the Matabele, another Bantu tribe of South Africa, no one might partake of the new fruits till the king had first tasted of them; any one who was known to have broken the law was instantly put to death. On this occasion the regiments assembled at Bulawayo, the capital, and danced in a great semicircle before the king, who occasionally joined in the dance. When he did so, the medicine-men and their satellites, armed with thorn-bushes, rushed about among the dancers and incited them to fresh efforts by a vigorous application of the thorns to the bodies of such as seemed to flag. The king's wives also sang and danced before him in long lines, holding the marriage ring in their right hands and green boughs in their left. On the third day of the festival hundreds of oxen were sacrificed: the flesh and blood of the black or sacred cattle were converted into charms; while the carcasses of the rest were cut up and distributed among the people, who feasted upon them. The fourth day was specially set apart for the ceremony of the first-fruits. In the morning all the people went down to the river to wash, and on their return a witch-doctor or medicine-man took a dish of the new vegetables and corn, mixed with charms, and scattered the contents by handfuls among the crowd, who seized and ate them. After that the people were free to eat the new crops. According to one account, this festival of first-fruits was held at the first full moon which followed the summer solstice (the twenty-first of December in the southern hemisphere); according to another account, it took place a few days after the full moon of February, which marked the beginning of the Matabele year.

The Ovambo or, as they call themselves, the Ovakuanjama, of South-West Africa, may not partake of the new fruits of the *omuongo* tree, which ripen in February and from which an intoxicating beverage is extracted, until certain ceremonies have been performed. Among other things husband and wife mutually offer each other one of the fruits, make white strokes with chalk each on the brow, cheeks, and nose of the other, and accompany the action with the formal expression of good wishes. If this ceremony, which seems to mark the beginning of the New Year, were omitted, they believe that they would be attacked by a painful disease of the knee-joints which would cripple them.

The Bororo Indians of Brazil think that it would be certain death to eat the new maize before it has been blessed by the medicine-man. The ceremony of blessing it is as follows. The half-ripe husk is washed and placed before the medicine-man, who by dancing and singing for several hours, and by incessant smoking, works himself up into a state of ecstasy, whereupon he bites into the husk, trembling in every limb and uttering shrieks from time to time. A similar ceremony is performed whenever a large animal or a large fish is killed. The Bororo are firmly persuaded that were any man to touch unconsecrated maize or meat, before the ceremony had been completed, he and his whole tribe would perish.

Amongst the Creek Indians of North America, the *busk* or festival of first-fruits was the chief ceremony of the year. It was held in July or August, when the corn was ripe, and marked the end of the old year and the beginning of the new one. Before it took place, none of the Indians would eat or even handle any part of the new harvest. Sometimes each town had its own busk; sometimes several towns united to hold one in common. Before celebrating the busk, the people provided themselves with new clothes and new household utensils and furniture; they collected their old clothes and rubbish, together with all the remaining grain and other old provisions, cast them together in one common heap, and consumed them with fire. As a preparation for the ceremony, all the fires in the village were extinguished, and the ashes swept clean away. In particular, the hearth or altar of the temple was dug up and the

ashes carried out. Then the chief priest put some roots of the button-snake plant, with some green tobacco leaves and a little of the new fruits, at the bottom of the fireplace, which he afterwards commanded to be covered up with white clay, and wetted over with clean water. A thick arbour of green branches of young trees was then made over the altar. Meanwhile the women at home were cleaning out their houses, renewing the old hearths, and scouring all the cooking vessels that they might be ready to receive the new fire and the new fruits. The public or sacred square was carefully swept of even the smallest crumbs of previous feasts, "for fear of polluting the first-fruit offerings." Also every vessel that had contained or had been used about any food during the expiring year was removed from the temple before sunset. Then all the men who were not known to have violated the law of the first-fruit offering and that of marriage during the year were summoned by a crier to enter the holy square and observe a solemn fast. But the women (except six old ones), the children, and all who had not attained the rank of warriors were forbidden to enter the square. Sentinels were also posted at the corners of the square to keep out all persons deemed impure and all animals. A strict fast was then observed for two nights and a day, the devotees drinking a bitter decoction of button-snake root "in order to vomit and purge their sinful bodies." That the people outside the square might also be purified, one of the old men laid down a quantity of green tobacco at a corner of the square; this was carried off by an old woman and distributed to the people without, who chewed and swallowed it "in order to afflict their souls." During this general fast, the women, children, and men of weak constitution were allowed to eat after mid-day, but not before. On the morning when the fast ended, the women brought a quantity of the old year's food to the outside of the sacred square. These provisions were then fetched in and set before the famished multitude, but all traces of them had to be removed before noon. When the sun was declining from the meridian, all the people were commanded by the voice of a crier to stay within doors, to do no bad act, and to be sure to extinguish and throw away every spark of the old fire. Universal silence now reigned. Then the high priest made the new fire by the friction of two pieces of wood, and placed it on the altar under the green arbour. This new fire was believed to atone for all past crimes except murder. Next a basket of new fruits was brought; the high priest took out a little of each sort of fruit, rubbed it with bear's oil, and offered it, together with some flesh, "to the bountiful holy spirit of fire, as a first-fruit offering, and an annual oblation for sin." He also consecrated the sacred emetics (the button-snake root and the cassina or black-drink) by pouring a little of them into the fire. The persons who had remained outside now approached, without entering, the sacred square; and the chief priest thereupon made a speech, exhorting the people to observe their old rites and customs, announcing that the new divine fire had purged away the sins of the past year, and earnestly warning the women that, if any of them had not extinguished the old fire, or had contracted any impurity, they must forthwith depart, "lest the divine fire should spoil both them and the people." Some of the new fire was then set down outside the holy square; the women carried it home joyfully, and laid it on their unpolluted hearths. When several towns had united to celebrate the festival, the new fire might thus be carried for several miles. The new fruits were then dressed on the new fires and eaten with bear's oil, which was deemed indispensable. At one point of the festival the men rubbed the new corn between their hands, then on their faces and breasts. During the festival which followed, the warriors, dressed in their wild martial array, their heads covered with white down and carrying white feathers in their hands, danced round the sacred arbour, under which burned the new fire. The ceremonies lasted eight days, during which the strictest continence was practised. Towards the conclusion of the festival the warriors fought a mock battle; then the men and women together, in three circles, danced round the sacred fire. Lastly, all the people smeared themselves with white clay and bathed in running water. They came out of

the water believing that no evil could now befall them for what they had done amiss in the past. So they departed in joy and peace.

Ceremonies of the same general type are still annually observed by the Yuchi Indians of Oklahoma, who belong to the Creek nation but speak a different language. The rites are said to have been instituted by the Sun. They are solemnised in the public square, and are timed so as to coincide with the ripening of the corn, which usually takes place about the middle or early part of July. Contenance and abstinence from salt are prescribed during their celebration, and all the men must fast for twelve hours before they take the emetic. A sacred new fire is kindled by striking two stones against each other, after which all the males are scarified or scratched by an official on the arm or breast, so as to let blood flow and drip on the ground of the public square. This bleeding of the men is said to be symbolical of the origin of the Yuchi people; for the first Yuchi sprang from some drops of blood which the mother of the Sun let fall on earth at one of her monthly periods. Hence the Yuchi call themselves the Children of the Sun. The solemn rite of scratching is followed by the no less solemn rite of vomiting. This also was instituted by the Sun. He taught the Indians to steep the button-snake root and the red root in water and to drink the decoction, in order that they might vomit and so purify their bodies against sickness during the ensuing year. They think that if they did not thus purge themselves before eating the new corn, they would fall sick. The chief of the town is charged with the solemn duty of preparing the nauseous concoction, and he is assisted by four boys who have been initiated into the mysteries. The pots containing the stuff are decorated on the rim with a pattern representing the sun, and they stand east of the fire near the middle of the public square. The order of drinking is regulated by the rank of the drinkers. When the sun is about the zenith, the four noblest come forward, face eastward, and gulp down the vile but salutary potion; then they retire to their places and await the usual results. When they feel the inward workings of the draught, they step out of the square and discharge the contents of their stomachs in a place set apart for the purpose. They are followed by another party of four, and that by another, and so on, till all the men have thus purged themselves. The rite is repeated several times. When it is over, they all go to water and wash off the paint with which they were adorned; then returning to their places in the square they feast on the new corn. After a rest of some hours the men engage in ball play, not as a mere recreation but as a matter of ritual. Sides are chosen; every player is equipped with two rackets, and the aim of each side is to drive the ball through their opponents' goal, which consists of two uprights and a cross-piece. The two goals stand east and west of each other. During the following night dancing is kept up, and a general laxity, degenerating into debauchery, prevails; but parents and elders wink at the excesses of the young folk. Among the dances are some in which the dancers mimic the motions and cries of their totemic animals, such as ducks, buzzards, rabbits, fish, buffaloes, chickens, and owls.

To this day, also, the remnant of the Seminole Indians of Florida, a people of the same stock as the Creeks, hold an annual purification and festival called the Green Corn Dance, at which the new corn is eaten. On the evening of the first day of the festival they quaff a nauseous "Black Drink," as it is called, which acts both as an emetic and a purgative; they believe that he who does not drink of this liquor cannot safely eat the new green corn, and besides that he will be sick at some time in the year. While the liquor is being drunk, the dancing begins, and the medicine-men join in it. Next day they eat of the green corn; the following day they fast, probably from fear of polluting the sacred food in their stomachs by contact with common food; but the third day they hold a great feast. Further, the Natchez Indians, another tribe of the same stock, who used to inhabit a district on the lower course and eastern bank of the Mississippi, ate the new corn sacramentally at a great festival which has been fully described by Du Pratz, the French historian of Louisiana. As his work is

probably not easily accessible to many of my readers, I shall perhaps consult their convenience by extracting his description entire. The Natchez, he tells us, began their year in March and divided it into thirteen moons. Their sixth moon, which answered to our August, was the Mulberry Moon, and the seventh was the moon of Maize or Great Corn. "This feast is beyond dispute the most solemn of all. It principally consists in eating in common, and in a religious manner, of new corn, which had been sown expressly with that design, with suitable ceremonies. This corn is sown upon a spot of ground never before cultivated; which ground is dressed and prepared by the warriors alone, who also are the only persons that sow the corn, weed it, reap it, and gather it. When this corn is near ripe, the warriors fix on a place proper for the general feast, and close adjoining to that they form a round granary, the bottom and sides of which are of cane; this they fill with the corn, and when they have finished the harvest, and covered the granary, they acquaint the Great Sun, who appoints the day for the general feast. Some days before the feast, they build huts for the Great Sun, and for all the other families, round the granary, that of the Great Sun being raised upon a mound of earth about two feet high. On the feast-day the whole nation set out from their village at sun-rising, leaving behind only the aged and infirm that are not able to travel, and a few warriors, who are to carry the Great Sun on a litter upon their shoulders. The seat of this litter is covered with several deer-skins, and to its four sides are fastened four bars which cross each other, and are supported by eight men, who at every hundred paces transfer their burden to eight other men, and thus successively transport it to the place where the feast is celebrated, which may be near two miles from the village. About nine o'clock the Great Sun comes out of his hut dressed in the ornaments of his dignity, and being placed in his litter, which has a canopy at the head formed of flowers, he is carried in a few minutes to the sacred granary, shouts of joy re-echoing on all sides. Before he alights he makes the tour of the whole place deliberately, and when he comes before the corn, he salutes it thrice with the words *hoo, hoo, hoo*, lengthened and pronounced respectfully. The salutation is repeated by the whole nation, who pronounce the word *hoo* nine times distinctly, and at the ninth time he alights and places himself on his throne.

"Immediately after they light a fire by rubbing two pieces of wood violently against each other, and when everything is prepared for dressing the corn, the chief of war, accompanied by the warriors belonging to each family, presents himself before the throne, and addresses the Sun in these words, 'Speak, for I hear thee.' The sovereign then rises up, bows towards the four quarters of the world, and advancing to the granary, lifts his eyes and hands to heaven, and says, 'Give us corn': upon which the great chief of war, the princes and princesses, and all the men, thank him separately by pronouncing the word *hoo*. The corn is then distributed, first to the female Suns, and then to all the women, who run with it to their huts, and dress it with the utmost dispatch. When the corn is dressed in all the huts, a plate of it is put into the hands of the Great Sun, who presents it to the four quarters of the world, and then says to the chief of war, 'Eat'; upon this signal the warriors begin to eat in all the huts; after them the boys of whatever age, excepting those who are on the breast; and last of all the women. When the warriors have finished their repast, they form themselves into two choirs before the huts, and sing war songs for half an hour; after which the chief of war, and all the warriors in succession, recount their brave exploits, and mention, in a boasting manner, the number of enemies they have slain. The youths are next allowed to harangue, and each tells in the best manner he can, not what he has done, but what he intends to do; and if his discourse merits approbation, he is answered by a general *hoo*; if not, the warriors hang down their heads and are silent.

"This great solemnity is concluded with a general dance by torch-light. Upwards of two hundred torches of dried canes, each of the thickness of a child, are lighted round the place,

where the men and women often continue dancing till daylight; and the following is the disposition of their dance. A man places himself on the ground with a pot covered with a deer-skin, in the manner of a drum, to beat time to the dancers; round him the women form themselves into a circle, not joining hands, but at some distance from each other; and they are inclosed by the men in another circle, who have in each hand a chichicois, or calabash, with a stick thrust through it to serve for a handle. When the dance begins, the women move round the men in the centre, from left to right, and the men contrariwise from right to left, and they sometimes narrow and sometimes widen their circles. In this manner the dance continues without intermission the whole night, new performers successively taking the place of those who are wearied and fatigued.

“Next morning no person is seen abroad before the Great Sun comes out of his hut, which is generally about nine o'clock, and then upon a signal made by the drum, the warriors make their appearance distinguished into two troops, by the feathers which they wear on their heads. One of these troops is headed by the Great Sun, and the other by the chief of war, who begin a new diversion by tossing a ball of deer-skin stuffed with Spanish beard from the one to the other. The warriors quickly take part in the sport, and a violent contest ensues which of the two parties shall drive the ball to the hut of the opposite chief. The diversion generally lasts two hours, and the victors are allowed to wear the feathers of superiority till the following year, or till the next time they play at the ball. After this the warriors perform the war dance; and last of all they go and bathe; an exercise which they are very fond of when they are heated or fatigued.

“The rest of that day is employed as the preceding; for the feast holds as long as any of the corn remains. When it is all eat up, the Great Sun is carried back in his litter, and they all return to the village, after which he sends the warriors to hunt both for themselves and him.”

Even tribes which do not till the ground sometimes observe analogous ceremonies when they gather the first wild fruits or dig the first roots of the season. Thus among the Salish and Tinneh Indians of North-West America, “before the young people eat the first berries or roots of the season, they always addressed the fruit or plant, and begged for its favour and aid. In some tribes regular First-fruit ceremonies were annually held at the time of picking the wild fruit or gathering the roots, and also among the salmon-eating tribes when the run of the ‘sockeye’ salmon began. These ceremonies were not so much thanksgivings, as performances to ensure a plentiful crop or supply of the particular object desired, for if they were not properly and reverently carried out there was danger of giving offence to the ‘spirits’ of the objects, and being deprived of them.” For example, these Indians are fond of the young shoots or suckers of the wild raspberry, and they observe the following ceremony at gathering the first of them in season. “When the shoots are ready to pick, that is, when they are about six or eight inches above the ground, the chief, or directing elder of the community, instructs his wife or his daughters to pluck a small bundle of these and prepare them for eating. This they do, using a new pot or kettle for cooking them in. In the meantime all the settlement comes together to take part in the ceremony. They stand in a great circle, the presiding chief, elder, or medicine-man as the case may be, and his assistants being in their midst. Whoever is conducting the ceremony now silently invokes the spirit of the plants, the tenor of his prayer being that it will be propitious to them and grant them a good supply of the suckers. While the invocation is being made all in the circle must keep their eyes reverently closed, this being an essential part in all such ceremonies, the non-observance of which would anger the spirits and cause them to withhold the favours sought. To ensure this being strictly done, the assisting elders are armed with long wands with which they strike any person found opening his eyes during the prayer. After this part of the ceremony is over the cooked suckers are handed to the presiding officer in a newly carved dish, and a small portion

is given to each person present, who reverently and decorously eats it. This brings the ceremony to a close. Later, when the berries of this plant are ripe, a second and similar ceremony takes place.”

The Thompson Indians of British Columbia cook and eat the sunflower root (*Balsamorhiza sagittata*, Nutt.), but they used to regard it as a mysterious being, and observed a number of taboos in connexion with it; for example, women who were engaged in digging or cooking the root must practise continence, and no man might come near the oven where the women were baking the root. When young people ate the first berries, roots, or other products of the season, they addressed a prayer to the Sunflower-Root as follows: “I inform thee that I intend to eat thee. Mayest thou always help me to ascend, so that I may always be able to reach the tops of mountains, and may I never be clumsy! I ask this from thee, Sunflower-Root. Thou art the greatest of all in mystery.” To omit this prayer would make the eater lazy and cause him to sleep long in the morning. Again, when the first tobacco of the season was gathered and smoked for the first time, the inhabitants of each lodge among the Thompson Indians observed the following ceremony. An elderly man assembled all the inmates, often outside the lodge and generally after sunset, and caused all the adult men and women, who were in the habit of smoking, to sit down in a circle, while he stood in the middle. Sometimes he made a long speech to the people, but as a rule he simply said, “Be it known to you that we will cut up the chief,” meaning by the chief the tobacco. So saying he cut up some of the tobacco, and after mixing it with bear-berry leaves he filled a large pipe, lighted it, and handed it to each person, following the sun's course. Everybody took one whiff, and holding up his or her hands, the palms close together, blew the smoke downwards between the fingers and over the breast; and as the smoke descended, he crossed his hands on his breast, and rubbing his chest and shoulders with both hands, as if he were rubbing the smoke in, he prayed: “Lengthen my breath, chief, so that I may never be sick, and so that I may not die for a long time to come.” By the chief he meant the tobacco. When every one had had his whiff, the tobacco was cut up small and a piece given to each person.

These customs of the Thompson and other Indian tribes of North-West America are instructive, because they clearly indicate the motive, or at least one of the motives, which underlies the ceremonies observed at eating the first fruits of the season. That motive in the case of these Indians is simply a belief that the plant itself is animated by a conscious and more or less powerful spirit, who must be propitiated before the people can safely partake of the fruits or roots which are supposed to be part of his body. Now if this is true of wild fruits and roots, we may infer with some probability that it is also true of cultivated fruits and roots, such as yams, and in particular that it holds good of the cereals, such as wheat, barley, oats, rice, and maize. In all cases it seems reasonable to infer that the scruples which savages manifest at eating the first fruits of any crop, and the ceremonies which they observe before they overcome their scruples, are due at least in large measure to a notion that the plant or tree is animated by a spirit or even a deity, whose leave must be obtained, or whose favour must be sought before it is possible to partake with safety of the new crop. This indeed is plainly affirmed of the Aino: they call the millet “the divine cereal,” “the cereal deity,” and they pray to and worship him before they will eat of the cakes made from the new millet. And even where the indwelling divinity of the first fruits is not expressly affirmed, it appears to be implied both by the solemn preparations made for eating them and by the danger supposed to be incurred by persons who venture to partake of them without observing the prescribed ritual. In all such cases, accordingly, we may not improperly describe the eating of the new fruits as a sacrament or communion with a deity, or at all events with a powerful spirit.

Among the usages which point to this conclusion are the custom of employing either new or specially reserved vessels to hold the new fruits, and the practice of purifying the persons of

the communicants and even the houses and streets of the whole town, before it is lawful to engage in the solemn act of communion with the divinity. Of all the modes of purification adopted on these occasions none perhaps brings out the sacramental virtue of the rite so clearly as the Creek and Seminole practice of taking a purgative before swallowing the new corn. The intention is thereby to prevent the sacred food from being polluted by contact with common food in the stomach of the eater. For the same reason Catholics partake of the Eucharist fasting; and among the pastoral Masai of Eastern Africa the young warriors, who live on meat and milk exclusively, are obliged to eat nothing but milk for so many days and then nothing but meat for so many more, and before they pass from the one food to the other they must make sure that none of the old food remains in their stomachs; this they do by swallowing a very powerful purgative and emetic. Similarly, among the Suk, a tribe of British East Africa, no one may partake of meat and milk on the same day, and if he has chewed raw millet he is forbidden to drink milk for seven days. Among the Wataturu, another people of Eastern Africa akin to the Masai, a warrior who had eaten antelope's flesh might not drink of milk on the same day. Similarly among the Central Esquimaux the rules prohibiting contact between venison and the flesh of marine animals are very strict. The Esquimaux themselves say that the goddess Sedna dislikes the deer, and therefore they may not bring that animal into contact with her favourites, the sea beasts. Hence the meat of the whale, the seal, or the walrus may not be eaten on the same day with venison. Both sorts of meat may not even lie on the floor of the hut or behind the lamps at the same time. If a man who has eaten venison in the morning happens to enter a hut in which the flesh of seal is being cooked, he is allowed to eat venison on the bed, but it must be wrapt up before being carried into the hut, and he must take care to keep clear of the floor. Before changing from one food to the other the Esquimaux must wash themselves. Again, just as the Esquimaux think that their goddess would be offended if venison met seal or whale or walrus meat in the eater's stomach, so the Melanesians of Florida, one of the Solomon Islands, believe that if a man who has eaten pork or fish or shell-fish or the flesh of a certain sort of cuscus were to enter a garden immediately afterwards, the ghosts who preside over the garden and cause the fruits to grow would be angry and the crop would consequently suffer; but three or four days after partaking of such victuals, when the food has quite left his stomach, he may enter the garden without offence to the ghosts or injury to the crop. In like manner the ancient Greeks, of whose intellectual kinship with savages like the Esquimaux and the Melanesians we have already met with many proofs, laid it down as a rule that a man who had partaken of the black ram offered to Pelops at Olympia might not enter into the temple of Zeus, and that persons who had sacrificed to Telephus at Pergamus might not go up to the temple of Aesculapius until they had washed themselves, just as the Esquimaux who have eaten venison must wash before they may partake of seal or whale or walrus meat. Again, at Lindus in Rhodes there was a sanctuary of some god or hero unknown into which no one who had partaken of goat's flesh or peas-pudding might enter for three days, and no one who had eaten cheese might enter for one day. The prescribed interval was probably calculated to allow the obnoxious food to pass out of the body of the eater before he entered into the presence of the deity, who for some reason or other cherished an antipathy to these particular viands. At Castabus in the Carian Chersonese there was a sanctuary of Hemithea, which no one might approach who had either eaten pork or touched a pig.

In some of the festivals which we have examined, as in the Cheremiss, Buru, Cham, Ewe, and Creek ceremonies, the sacrament of first-fruits is combined with a sacrifice or presentation of them to gods or spirits, and in course of time the sacrifice of first-fruits tends to throw the sacrament into the shade, if not to supersede it. The mere fact of offering the first-fruits to the gods or spirits comes now to be thought a sufficient preparation for eating the new corn; the higher powers having received their share, man is free to enjoy the rest.

This mode of viewing the new fruits implies that they are regarded no longer as themselves instinct with divine life, but merely as a gift bestowed by the gods upon man, who is bound to express his gratitude and homage to his divine benefactors by returning to them a portion of their bounty. More examples of the sacrifice, as distinct from sacrament, of first-fruits will be given presently.

§ 2. Eating the God among the Aztecs.

The custom of eating bread sacramentally as the body of a god was practised by the Aztecs before the discovery and conquest of Mexico by the Spaniards. Twice a year, in May and December, an image of the great Mexican god Huitzilopochtli or Vitzilipuztli was made of dough, then broken in pieces, and solemnly eaten by his worshippers. The May ceremony is thus described by the historian Acosta: "The Mexicans in the month of May made their principal feast to their god Vitzilipuztli, and two days before this feast, the virgins whereof I have spoken (the which were shut up and secluded in the same temple and were as it were religious women) did mingle a quantity of the seed of beets with roasted maize, and then they did mould it with honey, making an idol of that paste in bigness like to that of wood, putting instead of eyes grains of green glass, of blue or white; and for teeth grains of maize set forth with all the ornament and furniture that I have said. This being finished, all the noblemen came and brought it an exquisite and rich garment, like unto that of the idol, wherewith they did attire it. Being thus clad and deckt, they did set it in an azured chair and in a litter to carry it on their shoulders. The morning of this feast being come, an hour before day all the maidens came forth attired in white, with new ornaments, the which that day were called the Sisters of their god Vitzilipuztli, they came crowned with garlands of maize roasted and parched, being like unto azahar or the flower of orange; and about their necks they had great chains of the same, which went bauldrickwise under their left arm. Their cheeks were dyed with vermilion, their arms from the elbow to the wrist were covered with red parrots' feathers." Young men, dressed in red robes and crowned like the virgins with maize, then carried the idol in its litter to the foot of the great pyramid-shaped temple, up the steep and narrow steps of which it was drawn to the music of flutes, trumpets, cornets, and drums. "While they mounted up the idol all the people stood in the court with much reverence and fear. Being mounted to the top, and that they had placed it in a little lodge of roses which they held ready, presently came the young men, which strewed many flowers of sundry kinds, wherewith they filled the temple both within and without. This done, all the virgins came out of their convent, bringing pieces of paste compounded of beets and roasted maize, which was of the same paste whereof their idol was made and compounded, and they were of the fashion of great bones. They delivered them to the young men, who carried them up and laid them at the idol's feet, wherewith they filled the whole place that it could receive no more. They called these morsels of paste the flesh and bones of Vitzilipuztli. Having laid abroad these bones, presently came all the ancients of the temple, priests, Levites, and all the rest of the ministers, according to their dignities and antiquities (for herein there was a strict order amongst them) one after another, with their veils of diverse colours and works, every one according to his dignity and office, having garlands upon their heads and chains of flowers about their necks; after them came their gods and goddesses whom they worshipped, of diverse figures, attired in the same livery; then putting themselves in order about those morsels and pieces of paste, they used certain ceremonies with singing and dancing. By means whereof they were blessed and consecrated for the flesh and bones of this idol. This ceremony and blessing (whereby they were taken for the flesh and bones of the idol) being ended, they honoured those pieces in the same sort as their god.

"Then come forth the sacrificers, who began the sacrifice of men in the manner as hath been spoken, and that day they did sacrifice a greater number than at any other time, for that it was

the most solemn feast they observed. The sacrifices being ended, all the young men and maids came out of the temple attired as before, and being placed in order and rank, one directly against another, they danced by drums, the which sounded in praise of the feast, and of the idol which they did celebrate. To which song all the most ancient and greatest noblemen did answer dancing about them, making a great circle, as their use is, the young men and maids remaining always in the midst. All the city came to this goodly spectacle, and there was a commandment very strictly observed throughout all the land, that the day of the feast of the idol of Vitziliputzli they should eat no other meat but this paste, with honey, whereof the idol was made. And this should be eaten at the point of day, and they should drink no water nor any other thing till after noon: they held it for an ill sign, yea, for sacrilege to do the contrary: but after the ceremonies ended, it was lawful for them to eat anything. During the time of this ceremony they hid the water from their little children, admonishing all such as had the use of reason not to drink any water; which, if they did, the anger of God would come upon them, and they should die, which they did observe very carefully and strictly. The ceremonies, dancing, and sacrifice ended, they went to unclothe themselves, and the priests and superiors of the temple took the idol of paste, which they spoiled of all the ornaments it had, and made many pieces, as well of the idol itself as of the truncheons which they consecrated, and then they gave them to the people in manner of a communion, beginning with the greater, and continuing unto the rest, both men, women, and little children, who received it with such tears, fear, and reverence as it was an admirable thing, saying that they did eat the flesh and bones of God, wherewith they were grieved. Such as had any sick folks demanded thereof for them, and carried it with great reverence and veneration.”

From this interesting passage we learn that the ancient Mexicans, even before the arrival of Christian missionaries, were fully acquainted with the theological doctrine of transubstantiation and acted upon it in the solemn rites of their religion. They believed that by consecrating bread their priests could turn it into the very body of their god, so that all who thereupon partook of the consecrated bread entered into a mystic communion with the deity by receiving a portion of his divine substance into themselves. The doctrine of transubstantiation, or the magical conversion of bread into flesh, was also familiar to the Aryans of ancient India long before the spread and even the rise of Christianity. The Brahmans taught that the rice-cakes offered in sacrifice were substitutes for human beings, and that they were actually converted into the real bodies of men by the manipulation of the priest. We read that “when it (the rice-cake) still consists of rice-meal, it is the hair. When he pours water on it, it becomes skin. When he mixes it, it becomes flesh: for then it becomes consistent; and consistent also is the flesh. When it is baked, it becomes bone: for then it becomes somewhat hard; and hard is the bone. And when he is about to take it off (the fire) and sprinkles it with butter, he changes it into marrow. This is the completeness which they call the fivefold animal sacrifice.” These remarkable transformations, daily wrought by the priest, on the rice-wafer, were, however, nothing at all to those which the gods themselves accomplished when they first instituted the rite. For the horse and the ox which they sacrificed became a *bos gaurus* and a gayal respectively; the sheep was turned into a camel; and the goat was converted into a remarkable species of deer, enriched with eight legs, which slew lions and elephants. On the whole it would seem that neither the ancient Hindoos nor the ancient Mexicans had much to learn from the most refined mysteries of Catholic theology.

Now, too, we can perfectly understand why on the day of their solemn communion with the deity the Mexicans refused to eat any other food than the consecrated bread which they revered as the very flesh and bones of their God, and why up till noon they might drink nothing at all, not even water. They feared no doubt to defile the portion of God in their

stomachs by contact with common things. A similar pious fear led the Creek and Seminole Indians, as we saw, to adopt the more thoroughgoing expedient of rinsing out their insides by a strong purgative before they dared to partake of the sacrament of first-fruits. We can now also conjecture the reason why Zulu boys, after eating the flesh of the black bull at the feast of first-fruits, are forbidden to drink anything till the next day.

At the festival of the winter solstice in December the Aztecs killed their god Huitzilopochtli in effigy first and ate him afterwards. As a preparation for this solemn ceremony an image of the deity in the likeness of a man was fashioned out of seeds of various sorts, which were kneaded into a dough with the blood of children. The bones of the god were represented by pieces of acacia wood. This image was placed on the chief altar of the temple, and on the day of the festival the king offered incense to it. Early next day it was taken down and set on its feet in a great hall. Then a priest, who bore the name and acted the part of the god Quetzalcoatl, took a flint-tipped dart and hurled it into the breast of the dough-image, piercing it through and through. This was called "killing the god Huitzilopochtli so that his body might be eaten." One of the priests cut out the heart of the image and gave it to the king to eat. The rest of the image was divided into minute pieces, of which every man great and small, down to the male children in the cradle, received one to eat. But no woman might taste a morsel. The ceremony was called *teoqualo*, that is, "god is eaten."

At another festival the Mexicans made little images like men, which stood for the cloud-capped mountains. These images were moulded of a paste of various seeds and were dressed in paper ornaments. Some people fashioned five, others ten, others as many as fifteen of them. Having been made, they were placed in the oratory of each house and worshipped. Four times in the course of the night offerings of food were brought to them in tiny vessels; and people sang and played the flute before them through all the hours of darkness. At break of day the priests stabbed the images with a weaver's instrument, cut off their heads, and tore out their hearts, which they presented to the master of the house on a green saucer. The bodies of the images were then eaten by all the family, especially by the servants, "in order that by eating them they might be preserved from certain distempers, to which those persons who were negligent of worship to those deities conceived themselves to be subject." In some cities of Mexico, as in Tlacopan and Coyohuacan, an idol was fashioned out of grains of various kinds, and the warriors ate it in the belief that the sacred food would increase their forces fourfold when they marched to the fight. At certain festivals held thrice a year in Nicaragua all the men, beginning with the priests and chiefs, drew blood from their tongues and genital organs with sharp knives of flint, allowed it to drip on some sheaves of maize, and then ate the bloody grain as a blessed food.

But the Mexicans did not always content themselves with eating their gods in the outward and visible shape of bread or grain; it was not even enough that this material vehicle of the divine life should be kneaded and fortified with human blood. They craved, as it seems, after a closer union with the living god, and attained it by devouring the flesh of a real man, who, after he had paraded for a time in the trappings and received the honours of a god, was slaughtered and eaten by his cannibal worshippers. The deity thus consumed in effigy was Tetzcatlipoca, and the man chosen to represent him and die in his stead was a young captive of handsome person and illustrious birth. During his captivity the youth thus doomed to play the fatal part of divinity was allowed to range the streets of Mexico freely, escorted by a distinguished train, who paid him as much respect as if he had been indeed the god himself instead of only his living image. Twenty days before the festival at which the tragic mockery was to end, that he might taste all the joys of this transient world to which he must soon bid farewell, he received in marriage four women, from whom he parted only when he took his place in the last solemn procession. Arrived at the foot of the sacred pyramid on the top of

which he was to die, the sacrificers saluted him and led him up the long staircase. On the summit five of them seized him and held him down on his back upon the sacrificial stone, while the high priest, after bowing to the god he was about to kill, cut open his breast and tore out the throbbing heart with the accustomed rites. But instead of being kicked down the staircase and sent rolling from step to step like the corpses of common victims, the body of the dead god was carried respectfully down, and his flesh, chopped up small, was distributed among the priests and nobles as a blessed food. The head, being severed from the trunk, was preserved in a sacred place along with the white and grinning skulls of all the other victims who had lived and died in the character of the god Tetzcatlipoca.

The custom of entering into communion with a god by eating of his effigy survived till lately among the Huichol Indians of Mexico. In a narrow valley, at the foot of a beetling crag of red rock, they have a small thatched temple of the God of fire, and here down to recent years stood a small image of the deity in human form roughly carved out of solidified volcanic ash. The idol was very dirty and smeared with blood, and in his right side was a hole, which owed its existence to the piety and devotion of his worshippers. For they believed that the power of healing and a knowledge of mysteries could be acquired by eating a little of the god's holy body, and accordingly shamans, or medicine-men, who desired to lay in a stock of these accomplishments, so useful in the exercise of their profession, were wont to repair to the temple, where, having deposited an offering of food or a votive bowl, they scraped off with their finger-nails some particles of the god's body and swallowed them. After engaging in this form of communion with the deity they had to abstain from salt and from all carnal converse with their wives for five months. Again, the Malas, a caste of pariahs in Southern India, communicate with the goddess Sunkamma by eating her effigy. The communion takes place at marriage. An image of the goddess in the form of a truncated cone is made out of rice and green grain cooked together, and it is decorated with a nose jewel, garlands, and other religious symbols. Offerings of rice, frankincense, camphor, and a coco-nut are then made to the image, and a ram or he-goat is sacrificed. After the sacrifice has been presented, all the persons assembled prostrate themselves in silence before the image, then they break it in pieces, and distributing the pieces among themselves they swallow them. In this way they are, no doubt, believed to absorb the divine essence of the goddess whose broken body has just passed into their stomachs. In Europe the Catholic Church has resorted to similar means for enabling the pious to enjoy the ineffable privilege of eating the persons of the Infant God and his Mother. For this purpose images of the Madonna are printed on some soluble and harmless substance and sold in sheets like postage stamps. The worshipper buys as many of these sacred emblems as he has occasion for, and affixing one or more of them to his food swallows the bolus. The practice is not confined to the poor and ignorant. In his youth Count von Hoensbroech and his devout mother used thus to consume portions of God and his Mother with their meals.

§ 3. Many Manii at Aricia.

We are now able to suggest an explanation of the proverb "There are many Manii at Aricia." Certain loaves made in the shape of men were called by the Romans *maniae*, and it appears that this kind of loaf was especially made at Aricia. Now, Mania, the name of one of these loaves, was also the name of the Mother or Grandmother of Ghosts, to whom woollen effigies of men and women were dedicated at the festival of the Compitalia. These effigies were hung at the doors of all the houses in Rome; one effigy was hung up for every free person in the house, and one effigy, of a different kind, for every slave. The reason was that on this day the ghosts of the dead were believed to be going about, and it was hoped that, either out of good nature or through simple inadvertence, they would carry off the effigies at the door instead of the living people in the house. According to tradition, these woollen

figures were substitutes for a former custom of sacrificing human beings. Upon data so fragmentary and uncertain, it is impossible to build with confidence; but it seems worth suggesting that the loaves in human form, which appear to have been baked at Aricia, were sacramental bread, and that in the old days, when the divine King of the Wood was annually slain, loaves were made in his image, like the paste figures of the gods in Mexico, India, and Europe, and were eaten sacramentally by his worshippers. The Mexican sacraments in honour of Huitzilopochtli were also accompanied by the sacrifice of human victims. The tradition that the founder of the sacred grove at Aricia was a man named Manius, from whom many Manii were descended, would thus be an etymological myth invented to explain the name *maniae* as applied to these sacramental loaves. A dim recollection of the original connexion of the loaves with human sacrifices may perhaps be traced in the story that the effigies dedicated to Mania at the Compitalia were substitutes for human victims. The story itself, however, is probably devoid of foundation, since the practice of putting up dummies to divert the attention of ghosts or demons from living people is not uncommon. As the practice is both widely spread and very characteristic of the manner of thought of primitive man, who tries in a thousand ways to outwit the malice of spiritual beings, I may be pardoned for devoting a few pages to its illustration, even though in doing so I diverge somewhat from the strict line of argument. I would ask the reader to observe that the vicarious use of images, with which we are here concerned, differs wholly in principle from the sympathetic use of them which we examined before; and that while the sympathetic use belongs purely to magic, the vicarious use falls within the domain of religion.

The Tibetans stand in fear of innumerable earth-demons, all of whom are under the authority of Old Mother Khön-ma. This goddess, who may be compared to the Roman Mania, the Mother or Grandmother of Ghosts, is dressed in golden-yellow robes, holds a golden noose in her hand, and rides on a ram. In order to bar the dwelling-house against the foul fiends, of whom Old Mother Khön-ma is mistress, an elaborate structure somewhat resembling a chandelier is fixed above the door on the outside of the house. It contains a ram's skull, a variety of precious objects such as gold-leaf, silver, and turquoise, also some dry food, such as rice, wheat, and pulse, and finally images or pictures of a man, a woman, and a house. "The object of these figures of a man, wife, and house is to deceive the demons should they still come in spite of this offering, and to mislead them into the belief that the foregoing pictures are the inmates of the house, so that they may wreak their wrath on these bits of wood and so save the real human occupants." When all is ready, a priest prays to Old Mother Khön-ma that she would be pleased to accept these dainty offerings and to close the open doors of the earth, in order that the demons may not come forth to infest and injure the household.

Further, it is often supposed that the spirits of persons who have recently departed this life are apt to carry off with them to the world of the dead the souls of their surviving relations. Hence the savage resorts to the device of making up of dummies or effigies which he puts in the way of the ghost, hoping that the dull-witted spirit will mistake them for real people and so leave the survivors in peace. Hence in Tahiti the priest who performed the funeral rites used to lay some slips of plantain leaf-stalk on the breast and under the arms of the corpse, saying, "There are your family, there is your child, there is your wife, there is your father, and there is your mother. Be satisfied yonder (that is, in the world of spirits). Look not towards those who are left in the world." This ceremony, we are told, was designed "to impart contentment to the departed, and to prevent the spirit from repairing to the places of his former resort, and so distressing the survivors." When the Galelareese bury a corpse, they bury with it the stem of a banana-tree for company, in order that the dead person may not seek a companion among the living. Just as the coffin is being lowered into the earth, one of

the bystanders steps up and throws a young banana-tree into the grave, saying, "Friend, you must miss your companions of this earth; here, take this as a comrade." In the Banks Islands, Melanesia, the ghost of a woman who has died in childbed cannot go away to Panoi or ghost-land if her child lives, for she cannot leave the baby behind. Hence to bilk her ghost they tie up a piece of banana-trunk loosely in leaves and lay it on her bosom in the grave. So away she goes, thinking she has her baby with her, and as she goes the banana-stalk keeps slipping about in the leaves, and she fancies it is the child stirring at her breast. Thus she is happy, till she comes to ghost-land and finds she has been deceived; for a baby of banana-stalk cannot pass muster among the ghosts. So back she comes tearing in grief and rage to look for the child; but meantime the infant has been artfully removed to another house, where the dead mother cannot find it, though she looks for it everywhere. In the Pelew Islands, when a woman has died in childbed, her spirit comes and cries, "Give me the child!" So to beguile her they bury the stem of a young banana-tree with her body, cutting it short and laying it between her right arm and her breast. The same device is adopted for the same purpose in the island of Timor. In like circumstances negroes of the Niger Delta force a piece of the stem of a plantain into the womb of the dead mother, in order to make her think that she has her babe with her and so to prevent her spirit from coming back to claim the living child. Among the Yorubas of West Africa, when one of twins dies, the mother carries about, along with the surviving child, a small wooden figure roughly fashioned in human shape and of the sex of the dead twin. This figure is intended not merely to keep the live child from pining for its lost comrade, but also to give the spirit of the dead child something into which it can enter without disturbing its little brother or sister. Among the Tschwi of West Africa a lady observed a sickly child with an image beside it which she took for a doll. But it was no doll, it was an effigy of the child's dead twin which was being kept near the survivor as a habitation for the little ghost, lest it should wander homeless and, feeling lonely, call its companion away after it along the dark road of death.

At Onitsha, a town on the left bank of the Niger, a missionary once met a funeral procession which he describes as very singular. The real body had already been buried in the house, but a piece of wood in the form of a sofa and covered up was being borne by two persons on their heads, attended by a procession of six men and six women. The men carried cutlasses and the women clapped their hands as they passed along each street, crying, "This is the dead body of him that is dead, and is gone into the world of spirits." Meantime the rest of the villagers had to keep indoors. The sham corpse was probably intended as a lure to draw away prowling demons from the real body. So among the Angoni, who inhabit the western bank of Lake Nyassa, there is a common belief that demons hover about the dying and dead before burial in order to snatch away their souls to join their own evil order. Guns are fired and drums are beaten to repel these spiritual foes, but a surer way of baulking their machinations is to have a mock funeral and so mislead and confound them. A sham corpse is made up out of anything that comes to hand, and it is treated exactly as if it were what it pretends to be. This lay figure is then carried some distance to a grave, followed by a great crowd weeping and wailing as if their hearts would break, while the rub-a-dub of drums and the discharge of guns add to the uproar. Meantime the real corpse is being interred as quietly and stealthily as possible near the house. Thus the demons are baffled; for when the dummy corpse has been laid in the earth with every mark of respect, and the noisy crowd has dispersed, the fiends swoop down on the mock grave only to find a bundle of rushes or some such trash in it; but the true grave they do not know and cannot find. Similarly among the Bakundu of the Cameroons two graves are always made, one in the hut of the deceased and another somewhere else, and no one knows where the corpse is really buried. The custom is apparently intended to guard the knowledge of the real grave from demons, who might make an ill use of the body, if not of the soul, of the departed. In like manner the Kamilaroi tribe of Australia are reported to make

two graves, a real one and an empty one, for the purpose of cheating a malevolent spirit called Krooben. So, too, some of the Nagas of Assam dig two graves, a sham grave made conspicuous on purpose to attract the notice of the evil spirits, and the real grave made inconspicuous to escape their attention: a figure is set up over the false grave. Isis is said to have made many false graves of the dead Osiris in Egypt in order that his foe Typhon might not be able to find the true one. In Bombay, if a person dies on an unlucky day, a dough figure of a man is carried on the bier with him and burnt with his corpse. This is supposed to hinder a second death from occurring in the family, probably because the demons are thought to take the dough figure instead of a real person.

Again, effigies are often employed as a means of preventing or curing sickness; the demons of disease either mistake the effigies for living people or are persuaded or compelled to enter them, leaving the real men and women well and whole. Thus the Alfoors of Minahassa, in Celebes, will sometimes transport a sick man to another house, while they leave on his bed a dummy made up of a pillow and clothes. This dummy the demon is supposed to mistake for the sick man, who consequently recovers. Cure or prevention of this sort seems to find especial favour with the Dyaks of Borneo. Thus, when an epidemic is raging among them, the Dyaks of the Katoengouw river set up wooden images at their doors in the hope that the demons of the plague may be deluded into carrying off the effigies instead of the people. Among the Oloh Ngadju of Borneo, when a sick man is supposed to be suffering from the assaults of a ghost, puppets of dough or rice-meal are made and thrown under the house as substitutes for the patient, who thus rids himself of the ghost. So if a man has been attacked by a crocodile and has contrived to escape, he makes a puppet of dough or meal and casts it into the water as a vicarious offering; otherwise the water-god, who is conceived in the shape of a crocodile, might be angry. In certain of the western districts of Borneo if a man is taken suddenly and violently sick, the physician, who in this part of the world is generally an old woman, fashions a wooden image and brings it seven times into contact with the sufferer's head, while she says: "This image serves to take the place of the sick man; sickness, pass over into the image." Then, with some rice, salt, and tobacco in a little basket, the substitute is carried to the spot where the evil spirit is supposed to have entered into the man. There it is set upright on the ground, after the physician has invoked the spirit as follows: "O devil, here is an image which stands instead of the sick man. Release the soul of the sick man and plague the image, for it is indeed prettier and better than he." Similar substitutes are used almost daily by these Dyaks for the purpose of drawing off evil influences from anybody's person. Thus, when an Ot Danom baby will not stop squalling, its maternal grandmother takes a large leaf, fashions it into a puppet to represent the child, and presses it against the infant's body. Having thus decanted the spirit, so to speak, from the baby into the puppet, she pierces the effigy with little arrows from a blow-gun, thereby killing the spirit that had vexed her child. Similarly in the island of Dama, between New Guinea and Celebes, where sickness is ascribed to the agency of demons, the doctor makes a doll of palm-leaf and lays it, together with some betel, rice, and half of an empty eggshell, on the patient's head. Lured by this bait the demon quits the sufferer's body and enters the palm-leaf doll, which the wily doctor thereupon promptly decapitates. This may reasonably be supposed to make an end of the demon and of the sickness together. A Dyak sorcerer, being called in to prescribe for a little boy who suffered from a disorder of the stomach, constructed two effigies of the boy and his mother out of bundles of clothes and offered them, together with some of the parents' finery, to the devil who was plaguing the child; it was hoped that the demon would take the effigies and leave the boy. Batta magicians can conjure the demon of disease out of the patient's body into an image made out of a banana-tree with a human face and wrapt up in magic herbs; the image is then hurriedly removed and thrown away or buried beyond the boundaries of the village. Sometimes the image, dressed as a man or a woman according to the sex of the

patient, is deposited at a cross-road or other thoroughfare, in the hope that some passer-by, seeing it, may start and cry out, "Ah! So-and-So is dead"; for such an exclamation is supposed to delude the demon of disease into a belief that he has accomplished his fell purpose, so he takes himself off and leaves the sufferer to get well. The Mai Darat, a Sakai tribe of the Malay Peninsula, attribute all kinds of diseases to the agency of spirits which they call *nyani*; fortunately, however, the magician can induce these maleficent beings to come out of the sick person and take up their abode in rude figures of grass, which are hung up outside the houses in little bell-shaped shrines decorated with peeled sticks.

In the island of Nias people fear that the spirits of murdered infants may come and cause women with child to miscarry. To divert the unwelcome attention of these sprites from a pregnant woman an elaborate mechanism has been contrived. A potent idol called Fangola is set up beside her bed to guard her slumbers during the hours of darkness from the evil things that might harm her; another idol, connected with the first by a chain of palm-leaves, is erected in the large room of the house; and lastly a small banana-tree is planted in front of the second idol. The notion is that the sprites, scared away by the watchful Fangola from the sleeping woman, will scramble along the chain of palm-leaves to the other idol, and then, beholding the banana-tree, will mistake it for the woman they were looking for, and so pounce upon it instead of her. In Bhutan, when the Lamas make noisy music to drive away the demon who is causing disease, little models of animals are fashioned of flour and butter and the evil spirit is implored to enter these models, which are then burnt. So in Tibet, when a man is very ill and all other remedies have failed, his friends will sometimes, as a last resort, offer an image of him with some of his clothes to the Lord of Death, beseeching that august personage to accept the image and spare the man. A Burmese mode of curing a sick man is to bury a small effigy of him in a tiny coffin, after which he ought certainly to recover. In Siam, when a person is dangerously ill, the magician models a small image of him in clay and carrying it away to a solitary place recites charms over it which compel the malady to pass from the sick man into the image. The sorcerer then buries the image, and the sufferer is made whole. So, too, in Cambodia the doctor fashions a rude effigy of his patient in clay and deposits it in some lonely spot, where the ghost or demon takes it instead of the man. The same ideas and the same practices prevail much further to the north among the tribes on the lower course of the River Amoor. When a Goldi or a Gilyak shaman has cast out the devil that caused disease, an abode has to be provided for the homeless devil, and this is done by making a wooden idol in human form of which the ejected demon takes possession.

The Chinese of Amoy make great use of cheap effigies as means of diverting ghostly and other evil influence from people. These effigies are kept in stock and sold in the shops which purvey counterfeit paper money and other spurious wares for the use of simple-minded ghosts and gods, who accept them in all good faith instead of the genuine articles. Nothing could well be cruder than the puppets that are employed to relieve sufferers from the many ills which flesh is heir to. They are composed of two bamboo splinters fastened together crosswise with a piece of paper pasted on one side to represent a human body. Two other shreds of paper, supposed to stand for boots, distinguish the effigy of a man from the effigy of a woman. Armed with one of these "substitutes for a person," as they are called, you may set fortune at defiance. If a member of your family, for example, is ailing, or has suffered any evil whatever, or even is merely threatened by misfortune, all that you have to do is to send for one of these puppets, pass it all over his body while you recite an appropriate spell, and then burn the puppet. The maleficent influence is thus elicited from the person of the sufferer and destroyed once for all. If your child has tumbled into one of those open sewers which yawn for the unwary in the streets, you need only fish him out, pass the puppet over his filthy little body, and say: "This contact (of the substitute) with the front of the body brings purity

and prosperity, and the contact with the back gives power to eat till an old, old, old age; the contact with the left side establishes well-being for years and years, and the contact with the right side bestows longevity; happy fate, come! ill fate, be transferred to the substitute!" So saying you burn the substitute, by choice near the unsavoury spot where the accident happened; and if you are a careful man you will fetch a pail of water and wash the ashes away. Moreover, the child's head should be shaven quite clean; but if the sufferer was an adult, it is enough to lay bare with the razor a small patch on his scalp to let out the evil influence. In Corea effigies are employed on much the same principle for the purpose of prolonging life. On the fourteenth and the fifteenth day of the first month all men and women born under the Jen or "Man" star make certain straw images dressed in clothes and containing a number of the copper cash which form the currency of the country. Strictly speaking, there should be as many cash in the image as the person whom it represents has lived years; but the rule is not strictly observed. These images are placed on the path outside the house, and the poor people seize them and tear them up in order to get the cash which they contain. The destruction of the image is supposed to save the person represented from death for ten years. Accordingly the ceremony need only be performed once in ten years, though some people from excess of caution appear to observe it annually.

The Abchases of the Caucasus believe that sickness is sometimes caused by Mother Earth. So in order to appease her and redeem the life of the sick man, an innocent maiden will make a puppet in human form, richly clad, and bury it in the earth, saying, "Instead of the sick man, play and delight yourself with this." The Ewe negroes of Togoland, in West Africa, think that the spirits of all living people come from heaven, where they live in the intervals between their incarnations. Life in Amedzowe, as they call that heavenly region, which lies a little to the east of the town of Ho, is very like life on earth. There are fields there and wildernesses and forests. Also there are all kinds of food, such as yams and maize and likewise stock-yams, not to speak of cotton; in fact, all these things came from heaven just as men themselves did. Moreover, everybody has his spiritual mother in heaven and his spiritual aunt, also his spiritual uncle, his spiritual grandfather, and so on, just as on earth. Now the spirits in heaven are apt to resent it when one of their number quits them to go and be born as a child on earth; and sometimes they will pursue the truant and carry him back to the celestial country, and that is what we call death. Little children are most commonly fetched away by their mother in heaven; for she wearies for them and comes and lays an invisible hand on the child, and it sickens and dies. If you hear a child whimpering of nights, you may be sure that its mother from heaven has laid her hand on it and is drawing it away to herself. If the child grows very sick and its earthly mother fears that it will die, she will mould two figures of clay, a man and a woman, and offer them in exchange to the heavenly mother, saying, "O thou bearer and mother of children! instead of the child that has gone away from thee we bring thee here in exchange these clay men. Take them and withdraw thy hand from the child in this visible world." Grown-up people also, when they fall sick, will sometimes make images of clay and offer them as substitutes to the messengers who have come from heaven to fetch them away. These images are deposited with other offerings, such as cowry-shells and a musket, by the roadside; and if the messengers accept them instead of the sick man, he recovers. During an epidemic of small-pox the Ewe negroes will sometimes clear a space outside of the town, where they erect a number of low mounds and cover them with as many little clay figures as there are people in the place. Pots of food and water are also set out for the refreshment of the spirit of small-pox who, it is hoped, will take the clay figures and spare the living folk; and to make assurance doubly sure the road into the town is barricaded against him.

Among the Nishga Indians of British Columbia when a medicine-man dreams a dream which portends death to somebody, he informs the person whose life is threatened, and together they concert measures to avert the evil omen. The man whose life is at stake has a small wooden figure called a *shigigiadsqu* made as like himself as the skill of the wood-carver will allow, and this he hangs round his neck by a string so that the figure lies exactly over his heart. In this position he wears it long enough to allow the heat of his body to be imparted to it, generally for about four days. On the fourth day the medicine-man comes to the house, arrayed in his bearskin and other insignia of office and bringing with him a wisp of teased bark and a toy canoe made of cedar-bark. Thus equipped, he sings a doleful ditty, the death-song of the tribe. Then he washes the man over the region of the heart with the wisp of bark dipped in water, places the wisp, together with the wooden image, in the canoe, and after again singing the death-chant, commits image, wisp, and canoe to the flames, where they are all consumed. The death-chant is now changed to a song of joy, and the man who was lately in fear of his life joins in. He may well be gay, for has he not given death the slip by devoting to destruction, not merely a wisp saturated with the dangerous defilement of his body, but also a substitute made in his own likeness and impregnated with his very heart's warmth?

With these examples before us we may fairly conclude that the woollen effigies, which at the festival of the Compitalia might be seen hanging at the doors of all the houses in ancient Rome, were not substitutes for human victims who had formerly been sacrificed at this season, but rather vicarious offerings presented to the Mother or Grandmother of Ghosts, in the hope that on her rounds through the city she would accept or mistake the effigies for the inmates of the house and so spare the living for another year. It is possible that the puppets made of rushes, which in the month of May the pontiffs and Vestal Virgins annually threw into the Tiber from the old Sublician bridge at Rome, had originally the same significance; that is, they may have been designed to purge the city from demoniac influence by diverting the attention of the demons from human beings to the puppets and then toppling the whole uncanny crew, neck and crop, into the river, which would soon sweep them far out to sea. In precisely the same way the natives of Old Calabar used periodically to rid their town of the devils which infested it by luring the unwary demons into a number of lamentable scarecrows, which they afterwards flung into the river. This interpretation of the Roman custom is supported to some extent by the evidence of Plutarch, who speaks of the ceremony as "the greatest of purifications." However, other explanations of the rite have been proposed: indeed these puppets of rushes have been a standing puzzle to Roman antiquaries in ancient and modern times.

XI. The Sacrifice of First-Fruits

In the preceding chapter we saw that primitive peoples often partake of the new corn and the new fruits sacramentally, because they suppose them to be instinct with a divine spirit or life. At a later age, when the fruits of the earth are conceived as created rather than as animated by a divinity, the new fruits are no longer partaken of sacramentally as the body and blood of a god; but a portion of them is offered to the divine beings who are believed to have produced them. Originally, perhaps, offerings of first-fruits were supposed to be necessary for the subsistence of the divinities, who without them must have died of hunger; but in after times they seem to be looked on rather in the light of a tribute or mark of homage rendered by man to the gods for the good gifts they have bestowed on him. Sometimes the first-fruits are presented to the king, perhaps in his character of a god; very often they are made over to the spirits of the human dead, who are sometimes thought to have it in their power to give or withhold the crops. Till the first-fruits have been offered to the deity, the dead, or the king, people are not at liberty to eat of the new crops. But, as it is not always possible to draw a sharp line between the sacrament and the sacrifice of first-fruits, it may be well to round off this part of the subject by giving some examples of the latter.

The Ovambo or Ovakuanjama of South-West Africa stand in great fear of the spirits of the dead, who are believed to exercise a powerful influence over the living; in particular the spirits of dead chiefs can give or withhold rain, a matter of vital importance in the parched region of Ovamboland. Accordingly the people pay great respect to the spirits of the departed, and they hold a thanksgiving festival in their honour at the close of the harvest. When the new corn has been reaped and ground, a portion of it is made into porridge and carried to the quarters of the principal wife. Here all the inhabitants of the kraal assemble; the head of the family takes some of the porridge, dips it in melted fat, and throws it to the east, saying, "Take it, ye spirits of the East!" Then he does the same towards the west, saying, "Take it, ye spirits of the West!" This is regarded as a thank-offering presented to the spirits of the dead for not visiting the people with sickness while they were cultivating the fields, and especially for sending the rain.

Among the Basutos, when the corn has been threshed and winnowed, it is left in a heap on the threshing-floor. Before it can be touched a religious ceremony must be performed. The persons to whom the corn belongs bring a new vessel to the spot, in which they boil some of the grain. When it is boiled they throw a few handfuls of it on the heap of corn, saying, "Thank you, gods; give us bread to-morrow also!" When this is done the rest is eaten, and the provision for the year is considered pure and fit to eat. Here the sacrifice of the first-fruits to the gods is the prominent idea, which comes out again in the custom of leaving in the threshing-floor a little hollow filled with grain, as a thank-offering to these powerful beings. Still the Basutos retain a lively sense of the sanctity of the corn in itself; for, so long as it is exposed to view, all defiled persons are carefully kept from it. If it is necessary to employ a defiled person in carrying home the harvest, he remains at some distance while the sacks are being filled, and only approaches to place them upon the draught oxen. As soon as the load is deposited at the dwelling he retires, and under no pretext may he help to pour the corn into the baskets in which it is kept. The Makalaka worship a god called Shumpaoli, whose image is to be found in the enclosure outside of their huts. The image consists of the head of an axe, a stone from the river, and a twig or long stalk of grass planted between them in the ground. About this god they scatter the first-fruits of their harvest, and when they brew beer they pour some of it on him. Of the Bantu tribes of South Africa in

general we are told that they might not eat of the new crops till the chief gave them leave to do so. When the millet was ripe he appointed a general assembly of the people at his residence, which was known as the Great Place; he then performed certain rites, and in particular he offered a small quantity of the fresh grain to the spirits of his ancestors, either by laying it on their graves or by casting it into a stream. After that he granted the people permission to gather and eat the new corn.

Among the Maraves or Zimbabwes, a tribe of the Upper Zambesi, bordering on the Portuguese territory, it is the custom that first-fruits of all produce must be offered to the spirits of the dead (*muzimos*), to whom they attribute all the good and ill that befall them. Every year at harvest-time the offerings are brought to these mighty beings. Small portions of all kinds of fruits, together with cooked fowls and *pombe* (the native intoxicant), are carried in procession, with songs, dances, and the beating of drums, to the burial-ground, which is always situated in a grove or a wilderness and is esteemed a sacred place; no tree may be felled and no animal killed on the holy ground, for the natives believe that a spirit of the dead is present in everything within the precincts. Among the Yaos of British Central Africa "offerings are made to the spirit world or to *mulungu* as the great agency in the affairs of human life. Outside the village, or beside the head-man's hut, may often be seen a rough shed. In this are placed the first-fruits of the new crop, green maize, beans, pumpkins, peas, etc., as a thank offering from the villagers for their harvest. This is described as *kulomba mulungu*, to worship *mulungu*." By *mulungu* the Yaos mean primarily and strictly the soul of a dead person, which is believed to influence the lives and fortunes of the survivors, and therefore needs to be honoured and propitiated; but they employ the word in an extended sense to signify the aggregate of the spirits of all the dead, and missionaries have adopted it as the nearest equivalent for the word God. Among the Winamwanga, a tribe of north-eastern Rhodesia, between Lake Nyassa and Lake Tanganyika, it is customary to offer the first beer and the first flour made from the new harvest of millet to the spirits of the dead. The head of the family pours out some beer and a small quantity of the new flour in a heap on the floor of his own house, after which he prays to the spirits of his forefathers, thanks them for the harvest, and invites them to come and partake of it with the family. The priest performs the same ceremony at the shrine for the whole village. The householder or the priest speaks to the spirits as if they were sitting around him. Thus he may say, "O ye great spirits, fathers in the spirit world, mothers in the spirit world, and all ye others, bless us now. Here is the food, and here is the offering, call ye all of you each other." Then after summoning the dead by their names he may go on: "Come all of you and partake of this offering. Ye great spirits, all things of this earth were known to you while yet ye were here. Take care of this your family, and of all these your children. May we ever go in our ways in prosperity. Oh! ye great spirits, give to us food and all the produce of the land. Drive ye away all illnesses from your family, ye great spirits; every evil spirit put far away from us, and whatever might seek to hurt us may it fly away on the wind. Cause ye us to abide in peace." Among the Yombe of Northern Rhodesia, to the west of Lake Tanganyika, no one is allowed to partake of the new fruits until certain ceremonies have been performed. Escorted by a band of drummers, his medicine-men, and the village elders, the chief ascends the Kalanga Mountain until he reaches the hollow fastness which in former days his forefathers held against the marauding Angoni. Here the grandfather of the present chief lies buried. Before his tomb a bull is slain, and pots of freshly-brewed beer and porridge made from the first-fruits are deposited before the shrine. The ground is then carefully cleaned of weeds, and the blood of the bull is sprinkled on the freshly-turned-up soil and on the rafters of the little hut. After offering the customary prayers in thanksgiving for the harvest, and beseeching the spirits to partake with them of the first-fruits, the procession retires. On their return to the village, the carcase of the

bull is divided, all partake of the fresh porridge and beer awaiting them, and the day closes with beer-drinking and dancing.

The A-Kamba of British East Africa offer first-fruits to the spirits of their dead before anybody may eat of the new crop. Sometimes these offerings are piled on the graves of chiefs and left there along with the meat of a goat which has been sacrificed. Sometimes the offerings are made in a cleared place under the sacred wild fig tree (*mumbo*) of the village; for the A-Kamba think that the spirits of the dead (*aiimu*) dwell in wild fig trees, and they build miniature huts at the foot of the trees for the accommodation of the ghosts. The clearing under the wild fig tree of the village is called the Place of Prayer (*ithembo*). When any crop is ripe, all the inhabitants of the district assemble, and a very old man and woman, chosen for the purpose, leave the crowd and go to the Place of Prayer, where they call aloud to the spirits of the dead and ask leave to eat the crop. The people then dance, and during the dance one of the women is sure to be seized with a fit of shaking and to cry aloud, which is deemed the answer of the spirits to the people's prayer. Amongst the Baganda a man used to offer the first-fruits of a new garden to his god, imploring the blessing of the deity on the future crops. Among the Dinka of the White Nile no member of a family may eat the new fruits until the father or mother has scattered some of them over the courtyard of the house in order to ensure the blessing of God. When the millet is ripe, the Nubas of Jebel-Nuba, a range of mountains in the eastern Sudan, observe the following ceremony. Every group of villages is presided over by a sacred pontiff called a *cogiour* or *codjour*, who is believed to act under the inspiration of a spirit named Laro. So when it is known that the grain is ready to be cut, a drum is beaten, the pontiff mounts his horse and, attended by all the elderly men and women, repairs to his fields, while the rest of the people betake themselves to their own farms. There the people whose eldest child is a boy break five ears of corn, and those whose eldest child is a girl break four. But young unmarried people break five or four ears according as they desire to have a boy or a girl for their first-born. All then return to the village and place the ears they have gathered on the hedge which serves as an enclosure. When the beat of the drum and multitudinous cries of joy announce the return of the pontiff, the people take the gathered ears and advance to meet him. He rides at the head of a cavalcade composed of all the men who have horses. After that, attended by the elders, he retires to his house, while the rest of the people deposit the ears of corn in the cave of Laro, the being who inspires the holy pontiff. Feasting, drinking, and horse-races conclude the ceremony. At the races the young folk amuse themselves by flinging stalks of millet before the horses to make them shy and throw their riders.

The Igbiras, a pagan tribe at the confluence of the Niger and the Benue, bury their dead in their houses and have great faith in the power of the ghosts, whose guidance and protection they seek to ensure by periodical offerings of goats and cocks. Also they offer the first-fruits of their crops to the dead, hanging bunches of the new grain over the burial-places in their huts. The Igbiras also celebrate the festival of the new yams with great pomp. It is their New Year's Day. Sacrifices of fowls and goats are offered, and wine and oil are freely poured out. The king takes a prominent part in the feast. Among the Cross River natives, in the lower valley of the Niger, the eating of the new yams is an occasion of great rejoicing, but no one may partake of them until a portion has been ceremonially offered to the deities. The festival is not held simultaneously but separately for each village according to the state of the crops. High and low, old and young, men, women, and children dance to music on these joyful occasions. The Matse tribe of Ewe negroes in Togoland worship the Earth at the times when they dig the ripe yams in September, when they reap the ripe maize in November, and when they burn the grass in February. The place where they offer sacrifices to the Earth goddess is called "the Wood of our Mother." In the month of November the hunters, led by the Chief

Huntsman and the High Priest, repair to the maize-fields, where they gather cobs of the ripe grain. Some of these they deposit, with prayers, in the sacrificial place in the wood, but they keep the finest cobs for themselves. After this sacrifice of the new corn to the Earth goddess everybody is free to get in his maize. Amongst the Hos, another Ewe tribe of Togoland, when a man is about to dig up his yam crop, he first of all digs up two yams which he had planted for the goddess Mawu Sodza. These he holds up to her and prays, saying, "O Mawu Sodza, thou ship full of yams, give to me, and I will give to you; pass me over, and I will pass you over. Here are thy yams, which I have dug for thee. When I dig mine, grant that I may have plenty." Thereupon he begins to dig the crop. Among the Bassari, another tribe of Togoland, no man may eat of the new yams until the people have paid a tribute of the first-fruits to the king. At such times long files of men, women, and children may be seen wending their way to the capital to render to the king his dues. But the king himself may not partake of the new yams until he has offered a portion of them, along with ten white fowls, to the fetish. Before the Adeli of the Slave Coast may eat of the new yams, the owner of each farm must bring the first yams of his field to the fetish priest, who offers them to the fetish, after which he declares that the harvest may take place. The festival, accompanied by shooting and dancing, lasts several days; it generally falls in August.

Among the Betsileo of Madagascar the king used to receive first-fruits of all the crops, such as rice, maize, manioc, beans, and sweet potatoes: indeed this tribute of first-fruits formed a large part of his revenue. The Hovas of Madagascar present the first sheaves of the new grain to the sovereign. The sheaves are carried in procession to the palace from time to time as the grain ripens. So in Burma, when the *pangati* fruits ripen, some of them used to be taken to the king's palace that he might eat of them; no one might partake of them before the king. It has been suggested that the modern system of taxation may be directly derived from the ancient obligation of paying first-fruits to a sacred pontiff or king.

Every year, when they gather their first crops, the Kochs of Assam offer some of the first-fruits to their ancestors, calling to them by name and clapping their hands. Before they harvest any of their crops, the Garos, another people of Assam, deem it necessary to sacrifice the first-fruits of the crops to the gods. Thus, for example, they gather some ears of rice or millet, pound them between two stones, and offer them up on a piece of plantain stem. In August, when the rice ripens, the Hos of Bengal offer the first-fruits of the harvest to Sing Bonga, who dwells in the sun. Along with the new rice a white cock is sacrificed; and till the sacrifice has been offered no one may eat the new rice. Among the Oraons of Bengal no one will partake of the new rice until some of it has been offered to the ancestors. A handful of it is cooked and spread on the ground, and a pot of rice-beer is brewed and some of the beer also spilt on the ground. Before drinking every one dips his finger in his cup and lets fall some drops in honour of the ancestors. Further, a whity grey fowl is killed, and the eldest of the family, addressing the ancestral spirits, says, "O old mothers and fathers, you have always been so good to us on these days. Here we are rejoicing: we cannot forget you: come and rejoice with us." In Ladakh the peasants offer the first two or three handfuls of the wheat-crop to the spirit who presides over agriculture. These offerings they attach to the tops of the pillars which support the roofs of their houses; and thus the bands of straw and ears of wheat form a primitive sort of capital. Rams' horns are sometimes added to this decoration. In the Himalayan districts of the North-Western provinces of India the fields and boundaries are under the protection of a beneficent local deity named Kshetral or Bhumiya. Every village possesses a small temple sacred to him. When a crop is sown, a handful of grain is sprinkled over a stone in the corner of the field nearest to the temple, in order that the god may protect the growing crop from hail, blight, and the ravages of wild beasts; and at harvest he receives the first-fruits in order that he may save the garnered grain from the inroads of rats and

insects. Among the hill tribes near Rajamahall, in India, when the *kosarane* grain is being reaped in November or early in December, a festival is held as a thanksgiving before the new grain is eaten. On a day appointed by the chief a goat is sacrificed by two men to a god called Chitariah Gossaih, after which the chief himself sacrifices a fowl. Then the vassals repair to their fields, offer thanksgiving, make an oblation to Kull Gossaih (who is described as the Ceres of these mountaineers), and then return to their houses to eat of the new *kosarane*. As soon as the inhabitants have assembled at the chief's house—the men sitting on one side and the women on the other—a hog, a measure of *kosarane*, and a pot of spirits are presented to the chief, who in return blesses his vassals, and exhorts them to industry and good behaviour; “after which, making a libation in the names of all their gods, and of their dead, he drinks, and also throws a little of the *kosarane* away, repeating the same pious exclamations.” Drinking and festivity then begin, and are kept up for several days. The same tribes have another festival at reaping the Indian corn in August or September. Every man repairs to his fields with a hog, a goat, or a fowl, which he sacrifices to Kull Gossaih. Then, having feasted, he returns home, where another repast is prepared. On this day it is customary for every family in the village to distribute to every house a little of what they have prepared for their feast. Should any person eat of the new *kosarane* or the new Indian corn before the festival and public thanksgiving at the reaping of these crops, the chief fines him a white cock, which is sacrificed to Chitariah. In the Central Provinces of India the first grain of the season is commonly offered to the god Bhimsen or Bhím Deo. When the new rice crop is ripe, the Gadbas, a primitive tribe of the Central Provinces, cook the first-fruits and serve them to the cattle in new bamboo baskets; after that the men themselves partake of the new rice. The Nahals, a forest tribe of the same region, worship the forest god Jharkhandi in the month of Chait, and until this rite has been performed they may not use the leaves or fruits of the *Butea frondosa*, *Phyllanthus emblica*, and mango trees. When the god is worshipped, they collect branches and leaves of these trees and offer cooked food to them: after that they begin to use the new leaves, fruit, and timber. Again, when the Mannewars, another forest tribe of the Central Provinces, pick the flowers of the *mahua* tree (*Bassia latifolia*), they worship the tree and offer it some of the liquor distilled from the new flowers, along with a fowl and a goat. The principal festivals of the Parjas, a small tribe of the Central Provinces, are the feast of new vegetation in July, the feast of the new rice in August or September, and the feast of the new mango crop in April or May. At these feasts the new season's crop is eaten, and offerings of them are presented to the ancestors of the family, who are worshipped on these occasions. In the Punjaub, when sugar-cane is planted, a woman puts on a necklace and walks round the field, winding thread on a spindle; and when the sugar-cane is cut the first-fruits are offered on an altar, which is built close to the press and is sacred to the sugar-cane god. Afterwards the first-fruits are given to Brahmans. Also, when the women begin to pick the cotton, they go round the field eating rice-milk, the first mouthful of which they spit upon the field toward the west; and the first cotton picked is exchanged at the village shop for its weight in salt, which is prayed over and kept in the house till the picking is finished.

Among the ancient Hindoos the first-fruits were sacrificed to the gods at the beginning of harvest, generally at the new or the full moon. There were two harvests in the year; the barley was reaped in spring and the rice in autumn. From the new grain, whether barley or rice, a sacrificial cake was prepared and set forth on twelve potsherds for the two great gods Indra and Agni; a pap or gruel of boiled grain, sodden either in water or milk, was offered to the Visve Devah, that is, to the common mob of deities; and a cake on one potsherd was presented to Heaven and Earth. The origin of these sacrifices of first-fruits was explained by the following myth. They say that the gods and their powerful rivals the Asuras once strove with each other for the mastery. In this strife the Asuras defiled, both by magic and by poison, the plants on which men and beasts subsist; for thus they hoped to get the better of

the gods. Therefore neither man nor beast could eat food, and for lack of it they well nigh perished. When the gods heard of it, they said one to the other, "Come let us rid the plants of the defilement," and they did so by means of the sacrifice. But they could not agree as to which of them should receive the sacrifices, so to decide this delicate question they ran a race, and Indra and Agni came in first; that is why the cake is offered to them on twelve potsherds, while the common mob of the gods have to put up with a simple pap or gruel. To this day, therefore, he who offers the first-fruits to the gods does it either because no one will then be able to defile the plants, neither by magic nor yet by poison; or perhaps he does it because the gods did so before him. Be that as it may, certain it is that he thereby renders both kinds of plants wholesome and innocuous, both the plants which men eat and the plants on which cattle graze; that indeed is the reason why the sacrificer sacrifices the first-fruits. And the priest's fee for the sacrifice is the first-born calf of the season, which is, as it were, the first-fruit of the cattle.

The Kachins of Upper Burma worship the spirit (*nat*) of the earth every year before they sow their crops. The worship is performed by the chief on behalf of all the villagers, who contribute their offerings. The priest afterwards determines by exorcism which particular household shall start sowing first in order that the crop may be a good one. Then the household on which the lot has fallen goes out and sows its fields. When the crop is ripe, it may not be reaped until the household which was the first to sow its fields has gathered the first-fruits and offered them to its own domestic spirits (*nats*). This is usually done before the crop is quite ripe, in order that the reaping of the other crops may not be delayed. The Chins, another people of Upper Burma, eat the first-fruits of their corn as a religious rite, but before doing so they offer some of the new corn or vegetables to their dead ancestors. They also offer the first-fruits to the goddess Pok Klai, a single glance of whose eyes is enough to give them a plentiful harvest of rice. Among the Thay of Indo-China the first-fruits of the rice are offered at harvest to the guardian spirit of the family before the household may partake of the new crop. The guardian spirit of the family is the last ancestor who died; he mounts guard until he is relieved by his successor; his shrine is a corner of the house screened off by a low trellis of bamboo. But besides the first-fruits offered him at harvest this guardian spirit receives some of the parched grain in spring, at the time when the first thunder of the season is heard to mutter. The grain which is presented to him on this occasion was plucked from the crop before the rice was quite ripe, and it has been carefully kept to be offered to him when the first peal of thunder in spring announces the reviving energies of nature. When all is ready, the rice is served up together with fish, which have been caught for the purpose, on a table set in the corner which is sacred to the guardian spirit. A priest drones out a long invitation to the spirit to come and feast with his children; then the family sits down to table and consumes the offerings. At the close of the banquet the daughter-in-law of the deceased ancestor hangs up a basket containing rice and fish for his use in the corner, after which she closes the shrine for another year. In Corea the first-fruits of all the crops used to be offered to the king with religious pomp, and he received almost divine honours from his subjects. This suggests that, as I have already conjectured, the common practice, of presenting the first-fruits to kings is founded on a belief in their divinity.

In the island of Tjumba, East Indies, a festival is held after harvest. Vessels filled with rice are presented as a thankoffering to the gods. Then the sacred stone at the foot of a palm-tree is sprinkled with the blood of a sacrificed animal; and rice, with some of the flesh, is laid on the stone for the gods. The palm-tree is hung with lances and shields. The Dyaks of Borneo hold a feast of first-fruits when the paddy or unhusked rice is ripe. The priestesses, accompanied by a gong and drum, go in procession to the farms and gather several bunches of the ripe paddy. These are brought back to the village, washed in coco-nut water, and laid

round a bamboo altar, which at the harvest festivals is erected in the common room of the largest house. The altar is gaily decorated with white and red streamers, and is hung with the sweet-smelling blossom of the areca palm. The feast lasts two days, during which the village is tabooed; no one may leave it. Only fowls are killed, and dancing and gong-beating go on day and night. When the festival is over the people are free to get in their crops. The pounding of the new paddy is the occasion of a harvest festival which is celebrated all over Celebes. The religious ceremonies which accompany the feast were witnessed by Dr. B. F. Matthes in July 1857. Two mats were spread on the ground, each with a pillow on it. On one of the pillows were placed a man's clothes and a sword, on the other a woman's clothes. These were seemingly intended to represent the deceased ancestors. Rice and water were deposited before the two dummy figures, which were also sprinkled with the new paddy. Moreover, dishes of rice were set down for the rest of the family and the slaves of the deceased. This was the end of the ceremony. In Minahassa, a district of Celebes, the people have a festival of "eating the new rice." Fowls or pigs are killed; some of the flesh, with rice and palm-wine, is set apart for the gods, and then the eating and drinking begin. The people of Kobi and Sariputi, two villages on the north-east coast of Ceram, offer the first-fruits of the paddy, in the form of cooked rice, with tobacco and other things, to their ancestors as a token of gratitude. The ceremony is called "feeding the dead." In the Tenimber and Timor-laut Islands, East Indies, the first-fruits of the paddy, along with live fowls and pigs, are offered to the *matmate*. The *matmate* are the spirits of their ancestors, which are worshipped as guardian-spirits or household gods. They are supposed to enter the house through an opening in the roof, and to take up their abode temporarily in their skulls, or in images of wood or ivory, in order to partake of the offerings and to help the family. They also assume the form of birds, pigs, crocodiles, turtles, sharks, and so forth. In Amboyna, after the rice or other harvest has been gathered in, some of the new fruits are offered to the gods, and till this is done, the priests may by no means eat of them. A portion of the new rice, or whatever it may be, is boiled, and milk of the coco-nut is poured on it, mixed with Indian saffron. It is then taken to the place of sacrifice and offered to the god. Some people also pour out oil before the deity; and if any of the oil is left over, they take it home as a holy and priceless treasure, wherewith they smear the forehead and breast of sick people and whole people, in the firm conviction that the oil confers all kinds of blessings. In the Kei Islands, to the south-west of New Guinea, the first-fruits are offered to Lir majoran, the god of husbandry, when the harvest is ripe. After the rice has been reaped, the people of Nias deck the images of their ancestors with wreaths, and offer to them the first dishful of boiled rice, while they thank them for the blessings they have bestowed on the family. The Irayas and Catalangans of Luzon, tribes of the Malay stock, but of mixed blood, worship chiefly the souls of their ancestors under the name of *anitos*, to whom they offer the first-fruits of the harvest. The *anitos* are household deities; some of them reside in pots in the corners of the houses; and miniature houses, standing near the family dwelling, are especially sacred to them. When the Bagobos of the Philippines have got in their harvest of rice or maize, they will neither eat of it nor sell so much as a grain till they have made a pretence of feeding all their agricultural implements.

The Bukaua of German New Guinea think that the spirits of their dead have power to make the fruits of the earth to grow. Accordingly when they have cleared a patch in the forest for cultivation and are planting their crops, they take particular care to plant slips near the tree-stumps which have been left standing in the field, because the spirits of their long dead ancestors are supposed to perch on them. While they plant, they call out the names of the dead, praying them to guard the field, so that their children, the living, may have food to eat and not suffer hunger. And similarly, when they plant stones shaped like taro bulbs in the ground, which are supposed to produce a fine crop of taro, they pray to their forefathers to

grant them an abundance of the fruits. When the crops are ripe, the people fetch bundles of taro, clusters of bananas, sugar-canes, and vegetables from the fields and bring them back solemnly to the village; a feast is prepared and a portion of the new fruits, along with tobacco, betel, and dog's flesh, is put in a coco-nut shell and set on a scaffold in the house of the owner of the field, while he prays to the spirits of his forefathers, saying, "Ye who have guarded our field as we asked you to do, there is something for you; now look on us favourably also for the time to come." Afterwards, while the people are feasting, the owner privily stirs the contents of the coco-nut shell with his finger, and then calls the attention of the others to it as a proof that the spirits have partaken of the offering provided for them. Finally the food remaining in the shell is consumed by the banqueters.

In certain tribes of Fiji "the first-fruits of the yam harvest are presented to the ancestors in the Nanga [sacred enclosure] with great ceremony before the bulk of the crop is dug for the people's use, and no man may taste of the new yams until the presentation has been made. The yams thus offered are piled in the Great Nanga, and are allowed to rot there. If any one were impiously bold enough to appropriate them to his own use, he would be smitten with madness. The mission teacher before mentioned told me that, when he visited the Nanga he saw among the weeds with which it was overgrown, numerous yam vines which had sprung up out of the piles of decayed offerings. Great feasts are made at the presentations of the first-fruits, which are times of public rejoicing, and the Nanga itself is frequently spoken of as the *Mbaki*, or Harvest." In other parts of Fiji the practice with regard to the first-fruits seems to have been different, for we are told by another observer that "the first-fruits of the yams, which are always presented at the principal temple of the district, become the property of the priests, and form their revenue, although the pretence of their being required for the use of the god is generally kept up." In Tana, one of the New Hebrides, the general name for gods appeared to be *aremha*, which meant "a dead man." The spirits of departed ancestors were among the gods of the people. Chiefs who reached an advanced age were deified after their death, addressed by name, and prayed to on various occasions. They were supposed to preside especially over the growth of the yams and fruit-trees. The first-fruits were presented to them. A little of the new fruit was laid on a stone, or on a shelving branch of the tree, or on a rude temporary altar, made of a few sticks lashed together with strips of bark, in the form of a table, with its four feet stuck in the ground. All being quiet, the chief acted as high priest, and prayed aloud as follows: "Compassionate father! here is some food for you; eat it; be kind to us on account of it." Then all the people shouted. This took place about noon, and afterwards the assembled people feasted and danced till midnight or morning.

In Florida, one of the Solomon Islands, the canarium nut is much used in the native cookery, but formerly none might be eaten till the sacrifice of the first-fruits had been offered to the ghosts of the dead. This was done on behalf of a whole village by a man who inherited a knowledge of the way in which the sacrifice should be offered, and who accordingly had authority to open the season. When he saw that the time had come, he raised a shout early in the morning, then climbed a tree, cracked the nuts, ate some himself, and put some on the stones in his sacred place for the particular ghost whom he worshipped. Then all the people might gather the nuts for themselves. The chief offered food, in which the new nuts were mixed, on the stones of the village sanctuary; and every man who revered a ghost of his own did the same in his private sanctuary. This sacrifice of first-fruits was witnessed by Mr. Woodford at the village of Aola, in the neighbouring island of Guadalcanar. The canarium nuts, or Solomon Island almonds, had been ripe for a week, and Mr. Woodford had expressed a wish to taste them, but he was told that this was quite impossible till the offering to the ghost had been made. As a native put it, "Devil he eat first; all man he eat behind." All the inhabitants of the village adjourned to the sea-shore in groups of ten or twelve to perform the

sacrifice. The party to which Mr. Woodford attached himself swept a space clean beneath the spreading branches of a *Barringtonia*, and there constructed half-a-dozen tiny altars, each about six inches square, out of dry sticks. On these altars they laid offerings of yams, taros, bananas, and a little flesh; and a few of the nuts were skinned and set up on sticks round about the altars. Fire was then made by the friction of wood, for matches might not be used for this purpose, though probably every man had a box of them in his bag. With the sacred flame thus produced the altars were kindled and the offerings consumed. When this was done, the women produced large flat cakes baked of a paste of pounded nuts, and these were eaten by all. In Saa, another of the Solomon Islands, when the yams are ripe, the people fetch some from each garden to offer to the ghosts. Early in the morning all the male members of a family assemble at the sanctuary of the particular ancestral ghosts whom they revere. One of them goes with a yam into the holy place and cries with a loud voice to the ghosts, "This is yours to eat," and with that he sets the yam beside the skull which is in the sanctuary. The others call quietly upon all the ancestors and present their yams, which are many in number, because one from each garden is given to each of the ghosts. Moreover, if any man has a relic of the dead at home, such as a head, or bones, or hair, he takes back a yam to his house and places it beside the head or whatever it may be. In the same island, as in Florida, the new canarium nuts may not be eaten until the first-fruits have been offered to the ghosts. Moreover, the first flying-fish of the season must be sacrificed to these spirits of the dead before the living are allowed to partake of the fish. The ghosts to whom the flying-fish are offered have the form of sharks. Some of them have sanctuaries ashore, where images of sharks are set up; and the flying-fish are laid before these images. Other shark-ghosts have no place on shore; so the fish offered to them are taken out to sea and shredded into the water, while the names of the ghosts are called out.

In some of the Kingsmill Islands the god most commonly worshipped was called Tubuériki. He was represented by a flat coral stone, of irregular shape, about three feet long by eighteen inches wide, set up on end in the open air. Leaves of the coco-nut palm were tied about it, considerably increasing its size and height. The leaves were changed every month, that they might be always fresh. The worship paid to the god consisted in repeating prayers before the stone, and laying beside it a portion of the food prepared by the people for their own use. This they did at their daily meals, at festivals, and whenever they specially wished to propitiate the deity. The first-fruits of the season were always offered to him. Every family of distinction had one of these stones which was considered rather in the light of a family altar than as an idol.

In the Tonga Islands the first-fruits of the year were offered with solemn ceremony to the sacred chief Tooitonga, who was regarded as divine. The ceremony generally took place about October, and the people believed that if the rite were neglected the vengeance of the gods would fall in a signal manner upon them. The following is a description of the festival as it was celebrated in the days when a European flag rarely floated among the islands of the Pacific: "*Inachi*. This word means, literally, a share or portion of anything that is to be or has been distributed out: but in the sense here mentioned it means that portion of the fruits of the earth, and other eatables, which is offered to the gods in the person of the divine chief Tooitonga, which allotment is made once a year, just before the yams in general are arrived at a state of maturity; those which are used in this ceremony being of a kind which admit of being planted sooner than others, and, consequently, they are the first fruits of the yam season. The object of this offering is to insure the protection of the gods, that their favour may be extended to the welfare of the nation generally, and in particular to the productions of the earth, of which yams are the most important.

“The time for planting most kinds of yams is about the latter end of July, but the species called *caho-caho*, which is always used in this ceremony, is put in the ground about a month before, when, on each plantation, there is a small piece of land chosen and fenced in, for the purpose of growing a couple of yams of the above description. As soon as they have arrived at a state of maturity, the *How* [the King] sends a messenger to Tootonga, stating that the yams for the *inachi* are fit to be taken up, and requesting that he would appoint a day for the ceremony: he generally fixes on the tenth day afterwards, reckoning the following day for the first. There are no particular preparations made till the day before the ceremony: at night, however, the sound of the conch is heard occasionally in different parts of the islands, and as the day of the ceremony approaches it becomes more frequent, so that the people of almost every plantation sound the conch three or four times, which, breaking in upon the silence of the night, has a pleasing effect, particularly at Vavaoo, where the number of woods and hills send back repeated echoes, adding greatly to the effect. The day before the ceremony, the yams are dug up, and ornamented with a kind of ribbons prepared from the inner membrane of the leaf of a species of pandanus, and dyed red; when thus prepared, it is called *mellecoola* and is wrapped round the yam, beginning at one end, and running round spirally to the other, when it is brought back in the opposite direction, the turns crossing each other in a very neat manner. As the ceremony is always performed at the island where Tootonga chooses to reside, the distant islands must make these preparations two or three days beforehand, that the yams, etc., may be sent in time to Vavaoo, where we will suppose the affair is to take place. The ninth day then is employed in preparing and collecting the yams and other provisions, such as fish, cava root, and *mahoa*, and getting ready mats, *gnatoo*, and bundles of *mellecoola*: but the yams only are to be carried in the procession about to be described....

“The sun has scarcely set when the sound of the conch begins again to echo through the island, increasing as the night advances. At the Mooa [capital], and all the plantations, the voices of men and women are heard singing *Nófo óooa tegger gnaoóe, óooa gnaoóe*, ‘Rest thou, doing no work; thou shalt not work.’ This increases till midnight, men generally singing the first part of the sentence, and the women the last, to produce a more pleasing effect: it then subsides for three or four hours, and again increases as the sun rises. Nobody, however, is seen stirring out in the public roads till about eight o'clock, when the people from all quarters of the island are seen advancing towards the Mooa, and canoes from all the other islands are landing their men; so that all the inhabitants of Tonga seem approaching by sea and land, singing and sounding the conch. At the Mooa itself the universal bustle of preparation is seen and heard; and the different processions entering from various quarters, of men and women, all dressed up in new *gnatoo*s, ornamented with red ribbons and wreaths of flowers, and the men armed with spears and clubs, betoken the importance of the ceremony about to be performed. Each party brings in its yams in a basket, which is carried in the arms with great care, by the principal vassal of the chief to whom the plantation may belong. The baskets are deposited in the *malái* (in the *Mooa*), and some of them begin to employ themselves in slinging the yams, each upon the centre of a pole about eight or nine feet long, and four inches diameter. The proceedings are regulated by attending matabooles. The yams being all slung, each pole is carried by two men upon their shoulders, one walking before the other, and the yam hanging between them, ornamented with red ribbons. The procession begins to move towards the grave of the last Tootonga (which is generally in the neighbourhood, or the grave of one of his family will do), the men advancing in a single line, every two bearing a yam, with a slow and measured pace, sinking at every step, as if their burden were of immense weight. In the meantime the chiefs and matabooles are seated in a semicircle before the grave, with their heads bowed down, and their hands clasped before them.” The procession then marched round the grave twice or thrice in a great circle, the

conchs blowing and the men singing. Next the yams, still suspended from the poles, were deposited before the grave, and their bearers sat down beside them. One of the *matabooles* of Tooitonga, seating himself before the grave, a little in advance of the men, now addressed the gods generally, and afterwards particularly, mentioning the late Tooitonga, and the names of several others. He thanked them for their divine bounty in favouring the land with the prospect of so good a harvest, and prayed that their beneficence might be continued in future. When he had finished, the men rose and resumed their loads, and after parading two or three times before the grave, marched back to the *malái* the same way they came, singing and blowing the conchs as before. The chiefs and *matabooles* soon followed to the same place, where the yams had been again deposited and loosened from the poles, though they still retained their ornaments. Here the company sat down in a great circle, presided over by Tooitonga, while the king and other great chiefs retired into the background among the mass of the people. Then the other articles that formed part of the *inachi* were brought forward, consisting of dried fish, mats, etc., which, with the yams, were divided into shares by one of the *matabooles* of Tooitonga. About a fourth was allotted to the gods, and appropriated by the priests; about a half fell to the king; and the remainder belonged to Tooitonga. The materials of the *inachi* having been carried away, the company set themselves to drink *cava*. Some *cava* root was brought and prepared; a large quantity of provisions, perhaps a hundred and fifty baskets-full, was set forth, and a small part of it was distributed to be eaten with the *cava*. While the infusion was preparing, a *mataboole* made a speech to the people, saying that, as they had performed this important ceremony, the gods would protect them and grant them long lives, if only they continued to observe the religious rites and to pay due respect to the chiefs. When the *cava* was all drunk, the circle separated, and the provisions were shared out to each chief according to his rank. The day concluded with wrestling, boxing, and so forth, and then the night dances began. When these were ended, the people went home perfectly assured of the protection of the gods. At this ceremony, we are informed, the quantity of provisions distributed was incredible, and the people looked upon it as a very heavy tribute.

In this Tongan festival the solemn presentation of the first-fruits to the divine chief at the grave of his predecessor is highly significant: it confirms the conclusion which we have already reached, that wherever the first-fruits are paid to the chief, it is rather in his religious than in his civil capacity that he receives them. It is true that the king of Tonga received a large share of the first-fruits, indeed a larger share than was allotted to the divine chief; but it is very noticeable that while the division of the first-fruits was taking place under the presidency of the divine chief, the king and the other great chiefs retired from the scene and mingled with the mass of the people, as if to indicate that as mere laymen they had no right to participate in a religious rite of such deep solemnity.

The Samoans used to present the first-fruits to the spirits (*aitus*) and chiefs. For example, a family whose god was in the form of an eel presented the first-fruits of their taro plantations to the eel. In Tahiti “the first fish taken periodically on their shores, together with a number of kinds regarded as sacred, were conveyed to the altar. The first-fruits of their orchards and gardens were also *taumaha*, or offered, with a portion of their live stock, which consisted of pigs, dogs, and fowls, as it was supposed death would be inflicted on the owner or the occupant of the land, from which the god should not receive such acknowledgment.” In Huahine, one of the Society Islands, the first-fruits were presented to the god Tani. A poor person was expected to bring two of the earliest fruits gathered, of whatever kind; a *raatira* had to bring ten, and chiefs and princes had to bring more, according to their rank and riches. They carried the fruits to the temple, where they threw them down on the ground, with the words, “Here, Tani, I have brought you something to eat.” The chief gods of the

Easter Islanders were Make-Make and Haua. To these they offered the first of all the produce of the ground. Amongst the Maoris the offering of the first-fruits of the sweet potatoes to Pani, son of Rongo, the god of sweet potatoes, was a solemn religious ceremony. The crop of sweet potatoes (*kumara*) was sacred, and all persons engaged in its cultivation were also sacred or tabooed; they might not quit the place nor undertake any other work.

It has been affirmed that the old Prussians offered the first-fruits of their crops and of their fishing to the god Curcho, but doubt rests on the statement. We have seen that the Athenians and other Greek peoples offered the first-fruits of the wheat and barley harvests to Demeter and Persephone at Eleusis. The Troezenians sacrificed the first-fruits to Poseidon, whom they worshipped as the guardian deity of their city. In Attica the first-fruits of the vintage were presented to Icarius and Erigone. The Romans sacrificed the first ears of corn to Ceres, and the first of the new wine to Liber; and until the priests had offered these sacrifices, the people might not eat the new corn nor drink the new wine. In various parts of ancient Italy the vintage was solemnly inaugurated by the priests. At Rome the duty devolved on the Flamen Dialis, who sacrificed a lamb to Jupiter and then gathered the first grapes over the entrails of the victim. Till this ceremony had been performed, the new wine might not be brought into the city.

The Thompson River Indians of British Columbia used to offer the first berries of the season to the earth, or more generally to the mountains. The offering was made by an old grey-haired person, who danced and held out the fruit towards the mountain-tops. The rest of the people painted their faces red and danced for some time. The Okanaken Indians of British Columbia "observed first-fruits ceremonies. When the first berries or roots were ripe, the chief would send out his wife or eldest daughter to gather a portion. The whole community would then come together, and prayers would be offered to those spirits of the sky who were supposed to preside over the operations of nature, portions of the fruit or roots would be distributed to all present, after which any one was free to gather all he or she desired; but no one would think of picking a berry or digging a root until after the feast had been held." When the ears of maize were formed, the Quiches of Central America gathered the first-fruits and carried them to the priests; moreover, they baked loaves or cakes, which they offered to the idol who guarded their fields, but afterwards these cakes were given to the poor or the infirm to eat. It was the custom of the Arkansas Indians to offer the first-fruits of the ripe maize and melons to the Master of Life; even children would die of hunger rather than touch the new fruits before this offering had been made. Some of the new maize, melons, and other fruits were minced up with the carcase of a dog in the presence of the old men, who alone were privileged to assist at this solemn rite. Then, after performing certain ceremonies, the old men began to dance, and some young girls, wound up to a pitch of frenzy, threw themselves on the offering and bolted it in an instant. Thereupon the old men seized the damsels and ducked them in the river Arkansas, which had a sobering influence on the minds of the devotees. From this account we may perhaps infer that in eating the new fruits the girls were believed to be inspired by the Master of Life, who thus consumed the offering by deputy. The chief solemnity of the Natchez, an Indian tribe on the Lower Mississippi, was the Harvest Festival or the Festival of New Fire. An early account of this ceremony has been already submitted to the reader, but it may not be amiss to add here for comparison the later description by Chateaubriand, which differs from the other in some particulars, and lays stress on the sacrifice rather than on the sacrament of first-fruits. According to Chateaubriand, then, when the time for the festival drew near, a crier went through the villages calling upon the people to prepare new vessels and new garments, to wash their houses, and to burn the old grain, the old garments, and the old utensils in a common fire. He also proclaimed an amnesty to criminals. Next day he appeared again, commanding the

people to fast for three days, to abstain from all pleasures, and to make use of the medicine of purification. Thereupon all the people took some drops extracted from a root which they called the "root of blood." It was a kind of plantain and distilled a red liquor which acted as a violent emetic. During their three days' fast the people kept silence. At the end of it the crier proclaimed that the festival would begin on the following day. So next morning, as soon as it began to grow light in the sky, the people streamed from all quarters towards the temple of the Sun. The temple was a large building with two doors, one opening to the east, the other to the west. On this morning the eastern door of the temple stood open. Facing the eastern door was an altar, placed so as to catch the first beams of the rising sun. An image of a *chouchouacha* (a small marsupial) stood upon the altar; on its right was an image of a rattlesnake, on its left an image of a marmoset. Before these images a fire of oak-bark burned perpetually. Once a year only, on the eve of the Harvest Festival, was the sacred flame suffered to die out. To the right of the altar, on the morning of this holy day, stood the great chief, who took his title and traced his descent from the Sun. To the left of the altar stood his wife. Round them were grouped, according to their ranks, the war chiefs, the sachems, the heralds, and the young braves. In front of the altar were piled bundles of dry reeds, stacked in concentric rings.

The high priest, standing on the threshold of the temple, kept his eyes fixed on the eastern horizon. Before presiding at the festival he had to plunge thrice into the Mississippi. In his hands he held two pieces of dry wood which he kept rubbing slowly against each other, muttering magic words. At his side two acolytes held two cups filled with a kind of black sherbet. All the women, their backs turned to the east, each leaning with one hand on her rude mattock and supporting her infant with the other, stood in a great semicircle at the gate of the temple. Profound silence reigned throughout the multitude while the priest watched attentively the growing light in the east. As soon as the diffused light of dawn began to be shot with beams of fire, he quickened the motion of the two pieces of wood which he held in his hands; and at the moment when the upper edge of the sun's disc appeared above the horizon, fire flashed from the wood and was caught in tinder. At the same instant the women outside the temple faced round and held up their infants and their mattocks to the rising sun.

The great chief and his wife now drank the black liquor. The priests kindled the circle of dried reeds; fire was set to the heap of oak-bark on the altar, and from this sacred flame all the hearths of the village were rekindled. No sooner were the circles of reeds consumed than the chief's wife came from the temple and placing herself at the head of the women marched in procession to the harvest-fields, whither the men were not allowed to follow them. They went to gather the first sheaves of maize, and returned to the temple bearing them on their heads. Some of the sheaves they presented to the high priest, who laid them on the altar. Others they used to bake the unleavened bread which was to be eaten in the evening. The eastern door of the sanctuary was now closed, and the western door was opened.

When day began to decline, the multitude assembled once more at the temple, this time at its western gate, where they formed a great crescent, with the horns turned towards the west. The unleavened bread was held up and presented to the setting sun, and a priest struck up a hymn in praise of his descending light. When darkness had fallen the whole plain twinkled with fires, round which the people feasted; and the sounds of music and revelry broke the silence of night.

XII. Homoeopathic Magic of a Flesh Diet

The practice of killing a god has now been traced amongst peoples who have reached the agricultural stage of society. We have seen that the spirit of the corn, or of other cultivated plants, is commonly represented either in human or in animal form, and that in some places a custom has prevailed of killing annually either the human or the animal representative of the god. One reason for thus killing the corn-spirit in the person of his representative has been given implicitly in an earlier part of this work: we may suppose that the intention was to guard him or her (for the corn-spirit is often feminine) from the enfeeblement of old age by transferring the spirit, while still hale and hearty, to the person of a youthful and vigorous successor. Apart from the desirability of renewing his divine energies, the death of the corn-spirit may have been deemed inevitable under the sickles or the knives of the reapers, and his worshippers may accordingly have felt bound to acquiesce in the sad necessity. But, further, we have found a widespread custom of eating the god sacramentally, either in the shape of the man or animal who represents the god, or in the shape of bread made in human or animal form. The reasons for thus partaking of the body of the god are, from the primitive standpoint, simple enough. The savage commonly believes that by eating the flesh of an animal or man he acquires not only the physical, but even the moral and intellectual qualities which were characteristic of that animal or man; so when the creature is deemed divine, our simple savage naturally expects to absorb a portion of its divinity along with its material substance. It may be well to illustrate by instances this common faith in the acquisition of virtues or vices of many kinds through the medium of animal food, even when there is no pretence that the viands consist of the body or blood of a god. The doctrine forms part of the widely ramified system of sympathetic or homoeopathic magic.

Thus, for example, the Creeks, Cherokee, and kindred tribes of North American Indians "believe that nature is possest of such a property, as to transfuse into men and animals the qualities, either of the food they use, or of those objects that are presented to their senses; he who feeds on venison is, according to their physical system, swifter and more sagacious than the man who lives on the flesh of the clumsy bear, or helpless dunghill fowls, the slow-footed tame cattle, or the heavy wallowing swine. This is the reason that several of their old men recommend, and say, that formerly their greatest chieftains observed a constant rule in their diet, and seldom ate of any animal of a gross quality, or heavy motion of body, fancying it conveyed a dullness through the whole system, and disabled them from exerting themselves with proper vigour in their martial, civil, and religious duties." The Zaparo Indians of Ecuador "will, unless from necessity, in most cases not eat any heavy meats, such as tapir and peccary, but confine themselves to birds, monkeys, deer, fish, etc., principally because they argue that the heavier meats make them unwieldy, like the animals who supply the flesh, impeding their agility, and unfitting them for the chase." Similarly some of the Brazilian Indians would eat no beast, bird, or fish that ran, flew, or swam slowly, lest by partaking of its flesh they should lose their agility and be unable to escape from their enemies. The Caribs abstained from the flesh of pigs lest it should cause them to have small eyes like pigs; and they refused to partake of tortoises from a fear that if they did so they would become heavy and stupid like the animal. Among the Fans of West Africa men in the prime of life never eat tortoises for a similar reason; they imagine that if they did so, their vigour and fleetness of foot would be gone. But old men may eat tortoises freely, because having already lost the power of running they can take no harm from the flesh of the slow-footed creature. Some of the Chiriguanos of eastern Bolivia would not touch the flesh of the vicuña, because they imagined that if they ate it they would become woolly like the

vicuña. On the other hand the Abipones of Paraguay ate the flesh of jaguars in order to acquire the courage of the beast; indeed the number of jaguars which they consumed for this object is said to have been very great, and with a like intent they eagerly devoured the flesh of bulls, stags, boars, and ant-bears, being persuaded that by frequently partaking of such food they increased their strength, activity, and courage. On the other hand they all abhorred the thought of eating hens, eggs, sheep, fish, and tortoises, because they believed that these tender viands begot sloth and listlessness in their bodies and cowardice in their minds. The Thompson Indians of British Columbia would not eat the heart of the fool-hen, nor would they allow their dogs to devour the bird, lest they should grow foolish like the bird.

While many savages thus fear to eat the flesh of slow-footed animals lest they should themselves become slow-footed, the Bushmen of South Africa purposely ate the flesh of such creatures, and the reason which they gave for doing so exhibits a curious refinement of savage philosophy. They imagined that the game which they pursued would be influenced sympathetically by the food in the body of the hunter, so that if he had eaten of swift-footed animals, the quarry would be swift-footed also and would escape him; whereas if he had eaten of slow-footed animals, the quarry would also be slow-footed, and he would be able to overtake and kill it. For that reason hunters of gemsbok particularly avoided eating the flesh of the swift and agile springbok; indeed they would not even touch it with their hands, because they believed the springbok to be a very lively creature which did not go to sleep at night, and they thought that if they ate springbok, the gemsbok which they hunted would likewise not be willing to go to sleep, even at night. How, then, could they catch it?

Certain tribes on the Upper Zambesi believe in transmigration, and every man in his lifetime chooses the kind of animal whose body he wishes at death to enter. He then performs an initiatory rite, which consists in swallowing the maggots bred in the putrid carcase of the animal of his choice; thenceforth he partakes of that animal's nature. And on the occasion of a calamity, while the women are giving themselves up to lamentation, you will see one man writhing on the ground like a boa constrictor or a crocodile, another howling and leaping like a panther, a third baying like a jackal, roaring like a lion, or grunting like a hippopotamus, all of them imitating the characters of the various animals to perfection. Clearly these people imagine that the soul or vital essence of the animal is manifested in the maggots bred in its decaying carcase; hence they imagine that by swallowing the maggots they imbue themselves with the very life and spirit of the creature which they desire to become. The Namaquas abstain from eating the flesh of hares, because they think it would make them faint-hearted as a hare. But they eat the flesh of the lion, or drink the blood of the leopard or lion, to get the courage and strength of these beasts. The Bushmen will not give their children a jackal's heart to eat, lest it should make them timid like the jackal; but they give them a leopard's heart to eat to make them brave like the leopard. When a Wagogo man of German East Africa kills a lion, he eats the heart in order to become brave like a lion; but he thinks that to eat the heart of a hen would make him timid. Among the Ja-luo, a tribe of Nilotic negroes, young men eat the flesh of leopards in order to make themselves fierce in war. The flesh of the lion and also that of the spotted leopard are sometimes cooked and eaten by native warriors in South-Eastern Africa, who hope thereby to become as brave as lions. When a Zulu army assembles to go forth to battle, the warriors eat slices of meat which is smeared with a powder made of the dried flesh of various animals, such as the leopard, lion, elephant, snakes, and so on; for thus it is thought that the soldiers will acquire the bravery and other warlike qualities of these animals. Sometimes if a Zulu has killed a wild beast, for instance a leopard, he will give his children the blood to drink, and will roast the heart for them to eat, expecting that they will thus grow up brave and daring men. But others say that this is dangerous, because it is apt to produce courage without prudence, and to make a man rush heedlessly on his death. Among

the Wabondei of Eastern Africa the heart of a lion or leopard is eaten with the intention of making the eater strong and brave. In British Central Africa aspirants after courage consume the flesh and especially the hearts of lions, while lecherous persons eat the testicles of goats. Among the Suk of British East Africa the fat and heart of a lion are sometimes given to children to eat in order that they may become strong; but they are not allowed to know what they are eating. Arab women in North Africa give their male children a piece of a lion's heart to eat to make them fearless. The flesh of an elephant is thought by the Ewe-speaking peoples of West Africa to make the eater strong. Before they go forth to fight, Wajagga warriors drink a magical potion, which often consists of shavings of the horn and hide of a rhinoceros mixed with beer; this is supposed to impart to them the strength and force of the animal. When a serious disease has attacked a Zulu kraal, the medicine-man takes the bone of a very old dog, or the bone of an old cow, bull, or other very old animal, and administers it to the healthy as well as to the sick people, in order that they may live to be as old as the animal of whose bone they have partaken. So to restore the aged Aeson to youth, the witch Medea infused into his veins a decoction of the liver of the long-lived deer and the head of a crow that had outlived nine generations of men. In antiquity the flesh of deer and crows was eaten for other purposes than that of prolonging life. As deer were supposed not to suffer from fever, some women used to taste venison every morning, and it is said that in consequence they lived to a great age without ever being attacked by a fever; only the venison lost all its virtue if the animal had been killed by more blows than one. Again, ancient diviners sought to imbue themselves with the spirit of prophecy by swallowing vital portions of birds and beasts of omen; for example, they thought that by eating the hearts of crows or moles or hawks they took into their bodies, along with the flesh, the prophetic soul of the creature.

Among the Dyaks of North-West Borneo young men and warriors may not eat venison, because it would make them as timid as deer; but the women and very old men are free to eat it. However, among the Kayans of the same region, who share the same view as to the ill effect of eating venison, men will partake of the dangerous viand provided it is cooked in the open air, for then the timid spirit of the animal is supposed to escape at once into the jungle and not to enter into the eater. The Aino of Japan think that the otter is a very forgetful animal, and they often call a person with a bad memory an "otter head." Therefore it is a rule with them that "the otter's head must not lightly be used as an article of food, for unless people are very careful they will, if they eat it, become as forgetful as that creature. And hence it happens that when an otter has been killed the people do not usually eat the head. But if they are seized with a very strong desire for a feast of otter's head, they may partake thereof, providing proper precautions are taken. When eating it the people must take their swords, knives, axes, bows and arrows, tobacco-boxes and pipes, trays, cups, garden tools, and everything they possess, tie them up in bundles with carrying slings, and sit with them attached to their heads while in the act of eating. This feast may be partaken of in this way, and no other. If this method be carefully adhered to, there will be no danger of forgetting where a thing has been placed, otherwise loss of memory will be the result." On the other hand the Aino believe that the heart of the water-ousel is exceedingly wise, and that in speech the bird is most eloquent. Therefore whenever he is killed, he should be at once torn open and his heart wrenched out and swallowed before it has time to grow cold or suffer damage of any kind. If a man swallows it thus, he will become very fluent and wise, and will be able to argue down all his adversaries. In Northern India people fancy that if you eat the eyeballs of an owl you will be able like an owl to see in the dark.

When the Kansas Indians were going to war, a feast used to be held in the chief's hut, and the principal dish was dog's flesh, because, said the Indians, the animal who is so brave that he will let himself be cut in pieces in defence of his master, must needs inspire valour. On

extraordinary occasions the bravest warriors of the Dacotas used to perform a dance at which they devoured the livers of dogs raw and warm in order thereby to acquire the sagacity and bravery of the dog. The animals were thrown to them alive, killed, and cut open; then the livers were extracted, cut into strips, and hung on a pole. Each dancer grabbed at a strip of liver with his teeth and chewed and swallowed it as he danced: he might not touch it with his hands, only the medicine-man enjoyed that privilege. Women did not join in the dance. Men of the Buru and Aru Islands, East Indies, eat the flesh of dogs in order to be bold and nimble in war. Amongst the Papuans of the Port Moresby and Motumotu districts, New Guinea, young lads eat strong pig, wallaby, and large fish, in order to acquire the strength of the animal or fish. Some of the natives of Northern Australia fancy that by eating the flesh of the kangaroo or emu they are enabled to jump or run faster than before. The Miris of Assam prize tiger's flesh as food for men; it gives them strength and courage. But "it is not suited for women; it would make them too strong-minded." In Corea the bones of tigers fetch a higher price than those of leopards as a means of inspiring courage. A Chinaman in Seoul bought and ate a whole tiger to make himself brave and fierce. The special seat of courage, according to the Chinese, is the gall-bladder; so they sometimes procure the gall-bladders of tigers and bears, and eat the bile in the belief that it will give them courage. Again, the Similkameen Indians of British Columbia imagine that to eat the heart of a bear inspires courage.

In Norse legend, Ingiald, son of King Aunund, was timid in his youth, but after eating the heart of a wolf he became very bold; Hialto gained strength and courage by eating the heart of a bear and drinking its blood; and when Sigurd killed the dragon Fafnir and tasted his heart's blood, he acquired thereby a knowledge of the language of birds. The belief that the language of birds or of animals in general can be learned by eating some part of a serpent appears to be ancient and wide-spread. Democritus is reported to have said that serpents were generated from the mixed blood of certain birds, and that therefore whoever ate a serpent would understand the bird language. The Arabs in antiquity were supposed to be able to draw omens from birds because they had gained a knowledge of the bird language by eating either the heart or liver of a serpent; and the people of Paraka in India are said to have learned the language of animals in general by the same means. Saxo Grammaticus relates how Rollo acquired all knowledge, including an understanding of the speech of animals, both wild and tame, by eating of a black serpent. In Norway, Sweden, and Jutland down to the nineteenth century the flesh of a white snake was thought to confer supernatural wisdom on the eater; it is a German and Bohemian superstition that whoever eats serpent's flesh understands the language of animals. Notions of the same sort, based no doubt on a belief in the extraordinary wisdom or subtlety of the serpent, often meet us in popular tales and traditions.

In Morocco lethargic patients are given ants to swallow, and to eat lion's flesh will make a coward brave; but people abstain from eating the hearts of fowls, lest thereby they should be rendered timid. When a child is late in learning to speak, the Turks of Central Asia will give it the tongues of certain birds to eat. A North American Indian thought that brandy must be a decoction of hearts and tongues, "because," said he, "after drinking it I fear nothing, and I talk wonderfully." In Java there is a tiny earthworm which now and then utters a shrill sound like that of the alarum of a small clock. Hence when a public dancing girl has screamed herself hoarse in the exercise of her calling, the leader of the troop makes her eat some of these worms, in the belief that thus she will regain her voice and will, after swallowing them, be able to scream as shrilly as ever. The people of Darfur, in Central Africa, think that the liver is the seat of the soul, and that a man may enlarge his soul by eating the liver of an animal. "Whenever an animal is killed its liver is taken out and eaten, but the people are most careful not to touch it with their hands, as it is considered sacred; it is cut up in small pieces and eaten raw, the bits being conveyed to the mouth on the point of a knife, or the sharp point

of a stick. Any one who may accidentally touch the liver is strictly forbidden to partake of it, which prohibition is regarded as a great misfortune for him." Women are not allowed to eat liver, because they have no soul.

Again, the flesh and blood of dead men are commonly eaten and drunk to inspire bravery, wisdom, or other qualities for which the men themselves were remarkable, or which are supposed to have their special seat in the particular part eaten. Thus among the mountain tribes of South-Eastern Africa there are ceremonies by which the youths are formed into guilds or lodges, and among the rites of initiation there is one which is intended to infuse courage, intelligence, and other qualities into the novices. Whenever an enemy who has behaved with conspicuous bravery is killed, his liver, which is considered the seat of valour; his ears, which are supposed to be the seat of intelligence; the skin of his forehead, which is regarded as the seat of perseverance; his testicles, which are held to be the seat of strength; and other members, which are viewed as the seat of other virtues, are cut from his body and baked to cinders. The ashes are carefully kept in the horn of a bull, and, during the ceremonies observed at circumcision, are mixed with other ingredients into a kind of paste, which is administered by the tribal priest to the youths. By this means the strength, valour, intelligence, and other virtues of the slain are believed to be imparted to the eaters. When Basutos of the mountains have killed a very brave foe, they immediately cut out his heart and eat it, because this is supposed to give them his courage and strength in battle. At the close of the war the man who has slain such a foe is called before the chief and gets from the doctor a medicine which he chews with his food. The third day after this he must wash his body in running water, and at the expiry of ten days he may return to his wives and children. So an Ovambo warrior in battle will tear out the heart of his slain foe in the belief that by eating it he can acquire the bravery of the dead man. A similar belief and practice prevail among some of the tribes of British Central Africa, notably among the Angoni. These tribes also mutilate the dead and reduce the severed parts to ashes. Afterwards the ashes are stirred into a broth or gruel, "which must be 'lapped' up with the hand and thrown into the mouth, but not eaten as ordinary food is taken, to give the soldiers courage, perseverance, fortitude, strategy, patience and wisdom." In former times whenever a Nandi warrior killed an enemy he used to eat a morsel of the dead man's heart to make himself brave. The Wagogo of German East Africa do the same thing for the same purpose. When Sir Charles M'Carthy was killed by the Ashantees in 1824, it is said that his heart was devoured by the chiefs of the Ashantee army, who hoped by this means to imbibe his courage. His flesh was dried and parcelled out among the lower officers for the same purpose, and his bones were long kept at Coomassie as national fetishes. The Amazons of Dahomey used to eat the hearts of foes remarkable for their bravery, in order that some of the intrepidity which animated them might be transfused into the eaters. In former days, if report may be trusted, the hearts of enemies who enjoyed a reputation for sagacity were also eaten, for the Ewe-speaking negro of these regions holds that the heart is the seat of the intellect as well as of courage. Among the Yoruba-speaking negroes of the Slave Coast the priests of Ogun, the war-god, usually take out the hearts of human victims, which are then dried, crumbled to powder, mixed with rum, and sold to aspirants after courage, who swallow the mixture in the belief that they thereby absorb the manly virtue of which the heart is supposed to be the seat. Similarly, Indians of the Orinoco region used to toast the hearts of their enemies, grind them to powder, and then drink the powder in a liquid in order to be brave and valiant the next time they went forth to fight. The Nauras Indians of New Granada ate the hearts of Spaniards when they had the opportunity, hoping thereby to make themselves as dauntless as the dreaded Castilian chivalry. The Sioux Indians of North America used to reduce to powder the heart of a valiant enemy and swallow the powder, hoping thus to appropriate the dead man's valour. The Muskoghees also thought that to eat the heart of a foe would "communicate and give greater heart against the enemy.

They also think that the vigorous faculties of the mind are derived from the brain, on which account, I have seen some of their heroes drink out of a human skull; they imagine, they only imbibe the good qualities it formerly contained." For a similar reason in Uganda a priest used to drink beer out of the skull of a dead king in order that he might be possessed by the king's spirit. Among the Esquimaux of Bering Strait, when young men had slain an enemy for the first time in war, they were wont to drink some of the blood and to eat a small piece of the heart of their victim in order to increase their bravery. In some tribes of North-Western Australia, when a man dies who had been a great warrior or hunter, his friends cut out the fat about his heart and eat it, because they believe that it imparts to them the courage and cunning of the deceased.

But while the human heart is thus commonly eaten for the sake of imbuing the eater with the qualities of its original owner, it is not, as we have already seen, the only part of the body which is consumed for this purpose. Thus in New Caledonia the victors in a fight used to eat the bodies of the slain, "not, as might be supposed, from a taste for human flesh, but in order to assimilate part of the bravery which the deceased was supposed to possess." Among the tribes about Maryborough in Queensland, when a man was killed in a ceremonial fight, it was customary for his friends to skin and eat him, in order that his warlike virtues might pass into the eaters. Warriors of the Theddora and Ngarigo tribes in South-Eastern Australia used to eat the hands and feet of their slain enemies, believing that in this way they acquired some of the qualities and courage of the dead. In the Dieri tribe of Central Australia, when a man had been condemned and killed by a properly constituted party of executioners, the weapons with which the deed was done were washed in a small wooden vessel, and the bloody mixture was administered to all the slayers in a prescribed manner, while they lay down on their backs and the elders poured it into their mouths. This was believed to give them double strength, courage, and great nerve for any future enterprise. The Kamilaroi of New South Wales ate the liver as well as the heart of a brave man to get his courage. In Tonquin also there is a popular superstition that the liver of a brave man makes brave any who partake of it. Hence when a Catholic missionary was beheaded in Tonquin in 1837, the executioner cut out the liver of his victim and ate part of it, while a soldier attempted to devour another part of it raw. With a like intent the Chinese swallow the bile of notorious bandits who have been executed. The Dyaks of Sarawak used to eat the palms of the hands and the flesh of the knees of the slain in order to steady their own hands and strengthen their own knees. The Tolalaki, notorious head-hunters of Central Celebes, drink the blood and eat the brains of their victims that they may become brave. The Italones of the Philippine Islands drink the blood of their slain enemies, and eat part of the back of their heads and of their entrails raw to acquire their courage. For the same reason the Efugaos, another tribe of the Philippines, suck the brains of their foes. In like manner the Kai of German New Guinea eat the brains of the enemies they kill in order to acquire their strength. Among the Kimbunda of Western Africa, when a new king succeeds to the throne, a brave prisoner of war is killed in order that the king and nobles may eat his flesh, and so acquire his strength and courage. The notorious Zulu chief Matuana drank the gall of thirty chiefs, whose people he had destroyed, in the belief that it would make him strong. It is a Zulu fancy that by eating the centre of the forehead and the eyebrow of an enemy they acquire the power of looking steadfastly at a foe. In Tud or Warrior Island, Torres Straits, men would drink the sweat of renowned warriors, and eat the scrapings from their finger-nails which had become coated and sodden with human blood. This was done "to make strong and like stone; no afraid." In Nagir, another island of Torres Straits, in order to infuse courage into boys a warrior used to take the eye and tongue of a man whom he had killed, and after mincing them and mixing them with his urine he administered the compound to the boy, who received it with shut eyes and open mouth seated between the warrior's legs. Before every warlike expedition the people of Minahassa in Celebes used to

take the locks of hair of a slain foe and dabble them in boiling water to extract the courage; this infusion of bravery was then drunk by the warriors. In New Zealand “the chief was an *atua* [god], but there were powerful and powerless gods; each naturally sought to make himself one of the former; the plan therefore adopted was to incorporate the spirits of others with their own; thus, when a warrior slew a chief, he immediately gouged out his eyes and swallowed them, the *atua tonga*, or divinity, being supposed to reside in that organ; thus he not only killed the body, but also possessed himself of the soul of his enemy, and consequently the more chiefs he slew the greater did his divinity become.”

Even without absorbing any part of a man's bodily substance it is sometimes thought possible to acquire his moral virtues through simple contact with his bones. Thus among the Toradjas of Central Celebes, when a youth is being circumcised he is made to sit on the skull of a slain foe in order to make him brave in war; and when Scanderbeg, Prince of Epirus, was dead, the Turks, who had often felt the force of his arm in battle, are said to have imagined that by wearing a piece of his bones near their heart they should be animated with a strength and valour like his. A peculiar form of communion with the dead is practised by the Gallas of Eastern Africa. They think that food from the house of a dead man, especially food that he liked, or that he cooked for himself, contains a portion of his life or soul. If at the funeral feast a man eats some of that food, he fancies that he has thereby absorbed some of the life or soul of the departed, a portion of his spirit, intelligence, or courage.

Strange as it may seem to us, one motive which induces a savage warrior to eat the flesh or drink the blood of the foe whom he has slain appears to be a wish to form an indissoluble covenant of friendship and brotherhood with his victim. For it is a widespread belief among savages that by transfusing a little of their blood into each other's bodies two men become kinsmen and allies; the same blood now circulating in the veins of both, neither can injure the other without at the same time injuring himself; the two have therefore given each other the strongest bond, the best possible hostages, for their good behaviour. Acting on this theory, the primitive warrior seeks to convert his slain foe into the firmest of friends by imbibing the dead man's blood or swallowing his flesh. That at all events appears to be the idea at the root of the following customs. When an Arawak Indian of British Guiana has murdered another, he repairs on the third night to the grave of his victim, and pressing a pointed stick through the corpse he licks off and swallows any blood that he finds adhering to the stick. For he believes that if he did not taste his victim's blood, he would go mad and die; whereas by swallowing the blood he averts any ill consequences that might flow to him from the murder. The belief and practice of the Nandi are similar: “To the present day, when a person of another tribe has been slain by a Nandi, the blood must be carefully washed off the spear or sword into a cup made of grass, and drunk by the slayer. If this is not done it is thought that the man will become frenzied.” So among the tribes of the Lower Niger “it is customary and necessary for the executioner to lick the blood that is on the blade”; moreover, “the custom of licking the blood off the blade of a sword by which a man has been killed in war is common to all these tribes, and the explanation given me by the Ibo, which is generally accepted, is, that if this was not done, the act of killing would so affect the strikers as to cause them to run amok among their own people; because the sight and smell of blood render them absolutely senseless as well as regardless of all consequences. And this licking the blood is the only sure remedy, and the only way in which they can recover themselves.” Among the Shans executioners believe that they would soon fall ill and die if they did not taste the blood of their victims.

The most probable explanation of these practices seems to be that a manslayer is thought to be driven mad by the ghost of his victim, who takes possession of his murderer's body and causes him to demean himself in a frantic manner; whereas, as soon as the slayer has tasted

the blood of the slain, he becomes a blood-brother of his victim, whose ghost accordingly will do him no harm. This hypothesis is strongly confirmed by the reason alleged for a similar custom formerly observed by the Maoris. When a warrior had slain his foe in combat, he tasted his blood, believing that this preserved him from the avenging spirit of his victim; for they imagined that "the moment a slayer had tasted the blood of the slain, the dead man became a part of his being and placed him under the protection of the *atua* or guardian-spirit of the deceased." In the light of these facts we can now explain the opinion, still widely held in Calabria, that if a murderer is to escape, he must suck his victim's blood from the reeking blade of the dagger with which he did the deed; and, further, we can see at least a glimmering of reason, however misapplied, in the confidence cherished by the Botocudos of Brazil, that if only they ate a morsel of the flesh of their enemies, the arrows of the fellow tribesmen of the slain would not be able to hit them. Indeed the evidence which I have just adduced suggests that the intention of forming a blood-covenant with the dead may have been a common motive for the cannibalism which has been so often practised by savage victors on the bodies of their victims. If that was so, it would to some extent mitigate the horror with which such a practice is naturally viewed by civilised observers; since it would reveal the cannibal feast, no longer in the lurid light of a brutal outburst of blind rage and hatred against the vanquished, but in the milder aspect of a solemn rite designed to wipe out the memory of past hostilities and to establish a permanent relation of friendship and good fellowship with the dead.

Another mode of entering into communion with the dead by means of their bodily relics is to grind their bones to powder or to burn them to ashes, and then to swallow the powder or the ashes mixed with food or drink. This method of absorbing the virtues or appropriating the souls of deceased kinsfolk has been practised by a number of Indian tribes of South America. Thus the Tarianas, Tucanos, and other tribes in the valley of the Amazon, about a month after the funeral, disinter the corpse, which is then much decomposed, and put it in a great pan or oven over the fire till all the volatile parts are driven off with a most horrible stench, leaving only a black carbonaceous paste. This paste is then pounded into a fine powder, and being mixed in several large vats of the native beer, the liquor is drunk by the assembled company until all is consumed. They believe that thus the virtues of the deceased are transmitted to the drinkers. Similarly among the Xomanas and Passes of the Rio Negro and Japura River in Brazil, it was customary to burn the bones of the dead and mingle the ashes in their drink; "for they fancied, that by this means they received into their own bodies the spirits of their deceased friends." We may suppose that a similar motive underlies the custom wherever it has been observed by the Indians of South America, even when this particular motive is not expressly alleged by our authorities. For example, the Retoroños, Pechuyos, and Guarayos of eastern Bolivia "manifested their feeling for the dead by a remarkable custom: when the body had mouldered they dug up the bones, reduced them to powder, and mingling it with maize, composed a sort of cake, which they considered it the strongest mark of friendship to offer and partake. Some of the first missionaries were regaled with this family bread, before they knew what they were eating." Again, in the province of Coro, in north-western Venezuela, when a chief died, they lamented him in the night, celebrating his actions; then they parched his body at the fire, and reducing it to powder drank it up in their liquor, deeming this act the highest honour they could pay him. The Tauraré Indians of the Rio Enivra burn their dead, keep their ashes in hollow reeds, and eat a portion of the ashes with every meal. So in antiquity Artemisia expressed her love and grief for her dead husband Mausolus by powdering his ashes and drinking them in water. It is said that Mwamba, a recent king or chief of the Wemba in Northern Rhodesia, having detected one of his wives in an intrigue with another man, caused the guilty pair to be burned alive, while he watched their tortures from a raised seat. "Shortly after this, however, he would seem to have been stricken with

remorse and the dread of Nemesis. The presiding witch-doctor was therefore ordered to collect the ashes of the twain, and decoct therefrom a potion, which was administered to the king to avert the avenging furies of evil spirits of the murdered pair, which might otherwise have hounded him into a fit of madness." By drinking the ashes of his victims the king sought to identify himself with them and so to protect himself against their angry ghosts, just as we have seen that manslayers seek to protect themselves against the ghosts of their victims by drinking their blood.

Just as the savage thinks that he can swallow the moral and other virtues in the shape of food, so he fondly imagines that he can inoculate himself with them. Here in Europe we as yet inoculate only against disease; in Basutoland they have learned the art of inoculating not merely against disease but against moral evil and public calamity, against wild beasts and winter cold. For example, if an epidemic is raging, if public affairs go ill, or war threatens to break out, the chief, with paternal solicitude, seeks to guard his people against the evils that menace them by inoculating them with his own hand. Armed with a lancet, he makes a slight incision in the temples of each one, and rubs into the wound a pinch of magic powder which has been carefully compounded of the ashes of certain plants and animals. The plants and animals whose ashes compose this sovereign medicine are always symbolical; in other words, they are supposed to be imbued with the virtues which the chief desires to impart to his people. They consist, for example, of plants whose foliage withstands the rigours of winter; mimosas, whose thorns present an impenetrable barrier to all animals of the deer kind; the claws or a few hairs from the mane of a lion, the bravest of beasts; the tuft of hair round the root of the horns of a bull, which is the emblem of strength and fecundity; the skin of a serpent; the feathers of a kite or a hawk. So when the Barotsé wish to be swift of foot, to cripple the fleeing game, and to ensure an abundant catch, they scarify their arms and legs and rub into the wounds a powder made of the burnt bones of various beasts and birds. Among some tribes of South-Eastern Africa the same magic powder which is made from various parts of slain foes, and is eaten by boys at circumcision, is used to inoculate the fighting-men in time of war. The medicine-man makes an incision in the forehead of each warrior, and puts the powder into the cut, thus infusing strength and courage for the battle. Among some Caffre tribes the powdered charcoal with which the warriors are thus inoculated in various parts of their bodies is procured by burning the flesh of a live ox with a certain kind of wood or roots, to which magic virtue is attributed. The Basutos think that they can render themselves invulnerable by inoculation, and the Zulus imagine that they can protect themselves against snake-bite by similar means. But the saving virtue of the inoculation is not permanent; like vaccination, it has to be periodically renewed. Hence every year, about October, Zulu men, women, and children have a small piece of skin cut from the back of the left hand, and the poison of a snake, mixed with spittle, is rubbed into the wound. No snake will ever approach a man who has thus been inoculated; and what is even more curious, if the shadow of an inoculated man should touch the shadow of a man who has not been inoculated, the latter will fall down as if he had been shot, overcome by the poison transmitted through the shadow: so exceedingly virulent is the virus. Among the Jukos, a tribe of the Benue River in Northern Nigeria, before a hunter goes forth to hunt elephants, he makes four cuts in his left arm and rubs in "medicine"; this helps him to see the beast next day.

Again, the Zulus know how to inoculate themselves not merely with moral virtue, but even with celestial power. For you must know that the Zulus have heaven-herds or sky-herds, who drive away clouds big with hail and lightning, just as herdsmen drive cattle before them. These heaven-herds are in sympathy with the heaven. For when the heaven is about to be darkened, and before the clouds appear or the thunder mutters, the heart of the heaven-herd

feels it coming, for it is hot within him and he is excited by anger. When the sky begins to be overcast, he too grows dark like it; when it thunders, he frowns, that his face may be black as the scowl of the angry heaven. Now the way in which he thus becomes sympathetic with all the changing moods of the inconstant heaven is this: he eats the heaven and scarifies himself with it. And the way in which he eats the heaven and scarifies himself with it is as follows. When a bullock is struck by lightning, the wizard takes its flesh and puts it in a sherd and eats it while it is hot, mixed with medicine; and thus he eats the heaven by eating the flesh, which came from the beast, which was struck by the lightning, which came down from the heaven. And in like manner he scarifies himself with the heaven, for he makes cuts in his body and rubs in medicine mixed with the flesh of a bullock that was struck by lightning. In some Caffre tribes, when an animal or a man has been struck by lightning, the priest comes straightway and vaccinates every person in the kraal, apparently as a sort of insurance against lightning. He sets to work by tying a number of charms round the neck of every man and woman in the village, in order that they may have power to dig the dead man's grave; for in these tribes beasts and men alike that have been struck by lightning are always buried, and the flesh is never eaten. Next a sacrificial beast is killed and a fire kindled, in which certain magic woods or roots are burned to charcoal, and then ground to powder. The priest thereupon makes incisions in various parts of the bodies of each inmate of the kraal, and rubs a portion of the powdered charcoal into the cuts; the rest of the powder he mixes with sour milk, and gives to them all to drink. From the time the lightning strikes the kraal until this ceremony has been performed, the people are obliged to abstain entirely from the use of milk. Their heads are then shaved. Should a house have been struck by lightning it must be abandoned, with everything in it. Until all these rites have been performed, none of the people may leave the kraal or have any intercourse whatever with others; but when the ceremonies have been duly performed, the people are pronounced clean, and may again associate with their neighbours. However, for some months afterwards none of the livestock of the kraal and few other things belonging to it are allowed to pass into other hands, whether by way of sale or of gift. Hence it would appear that all persons in a village which has been struck by lightning are supposed to be infected with a dangerous virus, which they might communicate to their neighbours; and the vaccination is intended to disinfect them as well as to protect them against the recurrence of a like calamity. Young Carib warriors used to be inoculated for the purpose of making them brave and hardy. Some time before the ceremony the lad who was to be operated on caught a bird of prey of a particular sort and kept it in captivity till the day appointed. When the time was come and friends had assembled to witness the ceremony, the father of the boy seized the bird by its legs and crushed its head by beating it on the head of his son, who dared not wince under the rain of blows that nearly stunned him. Next the father bruised and pounded the bird's flesh, and steeped it in water together with a certain spice; after which he scored and slashed his son's body in all directions, washed his wounds with the decoction, and gave him the bird's heart to eat, in order, as it was said, that he might be the braver for it.

It is not always deemed necessary either that the mystical substance should be swallowed by the communicant, or that he should receive it by the more painful process of scarification and inoculation. Sometimes it is thought enough merely to smear or anoint him with it. Among some of the Australian blacks it used to be a common practice to kill a man, cut out his caul-fat, and rub themselves with it, in the belief that all the qualities, both physical and mental, which had distinguished the original owner of the fat, were thus communicated by its means to the person who greased himself with it. The Kamilaroi tribe of New South Wales sometimes deposited their dead on the forks of trees, and lighting fires underneath caught the fat as it dropped; for they hoped with the droppings to acquire the strength and courage of the deceased. The Wollaroi, another tribe of New South Wales, used to place the dead on a stage,

and the mourners sat under it and rubbed their bodies with the juices of putrefaction which exuded from the rotten body, believing that this made them strong. Others collected these juices in vessels, and the young men rubbed the stinking liquid into their persons in order to acquire the good qualities of the departed. Wherever a like custom has been practised, as it has been, for example, by some of the natives of New Guinea, Timor Laut, and Madagascar, we may conjecture that the motive has been similar. Again, the negroes of Southern Guinea regard the brain as the seat of wisdom, and think it a pity that, when a wise man dies, his brain and his wisdom should go to waste together. So they sever his head from his body and hang it up over a mass of chalk, which, as the head decays, receives the drippings of brain and wisdom. Any one who applies the precious dripping to his forehead is supposed to absorb thereby the intelligence of the dead. Among the Beku, a tribe of dwarfs attached to the Fans in West Africa, the great charm for success in hunting is procured by killing a man and afterwards, when the corpse has begun to moulder in the grave, detaching the head from the body. The brain, heart, eyes and hairs of the body are then removed and mixed, according to a secret formula, with special incantations. When the compound is dry, the hunter rubs himself with it "in order to acquire a dash of the higher power with which people are endowed in the other life, and in particular their invisibility." Among the Digger Indians of California, when a man died, it was customary to burn the body to ashes, mix the ashes with a thick resinous gum extracted from a pine-tree, and then smear the gum on the head of the mourner, where it was allowed to remain till it gradually wore away. The motive for the custom is not mentioned, but it was probably, like the motive for the parallel custom of swallowing the ashes of the dead, a desire to participate in the powers and virtues of the departed. At a certain stage of the ceremonies by which, in the Andaman Islands, a boy is initiated into manhood, the chief takes the carcass of a boar and presses it heavily down on the shoulders, back, and limbs of the young man as he sits, silent and motionless, on the ground. This is done to make him brave and strong. Afterwards the animal is cut up, and its melted fat is poured over the novice, and rubbed into his body. The Arabs of Eastern Africa believe that an unguent of lion's fat inspires a man with boldness, and makes the wild beasts flee in terror before him. In the forests of North-western Brazil there lives a small falcon with a red beak which is so sharp-sighted that it can detect even a worm on the ground from a considerable height. When a Kobeua Indian has killed one of these birds, he pokes out its eyes and allows the fluid to drip into his own, believing that in this way they will be sharp-sighted like those of the falcon. Most of the Baperis, or Malekootoos, a Bechuana tribe of South Africa, revere or, as they say, sing the porcupine, which seems to be their totem, as the sun is the totem of some members of the tribe, and a species of ape the totem of others. Those of them who have the porcupine for their totem swear by the animal, and lament if any one injures it. When a porcupine has been killed, they religiously gather up its bristles, spit on them, and rub their eyebrows with them, saying, "They have slain our brother, our master, one of ourselves, him whom we sing." They would fear to die if they ate of its flesh. Nevertheless they esteem it wholesome for an infant of the clan to rub into his joints certain portions of the paunch of the animal mixed with the sap of some plants to which they ascribe an occult virtue. So at the solemn ceremony which is observed by the Central Australian tribes for the purpose of multiplying kangaroos, men of the kangaroo totem not only eat a little kangaroo flesh as a sacrament, but also have their bodies anointed with kangaroo fat. Doubtless the intention alike of the eating and of the anointing is to impart to the man the qualities of his totem animal, and thus to enable him to perform the ceremonies for the multiplication of the breed.

In ancient Mexico the priests of the god Tezcatlipoca, before they engaged in religious rites which tried the nerve, used to smear their bodies with a magic ointment, which had the effect of banishing all fear, so that they would confront wild beasts in their dens or slaughter people

in sacrifice with the utmost indifference. The ointment which had this marvellous property was compounded of the ashes of venomous reptiles and insects, such as spiders, scorpions, centipedes, and vipers, which were brayed up in a mortar along with living specimens of the same creatures, tobacco, soot, and the ashes of black caterpillars. This precious substance was then set before the god in little pots, because they said it was his victuals; therefore they called it a divine food. And when the priests had besmeared themselves with it, they were ready to discharge the duties of their holy office by butchering their fellow men in the human shambles without one qualm of fear or one visiting of compassion. Moreover, an unction of this ointment was deemed a sovereign remedy for sickness and disease; hence they named it "the divine physic"; and sick people came from all quarters to the priests, as to their saviours, to have their ailing parts anointed with the divine physic and to be made whole.

Sometimes the valuable qualities of an animal or of a person may be imparted to another by the more delicate and ethereal process of fumigation. This refined mode of cultivating the moral virtues is or used to be practised by the Caffres of South Africa. Thus in former times as soon as a baby was born, some dirt was scraped from the forearm and other parts of the father's body and mixed with special medicines. The mixture was then made to smoulder and the baby was fumigated or "washed" in the smoke. This ceremony was deemed of great importance, being the established way of communicating to the child a portion of the ancestral spirit (*itongo*) through the physical medium of the father's dirt, to which the spirit naturally adheres. But while the dirt was endowed with this spiritual potency, the moral character of the infant depended in a large measure on the nature of the medicines with which the dirt was compounded, and accordingly much thought and skill were devoted to their selection and preparation. Foremost among the ingredients was a meteorite, burnt to a cinder and ground to powder. The effect of this powder, well mixed with the dirt, and introduced into the orifices of the child's body by means of smoke, is to close the anterior fontanelle of the baby's skull, to strengthen the bones of that important part of his person, to communicate vigour to his mind and courage to his disposition, and in general to brace and harden his whole system with the strength and hardness of the meteorite. Other ingredients which have a most beneficial effect are the powdered whiskers of a leopard, the claws of a lion, and the skin of a salamander. The mode of administering the medicine is as follows. You set fire to the compound, and while it smoulders, you hold the infant, wrapt up in a blanket, over the burning mass so as to compel it to inhale the smoke. To make sure of producing the desired effect, some of the powdered medicine is mixed with the baby's food. In like manner by holding the smouldering feather of a vulture under a baby's nose you render the child valiant and brave like a vulture, and if you do the same with a peacock's feather, your offspring will be, like a peacock, impavid and never dismayed by thunder or other terrible noises.

It is now easy to understand why a savage should desire to partake of the flesh of an animal or man whom he regards as divine. By eating the body of the god he shares in the god's attributes and powers. And when the god is a corn-god, the corn is his proper body; when he is a vine-god, the juice of the grape is his blood; and so by eating the bread and drinking the wine the worshipper partakes of the real body and blood of his god. Thus the drinking of wine in the rites of a vine-god like Dionysus is not an act of revelry, it is a solemn sacrament. Yet a time comes when reasonable men find it hard to understand how any one in his senses can suppose that by eating bread or drinking wine he consumes the body or blood of a deity. "When we call corn Ceres and wine Bacchus," says Cicero, "we use a common figure of speech; but do you imagine that anybody is so insane as to believe that the thing he feeds upon is a god?" In writing thus the Roman philosopher little foresaw that in Rome itself, and in the countries which have derived their creed from her, the belief which he here stigmatises as insane was destined to persist for thousands of years, as a cardinal doctrine of

religion, among peoples who pride themselves on their religious enlightenment by comparison with the blind superstitions of pagan antiquity. So little can even the greatest minds of one generation foresee the devious track which the religious faith of mankind will pursue in after ages.

XIII. Killing The Divine Animal

§ 1. Killing the Sacred Buzzard.

In the preceding chapters we saw that many communities which have progressed so far as to subsist mainly by agriculture have been in the habit of killing and eating their farinaceous deities either in their proper form of corn, rice, and so forth, or in the borrowed shapes of animals and men. It remains to shew that hunting and pastoral tribes, as well as agricultural peoples, have been in the habit of killing the beings whom they worship. Among the worshipful beings or gods, if indeed they deserve to be dignified by that name, whom hunters and shepherds adore and kill are animals pure and simple, not animals regarded as embodiments of other supernatural beings. Our first example is drawn from the Indians of California, who living in a fertile country under a serene and temperate sky, nevertheless rank near the bottom of the savage scale. Where a stretch of iron-bound coast breaks the long line of level sands that receive the rollers of the Pacific, there stood in former days, not far from the brink of the great cliffs, the white mission-house of San Juan Capistrano. Among the monks who here exercised over a handful of wretched Indians the austere discipline of Catholic Spain, there was a certain Father Geronimo Boscana who has bequeathed to us a precious record of the customs and superstitions of his savage flock. Thus he tells us that the Acagchemem tribe adored the great buzzard, and that once a year they celebrated a great festival called *Panes* or bird-feast in its honour. The day selected for the festival was made known to the public on the evening before its celebration and preparations were at once made for the erection of a special temple (*vanquech*), which seems to have been a circular or oval enclosure of stakes with the stuffed skin of a coyote or prairie-wolf set up on a hurdle to represent the god Chinigchinich. When the temple was ready, the bird was carried into it in solemn procession and laid on an altar erected for the purpose. Then all the young women, whether married or single, began to run to and fro, as if distracted, some in one direction and some in another, while the elders of both sexes remained silent spectators of the scene, and the captains, tricked out in paint and feathers, danced round their adored bird. These ceremonies being concluded, they seized upon the bird and carried it to the principal temple, all the assembly uniting in the grand display, and the captains dancing and singing at the head of the procession. Arrived at the temple, they killed the bird without losing a drop of its blood. The skin was removed entire and preserved with the feathers as a relic or for the purpose of making the festal garment or *paelt*. The carcase was buried in a hole in the temple, and the old women gathered round the grave weeping and moaning bitterly, while they threw various kinds of seeds or pieces of food on it, crying out, "Why did you run away? Would you not have been better with us? you would have made *pinole* (a kind of gruel) as we do, and if you had not run away, you would not have become a *Panes*," and so on. When this ceremony was concluded, the dancing was resumed and kept up for three days and nights. They said that the *Panes* was a woman who had run off to the mountains and there been changed into a bird by the god Chinigchinich. They believed that though they sacrificed the bird annually, she came to life again and returned to her home in the mountains. Moreover they thought that "as often as the bird was killed, it became multiplied; because every year all the different Capitanes celebrated the same feast of *Panes*, and were firm in the opinion that the birds sacrificed were but one and the same female."

The unity in multiplicity thus postulated by the Californians is very noticeable and helps to explain their motive for killing the divine bird. The notion of the life of a species as distinct from that of an individual, easy and obvious as it seems to us, appears to be one which the

Californian savage cannot grasp. He is unable to conceive the life of the species otherwise than as an individual life, and therefore as exposed to the same dangers and calamities which menace and finally destroy the life of the individual. Apparently he imagines that a species left to itself will grow old and die like an individual, and that therefore some step must be taken to save from extinction the particular species which he regards as divine. The only means he can think of to avert the catastrophe is to kill a member of the species in whose veins the tide of life is still running strong, and has not yet stagnated among the fens of old age. The life thus diverted from one channel will flow, he fancies, more freshly and freely in a new one; in other words, the slain animal will revive and enter on a new term of life with all the spring and energy of youth. To us this reasoning is transparently absurd, but so too is the custom. If a better explanation, that is, one more consonant with the facts and with the principles of savage thought, can be given of the custom, I will willingly withdraw the one here proposed. A similar confusion, it may be noted, between the individual life and the life of the species was made by the Samoans. Each family had for its god a particular species of animal; yet the death of one of these animals, for example an owl, was not the death of the god, "he was supposed to be yet alive, and incarnate in all the owls in existence."

§ 2. Killing the Sacred Ram.

The rude Californian rite which we have just considered has a close parallel in the religion of ancient Egypt. The Thebans and all other Egyptians who worshipped the Theban god Ammon held rams to be sacred, and would not sacrifice them. But once a year at the festival of Ammon they killed a ram, skinned it, and clothed the image of the god in the skin. Then they mourned over the ram and buried it in a sacred tomb. The custom was explained by a story that Zeus had once exhibited himself to Hercules clad in the fleece and wearing the head of a ram. Of course the ram in this case was simply the beast-god of Thebes, as the wolf was the beast-god of Lycopolis, and the goat was the beast-god of Mendes. In other words, the ram was Ammon himself. On the monuments, it is true, Ammon appears in semi-human form with the body of a man and the head of a ram. But this only shews that he was in the usual chrysalis state through which beast-gods regularly pass before they emerge as full-blown anthropomorphic gods. The ram, therefore, was killed, not as a sacrifice to Ammon, but as the god himself, whose identity with the beast is plainly shewn by the custom of clothing his image in the skin of the slain ram. The reason for thus killing the ram-god annually may have been that which I have assigned for the general custom of killing a god and for the special Californian custom of killing the divine buzzard. As applied to Egypt, this explanation is supported by the analogy of the bull-god Apis, who was not suffered to outlive a certain term of years. The intention of thus putting a limit to the life of the human god was, as I have argued, to secure him from the weakness and frailty of age. The same reasoning would explain the custom—probably an older one—of putting the beast-god to death annually, as was done with the ram of Thebes.

One point in the Theban ritual—the application of the skin to the image of the god—deserves particular attention. If the god was at first the living ram, his representation by an image must have originated later. But how did it originate? One answer to this question is perhaps furnished by the practice of preserving the skin of the animal which is slain as divine. The Californians, as we have seen, preserved the skin of the buzzard; and the skin of the goat, which is killed on the harvest-field as a representative of the corn-spirit, is kept for various superstitious purposes. The skin in fact was kept as a token or memorial of the god, or rather as containing in it a part of the divine life, and it had only to be stuffed or stretched upon a frame to become a regular image of him. At first an image of this kind would be renewed annually, the new image being provided by the skin of the slain animal. But from annual images to permanent images the transition is easy. We have seen that the older custom of

cutting a new May-tree every year was superseded by the practice of maintaining a permanent May-pole, which was, however, annually decked with fresh leaves and flowers, and even surmounted each year by a fresh young tree. Similarly when the stuffed skin, as a representative of the god, was replaced by a permanent image of him in wood, stone, or metal, the permanent image was annually clad in the fresh skin of the slain animal. When this stage had been reached, the custom of killing the ram came naturally to be interpreted as a sacrifice offered to the image, and was explained by a story like that of Ammon and Hercules.

§ 3. Killing the Sacred Serpent.

West Africa appears to furnish another example of the annual killing of a sacred animal and the preservation of its skin. The negroes of Issapoo, in the island of Fernando Po, regard the cobra-capella as their guardian deity, who can do them good or ill, bestow riches or inflict disease and death. The skin of one of these reptiles is hung tail downwards from a branch of the highest tree in the public square, and the placing of it on the tree is an annual ceremony. As soon as the ceremony is over, all children born within the past year are carried out and their hands made to touch the tail of the serpent's skin. The latter custom is clearly a way of placing the infants under the protection of the tribal god. Similarly in Senegambia a python is expected to visit every child of the Python clan within eight days after birth; and the Psylli, a Snake clan of ancient Africa, used to expose their infants to snakes in the belief that the snakes would not harm true-born children of the clan.

§ 4. Killing the Sacred Turtles.

In the Californian, Egyptian, and Fernando Po customs the animal slain may perhaps have been at some time or other a totem, but this is very doubtful. At all events, in all three cases the worship of the animal seems to have no relation to agriculture, and may therefore be presumed to date from the hunting or pastoral stage of society. The same may be said of the following custom, though the people who practise it—the Zuni Indians of New Mexico—are now settled in walled villages or towns of a peculiar type, and practise agriculture and the arts of pottery and weaving. But the Zuni custom is marked by certain features which appear to place it in a somewhat different class from the preceding cases. It may be well therefore to describe it at full length in the words of an eye-witness.

“With midsummer the heat became intense. My brother [*i.e.* adopted Indian brother] and I sat, day after day, in the cool under-rooms of our house,—the latter [*sic*] busy with his quaint forge and crude appliances, working Mexican coins over into bangles, girdles, ear-rings, buttons, and what not, for savage ornament. Though his tools were wonderfully rude, the work he turned out by dint of combined patience and ingenuity was remarkably beautiful. One day as I sat watching him, a procession of fifty men went hastily down the hill, and off westward over the plain. They were solemnly led by a painted and shell-bedecked priest, and followed by the torch-bearing Shu-lu-wit-si, or God of Fire. After they had vanished, I asked old brother what it all meant.

“‘They are going,’ said he, ‘to the city of the Ka-ka and the home of our others.’

“Four days after, towards sunset, costumed and masked in the beautiful paraphernalia of the Ka-k'ok-shi, or ‘Good Dance,’ they returned in file up the same pathway, each bearing in his arms a basket filled with living, squirming turtles, which he regarded and carried as tenderly as a mother would her infant. Some of the wretched reptiles were carefully wrapped in soft blankets, their heads and fore-feet protruding,—and, mounted on the backs of the plume-bedecked pilgrims, made ludicrous but solemn caricatures of little children in the same position. While I was at supper upstairs that evening, the governor's brother-in-law came in.

He was welcomed by the family as if a messenger from heaven. He bore in his tremulous fingers one of the much abused and rebellious turtles. Paint still adhered to his hands and bare feet, which led me to infer that he had formed one of the sacred embassy.

“‘So you went to Ka-thlu-el-lon, did you?’ I asked.

“‘E'e,’ replied the weary man, in a voice husky with long chanting, as he sank, almost exhausted, on a roll of skins which had been placed for him, and tenderly laid the turtle on the floor. No sooner did the creature find itself at liberty than it made off as fast as its lame legs would take it. Of one accord, the family forsook dish, spoon, and drinking-cup, and grabbing from a sacred meal-bowl whole handfuls of the contents, hurriedly followed the turtle about the room, into dark corners, around water-jars, behind the grinding-troughs, and out into the middle of the floor again, praying and scattering meal on its back as they went. At last, strange to say, it approached the foot-sore man who had brought it.

“‘Ha!’ he exclaimed with emotion; ‘see it comes to me again; ah, what great favours the fathers of all grant me this day,’ and, passing his hand gently over the sprawling animal, he inhaled from his palm deeply and long, at the same time invoking the favour of the gods. Then he leaned his chin upon his hand, and with large, wistful eyes regarded his ugly captive as it sprawled about, blinking its meal-bedimmed eyes, and clawing the smooth floor in memory of its native element. At this juncture I ventured a question:

“‘Why do you not let him go, or give him some water?’

“‘Slowly the man turned his eyes toward me, an odd mixture of pain, indignation, and pity on his face, while the worshipful family stared at me with holy horror.

“‘Poor younger brother!’ he said at last, ‘know you not how precious it is? It die? It will *not* die; I tell you, it cannot die.’

“‘But it will die if you don't feed it and give it water.’

“‘I tell you it *cannot* die; it will only change houses to-morrow, and go back to the home of its brothers. Ah, well! How should *you* know?’ he mused. Turning to the blinded turtle again: ‘Ah! my poor dear lost child or parent, my sister or brother to have been! Who knows which? Maybe my own great-grandfather or mother!’ And with this he fell to weeping most pathetically, and, tremulous with sobs, which were echoed by the women and children, he buried his face in his hands. Filled with sympathy for his grief, however mistaken, I raised the turtle to my lips and kissed its cold shell; then depositing it on the floor, hastily left the grief-stricken family to their sorrows. Next day, with prayers and tender beseechings, plumes, and offerings, the poor turtle was killed, and its flesh and bones were removed and deposited in the little river, that it might ‘return once more to eternal life among its comrades in the dark waters of the lake of the dead.’ The shell, carefully scraped and dried, was made into a dance-rattle, and, covered by a piece of buckskin, it still hangs from the smoke-stained rafters of my brother's house. Once a Navajo tried to buy it for a ladle; loaded with indignant reproaches, he was turned out of the house. Were any one to venture the suggestion that the turtle no longer lived, his remark would cause a flood of tears, and he would be reminded that it had only ‘changed houses and gone to live for ever in the home of “our lost others.” ’ ”

In this custom we find expressed in the clearest way a belief in the transmigration of human souls into the bodies of turtles. The theory of transmigration is held by the Moqui Indians, who belong to the same race as the Zunis. The Moquis are divided into totem clans—the Bear clan, Deer clan, Wolf clan, Hare clan, and so on; they believe that the ancestors of the clans were bears, deer, wolves, hares, and so forth; and that at death the members of each clan become bears, deer, and so on according to the particular clan to which they belonged. The

Zuni are also divided into clans, the totems of which agree closely with those of the Moquis, and one of their totems is the turtle. Thus their belief in transmigration into the turtle is probably one of the regular articles of their totem faith. What then is the meaning of killing a turtle in which the soul of a kinsman is believed to be present? Apparently the object is to keep up a communication with the other world in which the souls of the departed are believed to be assembled in the form of turtles. It is a common belief that the spirits of the dead return occasionally to their old homes; and accordingly the unseen visitors are welcomed and feasted by the living, and then sent upon their way. In the Zuni ceremony the dead are fetched home in the form of turtles, and the killing of the turtles is the way of sending back the souls to the spirit-land. Thus the general explanation given above of the custom of killing a god seems inapplicable to the Zuni custom, the true meaning of which is somewhat obscure. Nor is the obscurity which hangs over the subject entirely dissipated by a later and fuller account which we possess of the ceremony. From it we learn that the ceremony forms part of the elaborate ritual which these Indians observe at the midsummer solstice for the purpose of ensuring an abundant supply of rain for the crops. Envoys are despatched to bring "their otherselves, the tortoises," from the sacred lake Kothluwalawa, to which the souls of the dead are believed to repair. When the creatures have thus been solemnly brought to Zuni, they are placed in a bowl of water and dances are performed beside them by men in costume, who personate gods and goddesses. "After the ceremonial the tortoises are taken home by those who caught them and are hung by their necks to the rafters till morning, when they are thrown into pots of boiling water. The eggs are considered a great delicacy. The meat is seldom touched except as a medicine, which is curative for cutaneous diseases. Part of the meat is deposited in the river with *kóhakwa* (white shell beads) and turquoise beads as offerings to Council of the Gods." This account at all events confirms the inference that the tortoises are supposed to be reincarnations of the human dead, for they are called the "otherselves" of the Zuni; indeed, what else should they be than the souls of the dead in the bodies of tortoises seeing that they come from the haunted lake? As the principal object of the prayers uttered and of the dances performed at these midsummer ceremonies appears to be to procure rain for the crops, it may be that the intention of bringing the tortoises to Zuni and dancing before them is to intercede with the ancestral spirits, incarnate in the animals, that they may be pleased to exert their power over the waters of heaven for the benefit of their living descendants.

§ 5. Killing the Sacred Bear.

Doubt also hangs at first sight over the meaning of the bear-sacrifice offered by the Aino or Ainu, a primitive people who are found in the Japanese island of Yezo or Yesso, as well as in Saghalien and the southern of the Kurile Islands. It is not quite easy to define the attitude of the Aino towards the bear. On the one hand they give it the name of *kamui* or "god"; but as they apply the same word to strangers, it may mean no more than a being supposed to be endowed with superhuman, or at all events extraordinary, powers. Again, it is said that "the bear is their chief divinity"; "in the religion of the Aino the bear plays a chief part"; "amongst the animals it is especially the bear which receives an idolatrous veneration"; "they worship it after their fashion"; "there is no doubt that this wild beast inspires more of the feeling which prompts worship than the inanimate forces of nature, and the Aino may be distinguished as bear-worshippers." Yet, on the other hand, they kill the bear whenever they can; "in bygone years the Aino considered bear-hunting the most manly and useful way in which a person could possibly spend his time"; "the men spend the autumn, winter, and spring in hunting deer and bears. Part of their tribute or taxes is paid in skins, and they subsist on the dried meat"; bear's flesh is indeed one of their staple foods; they eat it both fresh and salted; and the skins of bears furnish them with clothing. In fact, the worship of which writers on this

subject speak appears to be paid chiefly to the dead animal. Thus, although they kill a bear whenever they can, “in the process of dissecting the carcass they endeavour to conciliate the deity, whose representative they have slain, by making elaborate obeisances and deprecatory salutations”; “when a bear has been killed the Aino sit down and admire it, make their salaams to it, worship it, and offer presents of *inao*”; “when a bear is trapped or wounded by an arrow, the hunters go through an apologetic or propitiatory ceremony.” The skulls of slain bears receive a place of honour in their huts, or are set up on sacred posts outside the huts, and are treated with much respect: libations of millet beer, and of *sake*, an intoxicating liquor, are offered to them; and they are addressed as “divine preservers” (*akoshiratki kamui*), or “precious divinities.” The skulls of foxes are also fastened to the sacred posts outside the huts; they are regarded as charms against evil spirits, and are consulted as oracles. Yet it is expressly said, “The live fox is revered just as little as the bear; rather they avoid it as much as possible, considering it a wily animal.” The bear can hardly, therefore, be described as a sacred animal of the Aino, nor yet as a totem; for they do not call themselves bears, and they kill and eat the animal freely. However, they have a legend of a woman who had a son by a bear; and many of them who dwell in the mountains pride themselves on being descended from a bear. Such people are called “Descendants of the bear” (*Kimun Kamui sanikiri*), and in the pride of their heart they will say, “As for me, I am a child of the god of the mountains; I am descended from the divine one who rules in the mountains,” meaning by “the god of the mountains” no other than the bear. It is therefore possible that, as our principal authority, the Rev. J. Batchelor, believes, the bear may have been the totem of an Aino clan; but even if that were so it would not explain the respect shewn for the animal by the whole Aino people.

But it is the bear-festival of the Aino which concerns us here. Towards the end of winter a bear cub is caught and brought into the village. If it is very small, it is suckled by an Aino woman, but should there be no woman able to suckle it, the little animal is fed from the hand or the mouth. If it cries loudly and long for its mother, as it is apt to do, its owner will take it to his bosom and let it sleep with him for a few nights, thus dispelling its fears and sense of loneliness. During the day it plays about in the hut with the children and is treated with great affection. But when the cub grows big enough to pain people by hugging or scratching them, he is shut up in a strong wooden cage, where he stays generally for two or three years, fed on fish and millet porridge, till it is time for him to be killed and eaten. But “it is a peculiarly striking fact that the young bear is not kept merely to furnish a good meal; rather he is regarded and honoured as a fetish, or even as a sort of higher being.” In Yezo the festival is generally celebrated in September or October. Before it takes place the Aino apologise to their gods, alleging that they have treated the bear kindly as long as they could, now they can feed him no longer, and are obliged to kill him. A man who gives a bear-feast invites his relations and friends; in a small village nearly the whole community takes part in the feast; indeed, guests from distant villages are invited and generally come, allured by the prospect of getting drunk for nothing. The form of invitation runs somewhat as follows: “I, so and so, am about to sacrifice the dear little divine thing who resides among the mountains. My friends and masters, come ye to the feast; we will then unite in the great pleasure of sending the god away. Come.” When all the people are assembled in front of the cage, an orator chosen for the purpose addresses the bear and tells it that they are about to send it forth to its ancestors. He craves pardon for what they are about to do to it, hopes it will not be angry, and comforts it by assuring the animal that many of the sacred whittled sticks (*inao*) and plenty of cakes and wine will be sent with it on the long journey. One speech of this sort which Mr. Batchelor heard ran as follows: “O thou divine one, thou wast sent into the world for us to hunt. O thou precious little divinity, we worship thee; pray hear our prayer. We have nourished thee and brought thee up with a deal of pains and trouble, all because we love thee so. Now, as thou hast grown big, we are about to send thee to thy father and mother. When thou comest to

them please speak well of us, and tell them how kind we have been; please come to us again and we will sacrifice thee.” Having been secured with ropes, the bear is then let out of the cage and assailed with a shower of blunt arrows in order to rouse it to fury. When it has spent itself in vain struggles, it is tied up to a stake, gagged and strangled, its neck being placed between two poles, which are then violently compressed, all the people eagerly helping to squeeze the animal to death. An arrow is also discharged into the beast's heart by a good marksman, but so as not to shed blood, for they think that it would be very unlucky if any of the blood were to drip on the ground. However, the men sometimes drink the warm blood of the bear "that the courage and other virtues it possesses may pass into them"; and sometimes they besmear themselves and their clothes with the blood in order to ensure success in hunting. When the animal has been strangled to death, it is skinned and its head is cut off and set in the east window of the house, where a piece of its own flesh is placed under its snout, together with a cup of its own meat boiled, some millet dumplings, and dried fish. Prayers are then addressed to the dead animal; amongst other things it is sometimes invited, after going away to its father and mother, to return into the world in order that it may again be reared for sacrifice. When the bear is supposed to have finished eating its own flesh, the man who presides at the feast takes the cup containing the boiled meat, salutes it, and divides the contents between all the company present: every person, young and old alike, must taste a little. The cup is called “the cup of offering” because it has just been offered to the dead bear. When the rest of the flesh has been cooked, it is shared out in like manner among all the people, everybody partaking of at least a morsel; not to partake of the feast would be equivalent to excommunication, it would be to place the recreant outside the pale of Aino fellowship. Formerly every particle of the bear, except the bones, had to be eaten up at the banquet, but this rule is now relaxed. The head, on being detached from the skin, is set up on a long pole beside the sacred wands (*inao*) outside of the house, where it remains till nothing but the bare white skull is left. Skulls so set up are worshipped not only at the time of the festival, but very often as long as they last. The Aino assured Mr. Batchelor that they really do believe the spirits of the worshipful animals to reside in the skulls; that is why they address them as “divine preservers” and “precious divinities.”

The ceremony of killing the bear was witnessed by Dr. B. Scheube on the tenth of August at Kunnui, which is a village on Volcano Bay in the island of Yezo or Yesso. As his description of the rite contains some interesting particulars not mentioned in the foregoing account, it may be worth while to summarise it.

On entering the hut he found about thirty Aino present, men, women, and children, all dressed in their best. The master of the house first offered a libation on the fireplace to the god of the fire, and the guests followed his example. Then a libation was offered to the house-god in his sacred corner of the hut. Meanwhile the housewife, who had nursed the bear, sat by herself, silent and sad, bursting now and then into tears. Her grief was obviously unaffected, and it deepened as the festival went on. Next, the master of the house and some of the guests went out of the hut and offered libations before the bear's cage. A few drops were presented to the bear in a saucer, which he at once upset. Then the women and girls danced round the cage, their faces turned towards it, their knees slightly bent, rising and hopping on their toes. As they danced they clapped their hands and sang a monotonous song. The housewife and a few old women, who might have nursed many bears, danced tearfully, stretching out their arms to the bear, and addressing it in terms of endearment. The young folks were less affected; they laughed as well as sang. Disturbed by the noise, the bear began to rush about his cage and howl lamentably. Next libations were offered at the *inao* (*inabos*) or sacred wands which stand outside of an Aino hut. These wands are about a couple of feet high, and are whittled at the top into spiral shavings. Five new wands with

bamboo leaves attached to them had been set up for the festival. This is regularly done when a bear is killed; the leaves mean that the animal may come to life again. Then the bear was let out of his cage, a rope was thrown round his neck, and he was led about in the neighbourhood of the hut. While this was being done the men, headed by a chief, shot at the beast with arrows tipped with wooden buttons. Dr. Scheube had to do so also. Then the bear was taken before the sacred wands, a stick was put in his mouth, nine men knelt on him and pressed his neck against a beam. In five minutes the animal had expired without uttering a sound. Meantime the women and girls had taken post behind the men, where they danced, lamenting, and beating the men who were killing the bear. The bear's carcass was next placed on the mat before the sacred wands; and a sword and quiver, taken from the wands, were hung round the beast's neck. Being a she-bear, it was also adorned with a necklace and earrings. Then food and drink were offered to it, in the shape of millet-broth, millet-cakes, and a pot of *sake*. The men now sat down on mats before the dead bear, offered libations to it, and drank deep. Meanwhile the women and girls had laid aside all marks of sorrow, and danced merrily, none more merrily than the old women. When the mirth was at its height two young Aino, who had let the bear out of his cage, mounted the roof of the hut and threw cakes of millet among the company, who all scrambled for them without distinction of age or sex. The bear was next skinned and disembowelled, and the trunk severed from the head, to which the skin was left hanging. The blood, caught in cups, was eagerly swallowed by the men. None of the women or children appeared to drink the blood, though custom did not forbid them to do so. The liver was cut in small pieces and eaten raw, with salt, the women and children getting their share. The flesh and the rest of the vitals were taken into the house to be kept till the next day but one, and then to be divided among the persons who had been present at the feast. Blood and liver were offered to Dr. Scheube. While the bear was being disembowelled, the women and girls danced the same dance which they had danced at the beginning—not, however, round the cage, but in front of the sacred wands. At this dance the old women, who had been merry a moment before, again shed tears freely. After the brain had been extracted from the bear's head and swallowed with salt, the skull, detached from the skin, was hung on a pole beside the sacred wands. The stick with which the bear had been gagged was also fastened to the pole, and so were the sword and quiver which had been hung on the carcass. The latter were removed in about an hour, but the rest remained standing. The whole company, men and women, danced noisily before the pole; and another drinking-bout, in which the women joined, closed the festival.

Perhaps the first published account of the bear-feast of the Aino is one which was given to the world by a Japanese writer in 1652. It has been translated into French and runs thus: "When they find a young bear, they bring it home, and the wife suckles it. When it is grown they feed it with fish and fowl and kill it in winter for the sake of the liver, which they esteem an antidote to poison, the worms, colic, and disorders of the stomach. It is of a very bitter taste, and is good for nothing if the bear has been killed in summer. This butchery begins in the first Japanese month. For this purpose they put the animal's head between two long poles, which are squeezed together by fifty or sixty people, both men and women. When the bear is dead they eat his flesh, keep the liver as a medicine, and sell the skin, which is black and commonly six feet long, but the longest measure twelve feet. As soon as he is skinned, the persons who nourished the beast begin to bewail him; afterwards they make little cakes to regale those who helped them."

The Aino of Saghalien rear bear cubs and kill them with similar ceremonies. We are told that they do not look upon the bear as a god but only as a messenger whom they despatch with various commissions to the god of the forest. The animal is kept for about two years in a cage, and then killed at a festival, which always takes place in winter and at night. The day

before the sacrifice is devoted to lamentation, old women relieving each other in the duty of weeping and groaning in front of the bear's cage. Then about the middle of the night or very early in the morning an orator makes a long speech to the beast, reminding him how they have taken care of him, and fed him well, and bathed him in the river, and made him warm and comfortable. "Now," he proceeds, "we are holding a great festival in your honour. Be not afraid. We will not hurt you. We will only kill you and send you to the god of the forest who loves you. We are about to offer you a good dinner, the best you have ever eaten among us, and we will all weep for you together. The Aino who will kill you is the best shot among us. There he is, he weeps and asks your forgiveness; you will feel almost nothing, it will be done so quickly. We cannot feed you always, as you will understand. We have done enough for you; it is now your turn to sacrifice yourself for us. You will ask God to send us, for the winter, plenty of otters and sables, and for the summer, seals and fish in abundance. Do not forget our messages, we love you much, and our children will never forget you." When the bear has partaken of his last meal amid the general emotion of the spectators, the old women weeping afresh and the men uttering stifled cries, he is strapped, not without difficulty and danger, and being let out of the cage is led on leash or dragged, according to the state of his temper, thrice round his cage, then round his master's house, and lastly round the house of the orator. Thereupon he is tied up to a tree, which is decked with sacred whittled sticks (*inao*) of the usual sort; and the orator again addresses him in a long harangue, which sometimes lasts till the day is beginning to break. "Remember," he cries, "remember! I remind you of your whole life and of the services we have rendered you. It is now for you to do your duty. Do not forget what I have asked of you. You will tell the gods to give us riches, that our hunters may return from the forest laden with rare furs and animals good to eat; that our fishers may find troops of seals on the shore and in the sea, and that their nets may crack under the weight of the fish. We have no hope but in you. The evil spirits laugh at us, and too often they are unfavourable and malignant to us, but they will bow before you. We have given you food and joy and health; now we kill you in order that you may in return send riches to us and to our children." To this discourse the bear, more and more surly and agitated, listens without conviction; round and round the tree he paces and howls lamentably, till, just as the first beams of the rising sun light up the scene, an archer speeds an arrow to his heart. No sooner has he done so, than the marksman throws away his bow and flings himself on the ground, and the old men and women do the same, weeping and sobbing. Then they offer the dead beast a repast of rice and wild potatoes, and having spoken to him in terms of pity and thanked him for what he has done and suffered, they cut off his head and paws and keep them as sacred things. A banquet on the flesh and blood of the bear follows. Women were formerly excluded from it, but now they share with the men. The blood is drunk warm by all present; the flesh is boiled, custom forbids it to be roasted. And as the relics of the bear may not enter the house by the door, and Aino houses in Saghalién have no windows, a man gets up on the roof and lets the flesh, the head, and the skin down through the smoke-hole. Rice and wild potatoes are then offered to the head, and a pipe, tobacco, and matches are considerably placed beside it. Custom requires that the guests should eat up the whole animal before they depart: the use of salt and pepper at the meal is forbidden; and no morsel of the flesh may be given to the dogs. When the banquet is over, the head is carried away into the depth of the forest and deposited on a heap of bears' skulls, the bleached and mouldering relics of similar festivals in the past.

The Gilyaks, a Tunguzian people of Eastern Siberia, hold a bear-festival of the same sort once a year in January. "The bear is the object of the most refined solicitude of an entire village and plays the chief part in their religious ceremonies." An old she-bear is shot and her cub is reared, but not suckled, in the village. When the bear is big enough he is taken from his cage and dragged through the village. But first they lead him to the bank of the river, for this

is believed to ensure abundance of fish to each family. He is then taken into every house in the village, where fish, brandy, and so forth are offered to him. Some people prostrate themselves before the beast. His entrance into a house is supposed to bring a blessing; and if he snuffs at the food offered to him, this also is a blessing. Nevertheless they tease and worry, poke and tickle the animal continually, so that he is surly and snappish. After being thus taken to every house, he is tied to a peg and shot dead with arrows. His head is then cut off, decked with shavings, and placed on the table where the feast is set out. Here they beg pardon of the beast and worship him. Then his flesh is roasted and eaten in special vessels of wood finely carved. They do not eat the flesh raw nor drink the blood, as the Aino do. The brain and entrails are eaten last; and the skull, still decked with shavings, is placed on a tree near the house. Then the people sing and both sexes dance in ranks, as bears.

One of these bear-festivals was witnessed by the Russian traveller L. von Schrenck and his companions at the Gilyak village of Tebach in January 1856. From his detailed report of the ceremony we may gather some particulars which are not noticed in the briefer accounts which I have just summarised. The bear, he tells us, plays a great part in the life of all the peoples inhabiting the region of the Amoor and Siberia as far as Kamtchatka, but among none of them is his importance greater than among the Gilyaks. The immense size which the animal attains in the valley of the Amoor, his ferocity whetted by hunger, and the frequency of his appearance, all combine to make him the most dreaded beast of prey in the country. No wonder, therefore, that the fancy of the Gilyaks is busied with him and surrounds him, both in life and in death, with a sort of halo of superstitious fear. Thus, for example, it is thought that if a Gilyak falls in combat with a bear, his soul transmigrates into the body of the beast. Nevertheless his flesh has an irresistible attraction for the Gilyak palate, especially when the animal has been kept in captivity for some time and fattened on fish, which gives the flesh, in the opinion of the Gilyaks, a peculiarly delicious flavour. But in order to enjoy this dainty with impunity they deem it needful to perform a long series of ceremonies, of which the intention is to delude the living bear by a show of respect, and to appease the anger of the dead animal by the homage paid to his departed spirit. The marks of respect begin as soon as the beast is captured. He is brought home in triumph and kept in a cage, where all the villagers take it in turns to feed him. For although he may have been captured or purchased by one man, he belongs in a manner to the whole village. His flesh will furnish a common feast, and hence all must contribute to support him in his life. His diet consists exclusively of raw or dried fish, water, and a sort of porridge compounded of powdered fish-skins, train-oil, and whortle-berries. The length of time he is kept in captivity depends on his age. Old bears are kept only a few months; cubs are kept till they are full-grown. A thick layer of fat on the captive bear gives the signal for the festival, which is always held in winter, generally in December but sometimes in January or February. At the festival witnessed by the Russian travellers, which lasted a good many days, three bears were killed and eaten. More than once the animals were led about in procession and compelled to enter every house in the village, where they were fed as a mark of honour, and to shew that they were welcome guests. But before the beasts set out on this round of visits, the Gilyaks played at skipping-rope in presence, and perhaps, as L. von Schrenck inclined to believe, in honour of the animals. The night before they were killed, the three bears were led by moonlight a long way on the ice of the frozen river. That night no one in the village might sleep. Next day, after the animals had been again led down the steep bank to the river, and conducted thrice round the hole in the ice from which the women of the village drew their water, they were taken to an appointed place not far from the village, and shot to death with arrows. The place of sacrifice or execution was marked as holy by being surrounded with whittled sticks, from the tops of which shavings hung in curls. Such sticks are with the Gilyaks, as with the Aino, the regular symbols that accompany all religious ceremonies. Before the bears received the fatal shafts

from two young men chosen for the purpose, the boys were allowed to discharge their small but not always harmless arrows at the beasts. As soon as the carcasses had been cut up, the skins with the heads attached to them were set up in a wooden cage in such a way as to make it appear that the animals had entered the cage and were looking out of it. The blood which flowed from the bears on the spot where they were killed was immediately covered up with snow, to prevent any one from accidentally treading on it, a thing which was strictly tabooed.

When the house has been arranged and decorated for their reception, the skins of the bears, with their heads attached to them, are brought into it, not however by the door, but through a window, and then hung on a sort of scaffold opposite the hearth on which the flesh is to be cooked. This ceremony of bringing the bears' skins into the house by the window was not witnessed by the Russian travellers, who only learned of it at second hand. They were told that when the thin disc of fish-skin, which is the substitute for a pane of glass in the window, has been replaced after the passage of the bear-skins, a figure of a toad made of birch bark is affixed to it on the outside, while inside the house a figure of a bear dressed in Gilyak costume is set on the bench of honour. The meaning of this part of the ceremony, as it is conjecturally interpreted by Von Schrenck, may be as follows. The toad is a creature that has a very evil reputation with the Gilyaks, and accordingly they attempt to lay upon it, as on a scapegoat, the guilt of the slaughter of the worshipful bear. Hence its effigy is excluded from the house and has to remain outside at the window, a witness of its own misdeeds; whereas the bear is brought into the house and treated as an honoured guest, for fish and flesh are laid before it, and its effigy, dressed in Gilyak costume, is seated on the bench of honour.

The boiling of the bears' flesh among the Gilyaks is done only by the oldest men, whose high privilege it is; women and children, young men and boys have no part in it. The task is performed slowly and deliberately, with a certain solemnity. On the occasion described by the Russian travellers the kettle was first of all surrounded with a thick wreath of shavings, and then filled with snow, for the use of water to cook bear's flesh is forbidden. Meanwhile a large wooden trough, richly adorned with arabesques and carvings of all sorts, was hung immediately under the snouts of the bears; on one side of the trough was carved in relief a bear, on the other side a toad. When the carcasses were being cut up, each leg was laid on the ground in front of the bears, as if to ask their leave, before being placed in the kettle; and the boiled flesh was fished out of the kettle with an iron hook, and set in the trough before the bears, in order that they might be the first to taste of their own flesh. As fast, too, as the fat was cut in strips it was hung up in front of the bears, and afterwards laid in a small wooden trough on the ground before them. Last of all the inner organs of the beasts were cut up and placed in small vessels. At the same time the women made bandages out of parti-coloured rags, and after sunset these bandages were tied round the bears' snouts just below the eyes "in order to dry the tears that flowed from them." To each bandage, just below the eyes, was attached a figure of a toad cut out of birch bark. The meaning of this appears to be, as Von Schrenck conjectured, as follows. With the carving of his inner organs, the heart, liver, and so forth, the bear sees that his fate is sealed, and sheds some natural tears at his hard lot. These tears trickle down his snout over the figure of the toad, which the poor deluded bear accordingly regards as the author of all the mischief. For he cannot blame the Gilyaks, who have treated him so kindly. Have they not received him as a guest in their house, set him on the seat of honour, given him of their best, and done nothing but with his knowledge and permission? Finally, have not their women shewn him the last delicate mark of attention by drying the tears that flow from his eyes and trickle down his nose? Surely then he cannot think that these kindly folk have done him any harm; it was all the fault of the unprincipled toad.

Whatever may be thought of this explanation, as soon as the ceremony of wiping away poor bruin's tears had been performed, the assembled Gilyaks set to work in earnest to devour his flesh. The broth obtained by boiling the meat had already been partaken of. The wooden bowls, platters, and spoons out of which the Gilyaks eat the broth and flesh of the bears on these occasions are always made specially for the purpose at the festival and only then; they are elaborately ornamented with carved figures of bears and other devices that refer to the animal or the festival, and the people have a strong superstitious scruple against parting with them. While the festival lasts, no salt may be used in cooking the bear's flesh or indeed any other food; and no flesh of any kind may be roasted, for the bear would hear the hissing and sputtering of the roasting flesh, and would be very angry. After the bones had been picked clean they were put back in the kettle in which the flesh had been boiled. And when the festal meal was over, an old man took his stand at the door of the house with a branch of fir in his hand, with which, as the people passed out, he gave a light blow to every one who had eaten of the bear's flesh or fat, perhaps as a punishment for their treatment of the worshipful animal. In the afternoon of the same day the women performed a strange dance. Only one woman danced at a time, throwing the upper part of her body into the oddest postures, while she held in her hands a branch of fir or a kind of wooden castanets. The other women meanwhile played an accompaniment in a peculiar rhythm by drumming on the beams of the house with clubs. The dance reminded one of the Russian travellers of the bear-dance which he had seen danced by the women of Kamtchatka. Von Schrenck believes, though he has not positive evidence, that after the fat and flesh of the bear have been consumed, his skull is cleft with an axe, and the brain taken out and eaten. Then the bones and the skull are solemnly carried out by the oldest people to a place in the forest not far from the village. There all the bones except the skull are buried. After that a young tree is felled a few inches above the ground, its stump cleft, and the skull wedged into the cleft. When the grass grows over the spot, the skull disappears from view, and that is the end of the bear.

Another description of the bear-festivals of the Gilyaks has been given us by Mr. Leo Sternberg. It agrees substantially with the foregoing accounts, but a few particulars in it may be noted. According to Mr. Sternberg, the festival is usually held in honour of a deceased relation: the next of kin either buys or catches a bear cub and nurtures it for two or three years till it is ready for the sacrifice. Only certain distinguished guests (*Narch-en*) are privileged to partake of the bear's flesh, but the host and members of his clan eat a broth made from the flesh; great quantities of this broth are prepared and consumed on the occasion. The guests of honour (*Narch-en*) must belong to the clan into which the host's daughters and the other women of his clan are married: one of these guests, usually the host's son-in-law, is entrusted with the duty of shooting the bear dead with an arrow. The skin, head, and flesh of the slain bear are brought into the house not through the door but through the smoke-hole; a quiver full of arrows is laid under the head and beside it are deposited tobacco, sugar, and other food. The soul of the bear is supposed to carry off the souls of these things with it on the far journey. A special vessel is used for cooking the bear's flesh, and the fire must be kindled by a sacred apparatus of flint and steel, which belongs to the clan and is handed down from generation to generation, but which is never used to light fires except on these solemn occasions. Of all the many viands cooked for the consumption of the assembled people a portion is placed in a special vessel and set before the bear's head: this is called "feeding the head." After the bear has been killed, dogs are sacrificed in couples of male and female. Before being throttled, they are fed and invited to go to their lord on the highest mountain, to change their skins, and to return next year in the form of bears. The soul of the dead bear departs to the same lord, who is also lord of the primaeval forest; it goes away laden with the offerings that have been made to it, and attended by the souls of the dogs and also by the souls of the sacred whittled sticks, which figure prominently at the festival.

The Goldi, neighbours of the Gilyaks, treat the bear in much the same way. They hunt and kill it; but sometimes they capture a live bear and keep him in a cage, feeding him well and calling him their son and brother. Then at a great festival he is taken from his cage, paraded about with marked consideration, and afterwards killed and eaten. "The skull, jaw-bones, and ears are then suspended on a tree, as an antidote against evil spirits; but the flesh is eaten and much relished, for they believe that all who partake of it acquire a zest for the chase, and become courageous."

The Orotchis, another Tunguzian people of the region of the Amoor, hold bear-festivals of the same general character. Any one who catches a bear cub considers it his bounden duty to rear it in a cage for about three years, in order at the end of that time to kill it publicly and eat the flesh with his friends. The feasts being public, though organised by individuals, the people try to have one in each Orotchi village every year in turn. When the bear is taken out of his cage, he is led about by means of ropes to all the huts, accompanied by people armed with lances, bows, and arrows. At each hut the bear and bear-leaders are treated to something good to eat and drink. This goes on for several days until all the huts, not only in that village but also in the next, have been visited. The days are given up to sport and noisy jollity. Then the bear is tied to a tree or wooden pillar and shot to death by the arrows of the crowd, after which its flesh is roasted and eaten. Among the Orotchis of the Tundja River women take part in the bear-feasts, while among the Orotchis of the River Vi the women will not even touch bear's flesh.

In the treatment of the captive bear by these tribes there are features which can hardly be distinguished from worship. Such, for example, are the prayers offered to it both alive and dead; the offerings of food, including portions of its own flesh, laid before the animal's skull; and the Gilyak custom of leading the living beast on to the ice of the river in order to ensure a supply of fish, and of conducting him from house to house in order that every family may receive his blessing, just as in Europe a May-tree or a personal representative of the tree-spirit used to be taken from door to door in spring for the sake of diffusing among all and sundry the fresh energies of reviving nature. Again, the solemn participation in his flesh and blood, and particularly the Aino custom of sharing the contents of the cup which had been consecrated by being set before the dead beast, are strongly suggestive of a sacrament, and the suggestion is confirmed by the Gilyak practice of reserving special vessels to hold the flesh and cooking it on a fire kindled by a sacred apparatus which is never employed except on these religious occasions. Indeed our principal authority on Aino religion, the Rev. John Batchelor, frankly describes as worship the ceremonious respect which the Aino pay to the bear, and he affirms that the animal is undoubtedly one of their gods. Certainly the Aino appear to apply their name for god (*kamui*) freely to the bear; but, as Mr. Batchelor himself points out, that word is used with many different shades of meaning and is applied to a great variety of objects, so that from its application to the bear we cannot safely argue that the animal is actually regarded as a deity. Indeed we are expressly told that the Aino of Saghalien do not consider the bear to be a god but only a messenger to the gods, and the message with which they charge the animal at its death bears out the statement. Apparently the Gilyaks also look on the bear in the light of an envoy despatched with presents to the Lord of the Mountain, on whom the welfare of the people depends. At the same time they treat the animal as a being of a higher order than man, in fact as a minor deity, whose presence in the village, so long as he is kept and fed, diffuses blessings, especially by keeping at bay the swarms of evil spirits who are constantly lying in wait for people, stealing their goods and destroying their bodies by sickness and disease. Moreover, by partaking of the flesh, blood, or broth of the bear, the Gilyaks, the Aino, and the Goldi are all of opinion that they acquire some portion of the animal's mighty powers, particularly his courage and strength. No wonder,

therefore, that they should treat so great a benefactor with marks of the highest respect and affection.

Some light may be thrown on the ambiguous attitude of the Aino to bears by comparing the similar treatment which they accord to other creatures. For example, they regard the eagle-owl as a good deity who by his hooting warns men of threatened evil and defends them against it; hence he is loved, trusted, and devoutly worshipped as a divine mediator between men and the Creator. The various names applied to him are significant both of his divinity and of his mediatorship. Whenever an opportunity offers, one of these divine birds is captured and kept in a cage, where he is greeted with the endearing titles of "Beloved god" and "Dear little divinity." Nevertheless the time comes when the dear little divinity is throttled and sent away in his capacity of mediator to take a message to the superior gods or to the Creator himself. The following is the form of prayer addressed to the eagle-owl when it is about to be sacrificed: "Beloved deity, we have brought you up because we loved you, and now we are about to send you to your father. We herewith offer you food, *inao*, wine, and cakes; take them to your parent, and he will be very pleased. When you come to him say, 'I have lived a long time among the Aino, where an Aino father and an Aino mother reared me. I now come to thee. I have brought a variety of good things. I saw while living in Aino-land a great deal of distress. I observed that some of the people were possessed by demons, some were wounded by wild animals, some were hurt by landslides, others suffered shipwreck, and many were attacked by disease. The people are in great straits. My father, hear me, and hasten to look upon the Aino and help them.' If you do this, your father will help us."

Again, the Aino keep eagles in cages, worship them as divinities, and ask them to defend the people from evil. Yet they offer the bird in sacrifice, and when they are about to do so they pray to him, saying: "O precious divinity, O thou divine bird, pray listen to my words. Thou dost not belong to this world, for thy home is with the Creator and his golden eagles. This being so, I present thee with these *inao* and cakes and other precious things. Do thou ride upon the *inao* and ascend to thy home in the glorious heavens. When thou arrivest, assemble the deities of thy own kind together and thank them for us for having governed the world. Do thou come again, I beseech thee, and rule over us. O my precious one, go thou quietly." Once more, the Aino revere hawks, keep them in cages, and offer them in sacrifice. At the time of killing one of them the following prayer should be addressed to the bird: "O divine hawk, thou art an expert hunter, please cause thy cleverness to descend on me." If a hawk is well treated in captivity and prayed to after this fashion when he is about to be killed, he will surely send help to the hunter.

Thus the Aino hopes to profit in various ways by slaughtering the creatures, which, nevertheless, he treats as divine. He expects them to carry messages for him to their kindred or to the gods in the upper world; he hopes to partake of their virtues by imbibing parts of their bodies or in other ways; and apparently he looks forward to their bodily resurrection in this world, which will enable him again to catch and kill them, and again to reap all the benefits which he has already derived from their slaughter. For in the prayers addressed to the worshipful bear and the worshipful eagle before they are knocked on the head the creatures are invited to come again, which seems clearly to point to a faith in their future resurrection. If any doubt could exist on this head, it would be dispelled by the evidence of Mr. Batchelor, who tells us that the Aino "are firmly convinced that the spirits of birds and animals killed in hunting or offered in sacrifice come and live again upon the earth clothed with a body; and they believe, further, that they appear here for the special benefit of men, particularly Aino hunters." The Aino, Mr. Batchelor tells us, "confessedly slays and eats the beast that another may come in its place and be treated in like manner"; and at the time of sacrificing the creatures "prayers are said to them which form a request that they will come again and

furnish viands for another feast, as if it were an honour to them to be thus killed and eaten, and a pleasure as well. Indeed such is the people's idea." These last observations, as the context shews, refer especially to the sacrifice of bears.

Thus among the benefits which the Aino anticipates from the slaughter of the worshipful animals not the least substantial is that of gorging himself on their flesh and blood, both on the present and on many a similar occasion hereafter; and that pleasing prospect again is derived from his firm faith in the spiritual immortality and bodily resurrection of the dead animals. A like faith is shared by many savage hunters in many parts of the world and has given rise to a variety of quaint customs, some of which will be described presently. Meantime it is not unimportant to observe that the solemn festivals at which the Aino, the Gilyaks, and other tribes slaughter the tame caged bears with demonstrations of respect and sorrow, are probably nothing but an extension or glorification of similar rites which the hunter performs over any wild bear which he chances to kill in the forest. Indeed with regard to the Gilyaks we are expressly informed that this is the case. If we would understand the meaning of the Gilyak ritual, says Mr. Sternberg, "we must above all remember that the bear-festivals are not, as is usually but falsely assumed, celebrated only at the killing of a house-bear but are held on every occasion when a Gilyak succeeds in slaughtering a bear in the chase. It is true that in such cases the festival assumes less imposing dimensions, but in its essence it remains the same. When the head and skin of a bear killed in the forest are brought into the village, they are accorded a triumphal reception with music and solemn ceremonial. The head is laid on a consecrated scaffold, fed, and treated with offerings, just as at the killing of a house-bear; and the guests of honour (*Narch-en*) are also assembled. So, too, dogs are sacrificed, and the bones of the bear are preserved in the same place and with the same marks of respect as the bones of a house-bear. Hence the great winter festival is only an extension of the rite which is observed at the slaughter of every bear."

Thus the apparent contradiction in the practice of these tribes, who venerate and almost deify the animals which they habitually hunt, kill, and eat, is not so flagrant as at first sight it appears to us: the people have reasons, and some very practical reasons, for acting as they do. For the savage is by no means so illogical and unpractical as to superficial observers he is apt to seem; he has thought deeply on the questions which immediately concern him, he reasons about them, and though his conclusions often diverge very widely from ours, we ought not to deny him the credit of patient and prolonged meditation on some fundamental problems of human existence. In the present case, if he treats bears in general as creatures wholly subservient to human needs and yet singles out certain individuals of the species for homage which almost amounts to deification, we must not hastily set him down as irrational and inconsistent, but must endeavour to place ourselves at his point of view, to see things as he sees them, and to divest ourselves of the prepossessions which tinge so deeply our own views of the world. If we do so, we shall probably discover that, however absurd his conduct may appear to us, the savage nevertheless generally acts on a train of reasoning which seems to him in harmony with the facts of his limited experience. This I propose to illustrate in the following chapter, where I shall attempt to shew that the solemn ceremonial of the bear-festival among the Ainos and other tribes of north-eastern Asia is only a particularly striking example of the respect which on the principles of his rude philosophy the savage habitually pays to the animals which he kills and eats.

XIV. The Propitiation of Wild Animals by Hunters

The explanation of life by the theory of an indwelling and practically immortal soul is one which the savage does not confine to human beings but extends to the animate creation in general. In so doing he is more liberal and perhaps more logical than the civilised man, who commonly denies to animals that privilege of immortality which he claims for himself. The savage is not so proud; he commonly believes that animals are endowed with feelings and intelligence like those of men, and that, like men, they possess souls which survive the death of their bodies either to wander about as disembodied spirits or to be born again in animal form. Thus, for example, we are told that the Indian of Guiana does not see “any sharp line of distinction, such as we see, between man and other animals, between one kind of animal and another, or between animals—man included—and inanimate objects. On the contrary, to the Indian, all objects, animate and inanimate, seem exactly of the same nature except that they differ in the accident of bodily form. Every object in the whole world is a being, consisting of a body and spirit, and differs from every other object in no respect except that of bodily form, and in the greater or less degree of brute power and brute cunning consequent on the difference of bodily form and bodily habits.” Similarly we read that “in Cherokee mythology, as in that of Indian tribes generally, there is no essential difference between men and animals. In the primal genesis period they seem to be completely undifferentiated, and we find all creatures alike living and working together in harmony and mutual helpfulness until man, by his aggressiveness and disregard for the rights of the others, provokes their hostility, when insects, birds, fishes, reptiles, and fourfooted beasts join forces against him. Henceforth their lives are apart, but the difference is always one of degree only. The animals, like the people, are organized into tribes and have like them their chiefs and townhouses, their councils and ballplays, and the same hereafter in the Darkening land of Usunhiyi. Man is still the paramount power, and hunts and slaughters the others as his own necessities compel, but is obliged to satisfy the animal tribes in every instance, very much as a murder is compounded for, according to the Indian system, by ‘covering the bones of the dead’ with presents for the bereaved relatives.” To the same effect another observer of the North American Indians writes: “I have often reflected on the curious connexion which appears to subsist in the mind of an Indian between man and the brute creation, and found much matter in it for curious observation. Although they consider themselves superior to all other animals and are very proud of that superiority; although they believe that the beasts of the forest, the birds of the air, and the fishes of the waters, were created by the Almighty Being for the use of man; yet it seems as if they ascribe the difference between themselves and the brute kind, and the dominion which they have over them, more to their superior bodily strength and dexterity than to their immortal souls. All beings endowed by the Creator with the power of volition and self-motion, they view in a manner as a great society of which they are the head, whom they are appointed, indeed, to govern, but between whom and themselves intimate ties of connexion and relationship may exist, or at least did exist in the beginning of time. They are, in fact, according to their opinions, only the first among equals, the legitimate hereditary sovereigns of the whole animated race, of which they are themselves a constituent part. Hence, in their languages, those inflections of their nouns which we call *genders*, are not, as with us, descriptive of the *masculine* and *feminine* species, but of the *animate* and *inanimate* kinds. Indeed, they go so far as to include trees and plants within the first of these descriptions. All animated nature, in whatever degree, is in their eyes a great whole, from which they have not yet ventured to separate themselves. They do not exclude other animals from their world of spirits, the place to which they expect to go after

death.” Even Chinese authors “have roundly avowed themselves altogether unable to discover any real difference between men and animals,” and they have drawn out the parallelism between the two in some detail.

But it is not merely between the mental and spiritual nature of man and the animals that the savage traces a close resemblance; even the distinction of their bodily form appears sometimes to elude his dull apprehension. An unusually intelligent Bushman questioned by a missionary “could not state any difference between a man and a brute—he did not know but a buffalo might shoot with bows and arrows as well as a man, if it had them.” In the opinion of the Gilyak, “the form and size of an animal are merely a sort of appearance. Every animal is in point of fact a real being like man, nay a Gilyak such as himself, but endowed with reason and strength which often surpass those of mere men.” Nor is it merely that in the mental fog the savage takes beasts for men; he seems to be nearly as ready to take himself and his fellows for beasts. When the Russians first landed on one of the Alaskan islands the people took them for cuttle-fish, “on account of the buttons on their clothes.” We have seen how some savages identify themselves with animals of various sorts by eating the maggots bred in the rotting carcasses of the beasts, and how thereafter, when occasion serves, they behave in their adopted characters by wriggling, roaring, barking, or grunting, according as they happen to be boa-constrictors, lions, jackals, or hippopotamuses. In the island of Mabuiag men of the Sam, that is, the Cassowary, totem think that cassowaries are men or nearly so. “Sam he all same as relation, he belong same family,” is the account they give of their kinship with the creature. Conversely they hold that they themselves are cassowaries, or at all events that they possess some of the qualities of the long-legged bird. When a Cassowary man went forth to reap laurels on the field of battle, he used to reflect with satisfaction on the length of his lower limbs: “My leg is long and thin, I can run and not feel tired; my legs will go quickly and the grass will not entangle them.” Omaha Indians believe that between a man and the creature which is his guardian spirit there subsists so close a bond that the man acquires the powers and qualities, the virtues and defects of the animal. Thus if a man has seen a bear in that vision at puberty which determines an Indian's guardian spirit, he will be apt to be wounded in battle, because the bear is a slow and clumsy animal and easily trapped. If he has dreamed of an eagle, he will be able to see into the future and foretell coming events, because the eagle's vision is keen and piercing. Similarly, the Thompson Indians of British Columbia imagined that every man partook of the nature of the animal which was his guardian spirit; for example, a man who had the grisly bear for his protector would prove a much fiercer warrior than one who had only a crow, a coyote, or a fox for his guardian spirit. And before they set out on the war-path these Indians used to perform a mimic battle, in which each man, tricked out with paint and feathers, imitated the sounds of the animal that was his guardian spirit, grunting and whooping in character. The Bororos, a tribe of Indians in the heart of Brazil, will have it that they are parrots of a gorgeous red plumage which live in the Brazilian forest. It is not merely that their souls will pass into these birds at death, but they themselves are actually identical with them in their life, and accordingly they treat the parrots as they might treat their fellow-tribesmen, keeping them in captivity, refusing to eat their flesh, and mourning for them when they die. However, they kill the wild birds for their feathers, and, though they will not kill, they pluck the tame ones to deck their own naked brown bodies with the gaudy plumage of their feathered brethren.

Thus to the savage, who regards all living creatures as practically on a footing of equality with man, the act of killing and eating an animal must wear a very different aspect from that which the same act presents to us, who regard the intelligence of animals as far inferior to our own and deny them the possession of immortal souls. Hence on the principles of his rude philosophy the primitive hunter who slays an animal believes himself exposed to the

vengeance either of its disembodied spirit or of all the other animals of the same species, whom he considers as knit together, like men, by the ties of kin and the obligations of the blood feud, and therefore as bound to resent the injury done to one of their number. Accordingly the savage makes it a rule to spare the life of those animals which he has no pressing motive for killing, at least such fierce and dangerous animals as are likely to exact a bloody vengeance for the slaughter of one of their kind. Crocodiles are animals of this sort. They are only found in hot countries, where, as a rule, food is abundant and primitive man has therefore little reason to kill them for the sake of their tough and unpalatable flesh. Hence it is a custom with some savages to spare crocodiles, or rather only to kill them in obedience to the law of blood feud, that is, as a retaliation for the slaughter of men by crocodiles. For example, the Dyaks of Borneo will not kill a crocodile unless a crocodile has first killed a man. "For why, say they, should they commit an act of aggression, when he and his kindred can so easily repay them? But should the alligator take a human life, revenge becomes a sacred duty of the living relatives, who will trap the man-eater in the spirit of an officer of justice pursuing a criminal. Others, even then, hang back, reluctant to embroil themselves in a quarrel which does not concern them. The man-eating alligator is supposed to be pursued by a righteous Nemesis; and whenever one is caught they have a profound conviction that it must be the guilty one, or his accomplice."

When a Dyak has made up his mind to take vengeance on the crocodiles for the death of a kinsman, he calls in the help of a Pangareran, a man whose business it is to charm and catch crocodiles and to make them do his will. While he is engaged in the discharge of his professional duties the crocodile-catcher has to observe a number of odd rules. He may not go to anybody and may not even pass in front of a window, because he is unclean. He may not himself cook anything nor come near a fire. If he would eat fruit, he may not peel or husk it himself, but must get others to do it for him. He may not even chew his food, but is obliged to swallow it unchewed. A little hut is made for him on the bank of the river, where he uses divination by means of the figure of a crocodile drawn on a piece of bamboo for the purpose of determining whether his undertaking will prosper. The boat in which he embarks to catch the wicked man-eating crocodile must be painted yellow and red, and in the middle of it lances are erected with the points upward. Then the man of skill casts lots to discover whether the hook is to be baited with pork, or venison, or the flesh of a dog or an ass. In throwing the baited hook into the water he calls out: "Ye crocodiles who are up stream, come down; and ye crocodiles who are down stream, come up; for I will give you all good food, as sweet as sugar and as fat as coco-nut. I will give you a pretty and beautiful necklace. When you have got it, keep it in your neck and body, for this food is very *pahuni*," which means that it would be sinful not to eat it. If a crocodile bites at the hook, the crocodile-catcher bawls out, "Choose a place for yourself where you will lie; for many men are come to see you. They are come joyfully and exultingly, and they give you a knife, a lance, and a shroud." If the crocodile is a female, he addresses her as "Princess"; if it is a male, he calls it "Prince." The enchanter, who is generally a cunning Malay, must continue his operations till he catches a crocodile in which traces are to be found shewing that the animal has indeed devoured a human being. Then the death of the man is atoned for, and in order not to offend the water-spirits a cat is sacrificed to the crocodiles. The heads of the dead crocodiles are fastened on stakes beside the river, where in time they bleach white and stand out sharply against the green background of the forest. While the captured crocodile is being hauled in to the bank, the subtle Dyaks speak softly to him and beguile him into offering no resistance; but once they have him fast, with arms and legs securely pinioned, they howl at him and deride him for his credulity, while they rip up the belly of the infuriated and struggling brute to find the evidence of his guilt in the shape of human remains. On one occasion Rajah Brooke of Sarawak was present at a discussion among a party of Dyaks as to how they ought

to treat a captured crocodile. One side maintained that it was proper to bestow all praise and honour on the kingly beast, since he was himself a rajah among animals and was now brought there to meet the rajah; in short, they held that praise and flattery were agreeable to him and would put him on his best behaviour. The other side fully admitted that on this occasion rajah met rajah; yet with prudent foresight they pointed to the dangerous consequences which might flow from establishing a precedent such as their adversaries contended for. If once a captured crocodile, said they, were praised and honoured, the other crocodiles, on hearing of it, would be puffed up with pride and ambition, and being seized with a desire to emulate the glory of their fellow would enter on a career of man-eating as the road likely to lead them by the shortest cut to the temple of fame.

The Minangkabauers of Sumatra have also a great respect for crocodiles. Their celebrated law-giver Katoemanggoengan was indeed born again in the form of a crocodile; and thus his descendants, including the rajah of Indrapoera and his family, are more or less distant cousins of the crocodiles, and enjoy the help and protection of the creatures in many ways, for example when they go on a journey. The respect entertained for the animals is also attested by the ceremonies observed in some places when a crocodile has been caught. A crowd of women then performs certain dances which closely resemble the dances performed when somebody has died. Moreover, it is a rule with the Minangkabauers that no cooking-pot may be washed in a river; to do so would be like offering the crocodiles the leavings of your food, and they would very naturally resent it. For the same reason in washing up the dinner or supper plates you must be careful not to make a splashing, or the crocodiles would hear it and take umbrage.

Among the Malays of Patani Bay, in Siam, there is a family whose members may not kill a crocodile nor even be present when one of these ferocious reptiles is captured. The reason alleged for this forbearance is that the family claim kindred with a woman named Betimor, who was drowned in the river and afterwards turned into a crocodile. After her transformation she appeared to her father in a dream and told him what had become of her; so he went down to the river and made offerings to her of rice and wax tapers. There is a shrine on the spot where the woman was transformed into a crocodile, and any one may dedicate offerings there and pray to Toh Sri Lam; for so she has been called ever since her metamorphosis. Members of the crocodile family call on her for help in sickness and other misfortunes, and they will do so on behalf of other people for a proper consideration. Rice and wax tapers are the usual offerings. In many islands of the Indian Archipelago, including Java, Sumatra, Celebes, Timor, and Ceram, this belief in a kinship of men with crocodiles assumes a peculiar form. The people imagine that women are often delivered of a child and a crocodile at the same birth, and that when this happens, the midwife carries the crocodile twin carefully down to the river and places it in the water. The family in which such a birth is thought to have happened, constantly put victuals into the river for their amphibious relation; and in particular the human twin, so long as he lives, goes down to the river at stated seasons to do his duty by his crocodile brother or sister; and if he were to fail to do so, it is the universal opinion that he would be visited with sickness or death for his unnatural conduct. Large parties of these crocodile people periodically go out in a boat furnished with great plenty of provisions and all kinds of music, and they row backwards and forwards, with the music playing, in places where crocodiles do most abound. As they do so they sing and weep by turns, each of them invoking his animal kinsfolk, till the snout of one of the brutes bobs up from the water, whereupon the music stops, and food, betel, and tobacco are thrown into the river. By these delicate attentions they hope to recommend themselves to the formidable creatures.

The crocodiles about the island of Damba in the Victoria Nyanza were sacred and might not be molested in any way. Hence they multiplied and became dangerous; people made offerings to them in the hope of being spared by the monsters when they crossed in the ferries. From time to time batches of men were brought down to the beach and sacrificed to the crocodiles. Their arms and legs were broken so that they could not stir from the spot; then they were laid out in a row on the shore, and the crocodiles came and dragged them into the water. On the island there was a temple dedicated to the crocodiles, and here an inspired medium resided who gave oracular responses. Under the influence of the spirit he wagged his head from side to side, opening his jaws and snapping them together, just as a crocodile does. No doubt the spirit which possessed him in these moments of fine frenzy was supposed to be that of a crocodile. Similarly in other parts of Uganda men were inspired by the ghosts or spirits of lions, leopards, and serpents, and in that state of exaltation they uttered oracles, roaring like a lion, growling like a leopard, or grovelling and wriggling like a serpent, according to the nature of the spirit by which they were possessed. Crocodiles abound in the Albert Nyanza Lake and its tributaries. In many places they are extremely dangerous, but the Alur tribe of that region only hunt them when they have dragged away a man; and they think that any one who has taken away a crocodile's eggs must be on his guard when he walks near the bank of the river, for the crocodiles will try to avenge the injury by seizing him. In general the Foulahs of Senegambia dare not kill a crocodile from fear of provoking the vengeance of the relations and friends of the murdered reptile; but if the sorcerer gives his consent and passes his word that he will guarantee them against the vengeance of the family of the deceased, they will pluck up courage to attack one of the brutes.

Like the Dyaks, the natives of Madagascar never kill a crocodile "except in retaliation for one of their friends who has been destroyed by a crocodile. They believe that the wanton destruction of one of these reptiles will be followed by the loss of human life, in accordance with the principle of *lex talionis*." The people who live near the lake Itasy in Madagascar make a yearly proclamation to the crocodiles, announcing that they will revenge the death of some of their friends by killing as many crocodiles in return, and warning all well-disposed crocodiles to keep out of the way, as they have no quarrel with them, but only with their evil-minded relations who have taken human life. Various tribes of Madagascar believe themselves to be descended from crocodiles, and accordingly they view the scaly reptile as, to all intents and purposes, a man and a brother. If one of the animals should so far forget himself as to devour one of his human kinsfolk, the chief of the tribe, or in his absence an old man familiar with the tribal customs, repairs at the head of the people to the edge of the water, and summons the family of the culprit to deliver him up to the arm of justice. A hook is then baited and cast into the river or lake. Next day the guilty brother, or one of his family, is dragged ashore, and after his crime has been clearly brought home to him by a strict interrogation, he is sentenced to death and executed. The claims of justice being thus satisfied and the majesty of the law fully vindicated, the deceased crocodile is lamented and buried like a kinsman; a mound is raised over his relics and a stone marks the place of his head. The Malagasy, indeed, regard the crocodile with superstitious veneration as the king of the waters and supreme in his own element. When they are about to cross a river they pronounce a solemn oath, or enter into an engagement to acknowledge his sovereignty over the waters. An aged native has been known to covenant with the crocodiles for nearly half an hour before plunging into the stream. After that he lifted up his voice and addressed the animal, urging him to do him no harm, since he had never hurt the crocodile; assuring him that he had never made war on any of his fellows, but on the contrary had always entertained the highest veneration for him; and adding that if he wantonly attacked him, vengeance would follow sooner or later; while if the crocodile devoured him, his relations and all his race would

declare war against the beast. This harangue occupied another quarter of an hour, after which the orator dashed fearlessly into the stream.

Again, the tiger is another of those dangerous beasts whom the savage prefers to leave alone, lest by killing one of the species he should excite the hostility of the rest. No consideration will induce a Sumatran to catch or wound a tiger except in self-defence or immediately after a tiger has destroyed a friend or relation. When a European has set traps for tigers, the people of the neighbourhood have been known to go by night to the place and explain to the animals that the traps are not set by them nor with their consent. If it is necessary to kill a tiger which has wrought much harm in the village, the Minangkabauers of Sumatra try to catch him alive in order to beg for his forgiveness before despatching him, and in ordinary life they will not speak evil of him or do anything that might displease him. For example, they will not use a path that has been untrodden for more than a year, because the tiger has chosen that path for himself, and would deem it a mark of disrespect were any one else to use it. Again, persons journeying by night will not walk one behind the other, nor keep looking about them, for the tiger would think that this betrayed fear of him, and his feelings would be hurt by the suspicion. Neither will they travel bareheaded, for that also would be disrespectful to the tiger; nor will they knock off the glowing end of a firebrand, for the flying sparks are like the tiger's glistening eyes, and he would treat this as an attempt to mimic him. The population of Mandeling, a district on the west coast of Sumatra, is divided into clans, one of which claims to be descended from a tiger. It is believed that the animal will not attack or rend the members of this clan, because they are his kinsmen. When members of the clan come upon the tracks of a tiger, they enclose them with three little sticks as a mark of homage; and when a tiger has been shot, the women of the clan are bound to offer betel to the dead beast. The Battas of Sumatra seldom kill a tiger except from motives of revenge, observing the rule an eye for an eye and a tooth for a tooth, or, as they express it, "He who owes gold must pay in gold; he who owes breath (that is, life) must pay with breath." Nor can the beast be attacked without some ceremony; only weapons that have proved themselves able to kill may be used for the purpose. When the tiger has been killed, they bring the carcass to the village, set offerings before it, and burn incense over it, praying the spirit of the tiger to quit its material envelope and enter the incense pot. As soon as the soul may be supposed to have complied with this request, a speaker explains to the spirits in general the reasons for killing the tiger, and begs them to set forth these reasons to the departed soul of the beast, lest the latter should be angry and the people should suffer in consequence. Then they dance round the dead body of the tiger till they can dance no longer, after which they skin the carcass and bury it. The inhabitants of the hills near Rajamahall, in Bengal, believe that if any man kills a tiger without divine orders, either he or one of his relations will be devoured by a tiger. Hence they are very averse to killing a tiger, unless one of their kinsfolk has been carried off by one of the beasts. In that case they go out for the purpose of hunting and slaying a tiger; and when they have succeeded they lay their bows and arrows on the carcass and invoke God, declaring that they slew the animal in retaliation for the loss of a kinsman. Vengeance having been thus taken, they swear not to attack another tiger except under similar provocation. The natives of Cochin China have a great respect for the tiger, whom they regard as a terrible divinity. Yet they set traps for him and leave no stone unturned to catch him. Once he is ensnared, they offer him their excuses and condolences for the painful position in which he finds himself.

The Indians of Carolina would not molest snakes when they came upon them, but would pass by on the other side of the path, believing that if they were to kill a serpent, the reptile's kindred would destroy some of their brethren, friends, or relations in return. So the Seminole Indians spared the rattlesnake, because they feared that the soul of the dead rattlesnake would incite its kinsfolk to take vengeance. Once when a rattlesnake appeared in their camp they

entreated an English traveller to rid them of the creature. When he had killed it, they were glad but tried to scratch him as a means of appeasing the spirit of the dead snake. Soon after the Iowas began to build their village near the mouth of Wolf River, a lad came into the village and reported that he had seen a rattlesnake on a hill not far off. A medicine-man immediately repaired to the spot, and finding the snake made it presents of tobacco and other things which he had brought with him for the purpose. He also had a long talk with the animal, and on returning to his people told them that now they might travel about in safety, for peace had been made with the snakes. The Delaware Indians also paid great respect to the rattlesnake, whom they called their grandfather, and they would on no account destroy one of the reptiles. They said that the rattlesnake guarded them and gave them notice of impending danger by his rattle, and that if they were to kill a rattlesnake, the rest of the species would soon hear of it and bite the Indians in revenge. The Potawatomi Indians highly venerated the rattlesnake for a similar reason, being grateful to it for the timely warning which it often gave of the approach of an enemy. Yet a young man who desired to obtain a rattle would have no hesitation in killing one of the snakes for the purpose; but he apologised profusely to the creature for the liberty he took with it, explaining that he required the rattle for the adornment of his person, and that no disrespect was intended to the snake; and in proof of his good will he would leave a piece of tobacco beside the carcass. The Cherokee regard the rattlesnake as the chief of the snake tribe and fear and respect him accordingly. Few Cherokee will venture to kill a rattlesnake, unless they cannot help it, and even then they must atone for the crime by craving pardon of the snake's ghost either in their own person or through the mediation of a priest, according to a set formula. If these precautions are neglected, the kinsfolk of the dead snake will send one of their number as an avenger of blood, who will track down the murderer and sting him to death. It is absolutely necessary to cut off the snake's head and bury it deep in the earth and to hide the body in a hollow log; for if the remains were exposed to the weather, the other snakes would be so angry that they would send torrents of rain and all the streams would overflow their banks. If a Cherokee dreams of being bitten by a snake, he must be treated in exactly the same way as if he had been really bitten; for they think that he has actually been bitten by the ghost of a snake, and that if the proper remedies were not applied to the hurt, the place would swell and ulcerate, though possibly not for years afterwards. Once when an Englishman attempted to kill a rattlesnake, a party of Ojibway Indians, with whom he was travelling, begged him to desist, and endeavoured to appease the snake, addressing it in turns as grandfather, smoking over it, and beseeching it to take care of their families in their absence, and to open the heart of the British Agent so that he should fill their canoe with rum. A storm which overtook them next day on Lake Huron was attributed by them to the wrath of the insulted rattlesnake, and they sought to mollify him by throwing dogs as sacrifices to him into the waves. The Kekchi Indians of Guatemala will not throw serpents or scorpions into the fire, lest the other creatures of the same species should punish them for the outrage.

In Kiziba, a district of Central Africa, to the west of Lake Victoria Nyanza, if a woman accidentally kills a snake with her hoe while she is working in the field, she hastens in great agitation to the snake-priest and hands him over the hoe, together with two strings of cowries and an ox-hide, begging him to appease the angry spirit of the slain serpent. In this application she is accompanied and supported by all the villagers, who share her fears and anxiety. Accordingly the priest beats his drum as a sign that no woman of the village is to work in the fields till further notice. Next he wraps the dead serpent in a piece of the ox-hide and buries it solemnly. On the following day he performs a ceremony of purification for the slaughter of the reptile. He compounds a medicine out of the guts of a leopard or hyaena and earth or mud dissolved in water, and with this mixture he disinfects all the houses in the village, beginning with the house of the woman who killed the serpent. Next he proceeds to

the fields, where all the women of the village have collected their hoes. These he purifies by dipping them in the fluid and then twirling them about so as to make the drops of water fly off. From that moment the danger incurred by the slaughter of the reptile is averted. The spirit of the serpent is appeased, and the women may resume their usual labours in the fields.

When the Kwakiutl Indians of British Columbia have slain a wolf they lay the carcase on a blanket and take out the heart, of which every person who helped to kill the beast must eat four morsels. Then they wail over the body, saying, "Woe! our great friend!" After that they cover the carcase with a blanket and bury it. A bow or gun that killed a wolf is regarded as unlucky, and the owner gives it away. These Indians believe that the slaying of a wolf produces a scarcity of game. When the Tinneh Indians of Central Alaska have killed a wolf or a wolverine, the carcase is brought into the camp or village with great pomp. The people go forth to meet it, saying, "The chief is coming." Then the body is carried into a hut and propped up in a sitting posture; and the medicine-man spreads before it a copious banquet, to which every family in the village has contributed of its best. When the dead animal is supposed to have satisfied his hunger, the men consume the remains of the feast, but no woman is allowed to participate in what has been thus offered to the wolf or the wolverine. No ordinary Cherokee dares to kill a wolf, if he can possibly help it; for he believes that the kindred of the slain beast would surely avenge its death, and that the weapon with which the deed had been done would be quite useless for the future, unless it were cleaned and exorcised by a medicine-man. However, certain persons who know the proper rites of atonement for such a crime can kill wolves with impunity, and they are sometimes hired to do so by people who have suffered from the raids of the wolves on their cattle or fish-traps. The professional wolf-killer prays to the animal whom he has bereaved of life, and seeks to avert the vengeance of the other wolves by laying the blame of the slaughter on the people of another settlement. To purify the gun which has perpetrated the murder, he unscrews the barrel, inserts into it seven small sour-wood rods which have been heated in the fire, and then allows the barrel and its contents to lie in a running stream till morning. When the Chuckchees of north-eastern Siberia have killed a wolf, they hold a festival, at which they cry, "Wolf, be not angry with us. It was not we who killed you, it was the Russians who destroyed you." In ancient Athens any man who killed a wolf had to bury it by subscription.

In Jebel-Nuba, a district of the eastern Sudan, it is forbidden to touch the nests or remove the young of a species of black birds, resembling our blackbirds, because the people believe that the parent birds would avenge the wrong by causing a stormy wind to blow, which would destroy the harvest. Some of the Sudanese negroes of Upper Egypt regard the great black raven (*Corvus umbrinus*) as their uncle and exact pecuniary compensation or blood-money from any one who has been so rash as to slay their sable relative. Having satisfied their scruples on that head, they give the bird a solemn burial, carrying the corpse to the graveyard on a bier with flags and shouts of *la ill Allah*, just as if they were interring one of their kinsfolk. The Palenques of South America are very careful to spare harmless animals which are not good for food; because they believe that any injury inflicted on such creatures would entail the sickness or death of their own children.

But the savage clearly cannot afford to spare all animals. He must either eat some of them or starve, and when the question thus comes to be whether he or the animal must perish, he is forced to overcome his superstitious scruples and take the life of the beast. At the same time he does all he can to appease his victims and their kinsfolk. Even in the act of killing them he testifies his respect for them, endeavours to excuse or even conceal his share in procuring their death, and promises that their remains will be honourably treated. By thus robbing death of its terrors he hopes to reconcile his victims to their fate and to induce their fellows to come and be killed also. For example, it was a principle with the Kamtchatkans never to kill a land

or sea animal without first making excuses to it and begging that the animal would not take it ill. Also they offered it cedar-nuts and so forth, to make it think that it was not a victim but a guest at a feast. They believed that this hindered other animals of the same species from growing shy. For instance, after they had killed a bear and feasted on its flesh, the host would bring the bear's head before the company, wrap it in grass, and present it with a variety of trifles. Then he would lay the blame of the bear's death on the Russians, and bid the beast wreak his wrath upon them. Also he would ask the bear to inform the other bears how well he had been treated, that they too might come without fear. Seals, sea-lions, and other animals were treated by the Kamtchatkans with the same ceremonious respect. Moreover, they used to insert sprigs of a plant resembling bear's wort in the mouths of the animals they killed; after which they would exhort the grinning skulls to have no fear but to go and tell it to their fellows, that they also might come and be caught and so partake of this splendid hospitality. When the Ostiaks have hunted and killed a bear, they cut off its head and hang it on a tree. Then they gather round in a circle and pay it divine honours. Next they run towards the carcass uttering lamentations and saying, "Who killed you? It was the Russians. Who cut off your head? It was a Russian axe. Who skinned you? It was a knife made by a Russian." They explain, too, that the feathers which sped the arrow on its flight came from the wing of a strange bird, and that they did nothing but let the arrow go. They do all this because they believe that the wandering ghost of the slain bear would attack them on the first opportunity, if they did not thus appease it. Or they stuff the skin of the slain bear with hay; and after celebrating their victory with songs of mockery and insult, after spitting on and kicking it, they set it up on its hind legs, "and then, for a considerable time, they bestow on it all the veneration due to a guardian god." When a party of Koryak have killed a bear or a wolf, they skin the beast and dress one of themselves in the skin. Then they dance round the skin-clad man, saying that it was not they who killed the animal, but some one else, generally a Russian. When they kill a fox they skin it, wrap the body in grass, and bid him go tell his companions how hospitably he has been received, and how he has received a new cloak instead of his old one. A fuller account of the Koryak ceremonies is given by a more recent writer. He tells us that when a dead bear is brought to the house, the women come out to meet it dancing with firebrands. The bear-skin is taken off along with the head; and one of the women puts on the skin, dances in it, and entreats the bear not to be angry, but to be kind to the people. At the same time they offer meat on a wooden platter to the dead beast, saying, "Eat, friend." Afterwards a ceremony is performed for the purpose of sending the dead bear, or rather his spirit, away back to his home. He is provided with provisions for the journey in the shape of puddings or reindeer-flesh packed in a grass bag. His skin is stuffed with grass and carried round the house, after which he is supposed to depart towards the rising sun. The intention of the ceremonies is to protect the people from the wrath of the slain bear and his kinsfolk, and so to ensure success in future bear-hunts. The Finns used to try to persuade a slain bear that he had not been killed by them, but had fallen from a tree, or met his death in some other way; moreover, they held a funeral festival in his honour, at the close of which bards expatiated on the homage that had been paid to him, urging him to report to the other bears the high consideration with which he had been treated, in order that they also, following his example, might come and be slain. When the Lapps had succeeded in killing a bear with impunity, they thanked him for not hurting them and for not breaking the clubs and spears which had given him his death wounds; and they prayed that he would not visit his death upon them by sending storms or in any other way. His flesh then furnished a feast.

The reverence of hunters for the bear whom they regularly kill and eat may thus be traced all along the northern region of the Old World, from Bering's Straits to Lappland. It reappears in similar forms in North America. With the American Indians a bear hunt was an important event for which they prepared by long fasts and purgations. Before setting out they offered

expiatory sacrifices to the souls of bears slain in previous hunts, and besought them to be favourable to the hunters. When a bear was killed the hunter lit his pipe, and putting the mouth of it between the bear's lips, blew into the bowl, filling the beast's mouth with smoke. Then he begged the bear not to be angry at having been killed, and not to thwart him afterwards in the chase. The carcase was roasted whole and eaten; not a morsel of the flesh might be left over. The head, painted red and blue, was hung on a post and addressed by orators, who heaped praise on the dead beast. When men of the Bear clan in the Ottawa tribe killed a bear, they made him a feast of his own flesh, and addressed him thus: "Cherish us no grudge because we have killed you. You have sense; you see that our children are hungry. They love you and wish to take you into their bodies. Is it not glorious to be eaten by the children of a chief?" Amongst the Nootka Indians of British Columbia, when a bear had been killed, it was brought in and seated before the head chief in an upright posture, with a chief's bonnet, wrought in figures, on its head, and its fur powdered over with white down. A tray of provisions was then set before it, and it was invited by words and gestures to eat. After that the animal was skinned, boiled, and eaten. The Assiniboins pray to the bear and offer sacrifices to it of tobacco, belts, and other valuable objects. Moreover, they hold feasts in its honour, that they may win the beast's favour and live safe and sound. The bear's head is often kept in camp for several days mounted in some suitable position and decked with scraps of scarlet cloth, necklaces, collars, and coloured feathers. They offer the pipe to it, and pray that they may be able to kill all the bears they meet, without harm to themselves, for the purpose of anointing themselves with his fine grease and banqueting on his tender flesh. The Ojibways will not suffer dogs to eat the flesh or gnaw the bones of a bear, and they throw all the waste portions into the fire. They think that if the flesh were desecrated, they would have no luck in hunting bears thereafter. A trader of the eighteenth century has described the endearments which a party of Ojibways lavished on a she-bear which he had just killed. They took her head in their hands, stroked it and kissed it, and begged a thousand pardons for her violent death; they called her their relation and grandmother, and begged her not to lay the fault at their door, for indeed it was an Englishman who had killed her. Having severed the head from the body, they adorned it with all the trinkets they could muster and set it up on a scaffold in the lodge. Next day pipes were lit and tobacco smoke blown into the nostrils of the dead bear, and the trader was invited to pay this mark of respect to the animal as an atonement for having taken her life. Before they feasted on the bear's flesh, an orator made a speech in which he deplored the sad necessity under which they laboured of destroying their friends the bears; for how otherwise could they subsist? Some of the Indians of the Queen Charlotte Islands, off the north-western coast of America, used to mark the skins of bears, otters, and other animals with four red crosses in a line, by way of propitiating the spirit of the beast they had killed. When the Thompson Indians of British Columbia were about to hunt bears, they would sometimes address the animal and ask it to come and be shot. They prayed the grisly bear not to be angry with the hunter, nor to fight him, but rather to have pity on him and to deliver himself up to his mercies. The man who intended to hunt the grisly bear had to be chaste for some time before he set out on his dangerous adventure. When he had killed a bear, he and his companions painted their faces in alternate perpendicular stripes of black and red, and sang the bear song. Sometimes the hunter also prayed, thanking the beast for letting itself be killed so easily, and begging that its mate might share the same fate. After they had eaten the flesh of the bear's head, they tied the skull to the top of a small tree, as high as they could reach, and left it there. Having done so, they painted their faces with alternate stripes of red and black as before; for if they failed to observe this ceremony, the bears would be offended, and the hunters would not be able to kill any more. To place the heads of bears or any large beasts on trees or stones was a mark of respect to the animals. The

Lillooet and Shuswap Indians of the same region used to observe similar ceremonies at the killing of a bear.

A like respect is testified for other dangerous creatures by the hunters who regularly trap and kill them. When Caffre hunters are in the act of showering spears on an elephant, they call out, "Don't kill us, great captain; don't strike or tread upon us, mighty chief." When he is dead they make their excuses to him, pretending that his death was a pure accident. As a mark of respect they bury his trunk with much solemn ceremony; for they say that "the elephant is a great lord; his trunk is his hand." Before the Amaxosa Caffres attack an elephant they shout to the animal and beg him to pardon them for the slaughter they are about to perpetrate, professing great submission to his person and explaining clearly the need they have of his tusks to enable them to procure beads and supply their wants. When they have killed him they bury in the ground, along with the end of his trunk, a few of the articles they have obtained for the ivory, thus hoping to avert some mishap that would otherwise befall them. Among the Wanyamwezi of Central Africa, when hunters have killed an elephant, they bury his legs on the spot where he fell and then cover the place with stones. The burial is supposed to appease the spirit of the dead elephant and to ensure the success of the hunters in future undertakings. When the Baganda have killed an elephant, they extract the nerve from the tusk and bury it, taking care to mark the place of the burial. For they think that the ghost of the dead elephant attaches itself to the nerve, and that if a hunter were to step over the nerve, the elephant's ghost would cause him to be killed by an elephant the next time he went forth to hunt the beasts.

In Latuka, a district of the Upper Nile, lions are much respected, and are only killed when they prove very troublesome and dangerous. There used to be in this region a Lion-chief, as he was called, who professed to have all lions under his control, and who actually kept several tame lions about his house. Whenever a lion was accidentally caught in a trap near the station of the Egyptian Government, this man would regularly present himself and demand the release of the noble animal. The favour was always granted, and planks were let down into the pit to enable the imprisoned lion to clamber up and escape. Amongst some tribes of Eastern Africa, when a lion is killed, the carcass is brought before the king, who does homage to it by prostrating himself on the ground and rubbing his face on the muzzle of the beast.

In some parts of Western Africa if a negro kills a leopard he is bound fast and brought before the chiefs for having killed one of their peers. The man defends himself on the plea that the leopard is chief of the forest and therefore a stranger. He is then set at liberty and rewarded. But the dead leopard, adorned with a chief's bonnet, is set up in the village, where nightly dances are held in its honour. The leopard is held in great veneration by the Igaras of the Niger. They call it "father" (*atta*), though they do not object to kill the animal in the chase. When a dead leopard is brought into Idah, the capital, it is dressed up in white and borne on the heads of four men from house to house, amidst singing and beating of drums. Each householder gives a present of cowries or cloth to the owner of the leopard, and at last the carcass is buried with great ceremony and firing of guns. Should these rites be neglected, the people imagine that the spirit of the dead leopard will punish them. Among the Ewe negroes of Togoland "hunters who had killed buffaloes, leopards, or wild black swine observed in Agome for nine days the same, or very similar, ceremonies as are customary at the death of a woman, in order to prevent the soul of the slain beasts from avenging itself on them, a custom which is the less surprising because the mourning customs themselves are based on the fear of spirits, namely the spirits of the dead. The natives ascribe to the souls of these dangerous animals the power of killing the man who shot them, or of so blinding and enchanting him that in the chase he confuses animals and men and so incurs serious mishaps." The quaint

ceremonies which these negroes observe for the purpose of avoiding the imaginary perils have been described by a German missionary. The leopard and the wild buffalo, he tells us, are believed to be animated by malignant souls which not only do the hunter a mischief while they still occupy the bodies of the living creatures, but even after death, in their disembodied state, continue to haunt and plague their slayer, sometimes egging on a serpent or a leopard to sting or bite him, sometimes blinding him so that he shoots a man for an animal, or cannot find his way home and goes groping about in the wilderness till he perishes miserably. If a man thus blinded and crazed should make his way back to the town, he is banished for life and sold into slavery; his house and plantation are razed to the ground; and his nearest relations are often given as bail into the hands of strangers. It is therefore a very serious matter indeed for a hunter to incur the wrath of a leopard's ghost, and it is quite natural that he should take all reasonable measures to guard himself against so threatening a calamity. Hence as soon as he has killed a leopard, he hurries back to the town and brings word of it to the other men who have slain leopards on former occasions, and who now assist him with their advice and experience. The first thing they do is to put a stalk of grass in his mouth as a sign that he may not speak. Then they repair to the place where the leopard lies dead in the forest, and inform the animal of the reasons why he has been shot, namely, because he has stolen sheep, fowls, and pigs, and has killed men. Next the drums are beaten and the people assemble in the open square of the town. The dead leopard meanwhile has been fastened to a pole, and with his eyes bandaged and his face upturned to heaven, is solemnly carried about the town and set down before the houses of the principal folk, who reward the hero and his comrades with presents. After the procession has gone the round, the leopard is tied to a tree, and the hunters paint the slayer with red and white so as to make him look like a leopard, except that the leopard's spots are only painted on the left side of his body; a basket painted in the same colours is clapped on his head, and magical strings of cowries are tied round his hands and feet. Thus attired, he and the other heroes who have killed leopards crawl about on all fours and roar like leopards when anybody comes near them. In his left hand every man grasps a bow for the slaughter of innocent cocks and hens, and with his right he grabbles about in the earth like an animal seeking what it may devour. None of them may speak, they may only roar, but they do that in a masterly manner. At the head of this imposing procession go two men armed with a thick cudgel and a spear respectively; and the rear is brought up by a third man, who is privileged to walk upright on his hind legs. This favoured person is the cook, whose office it is to dress the fowls which the human leopards; purloin in the course of their pilgrimage; indeed for nineteen days they are privileged, no doubt in their character of leopards, to rob the hen-roosts with impunity. In the afternoon the carcass of the leopard is taken down, skinned, and cut up. The titbits are sent to the chief and the other dignitaries, who eat them; and the remainder of the flesh is consumed by the common folk. The skin, the teeth, the head, and the claws belong to the hunter who killed the beast. But for nineteen days thereafter the slayer of the leopard must retain his peculiar costume: he may eat only warm-blooded animals and food seasoned with salt: he may not eat anything seasoned with pepper; and on no account may he taste fish, because they are cold-blooded creatures. A general feast, of which all the male inhabitants of the town partake, winds up the proceedings at the close of the nineteen days. A feature of the festivities is a dramatic representation of a leopard-hunt, which is carried out in every detail amid great excitement. If only all these ceremonies are strictly observed, the hunter need have no fear at all of being plagued by the leopard's ghost.

The Baganda greatly fear the ghosts of buffaloes which they have killed, and they always appease these dangerous spirits. On no account will they bring the head of a slain buffalo into a village or into a garden of plantains: they always eat the flesh of the head in the open country. Afterwards they place the skull in a small hut built for the purpose, where they pour out beer as an offering and pray to the ghost to stay where he is and not to harm them. Oddly

enough the Baganda also dread the ghosts of sheep, which they believe would haunt and kill the butcher if they saw him give the fatal stroke. Hence when a man is about to slaughter a sheep, he gets another man to divert its attention, and coming up behind the unsuspecting animal he stuns it with the blow of an axe-handle; then, before it can recover consciousness, he adroitly cuts its throat. In this way the ghost of the sheep is bamboozled and will not haunt the butcher. Moreover, when a sheep dies in a house, the housewife may not say bluntly to her husband, "The sheep is dead," or its ghost, touched to the quick, would certainly make her fall ill and might even kill her. She must put a finer point on the painful truth by saying, "I am unable to untie such and such a sheep." Her husband understands her, but the ghost of the animal does not, or at all events he does not resent so delicate an allusion to its melancholy decease. Even the ghost of a fowl may haunt a Muganda woman and make her ill, if she has accidentally killed it with her hoe and flung away the body in the long grass instead of carrying it to her husband and confessing her fault.

Another formidable beast whose life the savage hunter takes with joy, yet with fear and trembling, is the whale. After the slaughter of a whale the maritime Koryak of north-eastern Siberia hold a communal festival, the essential part of which "is based on the conception that the whale killed has come on a visit to the village; that it is staying for some time, during which it is treated with great respect; that it then returns to the sea to repeat its visit the following year; that it will induce its relatives to come along, telling them of the hospitable reception that has been accorded to it. According to the Koryak ideas, the whales, like all other animals, constitute one tribe, or rather family, of related individuals, who live in villages like the Koryak. They avenge the murder of one of their number, and are grateful for kindnesses that they may have received." As large whales are now rarely seen in the bays of the Okhotsk Sea, the Koryak at the present time generally celebrate the festival for a white whale. One such festival was witnessed by Mr. W. Jochelson, at the village of Kuel, in October 1900. A white whale had been caught in the nets, and as the sea was partially frozen, the carcass had to be brought ashore in a sledge. When it was seen nearing the beach, a number of women, arrayed in their long embroidered dancing-coats, went forth to meet and welcome it, carrying lighted fire-brands in their hands. To carry burning fire-brands from the hearth is the ancient Koryak fashion of greeting an honoured guest. Strictly speaking, the women who go forth to welcome a whale to the house should wear masks of sedge-grass on their faces as well as dancing-coats on their bodies, and should carry sacrificial alder branches as well as firebrands in their hands, but on the present occasion the women dispensed with the use of masks. They danced, shaking their heads, moving their shoulders, and swinging their whole bodies with arms outstretched, now squatting, now rising and singing, "Ah! a guest has come." In spite of the cold and the wind the sweat dripped from them, so violently did they dance, and they sang and screamed till they were hoarse. When the sledge with its burden had reached the shore, one of the women pronounced an incantation over the whale's head, and then thrust alder branches and sacrificial grass into its mouth. Next they muffled its head in a hood, apparently to prevent the creature from witnessing the painful spectacle of its own dissection. After that the men cut up the carcass, and the women collected the blood in pails. Two seals, which had also been killed, were included in the festivities which followed. The heads of all three animals were cut off and placed on the roof of the house. Next day the festival began. In the morning the women plaited travelling bags of grass for the use of the whale, and made grass masks. In the evening, the people having assembled in a large underground house, some boiled pieces of the white whale were placed in a grass bag and set before a wooden image of a white whale, so that the animal, or its departed spirit, was thus apparently supposed to be regaled with portions of its own body; for the white whale and the seals were treated as honoured guests at the banquet. To keep up the pretence, the people were silent or spoke only in whispers for

fear of wakening the guests before the time. At last the preparations were complete: fresh faggots piled on the hearth sent up a blaze, illumining with an unsteady light the smoke-blackened walls of the vast underground dwelling, which a moment before had been shrouded in darkness; and the long silence was broken by the joyful cries of the women, "Here dear guests have come!" "Visit us often!" "When you go back to the sea, tell your friends to call on us also, we will prepare just as nice food for them as for you." With these words they pointed to puddings set out temptingly on the boards. Next the host took a piece of the fat of the white whale and threw it into the fire, saying, "We are burning it in the fire for thee!" Then he went to the domestic shrine, placed lumps of fat before the rude effigies of the guardian spirits, and smeared fat on their mouths. The appetites of the higher powers having thus been satisfied, the people set to and partook of the good things provided for them, including the flesh of the white whale and the seals. Lastly, two old men practised divination by means of the shoulder-blade of a seal to discover whether the white whale would go back to the sea and call his fellows to come and be caught like himself. In order to extract this information from the bone burning coals were piled on it, and the resulting cracks were carefully scrutinised. To the delight of all present the omens proved favourable: a long transverse crack indicated the sea to which the spirit of the white whale would soon depart. Four days later the departure actually took place. It was a bright sunshiny wintry morning: the frost was keen; and for more than a mile seaward the beach was covered with blocks of ice. In the great underground dwelling, where the feast had been held, the hearth had been turned into something like an altar. On it lay the heads of the white whale and the seals, and beside them travelling-bags of grass filled with puddings, which the souls of the animals were to take with them on their long journey. Beside the hearth knelt two women, their faces covered with grass masks and their heads bent over the bags, mumbling an incantation. The sunlight streamed down on them through the smoke-hole overhead, but spread only a dim twilight through the remoter recesses of the vast subterranean chamber. The masks worn by the women were intended to guard them against the spirit of the white whale, which was supposed to be hovering invisible in the air. The incantation over, the women rose from their knees and doffed their masks. A careful examination of a pudding, which had been offered in sacrifice to the white whale, now revealed the joyful intelligence that the spirit of the whale had accepted the sacrifice and was about to return to the sea. All that remained, therefore, to do was to speed him on his way. For that purpose two men ascended the roof, let down thongs through the smoke-hole, and hauled up the heads of the white whale and of the seals together with the travelling-bags of provisions. That concluded the despatch of the souls of the dead animals to their home in the great waters.

When the inhabitants of the Isle of St. Mary, to the north of Madagascar, go a-whaling, they single out the young whales for attack and "humbly beg the mother's pardon, stating the necessity that drives them to kill her progeny, and requesting that she will be pleased to go below while the deed is doing, that her maternal feelings may not be outraged by witnessing what must cause her so much uneasiness." An Ajumba hunter having killed a female hippopotamus on Lake Azyingo in West Africa, the animal was decapitated and its quarters and bowels removed. Then the hunter, naked, stepped into the hollow of the ribs, and kneeling down in the bloody pool washed his whole body with the blood and excretions of the animal, while he prayed to the soul of the hippopotamus not to bear him a grudge for having killed her and so blighted her hopes of future maternity; and he further entreated the ghost not to stir up other hippopotamuses to avenge her death by butting at and capsizing his canoe. The ounce, a leopard-like creature, is dreaded for its depredations by the Indians of Brazil. When they have caught one of these animals in a snare, they kill it and carry the body home to the village. There the women deck the carcase with feathers of many colours, put bracelets on its legs, and weep over it, saying, "I pray thee not to take vengeance on our little

ones for having been caught and killed through thine own ignorance. For it was not we who deceived thee, it was thyself. Our husbands only set the trap to catch animals that are good to eat: they never thought to take thee in it. Therefore, let not thy soul counsel thy fellows to avenge thy death on our little ones!" When the Yuracares Indians of Bolivia have killed great apes in their tropical forests, they bring the bodies home, set them out in a row on palm leaves with their heads all looking one way, sprinkle them with chicha, and say, "We love you, since we have brought you home." They imagine that the performance of this ceremony is very gratifying to the other apes in the woods. Before they leave a temporary camp in the forest, where they have killed a tapir and dried the meat on a babracot, the Indians of Guiana invariably destroy this babracot, saying that should a tapir passing that way find traces of the slaughter of one of his kind, he would come by night on the next occasion when Indians slept at that place, and, taking a man, would babracot him in revenge.

When a Blackfoot Indian has caught eagles in a trap and killed them, he takes them home to a special lodge, called the eagles' lodge, which has been prepared for their reception outside of the camp. Here he sets the birds in a row on the ground, and propping up their heads on a stick, puts a piece of dried meat in each of their mouths in order that the spirits of the dead eagles may go and tell the other eagles how well they are being treated by the Indians. So when Indian hunters of the Orinoco region have killed an animal, they open its mouth and pour into it a few drops of the liquor they generally carry with them, in order that the soul of the dead beast may inform its fellows of the welcome it has met with, and that they too, cheered by the prospect of the same kind reception, may come with alacrity to be killed. A Cherokee hunter who has killed an eagle stands over the dead bird and prays it not to avenge itself on his tribe, because it is not he but a Spaniard who has done the cruel deed. When a Teton Indian is on a journey and he meets a grey spider or a spider with yellow legs, he kills it, because some evil would befall him if he did not. But he is very careful not to let the spider know that he kills it, for if the spider knew, his soul would go and tell the other spiders, and one of them would be sure to avenge the death of his relation. So in crushing the insect, the Indian says, "O Grandfather Spider, the Thunder-beings kill you." And the spider is crushed at once and believes what is told him. His soul probably runs and tells the other spiders that the Thunder-beings have killed him; but no harm comes of that. For what can grey or yellow-legged spiders do to the Thunder-beings?

But it is not merely dangerous creatures with whom the savage desires to keep on good terms. It is true that the respect which he pays to wild beasts is in some measure proportioned to their strength and ferocity. Thus the savage Stiens of Cambodia, believing that all animals have souls which roam about after their death, beg an animal's pardon when they kill it, lest its soul should come and torment them. Also they offer it sacrifices, but these sacrifices are proportioned to the size and strength of the animal. The ceremonies observed at the death of an elephant are conducted with much pomp and last seven days. Similar distinctions are drawn by North American Indians. "The bear, the buffalo, and the beaver are manidos [divinities] which furnish food. The bear is formidable, and good to eat. They render ceremonies to him, begging him to allow himself to be eaten, although they know he has no fancy for it. We kill you, but you are not annihilated. His head and paws are objects of homage.... Other animals are treated similarly from similar reasons.... Many of the animal manidos, not being dangerous, are often treated with contempt—the terrapin, the weasel, polecat, etc." The distinction is instructive. Animals which are feared, or are good to eat, or both, are treated with ceremonious respect; those which are neither formidable nor good to eat are despised. We have had examples of reverence paid to animals which are both feared and eaten. It remains to prove that similar respect is shewn to animals which, without being feared, are either eaten or valued for their skins.

When Siberian sable-hunters have caught a sable, no one is allowed to see it, and they think that if good or evil be spoken of the captured sable no more sables will be caught. A hunter has been known to express his belief that the sables could hear what was said of them as far off as Moscow. He said that the chief reason why the sable hunt was now so unproductive was that some live sables had been sent to Moscow. There they had been viewed with astonishment as strange animals, and the sables cannot abide that. Another, though minor, cause of the diminished take of sables was, he alleged, that the world is now much worse than it used to be, so that nowadays a hunter will sometimes hide the sable which he has got instead of putting it into the common stock. This also, said he, the sables cannot abide. A Russian traveller happening once to enter a Gilyak hut in the absence of the owner, observed a freshly killed sable hanging on the wall. Seeing him look at it, the housewife in consternation hastened to muffle the animal in a fur cap, after which it was taken down, wrapt in birch bark, and put away out of sight. Despite the high price he offered for it, the traveller's efforts to buy the animal were unavailing. It was bad enough, they told him, that he, a stranger, had seen the dead sable in its skin, but far worse consequences for the future catch of sables would follow if they were to sell him the animal entire. Alaskan hunters preserve the bones of sables and beavers out of reach of the dogs for a year and then bury them carefully, "lest the spirits who look after the beavers and sables should consider that they are regarded with contempt, and hence no more should be killed or trapped." The Shuswap Indians of British Columbia think that if they did not throw beaver-bones into the river, the beavers would not go into the traps any more, and that the same thing would happen were a dog to eat the flesh or gnaw the bone of a beaver. Carrier Indians who have trapped martens or beavers take care to keep them from the dogs; for if a dog were to touch these animals the Indians believe that the other martens or beavers would not suffer themselves to be caught. A missionary who fell in with an old Carrier Indian asked him what luck he had in the chase. "Oh, don't speak to me about it," replied the Indian; "there are beavers in plenty. I caught one myself immediately after my arrival here, but unluckily a dog got hold of it. You know that after that it has been impossible for me to catch another." "Nonsense," said the missionary; "set your traps as if nothing had happened, and you will see." "That would be useless," answered the Indian in a tone of despair, "quite useless. You don't know the ways of the beaver. If a dog merely touches a beaver, all the other beavers are angry at the owner of the dog and always keep away from his traps." It was in vain that the missionary tried to laugh or argue him out of his persuasion; the man persisted in abandoning his snares and giving up the hunt, because, as he asserted, the beavers were angry with him. A French traveller, observing that the Indians of Louisiana did not give the bones of beavers and otters to their dogs, enquired the reason. They told him there was a spirit in the woods who would tell the other beavers and otters, and that after that they would catch no more animals of these species. The Canadian Indians were equally particular not to let their dogs gnaw the bones, or at least certain of the bones, of beavers. They took the greatest pains to collect and preserve these bones, and, when the beaver had been caught in a net, they threw them into the river. To a Jesuit who argued that the beavers could not possibly know what became of their bones, the Indians replied, "You know nothing about catching beavers and yet you will be prating about it. Before the beaver is stone dead, his soul takes a turn in the hut of the man who is killing him and makes a careful note of what is done with his bones. If the bones are given to the dogs, the other beavers would get word of it and would not let themselves be caught. Whereas, if their bones are thrown into the fire or a river, they are quite satisfied; and it is particularly gratifying to the net which caught them." Before hunting the beaver they offered a solemn prayer to the Great Beaver, and presented him with tobacco; and when the chase was over, an orator pronounced a funeral oration over the dead beavers. He praised their spirit and wisdom. "You will hear no more," said he, "the voice of the chieftains who

commanded you and whom you chose from among all the warrior beavers to give you laws. Your language, which the medicine-men understand perfectly, will be heard no more at the bottom of the lake. You will fight no more battles with the otters, your cruel foes. No, beavers! But your skins shall serve to buy arms; we will carry your smoked hams to our children; we will keep the dogs from eating your bones, which are so hard.”

The elan, deer, and elk were treated by the American Indians with the same punctilious respect, and for the same reason. Their bones might not be given to the dogs nor thrown into the fire, nor might their fat be dropped upon the fire, because the souls of the dead animals were believed to see what was done to their bodies and to tell it to the other beasts, living and dead. Hence, if their bodies were ill-used, the animals of that species would not allow themselves to be taken, neither in this world nor in the world to come. The houses of the Indians of Honduras were encumbered with the bones of deer, the Indians believing that if they threw the bones away, the other deer could not be taken. Among the Chiquites of Paraguay a sick man would be asked by the medicine-man whether he had not thrown away some of the flesh of the deer or turtle, and if he answered yes, the medicine-man would say, “That is what is killing you. The soul of the deer or turtle has entered into your body to avenge the wrong you did it.” Before the Tzentaes of Southern Mexico and the Kekchis of Guatemala venture to skin a deer which they have killed, they lift up its head and burn copal before it as an offering; otherwise a certain being named Tzultacca would be angry and send them no more game. Cherokee hunters ask pardon of the deer they kill. If they failed to do so, they think that the Little Deer, the chief of the deer tribe, who can never die or be wounded, would track the hunter to his home by the blood-drops on the ground and would put the spirit of rheumatism into him. Sometimes the hunter, on starting for home, lights a fire in the trail behind him to prevent the Little Deer from pursuing him. Before they went out to hunt for deer, antelope, or elk the Apaches used to resort to sacred caves, where the medicine-men propitiated with prayer and sacrifice the animal gods whose progeny they intended to destroy. The Indians of Louisiana bewailed bitterly the death of the buffaloes which they were about to kill. More than two hundred of them at a time have been seen shedding crocodile tears over the approaching slaughter of the animals, while they marched in solemn procession, headed by an old man who waved a pocket-handkerchief at the end of a stick as an oriflamme, and by a woman who strutted proudly along, bearing on her back a large kettle which had been recently abstracted from the baggage of some French explorers. The Thompson Indians of British Columbia cherished many superstitious beliefs and observed many superstitious practices in regard to deer. When a deer was killed, they said that the rest of the deer would be well pleased if the hunters butchered the animal nicely and cleanly. To waste venison displeased the animals, who after that would not allow themselves to be shot by the hunter. If a hunter was overburdened and had to leave some of the venison behind, the other deer were better pleased if he hung it up on a tree than if he let it lie on the ground. The guts were gathered and put where the blood had been spilt in butchering the beast, and the whole was covered up with a few fir-boughs. In laying the boughs on the blood and guts the man told the deer not to grieve for the death of their friend and not to take it ill that he had left some of the body behind, for he had done his best to cover it. If he did not cover it, they thought the deer would be sorry or angry and would spoil his luck in the chase. When the head of a deer had to be left behind, they commonly placed it on the branch of a tree, that it might not be contaminated by dogs and women. For the same reason they burned the bones of the slain deer, lest they should be touched by women or gnawed by dogs. And venison was never brought into a hut by the common door, because that door was used by women; it was taken in through a hole made in the back of the hut. No hunter would give a deer's head to a man who was the first or second of a family, for that would make the rest of the deer very shy and hard to shoot. And in telling his friends of his bag he would generally call a buck a doe,

and a doe he would call a fawn, and a fawn he would call a hare. This he did that he might not seem to the deer to brag. The Lillooet Indians of British Columbia threw the bones of animals, particularly those of the deer and the beaver, into the water, in order that the dogs should not defile or eat them and thereby offend the animals. When the hunter committed the bones to the water he generally prayed to the dead animal, saying, "See! I treat you respectfully. Nothing shall defile you. Have pity on me, so I may kill more of you! May I be successful in hunting and trapping!" The Canadian Indians would not eat the embryos of the elk, unless at the close of the hunting season; otherwise the mother-elks would be shy and refuse to be caught.

Indians of the Lower Fraser River regard the porcupine as their elder brother. Hence when a hunter kills one of these creatures he asks his elder brother's pardon and does not eat of the flesh till the next day. The Sioux will not stick an awl or needle into a turtle, for they are sure that, if they were to do so, the turtle would punish them at some future time. Some of the North American Indians believed that each sort of animal had its patron or genius who watched over and preserved it. An Indian girl having once picked up a dead mouse, her father snatched the little creature from her and tenderly caressed and fondled it. Being asked why he did so, he said that it was to appease the genius of mice, in order that he might not torment his daughter for eating the mouse. With that he handed the mouse to the girl and she ate it.

When the Koryak have killed a fox, they take the body home and lay it down near the fire, saying, "Let the guest warm himself. When he feels warm, we will free him from his overcoat." So when the frozen carcass is thawed, they skin it and wrap long strips of grass round about it. Then the animal's mouth is filled with fish-roe, and the mistress of the house gashes the flesh and puts more roe or dried meat into the gashes, making believe that the gashes are the fox's pockets, which she thus fills with provisions. Then the carcass is carried out of the house, and the people say, "Go and tell your friends that it is good to visit yonder house. 'Instead of my old coat, they gave me a new one still warmer and with longer hair. I have eaten my fill, and had my pockets well stored. You, too, go and visit them.' " The natives think that if they neglected to observe this ceremonial they would have no luck in hunting foxes. When a Ewe hunter of Togoland has killed an antelope of a particular kind (*Antelope leucoryx*), he erects an enclosure of branches, within which he places the lower jawbones of all the animals he has shot. Then he pours palm-wine and sprinkles meal on the bones, saying, "Ye lower jawbones of beasts, ye are now come home. Here is food, here is drink. Therefore lead your comrades (that is, the living beasts of the forest) hither also." In the Timor-laut islands of the Indian Archipelago the skulls of all the turtles which a fisherman has caught are hung up under his house. Before he goes out to catch another, he addresses himself to the skull of the last turtle that he killed, and having inserted betel between its jaws, he prays the spirit of the dead animal to entice its kinsfolk in the sea to come and be caught. In the Poso district of central Celebes hunters keep the jawbones of deer and wild pigs which they have killed and hang them up in their houses near the fire. Then they say to the jawbones, "Ye cry after your comrades, that your grandfathers, or nephews, or children may not go away." Their notion is that the souls of the dead deer and pigs tarry near their jawbones and attract the souls of living deer and pigs, which are thus drawn into the toils of the hunter. Thus in all these cases the wily savage employs dead animals as decoys to lure living animals to their doom.

The Lengua Indians of the Gran Chaco love to hunt the ostrich, but when they have killed one of these birds and are bringing home the carcass to the village, they take steps to outwit the resentful ghost of their victim. They think that when the first natural shock of death is passed, the ghost of the ostrich pulls himself together and makes after his body. Acting on this sage calculation, the Indians pluck feathers from the breast of the bird and strew them at intervals

along the track. At every bunch of feathers the ghost stops to consider, "Is this the whole of my body or only a part of it?" The doubt gives him pause, and when at last he has made up his mind fully at all the bunches, and has further wasted valuable time by the zigzag course which he invariably pursues in going from one to another, the hunters are safe at home, and the bilked ghost may stalk in vain round about the village, which he is too timid to enter.

The Esquimaux of the Hudson Bay region believe that the reindeer are controlled by a great spirit who resides in a large cave near the end of Cape Chidley. The outward form of the spirit is that of a huge white bear. He obtains and controls the spirit of every reindeer that is slain or dies, and it depends on his good will whether the people shall have a supply of reindeer or not. The sorcerer intercedes with this great spirit and prevails on him to send the deer to the hungry Esquimaux. He informs the spirit that the people have in no way offended him, since he, the sorcerer, has taken great care that the whole of the meat was eaten up, and that last spring, when the does were returning to him to drop their young, none of the little or embryo fawns were devoured by the dogs. After long incantations the magician announces that the patron of the deer condescends to supply the Esquimaux with the spirits of the animals in a material form, and that soon there will be plenty in the land. He charges the people to fall on and slay and thereby win the approval of the spirit, who loves to see good folk enjoying themselves, knowing that so long as the Esquimaux refrain from feeding their dogs with the unborn young, the spirits of the dead reindeer will return again to his watchful care. The dogs are not allowed to taste the flesh, and until the supply is plentiful they may not gnaw the leg-bones, lest the guardian of the deer should take offence and send no more of the animals. If, unfortunately, a dog should get at the meat, a piece of his tail is cut off or his ear is cropped to let the blood flow. Again, the Central Esquimaux hold that sea-mammals, particularly whales, ground-seals, and common seals, sprang from the severed fingers of the goddess Sedna, and that therefore an Esquimau must make atonement for every such animal that he kills. When a seal is brought into the hut, the woman must stop working till it has been cut up. After the capture of a ground seal, walrus, or whale they must rest for three days. Not all sorts of work, however, are forbidden, for they may mend articles made of sealskin, but they may not make anything new. For example, an old tent cover may be enlarged in order to build a larger hut, but it is not allowed to make a new one. Working on new deerskins is strictly forbidden. No skins of this kind obtained in summer may be prepared before the ice has formed and the first seal has been caught with the harpoon. Later on, as soon as the first walrus has been taken, the work must again stop until autumn comes round. Hence all families are eager to finish the work on deerskins as fast as possible, for until that is done the walrus season may not begin. The Greenlanders are careful not to fracture the heads of seals or throw them into the sea, but pile them in a heap before the door, that the souls of the seals may not be enraged and scare their brethren from the coast.

The Esquimaux about Bering Strait believe that the souls of dead sea-beasts, such as seals, walrus, and whales, remain attached to their bladders, and that by returning the bladders to the sea they can cause the souls to be reincarnated in fresh bodies and so multiply the game which the hunters pursue and kill. Acting on this belief every hunter carefully removes and preserves the bladders of all the sea-beasts that he kills; and at a solemn festival held once a year in winter these bladders, containing the souls of all the sea-beasts that have been killed throughout the year, are honoured with dances and offerings of food in the public assembly-room, after which they are taken out on the ice and thrust through holes into the water; for the simple Esquimaux imagine that the souls of the animals, in high good humour at the kind treatment they have experienced, will thereafter be born again as seals, walrus, and whales, and in that form will flock willingly to be again speared, harpooned, or otherwise done to death by the hunters. The ceremonies observed at these annual festivals of reincarnation are

elaborate. The assembly-room or dancing-house (*kashim*, *kassigim*, or *kassigit*), in which the festival is held, consists of a spacious semi-subterranean chamber entered by a tunnel, which leads down to a large round cellar under the floor of the house. From the cellar you ascend into the assembly-room through a hole in the floor. Wooden benches run round the apartment, which is lit by lamps. An opening in the roof serves at once as a window and a chimney. Unmarried men sleep in the assembly-room at all times; they have no other home. The festival is commonly held in December, but it may fall as late as January. It lasts several days. When the time is come to celebrate it, each hunter brings into the assembly-room the inflated bladders of all the seals, walrus, and whales that he has killed during the year. These are tied by the necks in bunches and hung up on seal spears, which are stuck in a row in the wall some six or eight feet above the floor. Here food and water are offered to them, or rather to the spirits of the animals which are supposed to be present in the bladders; and the spirits signify their acceptance of the offering by causing the bladders to swing to and fro, a movement which is really produced by a man sitting in a dark corner, who pulls a string attached to the bladders. Further, the bladders are fumigated with torches of wild parsnip stalks, the aromatic smoke and red flames of which are believed to be well-pleasing to the souls of the animals dangling in the bladders. Moreover to amuse the souls men execute curious dances before them to the music of drums. First the dancers move slowly with a jerky action from side to side; then they gallop obliquely with arms tossed up and down; and lastly they hop and jump, always keeping perfect time to the beat of the drums. The dance is supposed to imitate the movements of seals and walrus; and again the spirits signify their pleasure by making the bladders swing backwards and forwards. During the continuance of the festival no loud noises may be made in the assembly-room for fear of alarming the souls of the animals in the bladders; if any person makes a noise by accident, all the men present raise a chorus of cries in imitation of the notes of the eider duck to let the souls of the animals think that the unseemly disturbance proceeds from the birds and not from the people. Further, so long as the festival lasts, no wood may be cut with an iron axe in the village, the men must keep rigidly apart from the women, and no female above the age of puberty may come near the bladders suspended in the assembly-room, the reason assigned being that such women are unclean and might offend the sensitive souls of the sea-beasts in the bladders. But immature girls, being untainted by the pollution which attaches to adult women, may go about the bladders freely. The last and crowning scene of the festival takes place at night or just at sunrise. The spears with the bladders attached to them are passed out by the shaman into the open air through the smoke-hole in the roof. When all are outside, a huge torch of wild parsnip stalks is lighted; the chief shaman takes it on his shoulder, and runs with it as fast as he can across the snow and out on the ice. Behind him troop all the men carrying each his spear with the bladders of the sea-beasts dangling and flapping from it; and in the rear race the women, children, and old men, howling, screaming and making a great uproar. In the darkness the lurid flame of the torch shoots high into the air, casting a red glare over the snowy landscape and lighting up the swarm of fantastic, fur-clad figures that stream along in wild excitement. Arrived at a hole, which had been cut on purpose in the sea-ice, the shaman plants his burning torch beside it in the snow, and every man as he comes up rips open his bladders and thrusts them, one after the other, into the water under the ice. This ends the ceremony. The souls of the dead seals, walrus, and whales, are now ready to be born again in the depths of the sea. So all the people return contented to the village. At St. Michael the men who have thrust the bladders under the ice are obliged on their return to leap through a fire of wild parsnip stalks, probably as a mode of ceremonial purification; for after the dance and the offering of food at the festival the chief shaman passes a lighted torch of parsnip stalks round the assembly-room and the dancers, for the express purpose of purifying them and averting any evil influence that might bring sickness or ill luck on the hunters.

For like reasons, a tribe which depends for its subsistence, chiefly or in part, upon fishing is careful to treat the fish with every mark of honour and respect. The Indians of Peru “worshipped the whale for its monstrous greatness. Besides this ordinary system of worship, which prevailed throughout the coast, the people of different provinces adored the fish that they caught in greatest abundance; for they said that the first fish that was made in the world above (for so they named Heaven) gave birth to all other fish of that species, and took care to send them plenty of its children to sustain their tribe. For this reason they worshipped sardines in one region, where they killed more of them than of any other fish; in others, the skate; in others, the dogfish; in others, the golden fish for its beauty; in others, the crawfish; in others, for want of larger gods, the crabs, where they had no other fish, or where they knew not how to catch and kill them. In short, they had whatever fish was most serviceable to them as their gods.” The Kwakiutl Indians of British Columbia think that when a salmon is killed its soul returns to the salmon country. Hence they take care to throw the bones and offal into the sea, in order that the soul may reanimate them at the resurrection of the salmon. Whereas if they burned the bones the soul would be lost, and so it would be quite impossible for that salmon to rise from the dead. In like manner the Ottawa Indians of Canada, believing that the souls of dead fish passed into other bodies of fish, never burned fish bones, for fear of displeasing the souls of the fish, who would come no more to the nets. The Hurons also refrained from throwing fish bones into the fire, lest the souls of the fish should go and warn the other fish not to let themselves be caught, since the Hurons would burn their bones. Moreover, they had men who preached to the fish and persuaded them to come and be caught. A good preacher was much sought after, for they thought that the exhortations of a clever man had a great effect in drawing the fish to the nets. In the Huron fishing village where the French missionary Sagard stayed, the preacher to the fish prided himself very much on his eloquence, which was of a florid order. Every evening after supper, having seen that all the people were in their places and that a strict silence was observed, he preached to the fish. His text was that the Hurons did not burn fish bones. “Then enlarging on this theme with extraordinary unction, he exhorted and conjured and invited and implored the fish to come and be caught and to be of good courage and to fear nothing, for it was all to serve their friends who honoured them and did not burn their bones.” At Bogadjim in German New Guinea an enchanter is employed to lure the fish to their doom. He stands in a canoe on the beach with a decorated fish-basket beside him, and commands the fish to come from all quarters to Bogadjim. When the Aino have killed a sword-fish, they thank the fish for allowing himself to be caught and invite him to come again. Among the Nootka Indians of British Columbia it was formerly a rule that any person who had partaken of bear's flesh must rigidly abstain from eating any kind of fish for a term of two months. The motive for the abstinence was not any consideration for the health of the eater, but “a superstitious belief, that should any of their people after tasting bear's flesh, eat of fresh salmon, cod, etc., the fish, though at ever so great a distance off, would come to the knowledge of it, and be so much offended thereat, as not to allow themselves to be taken by any of the inhabitants.” The disappearance of herring from the sea about Heligoland in 1530 was attributed by the fishermen to the misconduct of two lads who had whipped a freshly-caught herring and then flung it back into the sea. A similar disappearance of the herrings from the Moray Firth, in the reign of Queen Anne, was set down by some people to a breach of the Sabbath which had been committed by the fishermen, while others opined that it was due to a quarrel in which blood had been spilt in the sea. For Scotch fishermen are persuaded that if blood be drawn in a quarrel on the coast where herring are being caught, the shoal will at once take its departure and not return for that season at least. West Highland fishermen believe that every shoal of herring has its leader which it follows wherever he goes. This leader is twice as big as an ordinary herring, and the fishermen call it the king of herring. When they chance to catch it in

their nets they put it back carefully into the sea; for they would esteem it petty treason to destroy the royal fish. The natives of the Duke of York Island annually decorate a canoe with flowers and ferns, lade it, or are supposed to lade it, with shell-money, and set it adrift to compensate the fish for their fellows who have been caught and eaten. When the Tarahumares of Mexico are preparing to poison the waters of a river for the purpose of stupefying and catching the fish, they take the precaution of first making offerings to the Master of the Fish by way of payment for the fish of which they are about to bereave him. The offerings consist of axes, hats, blankets, girdles, pouches, and especially knives and strings of beads, which are hung to a cross or a horizontal bar set up in the middle of the river. However, the Master of the Fish, who is thought to be the oldest fish, does not long enjoy these good things; for next morning the owners of the various articles remove them from the river and appropriate them to their usual secular purposes. It is especially necessary to treat the first fish caught with consideration in order to conciliate the rest of the fish, whose conduct may be supposed to be influenced by the reception given to those of their kind which were the first to be taken. Accordingly the Maoris always put back into the sea the first fish caught, "with a prayer that it may tempt other fish to come and be caught." Among the Baganda "the first fish taken were treated ceremonially: some the fisherman took to the god Mukasa; the remainder his wife cooked, and he and she both partook of them, and he afterwards jumped over her."

Still more stringent are the precautions taken when the fish are the first of the season. On salmon rivers, when the fish begin to run up the stream in spring, they are received with much deference by tribes who, like the Indians of the Pacific Coast of North America, subsist largely upon a fish diet. To some of these tribes the salmon is what corn is to the European, rice to the Chinese, and seals to the Esquimaux. Plenty of salmon means abundance in the camp and joy at the domestic hearth; failure of the salmon for a single season means famine and desolation, silence in the village, and sad hearts about the fire. Accordingly in British Columbia the Indians used to go out to meet the first fish as they came up the river: "They paid court to them, and would address them thus: 'You fish, you fish; you are all chiefs, you are; you are all chiefs.'" Amongst the Thlinket or Tlingit of Alaska the first halibut of the season is carefully handled and addressed as a chief, and a festival is given in his honour, after which the fishing goes on. Among the tribes of the Lower Fraser River when the first sockeye-salmon of the season has been caught, the fisherman carries it to the chief of his tribe, who delivers it to his wife. She prays, saying to the salmon, "Who has brought you here to make us happy? We are thankful to your chief for sending you." When she has cut and roasted the salmon according to certain prescribed rules, the whole tribe is invited and partakes of the fish, after they have purified themselves by drinking a decoction of certain plants which is regarded as a medicine for cleansing the people. But widowers, widows, menstruous women, and youths may not eat of this particular salmon. Even later, when the fish have become plentiful and these ceremonies are dispensed with, the same classes of persons are not allowed to eat fresh salmon, though they may partake of the dried fish. The sockeye-salmon must always be looked after carefully. Its bones have to be thrown into the river, after which the fish will revive and return to its chief in the west. Whereas if the fish are not treated with consideration, they will take their revenge, and the careless fisherman will be unlucky. Among the Songish or Lkungen tribe of Vancouver Island it is a rule that on the day when the first salmon have been caught, the children must stand on the beach waiting for the boats to return. They stretch out their little arms and the salmon are heaped on them, the heads of the fish being always kept in the direction in which the salmon are swimming, else they would cease to run up the river. So the children carry them and lay them on a grassy place, carefully keeping the heads of the salmon turned in the same direction. Round the fish are placed four flat stones, on which the plant hog's wort (*Peucedanum leiocarpum*, Nutt.),

red paint, and bulrushes are burnt as an offering to the salmon. When the salmon have been roasted each of the children receives one, which he or she is obliged to eat, leaving nothing over. But grown people are not allowed to eat the fish for several days. The bones of the salmon that the children have eaten may not touch the ground. They are kept in dishes, and on the fourth day an old woman, who pretends to be lame, gathers them in a huge basket and throws them into the sea. The Tsimshian Indians of British Columbia observe certain ceremonies when the first olachen fish of the season are caught. The fish are roasted on an instrument of elder-berry wood, and the man who roasts them must wear his travelling dress, mittens, cape, and so forth. While this is being done the Indians pray that plenty of olachen may come to their fishing-ground. The fire may not be blown up, and in eating the fish they may not cool it by blowing nor break a single bone. Everything must be neat and clean, and the rakes used for catching the fish must be kept hidden in the house. In spring, when the winds blow soft from the south and the salmon begin to run up the Klamath river, the Karoks of California dance for salmon, to ensure a good catch. One of the Indians, called the Kareya or God-man, retires to the mountains and fasts for ten days. On his return the people flee, while he goes to the river, takes the first salmon of the catch, eats some of it, and with the rest kindles the sacred fire in the sweating-house. "No Indian may take a salmon before this dance is held, nor for ten days after it, even if his family are starving." The Karoks also believe that a fisherman will take no salmon if the poles of which his spearing-booth is made were gathered on the river-side, where the salmon might have seen them. The poles must be brought from the top of the highest mountain. The fisherman will also labour in vain if he uses the same poles a second year in booths or weirs, "because the old salmon will have told the young ones about them." Among the Indians of the Columbia River, "when the salmon make their first appearance in the river, they are never allowed to be cut crosswise, nor boiled, but roasted; nor are they allowed to be sold without the heart being first taken out, nor to be kept over night, but must be all consumed or eaten the day they are taken out of the water. All these rules are observed for about ten days." They think that if the heart of a fish were eaten by a stranger at the beginning of the season, they would catch no more fish. Hence, they roast and eat the hearts themselves. There is a favourite fish of the Aino which appears in their rivers about May and June. They prepare for the fishing by observing rules of ceremonial purity, and when they have gone out to fish, the women at home must keep strict silence or the fish would hear them and disappear. When the first fish is caught he is brought home and passed through a small opening at the end of the hut, but not through the door; for if he were passed through the door, "the other fish would certainly see him and disappear." This may partly explain the custom observed by other savages of bringing game in certain cases into their huts, not by the door, but by the window, the smoke-hole, or by a special opening at the back of the hut.

With some savages a special reason for respecting the bones of game, and generally of the animals which they eat, is a belief that, if the bones are preserved, they will in course of time be re clothed with flesh, and thus the animal will come to life again. It is, therefore, clearly for the interest of the hunter to leave the bones intact, since to destroy them would be to diminish the future supply of game. Many of the Minnetaree Indians "believe that the bones of those bisons which they have slain and divested of flesh rise again clothed with renewed flesh, and quickened with life, and become fat, and fit for slaughter the succeeding June." Hence on the western prairies of America, the skulls of buffaloes may be seen arranged in circles and symmetrical piles, awaiting the resurrection. After feasting on a dog, the Dacotas carefully collect the bones, scrape, wash, and bury them, "partly, as it is said, to testify to the dog-species, that in feasting upon one of their number no disrespect was meant to the species itself, and partly also from a belief that the bones of the animal will rise and reproduce another." Among the Esquimaux of Baffin Land and Hudson Bay, when a boy has killed his

first seal, his mother gathers all the bones and throws them into a seal-hole. They think that these bones will become seals which the boy will catch in later life. The Yuracares Indians of Bolivia are at great pains to collect all the bones of the beasts, birds, and fishes which they eat, and to throw them into a stream, bury them in the depths of the forest, or burn them in the fire, "in order that the animals of the sort killed may not be angry and may allow themselves to be killed again." In sacrificing an animal the Lapps regularly put aside the bones, eyes, ears, heart, lungs, sexual parts (if the animal was a male), and a morsel of flesh from each limb. Then, after eating the remainder of the flesh, they laid the bones and the rest in anatomical order in a coffin and buried them with the usual rites, believing that the god to whom the animal was sacrificed would reclothe the bones with flesh and restore the animal to life in *Jabme-Aimo*, the subterranean world of the dead. Sometimes, as after feasting on a bear, they seem to have contented themselves with thus burying the bones. Thus the Lapps expected the resurrection of the slain animal to take place in another world, resembling in this respect the Kamtchatkans, who believed that every creature, down to the smallest fly, would rise from the dead and live underground. On the other hand, the North American Indians looked for the resurrection of the animals in the present world. The habit, observed especially by Mongolian peoples, of stuffing the skin of a sacrificed animal, or stretching it on a framework, points rather to a belief in a resurrection of the latter sort. The objection commonly entertained by primitive peoples to break the bones of the animals which they have eaten or sacrificed may be based either on a belief in the resurrection of the animals, or on a fear of intimidating other creatures of the same species and offending the ghosts of the slain animals. The reluctance of North American Indians and Esquimaux to let dogs gnaw the bones of animals is perhaps only a precaution to prevent the bones from being broken.

We have already seen that some rude races believe in a resurrection of men as well as of beasts, and it is quite natural that people who entertain such a belief should take care of the bones of their dead in order that the original owners of the bones may have them to hand at the critical moment. Hence in the Mexican territories of *Guazacualco* and *Yluta*, where the Indians thought that the dead would rise again, the bones of the departed were deposited in baskets and hung up on trees, that their spirits might not be obliged to grub in the earth for them at the resurrection. On the other hand, the *Luritcha* tribe of Central Australia, who eat their enemies, take steps to prevent their coming to life again, which might prove very inconvenient, by destroying the bones and especially the skulls of the bodies on which they have banqueted.

The preceding review of customs observed by savages for the conciliation and multiplication of animals which they hunt and kill, is fitted to impress us with a lively sense of the unquestioning faith which primitive man reposes in the immortality of the lower creatures. He appears to assume as an axiom too obvious to be disputed that beasts, birds, and fishes have souls like his own, which survive the death of their bodies and can be reborn in other bodies to be again killed and eaten by the hunter. The whole series of customs described in the foregoing pages—customs which are apt to strike the civilised reader as quaint and absurd—rests on this fundamental assumption. A consideration of them suggests a doubt whether the current explanation of the savage belief in human immortality is adequate to account for all the facts. That belief is commonly deduced from a primitive theory of dreams. The savage, it is said, fails to distinguish the visions of sleep from the realities of waking life, and accordingly when he has dreamed of his dead friends he necessarily concludes that they have not wholly perished, but that their spirits continue to exist in some place and some form, though in the ordinary course of events they elude the perceptions of his senses. On this theory the conceptions, whether gross or refined, whether repulsive or beautiful, which savages and perhaps civilised men have formed of the state of the departed, would seem to be

no more than elaborate hypotheses constructed to account for appearances in dreams; these towering structures, for all their radiant or gloomy grandeur, for all the massy strength and solidity with which they present themselves to the imagination of many, may turn out on inspection to be mere visionary castles built of clouds and vapour, which a breath of reason suffices to melt into air.

But even if we grant for the sake of argument that this theory offers a ready explanation of the widespread belief in human immortality, it is less easy to see how the theory accounts for the corresponding belief of so many races in the immortality of the lower animals. In his dreams the savage recognises the images of his departed friends by those familiar traits of feature, voice, and gesture which characterised them in life. But can we suppose that he recognises dead beasts, birds, and fishes in like manner? That their images come before him in sleep with all the particular features, the minute individual differences, which distinguished them in life from their fellows, so that when he sees them he can say to himself, for example, "This is the very tiger that I speared yesterday; his carcase is dead, but his spirit must be still alive"; or, "That is the very salmon I caught and ate this morning; I certainly killed his body but clearly I have not succeeded in destroying his soul"? No doubt it is possible that the savage has arrived at his theory of animal immortality by some such process of reasoning, but the supposition seems at least more far-fetched and improbable than in the case of human immortality. And if we admit the insufficiency of the explanation in the one case, we seem bound to admit it, though perhaps in a less degree, in the other case also. In short, we conclude that the theory of dreams appears to be hardly enough by itself to account for the widespread belief in the immortality of men and animals; dreams have probably done much to confirm that belief, but would they suffice to originate it? We may reasonably doubt it.

Accordingly we are driven to cast about for some more adequate explanation of this prevalent and deeply rooted persuasion. In search of such an explanation perhaps we need go no further than the sense of life which every man feels in his own breast. We have seen that to the savage death presents itself not as a natural necessity but as a lamentable accident or crime that cuts short an existence which, but for it, might have lasted for ever. Thus arguing apparently from his own sensations he conceives of life as an indestructible kind of energy, which when it disappears in one form must necessarily reappear in another, though in the new form it need not be immediately perceptible by us; in other words, he infers that death does not destroy the vital principle nor even the conscious personality, but that it merely transforms both of them into other shapes, which are not the less real because they commonly elude the evidence of our senses. If I am right in thus interpreting the thought of primitive man, the savage view of the nature of life singularly resembles the modern scientific doctrine of the conservation of energy. According to that doctrine, no material energy ever perishes or is even diminished; when it seems to suffer diminution or extinction, all that happens is that a portion or the whole of it has been transmuted into other shapes which, though qualitatively different from, are quantitatively equivalent to, the energy in its original form. In short, if we listen to science, nothing in the physical world is ever lost, but all things are perpetually changing: the sum of energy in the universe is constant and invariable, though it undergoes ceaseless transformations. A similar theory of the indestructibility of energy is implicitly applied by the savage to explain the phenomena of life and death, and logically enough he does not limit the application to human beings but extends it to the lower animals. Therein he shews himself a better reasoner than his civilised brother, who commonly embraces with avidity the doctrine of human immortality but rejects with scorn, as derogatory to human dignity, the idea that animals have immortal souls. And when he attempts to confirm his own cherished belief in a life after death by appealing to similar beliefs among savages and

inferring from them a natural instinct of immortality, it is well to remind him that, if he stands by that appeal, he must, like the savage, consistently extend the privilege of immortality to the despised lower animals; for surely it is improper for him to pick and choose his evidence so as to suit his prepossessions, accepting those parts of the savage creed which tally with his own and rejecting those which do not. On logical and scientific grounds he seems bound to believe either more or less: he must hold that men and animals are alike immortal or that neither of them is so.

We have seen that many savages look forward to a joyful resurrection of men and beasts, if only a proper care is taken of their skeletons; the same old bones, they imagine, will do duty over again in the next life, when they have been decently clad in a new garment of flesh. This quaint fancy is reflected in many popular tales; not uncommonly the animal or man in the story comes to life lame of a limb, because one of his bones has been eaten, broken, or lost. In a Magyar tale, the hero is cut in pieces, but the serpent-king lays the bones together in their proper order, and washes them with water, whereupon the hero revives. His shoulder-blade, however, has been lost, so the serpent-king supplies its place with one of gold and ivory. Such stories, as Mannhardt has seen, explain why Pythagoras, who claimed to have lived many lives, one after the other, was said to have exhibited his golden leg as a proof of his supernatural pretensions. Doubtless he explained that at one of his resurrections a leg had been broken or mislaid, and that he had replaced it, like Miss Kilmansegg, with one of gold. Similarly, when the murdered Pelops was restored to life, the shoulder which Demeter had eaten was made good with one of ivory, which was publicly exhibited at Elis down to historical times. The story that one of the members of the mangled Osiris was eaten by fish, and that, when Isis collected his scattered limbs, she replaced the missing member with one of wood, may perhaps belong to the same circle of beliefs.

There is a certain rule observed by savage hunters and fishers which, enigmatical at first sight, may possibly be explained by this savage belief in resurrection. A traveller in America in the early part of the nineteenth century was told by a half-breed Choctaw that the Indians "had an obscure story, somewhat resembling that of Jacob wrestling with an angel; and that the full-blooded Indians always separate the sinew which shrank, and that it is never seen in the venison exposed for sale; he did not know what they did with it. His elder brother, whom I afterwards met, told me that they eat it as a rarity; but I have also heard, though on less respectable authority, that they refrain from it, like the ancient Jews. A gentleman, who had lived on the Indian frontier, or in the nation, for ten or fifteen years, told me that he had often been surprised that the Indians always detached this sinew; but it had never occurred to him to inquire the reason." James Adair, who knew the Indians of the South-Eastern States intimately, and whose absurd theories appear not to have distorted his view of the facts, observes that "when in the woods, the Indians cut a small piece out of the lower part of the thighs of the deer they kill, lengthways and pretty deep. Among the great number of venison-hams they bring to our trading-houses, I do not remember to have observed one without it.... And I have been assured by a gentleman of character, who is now an inhabitant of South Carolina, and well acquainted with the customs of the northern Indians, that they also cut a piece out of the thigh of every deer they kill, and throw it away; and reckon it such a dangerous pollution to eat it as to occasion sickness and other misfortunes of sundry kinds, especially by spoiling their guns from shooting with proper force and direction."

In more recent times the statement of Adair's informant has been confirmed by a French missionary, who has also published the "obscure story" to which the English traveller Hodgson refers. The Loucheux and Hare-skin Indians who roam the bleak steppes and forests that stretch from Hudson's Bay to the Rocky Mountains, and northward to the frozen sea, are forbidden by custom to eat the sinew of the legs of animals. To explain this custom they tell

the following "sacred story." Once upon a time a man found a burrow of porcupines, and going down into it after the porcupines he lost his way in the darkness, till a kind giant called "He who sees before and behind" released him by cleaving open the earth. So the man, whose name was "Fireless and Homeless," lived with the kind giant, and the giant hunted elans and beavers for him, and carried him about in the sheath of his flint knife. "But know, my son," said the giant, "that he who uses the sky as his head is angry with me, and has sworn my destruction. If he slays me the clouds will be tinged with my blood; they will be red with it, probably." Then he gave the man an axe made of the tooth of a gigantic beaver, and went forth to meet his foe. But from under the ice the man heard a dull muffled sound. It was a whale which was making this noise because it was naked and cold. Warned by the man, the giant went toward the whale, which took human shape, and rushed upon the giant. It was the wicked giant, the kind giant's enemy. The two struggled together for a long time, till the kind giant cried, "Oh, my son! cut, cut the sinew of the leg." The man cut the sinew, and the wicked giant fell down and was slain. That is why the Indians do not eat the sinew of the leg. Afterwards, one day the sky suddenly flushed a fiery red, so Fireless and Homeless knew that the kind giant was no more, and he wept.

This myth, it is almost needless to observe, does not really explain the custom. People do not usually observe a custom because on a particular occasion a mythical being is said to have acted in a certain way. But, on the contrary, they very often invent myths to explain why they practise certain customs. Dismissing, therefore, the story of Fireless and Homeless as a myth invented to explain why the Indians abstain from eating a particular sinew, it may be suggested that the original reason for observing the custom was a belief that the sinew in question was necessary to reproduction, and that deprived of it the slain animals could not come to life again and stock the steppes and prairies either of the present world or of the spirit land. We have seen that the resurrection of animals is a common article of savage faith, and that when the Lapps bury the skeleton of the male bear in the hope of its resurrection they are careful to bury the genital parts along with it. However, subsequent enquiries make it probable that the Indian practice of cutting out the hamstring of deer has no other object than that of preventing eaters of venison from going lame. Among the Cherokee, we are told, "on killing a deer the hunter always makes an incision in the hind quarter and removes the hamstring, because this tendon, when severed, draws up into the flesh; ergo, any one who should unfortunately partake of the hamstring would find his limbs drawn up in the same manner." Thus the superstition seems to rest on the common principle of homoeopathic or imitative magic, that an eater infects himself with the qualities of the animal of whose flesh he partakes. Many instances of the application of that principle have met us already.

But some hunters hamstring the game for a different purpose; they hope thereby to prevent the dead beast or its ghost from getting up and running away. This is the motive alleged for the practice by Kouli hunters in Laos; they think that the spells which they utter in the chase may lose their magical virtue, and that the slaughtered animal may consequently come to life again and escape. To prevent that catastrophe they therefore hamstring the beast as soon as they have butchered it. When an Esquimau of Alaska has killed a fox, he carefully cuts the tendons of all the animal's legs in order to prevent the ghost from reanimating the body and walking about. But hamstringing the carcase is not the only measure which the prudent savage adopts for the sake of disabling the ghost of his victim. In old days, when the Aino went out hunting and killed a fox first, they took care to tie its mouth up tightly in order to prevent the ghost of the animal from sallying forth and warning its fellows against the approach of the hunter. The Gilyaks of the Amoor River put out the eyes of the seals they have killed, lest the ghosts of the slain animals should know their slayers and avenge their death by spoiling the seal-hunt. The custom of putting out the eyes of slaughtered animals

appears to be not uncommon among primitive peoples, and we may suspect that even where a different reason is alleged for it, the true original motive was to blind the dangerous ghost of the injured creature, and so to incapacitate it for retaliating on the slayer. Thus, when a Samoyed has killed a wild reindeer, one of the first things he does is to cut out the eyes and throw them away "in order to ensure a good bag in future"; and he buries the eyes in some place where no woman or adult girl is likely to step over them, since that also would spoil his luck in the chase. Among the tribes of South-east Africa hunters pluck out the right eye of any animal they have killed and pour a charmed medicine into the empty socket. Among the Thompson Indians of British Columbia a man whose daughter has just arrived at puberty may not hunt or trap for a month, or he will have no luck. Moreover, he should cut off the head of the first grouse he snares, pluck out the eyes, and insert two small roots of the *Zygadenus elegans* Pursch. in the orbits and another in its mouth, and having done so he ought to hang up the bird's head above his pillow. If he neglects these precautions, he will not be able to snare any more grouse or other small game. No doubt the ceremonial pollution contracted by his daughter at this critical period of her life is supposed to infect the hunter and render him unacceptable to the game; hence it seems a mere elementary dictate of prudence to hoodwink the grouse effectually by putting out their eyes. Sometimes, perhaps, the cutting out of the eyes of fierce and powerful animals may be a rational, not a superstitious, precaution. Thus the Kamtchatkans, who stab with knives the eyes of slain bears before they cut the carcasses up, allege as their reason for doing so that bears which seem to be dead of their wounds will sometimes revive and kill their would-be killers.

It appears to be a common custom with savage hunters to cut out the tongues of the animals which they kill. On the analogy of the foregoing customs we may conjecture that the removal of the tongues is sometimes a precaution to prevent the ghosts of the creatures from telling their sad fate to their sympathising comrades, the living animals of the same sort, who would naturally be frightened, and so keep out of the hunter's way. Thus, for example, Omaha hunters remove the tongue of a slain buffalo through an opening made in the animal's throat. The tongues thus removed are sacred and may not touch any tool or metal except when they are boiling in the kettles at the sacred tent. They are eaten as sacred food. Indian bear-hunters cut out what they call the bear's little tongue (a fleshy mass under the real tongue) and keep it for good luck in hunting or burn it to determine, from its crackling and so on, whether the soul of the slain bear is angry with them or not. In folk-tales the hero commonly cuts out the tongue of the wild beast which he has slain and preserves it as a token. The incident serves to shew that the custom was a common one, since folk-tales reflect with accuracy the customs and beliefs of a primitive age. On the other hand, the tongues of certain animals, as the otter and the eagle, are torn out and sometimes worn round their necks by Thlinket and Haida shamans as a means of conferring superhuman knowledge and power on their possessors. In particular, an otter's tongue is supposed to convey a knowledge of "the language of all inanimate objects, of birds, animals, and other living creatures" to the shaman, who wears it in a little bag hung round his neck. When a Galla priest sacrifices an animal and decides that the omens are favourable, he cuts out the tongue, sticks his thumb through it, and so flays the animal. In certain cases Gallas cut out the tongues of oxen and wear them on their heads as tokens. In Bohemia a fox's tongue is worn as an amulet to make a timid person bold; in Oldenburg and Belgium it is a remedy for erysipelas. In Bohemia the tongue of a male snake, if cut from the living animal on St. George's Eve and placed under a person's tongue, will confer the gift of eloquence. The Homeric Greeks cut out the tongues of sacrificial victims and burned them. According to some accounts, the tongues of the victims were assigned by the Greeks to Hermes, as the god of speech, or to his human representatives the heralds. On the principles of sympathetic magic we might expect that heralds should taste the tongues of sacrificial victims to strengthen their voices, or to acquire the gift of tongues.

The conjecture that the practice of cutting out the tongues of dead animals may sometimes be a precaution to prevent their ghosts from telling tales, is to some extent confirmed by a ceremony which the Bechuanas used to observe after a battle. It was customary with them on these occasions to sacrifice a fine black ox, called the expiatory victim (*pekou*), cut off the tip of its tongue, and extract one of its eyes together with a piece of the hamstring and a piece of the principal tendon of the shoulder; and the severed parts were afterwards carefully fried, along with some medicinal herbs, in a horn by a medicine-man. The reasons for thus mutilating the animal were explained by a native to two French missionaries. "If we cut out and purify the victim's tongue," said he, "the motive is to induce the guardian deities to prevent the enemy from speaking ill of us. We ask also that the sinews of their feet and hands may fail them in the battle; and that their eyes may not cast a covetous look on our herds." In this custom the sacrificial ox appears to be treated as the ceremonial equivalent of the enemy; accordingly by cutting out its tongue you obviously prevent your enemy from cursing you, for how can he curse you if he has no tongue? Similarly, by hamstringing the beast you ensure that the legs and arms of your adversary will fail him in the battle, and by gouging out the ox's eye you make perfectly certain that the foe will never be able to cast a longing eye on your fat beeves. Thus for all practical purposes the mutilation of the ox is quite as effective as the mutilation of the enemy's dead, which is sometimes practised by savages from similar superstitious motives. Thus on the return from a field of battle the Baganda used to cut up one or two of the enemy's dead, scoop out the eyes, cut off the ears, and lay the limbs on the road taken by the returning army "to prevent evil following them." The nature of the evil which the Baganda warriors feared to incur if they did not mutilate the dead in this fashion, is not mentioned, but we may conjecture that by gouging out the eyes and ears of their slain foes they hoped to make their angry ghosts blind and deaf; or perhaps, upon the principles of homoeopathic magic, they counted on maiming their living foes in like manner. Some of the aborigines of Australia cut off the thumbs of their dead enemies in order that their ghosts may not be able to throw spears. Other Australian tribes burn off the thumb nails of their own dead to prevent the poor ghost from scratching a way for himself out of the grave. When the Tupi Indians of Brazil killed and ate a prisoner, "the thumb was cut off because of its use in archery, an art concerning which they were singularly superstitious; what was done with it does not appear, except that it was not eaten like the rest." Perhaps these Indians, like the Australians, thought by this mutilation to disarm the dangerous ghost of their victim. When any bad man died, the Esquimaux of Bering Strait used to cut the sinews of his arms and legs, "in order to prevent the shade from returning to the body and causing it to walk at night as a ghoul." In Travancore the ghosts of men who have been hanged for murder are particularly dreaded; so in order to incapacitate them from roaming about and attacking people, it used to be customary to slice off a criminal's heels with a sword or hamstring him at the moment when he swung free from the ladder. The Omaha Indians used to slit the soles of a man who had been killed by lightning in order to prevent his ghost from walking. Among the Awemba of Northern Rhodesia murderers often inflicted shocking mutilations on the bodies of their victims. "This was done, it is said, to prevent the spirit of the murdered person from exacting vengeance, and even if only the joint of the first or the little finger were cut off, such mutilation would suffice for this purpose." These examples suggest that many other mutilations which savages practise on their dead enemies may spring, not from the blind fury of hatred, but from a cool calculation of the best mode of protecting themselves against the very natural resentment of the ghosts; by mutilating the corpse they apparently hope to maim the ghost and so to render him incapable of harming them. At all events it appears that in certain circumstances some savages treat the dead bodies of men and beasts much alike, by hamstringing them in order to prevent their ghosts from getting up and walking. So consistent and impartial is the primitive philosopher in his attitude to the spirit world.

XV. The Propitiation of Vermin by Farmers

§ 1. The Enemies of the Crops.

Besides the animals which primitive man dreads for their strength and ferocity, and those which he reveres on account of the benefits which he expects from them, there is another class of creatures which he sometimes deems it necessary to conciliate by worship and sacrifice. These are the vermin that infest his crops and his cattle. To rid himself of these deadly foes the farmer has recourse to many superstitious devices, of which, though some are meant to destroy or intimidate the vermin, others aim at propitiating them and persuading them by fair means to spare the fruits of the earth and the herds. Thus Esthonian peasants, in the island of Oesel, stand in great awe of the weevil, an insect which is exceedingly destructive to the grain. They give it a fine name, and if a child is about to kill a weevil they say, "Don't do it; the more we hurt him, the more he hurts us." If they find a weevil they bury it in the earth instead of killing it. Some even put the weevil under a stone in the field and offer corn to it. They think that thus it is appeased and does less harm. Amongst the Saxons of Transylvania, in order to keep sparrows from the corn, the sower begins by throwing the first handful of seed backwards over his head, saying, "That is for you, sparrows." To guard the corn against the attacks of leaf-flies (*Erdflöhe*) he shuts his eyes and scatters three handfuls of oats in different directions. Having made this offering to the leaf-flies he feels sure that they will spare the corn. A Transylvanian way of securing the crops against all birds, beasts, and insects, is this: after he has finished sowing, the sower goes once more from end to end of the field imitating the gesture of sowing, but with an empty hand. As he does so he says, "I sow this for the animals; I sow it for everything that flies and creeps, that walks and stands, that sings and springs, in the name of God the Father, etc." The Huzuls of the Carpathians believe that the bite of the weasel is poisonous and that the animal commits ravages on the cattle. Yet they take care never to kill a weasel, lest the surviving kinsfolk of the deceased should avenge his death on the herds of his murderer. They even celebrate a festival of weasels either on St. Matthew's day (9th August, old style, 21st August, new style), or on St. Catherine's day (24th November, old style, 6th December, new style). On that day no work may be done, lest the weasels should harm the herds. The following is a German way of freeing a garden from caterpillars. After sunset or at midnight the mistress of the house, or another female member of the family, walks all round the garden dragging a broom after her. She must not look behind her, and must keep murmuring, "Good evening, Mother Caterpillar, you shall come with your husband to church." The garden gate is left open till the following morning.

The attempts thus made by European peasants to mollify the rage and avert the ravages of vermin have their counterpart in the similar observances of savages. When the Matabele find caterpillars in their fields they put an ear of corn in a calabash, fill the vessel up with caterpillars, and set it down on a path leading to another village, hoping thus to induce the insects to migrate thither. The Yabim of German New Guinea imagine that the caterpillars and worms which infest their fields of taro are animated by the souls of the human dead; hence in order to rid the crops of these vermin they politely request the insects to leave the fields and repair to the village. "Ye locusts, worms, and caterpillars," they say, "who have died or hanged yourselves, or have been killed by a falling log or devoured by a shark, go into the village." There is a certain ant whose destructive ravages are dreaded by the people of Nias. Generally they wage war on it by means of traps and other devices; but at the time of the rice-harvest they cease to call the insect by its common name, and refer to it under the

title of Sibaia, a good spirit who is supposed to protect the crop from harm. In South Mirzapur, when locusts threaten to eat up the fruits of the earth, the people catch one, decorate his head with a spot of red lead, salaam to him, and let him go. After these civilities he immediately departs along with his fellows. Among the Wajagga of German East Africa sorcerers attempt to rid the fields of locusts by catching one of the insects, tying its legs together, and letting it fly away, after charging the creature to lead the swarm to the lands of a neighbouring and hostile chief. The Wagogo, another tribe of German East Africa, catch one of the birds which infest their gardens, and, having drenched it with a charmed stuff, they release the bird in the hope that it may entice all its companions away into the forest.

Sometimes in dealing with vermin the farmer aims at hitting a happy mean between excessive rigour on the one hand and weak indulgence on the other; kind but firm, he tempers severity with mercy. An ancient Greek treatise on farming advises the husbandman who would rid his lands of mice to act thus: "Take a sheet of paper and write on it as follows: 'I adjure you, ye mice here present, that ye neither injure me nor suffer another mouse to do so. I give you yonder field' (here you specify the field); 'but if ever I catch you here again, by the Mother of the Gods I will rend you in seven pieces.' Write this, and stick the paper on an unhewn stone in the field before sunrise, taking care to keep the written side up." In the Ardennes they say that to get rid of rats you should repeat the following words: "*Erat verbum, apud Deum vestrum*. Male rats and female rats, I conjure you, by the great God, to go out of my house, out of all my habitations, and to betake yourselves to such and such a place, there to end your days. *Decretis, reversis et desembarassis virgo potens, clemens, justitiae*." Then write the same words on pieces of paper, fold them up, and place one of them under the door by which the rats are to go forth, and the other on the road which they are to take. This exorcism should be performed at sunrise. Some years ago an American farmer was reported to have written a civil letter to the rats, telling them that his crops were short, that he could not afford to keep them through the winter, that he had been very kind to them, and that for their own good he thought they had better leave him and go to some of his neighbours who had more grain. This document he pinned to a post in his barn for the rats to read. The mouse is one of the most dreaded enemies of the rice-crop in Celebes. Many therefore are the prayers and incantations which prudent farmers resort to for the purpose of keeping the vermin from their fields. Thus, for example, a man will run round his field, saying, "Pruner is your name. Creep not through my rice. Be blind and deaf. Creep not through my rice. If you must creep through rice, go and creep through other rice." The following formula is equally effective: "Pruner is your real name. Mouse is your by-name. Down in the evening land is the stone on which you ought to sit; in the west, in Java, is your abode." Or again: "O Longtail, Longtail, eat not my rice. It is the rice of a prince. It is the field of one who is revered." The Aino of Japan believe that God first created rats and mice at Erum kotan, which means "rat place." Indeed, there are a great many rats and mice there even now, and the people of the village worship mice and offer them libations and sacred sticks whittled at the top into shavings. Grateful for these attentions, the mice spare the gardens and will not nibble at the roots and the fruits. But if the people omit to worship the mice, or if they are rash enough to speak evil of them, the creatures are angry and eat up the garden produce. The havoc which rats and mice now work in the gardens of the Aino every year is attributed to the modern neglect of the people to worship the vermin.

Sometimes the desired object is supposed to be attained by treating with high distinction one or two chosen individuals of the obnoxious species, while the rest are pursued with relentless rigour. In the East Indian island of Bali, the mice which ravage the rice-fields are caught in great numbers, and burned in the same way that corpses are burned. But two of the captured mice are allowed to live, and receive a little packet of white linen. Then the people bow down

before them, as before gods, and let them go. In the Kangean archipelago, East Indies, when the mice prove very destructive to the rice-crop, the people rid themselves of the pest in the following manner. On a Friday, when the usual service in the mosque is over, four pairs of mice are solemnly united in marriage by the priest. Each pair is then shut up in a miniature canoe about a foot long. These canoes are filled with rice and other fruits of the earth, and the four pairs of mice are then escorted to the sea-shore just as if it were a real wedding.

Wherever the procession passes the people beat with all their might on their rice-blocks. On reaching the shore, the canoes, with their little inmates, are launched and left to the mercy of the winds and waves. When the farms of the Sea Dyaks or Ibans of Sarawak are much pestered by birds and insects, they catch a specimen of each kind of vermin (one sparrow, one grasshopper and so on), put them in a tiny boat of bark well-stocked with provisions, and then allow the little vessel with its obnoxious passengers to float down the river. If that does not drive the pests away, the Dyaks resort to what they deem a more effectual mode of accomplishing the same purpose. They make a clay crocodile as large as life and set it up in the fields, where they offer it food, rice-spirit, and cloth, and sacrifice a fowl and a pig before it. Mollified by these attentions, the ferocious animal very soon gobbles up all the creatures that devour the crops. In some parts of Bohemia the peasant, though he kills field mice and grey mice without scruple, always spares white mice. If he finds a white mouse he takes it up carefully, and makes a comfortable bed for it in the window; for if it died the luck of the house would be gone, and the grey mice would multiply fearfully in the dwelling. In Albania, if the fields or vineyards are ravaged by locusts or beetles, some of the women will assemble with dishevelled hair, catch a few of the insects, and march with them in a funeral procession to a spring or stream, in which they drown the creatures. Then one of the women sings, "O locusts and beetles who have left us bereaved," and the dirge is taken up and repeated by all the women in chorus. Thus by celebrating the obsequies of a few locusts and beetles, they hope to bring about the death of them all. When caterpillars invaded a vineyard or field in Syria, the virgins were gathered, and one of the caterpillars was taken and a girl made its mother. Then they bewailed and buried it. Thereafter they conducted the "mother" to the place where the caterpillars were, consoling her, in order that all the caterpillars might leave the garden. On the first of September, Russian girls "make small coffins of turnips and other vegetables, enclose flies and other insects in them, and then bury them with a great show of mourning." In South Africa a plague of caterpillars is removed by a number of small Caffre girls, who go singing through the fields. They wail as they pass through the languishing crops, and thus invoke the aid and pity of some ancestral spirits. The mournful rite ends with a dance on a plot of ground overlooking the fields.

On the shore of Delagoa Bay there thrives a small brown beetle which is very destructive to the beans and maize. The Baronga call it *noonoo*. In December or January, when the insects begin to swarm, women are sent to collect them from the bean-stalks in shells. When they have done so, a twin girl is charged with the duty of throwing the insects into a neighbouring lake. Accompanied by a woman of mature years and carrying the beetles in a calabash, the girl goes on her mission without saying a word to any one. At her back marches the whole troop of women, their arms, waists, and heads covered with grass and holding in their hands branches of manioc with large leaves which they wave to and fro, while they chant the words, "*Noonoo*, go away! Leave our fields! *Noonoo*, go away! leave our fields!" The little girl throws her calabash with the beetles into the water without looking behind her, and thereupon the women bellow out obscene songs, which they never dare to utter except on this occasion and at the ceremony for making rain.

Another mode of getting rid of vermin and other noxious creatures without hurting their feelings or shewing them disrespect is to make images of them. Apollonius of Tyana is said

to have cleared Antioch of scorpions by making a bronze image of a scorpion and burying it under a small pillar in the middle of the city. Further, it is reported that he freed Constantinople from flies by means of a bronze fly, and from gnats by means of a bronze gnat. In the Middle Ages Virgil passed for an enchanter and is said to have rid Naples of flies and grasshoppers by bronze or copper images of these insects; and when the waters of the city were infested by leeches, he made a golden leech, which put a stop to the plague. It is reported that a mosque at Fez used to be protected against scorpions by an image of a bird holding a scorpion in its beak. An Arab writer tells of a golden locust which guarded a certain town from a plague of locusts; and he also mentions two brazen oxen which checked a murrain among cattle. Gregory of Tours tells us that the city of Paris used to be free of dormice and serpents, but that in his lifetime, while they were cleaning a sewer, they found a bronze serpent and a bronze dormouse and removed them. "Since then," adds the good bishop, "dormice and serpents without number have been seen in Paris." When their land was overrun with mice, the Philistines made golden images of the vermin and sent them out of the country in a new cart drawn by two cows, hoping that the real mice would simultaneously depart. So when a swarm of serpents afflicted the Israelites in the desert, they made a serpent of brass and set it on a pole as a mode of staying the plague.

§ 2. Mouse Apollo and Wolf Apollo.

Some of the Greek gods were worshipped under titles derived from the vermin or other pests which they were supposed to avert or exterminate. Thus we hear of Mouse Apollo, Locust Apollo, and Mildew Apollo; of Locust Hercules and Worm-killing Hercules; of Foxy Dionysus; and of Zeus the Fly-catcher or Averter of Flies. If we could trace all these and similar worships to their origin, we should probably find that they were at first addressed, not to the high gods as the protectors of mankind, but to the baleful things themselves, the mice, locusts, mildew, and so forth, with the intention of flattering and soothing them, of disarming their malignity, and of persuading them to spare their worshippers. We know that the Romans worshipped the mildew, the farmer's plague, under its own proper name. The ravages committed by mice among the crops both in ancient and modern times are notorious, and according to a tradition which may be substantially correct the worship of the Mouse (Smintheus) Apollo was instituted to avert them. The image of a mouse which stood beside Apollo's tripod in the god's temple in the Troad, may be compared with the golden mice which the Philistines made for the purpose of ridding themselves of the vermin; and the tame mice kept in his sanctuary, together with the white mice which lived under the altar, would on this hypothesis be parallel to the white mice which the Bohemian peasant still cherishes as the best way of keeping down the numbers of their grey-coated brethren. An Oriental counterpart of the Mouse Apollo is the ancient pillar or rude idol which the Chams of Indo-China call *yang-tikuh* or "god rat," and to which they offer sacrifices whenever rats infest their fields in excessive numbers.

Another epithet applied to Apollo which probably admits of a similar explanation is Wolfish. Various legends set forth how the god received the title of Wolfish because he exterminated wolves; indeed this function was definitely attributed to him by the epithet Wolf-slayer. Arguing from the analogy of the preceding cases, we may suppose that at first the wolves themselves were propitiated by fair words and sacrifices to induce them to spare man and beast; and that at a later time, when the Greeks, or rather the enlightened portion of them, had outgrown this rude form of worship, they transferred the duty of keeping off the wolves to a beneficent deity who discharged the same useful office for other pests, such as mice, locusts, and mildew. A reminiscence of the direct propitiation of the fierce and dangerous beasts themselves is preserved in the legends told to explain the origin of the Lyceum or Place of Wolves at Athens and of the sanctuary of Wolfish Apollo at Sicyon. It is

said that once, when Athens was infested by wolves, Apollo commanded sacrifices to be offered on the Place of Wolves and the smell proved fatal to the animals. Similarly at Sicyon, when the flocks suffered heavily from the ravages of wolves, the same god directed the shepherds to set forth meat mixed with a certain bark, and the wolves devoured the tainted meat and perished. These legends probably reflect in a distorted form an old custom of sacrificing to the wolves, in other words of feeding them to mollify their ferocity and win their favour. We know that such a custom prevailed among the Letts down to comparatively recent times. In the month of December, about Christmas time, they sacrificed a goat to the wolves, with strange idolatrous rites, at a cross-road, for the purpose of inducing the wolves to spare the flocks and herds. After offering the sacrifice they used to brag that no beast of theirs would fall a victim to the ravening maw of a wolf for all the rest of that year, no, not though the pack were to run right through the herd. Sacrifices of this sort are reported to have been secretly offered by the Letts as late as the seventeenth century; and if we knew more of peasant life in ancient Greece we might find that on winter days, while Aristotle was expounding his philosophy in the Lyceum or Place of Wolves at Athens, the Attic peasant was still carrying forth, in the crisp frosty air, his offering to the wolves, which all night long had been howling round his sheepfold in a snowy glen of Parnes or Pentelicus.

XVI. The Transmigration of Human Souls Into Animals

With many savages a reason for respecting and sparing certain species of animals is a belief that the souls of their dead kinsfolk are lodged in these creatures. Thus the Indians of Cayenne refuse to eat certain large fish, because they say that the soul of some one of their relations might be in the fish, and that hence in eating the fish they might swallow the soul. The Piaroas Indians of the Orinoco believe that the tapir is their ancestor and that the souls of the dying transmigrate into animals of that species. Hence they will never hunt the tapir nor eat its flesh. It may even ravage their crops with impunity; they will not attempt to ward it off or scare it away. The Canelos Indians of Ecuador also believe in the transmigration of souls; it is especially under the form of jaguars that they expect to be born again; hence they refuse to attack a jaguar except by way of righteous retribution for some wrong he has done them. The doctrine of transmigration finds favour also with the Quixos Indians; an old man told the Italian traveller Osculati that the soul is a breath which passes from the human body into an animal, and on the death of the animal shifts its quarters to another body. The Caingua Indians of Paraguay think that the souls of the dead which are unable to depart this earth are born again in the shape of animals; for that reason many of them refuse to eat the flesh of the domestic pig, because they say, "He was a man." Once when a Spaniard was out hunting with two Piros Indians of Peru, they passed a deserted house in which they saw a fine jaguar. The Indians drew the Spaniard away, and when he asked why they did not attack the animal, they said: "It was our sister. She died at the last rains. We abandoned the hut and on the second night she came back. It was the beautiful jaguar." Similarly a missionary remarked of the Chiriguanos Indians of Bolivia that they must have some idea of the transmigration of souls; for one day, while he was talking with a woman of the tribe who had left her daughter in a neighbouring village, she started at sight of a fox passing near and exclaimed, "May it not be the soul of my daughter who has died?" The Colombian Indians in the district of Popayan will not kill the deer of their forests, and entertain such a respect for these animals that they view with horror and indignation any one who dares to eat venison in their presence. They say that the souls of persons who have led a good life are in the deer. In like manner the Indians of California formerly refused to eat the flesh of large game, because they held that the bodies of all large animals contained the souls of past generations of men and women. However, the Indians who were maintained at the Spanish missions and received their rations in the form of beef, had to overcome their conscientious scruples in regard to cattle. Once a half-caste, wishing to amuse himself at the expense of the devout, cooked a dish of bear's flesh for them and told them it was beef. They ate heartily of it, but when they learned the trick that had been played on them, they were seized with retchings, which only ended with the reappearance of the obnoxious meat. A reproach hurled by the wild tribes at their brethren who had fallen under European influence was "They eat venison!" Californian Indians have been known to plead for the life of an old grizzly she-bear, because they thought it housed the soul of a dead grandam, whose withered features had borne some likeness to the wrinkled face of the bear.

The doctrine of the transmigration of human souls into animal bodies is viewed with great favour by the negroes of northern Guinea. In different parts of the coast different species of animals are accounted sacred, because they are supposed to be animated by the spirits of the dead. Hence monkeys near Fishtown, snakes at Whydah, and crocodiles near Dix Cove live in the odour of sanctity. In the lagoon of Tendo, on the Ivory Coast of West Africa, there is a

certain sacred islet covered with impenetrable scrub, on which no native dare set foot. It is peopled only by countless huge bats, which at evening quit the island by hundreds of thousands to fly towards the River Tanoé, which flows into the lagoon. The natives say that these bats are the souls of the dead, who retire during the day to the holy isle and are bound to present themselves every night at the abode of Tano, the great and good fetish who dwells by the river of his name. Paddling past the island the negroes will not look at it, but turn away their heads. A European in crossing the lagoon wished to shoot one of the bats, but his boatmen implored him to refrain, lest he should kill the soul of one of their kinsfolk. In the Mopane country of South Africa there is, or used to be, no check on the increase of lions, because the natives, believing that the souls of their chiefs entered into the animals, never attempted to kill them; on the contrary, whenever they met a lion they saluted him in the usual fashion by clapping their hands. Hence the country was so infested by lions that people, benighted in fields, often slept for safety in trees. Similarly, the Makanga, who occupy the angle between the Zambesi and Shire rivers, refrain from killing lions because they believe that the spirits of dead chiefs enter into them. The Amambwe universally suppose that their reigning chief turns at death into a lion. The Bahima of Ankole, in Central Africa, also imagine that their dead kings are changed into lions. Their corpses are carried to a forest called Ensanzi, where they lie in state for several days. At the end of that time the body is supposed to burst and give forth a lion cub, which contains the spirit of the deceased king. The animal is nurtured by priests till it is grown up, when it is released and allowed to roam the forest with the other lions. It is the duty of the priests to feed and care for the lions and to hold communications with the dead kings when occasion arises. For that purpose the priests always live in a temple in the forest, where they receive frequent offerings of cattle for the lions. In this forest the lions are sacred and may not be killed, but in other parts of the country they may be slaughtered with impunity. Similarly, the Bahima think that at death the king's wives are changed into leopards; the transformation takes place in like manner through the bursting of the dead bodies in a belt of the same sacred forest. There the leopards are daily fed with offerings of meat by priests, whose office is hereditary. Further, the Bahima are of opinion that the spirits of dead princes and princesses come to life again in the form of snakes, which burst from their dead bodies in another belt of the same forest: there is a temple in the forest where priests feed and guard the holy serpents. When the little snakes have issued from the corpses of the princes, they are fed with milk till they are big enough to go alone. The El Kiboron clan of the Masai, in East Africa, imagine that when married men of the clan are buried, their bones turn into serpents. Hence the El Kiboron do not, like the other Masai, kill snakes: on the contrary they are glad to see the reptiles in the kraal and set out saucers of milk and honey for them on the ground. It is said that snakes never bite members of the clan. The Ababu and other tribes of the Congo region believe that at death their souls transmigrate into the bodies of various animals, such as the hippopotamus, the leopard, the gorilla, and the gazelle; and on no account would a man eat the flesh of an animal of the particular kind which he expects to inhabit in the next life. Some of the Caffres of the Zambesi region, in Portuguese territory, who believe in the transmigration of human souls into the bodies of animals, judge of the species of animals into which a dead person has transmigrated by the resemblance which he bore to it in his life. Thus, the soul of a big burly man with prominent teeth will pass into an elephant; a strong man with a long beard will become a lion; an ugly man with a large mouth and thick lips will be a hyaena; and so on. Animals supposed to be tenanted by the spirits of the dead are treated as sacred and invulnerable. When a Portuguese lady, named Dona Maria, to whom the blacks were much attached, had departed this life, it chanced that a hyaena came repeatedly by night to the village and carried off pigs and kids. The lady's old slaves would not do the creature the

smallest hurt, saying, "It is Dona Maria, our good mistress. She is hungry and comes to her house seeking what she may devour."

The belief that the souls of the dead transmigrate into the bodies of animals appears to be widely diffused among the tribes of Madagascar. Thus, for example, the souls of the Betsileo are thought after death to be reborn in boa-constrictors, crocodiles, and eels of a particular sort according to their rank in life. It is the nobles, or at all events the most illustrious of them, who have the privilege of turning into boa-constrictors at death. To facilitate the transformation the corpse of a dead noble is strapped to the central pillar of his house, and the products of decomposition are collected in a silver bowl. The largest of the worms which are bred in the putrid liquid is believed to contain the soul of the dead nobleman and to develop in due time into a boa-constrictor. Accordingly these huge serpents are regarded as sacred by the Betsileo; nobody would dare to kill one of them. The people go down on their knees to them and salute them, just as they would do to a real live nobleman. It is a happy day when a boa-constrictor deigns to visit the village which he formerly inhabited in human form. He receives an ovation from his family. They go forth to meet him, spread silk for him to crawl upon, and carry him off to the public square, where he is allowed to gorge himself with the blood of a sacrificed ox. The souls of commoners of good standing transmigrate into the bodies of crocodiles, and in their new form still serve their old masters, particularly by announcing to them the approach of the hour when they must shuffle out of the human frame into the frame of boa-constrictors. Lastly, the scum of the population turn at death into eels, and to render the change as easy for them as possible it is customary to remove the bowels from the corpse and throw them into a sacred lake. The eel that swallows the first mouthful becomes the domicile of the soul of the deceased. No Betsileo would eat such eels. Again, the Antankarana, a tribe in the extreme north of Madagascar, believe that the spirits of their dead chiefs pass into crocodiles, while those of common folk are reborn in other animals. Once more, the Tanala, a tribe of south-eastern Madagascar, suppose that the souls of their dead transmigrate into certain animals, such as scorpions and insects, which accordingly they will not kill or eat, believing that the creatures will in like manner abstain from injuring them.

Some of the Nagas of Assam hold that the spirits of the departed, after undergoing a cycle of changes in a subterranean world, are reborn on earth in the form of butterflies or small house flies, only however in that shape to perish for ever. Hence, when these small flies light on the wine-cups of the living, the wassailers will not kill them for fear of destroying some one of their ancestors. For a like reason the Angamis, one of the Naga tribes, carefully abstain from injuring certain species of butterfly. At Ang Teng, a large village of Upper Burma, the river at a point above a dilapidated bridge swarms with fish, which the people hold sacred, because they imagine them to be their dead come to life again in a fishy form. In former days no one might kill one of these fish under pain of death. Once a Shan, caught fishing with some dead fish in his possession, was instantly hauled away and killed. The people of Kon-Meney in eastern Cochin China will not eat toads, because long ago the soul of one of their chiefs passed at death into a toad. In his new shape he appeared to his son in a dream, informed him of the transformation, and commanded him to sacrifice a pig, a fowl, and millet wine to his deceased parent, assuring him that if he complied with the injunction the rice would grow well. The dutiful son obeyed the author of his being; the toad appeared in the rice-fields watching over the growth of the rice, and the crop was magnificent. For two generations the sacrifices were duly offered, the toad appeared at the time of sowing, and the granaries were full. Afterwards, however, the people neglected to sacrifice to the toad and were punished accordingly by failure of the crops and consequent famine. Some of the Chams of Indo-China believe that the souls of the dead inhabit the bodies of certain animals, such as serpents, crocodiles, and so forth, the kind of animal varying with the family. The species of animals

most commonly regarded as tenanted by the spirits of the departed are the rodents and active climbing creatures which abound in the country, such as squirrels. According to some people, these small animals are especially the abode of still-born infants or of children who died young. The souls of these little ones appear in dreams to their mourning parents and say: "I inhabit the body of a squirrel. Honour me as such. Make me a present of a flower, a coco-nut, a cup of roasted rice," and so on. The parents discharge this pious duty, respect these familiar spirits, ascribe illnesses to their displeasure, pray to them for healing, and on their deathbed commend to their descendants the care of such and such a spirit, as a member of the family.

The Igorrots of Cabugatan, in the Philippines, regard the eels in their stream as the souls of their forefathers. Hence instead of catching and eating them they feed them, till the eels become as tame as carp in a pond. In the Sandwich Islands various people worshipped diverse kinds of animals, such as fowls, lizards, owls, rats, and so forth. If a man who adored sharks happened to have a child still-born, he would endeavour to lodge the soul of the dead infant in the body of a shark. For this purpose he laid the tiny body, together with a couple of roots of taro, some kava, and a piece of sugar-cane, on a mat, recited prayers over it, and then flung the whole into the sea, believing that by virtue of this offering the transmigration of the child's soul into the shark's body would be effected, and that henceforth the voracious monsters would spare all members of the family who might otherwise be exposed to their attacks. In the temples dedicated to sharks there were priests who, morning and evening, addressed prayers to the shark-idol, and rubbed their bodies with water and salt, which, drying on their skin, imparted to it an appearance of being covered with scales. They also wore red stuffs, uttered shrill cries, leaped over the sacred enclosure, and persuaded the credulous islanders that they knew the exact moment when the children thrown into the sea were turned into sharks. For this revelation they were rewarded by the happy parents with a plentiful supply of little pigs, coco-nuts, kava, and so on. The Pelew Islanders believed that the souls of their forefathers lived in certain species of animals, which accordingly they held sacred and would not injure. For this reason one man would not kill snakes, another would not harm pigeons, and so on; but every one was quite ready to kill and eat the sacred animals of his neighbours.

We have seen that the Battas of Sumatra seldom kill a tiger and never without performing an elaborate ceremony to appease the animal's ghost. The reason alleged for treating tigers with this respect is that the souls of the dead often transmigrate into these animals, and therefore in killing a tiger a man never knows whether he is not killing a relative of his own. If members of the totemic clan of the Tiger should happen to be in a village when the carcase of a slain tiger is brought into it, they are bound to pay special marks of honour to its remains by putting betel in its mouth. A priest offers food and drink to the dead tiger, addresses him as Grandfather, prays him not to be angry or frightened, and explains to the gods the reasons for putting the animal to death.

The Kayans of Borneo think that when the human soul departs from the body at death it may take the form of an animal or bird. For example, if a deer were seen browsing near a man's grave, his relations would probably conclude that his soul had assumed the shape of a deer, and the whole family would abstain from eating venison lest they should annoy the deceased. Most of the Kalamantans, another tribe of Borneo, will kill and eat deer freely, but there are exceptions to the rule. "Thus Damong, the chief of a Malanau household, together with all his people, will not kill or eat the deer *Cervulus muntjac*, alleging that an ancestor had become a deer of this kind, and that, since they cannot distinguish this incarnation of his ancestor from other deer, they must abstain from killing all deer of this species. We know of one instance in which one of these people refused to use again his cooking-pot which a Malay had borrowed and used for cooking the flesh of this deer. This superstition is still rigidly

adhered to, although these people have been converted to Islam of recent years.... The people of Miri, who also are Mohammedan Malanaus, claim to be related to the large deer (*Cervus equinus*) and some of them to the muntjac deer also. Now these people live in a country in which deer of all kinds abound, and they always make a clearing in the jungle around a tomb. On such a clearing grass grows up rapidly, and so the spot becomes attractive to deer as a grazing ground; and it seems not improbable that it is through frequently seeing deer about the tombs that the people have come to entertain the belief that their dead relatives become deer or that they are in some other way closely related to the deer. The Bakongs, another group of Malanaus, hold a similar belief with regard to the bear-cat (*Artictis*) and the various species of *Paradoxurus*, and in this case the origin of the belief is admitted by them to be the fact that on going to their graveyards they often see one of these beasts coming out of a tomb. These tombs are roughly constructed wooden coffins raised a few feet only from the ground, and it is probable that these carnivores make their way into them in the first place to devour the corpse, and that they then make use of them as lairs.” Among the Sea Dyaks, also of Borneo, the idea of metempsychosis is not unknown. One of them used to treat a snake with the greatest kindness, because he said it had been revealed to him in a dream that the spirit of his grandfather dwelt in that snake.

Some of the Papuans on the northern coast of New Guinea also believe in the transmigration of souls. They hold that at death the souls of human beings sometimes pass into animals, such as cassowaries, fish, or pigs, and they abstain from eating the animals of the sort in which the spirits of the dead are supposed to have taken up their abode. For example, at Masur in Dutch New Guinea there are people who imagine that the spirits of their ancestors transmigrated into cassowaries, and accordingly they will not partake of the flesh of the long-legged bird. In Simbang, a village at the mouth of the Bubui river in German New Guinea, there is a family who will not harm crocodiles, not merely because they fear the vengeance of the creatures, but also because they reckon crocodiles their kinsfolk and expect that they themselves will turn into crocodiles at death. As head of the family they recognise a certain aged crocodile, everywhere known as “old Butong,” who is said to have been born of a woman at Simbang. They think that while they are at work in the fields, and the houses stand empty, their ancestors come forth from the river and repair to the place in the roof where the mysterious bull-roarers are kept, which make a humming sound at the initiatory rites of young men. But when the people return from the fields they find the houses as empty and silent as when they left them: the spirits of their forefathers have plunged into the river again. If a crocodile carries off anybody, the natives are sure that the brute must be a stranger, not one of their own crocodile kinsfolk, who never would do such a thing; and if their neighbours at Yabim are so unfeeling as to kill a crocodile, the Bubui people protest against the outrage and demand satisfaction. Some Yabim people give out that after death their souls will be turned into certain fabulous cave-haunting swine, and accordingly their relatives refuse to spear or to eat the real wild swine. If these animals break into and ravage the fields, their human kinsfolk attempt to appease them with offerings of coco-nuts and other valuable articles. Similarly in Tamara, an island off the coast of German New Guinea, the people will not eat pork, because it is their conviction that the souls of the dead transmigrate into the bodies of pigs. The Kai people, who inhabit the rugged and densely wooded mountains inland from Finsch Harbour in German New Guinea, imagine that the gloomy depths of some wild ravines are haunted by the souls of the dead in the form of cuscuses and other animals. None but the owner has the right to kill game in these dark and awful gullies, and even he must propitiate the soul of every animal that he slays in such a spot. For this purpose he spreads out offerings on the carcase and presents them to the injured spirit, saying, “Take the gifts and leave us the animal, that we may eat it.” After leaving the articles long enough to allow the soul of the beast to abstract and convey away the souls of the things, the hunter is free to

cut up and consume the carcase. Some years ago, when heavy rains caused a land-slip in these wild mountains, and a house with its inmates was buried in the ruins, public opinion in the neighbourhood attributed the disaster to the misconduct of the deceased, who had failed to appease the soul of a boa-constrictor slain by them on haunted ground.

In the Solomon Islands a man at the point of death would gather the members of his family about him and inform them of the particular sort of creature, say a bird or a butterfly, into which he proposed to transmigrate. Henceforth the family would regard that species of animal as sacred and would neither kill nor injure it. If they fell in with a creature of the kind, it might be a bird or a butterfly, they would say, "That is papa," and offer him a coco-nut. In these islands sharks are very often supposed to be ghosts, for dying people frequently announce their intention of being sharks when they have put off their human shape. After that, if any shark remarkable for its size or colour is seen to haunt a certain shore or rock, it is taken to be somebody's ghost, and the name of the deceased is given to it. For example, at Ulawa a dreaded man-eating shark received the name of a dead man and was propitiated with offerings of porpoise teeth. At Saa, certain food, for example coco-nuts from particular trees, is reserved to feed such a ghost-shark, but men of whom it is positively known that after death they will be in sharks are allowed by anticipation to partake of the shark-food in the sacred place. Other men will sometimes join themselves to their company, and speaking with the voice of a shark-ghost will say, "Give me to eat of that food." If such a man happens to be really possessed of supernatural power, he will in due time become a shark-ghost himself; but it is perfectly possible that he may fail. In Savo not very long ago a certain man had a shark that he used to feed and to which he offered sacrifice. He swam out to it with food, called it by name, and it came to him. Of course it was not a common shark, but a ghost, the knowledge of which had been handed down to him from his ancestors. Alligators also may lodge the souls of dead Solomon Islanders. In the island of Florida a story was told of an alligator that used to come up out of the sea and make itself quite at home in the village in which the man whose ghost it was had lived. It went by the name of the deceased, and though there was one man in particular who had special connexion with it and was said to own it, the animal was on friendly terms with everybody in the place and would even let children ride on its back. But the village where this happened has not yet been identified. In the same island the appearance of anything wonderful is taken as proof of a ghostly presence and stamps the place as sacred. For example, a man planted some coco-nut palms and almond trees in the bush and died not long afterwards. After his death there appeared among the trees a great rarity in the shape of a white cuscus. The animal was accordingly assumed to be the ghost of the departed planter and went by his name. The place became sacred, and no one would gather the fruits of the trees there, until two young men, who had been trained in the principles of Christianity, boldly invaded the sanctuary and appropriated the almonds and coco-nuts. It must not be supposed, however, that the choice of transmigration open to a Solomon Islander is restricted to the animal kingdom; he is free after death to become a vegetable, if he feels so disposed. When a mission-school was established in the island of Ulawa it was observed with surprise that the natives would not eat bananas and had ceased to plant the tree. Enquiry elicited the origin of the restriction, which was recent and well remembered. A man of great influence, dying not long before, had forbidden the eating of bananas after his death, saying that he would be in the banana. The older natives would still mention his name and say, "We cannot eat So-and-so."

The doctrine of the reincarnation of human souls in the bodies either of men or of animals, which meets us as an article of faith in so many savage tribes, has a special interest for the historian of thought, because it has been adopted more or less explicitly and employed, not merely as a philosophical theory, but as a means of enforcing moral lessons, by thinkers,

teachers, and lawgivers among various civilised peoples, notably in ancient India and Greece. Thus in the most famous of old Indian law-books, *The Laws of Manu*, the penalties to be endured by evil-doers in future births are described with a precision which leaves nothing to be desired: the degradation of the birth is exactly proportioned to the degree of moral guilt of the transgressor. For example, if a man has the temerity to censure his teacher, even though the censure is richly deserved, that rash man in his next birth will be an ass; but if he defames his teacher falsely, he will be a dog; and if he is so lost to all sense of propriety as to live at the expense of his teacher, he will be a worm. A faithless wife in her next transmigration will be born a jackal. A Brahman who misappropriates money which he has received for a sacrifice will hereafter be either a vulture or a crow for the period of one hundred years. Men who delight in doing hurt will be born as carnivorous animals, and those who eat forbidden food will be degraded into worms. As for thieves, their lot is a hard one, and it is harder in proportion to the value of the article stolen. A man who steals gems will be born a goldsmith; a man who steals grain will be born a rat; a man who steals honey will be born a stinging insect; and a man who steals clarified butter will be born an ichneumon. The penalty for stealing silk is to become a partridge, for stealing linen a frog, for stealing vegetables a peacock, for stealing cooked food a porcupine, for stealing uncooked food a hedgehog, and for stealing molasses a flying-fox. And so on for the various degrees of moral turpitude throughout the entire range of the animal kingdom. Buddha himself, who gave an immense extension to the doctrine of transmigration by incorporating it in his religious or rather philosophical system, is traditionally said to have undergone many animal births of various sorts before he attained to his supreme dignity. Thus it is reported that he was once a hare, once a dog, twice a pig, twice a frog, four times a serpent, six times a snipe, ten times a lion, eleven times a deer, and eighteen times a monkey; to say nothing of having been once a devil-dancer, twice a thief, eighty-three times an ascetic, and so on.

In ancient Greece also the theory of the transmigration of souls found favour with the early philosophers Pythagoras and Empedocles, both of whom, if we may trust tradition, appealed to their own personal experience in support of the doctrine. According to ancient writers, Pythagoras affirmed that he had been Euphorbus the Trojan in one of his former lives, and in proof of the assertion he identified the shield of Euphorbus among the Trojan spoils at Mycenae. He would seem to have held that human souls can transmigrate into animals or even into plants; and we may suppose that the possibility of such transmigrations was at least one of the reasons he alleged for enjoining the strictest of his disciples neither to kill nor to eat animals and to abstain from certain vegetables, such as beans and mallows. Certainly at a later time these principles were maintained and these precepts inculcated by Empedocles, who outdid the reminiscences of his predecessor by asserting that he himself in former lives had been a boy, a girl, a bush, a bird, and a fish. Hence he denounced as a crime the practice of killing and eating animals, since according to him a man could never know but that in slaughtering and eating an animal he might be murdering and devouring one of his dead kinsfolk, it might be his father or mother, his son or daughter. Thus from the doctrine of transmigration Empedocles logically drew the same practical conclusion as the savage, who abstains, for example, from killing and eating crocodiles or pigs because he believes the souls of his departed relations to be embodied in crocodiles or pigs: the only important difference between the savage and the philosopher in this respect is that, whereas the savage venerates and spares only animals of one particular species on the ground of their possible affinity to himself, the philosopher on his own shewing was bound to abstain from all animals whatever, since according to him the spirits of his deceased relatives might be lurking in creatures of any species. Hence while a faith in transmigration imposes but few restrictions on the diet of a savage, since it leaves him free to partake of the flesh of every sort of animals but one, the creed of Empedocles logically cut him off from a flesh diet altogether and compelled him to

live on vegetables alone; indeed, if he had been rigidly logical, he must have denied himself the use of vegetables also and perished of hunger, since on his theory vegetables as well as animals may house the souls of the dead. However, like a wise man he sacrificed logic to life, and contented himself with forbidding his disciples the use of a few vegetables, such as beans and laurels, while he suffered them to browse freely on all the rest.

So far as we can gather the real opinions of Pythagoras and Empedocles from the traditional history of the one and the miserably mutilated writings of the other, they seem both, like Buddha, with whom they had much in common, to have used the old savage doctrine of the transmigration of souls mainly as a handle by which to impress on the minds of their followers the necessity of leading an innocent, pure, and even ascetic life in this world as the only means of ensuring a blissful or at all events an untroubled eternity in a world to come. At least this is fairly certain for Empedocles, whose views are comparatively well known to us through the fragments of his philosophical writings. From these utterances of his, the genuineness of which seems to be beyond suspicion, we gather that the psychology of Empedocles was a curious blend of savagery and mysticism. He regarded the incarnation of the human soul in a body of any sort as a punishment for sin, a degradation, a fall from heaven, an exile from God, a banishment from a world of bliss to a world of woe. He describes the earth as a cavern, a joyless land, where men wander in darkness, a prey to murder and revenge, to swarms of foul fiends, to wasting sickness and decay. He speaks with pity and contempt of the life of mortals as a wretched and miserable existence, begotten of strife and sighs and prolonged as a punishment for their sins through a series of transmigrations, until, by the exercise of virtue, they have been born again as prophets, poets, physicians, and princes, and so return at last to communion with the gods to live thenceforth free from pain and sorrow, immortal, incorruptible, divine. This view of human destiny, this passionate scorn poured on the present world, this ecstatic aspiration after a blissful eternity, the reward of virtue in a world to come, are very alien from the cheerful serenity, the calm rationalism of the ordinary Greek attitude towards existence on earth. In his profound conviction of the manifold sufferings inseparable from mortality, in his longing to put off the burden of the body or what he calls "the garment of flesh," in his tenderness for the lower animals and his strong sense of kinship with them, Empedocles resembled Buddha, whose whole cast of thought, however, was tinged with a still deeper shade of melancholy, a more hopeless outlook on the future. Yet so close in some respects is the similarity between the two that we might incline to suppose a direct influence of Buddhism on Empedocles, were it not that the dates of the two great thinkers, so far as they can be ascertained, appear to exclude the supposition.

But if on its ethical side the teaching of Empedocles may almost be described as Buddhism relieved of its deepest shadows, on its scientific side it curiously anticipated some speculations which have deeply stirred the European mind in our own and our fathers' days. For to his savage psychology and religious mysticism Empedocles superadded a comprehensive and grandiose theory of the material universe, which presents a close analogy to that of Herbert Spencer. The scientific doctrine of the conservation of energy or, as he preferred to call it, the persistence of force, which Spencer made the corner-stone of his system, has its counterpart in the Empedoclean doctrine of the conservation or indestructibility of matter, the sum of which, according to him, remains always constant, never undergoing either increase or diminution. Hence all the changes that take place in the physical world, according to Empedocles, resolve themselves into the integration and disintegration of matter, the composition and decomposition of bodies, brought about by the two antagonistic forces of attraction and repulsion, which in mythical language he called love and hate. And just as all particular things are evolved by the force of attraction and dissolved

by the force of repulsion, a state of concentration or aggregation in the individual perpetually alternating with a state of diffusion or segregation, so it is also with the material universe as a whole. It, too, alternately contracts and expands according as the forces of attraction and repulsion alternately prevail. For it was the opinion of Empedocles that a long, perhaps immeasurable, period of time, during which the force of attraction prevails over the force of repulsion, is succeeded by an equally long period in which the force of repulsion prevails over the force of attraction, each period lasting till, the predominant force being spent, its action is first arrested and then reversed by the opposite force; so that the material universe performs a periodic and rhythmic movement of alternate contraction and expansion, which never ceases except at the moments when, the two opposite forces exactly balancing each other, all things come to rest and equilibrium for a time, only however to return, with the backward sweep of the cosmic pendulum, to their former state either of consolidation or of dispersion. Thus under the influence of attraction and repulsion matter is constantly oscillating to and fro: at the end of a period of contraction it is gathered up in a solid globe: at the end of a period of expansion it is diffused throughout space in a state of tenuity which nowadays we might describe as gaseous. And this gigantic see-saw motion of the universe as a whole has gone on and will go on for ever and ever.

The imposing generalisation thus formulated by Empedocles in the fifth century before our era was enunciated independently in the nineteenth century of our era by Herbert Spencer. Like his Greek predecessor, the modern English philosopher held that the material universe passes through alternate periods of concentration and dissipation, of evolution and dissolution, according as the forces of attraction and repulsion alternately prevail. The terms in which he sums up his general conclusions might be used with hardly any change to describe the conclusions of Empedocles. For the sake of comparison it may be well to subjoin the passage. It runs as follows:—

“Thus we are led to the conclusion that the entire process of things, as displayed in the aggregate of the visible Universe, is analogous to the entire process of things as displayed in the smallest aggregates.

“Motion as well as matter being fixed in quantity, it would seem that the change in the distribution of Matter which Motion effects, coming to a limit in whichever direction it is carried, the indestructible Motion thereupon necessitates a reverse distribution. Apparently, the universally coexistent forces of attraction and repulsion, which, as we have seen, necessitate rhythm in all minor changes throughout the Universe, also necessitate rhythm in the totality of its changes—produce now an immeasurable period during which the attractive forces predominating, cause universal concentration, and then an immeasurable period during which the repulsive forces predominating, cause universal diffusion—alternate eras of Evolution and Dissolution. And thus there is suggested the conception of a past during which there have been successive Evolutions analogous to that which is now going on; and a future during which successive other such Evolutions may go on—ever the same in principle but never the same in concrete result.”

The most recent researches in physical science tend apparently rather to confirm than to invalidate these general views of the nature of the universe; for if modern physicists are right in regarding the constitution of matter as essentially electrical, the antagonistic forces of attraction and repulsion postulated by Empedocles and Spencer would resolve themselves into positive and negative electricity. On the other hand the atomic disintegration which is now known to be proceeding in certain of the chemical elements, particularly in uranium and radium, and which is probably proceeding in all, suggests a doubt whether the universe is really, as Spencer supposed, in process of integration and evolution and not rather in process

of disintegration and dissolution; or whether perhaps the apparent evolution of the organic world is not attended by a simultaneous dissolution of the inorganic, so that the fabric of the universe would be a sort of Penelope's web, which the great artificer weaves and unweaves at the same time. With such a grave doubt to trouble the outlook on the future, we may perhaps say that Empedocles was wiser than Herbert Spencer in leaving, as he apparently did, the question undecided, whether during the epoch open to human observation the force of attraction or that of repulsion has been and is predominant, and consequently whether matter as a whole is integrating or disintegrating, whether all things are gradually evolving into more complex and concentrated forms, or are gradually dissolving and wasting away, through simpler and simpler forms, into the diffused tenuity of their primordial constituents.

Just as in his view of the constitution and history of the physical universe Empedocles anticipated to some extent the theories of Spencer, so in his view of the development of living beings he anticipated to some extent the theories of Darwin; for he held that the existing species of animals have been evolved out of inorganic matter through intermediate sorts of monstrous creatures, which, being ill fitted to survive, gradually succumbed and were exterminated in the struggle for existence. Whether Empedocles himself clearly enunciated the principle of the survival of the fittest as well as the doctrine of evolution, we cannot say with certainty; but at all events it is significant that Aristotle, after stating for the first time the principle of the survival of the fittest, illustrates it by a reference to Empedocles's theory of the extinction of monstrous forms in the past, as if he understood the theory to imply the principle.

It is a remarkable instance of the strange complexities and seeming inconsistencies of human nature, that a man whose capacious mind revolved ideas so far-reaching and fruitful, should have posed among his contemporaries as a prophet or even as a god, parading the streets of his native city bedecked with garlands and ribbons and followed by obsequious crowds of men and women, who worshipped him and prayed to him that he would reveal to them the better way, that he would give them oracles and heal their infirmities. In the character of Empedocles, as in that of another forerunner of science, Paracelsus, the sterling qualities of the genuine student would seem to have been alloyed with a vein of ostentation and braggadocio; but the dash of the mountebank which we may detect in his composition probably helped rather than hindered him to win for a time the favour and catch the ear of the multitude, ever ready as they are to troop at the heels of any quack who advertises his wares by a loud blast on a brazen trumpet. With so many claims on the admiration of the wise and the adulation of the foolish, we may almost wonder that Empedocles did not become the founder, if not the god, of a new religion. Certainly other human deities have set up in business and prospered with an intellectual stock-in-trade much inferior to that of the Sicilian philosopher. Perhaps Empedocles lacked that perfect sincerity of belief in his own pretensions without which it seems difficult or impossible permanently to impose on the credulity of mankind. To delude others successfully it is desirable, if not absolutely necessary, to begin by being one's self deluded, and the Sicilian sage was probably too shrewd a man to feel perfectly at ease in the character of a god.

The old savage doctrine of the transmigration of souls, which Empedocles furbished up and passed off on his disciples as a philosophical tenet, was afterwards countenanced, if not expressly affirmed, by another Greek philosopher of a very different stamp, who united, as no one else has ever done in the same degree, the highest capacity for abstract thought with the most exquisite literary genius. But if he borrowed the doctrine from savagery, Plato, like his two predecessors, detached it from its rude original setting and fitted it into an edifying moral scheme of retributive justice. For he held that the transmigration of human souls after death into the bodies of animals is a punishment or degradation entailed on the souls by the

weaknesses to which they had been subject or the vices to which they had been addicted in life, and that the kind of animal into which a peccant soul transmigrates is appropriate to the degree and nature of its weakness or guilt. Thus, for example, the souls of gluttons, sots, and rakes pass into the bodies of asses; the souls of robbers and tyrants are born again in wolves and hawks; the souls of sober quiet people, untinged by philosophy, come to life as bees and ants; a bad poet may turn at death into a swan or a nightingale; and a bad jester into an ape. Nothing but a rigid practice of the highest virtue and a single-minded devotion to abstract truth will avail to restore such degraded souls to their human dignity and finally raise them to communion with the gods. Though the passages in which these views are set forth have a mythical colouring and are, like all Plato's writings, couched in dramatic form and put into the mouths of others, we need not seriously doubt that they represent the real opinion of the philosopher himself. It is interesting and instructive to meet with the old savage theory of the transmigration of souls thus masquerading under a flowing drapery of morality and sparkling with the gems of Attic eloquence in the philosophic system of a great Greek thinker. So curiously alike may be the solutions which the highest and the lowest intellects offer of those profound problems which in all ages have engaged the curiosity and baffled the ingenuity of mankind.

XVII. Types of Animal Sacrament

§ 1. The Egyptian and the Aino Types of Sacrament.

We are now perhaps in a position to understand the ambiguous behaviour of the Aino and Gilyaks towards the bear. It has been shewn that the sharp line of demarcation which we draw between mankind and the lower animals does not exist for the savage. To him many of the other animals appear as his equals or even his superiors, not merely in brute force but in intelligence; and if choice or necessity leads him to take their lives, he feels bound, out of regard to his own safety, to do it in a way which will be as inoffensive as possible not merely to the living animal, but to its departed spirit and to all the other animals of the same species, which would resent an affront put upon one of their kind much as a tribe of savages would revenge an injury or insult offered to a tribesman. We have seen that among the many devices by which the savage seeks to atone for the wrong done by him to his animal victims one is to shew marked deference to a few chosen individuals of the species, for such behaviour is apparently regarded as entitling him to exterminate with impunity all the rest of the species upon which he can lay hands. This principle perhaps explains the attitude, at first sight puzzling and contradictory, of the Aino towards the bear. The flesh and skin of the bear regularly afford them food and clothing; but since the bear is an intelligent and powerful animal, it is necessary to offer some satisfaction or atonement to the bear species for the loss which it sustains in the death of so many of its members. This satisfaction or atonement is made by rearing young bears, treating them, so long as they live, with respect, and killing them with extraordinary marks of sorrow and devotion. So the other bears are appeased, and do not resent the slaughter of their kind by attacking the slayers or deserting the country, which would deprive the Aino of one of their means of subsistence.

Thus the primitive worship of animals assumes two forms, which are in some respects the converse of each other. On the one hand, animals are worshipped, and are therefore neither killed nor eaten. On the other hand, animals are worshipped because they are habitually killed and eaten. In both forms of worship the animal is revered on account of some benefit, positive or negative, which the savage hopes to receive from it. In the former worship the benefit comes either in the positive form of protection, advice, and help which the animal affords the man, or in the negative one of abstinence from injuries which it is in the power of the animal to inflict. In the latter worship the benefit takes the material form of the animal's flesh and skin. The two forms of worship are in some measure antithetical: in the one, the animal is not eaten because it is revered; in the other, it is revered because it is eaten. But both may be practised by the same people, as we see in the case of the North American Indians, who, while they apparently revere and spare their totem animals, also revere the animals and fish upon which they subsist. The aborigines of Australia have totemism in the most primitive form known to us; but, so far as I am aware, there is no clear evidence that they attempt, like the North American Indians, to conciliate the animals which they kill and eat. The means which the Australians adopt to secure a plentiful supply of game appear to be primarily based, not on conciliation, but on sympathetic magic, a principle to which the North American Indians also resort for the same purpose. Hence, as the Australians undoubtedly represent a ruder and earlier stage of human progress than the American Indians, it would seem that before hunters think of worshipping the game as a means of ensuring an abundant supply of it, they seek to attain the same end by sympathetic magic. This, again, would shew—what there is good reason for believing—that sympathetic magic is one of the earliest means by which man endeavours to adapt the agencies of nature to his needs.

Corresponding to the two distinct types of animal worship, there are two distinct types of the custom of killing the animal god. On the one hand, when the revered animal is habitually spared, it is nevertheless killed—and sometimes eaten—on rare and solemn occasions. Examples of this custom have been already given and an explanation of them offered. On the other hand, when the revered animal is habitually killed, the slaughter of any one of the species involves the killing of the god, and is atoned for on the spot by apologies and sacrifices, especially when the animal is a powerful and dangerous one; and, in addition to this ordinary and everyday atonement, there is a special annual atonement, at which a select individual of the species is slain with extraordinary marks of respect and devotion. Clearly the two types of sacramental killing—the Egyptian and the Aino types, as we may call them for distinction—are liable to be confounded by an observer; and, before we can say to which type any particular example belongs, it is necessary to ascertain whether the animal sacramentally slain belongs to a species which is habitually spared, or to one which is habitually killed by the tribe. In the former case the example belongs to the Egyptian type of sacrament, in the latter to the Aino type.

The practice of pastoral tribes appears to furnish examples of both types of sacrament. “Pastoral tribes,” says a learned ethnologist, “being sometimes obliged to sell their herds to strangers who may handle the bones disrespectfully, seek to avert the danger which such a sacrilege would entail by consecrating one of the herd as an object of worship, eating it sacramentally in the family circle with closed doors, and afterwards treating the bones with all the ceremonious respect which, strictly speaking, should be accorded to every head of cattle, but which, being punctually paid to the representative animal, is deemed to be paid to all. Such family meals are found among various peoples, especially those of the Caucasus. When amongst the Abchases the shepherds in spring eat their common meal with their loins girt and their staves in their hands, this may be looked upon both as a sacrament and as an oath of mutual help and support. For the strongest of all oaths is that which is accompanied with the eating of a sacred substance, since the perjured person cannot possibly escape the avenging god whom he has taken into his body and assimilated.” This kind of sacrament is of the Aino or expiatory type, since it is meant to atone to the species for the possible ill-usage of individuals. An expiation, similar in principle but different in details, is offered by the Kalmucks to the sheep, whose flesh is one of their staple foods. Rich Kalmucks are in the habit of consecrating a white ram under the title of “the ram of heaven” or “the ram of the spirit.” The animal is never shorn and never sold; but when it grows old and its owner wishes to consecrate a new one, the old ram must be killed and eaten at a feast to which the neighbours are invited. On a lucky day, generally in autumn when the sheep are fat, a sorcerer kills the old ram, after sprinkling it with milk. Its flesh is eaten; the skeleton, with a portion of the fat, is burned on a turf altar; and the skin, with the head and feet, is hung up.

An example of a sacrament of the Egyptian type is furnished by the Todas, a pastoral people of Southern India, who subsist largely upon the milk of their buffaloes. Amongst them “the buffalo is to a certain degree held sacred” and “is treated with great kindness, even with a degree of adoration, by the people.” They never eat the flesh of the cow buffalo, and as a rule abstain from the flesh of the male. But to the latter rule there is a single exception. Once a year all the adult males of the village join in the ceremony of killing and eating a very young male calf,—seemingly under a month old. They take the animal into the dark recesses of the village wood, where it is killed with a club made from the sacred tree of the Todas (the *tûde* or *Millingtonia*). A sacred fire having been made by the rubbing of sticks, the flesh of the calf is roasted on the embers of certain trees, and is eaten by the men alone, women being excluded from the assembly. This is the only occasion on which the Todas eat buffalo

flesh. The Madi or Moru tribe of Central Africa, whose chief wealth is their cattle, though they also practise agriculture, appear to kill a lamb sacramentally on certain solemn occasions. The custom is thus described by Dr. Felkin: "A remarkable custom is observed at stated times—once a year, I am led to believe. I have not been able to ascertain what exact meaning is attached to it. It appears, however, to relieve the people's minds, for beforehand they evince much sadness, and seem very joyful when the ceremony is duly accomplished. The following is what takes place: A large concourse of people of all ages assemble, and sit down round a circle of stones, which is erected by the side of a road (really a narrow path). A very choice lamb is then fetched by a boy, who leads it four times round the assembled people. As it passes they pluck off little bits of its fleece and place them in their hair, or on to some other part of their body. The lamb is then led up to the stones, and there killed by a man belonging to a kind of priestly order, who takes some of the blood and sprinkles it four times over the people. He then applies it individually. On the children he makes a small ring of blood over the lower end of the breast bone, on women and girls he makes a mark above the breasts, and the men he touches on each shoulder. He then proceeds to explain the ceremony, and to exhort the people to show kindness.... When this discourse, which is at times of great length, is over, the people rise, each places a leaf on or by the circle of stones, and then they depart with signs of great joy. The lamb's skull is hung on a tree near the stones, and its flesh is eaten by the poor. This ceremony is observed on a small scale at other times. If a family is in any great trouble, through illness or bereavement, their friends and neighbours come together and a lamb is killed; this is thought to avert further evil. The same custom prevails at the grave of departed friends, and also on joyful occasions, such as the return of a son home after a very prolonged absence." The sorrow thus manifested by the people at the annual slaughter of the lamb clearly indicates that the lamb slain is a sacred or divine animal, whose death is mourned by his worshippers, just as the death of the sacred buzzard was mourned by the Californians and the death of the Theban ram by the Egyptians. The smearing each of the worshippers with the blood of the lamb is a form of communion with the divinity; the vehicle of the divine life is applied externally instead of being taken internally, as when the blood is drunk or the flesh eaten.

§ 2. Processions with Sacred Animals.

The form of communion in which the sacred animal is taken from house to house, that all may enjoy a share of its divine influence, has been exemplified by the Gilyak custom of promenading the bear through the village before it is slain. A similar form of communion with the sacred snake is observed by a Snake tribe in the Punjaub. Once a year in the month of September the snake is worshipped by all castes and religions for nine days only. At the end of August the Mirasans, especially those of the Snake tribe, make a snake of dough which they paint black and red, and place on a winnowing basket. This basket they carry round the village, and on entering any house they say:—

*"God be with you all!
May every ill be far!
May our patron's (Gugga's) word thrive!"*

Then they present the basket with the snake, saying:—

*"A small cake of flour:
A little bit of butter:
If you obey the snake,
You and yours shall thrive!"*

Strictly speaking, a cake and butter should be given, but it is seldom done. Every one, however, gives something, generally a handful of dough or some corn. In houses where there is a new bride or whence a bride has gone, or where a son has been born, it is usual to give a rupee and a quarter, or some cloth. Sometimes the bearers of the snake also sing:—

*“Give the snake a piece of cloth,
And he will send a lively bride!”*

When every house has been thus visited, the dough snake is buried and a small grave is erected over it. Thither during the nine days of September the women come to worship. They bring a basin of curds, a small portion of which they offer at the snake's grave, kneeling on the ground and touching the earth with their foreheads. Then they go home and divide the rest of the curds among the children. Here the dough snake is clearly a substitute for a real snake. Indeed, in districts where snakes abound the worship is offered, not at the grave of the dough snake, but in the jungles where snakes are known to be. Besides this yearly worship, performed by all the people, the members of the Snake tribe worship in the same way every morning after a new moon. The Snake tribe is not uncommon in the Punjaub. Members of it will not kill a snake, and they say that its bite does not hurt them. If they find a dead snake, they put clothes on it and give it a regular funeral.

Ceremonies closely analogous to this Indian worship of the snake have survived in Europe into recent times, and doubtless date from a very primitive paganism. The best-known example is the “hunting of the wren.” By many European peoples—the ancient Greeks and Romans, the modern Italians, Spaniards, French, Germans, Dutch, Danes, Swedes, English, and Welsh—the wren has been designated the king, the little king, the king of birds, the hedge king, and so forth, and has been reckoned amongst those birds which it is extremely unlucky to kill. In England it is supposed that if any one kills a wren or harries its nest, he will infallibly break a bone or meet with some dreadful misfortune within the year; sometimes it is thought that the cows will give bloody milk. In Scotland the wren is called “the Lady of Heaven's hen,” and boys say:—

*“Malisons, malisons, mair than ten,
That harry the Ladye of Heaven's hen!”*

At Saint Donan, in Brittany, people believe that if children touch the young wrens in the nest, they will suffer from the fire of St. Lawrence, that is, from pimples on the face, legs, and so on. In other parts of France it is thought that if a person kills a wren or harries its nest, his house will be struck by lightning, or that the fingers with which he did the deed will shrivel up and drop off, or at least be maimed, or that his cattle will suffer in their feet.

Notwithstanding such beliefs, the custom of annually killing the wren has prevailed widely both in this country and in France. In the Isle of Man down to the eighteenth century the custom was observed on Christmas Eve or rather Christmas morning. On the twenty-fourth of December, towards evening, all the servants got a holiday; they did not go to bed all night, but rambled about till the bells rang in all the churches at midnight. When prayers were over, they went to hunt the wren, and having found one of these birds they killed it and fastened it to the top of a long pole with its wings extended. Thus they carried it in procession to every house chanting the following rhyme:—

*“We hunted the wren for Robin the Bobbin,
We hunted the wren for Jack of the Can,
We hunted the wren for Robin the Bobbin,
We hunted the wren for every one.”*

When they had gone from house to house and collected all the money they could, they laid the wren on a bier and carried it in procession to the parish churchyard, where they made a grave and buried it “with the utmost solemnity, singing dirges over her in the Manks language, which they call her knell; after which Christmas begins.” The burial over, the company outside the churchyard formed a circle and danced to music. About the middle of the nineteenth century the burial of the wren took place in the Isle of Man on St. Stephen's Day (the twenty-sixth of December). Boys went from door to door with a wren suspended by the legs in the centre of two hoops, which crossed each other at right angles and were decorated with evergreens and ribbons. The bearers sang certain lines in which reference was made to boiling and eating the bird. If at the close of the song they received a small coin, they gave in return a feather of the wren; so that before the end of the day the bird often hung almost featherless. The wren was then buried, no longer in the churchyard, but on the sea-shore or in some waste place. The feathers distributed were preserved with religious care, it being believed that every feather was an effectual preservative from shipwreck for a year, and a fisherman would have been thought very foolhardy who had not one of them. Even to the present time, in the twentieth century, the custom is generally observed, at least in name, on St. Stephen's Day, throughout the Isle of Man.

A writer of the eighteenth century says that in Ireland the wren “is still hunted and killed by the peasants on Christmas Day, and on the following (St. Stephen's Day) he is carried about, hung by the leg, in the centre of two hoops, crossing each other at right angles, and a procession made in every village, of men, women, and children, singing an Irish catch, importing him to be the king of all birds.” Down to the present time the “hunting of the wren” still takes place in parts of Leinster and Connaught. On Christmas Day or St. Stephen's Day the boys hunt and kill the wren, fasten it in the middle of a mass of holly and ivy on the top of a broomstick, and on St. Stephen's Day go about with it from house to house, singing:—

*“The wren, the wren, the king of all birds,
St. Stephen's Day was caught in the furze;
Although he is little, his family's great,
I pray you, good landlady, give us a treat.”*

Money or food (bread, butter, eggs, etc.) were given them, upon which they feasted in the evening. In Essex a similar custom used to be observed at Christmas, and the verses sung by the boys were almost identical with those sung in Ireland. In Pembrokehire a wren, called the King, used to be carried about on Twelfth Day in a box with glass windows surmounted by a wheel, from which hung various coloured ribbons. The men and boys who carried it from house to house sang songs, in one of which they wished joy, health, love, and peace to the inmates of the house.

In the first half of the nineteenth century similar customs were still observed in various parts of the south of France. Thus at Carcassone, every year on the first Sunday of December the young people of the street Saint Jean used to go out of the town armed with sticks, with which they beat the bushes, looking for wrens. The first to strike down one of these birds was proclaimed King. Then they returned to the town in procession, headed by the King, who carried the wren on a pole. On the evening of the last day of the year the King and all who had hunted the wren marched through the streets of the town to the light of torches, with drums beating and fifes playing in front of them. At the door of every house they stopped, and one of them wrote with chalk on the door *vive le roi!* with the number of the year which was about to begin. On the morning of Twelfth Day the King again marched in procession with great pomp, wearing a crown and a blue mantle and carrying a sceptre. In front of him

was borne the wren fastened to the top of a pole, which was adorned with a verdant wreath of olive, of oak, and sometimes of mistletoe grown on an oak. After hearing high mass in the parish church of St. Vincent, surrounded by his officers and guards, the King visited the bishop, the mayor, the magistrates, and the chief inhabitants, collecting money to defray the expenses of the royal banquet which took place in the evening and wound up with a dance. At Entraigues men and boys used to hunt the wren on Christmas Eve. When they caught one alive they presented it to the priest, who, after the midnight mass, set the bird free in the church. At Mirabeau the priest blessed the bird. If the men failed to catch a wren and the women succeeded in doing so, the women had the right to mock and insult the men, and to blacken their faces with mud and soot, when they caught them. At La Ciotat, near Marseilles, a large body of men armed with swords and pistols used to hunt the wren every year about the end of December. When a wren was caught it was hung on the middle of a pole, which two men carried, as if it were a heavy burden. Thus they paraded round the town; the bird was weighed in a great pair of scales; and then the company sat down to table and made merry.

The parallelism between this custom of "hunting the wren" and some of those which we have considered, especially the Gilyak procession with the bear, and the Indian one with the snake, seems too close to allow us to doubt that they all belong to the same circle of ideas. The worshipful animal is killed with special solemnity once a year; and before or immediately after death he is promenaded from door to door, that each of his worshippers may receive a portion of the divine virtues that are supposed to emanate from the dead or dying god. Religious processions of this sort must have had a great place in the ritual of European peoples in prehistoric times, if we may judge from the numerous traces of them which have survived in folk-custom. A well-preserved specimen is the following, which lasted in the Highlands of Scotland and in St. Kilda down at least to the latter half of the eighteenth century. It was described to Dr. Samuel Johnson in the island of Coll. Another description of it runs as follows: "On the evening before New Year's Day it is usual for the cowherd and the young people to meet together, and one of them is covered with a cow's hide. The rest of the company are provided with staves, to the end of which bits of raw hide are tied. The person covered with the hide runs thrice round the dwelling-house, *deiseil*—*i.e.* according to the course of the sun; the rest pursue, beating the hide with their staves, and crying [here follows the Gaelic], 'Let us raise the noise louder and louder; let us beat the hide.' They then come to the door of each dwelling-house, and one of them repeats some verses composed for the purpose. When admission is granted, one of them pronounces within the threshold the *beannachadhthurlair*, or verses by which he pretends to draw down a blessing upon the whole family [here follows the Gaelic], 'May God bless the house and all that belongs to it, cattle, stones, and timber! In plenty of meat, of bed and body-clothes, and health of men, may it ever abound!' Then each burns in the fire a little of the bit of hide which is tied to the end of the staff. It is applied to the nose of every person and domestic animal that belongs to the house. This, they imagine, will tend much to secure them from diseases and other misfortunes during the ensuing year. The whole of the ceremony is called *colluinn*, from the great noise which the hide makes. It is the principal remnant of superstition among the inhabitants of St. Kilda."

A more recent writer has described the old Highland custom as follows. Towards evening on the last day of the year, or Hogmanay, as the day is called in Scotland, "men began to gather and boys ran about shouting and laughing, playing shinty, and rolling 'pigs of snow' (*mucan sneachda*), *i.e.* large snowballs. The hide of the mart or winter cow (*seiche a mhairt gheamhraidh*) was wrapped round the head of one of the men, and he made off, followed by the rest, belabouring the hide, which made a noise like a drum, with switches. The disorderly

procession went three times *deiseal*, according to the course of the sun (*i.e.* keeping the house on the right hand) round each house in the village, striking the walls and shouting on coming to a door:

*'The calluinn of the yellow bag of hide,
Strike the skin (upon the wall)
An old wife in the graveyard,
An old wife in the corner,
Another old wife beside the fire,
A pointed stick in her two eyes,
A pointed stick in her stomach,
Let me in, open this.'*

“Before this request was complied with, each of the revellers had to repeat a rhyme, called *Rann Calluinn* (*i.e.* a Christmas rhyme), though, as might be expected when the door opened for one, several pushed their way in, till it was ultimately left open for all. On entering each of the party was offered refreshments, oatmeal bread, cheese, flesh, and a dram of whisky. Their leader gave to the goodman of the house that indispensable adjunct of the evening's mummeries, the *Caisein-uchd*, the breast-stripe of a sheep wrapped round the point of a shinty stick. This was then singed in the fire (*teallach*), put three times with the right-hand turn (*deiseal*) round the family, and held to the noses of all. Not a drop of drink was given till this ceremony was performed. The *Caisein-uchd* was also made of the breast-stripe or tail of a deer, sheep, or goat, and as many as chose had one with them.” Another writer who gives a similar account of the ceremony and of the verses sung by the performers, tells us that the intention of putting the burnt sheep-skin to the noses of the people was to protect them against witchcraft and every infection. The explanation, which is doubtless correct, reminds us of the extraordinarily persistent hold which the belief in sorcery and witchcraft has retained on the minds of the European peasantry. Formerly, perhaps, pieces of the cow-hide in which the man was clad were singed and put to the noses of the people, just as in the Isle of Man a feather of the wren used to be given to each household. Similarly, as we have seen, the human victim whom the Khonds slew as a divinity was taken from house to house, and every one strove to obtain a relic of his sacred person. Such customs are only another form of that communion with the deity which is attained most completely by eating the body and drinking the blood of the god.

§ 3. The Rites of Plough Monday.

In the “hunting of the wren,” and the procession with the man clad in a cow-skin, there is nothing to shew that the customs in question have any relation to agriculture. So far as appears, they may date from a time before the invention of husbandry when animals were revered as divine in themselves, not merely as divine because they embodied the corn-spirit; and the analogy of the Gilyak procession of the bear and the Indian procession of the snake is in favour of assigning the corresponding European customs to this very early date. On the other hand, there are certain European processions of animals, or of men disguised as animals, which may perhaps be purely agricultural in their origin; in other words, the animals which figure in them may have been from the first nothing but representatives of the corn-spirit conceived in animal shape. Examples of such dramatic and at the same time religious rites have been collected by W. Mannhardt, who says of them in general: “Not only on the harvest field and on the threshing-floor but also quite apart from them people loved to represent the corn-spirit dramatically, especially in solemn processions in spring and about the winter solstice, whereby they meant to depict the return of the beneficent powers of summer to the desolate realm of nature.” Thus, for example, in country districts of Bohemia it

is, or used to be, customary during the last days of the Carnival for young men to go about in procession from house to house collecting gratuities. Usually a man or boy is swathed from head to foot in pease-straw and wrapt round in straw-ropes: thus attired he goes by the name of the Shrovetide or Carnival Bear (*Fastnachtsbär*) and is led from house to house to the accompaniment of music and singing. In every house he dances with the girls, the maids, and the housewife herself, and drinks to the health of the good man, the good wife, and the girls. For this performance the mummer is regaled with food by the good wife, while the good man puts money in his box. When the mummers have gone the round of the village, they betake themselves to the ale-house, whither also all the peasants repair with their wives; "for at Shrovetide, but especially on Shrove Tuesday, every one must dance, if the flax, the vegetables, and the corn are to thrive; and the more and the higher they dance, the greater the blessing which the people expect to crown their exertions." In the Leitmeritz district the Shrovetide Bear, besides being wrapt in straw, sometimes wears a bear's mask to emphasise his resemblance to the animal. In the Czech villages the housewives pluck the pease-straw and other straw from the Shrovetide Bear and put it in the nests of their geese, believing that the geese will lay more eggs and hatch their broods better for the addition of this straw to their nests. For a similar purpose in the Saaz district the women put the straw of the Shrovetide Bear in the nests of their hens. In these customs the dancing for the express purpose of making the crops grow high, and the use of the straw to make the geese and hens lay more eggs, sufficiently prove that the Shrovetide Bear is conceived to represent the spirit of fertility both animal and vegetable; and we may reasonably conjecture that the dances of the mummer with the women and girls are especially intended to convey to them the fertilising powers of the spirit whom the mummer personates.

In some parts of Bohemia the straw-clad man in these Shrovetide processions is called, not the Bear, but the Oats-goat, and he wears horns on his head to give point to the name. These different names and disguises indicate that in some places the corn-spirit is conceived as a bear and in others as a goat. Many examples of the conception of the corn-spirit as a goat have already been cited; the conception of him as a bear seems to be less common. In the neighbourhood of Gniewkowo, in Prussian Lithuania, the two ideas are combined, for on Twelfth Day a man wrapt in pease-straw to represent a Bear and another wrapt in oats-straw to represent a Goat go together about the village; they imitate the actions of the two animals and perform dances, for which they receive a present in every house. At Marburg in Steiermark the corn-spirit figures now as a wolf and now as a bear. The man who gave the last stroke at threshing is called the Wolf. All the other men flee from the barn, and wait till the Wolf comes forth; whereupon they pounce on him, wrap him in straw to resemble a wolf, and so lead him about the village. He keeps the name of Wolf till Christmas, when he is wrapt in a goat's skin and led from house to house as a Pease-bear at the end of a rope. In this custom the dressing of the mummer in a goat's skin seems to mark him out as the representative of a goat; so that here the mythical fancy of the people apparently hesitates between a goat, a bear, and a wolf as the proper embodiment of the corn-spirit. In Scandinavia the conception of the spirit as a goat who appears at Christmas (*Julbuck*) appears to be common. Thus, for example, in Bergslaghshärad (Sweden) it used to be customary at Christmas to lead about a man completely wrapt in corn-straw and wearing a goat's horns on his head: he personated the Yule-goat. In some parts of Sweden a regular feature of the little Christmas drama is a pretence of slaughtering the Yule-goat, who, however, comes to life again. The actor, hidden by a coverlet made of skins and wearing a pair of formidable horns, is led into the room by two men, who make believe to slaughter him, while they sing verses referring to the mantles of various colours, red, blue, white, and yellow, which they laid on him, one after the other. At the conclusion of the song, the Yule-goat, after feigning death, jumps up and skips about to the amusement of the spectators. In Willstad after supper on

Christmas evening, while the people are dancing “the angel dance” for the sake of ensuring a good crop of flax, some long stalks of the Yule straw, either of wheat or rye, are made up into the likeness of a goat, which is thrown among the dancers with the cry, “Catch the Yule-goat!” The custom in Dalarna is similar, except that there the straw-animal goes by the name of the Yule-ram. In these customs the identification of the Yule-goat or the Yule-ram with the corn-spirit seems unmistakable. As if to clinch the argument it is customary in Denmark and Sweden to bake cakes of fine meal at Christmas in the form of goats, rams, or boars. These are called Yule-goats, Yule-rams, or Yule-boars; they are often made out of the last sheaf of corn at harvest and kept till sowing-time, when they are partly mixed with the seed-corn and partly eaten by the people and the plough-oxen in the hope thereby of securing a good harvest. It would seem scarcely possible to represent the identification of the corn-spirit with an animal, whether goat, ram, or boar, more graphically; for the last corn cut at harvest is regularly supposed to house the corn-spirit, who is accordingly caught, kept through the winter in the shape of an animal, and then mixed with the seed in spring to quicken the grain before it is committed to the ground. Examples of the corn-spirit conceived as a wether and a boar have met us in a preceding part of this work. The pretence of killing the Yule-goat and bringing him to life again was probably in origin a magical rite to ensure the rebirth of the corn-spirit in spring.

In England a custom like some of the preceding still prevails at Whittlesey in Cambridgeshire on the Tuesday after Plough Monday, as I learn from an obliging communication of Professor G. C. Moore Smith of Sheffield University. He writes: “When I was at Whittlesey yesterday I had the pleasure of meeting a ‘Straw-bear,’ if not two, in the street. I had not been at Whittlesey on the day for nearly forty years, and feared the custom had died out. In my boyhood the Straw-bear was a man completely swathed in straw, led by a string by another and made to dance in front of people's houses, in return for which money was expected. This always took place on the Tuesday following Plough-Monday. Yesterday the Straw-bear was a boy, and I saw no dancing. Otherwise there was no change.”

A comparison of this English custom with the similar Continental customs which have been described above, raises a presumption that the Straw-bear, who is thus led about from house to house, represents the corn-spirit bestowing his blessing on every homestead in the village. This interpretation is strongly confirmed by the date at which the ceremony takes place. For the date is the day after Plough Monday, and it can hardly be doubted that the old popular celebration of Plough Monday has a direct reference to agriculture. Plough Monday is the first Monday of January after Twelfth Day. On that day it used to be the custom in various parts of England for a band of sturdy swains to drag a gaily decorated plough from house to house and village to village, collecting contributions which were afterwards spent in rustic revelry at a tavern. The men who drew the plough were called Plough Bullocks; they wore their shirts over their coats, and bunches of ribbons flaunted from their hats and persons. Among them there was always one who personated a much bedizened old woman called Bessy; under his gown he formerly had a bullock's tail fastened to him behind, but this appendage was afterwards discarded. He skipped, danced and cut capers, and carried a money-box soliciting contributions from the onlookers. Some of the band, in addition to their ribbons, “also wore small bunches of corn in their hats, from which the wheat was soon shaken out by the ungainly jumping which they called dancing. Occasionally, if the winter was severe, the procession was joined by threshers carrying their flails, reapers bearing their sickles, and carters with their long whips, which they were ever cracking to add to the noise, while even the smith and the miller were among the number, for the one sharpened the plough-shares and the other ground the corn; and Bessy rattled his box and danced so high that he shewed his worsted stockings and corduroy breeches; and very often, if there was a

thaw, tucked up his gown skirts under his waistcoat, and shook the bonnet off his head, and disarranged the long ringlets that ought to have concealed his whiskers." Sometimes among the mummers there was a Fool, who wore the skin of a calf with the tail hanging down behind, and wielded a stick with an inflated bladder tied to it, which he applied with rude vigour to the heads and shoulders of the human team. Another mummer generally wore a fox's skin in the form of a hood with the tail dangling on his back. If any churl refused to contribute to the money-box, the plough-bullocks put their shoulders to the plough and ploughed up the ground in front of his door.

The clue to the meaning of these curious rites is probably furnished by the dances or rather jumps of the men who wore bunches of corn in their hats. When we remember how often on the Continent about the same time of year the peasants dance and jump for the express purpose of making the crops grow tall, we may conjecture with some probability that the intention of the dancers on Plough Monday was similar; the original notion, we may suppose, was that the corn would grow that year just as high as the dancers leaped. If that was so, we need not wonder at the agility displayed on these occasions by the yokels in general and by Bessy in particular. What stronger incentive could they have to exert themselves than the belief that the higher they leaped into the air the higher would sprout the corn-stalks? In short, the whole ceremony was probably a magical rite intended to procure a good crop. The principle on which it rested was the familiar one of homoeopathic or imitative magic: by mimicking the act of ploughing and the growth of the corn the mummers hoped to ensure the success of the real ploughing, which was soon to take place.

If such was the real meaning of the ritual of Plough Monday, we may the more confidently assume that the Straw-bear who makes his appearance at Whittlesey in Cambridgeshire on the day after Plough Monday represents indeed the corn-spirit. What could be more appropriate than for that beneficent being to manifest himself from house to house the very day after a magical ceremony had been performed to quicken the growth of the corn?

The foregoing interpretation of the rites observed in England on Plough Monday tallies well with the explanation which I have given of the very similar rites annually performed at the end of the Carnival in Thrace. The mock ploughing is probably practised for the same purpose in both cases, and what that purpose is may be safely inferred from the act of sowing and the offering of prayers for abundant crops which accompany and explain the Thracian ceremony. It deserves to be noted that ceremonies of the same sort and closely resembling those of Plough Monday are not confined to the Greek villages of Thrace but are observed also by the Bulgarians of that province at the same time, namely, on the Monday of the last week in Carnival. Thus at Malko-Tirnovsko, in the district of Adrianople, a procession of mummers goes through the streets on that day. The principal personages in it bear the names of the *Kuker* and *Kukerica*. The *Kuker* is a man clad in a goatskin. His face is blackened with soot and he wears on his head a high shaggy hat made of an entire skin. Bells jingle at his girdle, and in his hand he carries a club. The *Kukerica*, who sometimes goes by the name of *Baba*, that is, "Old Woman," is a man disguised in petticoats with his face blackened. Other figures in the procession are young men dressed as girls, and girls dressed as men and wearing masks. Bears are represented by dogs wrapt in bearskins. A king, a judge, and other officials are personated by other mummers; they hold a mock court and those whom they condemn receive a bastinado. Some of the maskers carry clubs; it is their duty to beat all who fall into their hands and to levy contributions from them. The play and gestures of the *Kuker* and *Kukerica* are wanton and lascivious: the songs and cries addressed to the *Kuker* are also very cynical. Towards evening two of the company are yoked to a plough, and the *Kuker* ploughs a few furrows, which he thereupon sows with corn. After sunset he puts off his disguise, is paid for his trouble, and carouses with his fellows. The people believe

that the man who plays the part of *Kuker* commits a deadly sin, and the priests make vain efforts to abolish the custom. At the village of Kuria, in the district of Losengrad, the custom is in general the same, but there are some significant variations. The money collected by the mummers is used to buy wine, which is distributed among all the villagers at a banquet in the evening. On this occasion a cake in which an old coin has been baked is produced by the *Kuker*, broken into bits, and so divided among all present. If the bit with the coin in it falls to a farmer, then the crops will be good that year; but if it falls to a herdsman, then the cattle will thrive. Finally, the *Kuker* ploughs a small patch of ground, "bending his body to right and left in order to indicate symbolically the ears of corn bending under the weight of the grain." The others lay hold of the man with whom the coin was found, bind him by the feet, and drag him over the land that has just been ploughed. In these observances the intention of promoting the fertility of the ground is unmistakable; the ploughman's imitation of the cornstalks bending under their own weight is a simple case of homoeopathic or imitative magic, while the omens drawn from the occupation of the person who obtains the piece of cake with the coin in it indicate that the ceremony is designed to quicken the herds as well as the crops. We can hardly doubt that the same serious motive underlies the seemingly wanton gestures of the principal actors and explains the loose character of the songs and words which accompany the ceremony. Nor is it hard to divine the reason for dragging over the fresh furrows the man who is lucky enough to get the coin in the cake. He is probably looked on as an embodiment of the corn-spirit, and in that character is compelled to fertilise the ground by bodily contact with the newly-ploughed earth.

Similar customs are observed at the Carnival not only by Bulgarian peasants in Thrace but also here and there in Bulgaria itself. In that country the leading personage of the masquerade is the *Baba*, that is, the Old Woman or Mother. The part is played by a man in woman's clothes; she, or rather he, wears no mask, but in many villages she carries a spindle with which she spins. The *Kuker* and the *Kukerica* also figure in the performance, but they are subordinate to the Old Woman or Mother. Their costume varies in different villages. Usually they are clad in skins with a girdle of lime-tree bark and five or six bells fastened to it; on their back they wear a hump made up of rags. But the principal feature in their attire consists of their masks, which represent the heads of animals and men in fantastic combinations, such as the horned head of a man or a bird, the head of a ram, a bull, and so on. Much labour is spent on the manufacture of these masks. Early in the morning of Cheese Monday (the Monday of the last week in Carnival) the mummers go about the village levying contributions. Towards noon they form a procession and go from house to house. In every house they dance a round dance, while the Old Woman spins. It is believed that if any householder contrives to carry off the Old Woman and secrete her, a blessing and prosperity will enter into his dwelling; but the maskers defend the Old Woman stoutly against all such attempts of individuals to appropriate her beneficent presence. After the dance the mummers receive gifts of money, eggs, meal, and so on. Towards evening a round dance is danced in the village square, and there the Old Woman yokes the *Kuker* and *Kukerica* to a plough, ploughs with it a small piece of ground, and sows the ground with corn. Next day the performers reassemble, sell the presents they had collected, and with the produce hold a feast in the house of the Old Woman. It is supposed that if strange maskers make their way into a village, fertility will be drawn away to the village from which they have come; hence the villagers resist an inroad of strange maskers at any price. In general the people believe that the masquerade is performed for the purpose of increasing the luck and fertility of the village.

In these Bulgarian rites, accordingly, we are not left to form conjectures as to the intention with which they are practised; that intention is plainly avowed, and it is no other than the one which we have inferred for the similar rites observed in Thrace at the same season and in

England on Plough Monday. In all these cases it is reasonable to suppose that the real aim of the ceremonial ploughing and sowing of the ground is thereby, on the principles of homoeopathic or imitative magic, to ensure the growth of the corn on all the fields of the community. Perhaps we may go a step further and suggest that in the Bulgarian Old Woman or Mother, who guides the plough and sows the seed, and whose presence is believed to bring a blessing to any household that can contrive to appropriate her, we have the rustic prototype of Demeter, the Corn-Mother, who in the likeness of an Old Woman brought a blessing to the house of Celeus, king of Eleusis, and restored their lost fertility to the fallow Eleusinian fields. And in the pair of mummers, man and woman, who draw the plough, may we not discern the rude originals of Pluto and Persephone? If that is so, the gods of Greece are not wholly dead; they still hide their diminished heads in the cottages of the peasantry, to come forth on sunshine holidays and parade, with a simple but expressive pageantry, among a gazing crowd of rustics, at the very moment of the year when their help is most wanted by the husbandman.

Be that as it may, these rites still practised by the peasantry at opposite ends of Europe, no doubt date from an extremely early age in the history of agriculture. They are probably far older than Christianity, older even than those highly developed forms of Greek religion with which ancient writers and artists have made us familiar, but which have been for so many centuries a thing of the past. Thus it happens that, while the fine flower of the religious consciousness in myth, ritual, and art is fleeting and evanescent, its simpler forms are comparatively stable and permanent, being rooted deep in those principles of common minds which bid fair to outlive all the splendid but transient creations of genius. It may be that the elaborate theologies, the solemn rites, the stately temples, which now attract the reverence or the wonder of mankind, are destined themselves to pass away like "all Olympus' faded hierarchy," and that simple folk will still cherish the simple faiths of their nameless and dateless forefathers, will still believe in witches and fairies, in ghosts and hobgoblins, will still mumble the old spells and make the old magic passes, when the muezzin shall have ceased to call the faithful to prayer from the minarets of St. Sophia, and when the worshippers shall gather no more in the long-drawn aisles of Nôtre Dame and under the dome of St. Peter's.

Note: The Ceremony of the Horse at Rice-Harvest Among The Garos

Among the Garos, an agricultural tribe of Assam, the close of the rice-harvest is celebrated by a festival in which the effigy of a horse figures prominently. The intention of the ceremony is not stated, but possibly it may be to ensure a good rice crop in the following year. If so, the artificial horse of the Garos would be analogous to the October horse of the Romans, as that animal has been explained by W. Mannhardt. For the sake of comparison it may be well to subjoin Major A. Playfair's account of the Garo ceremony:—

“When the rice harvest has been fully gathered in, the great sacrifice and festival of the year, the *Wangala* or *Guréwata*, takes place. This is the most festive observance of the year, and combines religious sacrifice with much conviviality. It is celebrated by all sections of the tribe except the Duals and some Plains Garos. The cost of the entertainment falls principally on the *nokma* [headman] of the village, who provides a pig to be eaten by his guests, and plenty of liquor. Among the Akawés and Chisaks of the north and north-eastern hills a curious feature of the ceremony is the manufacture of *guré* or ‘horses’ out of pieces of plantain-stem for the body, and of bamboo for the head and legs. The image of the ‘horse’ is laid on the floor of the *nokma's* house, and the assembled guests dance and sing around it the whole night long, with the usual intervals for refreshments. Early the next morning, the ‘horse’ is taken to the nearest river and launched on the water to find its way down stream on the current. For those who possess the necessary paraphernalia, the *guré* takes the shape of a horse's head of large size, made of straw, and covered with cloth. I once saw one in the village of Rongrong, which, when in use, was ornamented with discs of brass on both sides of the face. Its eyes and ears were made of the same metal, and between the ears were fixed a pair of wild goat's horns. To the head were attached a number of bronze bells similar to those hawked about by Bhutia pedlars. The owner, a *laskar*, was unable to tell me whence they came, but said that they were inherited from his wife's mother, and were many generations old.

“The manner in which this form of *guré* is used is the following. The head is mounted on a stick, which a man holds before him in such a way that the head comes up to the level of his chest. Two straps pass over his shoulders to relieve his hands of the weight. The body of the ‘horse’ is then built round his own body with cane and cloth. For a tail, yak's tails are fastened in with his own hair, which, for the occasion, is allowed to hang down instead of being tied up. The performer thus appalled, commences to dance a shuffling step to the usual music. In front of him dances the priest, who goes through the pantomime of beckoning the animal to come to him. The remaining guests of the *nokma* [headman] form a *queue* behind the ‘horse,’ and dance after it. When the first man gets tired, another takes his place, and the dancing goes on right through the night. A pleasant part of the performance is the pelting of the *guré* with eggs. A piece of egg-shell was still sticking to the horn of the *guré* which was shown to me.

“Strictly speaking, this festival should last for three days and two nights. When it is over, the *guré* is taken to a stream and the body thrown into the water, the head being preserved for another year. The people who come to see it off, bring rice with them, and a meal by the water's edge closes the proceedings.

“At the *Wangala*, it is the custom to mix flour with water, and for the assembled people to dip their hands into the mixture and make white hand-marks on the posts and walls of the house and on the backs of the guests.”

Can it be that the horse whose effigy is thus made at rice-harvest and thrown into the water, while the head is kept for another year, represents the spirit of the rice? If that were so, the pelting of the head with eggs would be a charm to ensure fertility and the throwing of it into water would be a rain-charm. And on the same theory the horse's head would be comparable to the horse-headed Demeter of Phigalia as well as to the head of the October horse at Rome, which was nailed to a wall, probably to be kept there till next October. If we knew more about the rites of the horse-headed Demeter at Phigalia, we might find that amongst them was a dance of a man or woman who wore the mask of a horse's head and personated the goddess herself, just as, if I am right, the man who dances disguised as a horse at the harvest festival of the Garos, represents the spirit of the rice dancing among the garnered sheaves. The conjecture is to some extent supported by the remains of the magnificent marble drapery, which once adorned the colossal statue of Demeter or Persephone in the sanctuary of the two goddesses at Lycosura, in Arcadia; for on that drapery are carved rows of semi-human, semi-bestial figures dancing and playing musical instruments; the bodies of the figures are those of women, but their heads, paws, and feet are those of animals. Among the heads set on the figures are those of a horse, a pig, a cat or a hare, and apparently an ass. It is reasonable to suppose that these dancing figures represent a ritual dance which was actually performed in the rites of Demeter and Persephone by masked men or women, who personated the goddesses in their character of beasts.

Part VI. The Scapegoat

(Originally published in Volume IX)

Preface

With *The Scapegoat* our general discussion of the theory and practice of the Dying God is brought to a conclusion. The aspect of the subject with which we are here chiefly concerned is the use of the Dying God as a scapegoat to free his worshippers from the troubles of all sorts with which life on earth is beset. I have sought to trace this curious usage to its origin, to decompose the idea of the Divine Scapegoat into the elements out of which it appears to be compounded. If I am right, the idea resolves itself into a simple confusion between the material and the immaterial, between the real possibility of transferring a physical load to other shoulders and the supposed possibility of transferring our bodily and mental ailments to another who will bear them for us. When we survey the history of this pathetic fallacy from its crude inception in savagery to its full development in the speculative theology of civilized nations, we cannot but wonder at the singular power which the human mind possesses of transmuting the leaden dross of superstition into a glittering semblance of gold. Certainly in nothing is this alchemy of thought more conspicuous than in the process which has refined the base and foolish custom of the scapegoat into the sublime conception of a God who dies to take away the sins of the world.

Along with the discussion of the Scapegoat I have included in this volume an account of the remarkable religious ritual of the Aztecs, in which the theory of the Dying God found its most systematic and most tragic expression. There is nothing, so far as I am aware, to shew that the men and women, who in Mexico died cruel deaths in the character of gods and goddesses, were regarded as scapegoats by their worshippers and executioners; the intention of slaying them seems rather to have been to reinforce by a river of human blood the tide of life which might else grow stagnant and stale in the veins of the deities. Hence the Aztec ritual, which prescribed the slaughter, the roasting alive, and the flaying of men and women in order that the gods might remain for ever young and strong, conforms to the general theory of deicide which I have offered in this work. On that theory death is a portal through which gods and men alike must pass to escape the decrepitude of age and to attain the vigour of eternal youth. The conception may be said to culminate in the Brahmanical doctrine that in the daily sacrifice the body of the Creator is broken anew for the salvation of the world.

I. The Transference of Evil

§ 1. The Transference to Inanimate Objects.

In the preceding parts of this work we have traced the practice of killing a god among peoples in the hunting, pastoral, and agricultural stages of society; and I have attempted to explain the motives which led men to adopt so curious a custom. One aspect of the custom still remains to be noticed. The accumulated misfortunes and sins of the whole people are sometimes laid upon the dying god, who is supposed to bear them away for ever, leaving the people innocent and happy. The notion that we can transfer our guilt and sufferings to some other being who will bear them for us is familiar to the savage mind. It arises from a very obvious confusion between the physical and the mental, between the material and the immaterial. Because it is possible to shift a load of wood, stones, or what not, from our own back to the back of another, the savage fancies that it is equally possible to shift the burden of his pains and sorrows to another, who will suffer them in his stead. Upon this idea he acts, and the result is an endless number of very unamiable devices for palming off upon some one else the trouble which a man shrinks from bearing himself. In short, the principle of vicarious suffering is commonly understood and practised by races who stand on a low level of social and intellectual culture. In the following pages I shall illustrate the theory and the practice as they are found among savages in all their naked simplicity, undisguised by the refinements of metaphysics and the subtleties of theology.

The devices to which the cunning and selfish savage resorts for the sake of easing himself at the expense of his neighbour are manifold; only a few typical examples out of a multitude can be cited. At the outset it is to be observed that the evil of which a man seeks to rid himself need not be transferred to a person; it may equally well be transferred to an animal or a thing, though in the last case the thing is often only a vehicle to convey the trouble to the first person who touches it. In some of the East Indian islands they think that epilepsy can be cured by striking the patient on the face with the leaves of certain trees and then throwing them away. The disease is believed to have passed into the leaves, and to have been thrown away with them. In the Warramunga and Tjingilli tribes of Central Australia men who suffered from headache have often been seen wearing women's head-rings. "This was connected with the belief that the pain in the head would pass into the rings, and that then it could be thrown away with them into the bush, and so got rid of effectually. The natives have a very firm belief in the efficacy of this treatment. In the same way when a man suffers from internal pain, usually brought on by overeating, his wife's head-rings are placed on his stomach; the evil magic which is causing all the trouble passes into them, and they are then thrown away into the bushes, where the magic is supposed to leave them. After a time they are searched for by the woman, who brings them back, and again wears them in the ordinary way." Among the Sihanaka of Madagascar, when a man is very sick, his relatives are sometimes bidden by the diviner to cast out the evil by means of a variety of things, such as a stick of a particular sort of tree, a rag, a pinch of earth from an ant's nest, a little money, or what not. Whatever they may be, they are brought to the patient's house and held by a man near the door, while an exorcist stands in the house and pronounces the formula necessary for casting out the disease. When he has done, the things are thrown away in a southward direction, and all the people in the house, including the sick man, if he has strength enough, shake their loose robes and spit towards the door in order to expedite the departure of the malady. When an Atkhan of the Aleutian Islands had committed a grave sin and desired to unburden himself of his guilt, he proceeded as follows. Having chosen a time when the sun

was clear and unclouded, he picked up certain weeds and carried them about his person. Then he laid them down, and calling the sun to witness, cast his sins upon them, after which, having eased his heart of all that weighed upon it, he threw the weeds into the fire, and fancied that thus he cleansed himself of his guilt. In Vedic times a younger brother who married before his elder brother was thought to have sinned in so doing, but there was a ceremony by which he could purge himself of his sin. Fetters of reed-grass were laid on him in token of his guilt, and when they had been washed and sprinkled they were flung into a foaming torrent, which swept them away, while the evil was bidden to vanish with the foam of the stream. The Matse negroes of Togoland think that the river Awo has power to carry away the sorrows of mankind. So when one of their friends has died, and their hearts are heavy, they go to the river with leaves of the raphia palm tied round their necks and drums in their hands. Standing on the bank they beat the drums and cast the leaves into the stream. As the leaves float away out of sight to the sound of the rippling water and the roll of the drums, they fancy that their sorrow too is lifted from them. Similarly, the ancient Greeks imagined that the pangs of love might be healed by bathing in the river Selemnus. The Indians of Peru sought to purify themselves from their sins by plunging their heads in a river; they said that the river washed their sins away.

An Arab cure for melancholy or madness caused by love is to put a dish of water on the sufferer's head, drop melted lead into it, and then bury the lead in an open field; thus the mischief that was in the man goes away. Amongst the Miotse of China, when the eldest son of the house attains the age of seven years, a ceremony called "driving away the devil" takes place. The father makes a kite of straw and lets it fly away in the desert, bearing away all evil with it. When an Indian of Santiago Tepehuacan is ill, he will sometimes attempt to rid himself of the malady by baking thrice seven cakes; of these he places seven in the top of the highest pine-tree of the forest, seven he lays at the foot of the tree, and seven he casts into a well, with the water of which he then washes himself. By this means he transfers the sickness to the water of the well and so is made whole. The Baganda believed that plague was caused by the god Kaumpuli, who resided in a deep hole in his temple. To prevent him from escaping and devastating the country, they battened him down in the hole by covering the top with plantain-stems and piling wild-cat-skins over them; there was nothing like wild-cat-skins to keep him down, so hundreds of wild cats were hunted and killed every year to supply the necessary skins. However, sometimes in spite of these precautions the god contrived to escape, and then the people died. When a garden or house was plague-stricken, the priests purified it by transferring the disease to a plantain-tree and then carrying away the tree to a piece of waste land. The way in which they effected the transference of the disease was this. They first made a number of little shields and spears out of plantain fibre and reeds and placed them at intervals along the path leading from the garden to the main road. A young plantain-tree, about to bear fruit, was then cut down, the stem was laid in the path leading to one of the plague-stricken huts, and it was speared with not less than twenty reed spears, which were left sticking in it, while some of the plantain-fibre shields were also fastened to it. This tree was then carried down the path to the waste land and left there. It went by the name of the Scapegoat (*kyonzire*). To make quite sure that the plague, after being thus deposited in the wilderness, should not return by the way it went, the priests raised an arch, covered with barkcloth, over the path at the point where it diverged from the main road. This arch was thought to interpose an insurmountable barrier to the return of the plague.

Dyak priestesses expel ill-luck from a house by hewing and slashing the air in every corner of it with wooden swords, which they afterwards wash in the river, to let the ill-luck float away down stream. Sometimes they sweep misfortune out of the house with brooms made of the leaves of certain plants and sprinkled with rice-water and blood. Having swept it clean out of

every room and into a toy-house made of bamboo, they set the little house with its load of bad luck adrift on the river. The current carries it away out to sea, where it shifts its baleful cargo to a certain kettle-shaped ship, which floats in mid-ocean and receives in its capacious hold all the ills that flesh is heir to. Well would it be with mankind if the evils remained for ever tossing far away on the billows; but, alas, they are dispersed from the ship to the four winds, and settle again, and yet again, on the weary Dyak world. On Dyak rivers you may see many of the miniature houses, laden with manifold misfortunes, bobbing up and down on the current, or sticking fast in the thickets that line the banks.

These examples illustrate the purely beneficent side of the transference of evil; they shew how men seek to alleviate human sufferings by diverting them to material objects, which are then thrown away or otherwise disposed of so as to render them innocuous. Often, however, the transference of evil to a material object is only a step towards foisting it upon a living person. This is the maleficent side of such transferences. It is exemplified in the following cases. To cure toothache some of the Australian blacks apply a heated spear-thrower to the cheek. The spear-thrower is then cast away, and the toothache goes with it in the shape of a black stone called *karritch*. Stones of this kind are found in old mounds and sandhills. They are carefully collected and thrown in the direction of enemies in order to give them toothache. In Mirzapur a mode of transferring disease is to fill a pot with flowers and rice and bury it in a pathway covered up with a flat stone. Whoever touches this is supposed to contract the disease. The practice is called *chalauiwa*, or "passing on" the malady. This sort of thing goes on daily in Upper India. Often while walking of a morning in the bazaar you will see a little pile of earth adorned with flowers in the middle of the road. Such a pile usually contains some scabs or scales from the body of a smallpox patient, which are placed there in the hope that some one may touch them, and by catching the disease may relieve the sufferer. The Bahima, a pastoral people of the Uganda Protectorate, often suffer from deep-seated abscesses: "their cure for this is to transfer the disease to some other person by obtaining herbs from the medicine-man, rubbing them over the place where the swelling is, and burying them in the road where people continually pass; the first person who steps over these buried herbs contracts the disease, and the original patient recovers." The practice of the Wagogo of German East Africa is similar. When a man is ill, the native doctor will take him to a cross-road, where he prepares his medicines, uttering at the same time the incantations which are necessary to give the drugs their medical virtue. Part of the dose is then administered to the patient, and part is buried under a pot turned upside down at the cross-road. It is hoped that somebody will step over the pot, and catching the disease, which lurks in the pot, will thereby relieve the original sufferer. A variation of this cure is to plaster some of the medicine, or a little of the patient's blood, on a wooden peg and to drive the peg into a tree; any one who passes the tree and is so imprudent as to draw out the peg, will carry away with it the disease.

Sometimes in case of sickness the malady is transferred to an effigy as a preliminary to passing it on to a human being. Thus among the Baganda the medicine-man would sometimes make a model of his patient in clay; then a relative of the sick man would rub the image over the sufferer's body and either bury it in the road or hide it in the grass by the wayside. The first person who stepped over the image or passed by it would catch the disease. Sometimes the effigy was made out of a plantain-flower tied up so as to look like a person; it was used in the same way as the clay figure. But the use of images for this maleficent purpose was a capital crime; any person caught in the act of burying one of them in the public road would surely have been put to death. Among the Sena-speaking people to the north of the Zambesi, when any one is ill, the doctor makes a little pig of straw to which he transfers the sickness. The little pig is then set on the ground where two paths meet, and any passer-by

who chances to kick it over is sure to absorb the illness and to draw it away from the patient. Among the Korkus, a forest tribe of the Central Provinces in India, when a person wishes to transfer his sickness to another, he contrives to obtain the loin-cloth of his intended victim and paints two figures on it in lamp black, one upright and the other upside down. As soon as the owner of the loin-cloth puts it on, he falls a victim to the ailment which afflicted the artist who drew the figures. Every nine years a Mongol celebrates a memorial festival of his birth for the purpose of ensuring the continuance of his life and welfare. At this solemn ceremony two lambskins, one black and the other white, are spread on the floor of the hut, which is further covered with a felt carpet, and on the carpet are made nine little ridges of earth brought from nine mountains, the bottom of a river, and a sepulchral mound. The owner of the hut, for whose benefit the rite is performed, next seats himself on the black lambskin, and opposite him is set an effigy of himself made of dough by a lama. The priest then throws a black stone at the effigy, praying that the black arrow of death may pierce it, after which he throws a white stone at the master of the hut, praying that the bright beam of life may endow him with wondrous strength. After that the Mongol gets up, steps over one of the ridges of earth and says, "I have overcome a mishap, I have escaped a death." This ceremony he performs nine times, stepping over all the ridges, one after the other. Then he sits down on the white lambskin, and the lama takes the dough effigy, swings it thrice round the man whom it represents, spits on it thrice, and hands it to attendants who carry it away into the steppe. A little holy water sprinkled over the Mongol now completes his protection against perils and dangers. This last is a case of the beneficent transference of evil; for in it no attempt seems to be made to shift the burden of misfortune to anybody else.

§ 2. The Transference to Stones and Sticks.

In the western district of the island of Timor, when men or women are making long and tiring journeys, they fan themselves with leafy branches, which they afterwards throw away on particular spots where their forefathers did the same before them. The fatigue which they felt is thus supposed to have passed into the leaves and to be left behind. Others use stones instead of leaves. Similarly in the Babar Archipelago tired people will strike themselves with stones, believing that they thus transfer to the stones the weariness which they felt in their own bodies. They then throw away the stones in places which are specially set apart for the purpose. A like belief and practice in many distant parts of the world have given rise to those cairns or heaps of sticks and leaves which travellers often observe beside the path, and to which every passing native adds his contribution in the shape of a stone, or stick, or leaf. Thus in the Solomon and Banks' Islands the natives are wont to throw sticks, stones, or leaves upon a heap at a place of steep descent, or where a difficult path begins, saying, "There goes my fatigue." The act is not a religious rite, for the thing thrown on the heap is not an offering to spiritual powers, and the words which accompany the act are not a prayer. It is nothing but a magical ceremony for getting rid of fatigue, which the simple savage fancies he can embody in a stick, leaf, or stone, and so cast it from him.

An early Spanish missionary to Nicaragua, observing that along the paths there were heaps of stones on which the Indians as they passed threw grass, asked them why they did so. "Because we think," was the answer, "that thereby we are kept from weariness and hunger, or at least that we suffer less from them." When the Peruvian Indians were climbing steep mountains and felt weary, they used to halt by the way at certain points where there were heaps of stones, which they called *apachitas*. On these heaps the weary men would place other stones, and they said that when they did so, their weariness left them. In the passes of the eastern Andes, on the borders of Argentina and Bolivia, "large cairns are constantly found, and every Puna Indian, on passing, adds a stone and a coca leaf, so that neither he nor his beast of burden may tire on the way." In the country of the Tarahumares

and Tepehuanes in Mexico heaps of stones and sticks may be observed on high points, where the track leads over a ridge between two or more valleys. "Every Indian who passes such a pile adds a stone or a stick to it in order to gain strength for his journey. Among the Tarahumares only the old men observe this custom. Whenever the Tepehuanes carry a corpse, they rest it for some fifteen minutes on such a heap by the wayside that the deceased may not be fatigued but strong enough to finish his long journey to the land of the dead. One of my Huichol companions stopped on reaching this pile, pulled up some grass from the ground and picked up a stone as big as his fist. Holding both together he spat on the grass and on the stone and then rubbed them quickly over his knees. He also made a couple of passes with them over his chest and shoulders, exclaiming '*Kenestiquai!*' (May I not get tired!) and then put the grass on the heap and the stone on top of the grass." In Guatemala also piles of stones may be seen at the partings of ways and on the tops of cliffs and mountains. Every passing Indian used to gather a handful of grass, rub his legs with it, spit on it, and deposit it with a small stone on the pile, firmly persuaded that by so doing he would restore their flagging vigour to his weary limbs. Here the rubbing of the limbs with the grass, like the Babar custom of striking the body with a stone, was doubtless a mode of extracting the fatigue from them as a preliminary to throwing it away.

Similarly on the plateau between Lakes Tanganyika and Nyassa the native carriers, before they ascend a steep hill with their loads, will pick up a stone, spit on it, rub the calves of their legs with it, and then deposit it on one of those small piles of stones which are commonly to be found at such spots in this part of Africa. A recent English traveller, who noticed the custom, was informed that the carriers practise it "to make their legs light," in other words, to extract the fatigue from them. On the banks of the Kei river in Southern Africa another English traveller noticed some heaps of stones. On enquiring what they meant, he was told by his guides that when a Caffre felt weary he had but to add a stone to the heap to regain fresh vigour. In some parts of South Africa, particularly on the Zambesi, piles of sticks take the place of cairns. "Sometimes the natives will rub their leg with a stick, and throw the stick on the heap, 'to get rid of fatigue,' they avow. Others say that throwing a stone on the heap gives one fresh vigour for the journey."

From other accounts of the Caffre custom we learn that these cairns are generally on the sides or tops of mountains, and that before a native deposits his stone on the pile he spits on it. The practice of spitting on the stone which the weary wayfarer lays on the pile is probably a mode of transferring his fatigue the more effectually to the material vehicle which is to rid him of it. We have seen that the practice prevails among the Indians of Guatemala and the natives of the Tanganyika plateau, and it appears to be observed also under similar circumstances in Corea, where the cairns are to be found especially on the tops of passes. From the primitive point of view nothing can be more natural than that the cairns or the heaps of sticks and leaves to which the tired traveller adds his contribution should stand at the top of passes and, in general, on the highest points of the road. The wayfarer who has toiled, with aching limbs and throbbing temples, up a long and steep ascent, is aware of a sudden alleviation as soon as he has reached the summit; he feels as if a weight had been lifted from him, and to the savage, with his concrete mode of thought, it seems natural and easy to cast the weight from him in the shape of a stone or stick, or a bunch of leaves or of grass. Hence it is that the piles which represent the accumulated weariness of many foot-sore and heavy-laden travellers are to be seen wherever the road runs highest in the lofty regions of Bolivia, Tibet, Bhootan, and Burma, in the passes of the Andes and the Himalayas, as well as in Corea, Caffraria, Guatemala, and Melanesia.

While the mountaineer Indians of South America imagine that they can rid themselves of their fatigue in the shape of a stick or a stone, other or the same aborigines of that continent

believe that they can let it out with their blood. A French explorer, who had seen much of the South American Indians, tells us that “they explain everything that they experience by attributing it to sorcery, to the influence of maleficent beings. Thus an Indian on the march, when he feels weary, never fails to ascribe his weariness to the evil spirit; and if he has no diviner at hand, he wounds himself in the knees, the shoulders, and on the arms in order to let out the evil with the blood. That is why many Indians, especially the Aucas [Araucanians], have always their arms covered with scars. This custom, differently applied, is almost general in America; for I found it up to the foot of the Andes, in Bolivia, among the Chiriguana and Yuracares nations.”

But it is not mere bodily fatigue which the savage fancies he can rid himself of by the simple expedient of throwing a stick or a stone. Unable clearly to distinguish the immaterial from the material, the abstract from the concrete, he is assailed by vague terrors, he feels himself exposed to some ill-defined danger on the scene of any great crime or great misfortune. The place to him seems haunted ground. The thronging memories that crowd upon his mind, if they are not mistaken by him for goblins and phantoms, oppress his fancy with a leaden weight. His impulse is to flee from the dreadful spot, to shake off the burden that seems to cling to him like a nightmare. This, in his simple sensuous way, he thinks he can do by casting something at the horrid place and hurrying by. For will not the contagion of misfortune, the horror that clutched at his heart-strings, be diverted from himself into the thing? will it not gather up in itself all the evil influences that threatened him, and so leave him to pursue his journey in safety and peace? Some such train of thought, if these gropings and fumbings of a mind in darkness deserve the name of thought, seems to explain the custom, observed by wayfarers in many lands, of throwing sticks or stones on places where something horrible has happened or evil deeds have been done. When Sir Francis Younghusband was travelling across the great desert of Gobi his caravan descended, towards dusk on a June evening, into a long depression between the hills, which was notorious as a haunt of robbers. His guide, with a terror-stricken face, told how not long before nine men out of a single caravan had been murdered, and the rest left in a pitiable state to continue their journey on foot across the awful desert. A horseman, too, had just been seen riding towards the hills. “We had accordingly to keep a sharp look-out, and when we reached the foot of the hills, halted, and, taking the loads off the camels, wrapped ourselves up in our sheepskins and watched through the long hours of the night. Day broke at last, and then we silently advanced and entered the hills. Very weird and fantastic in their rugged outline were they, and here and there a cairn of stones marked where some caravan had been attacked, and as we passed these each man threw one more stone on the heap.” In the Norwegian district of Tellemarken a cairn is piled up wherever anything fearful has happened, and every passer-by must throw another stone on it, or some evil will befall him. In Sweden and the Esthonian island of Oesel the same custom is practised on scenes of clandestine or illicit love, with the strange addition in Oesel that when a man has lost his cattle he will go to such a spot, and, while he flings a stick or stone on it, will say, “I bring thee wood. Let me soon find my lost cattle.” Far from these northern lands, the Dyaks of Batang Lupar keep up an observance of the same sort in the forests of Borneo. Beside their paths may be seen heaps of sticks or stones which are called “lying heaps.” Each heap is in memory of some man who told a stupendous lie or disgracefully failed in carrying out an engagement, and everybody who passes adds a stick or stone to the pile, saying as he does so, “For So-and-so's lying heap.” The Dyaks think it a sacred duty to add to every such “liar's mound” (*tugong bula*) which they pass; they imagine that the omission of the duty would draw down on them a supernatural punishment. Hence, however pressed a Dyak may be for time, he will always stop to throw on the pile some branches or twigs. The person to start such a heap is one of the men who has suffered by a malicious lie. He takes a stick, throws it down on some spot where people are constantly

passing, and says, "Let any one who does not add to this liar's heap suffer from pains in the head." Others then do likewise, and every passer-by throws a stick on the spot lest he should suffer pains. In this way the heap often grows to a large size, and the liar by whose name it is known is greatly ashamed.

But it is on scenes of murder and sudden death that this rude method of averting evil is most commonly practised. The custom that every passer-by must cast a stone or stick on the spot where some one has come to a violent end, whether by murder or otherwise, has been observed in practically the same form in such many and diverse parts of the world as Ireland, France, Spain, Sweden, Germany, Bohemia, Lesbos, Morocco, Armenia, Palestine, Arabia, India, North America, Venezuela, Bolivia, Celebes, and New Zealand. In Fiji, for example, it was the practice for every passer-by to throw a leaf on the spot where a man had been clubbed to death; "this was considered as an offering of respect to him, and, if not performed, they have a notion they will soon be killed themselves." Sometimes the scene of the murder or death may also be the grave of the victim, but it need not always be so, and in Europe, where the dead are buried in consecrated ground, the two places would seldom coincide. However, the custom of throwing stones or sticks on a grave has undoubtedly been observed by passers-by in many parts of the world, and that, too, even when the graves are not those of persons who have come to a violent end. Thus we are told that the people of Unalashka, one of the Aleutian Islands, bury their dead on the summits of hills and raise a little hillock over the grave. "In a walk into the country, one of the natives, who attended me, pointed out several of these receptacles of the dead. There was one of them, by the side of the road leading from the harbour to the village, over which was raised a heap of stones. It was observed, that every one who passed it, added one to it." The Roumanians of Transylvania think that a dying man should have a burning candle in his hand, and that any one who dies without a light has no right to the ordinary funeral ceremonies. The body of such an unfortunate is not laid in holy ground, but is buried wherever it may be found. His grave is marked only by a heap of dry branches, to which each passer-by is expected to add a handful of twigs or a thorny bough. The Hottentot god or hero Heitsi-eibib died several times and came to life again. When the Hottentots pass one of his numerous graves they throw a stone, a bush, or a fresh branch on it for good luck. Near the former mission-station of Blydeuitzigt in Cape Colony there was a spot called Devil's Neck where, in the opinion of the Bushmen, the devil was interred. To hinder his resurrection stones were piled in heaps about the place. When a Bushman, travelling in the company of a missionary, came in sight of the spot he seized a stone and hurled it at the grave, remarking that if he did not do so his neck would be twisted round so that he would have to look backwards for the term of his natural life. Stones are cast by passers-by on the graves of murderers in some parts of Senegambia. In Syria deceased robbers are not buried like honest folk, but left to rot where they lie; and a pile of stones is raised over the mouldering corpse. Every one who passes such a pile must fling a stone at it, on pain of incurring God's malison. Between sixty and seventy years ago an Englishman was travelling from Sidon to Tyre with a couple of Musalmans. When he drew near Tyre his companions picked up some small stones, armed him in the same fashion, and requested him to be so kind as to follow their example. Soon afterwards they came in sight of a conical heap of pebbles and stones standing in the road, at which the two Musalmans hurled stones and curses with great vehemence and remarkable volubility. When they had discharged this pious duty to their satisfaction, they explained that the missiles and maledictions were directed at a celebrated robber and murderer, who had been knocked on the head and buried there some half a century before.

In these latter cases it may perhaps be thought that the sticks and stones serve no other purpose than to keep off the angry and dangerous ghost who might be supposed to haunt

either the place of death or the grave. This interpretation seems certainly to apply to some cases of the custom. For example, in Pomerania and West Prussia the ghosts of suicides are much feared. Such persons are buried, not in the churchyard, but at the place where they took their lives, and every passer-by must cast a stone or a stick on the spot, or the ghost of the suicide will haunt him by night and give him no rest. Hence the piles of sticks or stones accumulated on the graves of these poor wretches sometimes attain a considerable size. Similarly the Baganda of Central Africa used to stand in great fear of the ghosts of suicides and they took many precautions to disarm or even destroy these dangerous spirits. For this purpose the bodies of suicides were removed to waste land or cross-roads and burned there, together with the wood of the house in which the deed had been done or of the tree on which the person had hanged himself. By these means they imagined that they destroyed the ghost so that he could not come and lure others to follow his bad example. Lest, however, the ghost should survive the destruction of his body by fire, the Baganda, in passing any place where a suicide had been burnt, always threw grass or sticks on the spot to prevent the ghost from catching them. And they did the same, for the same reason, whenever they passed the places on waste ground where persons accused of witchcraft and found guilty by the poison ordeal had been burnt to death. Baganda women had a special reason for dreading all graves which were believed to be haunted by dangerous ghosts; for, imagining that they could conceive children without intercourse with the other sex, they feared to be impregnated by the entrance into them of the ghosts of suicides and other unfortunate or uncanny people, such as persons with a light complexion, twins, and particularly all who had the mishap to be born feet foremost. For that reason Baganda women were at pains, whenever they passed the graves of any such persons, to throw sticks or grass upon them; "for by so doing they thought that they could prevent the ghost of the dead from entering into them, and being reborn." Hence the mounds which accumulated over these graves became in course of time large enough to deflect the path and to attract the attention of travellers. It was not merely matrons who thus took care not to become mothers unaware; the same fears were entertained and the same precautions were adopted by all women, whether old or young, whether married or single; since they thought that there was no woman, whatever her age or condition, who might not be impregnated by the entrance into her of a spirit. In these cases, therefore, the throwing of sticks or grass at graves is a purely defensive measure; the missiles are intended to ward off the assaults of dangerous ghosts. Similarly we are told that in Madagascar solitary graves by the wayside have a sinister reputation, and that passers-by, without looking back, will throw stones or clods at them "to prevent the evil spirits from following them." The Maraves of South Africa, like the Baganda, used to burn witches alive and to throw stones on the places of execution whenever they passed them, so that in time regular cairns gradually rose on these spots. No doubt with these Maraves, as with the Baganda, the motive for throwing missiles at such places is to protect themselves against the ghosts. A protective motive is also assigned for a similar custom observed in Chota Nagpur, a region of India which is the home of many primitive tribes. There heaps of stones or of leaves and branches may often be seen beside the path; they are supposed to mark the places where people have been killed by wild beasts, and the natives think that any passer-by who failed to add a stone or a stick to the pile would himself be seized and devoured by a wild animal. Here, though the ghost is not explicitly mentioned, we may perhaps suppose that out of spite he is instrumental in causing others to perish by the same untimely death by which he was himself carried off. The Kayans of Borneo imagine that they can put evil spirits to flight by hurling sticks or stones at them; so on a journey they will let fly volleys of such missiles at the rocks and dens where demons are known to reside. Hence, whenever the throwing of stones at a grave is regarded as an insult to the dead, we may suppose that the missiles are intended to hit and hurt the ghost. Thus Euripides represents the murderer Aegisthus as leaping on the tomb

of his victim Agamemnon and pelting it with stones; and Propertius invites all lovers to discharge stones and curses at the dishonoured grave of an old bawd.

But if this theory seems adequately to account for some cases of the custom with which we are concerned, it apparently fails to explain others. The view that the sticks and stones hurled at certain places are weapons turned against dangerous or malignant spirits is plausible in cases where such spirits are believed to be in the neighbourhood; but in cases where no such spirits are thought to be lurking, we must, it would seem, cast about for some other explanation. For example, we have seen that it has been customary to throw sticks or stones on spots which have been defiled by deeds of moral turpitude without any shedding of blood, and again on spots where weary travellers stop to rest. It is difficult to suppose that in these latter cases the evil deeds or the sensations of fatigue are conceived in the concrete shape of demons whom it is necessary to repel by missiles, though many South American Indians, as we saw, do attribute fatigue to a demon. Still more difficult is it to apply the purely defensive theory to cases where beneficent spirits are imagined to be hovering somewhere near, and where the throwing of the stones or sticks is apparently regarded by those who practise it as a token of respect rather than of hostility. Thus amongst the Masai, when any one dies away from the kraal, his body is left lying on the spot where he died, and all persons present throw bunches of grass or leaves on the corpse. Afterwards every passer-by casts a stone or a handful of grass on the place, and the more the dead man was respected, the longer is the usage observed. It is especially the graves of Masai medicine-men that are honoured in this way. In the forest near Avestad, in Sweden, the traveller, Clarke, observed "several heaps made with sticks and stones; upon which the natives, as they pass, cast either a stone, or a little earth, or the bough of a tree; deeming it an uncharitable act to omit this tribute, in their journeys to and fro. As this custom appeared closely allied to the pious practice in the Highlands of Scotland, of casting a stone upon the cairn of a deceased person, we, of course, concluded these heaps were places of sepulture." They were said to be the graves of a band of robbers, who had plundered merchants on their passage through the forest, but had afterwards been killed and buried where they fell. However, in all these cases the practice of throwing stones on the grave, though interpreted as a mark of respect and charity, may really be based on the fear of the ghosts, so that the motive for observing the custom may be merely that of self-defence against a dangerous spirit. Yet this explanation can hardly apply to certain other cases. Thus in Syria it is a common practice with pious Moslems, when they first come in sight of a very sacred place, such as Hebron or the tomb of Moses, to make a little heap of stones or to add a stone to a heap which has been already made. Hence every here and there the traveller passes a whole series of such heaps by the side of the track. In Northern Africa the usage is similar. Cairns are commonly erected on spots from which the devout pilgrim first discerns the shrine of a saint afar off; hence they are generally to be seen on the top of passes. For example, in Morocco, at the point of the road from Casablanca to Azemmour, where you first come in sight of the white city of the saint gleaming in the distance, there rises an enormous cairn of stones shaped like a pyramid several hundreds of feet high, and beyond it on both sides of the road there is a sort of avalanche of stones, either standing singly or arranged in little pyramids. Every pious Mohammedan whose eyes are gladdened by the blessed sight of the sacred town adds his stone to one of the piles or builds a little pile for himself.

Such a custom can hardly be explained as a precaution adopted against a dangerous influence supposed to emanate from the saint and to communicate itself even to people at a distance. On the contrary, it points rather to a desire of communion with the holy man than to a wish to keep him at bay. The mode of communion adopted, however strange it may seem to us, is apparently quite in harmony with the methods by which good Mohammedans in Northern

Africa attempt to appropriate to themselves the blessed influence (*baraka*) which is supposed to radiate on all sides from the person of a living saint. "It is impossible to imagine," we are told, "the extremity to which the belief in the blessed influence of saints is carried in North Africa. To form an exact idea of it you must see a great saint in the midst of the faithful. 'The people fling themselves down on his path to kiss the skirt of his robe, to kiss his stirrup if he is on horseback, to kiss even his footprint if he is on foot. Those who are too far from him to be able to touch his hand touch him with their staff, or fling a stone at him which they have marked previously so as to be able to find it afterwards and to embrace it devoutly.' " Thus through the channel of the stone or the stick, which has been in bodily contact with the living saint, his blessed influence flows to the devotee who has wielded the stick or hurled the stone. In like manner we may perhaps suppose that the man who adds a stone to a cairn in honour of a dead saint hopes to benefit by the saintly effluence which distils in a mysterious fashion through the stone to him.

When we survey the many different cases in which passing travellers are accustomed to add stones or sticks to existing piles, it seems difficult, if not impossible, to explain them all on one principle; different and even opposite motives appear, at least at first sight, to have operated in different cases to produce customs superficially alike. Sometimes the motive for throwing the stone is to ward off a dangerous spirit; sometimes it is to cast away an evil; sometimes it is to acquire a good. Yet, perhaps, if we could trace them back to their origin in the mind of primitive man, we might find that they all resolve themselves more or less exactly into the principle of the transference of evil. For to rid ourselves of an evil and to acquire a good are often merely opposite sides of one and the same operation; for example, a convalescent regains health in exactly the same proportion as he shakes off his malady. And though the practice of throwing stones at dangerous spirits especially at mischievous and malignant ghosts of the dead, appears to spring from a different motive, yet it may be questioned whether the difference is really as great to the savage as it seems to us. To primitive man the idea of spiritual and ghostly powers is still more indefinite than it is to his civilized brother: it fills him with a vague uneasiness and alarm; and this sentiment of dread and horror he, in accordance with his habitual modes of thought, conceives in a concrete form as something material which either surrounds and oppresses him like a fog, or has entered into and taken temporary possession of his body. In either case he imagines that he can rid himself of the uncanny thing by stripping it from his skin or wrenching it out of his body and transferring it to some material substance, whether a stick, a stone, or what not, which he can cast from him, and so, being eased of his burden, can hasten away from the dreadful spot with a lighter heart. Thus the throwing of the sticks or stones would be a form of ceremonial purification, which among primitive peoples is commonly conceived as a sort of physical rather than moral purgation, a mode of sweeping or scouring away the morbid matter by which the polluted person is supposed to be infected. This notion perhaps explains the rite of stone-throwing observed by pilgrims at Mecca; on the day of sacrifice every pilgrim has to cast seven stones on a cairn, and the rite is repeated thrice on the three following days. The traditional explanation of the custom is that Mohammed here drove away the devil with a shower of stones; but the original idea may perhaps have been that the pilgrims cleanse themselves by transferring their ceremonial impurity to the stones which they fling on the heap.

The theory that the throwing of stones is practised in certain circumstances as a mode of purification tallies very well with the tradition as to the origin of those cairns which were to be seen by wayside images of Hermes in ancient Greece, and to which every passer-by added a stone. It was said that when Hermes was tried by the gods for the murder of Argus all the gods flung stones at him as a means of freeing themselves from the pollution contracted by

bloodshed; the stones thus thrown made a great heap, and the custom of rearing such heaps at wayside images of Hermes continued ever afterwards. Similarly Plato recommended that if any man had murdered his father or mother, his brother or sister, his son or daughter, he should be put to death, and that his body should be cast forth naked at a cross-road outside of the city. There the magistrates should assemble on behalf of the city, each carrying in his hand a stone, which he was to cast at the head of the corpse by way of purifying the city from the pollution it had contracted by the crime. After that the corpse was to be carried away and flung outside the boundaries. In these cases it would seem that the pollution incurred by the vicinity of a murderer is thought to be gathered up in the stones as a material vehicle and to be thrown away with them. A sacrificial custom of the Brahmans, prescribed in one of their sacred books, is susceptible of a like interpretation. At a certain stage of the ritual the sacrificer is directed to put a stone into a water-pot and to throw it away in a south-westerly direction, because that is the region of Nirriti, the goddess of Evil or Destruction. With the stone and the pitcher he is supposed to cast away his pain and evil; and he can transfer the pain to another by saying, as he throws away the stone and the pitcher, "Let thy pain enter him whom we hate," or "Let thy pain enter so-and-so," naming his enemy; but in order to ensure the transference of the pain to his enemy he must take care that the stone or the pitcher is broken.

This mode of interpreting the custom of throwing sticks and stones on piles appears preferable to the one which has generally found favour with European travellers and writers. Imperfectly acquainted for the most part with the notions which underlie primitive magic, but very familiar with the religious conception of a deity who requires sacrifice of his worshippers, they are apt to interpret the missiles in question as cheap and easy offerings presented by pious but frugal worshippers to ghosts or spirits whose favour they desire to win. Whether a likely mode of conciliating a ghost or spirit is to throw sticks and stones at him is a question about which opinions might perhaps differ. It is difficult to speak with confidence about the tastes of spiritual beings, but as a rule they bear a remarkable likeness to those of mere ordinary mortals, and it may be said without fear of contradiction that few of the latter would be gratified by being set up as a common target to be aimed at with sticks and stones by everybody who passed within range. Yet it is quite possible that a ceremony, which at first was purely magical, may in time have a religious gloss or interpretation put on it even by those who practise it; and this seems in fact to have sometimes happened to the particular custom under consideration. Certainly some people accompany the throwing of the stone on the pile with the presentation of useful articles, which can hardly serve any other purpose than that of propitiating some local spirits. Thus travellers in Sikhim and Bhootan offer flour and wine, as well as stones, at the cairns; and they also burn incense and recite incantations or prayers, or they tear strips from their garments, tie them to twigs or stones, and then lay them on the cairn, calling out to the spirit of the mountain, "Pray accept our offering! The spirits are victorious! The devils are defeated!" Indians of Guatemala offered, according to their means, a little cotton, salt, cacao, or chili. They now burn copal and sometimes dance on the tops of the passes where the cairns are to be seen, but perhaps these devotions may be paid to the crosses which at the present day are generally set up in such situations. The Indian of Bolivia will squirt out the juice of his coca-quin, or throw the quid itself on the cairn, to which he adds a stone; occasionally he goes so far as to stick feathers or a leathern sandal or two on the pile. In passing the cairns he will sometimes pull a hair or two out of his eyebrows or eyelashes and puff them away towards the sun. Peruvian Indians used similarly to make cheap offerings of chewed coca or maize, old shoes, and so forth, on the cairns. In Sweden and Corea a little money is sometimes thrown on a cairn instead of a stick or stone. The shrine of the Jungle Mother in Northern India is usually a pile of stones and branches to which every passer-by contributes. When she is displeased, she lets a tiger or

leopard kill her negligent votary. She is the great goddess of the herdsmen and other dwellers in the forest, and they vow to her a cock and a goat, or a young pig, if she saves them and their cattle from beasts of prey. In the jungles of Mirzapur the cairn which marks the spot where a man has been killed by a tiger, and to which each passer-by contributes a stone, is commonly in charge of a Baiga or aboriginal priest, who offers upon it a cock, a pig, or some spirits, and occasionally lights a little lamp at the shrine. Amongst the Baganda members of the Bean clan worshipped the spirit of the river Nakiza. "There was no temple, but they had two large heaps of sticks and grass, one on either side of the river by the ford; to these heaps the members went, when they wished to make an offering to the spirit, or to seek his assistance. The offerings were usually goats, beer, barkcloth, and fowls. When people crossed the river they threw a little grass or some sticks on to the heap before crossing, and again a little more on to the second heap after crossing; this was their offering to the spirit for a safe crossing." There is a ford on the Calabar river in West Africa which has an ill repute, for the stream is broad, the current rapid, and there are crocodiles in the deep places. Beside the ford is a large oval-shaped stone which the Ekoi regard as an altar of Nimm, a powerful goddess, who dwells in the depth of the river Kwa and manifests herself in the likeness now of a crocodile and now of a snake. In order to ensure a safe passage through the river it is customary to pluck a leaf, rub it on the forehead over the pineal gland, and throw it on a heap of leaves in front of the stone. As he rubs the leaf on his forehead, the person who is about to plunge into the river prays, "May I be free from danger! May I go through the water to the other side! May I see no evil!" And when he throws the leaf on the heap he prays again, saying, "I am coming across the river, may the crocodile lay down his head!" Here the leaves appear to be a propitiatory offering presented to the dread goddess in the hope that she will suffer her worshipper to pass the ford unmolested. At another but smaller stream, called the River of Good Fortune, the Ekoi similarly rub leaves on their foreheads, praying for luck, and throw them on a heap before they pass through the water. They think that he who complies with this custom will have good luck throughout the year. Again, when the Ekoi kill a chameleon on the road, they do not throw the body away in the forest, but lay it by the wayside, and all who pass by pluck a few leaves and drop them on the dead animal, saying, "Look! Here is your mat." In this way heaps of leaves accumulate over the carcasses of chameleons. The custom is intended to appease the shade of the chameleon, who, if he were not pacified, would go to the Earth-god Obassi Nsi and pray for vengeance on the race of those who had caused his death. The Washamba of German East Africa believe that certain stony and dangerous places in the paths are the abodes of spirits; hence at any such spot a traveller who would have a prosperous journey must dance a little and deposit a few small stones. The dance and the stones are presumably intended to soften the heart of the spirits and induce them to look favourably on the dancer. In Papa Westray, one of the Orkney Islands, there is a ruined chapel called St. Tredwels, "at the door of which there is a heap of stones; which was the superstition of the common people, who have such a veneration for this chapel above any other, that they never fail, at their coming to it, to throw a stone as an offering before the door: and this they reckon an indispensable duty enjoined by their ancestors."

Prayers, too, as we have seen, are sometimes offered at these piles. In Laos heaps of stones may be seen beside the path, on which the passenger will deposit a pebble, a branch, or a leaf, while he beseeches the Lord of the Diamond to bestow on him good luck and long life. In the Himalayan districts of the North-Western Provinces of India heaps of stones and sticks are often to be seen on hills or at cross-roads. They are formed by the contributions of passing travellers, each of whom in adding his stone or stick to the pile prays, saying, "Thou goddess whose home is on the ridge, eater of wood and stone, preserve me." Tibetan travellers mutter a prayer at the cairns on the tops of passes to which they add a few stones gathered by them on the ascent. A native of South-Eastern Africa who places a small stone on a cairn is wont to

say as he does so, "Cairn, grant me strength and prosperity." In the same circumstances the Hottentot prays for plenty of cattle, and the Caffre that his journey may be prosperous, that he may have strength to accomplish it, and that he may obtain an abundant supply of food by the way. It is said that sick Bushmen used to go on pilgrimage to the cairn called the Devil's Neck, and pray to the spirit of the place to heal them, while they rubbed the sick part of their body and cried, "Woe! woe!" On special occasions, too, they resorted thither and implored the spirit's help. Such customs seem to indicate the gradual transformation of an old magical ceremony into a religious rite with its characteristic features of prayer and sacrifice. Yet behind these later accretions, as we may perhaps regard them, it seems possible in many, if not in all, cases to discern the nucleus to which they have attached themselves, the original idea which they tend to conceal and in time to transmute. That idea is the transference of evil from man to a material substance which he can cast from him like an outworn garment.

§ 3. The Transference to Animals.

Animals are often employed as a vehicle for carrying away or transferring the evil. A Guinea negro who happens to be unwell will sometimes tie a live chicken round his neck, so that it lies on his breast. When the bird flaps its wings or cheeps the man thinks it a good sign, supposing the chicken to be afflicted with the very pain from which he hopes soon to be released, or which he would otherwise have to endure. When a Moor has a headache he will sometimes take a lamb or a goat and beat it till it falls down, believing that the headache will thus be transferred to the animal. In Morocco most wealthy Moors keep a wild boar in their stables, in order that the jinn and evil spirits may be diverted from the horses and enter into the boar. In some parts of Algeria people think that typhoid fever can be cured by taking a tortoise, putting it on its back in the road, and covering it over with a pot. The patient recovers, but whoever upsets the pot catches the fever. In Tlemcen a pregnant woman is protected against jinn by means of a black fowl which is kept in the house from the seventh month of her pregnancy till her delivery. Finally, the oldest woman in the house releases the fowl in the Jews' quarter; the bird is supposed to carry the jinn away with it. Amongst the Caffres of South Africa, when other remedies have failed, "natives sometimes adopt the custom of taking a goat into the presence of a sick man, and confess the sins of the kraal over the animal. Sometimes a few drops of blood from the sick man are allowed to fall on the head of the goat, which is turned out into an uninhabited part of the veldt. The sickness is supposed to be transferred to the animal, and to become lost in the desert." After an illness a Bechuana king seated himself upon an ox which lay stretched on the ground. The native doctor next poured water on the king's head till it ran down over his body. Then the head of the ox was held in a vessel of water till the animal expired; whereupon the doctor declared, and the people believed, that the ox died of the king's disease, which had been transferred from him to it. The Baganda of Central Africa also attempted to transfer illness from a person to an animal. "The medicine-man would take the animal, pass some herbs over the sick man, tie these to the animal, and then drive it away to some waste land, where he would kill it, taking the meat as his perquisite. The sick man would be expected to recover." The Akikuyu of East Africa think that a man can transfer the guilt of incest by means of "an ignoble ceremony" to a goat, which is then killed; this saves the life of the culprit, who otherwise must die. When disease breaks out among the cattle of the Bahima, a pastoral people of Central Africa, the priest "collects herbs and other remedies to attract the disease from the cattle. An animal is chosen from the herd in the evening, which is to be the scapegoat for the herd; the herbs, etc., are tied round its neck, with certain fetiches to ensure the illness leaving the other animals; the cow is driven round the outside of the kraal several times, and afterwards placed inside with the herd for the night. Early the following morning the animal is taken out and again driven round the kraal; the priest then kills it in the gateway, and some of the blood is

sprinkled over the people belonging to the kraal, and also over the herd. The people next file out, each one jumping over the carcass of the cow, and all the animals are driven over it in the same way. The disease is thus transferred to the scapegoat and the herd is saved. All the fetiches and herbs, which were upon the scapegoat, are fastened upon the door-posts and lintel of the kraal to prevent the disease from entering again."

When the cattle of the Huzuls, a pastoral people of the Carpathians, are sick and the owner attributes the sickness to witchcraft, he throws glowing coals into a vessel of water and then pours the water on a black dog; thus the sickness passes into the dog and the cattle are made whole. In Arabia, when the plague is raging, the people will sometimes lead a camel through all the quarters of the town in order that the animal may take the pestilence on itself. Then they strangle it in a sacred place and imagine that they have rid themselves of the camel and of the plague at one blow. In Annam, when sickness is caused by the presence of a demon in the body of the sufferer, a skilful exorcist will decoy the unwary devil into a fowl and then, quick as thought, decapitate the bird and throw it out of the door. But lest the fiend should survive this severe operation, cabalistic figures are posted on the outside of the door, which preclude him from entering the premises and assaulting the patient afresh. It is said that when smallpox is raging the savages of Formosa will drive the demon of disease into a sow, then cut off the animal's ears and burn them or it, believing that in this way they rid themselves of the plague. When a Kabyle child is pining for jealousy of a younger brother or sister, the parents imagine that they can cure it as follows. They take fifteen grains of wheat, wrap them up in a packet, and leave the packet all night under the head of the jealous child. Then in the morning they throw the grains into an ant-hill, saying, "Salutation to you, oh beautiful beings clad in black; salutation to you who dig the earth so well without the aid of any hoe by the help of God and the angels! May each of you take his share of the jealousy attached to these grains!"

Amongst the Malagasy the vehicle for carrying away evils is called a *faditra*. "The *faditra* is anything selected by the sikidy [divining board] for the purpose of taking away any hurtful evils or diseases that might prove injurious to an individual's happiness, peace, or prosperity. The *faditra* may be either ashes, cut money, a sheep, a pumpkin, or anything else the sikidy may choose to direct. After the particular article is appointed, the priest counts upon it all the evils that may prove injurious to the person for whom it is made, and which he then charges the *faditra* to take away for ever. If the *faditra* be ashes, it is blown, to be carried away by the wind. If it be cut money, it is thrown to the bottom of deep water, or where it can never be found. If it be a sheep, it is carried away to a distance on the shoulders of a man, who runs with all his might, mumbling as he goes, as if in the greatest rage against the *faditra*, for the evils it is bearing away. If it be a pumpkin, it is carried on the shoulders to a little distance, and there dashed upon the ground with every appearance of fury and indignation." A Malagasy was informed by a diviner that he was doomed to a bloody death, but that possibly he might avert his fate by performing a certain rite. Carrying a small vessel full of blood upon his head, he was to mount upon the back of a bullock; while thus mounted, he was to spill the blood upon the bullock's head, and then send the animal away into the wilderness, whence it might never return.

Among the Toradjas of Central Celebes a chief's daughter, who suffered from kleptomania, was healed by a wise woman, who placed a bag containing spiders and crabs on the patient's hands. The physician calculated that the prehensile claws of these creatures, so suggestive of a thief's hands in the act of closing on his prey, would lay hold of the vicious propensity in the young woman's mind and extract it as neatly as a pair of forceps nips out a thorn from the flesh. The Battas of Sumatra have a ceremony which they call "making the curse to fly away." When a woman is childless, a sacrifice is offered to the gods of three grasshoppers,

representing a head of cattle, a buffalo, and a horse. Then a swallow is set free, with a prayer that the curse may fall upon the bird and fly away with it. "The entrance into a house of an animal which does not generally seek to share the abode of man is regarded by the Malays as ominous of misfortune. If a wild bird flies into a house, it must be carefully caught and smeared with oil, and must then be released in the open air, a formula being recited in which it is bidden to fly away with all the ill-luck and misfortunes (*sial jambalang*) of the occupier." In antiquity Greek women seem to have done the same with swallows which they caught in the house: they poured oil on them and let them fly away, apparently for the purpose of removing ill-luck from the household. The Huzuls of the Carpathians imagine that they can transfer freckles to the first swallow they see in spring by washing their face in flowing water and saying, "Swallow, swallow, take my freckles, and give me rosy cheeks." At the cleansing of a leper and of a house suspected of being tainted with leprosy among the Hebrews the priest used to let a living bird fly away into the open field, no doubt in order to carry away the leprosy with it. Similarly among the ancient Arabs a widow was expected to live secluded in a small tent for a year after her husband's death; then a bird or a sheep was brought to her, she made the creature touch her person, and let it go. It was believed that the bird or the sheep would not live long thereafter; doubtless it was supposed to suffer from the uncleanness or taint of death which the widow had transferred to it.

Among the Majhwar, a Dravidian race of South Mirzapur, if a man has died of a contagious disease, such as cholera, the village priest walks in front of the funeral procession with a chicken in his hands, which he lets loose in the direction of some other village as a scapegoat to carry the infection away. None but another very experienced priest would afterwards dare to touch or eat such a chicken. Among the Badagas of the Neilgherry Hills in Southern India, when a death has taken place, the sins of the deceased are laid upon a buffalo calf. For this purpose the people gather round the corpse and carry it outside of the village. There an elder of the tribe, standing at the head of the corpse, recites or chants a long list of sins such as any Badaga may commit, and the people repeat the last words of each line after him. The confession of sins is thrice repeated. "By a conventional mode of expression, the sum total of sins a man may do is said to be thirteen hundred. Admitting that the deceased has committed them all, the performer cries aloud, 'Stay not their flight to God's pure feet.' As he closes, the whole assembly chants aloud 'Stay not their flight.' Again the performer enters into details, and cries, 'He killed the crawling snake. It is a sin.' In a moment the last word is caught up, and all the people cry 'It is a sin.' As they shout, the performer lays his hand upon the calf. The sin is transferred to the calf. Thus the whole catalogue is gone through in this impressive way. But this is not enough. As the last shout 'Let all be well' dies away, the performer gives place to another, and again confession is made, and all the people shout 'It is a sin.' A third time it is done. Then, still in solemn silence, the calf is let loose. Like the Jewish scapegoat, it may never be used for secular work." At a Badaga funeral witnessed by the Rev. A. C. Clayton the buffalo calf was led thrice round the bier, and the dead man's hand was laid on its head. "By this act, the calf was supposed to receive all the sins of the deceased. It was then driven away to a great distance, that it might contaminate no one, and it was said that it would never be sold, but looked on as a dedicated sacred animal." "The idea of this ceremony is, that the sins of the deceased enter the calf, or that the task of his absolution is laid on it. They say that the calf very soon disappears, and that it is never after heard of." Some of the Todas of the Neilgherry Hills in like manner let loose a calf as a funeral ceremony; the intention may be to transfer the sins of the deceased to the animal. Perhaps the Todas have borrowed the ceremony from the Badagas. In Kumaon, a district of North-Western India, the custom of letting loose a bullock as a scapegoat at a funeral is occasionally observed. A bell is hung on the bullock's neck, and bells are tied to its feet, and the animal is told that it is to be let go in order to save the spirit of the deceased from the torments of hell. Sometimes the bullock's

right quarter is branded with a trident and the left with a discus. Perhaps the original intention of such customs was to banish the contagion of death by means of the animal, which carried it away and so ensured the life of the survivors. The idea of sin is not primitive.

§ 4. The Transference to Men.

Again, men sometimes play the part of scapegoat by diverting to themselves the evils that threaten others. An ancient Hindoo ritual describes how the pangs of thirst may be transferred from a sick man to another. The operator seats the pair on branches, back to back, the sufferer with his face to the east, and the whole man with his face to the west. Then he stirs some gruel in a vessel placed on the patient's head and hands the stir-about to the other man to drink. In this way he transfers the pangs of thirst from the thirsty soul to the other, who obligingly receives them in his stead. There is a painful Telugu remedy for a fever: it is to embrace a bald-headed Brahman widow at the earliest streak of dawn. By doing so you get rid of the fever, and no doubt (though this is not expressly affirmed) you at the same time transfer it to the bald-headed widow. When a Cinghalese is dangerously ill, and the physicians can do nothing, a devil-dancer is called in, who by making offerings to the devils, and dancing in the masks appropriate to them, conjures these demons of disease, one after the other, out of the sick man's body and into his own. Having thus successfully extracted the cause of the malady, the artful dancer lies down on a bier, and shamming death, is carried to an open place outside the village. Here, being left to himself, he soon comes to life again, and hastens back to claim his reward. In 1590 a Scotch witch of the name of Agnes Sampson was convicted of curing a certain Robert Kers of a disease "laid upon him by a westland warlock when he was at Dumfries, whilk sickness she took upon herself, and kept the same with great groaning and torment till the morn, at whilk time there was a great din heard in the house." The noise was made by the witch in her efforts to shift the disease, by means of clothes, from herself to a cat or dog. Unfortunately the attempt partly miscarried. The disease missed the animal and hit Alexander Douglas of Dalkeith, who dwined and died of it, while the original patient, Robert Kers, was made whole. The Dyaks believe that certain men possess in themselves the power of neutralizing bad omens. So, when evil omens have alarmed a farmer for the safety of his crops, he takes a small portion of his farm produce to one of these wise men, who eats it raw for a small consideration, "and thereby appropriates to himself the evil omen, which in him becomes innocuous, and thus delivers the other from the ban of the *pemali* or taboo."

"In one part of New Zealand an expiation for sin was felt to be necessary; a service was performed over an individual, by which all the sins of the tribe were supposed to be transferred to him, a fern stalk was previously tied to his person, with which he jumped into the river, and there unbinding, allowed it to float away to the sea, bearing their sins with it." In great emergencies the sins of the Rajah of Manipur used to be transferred to somebody else, usually to a criminal, who earned his pardon by his vicarious sufferings. To effect the transference the Rajah and his wife, clad in fine robes, bathed on a scaffold erected in the bazaar, while the criminal crouched beneath it. With the water which dripped from them on him their sins also were washed away and fell on the human scapegoat. To complete the transference the Rajah and his wife made over their fine robes to their substitute, while they themselves, clad in new raiment, mixed with the people till evening. But at the close of the day they entered into retreat and remained in seclusion for about a week, during which they were esteemed sacred or tabooed. Further, in Manipur "they have a noteworthy system of keeping count of the years. Each year is named after some man, who—for a consideration—undertakes to bear the fortune good or bad of the year. If the year be good, if there be no pestilence and a good harvest, he gets presents from all sorts of people, and I remember hearing that in 1898, when the cholera was at its worst, a deputation came to the Political

Agent and asked him to punish the name-giver, as it was obvious that he was responsible for the epidemic. In former times he would have got into trouble." The nomination of the eponym, or man who is to give his name to the year, takes place at a festival called *Chirouba*, which falls about the middle of April. It is the priests who nominate the eponym, after comparing his horoscope with that of the Rajah and of the State generally. The retiring official, who gave his name to the past year, addresses his successor as follows: "My friend, I bore and took away all evil spirits and sins from the Rajah and his people during the last year. Do thou likewise from to-morrow until the next *Chirouba*." Then the incoming official, who is to give his name to the New Year, addresses the Rajah in these words: "O son of heaven, Ruler of the Kings, great and ancient Lord, Incarnation of God, the great Lord Pakhangba, Master of the bright Sun, Lord of the Plain and Despot of the Hills, whose kingdom is from the hills on the east to the mountains on the west, the old year perishes, the new cometh. New is the sun of the new year, and bright as the new sun shalt thou be, and mild withal as the moon. May thy beauty and thy strength grow with the growth of the new year. From to-day will I bear on my head all thy sins, diseases, misfortunes, shame, mischief, all that is aimed in battle against thee, all that threatens thee, all that is bad and hurtful for thee and thy kingdom." For these important services the eponym or vicar receives from the Rajah a number of gifts, including a basket of salt, and his grateful country rewards his self-sacrificing devotion by bestowing many privileges on him. Elsewhere, perhaps, if we knew more about the matter, we might find that eponymous magistrates who give their names to the year have been similarly regarded as public scapegoats, who bore on their devoted heads the misfortunes, the sins, and the sorrows of the whole people.

In the *Jataka*, or collection of Indian stories which narrate the many transmigrations of the Buddha, there is an instructive tale, which sets forth how sins and misfortunes can be transferred by means of spittle to a holy ascetic. A lady of easy virtue, we are told, had lost the favour of King Dandaki and bethought herself how she could recover it. As she walked in the park revolving these things in her mind, she spied a devout ascetic named Kisavaccha. A thought struck her. "Surely," said she to herself, "this must be Ill Luck. I will get rid of my sin on his person and then go and bathe." No sooner said than done. Chewing her toothpick, she collected a large clot of spittle in her mouth with which she beslavered the matted locks of the venerable man, and having hurled her toothpick at his head into the bargain she departed with a mind at peace and bathed. The stratagem was entirely successful; for the king took her into his good graces again. Not long after it chanced that the king deposed his domestic chaplain from his office. Naturally chagrined at this loss of royal favour, the clergyman repaired to the king's light o' love and enquired how she had contrived to recapture the monarch's affection. She told him frankly how she had got rid of her sin and emerged without a stain on her character by simply spitting on the head of Ill Luck in the royal park. The chaplain took the hint, and hastening to the park bespattered in like manner the sacred locks of the holy man; and in consequence he was soon reinstated in office. It would have been well if the thing had stopped there, but unfortunately it did not. By and bye it happened that there was a disturbance on the king's frontier, and the king put himself at the head of his army to go forth and fight. An unhappy idea occurred to his domestic chaplain. Elated by the success of the expedient which had restored him to royal favour, he asked the king, "Sire, do you wish for victory or defeat?" "Why for victory, of course," replied the king. "Then you take my advice," said the chaplain; "just go and spit on the head of Ill Luck, who dwells in the royal park; you will thus transfer all your sin to his person." It seemed to the king a capital idea and he improved on it by proposing that the whole army should accompany him and get rid of their sins in like manner. They all did so, beginning with the king, and the state of the holy man's head when they had all done is something frightful to contemplate. But even this was not the worst. For after the king had gone, up came the commander-in-chief

and seeing the sad plight of the pious ascetic, he took pity on him and had his poor bedabbled hair thoroughly washed. The fatal consequences of this kindly-meant but most injudicious shampoo may easily be anticipated. The sins which had been transferred with the saliva to the person of the devotee were now restored to their respective owners; and to punish them for their guilt fire fell from heaven and destroyed the whole kingdom for sixty leagues round about.

A less harmless way of relieving an army from guilt or misfortune used in former times to be actually practised by the Baganda. When an army had returned from war, and the gods warned the king by their oracles that some evil had attached itself to the soldiers, it was customary to pick out a woman slave from the captives, together with a cow, a goat, a fowl, and a dog from the booty, and to send them back under a strong guard to the borders of the country from which they had come. There their limbs were broken and they were left to die; for they were too crippled to crawl back to Uganda. In order to ensure the transference of the evil to these substitutes, bunches of grass were rubbed over the people and cattle and then tied to the victims. After that the army was pronounced clean and was allowed to return to the capital. A similar mode of transferring evil to human and animal victims was practised by the Baganda whenever the gods warned the king that his hereditary foes the Banyoro were working magic against him and his people.

In Travancore, when a rajah is near his end, they seek out a holy Brahman, who consents to take upon himself the sins of the dying man in consideration of the sum of ten thousand rupees. Thus prepared to immolate himself on the altar of duty as a vicarious sacrifice for sin, the saint is introduced into the chamber of death, and closely embraces the dying rajah, saying to him, "O King, I undertake to bear all your sins and diseases. May your Highness live long and reign happily." Having thus, with a noble devotion, taken to himself the sins of the sufferer, and likewise the rupees, he is sent away from the country and never more allowed to return. Closely akin to this is the old Welsh custom known as "sin-eating." According to Aubrey, "In the County of Hereford was an old Custome at funeralls to hire poor people, who were to take upon them all the sinnes of the party deceased. One of them I remember lived in a cottage on Rosse-high way. (He was a long, leane, ugly, lamentable poor raskal.) The manner was that when the Corps was brought out of the house and layd on the Biere; a Loafe of bread was brought out, and delivered to the Sinne-eater over the corps, as also a Mazar-bowle of maple (Gossips bowle) full of beer, which he was to drinke up, and sixpence in money, in consideration whereof he took upon him (ipso facto) all the Sinnes of the Defunct, and freed him (or her) from walking after they were dead.... This Custome (though rarely used in our dayes) yet by some people was observed even in the strictest time of ye Presbyterian government: as at Dynder, volens nolens the Parson of ye Parish, the kinred of a woman deceased there had this ceremonie punctually performed according to her Will: and also the like was donne at ye City of Hereford in these times, when a woman kept many yeares before her death a Mazard-bowle for the Sinne-eater; and the like in other places in this Countie; as also in Brecon, *e.g.* at Llangors, where Mr. Gwin the minister about 1640 could no hinder ye performing of this ancient custome. I believe this custom was heretofore used over all Wales.... In North Wales the Sinne-eaters are frequently made use of; but there, instead of a Bowle of Beere, they have a bowle of Milke." According to a letter dated February 1, 1714-15, "within the memory of our fathers, in Shropshire, in those villages adjoyning to Wales, when a person dyed, there was notice given to an old sire (for so they called him), who presently repaired to the place where the deceased lay, and stood before the door of the house, when some of the family came out and furnished him with a cricket, on which he sat down facing the door. Then they gave him a groat, which he put in his pocket; a crust of bread, which he eat; and a full bowle of ale,

which he drank off at a draught. After this he got up from the cricket and pronounced, with a composed gesture, the ease and rest of the soul departed for which he would pawn his own soul. This I had from the ingenious John Aubrey, Esq." In modern times some doubt has been thrown on Aubrey's account of the custom. The practice, however, is reported to have prevailed in a valley not far from Llandebie to a recent period. An instance was said to have occurred about sixty years ago.

Aubrey's statement is moreover supported by the analogy of similar customs in India. When the Rajah of Tanjore died in 1801, some of his bones and the bones of the two wives, who were burned with his corpse, were ground to powder and eaten, mixed with boiled rice, by twelve Brahmans. It was believed that the sins of the deceased passed into the bodies of the Brahmans, who were paid for the service. A Brahman, resident in a village near Raipur, stated that he had eaten food (rice and milk) out of the hand of the dead Rajah of Bilaspur, and that in consequence he had been placed on the throne for the space of a year. At the end of the year he had been given presents and then turned out of the territory and forbidden apparently to return. He was an outcast among his fellows for having eaten out of a dead man's hand. A similar custom is believed to obtain in the hill states about Kangra, and to have given rise to a caste of "outcaste" Brahmans. At the funeral of a Rani of Chamba rice and ghee were eaten out of the hands of the corpse by a Brahman paid for the purpose. Afterwards a stranger, who had been caught outside the Chamba territory, was given the costly wrappings of the corpse, then told to depart and never shew his face in the country again. In Oude when an infant was killed it used to be buried in the room where it had been born. On the thirteenth day afterwards the priest had to cook and eat his food in that room. By doing so he was supposed to take the whole sin upon himself and to cleanse the family from it. At Utch Kurgan in Turkestan Mr. Schuyler saw an old man who was said to get his living by taking on himself the sins of the dead, and thenceforth devoting his life to prayer for their souls.

In Tahiti, where the bodies of chiefs and persons of rank were embalmed and preserved above ground in special sheds or houses erected for them, a priest was employed at the funeral rites who bore the title of the "corpse-praying priest." His office was singular. When the house for the dead had been prepared, and the corpse placed on the platform or bier, the priest ordered a hole to be made in the floor, near the foot of the platform. Over this he prayed to the god by whom it was supposed that the soul of the deceased had been called away. The purport of his prayer was that all the dead man's sins, especially the one for which his soul had been required of him, might be deposited there, that they might not attach in any degree to the survivors, and that the anger of the god might be appeased. He next addressed the corpse, usually saying, "With you let the guilt now remain." The pillar or post of the corpse, as it was called, was then planted in the hole, and the hole filled up. As soon as the ceremony of depositing the sins in the hole was over, all who had touched the body or the garments of the deceased, which were buried or destroyed, fled precipitately into the sea, to cleanse themselves from the pollution which they had contracted by touching the corpse. They also cast into the sea the garments they had worn while they were performing the last offices to the dead. Having finished their ablutions, they gathered a few pieces of coral from the bottom of the sea, and returning with them to the house addressed the corpse, saying, "With you may the pollution be." So saying they threw down the coral on the top of the hole which had been dug to receive the sins and the defilement of the dead. In this instance the sins of the departed, as well as the pollution which the primitive mind commonly associates with death, are not borne by a living person, but buried in a hole. Yet the fundamental idea—that of the transference of sins—is the same in the Tahitian as in the Welsh and Indian customs; whether the vehicle or receptacle destined to catch and draw off

the evil be a person, an animal, or a thing, is for the purpose in hand a matter of little moment.

§ 5. The Transference of Evil in Europe.

The examples of the transference of evil hitherto adduced have been mostly drawn from the customs of savage or barbarous peoples. But similar attempts to shift the burden of disease, misfortune, and sin from one's self to another person, or to an animal or thing, have been common also among the civilized nations of Europe, both in ancient and modern times. A Roman cure for fever was to pare the patient's nails, and stick the parings with wax on a neighbour's door before sunrise; the fever then passed from the sick man to his neighbour. Similar devices must have been resorted to by the Greeks; for in laying down laws for his ideal state, Plato thinks it too much to expect that men should not be alarmed at finding certain wax figures adhering to their doors or to the tombstones of their parents, or lying at cross-roads. Among the ruins of the great sanctuary of Aesculapius, which were excavated not very long ago in an open valley among the mountains of Epidaurus, inscriptions have been found recording the miraculous cures which the god of healing performed for his faithful worshippers. One of them tells how a certain Pandarus, a Thessalian, was freed from the letters which, as a former slave or prisoner of war, he bore tattooed or branded on his brow. He slept in the sanctuary with a fillet round his head, and in the morning he discovered to his joy that the marks of shame—the blue or scarlet letters—had been transferred from his brow to the fillet. By and by there came to the sanctuary a wicked man, also with brands or tattoo marks on his face, who had been charged by Pandarus to pay his debt of gratitude to the god, and had received the cash for the purpose. But the cunning fellow thought to cheat the god and keep the money all to himself. So when the god appeared to him in a dream and asked anxiously after the money, he boldly denied that he had it, and impudently prayed the god to remove the ugly marks from his own brazen brow. He was told to tie the fillet of Pandarus about his head, then to take it off, and look at his face in the water of the sacred well. He did so, and sure enough he saw on his forehead the marks of Pandarus in addition to his own. In the fourth century of our era Marcellus of Bordeaux prescribed a cure for warts, which has still a great vogue among the superstitious in various parts of Europe. Doubtless it was an old traditional remedy in the fourth, and will long survive the expiry of the twentieth, century. You are to touch your warts with as many little stones as you have warts; then wrap the stones in an ivy leaf, and throw them away in a thoroughfare. Whoever picks them up will get the warts, and you will be rid of them. A similar cure for warts, with such trifling variations as the substitution of peas or barley for pebbles, and a rag or a piece of paper for an ivy leaf, has been prescribed in modern times in Italy, France, Austria, England, and Scotland. Another favourite way of passing on your warts to somebody else is to make as many knots in a string as you have warts; then throw the string away or place it under a stone. Whoever treads on the stone or picks up the thread will get the warts instead of you; sometimes to complete the transference it is thought necessary that he should undo the knots. Or you need only place the knotted thread before sunrise in the spout of a pump; the next person who works the pump will be sure to get your warts. Equally effective methods are to rub the troublesome excrescences with down or fat, or to bleed them on a rag, and then throw away the down, the fat, or the bloody rag. The person who picks up one or other of these things will be sure to release you from your warts by involuntarily transferring them to himself. People in the Orkney Islands will sometimes wash a sick man, and then throw the water down at a gateway, in the belief that the sickness will leave the patient and be transferred to the first person who passes through the gate. A Bavarian cure for fever is to write upon a piece of paper, "Fever, stay away, I am not at home," and to put the paper in somebody's pocket. The latter then catches the fever, and the

patient is rid of it. Or the sufferer may cure himself by sticking a twig of the elder-tree in the ground without speaking. The fever then adheres to the twig, and whoever pulls up the twig will catch the disease. A Bohemian prescription for the same malady is this. Take an empty pot, go with it to a cross-road, throw it down, and run away. The first person who kicks against the pot will catch your fever, and you will be cured. In Oldenburg they say that when a person lies sweating with fever, he should take a piece of money to himself in bed. The money is afterwards thrown away on the street, and whoever picks it up will catch the fever, but the original patient will be rid of it.

Often in Europe, as among savages, an attempt is made to transfer a pain or malady from a man to an animal. Grave writers of antiquity recommended that, if a man be stung by a scorpion, he should sit upon an ass with his face to the tail, or whisper in the animal's ear, "A scorpion has stung me"; in either case, they thought, the pain would be transferred from the man to the ass. Many cures of this sort are recorded by Marcellus. For example, he tells us that the following is a remedy for toothache. Standing booted under the open sky on the ground, you catch a frog by the head, spit into its mouth, ask it to carry away the ache, and then let it go. But the ceremony must be performed on a lucky day and at a lucky hour. In Cheshire the ailment known as aphtha or thrush, which affects the mouth or throat of infants, is not uncommonly treated in much the same manner. A young frog is held for a few moments with its head inside the mouth of the sufferer, whom it is supposed to relieve by taking the malady to itself. "I assure you," said an old woman who had often superintended such a cure, "we used to hear the poor frog whooping and coughing, mortal bad, for days after; it would have made your heart ache to hear the poor creature coughing as it did about the garden." Again Marcellus tells us that if the foam from a mule's mouth, mixed with warm water, be drunk by an asthmatic patient, he will at once recover, but the mule will die. An ancient cure for the gripes, recorded both by Pliny and Marcellus, was to put a live duck to the belly of the sufferer; the pains passed from the man into the bird, to which they proved fatal. According to the same writers a stomachic complaint of which the cause was unknown might be cured by applying a blind puppy to the suffering part for three days. The secret disorder thus passed into the puppy; it died, and a post-mortem examination of its little body revealed the cause of the disease from which the man had suffered and of which the dog had died. Once more, Marcellus advises that when a man was afflicted with a disorder of the intestines the physician should catch a live hare, take the huckle-bone from one of its feet and the down from the belly, then let the hare go, pronouncing as he did so the words, "Run away, run away, little hare, and take away with you the intestine pain." Further, the doctor was to fashion the down into thread, with which he was to tie the huckle-bone to the patient's body, taking great care that the thread should not be touched by any woman. A Northamptonshire, Devonshire, and Welsh cure for a cough is to put a hair of the patient's head between two slices of buttered bread and give the sandwich to a dog. The animal will thereupon catch the cough and the patient will lose it. Sometimes an ailment is transferred to an animal by sharing food with it. Thus in Oldenburg, if you are sick of a fever you set a bowl of sweet milk before a dog and say, "Good luck, you hound! may you be sick and I be sound!" Then when the dog has lapped some of the milk, you take a swig at the bowl; and then the dog must lap again, and then you must swig again; and when you and the dog have done it the third time, he will have the fever and you will be quit of it. A peasant woman in Abbehausen told her pastor that she suffered from fever for a whole year and found no relief. At last somebody advised her to give some of her food to a dog and a cat. She did so and the fever passed from her into the animals. But when she saw the poor sick beasts always before her, she wished it undone. Then the fever left the cat and the dog and returned to her.

A Bohemian cure for fever is to go out into the forest before the sun is up and look for a snipe's nest. When you have found it, take out one of the young birds and keep it beside you for three days. Then go back into the wood and set the snipe free. The fever will leave you at once. The snipe has taken it away. So in Vedic times the Hindoos of old sent consumption away with a blue jay. They said, "O consumption, fly away, fly away with the blue jay! With the wild rush of the storm and the whirlwind, oh, vanish away!" In Oldenburg they sometimes hang up a goldfinch or a turtle-dove in the room of a consumptive patient, hoping that the bird may draw away the malady from the sufferer to itself. A prescription for a cough in Sunderland is to shave the patient's head and hang the hair on a bush. When the birds carry the hair to their nests, they will carry the cough with it. In the Mark of Brandenburg a cure for headache is to tie a thread thrice round your head and then hang it in a loop from a tree; if a bird flies through the loop, it will take your headache away with it. A Saxon remedy for rupture in a child is to take a snail, thrust it at sunset into a hollow tree, and stop up the hole with clay. Then as the snail perishes the child recovers. But this cure must be accompanied by the recitation of a proper form of words; otherwise it has no effect. A Bohemian remedy for jaundice is as follows. Take a living tench, tie it to your bare back and carry it about with you for a whole day. The tench will turn quite yellow and die. Then throw it into running water, and your jaundice will depart with it. In the village of Llandegla in Wales there is a church dedicated to the virgin martyr St. Tecla, where the falling sickness is, or used to be, cured by being transferred to a fowl. The patient first washed his limbs in a sacred well hard by, dropped fourpence into it as an offering, walked thrice round the well, and thrice repeated the Lord's prayer. Then the fowl, which was a cock or a hen according as the patient was a man or a woman, was put into a basket and carried round first the well and afterwards the church. Next the sufferer entered the church and lay down under the communion table till break of day. After that he offered sixpence and departed, leaving the fowl in the church. If the bird died, the sickness was supposed to have been transferred to it from the man or woman, who was now rid of the disorder. As late as 1855 the old parish clerk of the village remembered quite well to have seen the birds staggering about from the effects of the fits which had been transferred to them. In South Glamorgan and West Pembrokeshire it is thought possible to get rid of warts by means of a snail. You take a snail with a black shell, you rub it on each wart and say,

*"Wart, wart, on the snail's shell black,
Go away soon, and never come back."*

Then you put the snail on the branch of a tree or bramble and you nail it down with as many thorns as you have warts. When the snail has rotted away on the bough, your warts will have vanished. Another Welsh cure for warts is to impale a frog on a stick and then to rub the warts on the creature. The warts disappear as the frog expires. In both these cases we may assume that the warts are transferred from the human sufferer to the suffering animal.

Often the sufferer seeks to shift his burden of sickness or ill-luck to some inanimate object. In Athens there is a little chapel of St. John the Baptist built against an ancient column. Fever patients resort thither, and by attaching a waxed thread to the inner side of the column believe that they transfer the fever from themselves to the pillar. In the Mark of Brandenburg they say that if you suffer from giddiness you should strip yourself naked and run thrice round a flax-field after sunset; in that way the flax will get the giddiness and you will be rid of it. Sometimes an attempt is made to transfer the mischief, whatever it may be, to the moon. In Oldenburg a peasant related how he rid himself of a bony excrescence by stroking it thrice crosswise in the name of the Trinity, and then making a gesture as if he were seizing the deformity and hurling it towards the moon. In the same part of Germany a cure for warts is to stand in the light of a waxing moon so that you cannot see your own shadow, then hold the

disfigured hand towards the moon, and stroke it with the other hand in the direction of the luminary. Some say that in doing this you should pronounce these words, "Moon, free me from these vermin."

But perhaps the thing most commonly employed in Europe as a receptacle for sickness and trouble of all sorts is a tree or bush. The modes of transferring the mischief to it are many. For example, the Esthonians say that you ought not to go out of the house on a spring morning before you have eaten or drunk; for if you do, you may chance to hear one of "the sounds which are not heard in winter," such as the song of a bird, and that would be unlucky. They think that if you thus let yourself be deceived or outwitted, as they call it, by a bird, you will be visited by all sorts of ill-luck during the year; indeed it may very well happen that you will fall sick and die before another spring comes round. However, there is a way of averting the evil. You have merely to embrace a tree or go thrice round it, biting into the bark each time or tearing away a strip of the bark with your teeth. Thus the bad luck passes from you to the tree, which accordingly withers away. In Sicily it is believed that all kinds of marvellous cures can be effected on the night which precedes Ascension Day. For example, people who suffer from goitre bite the bark of a peach-tree just at the moment when the clocks are striking midnight. Thus the malady is transferred to the sap of the tree, and its leaves wither away in exact proportion as the patient recovers. But in order that the cure may be successful it is absolutely essential that the bark should be bitten at midnight precisely; a bite before or after that witching hour is labour thrown away. On St. George's Day, South Slavonian lads and lasses climb thrice up and down a cornel-tree, saying, "My laziness and sleepiness to you, cornel-tree, but health and booty (?) to me." Then as they wend homewards they turn once more towards the tree and call out, "Cornel-tree! cornel-tree! I leave you my laziness and sleepiness." The same people attempt to cure fever by transferring it to a dwarf elder-bush. Having found such a bush with three shoots springing from the root, the patient grasps the points of the three shoots in his hand, bends them down to the ground, and fastens them there with a stone. Under the arch thus formed he creeps thrice; then he cuts off or digs up the three shoots, saying, "In three shoots I cut three sicknesses out. When these three shoots grow young again, may the fever come back." A Bulgarian cure for fever is to run thrice round a willow-tree at sunrise, crying, "The fever shall shake thee, and the sun shall warm me." In the Greek island of Karpathos the priest ties a red thread round the neck of a sick person. Next morning the friends of the patient remove the thread and go out to the hillside, where they tie the thread to a tree, thinking that they thus transfer the sickness to the tree. Italians attempt to cure fever in like manner by fastening it to a tree. The sufferer ties a thread round his left wrist at night, and hangs the thread on a tree next morning. The fever is thus believed to be tied up to the tree, and the patient to be rid of it; but he must be careful not to pass by that tree again, otherwise the fever would break loose from its bonds and attack him afresh. An old French remedy for fever was to bind the patient himself to a tree and leave him there for a time; some said that the ceremony should be performed fasting and early in the morning, that the cord or straw rope with which the person was bound to the tree should be left there to rot, and that the sufferer should bite the bark of the tree before returning home. In Bohemia the friends of a fever patient will sometimes carry him head foremost, by means of straw ropes, to a bush, on which they dump him down. Then he must jump up and run home. The friends who carried him also flee, leaving the straw ropes and likewise the fever behind them on the bush.

Sometimes the sickness is transferred to the tree by making a knot in one of its boughs. Thus in Mecklenburg a remedy for fever is to go before sunrise to a willow-tree and tie as many knots in one of its branches as the fever has lasted days; but going and coming you must be careful not to speak a word. A Flemish cure for the ague is to go early in the morning to an

old willow, tie three knots in one of its branches, say, "Good-morrow, Old One, I give thee the cold; good-morrow, Old One," then turn and run away without looking round. In Rhenish Bavaria the cure for gout is similar. The patient recites a spell or prayer while he stands at a willow-bush holding one of its boughs. When the mystic words have been spoken, he ties a knot in the bough and departs cured. But all his life long he must never go near that willow-bush again, or the gout will come back to him. In Sonnenberg, if you would rid yourself of gout you should go to a young fir-tree and tie a knot in one of its twigs, saying, "God greet thee, noble fir. I bring thee my gout. Here will I tie a knot and bind my gout into it. In the name," etc. Not far from Marburg, at a place called Neuhof, there is a wood of birches. Thither on a morning before sunrise, in the last quarter of the moon, bands of gouty people may often be seen hobbling in silence. Each of them takes his stand before a separate tree and pronounces these solemn words: "Here stand I before the judgment bar of God and tie up all my gout. All the disease in my body shall remain tied up in this birch-tree." Meanwhile the good physician ties a knot in a birch-twigg, repeating thrice, "In the name of the Father," etc.

Another way of transferring gout from a man to a tree is this. Pare the nails of the sufferer's fingers and clip some hairs from his legs. Bore a hole in an oak, stuff the nails and hair in the hole, stop up the hole again, and smear it with cow's dung. If, for three months thereafter, the patient is free of gout, you may be sure the oak has it in his stead. A German cure for toothache is to bore a hole in a tree and cram some of the sufferer's hair into it. In these cases, though no doubt the tree suffers the pangs of gout or toothache respectively, it does so with a sort of stoical equanimity, giving no outward and visible sign of the pains that rack it inwardly. It is not always so, however. The tree cannot invariably suppress every symptom of its suffering. It may hide its toothache, but it cannot so easily hide its warts. In Cheshire if you would be rid of warts, you have only to rub them with a piece of bacon, cut a slit in the bark of an ash-tree, and slip the bacon under the bark. Soon the warts will disappear from your hand, only however to reappear in the shape of rough excrescences or knobs on the bark of the tree. Again in Beauce and Perche, two provinces of France, fever may be transferred to a young aspen by inserting the parings of the patient's nails in the tree and then plastering up the hole to prevent the fever from getting out. But the operation must be performed by night. How subject an aspen is to fever must be obvious to the meanest capacity from the trembling of its leaves in every breath of wind; nothing therefore can be easier or more natural than to transfer the malady, with its fits of shaking, to the tree. At Berkhamstead, in Hertfordshire, there used to be certain oak-trees which were long celebrated for the cure of ague. The transference of the malady to the tree was simple but painful. A lock of the sufferer's hair was pegged into an oak; then by a sudden wrench he left his hair and his ague behind him in the tree.

It seems clear that, though you may stow away your pain or sickness in a tree, there is a considerable risk of its coming out again. To obviate this danger common prudence suggests that you should plug or bung up the hole as tight as you can. And this, as we should naturally expect, is often done. A German cure for toothache or headache is to wrap some of the sufferer's cut hair and nails in paper, make a hole in the tree, stuff the parcel into it, and stop up the hole with a plug made from a tree which has been struck by lightning. In Bohemia they say that, if you feel the fever coming on, you should pull out some of your hair, tear off a strip of a garment you are wearing, and bore a hole in a willow-tree. Having done so, you put the hair and the rag in the hole and stop it up with a wedge of hawthorn. Then go home without looking back, and if a voice calls to you, be sure not to answer. When you have complied with this prescription, the fever will cease. In Oldenburg a common remedy for fever is to bore a hole in a tree, breathe thrice into the hole, and then plug it up. Once a man who had thus shut up his fever in a tree was jeered at by a sceptical acquaintance for his

credulity. So he went secretly to the tree and drew the stopper, and out came that fever and attacked the sceptic. Sometimes they say that the tree into which you thus breathe your fever or ague should be a hollow willow, and that in going to the tree you should be careful not to utter a word, and not to cross water. Again, we read of a man who suffered acute pains in his arm. So “they beat up red corals with oaken leaves, and having kept them on the part affected till suppuration, they did in the morning put this mixture into an hole bored with an auger in the root of an oak, respecting the east, and stop up this hole with a peg made of the same tree; from thenceforth the pain did altogether cease, and when they took out the amulet immediately the torments returned sharper than before.” These facts seem to put it beyond the reach of reasonable doubt that the pain or malady is actually in the tree and waiting to pop out, if only it gets the chance.

§ 6. The Nailing of Evils.

Often the patient, without troubling to bore a hole in the tree, merely knocks a wedge, a peg, or a nail into it, believing that he thus pegs or nails the sickness or pain into the wood. Thus a Bohemian cure for fever is to go to a tree and hammer a wedge into it with the words “There, I knock you in, that you may come no more out to me.” A German way of getting rid of toothache is to go in silence before sunrise to a tree, especially a willow-tree, make a slit in the bark on the north side of the tree, or on the side that looks towards the sunrise, cut out a splinter from the place thus laid bare, poke the splinter into the aching tooth till blood comes, then put back the splinter in the tree, fold down the bark over it, and tie a string round the trunk, that the splinter may grow into the trunk as before. As it does so, your pain will vanish; but you must be careful not to go near the tree afterwards, or you will get the toothache again. And any one who pulls the splinter out will also get the toothache. He has in fact uncorked the toothache which was safely bottled up in the tree, and he must take the natural consequence of his rash act. A simpler plan, practised in Persia as well as in France and Germany, is merely to scrape the aching tooth with a nail or a twig till it bleeds, and then hammer the nail or the twig into a tree. In the Vosges, in Voigtland, and probably elsewhere, it is believed that any person who should draw out such a nail or twig would get the toothache. An old lime-tree at Evessen, in Brunswick, is studded with nails of various shapes, including screw-nails, which have been driven into it by persons who suffered from aching teeth. In the Mark of Brandenburg they say that the ceremony should be performed when the moon is on the wane, and that the bloody nail should be knocked, without a word being spoken, into the north side of an oak-tree, where the sun cannot shine on it; after that the person will have no more toothache so long as the tree remains standing. Here it is plainly implied that the toothache is bottled up in the tree. If further proof were needed that in such cases the malady is actually transferred to the tree and stowed away in its trunk, it would be afforded by the belief that if the tree is cut down the toothache will return to the original sufferer. Rupture as well as toothache can be nailed to an oak. For that purpose all that need be done is to take a coffin-nail and touch with it the injured part of the patient; then set the sufferer barefoot before an oak-tree, and knock the nail into the trunk above his head. That transfers the rupture to the tree, and that is why you may often see the boles of ancient oaks studded with nails.

Such remedies are not confined to Europe. At Bilda in Algeria, there is a sacred old olive-tree, in which pilgrims, especially women, knock nails for the purpose of ridding themselves of their ailments and troubles. Again, the Majhwars, a Dravidian tribe in the hill country of South Mirzapur, believe that all disease is due to ghosts, but that ghosts, when they become troublesome, can be shut up in a certain tree, which grows on a little islet in a very deep pool of the Sukandar, a tributary of the Kanhar river. Accordingly, when the country is infested by ghosts, in other words when disease is raging, a skilful wizard seeks for a piece of deer-horn

in the jungle. When he has found it, he hammers it with a stone into the tree and thus shuts up the ghost. The tree is covered with hundreds of such pieces of horn. Again, when a new settlement is being made in some parts of the North-Western Provinces of India, it is deemed necessary to apprehend and lay by the heels the local deities, who might otherwise do a deal of mischief to the intruders on their domain. A sorcerer is called in to do the business. For days he marches about the place mustering the gods to the tuck of drum. When they are all assembled, two men known as the Earthman and the Leafman, who represent the gods of the earth and of the trees respectively, become full of the spirit, being taken possession of bodily by the local deities. In this exalted state they shout and caper about in a fine frenzy, and their seemingly disjointed ejaculations, which are really the divine voice speaking through them, are interpreted by the sorcerer. When the critical moment has come, the wizard rushes in between the two incarnations of divinity, clutches at the spirits which are hovering about them in the air, and pours grains of sesame through their hands into a perforated piece of the wood of the sacred fig-tree. Then without a moment's delay he plasters up the hole with a mixture of clay and cow-dung, and carefully buries the piece of wood on the spot which is to be the shrine of the local deities. Needless to say that the gods themselves are bunged up in the wood and are quite incapable of doing further mischief, provided always that the usual offerings are made to them at the shrine where they live in durance vile. In this case the source of mischief is imprisoned, not in a tree, but in a piece of one; but the principle is clearly the same. Similarly in Corea an English lady observed at a cross-road a small log with several holes like those of a mouse-trap, one of which was plugged up doubly with bungs of wood. She was told that a demon, whose ravages spread sickness in a family, had been inveigled by a sorceress into that hole and securely bunged up. It was thought proper for all passers-by to step over the incarcerated devil, whether to express their scorn and abhorrence of him, or more probably as a means of keeping him forcibly down. In Cochinchina a troublesome ghost can be confined to the grave by the simple process of knocking a nail or thrusting a bar of iron into the earth at the point where the head of the corpse may be presumed to repose.

From knocking the mischief into a tree or a log it is only a step to knocking it into a stone, a door-post, a wall, or such like. At the head of Glen Mor, near Port Charlotte, in Islay, there may be seen a large boulder, and it is said that whoever drives a nail into this stone will thereafter be secure from attacks of toothache. A farmer in Islay told an enquirer some years ago how a passing stranger once cured his grandmother of toothache by driving a horse-nail into the lintel of the kitchen door, warning her at the same time to keep the nail there, and if it should come loose just to tap it with a hammer till it had a grip again. She had no more toothache for the rest of her life. In Brunswick it is open to any one to nail his toothache either into a wall or into a tree, as he thinks fit; the pain is cured quite as well in the one way as in the other. So in Beauce and Perche a healer has been known to place a new nail on the aching tooth of a sufferer and then knock the nail into a door, a beam, or a joist. The procedure in North Africa is similar. You write certain Arabic letters and numbers on the wall; then, while the patient puts a finger on the aching tooth, you knock a nail, with a light tap of a hammer, into the first letter on the wall, reciting a verse of the Coran as you do so. Next you ask the sufferer whether the pain is now abated, and if he says "Yes" you draw out the nail entirely. But if he says "No," you shift the nail to the next letter in the wall, and so on, till the pain goes away, which it always does, sooner or later. A Bohemian who fears he is about to have an attack of fever will snatch up the first thing that comes to hand and nail it to the wall. That keeps the fever from him.

As in Europe we nail toothache or fever to a wall, so in Morocco they nail devils. A house in Mogador having been infested with devils, who threw stones about it in a way that made life

a burden to the inmates, a holy man was called in to exorcise them, which he did effectually by pronouncing an incantation and driving a nail into the wall; at every stroke of the hammer a hissing sound announced that another devil had received his quietus. Among the modern Arabs the soul of a murdered man must be nailed down. Thus if a man be murdered in Egypt, his ghost will rise from the ground where his blood was shed: but it can be prevented from doing so by driving a new nail, which has never been used, into the earth at the spot where the murder was committed. In Tripoli the practice is similar. Some years ago a native was murdered close to the door of a little Italian inn. Immediately the Arabs of the neighbourhood thronged thither and effectually laid the ghost with hammer and nail. When the innkeeper rashly attempted to remove the nail, he was warned that to do so would be to set the ghost free. In modern Egypt numbers of people afflicted with headache used to knock a nail into the great wooden door of the old south gate of Cairo, for the purpose of charming away the pain; others who suffered from toothache used to extract a tooth and insert it in a crevice of the door, or fix it in some other way, in order to be rid of toothache for the future. A holy and miraculous personage, invisible to mortal eyes, was supposed to have one of his stations at this gate. In Mosul also a sheikh can cure headache by first laying his hands on the sufferer's head and then hammering a nail into a wall. Not far from Neuenkirchen, in Oldenburg, there is a farmhouse to which, while the Thirty Years' War was raging, the plague came lounging along from the neighbouring town in the shape of a bluish vapour. Entering the house it popped into a hole in the door-post of one of the rooms. The farmer saw his chance, and quick as thought he seized a peg and hammered it into the hole, so that the plague could not possibly get out. After a time, however, thinking the danger was past, he drew out the peg. Alas! with the peg came creeping and curling out of the hole the blue vapour once more. The plague thus let loose seized on every member of the family in that unhappy house and left not one of them alive. Again, the great plague which devastated the ancient world in the reign of Marcus Antoninus is said to have originated in the curiosity and greed of some Roman soldiers, who, pillaging the city of Seleucia, came upon a narrow hole in a temple and incautiously enlarged the opening in the expectation of discovering treasure. But that which came forth from the hole was not treasure but the plague. It had been pent up in a secret chamber by the magic art of the Chaldeans; but now, released from its prison by the rash act of the spoilers, it stalked abroad and spread death and destruction from the Euphrates to the Nile and the Atlantic.

The simple ceremony, in which to this day the superstition of European peasants sees a sovereign remedy for plague and fever and toothache, has come down to us from a remote antiquity; for in days when as yet Paris and London were not, when France still revered the Druids as the masters of all knowledge, human and divine, and when our own country was still covered with virgin forests, the home of savage beasts and savage men, the same ceremony was solemnly performed from time to time by the highest magistrate at Rome, to stay the ravages of pestilence or retrieve disaster that threatened the foundations of the national life. In the fourth century before our era the city of Rome was desolated by a great plague which raged for three years, carrying off some of the highest dignitaries and a great multitude of common folk. The historian who records the calamity informs us that when a banquet had been offered to the gods in vain, and neither human counsels nor divine help availed to mitigate the violence of the disease, it was resolved for the first time in Roman history to institute dramatical performances as an appropriate means of appeasing the wrath of the celestial powers. Accordingly actors were fetched from Etruria, who danced certain simple and decorous dances to the music of a flute. But even this novel spectacle failed to amuse or touch, to move to tears or laughter the sullen gods. The plague still raged, and at the very moment when the actors were playing their best in the circus beside the Tiber, the yellow river rose in angry flood and drove players and spectators, wading and splashing

through the fast-deepening waters, away from the show. It was clear that the gods spurned plays as well as prayers and banquets; and in the general consternation it was felt that some more effectual measure should be taken to put an end to the scourge. Old men remembered that a plague had once been stayed by the knocking of a nail into a wall; and accordingly the Senate resolved that now in their extremity, when all other means had failed, a supreme magistrate should be appointed for the sole purpose of performing this solemn ceremony. The appointment was made, the nail was knocked, and the plague ceased, sooner or later. What better proof could be given of the saving virtue of a nail?

Twice more within the same century the Roman people had recourse to the same venerable ceremony as a cure for public calamities with which the ordinary remedies, civil and religious, seemed unable to cope. One of these occasions was a pestilence; the other was a strange mortality among the leading men, which public opinion traced, rightly or wrongly, to a series of nefarious crimes perpetrated by noble matrons, who took their husbands off by poison. The crimes, real or imaginary, were set down to frenzy, and nothing could be thought of so likely to minister to minds diseased as the knocking of a nail into a wall. Search among the annals of the city proved that in a season of civil discord, when the state had been rent by party feud, the same time-honoured remedy, the same soothing balm, had been applied with the happiest results to the jarring interests and heated passions of the disputants. Accordingly the old nostrum was tried once more, and again success appeared to justify the experiment.

If the Romans in the fourth century before Christ thus deemed it possible to rid themselves of pestilence, frenzy, and sedition by hammering them into a wall, even as French and German peasants still rid themselves of fever and toothache by knocking them into a tree, their prudent ancestors appear to have determined that so salutary a measure should not be restricted in its scope to meeting special and urgent emergencies as they arose, but should regularly diffuse its benefits over the community by anticipating and, as it were, nipping in the bud evils which, left unchecked, might grow to dangerous proportions. This, we may conjecture, was the original intention of an ancient Roman law which ordained that the highest magistrate of the republic should knock in a nail every year on the thirteenth day of September. The law might be seen, couched in old-fashioned language, engraved on a tablet which was fastened to a wall of the temple of Capitoline Jupiter; and although the place where the nails were driven in is nowhere definitely stated by classical writers, there are some grounds for thinking that it may have been the same wall on which the law that sanctioned the custom was exhibited. Livy tells us that the duty of affixing the nail, at one time discharged by the consuls, was afterwards committed to dictators, whose higher rank consorted better with the dignity and importance of the function. At a later time the custom fell into abeyance, and the ancient ceremony was revived only from time to time in seasons of grave peril or extraordinary calamity, which seemed to attest the displeasure of the gods at modern ways, and disposed men to bethink them of ancestral lore and to walk in the old paths.

In antiquity the annual practice of hammering a nail into a wall was not confined to Rome. It was observed also at Vulsinii, in Etruria, where the nails thus fixed in the temple of the goddess Nortia served as a convenient means of recording and numbering the years. To Roman antiquaries of a later period it seemed, naturally enough, that such a practice had indeed no other object than that of marking the flight of time in ages when writing was but little used. Yet a little reflection will probably convince us that this, though it was doubtless a useful consequence of the custom, can hardly have been its original intention. For it will scarcely be disputed that the annual observance of the custom cannot be wholly dissociated from its occasional observance in seasons of great danger or calamity, and that whatever explanation we give of the one ought to apply to the other also. Now it is plain that if we start

from the annual observance and regard it as no more than a timekeeper or mode of recording the years, we shall never reach an adequate explanation of the occasional observance. If the nails were merely ready reckoners of the years, how could they come to be used as supreme remedies for pestilence, frenzy, and sedition, resorted to by the state in desperate emergencies when all the ordinary resources of policy and religion had failed? On the other hand, if we start from the occasional observance and view it, in accordance with modern analogies, as a rude attempt to dispose of intangible evils as if they were things that could be handled and put away out of sight, we can readily understand how such an attempt, from being made occasionally, might come to be repeated annually for the sake of wiping out all the old troubles and misfortunes of the past year and enabling the community to start afresh, unencumbered by a fardel of ills, at the beginning of a new year. Fortunately we can shew that the analogy which is thus assumed to exist between the Roman custom and modern superstition is not a merely fanciful one; in other words, it can be proved that the Romans, like modern clowns, did believe in the possibility of nailing down trouble, in a literal and physical sense, into a material substance. Pliny tells us that an alleged cure for epilepsy, or the falling sickness, was to drive an iron nail into the ground on the spot which was first struck by the patient's head as he fell. In the light of the modern instances which have come before us, we can hardly doubt that the cure was supposed to consist in actually nailing the disease into the earth in such a way that it could not get up and attack the sufferer again. Precisely parallel is a Suffolk cure for ague. You must go by night alone to a cross-road, and just as the clock strikes the midnight hour you must turn yourself about thrice and drive a tenpenny nail up to the head into the ground. Then walk away backwards from the spot before the clock is done striking twelve, and you will miss the ague; but the next person who passes over the nail will catch the malady in your stead. Here it is plainly assumed that the ague of which the patient is relieved has been left by him nailed down into the earth at the cross-road, and we may fairly suppose that a similar assumption underlay the Roman cure for epilepsy. Further, we seem to be now justified in holding that originally, when a Roman dictator sought to stay a plague, to restore concord, or to terminate an epidemic of madness by knocking a nail into a wall, he was doing for the commonwealth exactly what any private man might do for an epileptic patient by knocking a nail into the ground on the spot where his poor friend had collapsed. In other words, he was hammering the plague, the discord, or the madness into a hole from which it could not get out to afflict the community again.

Different in principle from the foregoing customs appears to be the Loango practice of sticking nails into wooden idols or fetishes. The intention of knocking a nail into a worshipful image is said to be simply to attract the notice of the deity in a forcible manner to the request of his worshipper; it is like pinching a man or running a pin into his leg as a hint that you desire to speak with him. Hence in order to be quite sure of riveting the god's attention the nails are sometimes made red-hot. Even the most absent-minded deity could hardly overlook a petition urged in so importunate a fashion. The practice is resorted to in many emergencies. For example, when a man has been robbed, he will go and get a priest to knock a nail into an idol. The sharp pang naturally exasperates the deity and he seeks to wreak his wrath on the thief, who is the real occasion of his suffering. So when the thief hears of what has been done, he brings back the stolen goods in fear and trembling. Similarly a nail may be knocked into an idol for the purpose of making somebody fall ill; and if a sick man fancies that his illness is due to an enemy who has played him this trick, he will send to the priest of the idol and pay him to remove the nail. This mode of refreshing the memory and stimulating the activity of a supernatural being is not confined to the negroes of Loango; it is practised also by French Catholics, as we learn from Sir John Rhys. "Some years ago," he writes, "when I was on a visit at the late Ernest Renan's house at Rosmapamon, near Perros-Guirec on the north coast of Brittany, our genial host took his friends one day to see some of the sights of

that neighbourhood. Among other things which he showed us was a statue of St. Guirec standing at the head of an open creek. It was of wood, and altogether a very rude work of art, if such it might be called; but what attracted our attention most was the fact that it had innumerable pins stuck into it. We asked M. Renan what the pins meant, and his explanation was exceedingly quaint. He said that when any young woman in the neighbourhood made up her mind that she should marry, she came there and asked the saint to provide her with a husband, and to do so without undue delay. She had every confidence in the willingness and ability of the saint to oblige her, but she was haunted by the fear that he might be otherwise engaged and forget her request. So she would stick pins into him, and thus goad him, as she fancied, to exert himself on her behalf. This is why the saint's statue was full of pins." Similarly in Japan sufferers from toothache sometimes stick needles into a willow-tree, "believing that the pain caused to the tree-spirit will force it to exercise its power to cure."

Thus it would seem that we must distinguish at least two uses of nails or pins in their application to spirits and spiritual influences. In one set of cases the nails act as corks or bungs to bottle up and imprison a troublesome spirit; in the other set of cases they act as spurs or goads to refresh his memory and stimulate his activity. But so far as the evidence which I have cited allows us to judge, the use of nails as spiritual bungs appears to be commoner than their use as mental refreshers.

II. The Omnipresence of Demons

In the foregoing chapter the primitive principle of the transference of ills to another person, animal, or thing was explained and illustrated. A consideration of the means taken, in accordance with this principle, to rid individuals of their troubles and distresses led us to believe that at Rome similar means had been adopted to free the whole community, at a single blow of the hammer, from diverse evils that afflicted it. I now propose to shew that such attempts to dismiss at once the accumulated sorrows of a people are by no means rare or exceptional, but that on the contrary they have been made in many lands, and that from being occasional they tend to become periodic and annual.

It needs some effort on our part to realise the frame of mind which prompts these attempts. Bred in a philosophy which strips nature of personality and reduces it to the unknown cause of an orderly series of impressions on our senses, we find it hard to put ourselves in the place of the savage, to whom the same impressions appear in the guise of spirits or the handiwork of spirits. For ages the army of spirits, once so near, has been receding further and further from us, banished by the magic wand of science from hearth and home, from ruined cell and ivied tower, from haunted glade and lonely mere, from the riven murky cloud that belches forth the lightning, and from those fairer clouds that pillow the silver moon or fret with flakes of burning red the golden eve. The spirits are gone even from their last stronghold in the sky, whose blue arch no longer passes, except with children, for the screen that hides from mortal eyes the glories of the celestial world. Only in poets' dreams or impassioned flights of oratory is it given to catch a glimpse of the last flutter of the standards of the retreating host, to hear the beat of their invisible wings, the sound of their mocking laughter, or the swell of angel music dying away in the distance. Far otherwise is it with the savage. To his imagination the world still teems with those motley beings whom a more sober philosophy has discarded. Fairies and goblins, ghosts and demons, still hover about him both waking and sleeping. They dog his footsteps, dazzle his senses, enter into him, harass and deceive and torment him in a thousand freakish and mischievous ways. The mishaps that befall him, the losses he sustains, the pains he has to endure, he commonly sets down, if not to the magic of his enemies, to the spite or anger or caprice of the spirits. Their constant presence wearies him, their sleepless malignity exasperates him; he longs with an unspeakable longing to be rid of them altogether, and from time to time, driven to bay, his patience utterly exhausted, he turns fiercely on his persecutors and makes a desperate effort to chase the whole pack of them from the land, to clear the air of their swarming multitudes, that he may breathe more freely and go on his way unmolested, at least for a time. Thus it comes about that the endeavour of primitive people to make a clean sweep of all their troubles generally takes the form of a grand hunting out and expulsion of devils or ghosts. They think that if they can only shake off these their accursed tormentors, they will make a fresh start in life, happy and innocent; the tales of Eden and the old poetic golden age will come true again.

Hence, before we review some examples of these spirit-hunts, it may be well to adduce evidence of the deep hold which a belief in the omnipresence and malignity of spirits has upon the primitive mind. The reader will be better able to understand the savage remedy when he has an inkling of the nature of the evil which it is designed to combat. In citing the evidence I shall for the most part reproduce the exact words of my authorities lest I should incur the suspicion of deepening unduly the shadows in a gloomy picture.

Thus in regard to the aborigines of Australia we are told that “the number of supernatural beings, feared if not loved, that they acknowledge is exceedingly great; for not only are the heavens peopled with such, but the whole face of the country swarms with them; every thicket, most watering-places, and all rocky places abound with evil spirits. In like manner, every natural phenomenon is believed to be the work of demons, none of which seem of a benign nature, one and all apparently striving to do all imaginable mischief to the poor blackfellow.” “The negro,” says another writer, “is wont to regard the whole world around him as peopled with invisible beings, to whom he imputes every misfortune that happens to him, and from whose harmful influence he seeks to protect himself by all kinds of magic means.” The Bantu negroes of Western Africa “regard their god as the creator of man, plants, animals, and the earth, and they hold that having made them, he takes no further interest in the affair. But not so the crowd of spirits with which the universe is peopled, they take only too much interest, and the Bantu wishes they would not and is perpetually saying so in his prayers, a large percentage whereof amounts to, ‘Go away, we don’t want you.’ ‘Come not into this house, this village, or its plantations.’” Almost all these subordinate spirits are malevolent. A similar but fuller account of the West African creed is given by a German writer, whose statements apply particularly to the Ewe-speaking negroes of the Slave Coast. He says: “Thus the term fetishism denotes the attitude of the Ewes, or of West African negro tribes in general, towards magic; it forms one of the principal constituents of their religion. The other main constituent is their attitude to the gods, which is properly demonolatry. The Ewe names the gods *drowo*, that is, intermediaries, namely, between a Supreme Being, whom he calls *Mawu* (‘the Unsurpassable’), and mankind. The *drowo* with whom the Ewe has to do, to whom his offerings and his respects are paid, are thus subordinate deities, who according to the etymological meaning of the word *dro* are conceived as judging, composing disputes, and mediating among men. The existence of a Supreme Being is by no means unfamiliar to the Ewe; he has his *Mawu* often in his mouth, especially in talking with the missionary, and he willingly acknowledges that *Mawu* created him and the gods. But he can only conceive of this Supreme Being on the analogy of his own personality and not as omnipresent and so forth. It is impossible that this *Mawu* can trouble himself about details in the creation or even about every individual man and his petty affairs; what would be the use of the many higher and lower spirits with which the world is filled before his eyes? The West African perhaps conceives of God as transcendent, but not as immanent; a creation he possibly apprehends, but not an omnipresent government of the world by the Supreme Being. That government is carried on by *Mawu* at a distance by means of the many spirits or subordinate gods whom he has created for the purpose.... A portion of the gods fills the air, wherefore the forces and the phenomena of nature are deified as their manifestations. The elements are thought to be moved by the gods of the air. In the storm and the wind, in thunder and lightning the Ewe sees the manifestation of particularly powerful gods. In the mysterious roll and roar of the deep sea the Ewe, like the negro in general, beholds the sway of a very mighty god or of a whole host of gods. Further, the earth itself is also the abode of a multitude of spirits or gods, who have in it their sphere of activity. They inhabit certain great mountains, great hollow trees, caves, rivers, and especially woods. In such woods of the gods no timber may be felled. Thus the gods fill not only the air and the sea, they also walk on earth, on all paths; they lurk under the trees, they terrify the lonely wayfarer, they disquiet and plague even the sleeper. When the negro rises from the stool on which he has been sitting, he never fails to turn it upside down, to prevent a spirit from sitting down on it.... The spirit-world falls into two main classes: there are good and kindly spirits, whose help is eagerly sought by offerings; but there are also gloomy and revengeful spirits, whose approach and influence people eagerly endeavour to avert, and against whom all possible means are employed to ban them from the houses and villages. The people are much more zealous in their devotion to the evil spirits

than in their devotion to the good. The reason is that the feeling of fear and the consciousness of guilt are much stronger than the emotions of love and gratitude for benefits received. Hence the worship of the false gods or spirits among this people, and among the West African negro tribes in general, is properly speaking a worship of demons or devils.”

Again, a missionary who spent fifteen years among the Boloki of the Upper Congo River tells us that “the religion of the Boloki has its basis in their fear of those numerous invisible spirits which surround them on every side, and are constantly trying to compass their sickness, misfortune and death; and the Boloki's sole object in practising their religion is to cajole, or appease, cheat, or conquer and kill those spirits that trouble them—hence their *nganga* [medicine-men], their rites, their ceremonies and their charms. If there were no evil spirits to be circumvented there would be no need of their medicine men and their charms.” “The Boloki folk believe they are surrounded by spirits which try to thwart them at every twist and turn, and to harm them every hour of the day and night. The rivers and creeks are crowded with the spirits of their ancestors, and the forests and bush are full also of spirits, ever seeking to injure the living who are overtaken by night when travelling by road or canoe. I never met among them a man daring enough to go at night through the forest that divided Monsembe from the upper villages, even though a large reward was offered. Their invariable reply was: ‘There are too many spirits in the bush and forest.’ ” The spirits which these people dread so much are the *mingoli* or disembodied souls of the dead; the life of the Boloki is described as “one long drawn out fear of what the *mingoli* may next do to them.” These dangerous beings dwell everywhere, land and water are full of them; they are ever ready to pounce on the living and carry them away or to smite them with disease and kill them. Though they are invisible to common eyes, the medicine-man can see them, and can cork them up in calabashes or cover them up with saucepans; indeed, if it is made worth his while, he can even destroy them altogether. Again, of the Bantu tribes of South Africa we read that “nearer than the spirits of deceased chiefs or of their own ancestors was a whole host of hobgoblins, water sprites, and malevolent demons, who met the Bantu turn which way they would. There was no beautiful fairyland for them, for all the beings who haunted the mountains, the plains, and the rivers were ministers of evil. The most feared of these was a large bird that made love to women and incited those who returned its affection to cause the death of those who did not, and a little mischievous imp who was also amorously inclined. Many instances could be gathered from the records of magistrates' courts in recent years of demented women having admitted their acquaintance with these fabulous creatures, as well as of whole communities living in terror of them.” However, it would be no doubt a great mistake to imagine that the minds of the Bantu, or indeed of any savages, are perpetually occupied by a dread of evil spirits; the savage and indeed the civilized man is incapable, at least in his normal state, of such excessive preoccupation with a single idea, which, if prolonged, could hardly fail to end in insanity.

Speaking of the spirits which the Indians of Guiana attribute to all objects in nature, Sir Everard F. im Thurn observes that “the whole world of the Indian swarms with these beings. If by a mighty mental effort we could for a moment revert to a similar mental position, we should find ourselves everywhere surrounded by a host of possibly hurtful beings, so many in number that to describe them as innumerable would fall ridiculously short of the truth. It is not therefore wonderful that the Indian fears to move beyond the light of his camp-fire after dark, or, if he is obliged to do so, carries a fire-brand with him that he may at least see among what enemies he walks; nor is it wonderful that occasionally the air round the settlement seems to the Indian to grow so full of beings, that a peaiman [sorcerer], who is supposed to have the power of temporarily driving them away, is employed to effect a general clearance of these beings, if only for a time. That is the main belief, of the kind that is generally called

religious, of the Indians of Guiana.” The Lengua Indians of the Paraguayan Chaco believe in certain demons which they call *kilyikhama*. “The *kilyikhama* are confined to no particular place. Time and distance do not seem to affect them in the least. They are held in great awe by the Indian, and whithersoever he turns, whether by day or night, but particularly at night, he is subject to their malign influences.... They live in constant dread of these supernatural beings, and if nothing else contributed to make their life miserable, this ever-present dread of the *kilyikhama* would be in itself quite sufficient to rob it of most of its joy.”

Very different from the life of these Indians of the South American forests and prairies is the life of the Esquimaux on the desolate shores of Labrador; yet they too live in like bondage to the evil creatures of their own imagination. “All the affairs of life are supposed to be under the control of spirits, each of which rules over a certain element, and all of which are under the direction of a greater spirit. Each person is supposed to be attended by a special guardian who is malignant in character, ever ready to seize upon the least occasion to work harm upon the individual whom it accompanies. As this is an evil spirit, its good offices and assistance can be obtained by propitiation only. The person strives to keep the good-will of the evil spirit by offerings of food, water, and clothing.” “Besides this class of spirits, there are the spirits of the sea, the land, the sky (for be it understood that the Eskimo know nothing of the air), the winds, the clouds, and everything in nature. Every cove of the sea-shore, every point, island, and prominent rock has its guardian spirit. All are of the malignant type, and to be propitiated only by acceptable offerings from persons who desire to visit the locality where it is supposed to reside. Of course some of the spirits are more powerful than others, and these are more to be dreaded than those able to inflict less harm. These minor spirits are under the control of the great spirit, whose name is Tung ak. This one great spirit is more powerful than all the rest besides. The lesser spirits are immediately under his control and ever ready to obey his command. The shaman (or conjuror) alone is supposed to be able to deal with the Tung ak. While the shaman does not profess to be superior to the Tung ak, he is able to enlist his assistance and thus be able to control all the undertakings his profession may call for. This Tung ak is nothing more or less than death, which ever seeks to torment and harass the lives of people that their spirits may go to dwell with him.”

Brighter at first sight and more pleasing is the mythology of the islanders of the Pacific, as the picture of it is drawn for us by one who seems to have felt the charm of those beliefs which it was his mission to destroy. “By their rude mythology,” he says, “each lovely island was made a sort of fairy-land, and the spells of enchantment were thrown over its varied scenes. The sentiment of the poet that

*‘Millions of spiritual creatures walk the earth,
Unseen, both when we wake, and when we sleep,’*

was one familiar to their minds; and it is impossible not to feel interested in a people who were accustomed to consider themselves surrounded by invisible intelligences, and who recognized in the rising sun—the mild and silver moon—the shooting star—the meteor's transient flame—the ocean's roar—the tempest's blast, or the evening breeze—the movements of mighty spirits. The mountain's summit, and the fleecy mists that hang upon its brows—the rocky defile—the foaming cataract—and the lonely dell—were all regarded as the abode or resort of these invisible beings.” Yet the spiritual powers which compassed the life of the islanders on every side appear to have been far from friendly to man. Speaking of their beliefs touching the souls of the dead, the same writer says that the Polynesians “imagined they lived in a world of spirits, which surrounded them night and day, watching every action of their lives, and ready to avenge the slightest neglect or the least disobedience to their injunctions, as proclaimed by their priests. These dreaded beings were

seldom thought to resort to the habitations of men on errands of benevolence.” The Tahitians, when they were visited by Captain Cook, believed that “sudden deaths and all other accidents are effected by the immediate action of some divinity. If a man only stumble against a stone and hurt his toe, they impute it to an *Eatooa*; so that they may be literally said, agreeably to their system, to tread enchanted ground.” “The Maori gods,” says a well-informed writer, “were demons, whose evil designs could only be counteracted by powerful spells and charms; these proving effectual, sacrifices and offerings were made to soothe the vanquished spirits and appease their wrath.” “The gods in general appeared in the whirlwind and lightning, answering their votaries in the clap of thunder. The inferior beings made themselves visible in the form of lizards, moths, butterflies, spiders, and even flies; when they spoke it was in a low whistling tone. They were supposed to be so numerous as to surround the living in crowds, *kei te muia nga wairua penei nga wairoa*, ‘the spirits throng like mosquitoes,’ ever watching to inflict evil.”

Again, we are informed that the popular religion of the Pelew Islanders “has reference to the gods (*kaliths*) who may be useful or harmful to men in all their doings. Their imagination peoples the sea, the wood, the earth with numerous gods, and whatever a man undertakes, be it to catch fish or fell a tree, he must first propitiate the deities, or rather guard himself against their spiteful anger, which can only be done by means of certain spells and incantations. The knowledge of these incantations is limited to a very few persons, and forms in fact the secret of the arts and industries which are plied in the islands. A master of his craft is not he who can build a good house or a faultless canoe, but he who possesses the *golay* or magic power to ban the tree-gods, that they may not prove hurtful to the workmen and to the people who afterwards use the things. All these gods of the earth, the woods, the mountains, the brooks are very mischievous and dangerous, and most diseases are caused by them. Hence the persons who possess the magic power are dreaded, frequently employed, and well paid; but in extreme cases they are regarded as sorcerers and treated accordingly. If one of them builds a house for somebody and is dissatisfied with his remuneration, he stirs up the tree-god to avenge him. So the inhabitants of the house he has built fall sick, and if help is not forthcoming they die.” Of the Mortlock Islanders we are told that “their imagination peopled the whole of nature with spirits and deities, of whom the number was past finding out.”

Speaking of the natives of the Philippine Islands a writer observes that “the basis of all the superstitious beliefs of the Negritos, what might else be termed their religion, is the constant presence of the spirits of the dead near where they lived when alive. All places are inhabited by the spirits. All adverse circumstances, sickness, failure of crops, unsuccessful hunts, are attributed to them.” As to the Melanesians of New Britain we read that “another deeply rooted belief which exercises an extraordinary influence on the life and customs of these people is a belief in demons. To their thinking the demons, *tambaran* (a word synonymous with ‘poor wretch,’ ‘sufferer’) are spirits entirely perverse, deceitful, maleficent, and ceaselessly occupied in injuring us. Diseases, death, the perturbations of nature, all unfortunate events are imputed to them. The demons exist in legions; they live everywhere, especially in the forests, desert places, and the depths of the sea.” The beliefs and customs of one particular tribe of this great island—the Livuans, who occupy the eastern coast of the Gazelle Peninsula in New Britain—have been described by a Catholic missionary in similar terms. “The distrustful natives,” he tells us, “have not attained to a belief in a beneficent, compassionate deity. All the more numerous, however, are the evil spirits with which they people the universe. These are legion. The power which the natives ascribe to these spirits extends not merely to the property of mankind but also to life and death. The Livuan always believes that he can trace the pernicious influence of these *tambaran* (devils) on his actions. In his conviction, the whole thoughts and endeavours of the evil spirits have no other object

than to injure men in every possible way. This dismal, comfortless superstition weighs heavy on the native.” Again, another writer who lived for thirty years among the Melanesians of the Bismarck Archipelago, of which New Britain forms part, observes that “we often find the view expressed that the native is a being who lives only for the day, without cares of any kind. The view is very erroneous, for in fact he leads a life which is plagued by cares of all sorts. Amongst the greatest plagues of his life is his bottomless superstition. He sees himself surrounded at every step by evil spirits and their influences. He trusts nobody, for who knows whether his nearest neighbour, his professedly best friend, is not plotting to bring trouble, sickness, and even death on him by means of magic? Everywhere he sees snares set for him, everywhere he scents treachery and guile. We need not wonder, therefore, that mistrust is a leading feature in the character not only of the New Britons, but of the Melanesians generally.... The native is simply not accessible to rational motives. The only motive he understands is sorcery on the part of malicious men or the influence of evil spirits.”

A Dutch missionary, who spent twenty-five years among the natives of Dutch New Guinea, tells us that “in their ignorance of a living God the Papuans people earth and air, land and sea with mysterious malignant powers, which take up their abode in stones and trees or in men and cause all kinds of misfortunes, especially sickness and death.” Again, speaking of the Bukaua, a tribe of German New Guinea, a German missionary writes that “the Bukaua knows himself to be surrounded by spirits (*balum*) at every step. An insight into the life and mode of thought of the natives, as the latter is expressed especially in their stories, confirms this view completely. What wonder that the fear of spirits dominates the whole existence of the Bukaua and causes him to tremble even in the hour of death? There are spirits of the beach, the water, the fields, the forests, spirits that reside in the villages and particular places, and a sort of vagabonds, who can take up their abode even in lifeless things.” Then after describing the demons of the beach, the water, and the field, the writer proceeds as follows: “Of forest spirits the number is infinite; for it is above all in the mysterious darkness, the tangled wildernesses of the virgin forest that the spirits love to dwell. They hold their meetings in what are called evil places. They are never bent on good. Especially at nightfall the native fancies he hears the voice of the spirits in the hum and chirping of the insects in the forest. They lure hunting dogs from the trail. They make wild boars rabid; in the form of snakes they make inroads into human dwellings; they drive men crazy or into fits; they play roguish tricks of all sorts.”

Among the tribes who inhabit the south-eastern coasts of New Guinea “a death in a village is the occasion of bringing plenty of ghosts to escort their new companion, and perhaps fetch some one else. All night the friends of the deceased sit up and keep the drums going to drive away the spirits. When I was sleeping one night at Hood Bay, a party of young men and boys came round with sticks, striking the fences and posts of houses all through the village. This I found was always done when any one died, to drive back the spirits to their own quarters on the adjacent mountain tops. But it is the spirits of the inland tribes, the aborigines of the country, that the coast tribes most fear. The road from the interior to Port Moresby passed close to our house, and the natives told us that the barking of our English dog at night had frightened the evil spirits so effectually that they had had no ghostly visitors since we came. I was camping out one night in the bush with some coast natives, at a time when a number of the natives of the interior were hunting in the neighbourhood; noticing that the men with me did not go to sleep, I asked if they were afraid of the mountain men. ‘No,’ they replied, ‘but the whole plain is full of the spirits who come with them.’ All calamities are attributed to the power and malice of these evil spirits. Drought and famine, storm and flood, disease and death are all supposed to be brought by ‘Vata’ and his hosts.”

The inhabitants of Timor, an island to the south-west of New Guinea, revere the lord of heaven, the sun, the mistress of the earth, and the spirits of the dead. "These last dwell, some with the mistress of the earth under ground, others on graves, others in stones and springs and woods, some on mountains and some in the habitations of their kinsfolk, where they take up their abode in the middle of the principal post of the house or in copper cymbals, in swords and pikes. Others again assume the shape of pigs and deer and bees; men who have fallen in battle love especially to turn into bees, that they may roam over the earth at will. The ghosts who reside with the mistress of the earth are male and female, and their offspring swarm by myriads in the air, so that the people think you cannot stir without striking against one of them. According to their whim of the moment the ghosts are good or bad." "All diseases which are not due to infection or transmitted by inheritance are ascribed to the mistress of the earth, to the ghosts, and to their wicked offspring, who inflict them as punishments for insults and injuries, for insufficient food, for the killing of deer and of wild pigs, in which the ghosts take up their abode temporarily, and also for the sale of cymbals, swords and pikes, in which a ghost had settled." The natives of Amboyna think that "woods, mountains, trees, stones, indeed the whole universe, is inhabited by a multitude of spirits, of whom many are the souls of the dead." In Bolang Mongondo, a district of Celebes, "all calamities, great and small, of whatever kind, and by whatever name they are called, that befall men and animals, villages, gardens and so forth, are attributed to evil or angry spirits. The superstition is indescribably great. The smallest wound, the least indisposition, the most trifling adversity in the field, at the fishing, on a journey or what not, is believed by the natives to be traceable to the anger of their ancestors. The superstition cripples every effort to remedy the calamities except by sacrifice. There is perhaps no country the inhabitants of which know so little about simples as Bolang Mongondo. What a native of Bolang Mongondo calls medicine is nothing but sacrifice, magic, and talismans. And the method of curing a sick man always consists in the use of magic, or in the propitiation of angry ancestral spirits by means of offerings, or in the banishment of evil spirits. The application of one or other of these three methods depends again on the decision of the sorcerer, who plays a great part in every case of sickness."

In the island of Bali "all the attention paid to the sick has its root solely in the excessive superstition of these islanders, which leads them to impute every unpleasantness in life, every adversity to the influence of evil spirits or of men who are in some way in league with them. The belief in witches and wizards is everywhere great in the Indies, but perhaps nowhere is it so universal and so strong as in Bali." In Java, we are told, it is not merely great shady trees that are believed to be the abode of spirits. "In other places also, where the vital energy of nature manifests itself strikingly and impressively, a feeling of veneration is stirred, as on the sea-shore, in deep woods, on steep mountain sides. All such spots are supposed to be the abode of spirits of various kinds, whose mighty power is regarded with reverence and awe, whose anger is dreaded, and whose favour is hoped for. But wherever they dwell, whether in scenes of loveliness that move the heart, or in spots that affect the mind with fright and horror, the nature and disposition of these spirits appear not to differ. They are a source of fear and anxiety in the one case just as much as in the other. To none of them did I ever hear moral qualities ascribed. They are mighty, they are potentates, and therefore it is well with him who has their favour and ill with him who has it not; this holds true of them all." "The number of the spirits is innumerable and inconceivable. All the phenomena of nature, which we trace to fixed laws and constant forces, are supposed by the Javanese to be wrought by spirits."

The natives of the valley of the Barito in Borneo hold that "the air is filled with countless *hantoes* (spirits). Every object has such a spirit which watches over it and seeks to defend it from danger. It is these spirits especially that bring sickness and misfortune on men,

and for that reason offerings are often made to them and also to the powerful *Sangsangs* (angels), whereas the supreme God, the original fountain of all good, is neglected." Of the Battas or Bataks of Sumatra we are told that "the key-note of their religious mood is fear of the unknown powers, a childish feeling of dependence, the outcome of a belief in supernatural influences to which man is constantly exposed, in wonders and witchcraft, which hamper his free action. They feel themselves continually surrounded by unseen beings and dependent on them for everything." "Every misfortune bespeaks the ill-will of the hostile spirits. The whole world is a meeting-place of demons, and most of the phenomena of nature are an expression of their power. The only means of remedying or counteracting their baleful influence is to drive away the spirits by means of certain words, as well as by the use of amulets and the offering of sacrifices to the guardian spirits." To the same effect another authority on the religion of the Battas remarks that "the common man has only a very dim and misty notion of his triune god, and troubles himself far more about the legions of spirits which people the whole world around him, and against which he must always be protected by magic spells." Again, speaking of the same people, a Dutch missionary observes that "if there is still any adherent of Rousseau's superficial theories about the idyllically happy and careless life of people 'in a state of nature,' he ought to come and spend a little time among the Bataks and keep his eyes and ears open. He would soon be convinced of the hollowness and falsehood of these phrases and would learn to feel a deep compassion for human beings living in perpetual fear of evil spirits."

The religion of the Nicobar Islanders "is an undisguised animism, and the whole of their very frequent and elaborate ceremonies and festivals are aimed at exorcising and scaring spirits ('devils,' as they have been taught to call them). Fear of spirits and ghosts (*iwi*) is the guide to all ceremonies, and the life of the people is *very* largely taken up with ceremonials and feasts of all kinds. These are usually held at night, and whether directly religious or merely convivial, seem all to have an origin in the overmastering fear of spirits that possesses the Nicobarese. It has so far proved ineradicable, for two centuries of varied and almost continuous missionary effort has had no appreciable effect on it." The Mantras, an aboriginal race of the Malay Peninsula, "find or put a spirit everywhere, in the air they breathe, in the land they cultivate, in the forests they inhabit, in the trees they cut down, in the caves of the rocks. According to them, the demon is the cause of everything that turns out ill. If they are sick, a demon is at the bottom of it; if an accident happens, it is still the spirit who is at work; thereupon the demon takes the name of the particular evil of which he is supposed to be the cause. Hence the demon being assumed as the author of every ill, all their superstitions resolve themselves into enchantments and spells to appease the evil spirit, to render mild and tractable the fiercest beasts." To the mind of the Kamtchatkan every corner of earth and heaven seemed full of spirits, whom he revered and dreaded more than God.

In India from the earliest times down to the present day the real religion of the common folk appears always to have been a belief in a vast multitude of spirits, of whom many, if not most, are mischievous and harmful. As in Europe beneath a superficial layer of Christianity a faith in magic and witchcraft, in ghosts and goblins has always survived and even flourished among the weak and ignorant, so it has been and so it is in the East. Brahmanism, Buddhism, Islam may come and go, but the belief in magic and demons remains unshaken through them all, and, if we may judge of the future from the past, is likely to survive the rise and fall of other historical religions. For the great faiths of the world, just in so far as they are the outcome of superior intelligence, of purer morality, of extraordinary fervour of aspiration after the ideal, fail to touch and move the common man. They make claims upon his intellect and his heart to which neither the one nor the other is capable of responding. The philosophy they teach is too abstract, the morality they inculcate too exalted for him. The keener minds

embrace the new philosophy, the more generous spirits are fired by the new morality; and as the world is led by such men, their faith sooner or later becomes the professed faith of the multitude. Yet with the common herd, who compose the great bulk of every people, the new religion is accepted only in outward show, because it is impressed upon them by their natural leaders whom they cannot choose but follow. They yield a dull assent to it with their lips, but in their heart they never really abandon their old superstitions; in these they cherish a faith such as they cannot repose in the creed which they nominally profess; and to these, in the trials and emergencies of life, they have recourse as to infallible remedies, when the promises of the higher faith have failed them, as indeed such promises are apt to do.

To establish for India in particular the truth of the propositions which I have just advanced, it may be enough to cite the evidence of two writers of high authority, one of whom deals with the most ancient form of Indian religion known to us, while the other describes the popular religion of the Hindoos at the present day. "According to the creed of the Vedic ages," says Professor Oldenberg, "the whole world in which man lives is animated. Sky and earth, mountain, forest, trees and beasts, the earthly water and the heavenly water of the clouds,—all is filled with living spiritual beings, who are either friendly or hostile to mankind. Unseen or embodied in visible form, hosts of spirits surround and hover about human habitations,—bestial or misshapen goblins, souls of dead friends and souls of foes, sometimes as kindly guardians, oftener as mischief-makers, bringing disease and misfortune, sucking the blood and strength of the living. A soul is attributed even to the object fashioned by human hands, whose functions are felt to be friendly or hostile. The warrior pays his devotion to the divine war-chariot, the divine arrow, the drum; the ploughman to the ploughshare; the gambler to the dice; the sacrificer, about whom naturally we have the most exact information, reveres the stone that presses out the juice of the Soma, the straw on which the gods recline, the post to which the sacrificial victim is bound, and the divine doors through which the gods come forth to enjoy the sacrifice. At one time the beings in whose presence man feels himself are regarded by him as really endowed with souls; at another time, in harmony with a more advanced conception of the world, they are imagined as substances or fluids invested with beneficent or maleficent properties: belief oscillates to and fro between the one mode of thought and the other. The art of turning to account the operations of these animated beings, the play of these substances and forces, is magic rather than worship in the proper sense of the word. The foundations of this faith and of this magic are an inheritance from the remotest past, from a period, to put it shortly, of shamanistic faith in spirits and souls, of shamanistic magic. Such a period has been passed through by the forefathers of the Indo-Germanic race as well as by other peoples."

Coming down to the Hindoos of the present day, we find that their attitude towards the spiritual world is described as follows by Professor Monier Williams. "The plain fact undoubtedly is that the great majority of the inhabitants of India are, from the cradle to the burning-ground, victims of a form of mental disease which is best expressed by the term demonophobia. They are haunted and oppressed by a perpetual dread of demons. They are firmly convinced that evil spirits of all kinds, from malignant fiends to merely mischievous imps and elves, are ever on the watch to harm, harass, and torment them, to cause plague, sickness, famine, and disaster, to impede, injure, and mar every good work." Elsewhere the same writer has expressed the same view somewhat more fully. "In fact," he says, "a belief in every kind of demoniacal influence has always been from the earliest times an essential ingredient in Hindu religious thought. The idea probably had its origin in the supposed peopling of the air by spiritual beings—the personifications or companions of storm and tempest. Certainly no one who has ever been brought into close contact with the Hindus in their own country can doubt the fact that the worship of at least ninety per cent. of the people

of India in the present day is a worship of fear. Not that the existence of good deities presided over by one Supreme Being is doubted; but that these deities are believed to be too absolutely good to need propitiation; just as in ancient histories of the Slav races, we are told that they believed in a white god and a black god, but paid adoration to the last alone, having, as they supposed, nothing to apprehend from the beneficence of the first or white deity. The simple truth is that evil of all kinds, difficulties, dangers and disasters, famines, diseases, pestilences and death, are thought by an ordinary Hindu to proceed from demons, or, more properly speaking, from devils, and from devils alone. These malignant beings are held, as we have seen, to possess varying degrees of rank, power, and malevolence. Some aim at destroying the entire world, and threaten the sovereignty of the gods themselves. Some delight in killing men, women, and children, out of a mere thirst for human blood. Some take a mere mischievous pleasure in tormenting, or revel in the infliction of sickness, injury, and misfortune. All make it their business to mar or impede the progress of good works and useful undertakings.”

It would be easy but tedious to illustrate in detail this general account of the dread of demons which prevails among the inhabitants of India at the present day. A very few particular statements must suffice. Thus, we are told that the Oraons, a Dravidian race in Bengal, “acknowledge a Supreme God, adored as Dharmi or Dharmesh, the Holy One, who is manifest in the sun, and they regard Dharmesh as a perfectly pure, beneficent being, who created us and would in his goodness and mercy preserve us, but that his benevolent designs are thwarted by malignant spirits whom mortals must propitiate, as Dharmesh cannot or does not interfere, if the spirit of evil once fastens upon us. It is, therefore, of no use to pray to Dharmesh or to offer sacrifices to him; so though acknowledged, recognised, and revered, he is neglected, whilst the malignant spirits are adored.” Again, it is said of these Oraons that, “as the sole object of their religious ceremonies is the propitiation of the demons who are ever thwarting the benevolent intentions of Dharmesh, they have no notion of a service of thanksgiving.” Once more, after giving a list of Oraon demons, the same writer goes on: “Besides this superstitious dread of the spirits above named, the Oraon's imagination tremblingly wanders in a world of ghosts. Every rock, road, river, and grove is haunted.” Again, a missionary who spent many years among the Kacharis of Assam tells us that “the religion of the Kachári race is distinctly of the type commonly known as ‘animistic’ and its underlying principle is characteristically one of fear or dread. The statement *Timor fecit deos* certainly holds good of this people in its widest and strictest sense; and their religion thus stands in very marked, not to say violent, contrast with the teaching of the Faith in Christ. In the typical Kachári village as a rule neither idol nor place of worship is to be found; but to the Kachári mind and imagination earth, air, and sky are alike peopled with a vast number of invisible spiritual beings, known usually as *Modai*, all possessing powers and faculties far greater than those of man, and almost invariably inclined to use these powers for malignant and malevolent, rather than benevolent, purposes. In a certain stage of moral and spiritual development men are undoubtedly influenced far more by what they fear than by what they love; and this truth certainly applies to the Kachári race in the most unqualified way.” Again, the Siyins, who inhabit the Chin Hills of north-eastern India, on the borders of Burma, “say that there is no Supreme God and no other world save this, which is full of evil spirits who inhabit the fields, infest the houses, and haunt the jungles. These spirits must be propitiated or bribed to refrain from doing the particular harm of which each is capable, for one can destroy crops, another can make women barren, and a third cause a lizard to enter the stomach and devour the bowels.” “Like most mountaineers, the people of Sikhim and the Tibetans are thorough-going demon-worshippers. In every nook, path, big tree, rock, spring, waterfall and lake there lurks a devil; for which reason few individuals will venture out alone after dark. The sky, the ground, the house, the field, the country have each

their special demons, and sickness is always attributed to malign demoniacal influence.” “Even the purest of all the Lamaist sects—the Ge-lug-pa—are thorough-paced devil-worshippers, and value Buddhism chiefly because it gives them the whip-hand over the devils which everywhere vex humanity with disease and disaster, and whose ferocity weighs heavily on all.” The Lushais of Assam believe in a beneficent spirit named Pathian, who made everything but troubles himself very little about men. Far more important in ordinary life are the numerous demons (*huai*), who inhabit every stream, mountain, and forest, and are all malignant. To their agency are ascribed all the illnesses and misfortunes that afflict humanity, and a Lushai's whole life is spent in propitiating them. It is the sorcerer (*puithiam*) who knows what demon is causing any particular trouble, and it is he who can prescribe the sort of sacrifice which will appease the wrath of the fiend. Every form of sickness is set down to the influence of some demon or other, and all the tales about these spiritual foes begin or end with the recurrent phrase, “There was much sickness in our village.” In Travancore “the minor superstitions connected with demon-worship are well-nigh innumerable; they enter into all the feelings, and are associated with the whole life of these people. Every disease, accident, or misfortune is attributed to the agency of the devils, and great caution is exercised to avoid arousing their fury.”

With regard to the inhabitants of Ceylon we are told that “the fiends which they conceive to be hovering around them are without number. Every disease or trouble that assails them is produced by the immediate agency of the demons sent to punish them: while, on the other hand, every blessing or success comes directly from the hands of the beneficent and supreme God. To screen themselves from the power of the inferior deities, who are all represented as wicked spirits, and whose power is by no means irresistible, they wear amulets of various descriptions; and employ a variety of charms and spells to ward off the influence of witchcraft and enchantments by which they think themselves beset on all sides.” “It is probable that, by degrees, intercourse with Europeans will entirely do away these superstitious fears, as the Cinglese of the towns have already made considerable progress in subduing their gloomy apprehensions. Not so the poor wretched peasants who inhabit the more mountainous parts of the country, and live at a distance from our settlements. These unhappy people have never for a moment their minds free from the terror of those demons who seem perpetually to hover around them. Their imaginations are so disturbed by such ideas that it is not uncommon to see many driven to madness from this cause. Several Cinglese lunatics have fallen under my own observation; and upon inquiring into the circumstances which had deprived them of their reason, I universally found that their wretched state was to be traced solely to the excess of their superstitious fears. The spirits of the wicked subordinate demons are the chief objects of fear among the Ceylonese; and impress their minds with much more awe than the more powerful divinities who dispense blessings among them. They indeed think that their country is in a particular manner delivered over to the dominion of evil spirits.”

In Eastern as well as Southern Asia the same view of nature as pervaded by a multitude of spirits, mostly mischievous and malignant, has survived the nominal establishment of a higher faith. “In spite of their long conversion, their sincere belief in, and their pure form of, Buddhism, which expressly repudiates and forbids such worship, the Burmans and Taleins (or Mons) have in a great measure kept their ancient spirit or demon worship. With the Taleins this is more especially the case. Indeed, with the country population of Pegu the worship, or it should rather be said the propitiation, of the ‘nats’ or spirits, enters into every act of their ordinary life, and Buddha's doctrine seems kept for sacred days and their visits to the kyoung (monastery) or to the pagoda.” Or, as another writer puts it, “the propitiating of the nats is a question of daily concern to the lower class Burman, while the worship at the

pagoda is only thought of once a week. For the nat may prove destructive and hostile at any time, whereas the acquisition of *koothoh* [merit] at the pagoda is a thing which may be set about in a business-like way, and at proper and convenient seasons." But the term worship, we are informed, hardly conveys a proper notion of the attitude of the Burmese towards the nats or spirits. "Even the Karens and Kachins, who have no other form of belief, do not regard them otherwise than as malevolent beings who must be looked up to with fear, and propitiated by regular offerings. They do not want to have anything to do with the nats; all they seek is to be let alone. The bamboo pipes of spirit, the bones of sacrificial animals, the hatchets, swords, spears, bows and arrows that line the way to a Kachin village, are placed there not with the idea of attracting the spirits, but of preventing them from coming right among the houses in search of their requirements. If they want to drink, the rice spirit has been poured out, and the bamboo stoup is there in evidence of the libation; the blood-stained skulls of oxen, pigs, and the feathers of fowls show that there has been no stint of meat offerings; should the nats wax quarrelsome, and wish to fight, there are the axes and dahs with which to commence the fray. Only let them be grateful, and leave their trembling worshippers in peace and quietness."

Similarly the Lao or Laosians of Siam, though they are nominally Buddhists, and have monks and pagodas with images of Buddha, are said to pay more respect to spirits or demons than to these idols. "The desire to propitiate the good spirits and to exorcise the bad ones is the prevailing influence upon the life of a Laosian. With *phees* [evil spirits] to right of him, to left of him, in front of him, behind him, all round him, his mind is haunted with a perpetual desire to make terms with them, and to ensure the assistance of the great Buddha, so that he may preserve both body and soul from the hands of the spirits." "Independently of the demons who are in hell, the Siamese recognise another sort of devils diffused in the air: they call them *phi*; these are, they say, the demons who do harm to men and who appear sometimes in horrible shapes. They put down to the account of these malign spirits all the calamities which happen in the world. If a mother has lost a child, it is a *phi* who has done the ill turn; if a sick man is given over, it is a *phi* that is at the bottom of it. To appease him, they invoke him and make him offerings which they hang up in desert places." As to the Thay, a widely spread race of Indo-China, a French missionary writes as follows: "It may be said that the Thay lives in constant intercourse with the invisible world. There is hardly an act of his life which is not regulated by some religious belief. There are two worships, the worship of the spirits and the worship of the dead, which, however, are scarcely distinguishable from each other, since the dead become spirits by the mere fact of their death. His simple imagination represents to him the world of spirits as a sort of double of the state of things here below. At the summit is Po Then, the father of the empyrean. Below him are the Then—Then Bun, Then Kum, Then Kom, of whom the chief is Then Luong, 'the great Then.' The dead go and cultivate his rice-fields in heaven and clear his mountains, just as they did their own in their life on earth. He has to wife a goddess Me Bau. Besides these heavenly spirits, the Thay reckons a multitude of others under the name of *phi*. His science being not very extensive, many things seem extraordinary to him. If he cannot explain a certain natural phenomenon, his perplexity does not last long. It is the work of a *phi*, he says, and his priests take care not to dissuade him. Hence he sees spirits everywhere. There are *phi* on the steep mountains, in the deep woods, the *phi bai* who, by night on the mountain, imitate the rain and the storms and leave no trace of their passage. If they shew themselves, they appear in the form of gigantic animals and cause terrible stomach troubles, such as diarrhoea, dysentery, and so on.... The large animals of the forest, wild oxen and buffaloes, rhinoceroses, elephants, and so on, have their guardian spirits. Hence the prudent hunter learns at the outset to exorcise them in order that, when he has killed these animals, he may be able to cut them up and eat their flesh without having to fear the vengeance of their invisible guardian. Spirits also guard the clearings whither the

deer come by night to drink. The hunter should sacrifice a fowl to them from time to time, if he would bring down his game with ease. The gun itself has a spirit who looks to it that the powder explodes. In short, the Thay cannot take a single step without meeting a spirit on the path." "Thus the life of the Thay seems regulated down to its smallest details by custom founded on his belief in the spirits. Spirits perpetually watch him, ready to punish his negligences, and he is afraid. Fear is not only for him the beginning of wisdom, it is the whole of his wisdom. Love has only a very moderate place in it. Even the respect in which he holds his dead, and the honours which he pays them on various occasions, seem to be dominated by a superstitious fear. It seems that the sacrifices which he offers to them aim rather at averting from himself the evils which he dreads than at honouring worthily the memory of his deceased kinsfolk and at paying them the tribute of his affection and gratitude. Once they sleep their last sleep yonder in the shadow of the great trees of the forest, none goes to shed a tear and murmur a prayer on their grave. Nothing but calamity suffices to rescue them from the oblivion into which they had fallen in the memory of the living."

"The dogma, prevailing in China from the earliest times, that the universe is filled in all its parts with *shen* and *kwei*, naturally implies that devils and demons must also swarm about the homes of men in numbers inestimable. It is, in fact, an axiom which constantly comes out in conversing with the people, that they haunt every frequented and lonely spot, and that no place exists where man is safe from them." "The worship and propitiation of the gods, which is the main part of China's religion, has no higher purpose than that of inducing the gods to protect man against the world of evil, or, by descending among men, to drive spectres away by their intimidating presence. This cult implies invocation of happiness; but as happiness merely means absence of misfortune which the spectres cause, such a cult is tantamount to the disarming of spectres by means of the gods.... Taoism may then actually be defined as Exorcising Polytheism, a cult of the gods with which Eastern Asiatic imagination has filled the universe, connected with a highly developed system of magic, consisting for a great part in exorcism. This cult and magic is, of course, principally in the hands of priests. But, besides, the lay world, enslaved to the intense belief in the perilous omnipresence of spectres, is engaged every day in a restless defensive and offensive war against those beings."

In Corea, "among the reasons which render the shaman a necessity are these. In Korean belief, earth, air, and sea are peopled by demons. They haunt every umbrageous tree, shady ravine, crystal spring, and mountain crest. On green hill-slopes, in peaceful agricultural valleys, in grassy dells, on wooded uplands, by lake and stream, by road and river, in north, south, east, and west, they abound, making malignant sport of human destinies. They are on every roof, ceiling, fireplace, *kang* and beam. They fill the chimney, the shed, the living-room, the kitchen—they are on every shelf and jar. In thousands they waylay the traveller as he leaves his home, beside him, behind him, dancing in front of him, whirring over his head, crying out upon him from earth, air, and water. They are numbered by *thousands of billions*, and it has been well said that their ubiquity is an unholy travesty of the Divine Omnipresence. This belief, and it seems to be the only one he has, keeps the Korean in a perpetual state of nervous apprehension, it surrounds him with indefinite terrors, and it may truly be said of him that he 'passes the time of his sojourning here in fear.' Every Korean home is subject to demons, here, there, and everywhere. They touch the Korean at every point in life, making his well-being depend on a continual series of acts of propitiation, and they avenge every omission with merciless severity, keeping him under this yoke of bondage from birth to death." "Koreans attribute every ill by which they are afflicted to demoniacal influence. Bad luck in any transaction, official malevolence, illness, whether sudden or prolonged, pecuniary misfortune, and loss of power or position, are due to the malignity of demons. It is over such

evils that the *Pan-su* [shaman] is supposed to have power, and to be able to terminate them by magical rites, he being possessed by a powerful demon, whose strength he is able to wield.”

Of the nomadic Koryaks of north-eastern Asia it is said that “all their religious customs have only reference to the evil spirits of the earth. Their religion is thus a cunning diplomacy or negotiation with these spirits in order, as far as possible, to deter them from actions which would be injurious to men. Everywhere, on every mountain, in the sea, by the rivers, in the forest, and on the plains their fancy sees demons lurking, whom they picture to themselves as purely malignant and very greedy. Hence the frequent offerings by which they seek to satisfy the greed of these insatiable beings, and to redeem that which they value and hold dear. Those of the people who are believed to be able to divine most easily the wishes of the evil ones and who enjoy their favour to a certain extent are called shamans, and the religious ceremonies which they perform are shamanism. In every case the shamans must give their advice as to how the devils are to be got rid of, and must reveal the wishes of the demons.” As to these demons of the earth, who infest the Koryaks, we are told that “when visiting the houses to cause diseases and to kill people, they enter from under ground, through the hearth-fire, and return the same way. It happens at times that they steal people, and carry them away. They are invisible to human beings, and are capable of changing their size. They are sometimes so numerous in houses, that they sit on the people, and fill up all corners. With hammers and axes they knock people over their heads, thus causing headaches. They bite, and cause swellings. They shoot invisible arrows, which stick in the body, causing death, if a shaman does not pull them out in time. The *kalau* [demons] tear out pieces of flesh from people, thus causing sores and wounds to form on their bodies.”

The Gilyaks of the Amoor valley in eastern Asia believe that besides the gods “there are evil supernatural beings who do him harm. They are devils, called *mil'k*, *kinr*. These beings appear in the most varied forms and are distinguished according to the degree of their harmfulness. They appear now in the form of a Gilyak, now in the form of an animal, from a bear down to a toad and a lizard. They exist on the land and in the sea, under the earth and in the sky. Some of them form special tribes of treacherous beings whose essential nature it is to be destructive. Others are isolated individuals, ruined beings, ‘lost sons’ of families of beneficent beings, who are exceptional in their hostility to man. The former class are naturally the most dangerous. Some are wholly occupied in robbing the Gilyak on the road (the spirits of loss—*gerniwuch-en*); others empty his barns, his traps, his pitfalls, and so on; lastly there are such also, the most dreadful of all, who lie in wait for his life and bring sickness and death. Were there no such beings, men would not die. A natural death is impossible. Death is the result of the wiles of these treacherous beings.”

In the more westerly parts of the old world the same belief in the omnipresence and mischievous power of spirits has prevailed from antiquity to the present day. If we may judge from the fragments of their literature which have been deciphered, few people seem to have suffered more from the persistent assaults of demons than the ancient Babylonians and Assyrians, and the evil spirits that preyed on them were of a peculiarly cruel and malignant sort; even the gods themselves were not exempt from their attacks. These baleful beings lurked in solitary places, in graves, in the shadow of ruins and on the tops of mountains. They dwelt in the wilderness, in the holes and dens of the earth, they issued from the lower parts of the ground. Nothing could resist them in heaven above, nothing could withstand them on earth below. They roamed the streets, they leaped from house to house. The high and thick fences they penetrated like a flood, the door could not stay them, nor the bolt make them turn back. They glided through the door like a serpent, they pierced through the planks like the wind. There was no place, however small, which they could not invade, none so large that they could not fill. And their wickedness was equal to their power. “They are wicked, they

are wicked,” says an incantation. No prayers could move them, no supplications could make them relent; for they knew no pity, they hearkened not to reason, they knew no truth. To them all manner of evil was ascribed. Their presence was felt not only in the terrible winds that swept the land, in the fevers bred of the marshes, and in the diseases engendered by the damp heat of summer. All the petty annoyances of life—a sudden fall, an unlucky word, a headache, a paltry quarrel—were set down to the agency of fiends; and all the fierce emotions that rend the mind—love, hate, jealousy, and madness—were equally the work of these invisible tormentors. Men and women stood in constant danger of them. They tore the wife from the bosom of her husband, the son from the knees of his father. They ate the flesh and drank the blood of men, they prevented them from sleeping or taking food, and to adopt a metaphor from one of the texts, “they ground the country like flour.” Almost every part of the human frame was menaced by a special fiend. One demon assailed the head, another the neck, another the hips, and so on. They bound a man's hands, they fettered his feet, they spat poison and gall on him. Day and night must he wander without rest; sighs and lamentations were his food. They attacked even the animals. They drove doves from their dovecotes, and swallows from their nests; they smote the bull and the ass. They pursued the cattle to their stalls: they lodged with the horses in the stable: they caused the she-ass to miscarry, and the young ass at its mother's dugs to pine away. Even lifeless things could be possessed by them; for there were demons that rushed against houses and took walls by storm, that shut themselves up in doors, and hid themselves under bolts. Indeed they threatened the whole world with destruction, and there was none that could deliver from them save only the mighty god Marduk.

In the opinion of the ancient Egyptians “there were good spirits as well as bad, but the *Book of the Dead* practically ignores the former, and its magical formulae were directed entirely against the operations of evil spirits. Though naturally of a gay and light-hearted disposition, the Egyptian must have lived in a perpetual state of fear of spirits of all kinds, spirits of calamity, disease, and sickness, spirits of angry gods and ancestors, and above all the spirit of Death. His imagination filled the world with spirits, whose acts seemed to him to be generally malevolent, and his magical and religious literature and his amulets testify to the very real terror with which he regarded his future existence in the world of spirits. Escape from such spirits was impossible, for they could not die.” In modern Egypt the jinn, a class of spiritual beings intermediate between angels and men, are believed to pervade the solid matter of the earth as well as the firmament, and they inhabit rivers, ruined houses, wells, baths, ovens, and so forth. So thickly do they swarm that in pouring water or other liquids on the ground an Egyptian will commonly exclaim or mutter “*Destoor!*” thereby asking the permission or craving the pardon of any jinn who might chance to be there, and who might otherwise resent being suddenly soused with water or unsavoury fluids. So too when people light a fire, let down a bucket into a well, or perform other necessary functions, they will say “Permission!” or “Permission, ye blessed!” Again, in Egypt it is not considered proper to sweep out a house at night, lest in doing so you should knock against a jinnee, who might avenge the insult.

The earliest of the Greek philosophers, Thales, held that the world is full of gods or spirits; and the same primitive creed was expounded by one of the latest pagan thinkers of antiquity. Porphyry declared that demons appeared in the likeness of animals, that every house and every body was full of them, and that forms of ceremonial purification, such as beating the air and so forth, had no other object but that of driving away the importunate swarms of these invisible but dangerous beings. He explained that evil spirits delighted in food, especially in blood and impurities, that they settled like flies on us at meals, and that they could only be kept at a distance by ceremonial observances, which were directed, not to

pleasing the gods, but simply and solely to beating off devils. His theory of religious purification seems faithfully to reflect the creed of the savage on this subject, but a philosopher is perhaps the last person whom we should expect to find acting as a mirror of savagery. It is less surprising to meet with the same venerable doctrine, the same world-wide superstition in the mouth of a mediaeval abbot; for we know that a belief in devils has the authority of the founder of Christianity and is sanctioned by the teaching of the church. No Esquimau on the frozen shores of Labrador, no Indian in the sweltering forests of Guiana, no cowering Hindoo in the jungles of Bengal, could well have a more constant and abiding sense of the presence of malignant demons everywhere about him than had Abbot Richalm, who ruled over the Cistercian monastery of Schönthal in the first half of the thirteenth century. In the curious work to which he gave the name of *Revelations*, he set forth how he was daily and hourly infested by devils, whom, though he could not see, he heard, and to whom he imputed all the ailments of his flesh and all the frailties of his spirit. If he felt squeamish, he was sure that the feeling was wrought in him by demoniacal agency. If puckers appeared on his nose, if his lower lip drooped, the devils had again to answer for it; a cough, a cold in the head, a hawking and spitting, could have none but a supernatural and devilish origin. If, pacing in his orchard on a sunny autumn morning, the portly abbot stooped to pick up the mellow fruit that had fallen in the night, the blood that mounted to his purple face was sent coursing thither by his invisible foes. If the abbot tossed on his sleepless couch, while the moonlight, streaming in at the window, cast the shadows of the stanchions like black bars on the floor of his cell, it was not the fleas and so forth that kept him awake—oh no! “Vermin,” said he sagely, “do not really bite”; they seem to bite indeed, but it is all the work of devils. If a monk snored in the dormitory, the unseemly noise proceeded not from him, but from a demon lurking in his person. Especially dangerous were the demons of intoxication. These subtle fiends commonly lodged at the taverns in the neighbouring town, but on feast days they were apt to slip through the monastery gates and glide unseen among the monks seated at the refectory table, or gathered round the roaring fire on the hearth, while the bleak wind whistled in the abbey towers, and a more generous vintage than usual glowed and sparkled in the flagons. If at such times a jolly, rosy-faced brother appeared to the carnal eye and ear to grow obstreperous or maudlin, to speak thick or to reel and stagger in his gait, be sure it was not the fiery spirit of the grape that moved the holy man; it was a spirit of quite a different order. Holding such views on the source of all bodily and mental indisposition, it was natural enough that the abbot should prescribe remedies which are not to be found in the pharmacopœia, and which would be asked for in vain at an apothecary's. They consisted chiefly of holy water and the sign of the cross; this last he recommended particularly as a specific for flea-bites.

It is easy to suggest that the abbot's wits were unsettled, that he suffered from hallucinations, and so forth. This may have been so; yet a mode of thought like his seems to be too common over a great part of the world to allow us to attribute it purely to mental derangement. In the Middle Ages, when the general level of knowledge was low, a state of mind like Richalm's may have been shared by multitudes even of educated people, who have not, however, like him, left a monument of their folly to posterity. At the present day, through the advance and spread of knowledge, it might be difficult to find any person of acknowledged sanity holding the abbot's opinions on the subject of demons; but in remote parts of Europe a little research might shew that the creed of Porphyry and Richalm is still held, with but little variation, by the mass of the people. Thus we are told that the Roumanians of Transylvania “believe themselves to be surrounded on all sides by whole legions of evil spirits. These devils are furthermore assisted by *ismejus* (another sort of dragon), witches, and goblins, and to each of these dangerous beings are ascribed particular powers on particular days and at certain places. Many and curious are therefore the means by which the Roumanians endeavour to counteract these baleful influences; and a whole complicated study, about as laborious as the mastering

of an unknown language, is required in order to teach an unfortunate peasant to steer clear of the dangers by which he supposes himself to be beset on all sides.”

Similar beliefs are held to this day by the Armenians, who, though they are not a European people, have basked in the light of Christianity from a time when Central and Northern Europe was still plunged in heathen darkness. All the activities, we are told, of these professing Christians “are paralyzed after sunset, because at every step they quake with fear, believing that the evil demons are everywhere present in the air, in the water, on the earth. By day the evil ones are under the earth, therefore boiling hot water may not be poured on the ground, because it sinks into the earth and burns the feet of the children of the evil spirits. But in the evening the superstitious Armenian will pour no water at all on the earth, because the evil ones are everywhere present on the earth. Some of them are walking about, others are sitting at table and feasting, so that they might be disturbed by the pouring out of water, and they would take vengeance for it. Also by night you should not smite the ground with a stick, nor sweep out the house, nor remove the dung from the stable, because without knowing it you might hit the evil spirits. But if you are compelled to sweep by night, you sing the tip of the broom so as to frighten the evil ones away in time. You must not go out at night bareheaded, for the evil ones would smite you on the head. It is also dangerous to drink water out of a vessel in the dark, especially when the water is drawn from a brook or river; for the evil ones in the water hit out, or they pass with the water into a man. Therefore in drinking you should hold a knife with three blades or a piece of iron in the water. The baleful influence of the nocturnal demons extends also to useful objects; hence after sunset people do not lend salt or fire and do not shake out the tablecloth, because thereby the salt would lose its savour and the welfare of the house would depart.”

III. The Public Expulsion of Evils

§ 1. The Occasional Expulsion of Evils.

We can now understand why those general clearances of evil, to which from time to time the savage resorts, should commonly take the form of a forcible expulsion of devils. In these evil spirits primitive man sees the cause of many if not of most of his troubles, and he fancies that if he can only deliver himself from them, things will go better with him. The public attempts to expel the accumulated ills of a whole community may be divided into two classes, according as the expelled evils are immaterial and invisible or are embodied in a material vehicle or scapegoat. The former may be called the direct or immediate expulsion of evils; the latter the indirect or mediate expulsion, or the expulsion by scapegoat. We begin with examples of the former.

In the island of Rook, between New Guinea and New Britain, when any misfortune has happened, all the people run together, scream, curse, howl, and beat the air with sticks to drive away the devil (*Marsába*), who is supposed to be the author of the mishap. From the spot where the mishap took place they drive him step by step to the sea, and on reaching the shore they redouble their shouts and blows in order to expel him from the island. He generally retires to the sea or to the island of Lottin. The natives of New Britain ascribe sickness, drought, the failure of crops, and in short all misfortunes, to the influence of wicked spirits. So at times when many people sicken and die, as at the beginning of the rainy season, all the inhabitants of a district, armed with branches and clubs, go out by moonlight to the fields, where they beat and stamp on the ground with wild howls till morning, believing that this drives away the devils; and for the same purpose they rush through the village with burning torches. The natives of New Caledonia are said to believe that all evils are caused by a powerful and malignant spirit; hence in order to rid themselves of him they will from time to time dig a great pit, round which the whole tribe gathers. After cursing the demon, they fill up the pit with earth, and trample on the top with loud shouts. This they call burying the evil spirit. Among the Dieri tribe of Central Australia, when a serious illness occurs, the medicine-men expel Cootchie or the devil by beating the ground in and outside of the camp with the stuffed tail of a kangaroo, until they have chased the demon away to some distance from the camp. In some South African tribes it is a general rule that no common man may meddle with spirits, whether good or bad, except to offer the customary sacrifices. Demons may haunt him and make his life a burden to him, but he must submit to their machinations until the matter is taken up by the proper authorities. A baboon may be sent by evil spirits and perch on a tree within gunshot, or regale itself in his maize-field; but to fire at the beast would be worse than suicide. So long as a man remains a solitary sufferer, he has little chance of redress. It is supposed that he has committed some crime, and that the ancestors in their wrath have sent a demon to torment him. But should his neighbours also suffer; should the baboon from choice or necessity (for men do sometimes pluck up courage to scare the brutes) select a fresh field for its depredations, or the roof of another man's barn for its perch, the case begins to wear a different complexion. The magicians now deal with the matter seriously. One man may be haunted for his sins by a demon, but a whole community infested by devils is another matter. To shoot the baboon, however, would be useless; it would merely enrage the demon and increase the danger. The first thing to do is to ascertain the permanent abode of the devil. It is generally a deep pool with overhanging banks and dark recesses. There the villagers assemble with the priests and magicians at their head, and set about pelting the demon with stones, men, women, and children all joining in the assault, while

they load the object of their fear and hate with the foulest abuse. Drums too are beaten, and horns blown at intervals, and when everybody has been worked up to such a frenzy of excitement that some even fancy they see the imp dodging the missiles, he suddenly takes to flight, and the village is rid of him for a time. After that, the crops may be protected and baboons killed with impunity.

When a village has been visited by a series of disasters or a severe epidemic, the inhabitants of Minahassa in Celebes lay the blame upon the devils who are infesting the village and who must be expelled from it. Accordingly, early one morning all the people, men, women, and children, quit their homes, carrying their household goods with them, and take up their quarters in temporary huts which have been erected outside the village. Here they spend several days, offering sacrifices and preparing for the final ceremony. At last the men, some wearing masks, others with their faces blackened, and so on, but all armed with swords, guns, pikes, or brooms, steal cautiously and silently back to the deserted village. Then, at a signal from the priest, they rush furiously up and down the streets and into and under the houses (which are raised on piles above the ground), yelling and striking on walls, doors, and windows, to drive away the devils. Next, the priests and the rest of the people come with the holy fire and march nine times round each house and thrice round the ladder that leads up to it, carrying the fire with them. Then they take the fire into the kitchen, where it must burn for three days continuously. The devils are now driven away, and great and general is the joy. The Alfoors of Halmahera attribute epidemics to the devil who comes from other villages to carry them off. So, in order to rid the village of the disease, the sorcerer drives away the devil. From all the villagers he receives a costly garment and places it on four vessels, which he takes to the forest and leaves at the spot where the devil is supposed to be. Then with mocking words he bids the demon abandon the place. In the Kei Islands to the south-west of New Guinea, the evil spirits, who are quite distinct from the souls of the dead, form a mighty host. Almost every tree and every cave is the lodging-place of one of these fiends, who are moreover extremely irascible and apt to fly out on the smallest provocation. To speak loudly in passing their abode, to ease nature near a haunted tree or cave, is enough to bring down their wrath on the offender, and he must either appease them by an offering or burn the scrapings of a buffalo's horn or the hair of a Papuan slave, in order that the smell may drive the foul fiends away. The spirits manifest their displeasure by sending sickness and other calamities. Hence in times of public misfortune, as when an epidemic is raging, and all other remedies have failed, the whole population go forth with the priest at their head to a place at some distance from the village. Here at sunset they erect a couple of poles with a cross-bar between them, to which they attach bags of rice, wooden models of pivot-guns, gongs, bracelets, and so on. Then, when everybody has taken his place at the poles and a death-like silence reigns, the priest lifts up his voice and addresses the spirits in their own language as follows: "Ho! ho! ho! ye evil spirits who dwell in the trees, ye evil spirits who live in the grottoes, ye evil spirits who lodge in the earth, we give you these pivot-guns, these gongs, etc. Let the sickness cease and not so many people die of it." Then everybody runs home as fast as their legs can carry them.

In the island of Nias, when a man is seriously ill and other remedies have been tried in vain, the sorcerer proceeds to exorcise the devil who is causing the illness. A pole is set up in front of the house, and from the top of the pole a rope of palm-leaves is stretched to the roof of the house. Then the sorcerer mounts the roof with a pig, which he kills and allows to roll from the roof to the ground. The devil, anxious to get the pig, lets himself down hastily from the roof by the rope of palm-leaves, and a good spirit, invoked by the sorcerer, prevents him from climbing up again. If this remedy fails, it is believed that other devils must still be lurking in the house. So a general hunt is made after them. All the doors and windows in the house are

closed, except a single dormer-window in the roof. The men, shut up in the house, hew and slash with their swords right and left to the clash of gongs and the rub-a-dub of drums. Terrified at this onslaught, the devils escape by the dormer-window, and sliding down the rope of palm-leaves take themselves off. As all the doors and windows, except the one in the roof, are shut, the devils cannot get into the house again. In the case of an epidemic, the proceedings are similar. All the gates of the village, except one, are closed; every voice is raised, every gong and drum beaten, every sword brandished. Thus the devils are driven out and the last gate is shut behind them. For eight days thereafter the village is in a state of siege, no one being allowed to enter it.

The means adopted in Nias to exclude an epidemic from a village which has not yet been infected by it are somewhat similar; but as they exhibit an interesting combination of religious ritual with the purely magical ceremony of exorcism, it may be worth while to describe them. When it is known that a village is suffering from the ravages of a dangerous malady, the other villages in the neighbourhood take what they regard as effective measures for securing immunity from the disease. Some of these measures commend themselves to us as rational and others do not. In the first place, quarantine is established in each village, not only against the inhabitants of the infected village, but against all strangers; no person from outside is allowed to enter. In the second place, a feast is made by the people for one of their idols who goes by the name of *Fangeroe wōchō*, or Protector from sickness. All the people of the village must participate in the sacrifice and bear a share of the cost. The principal idol, crowned with palm-leaves, is set up in front of the chief's house, and all the inhabitants who can do so gather about it. The names of those who cannot attend are mentioned, apparently as a substitute for their attendance in person. While the priest is reciting the spells for the banishment of the evil spirits, all persons present come forward and touch the image. A pig is then killed and its flesh furnishes a common meal. The mouth of the idol is smeared with the bloody heart of the pig, and a dishful of the cooked pork is set before him. Of the flesh thus consecrated to the idol none but priests and chiefs may partake. Idols called *daha*, or branches of the principal idol, are also set up in front of all the other houses in the village. Moreover, bogies made of black wood with white eyes, to which the broken crockery of the inhabitants has freely contributed, are placed at the entrances of the village to scare the demon and prevent him from entering. All sorts of objects whitened with chalk are also hung up in front of the houses to keep the devil out. When eight days have elapsed, it is thought that the sacrifice has taken effect, and the priest puts an end to the quarantine. All boys and men now assemble for the purpose of expelling the evil spirit. Led by the priest, they march four times, with a prodigious noise and uproar, from one end of the village to the other, slashing the air with their knives and stabbing it with their spears to frighten the devil away. If all these efforts prove vain, and the dreaded sickness breaks out, the people think it must be because they have departed from the ways of their fathers by raising the price of victuals and pigs too high or by enriching themselves with unjust gain. Accordingly a new idol is made and set up in front of the chief's house; and while the priest engages in prayer, the chief and the magnates of the village touch the image, vowing as they do so to return to the old ways and cursing all such as may refuse their consent or violate the new law thus solemnly enacted. Then all present betake themselves to the river and erect another idol on the bank. In presence of this latter idol the weights and measures are compared, and any that exceed the lawful standard are at once reduced to it. When this has been done, they rock the image to and fro to signify, or perhaps rather to ensure, thereby that he who does not keep the new law shall suffer misfortune, or fall sick, or be thwarted in some way or other. Then a pig is killed and eaten on the bank of the river. The feast being over, each family contributes a certain sum in token that they make restitution of their unlawful gains. The money thus collected is tied in a bundle, and the priest holds the bundle up towards the sky and down towards the earth to

satisfy the god of the upper and the god of the nether world that justice has now been done. After that he either flings the bag of money into the river or buries it in the ground beside the idol. In the latter case the money naturally disappears, and the people explain its disappearance by saying that the evil spirit has come and fetched it. A method like that which at the present day the people of Nias adopt for the sake of conjuring the demon of disease was employed in antiquity by the Caunians of Asia Minor to banish certain foreign gods whom they had imprudently established in their country. All the men of military age assembled under arms, and with spear-thrusts in the air drove the strange gods step by step from the land and across the boundaries.

The Solomon Islanders of Bougainville Straits believe that epidemics are always, or nearly always, caused by evil spirits; and accordingly when the people of a village have been suffering generally from colds, they have been known to blow conch-shells, beat tins, shout, and knock on the houses for the purpose of expelling the demons and so curing their colds. When cholera has broken out in a Burmese village the able-bodied men scramble on the roofs and lay about them with bamboos and billets of wood, while all the rest of the population, old and young, stand below and thump drums, blow trumpets, yell, scream, beat floors, walls, tin pans, everything to make a din. This uproar, repeated on three successive nights, is thought to be very effective in driving away the cholera demons. The Shans of Kengtung, a province of Upper Burma, imagine that epidemics are brought about by the prowling ghosts of wicked men, such as thieves and murderers, who cannot rest but go about doing all the harm they can to the living. Hence when sickness is rife, the people take steps to expel these dangerous spirits. The Buddhist priests exert themselves actively in the beneficent enterprise. They assemble in a body at the Town Court and read the scriptures. Guns are fired and processions march to the city gates, by which the fiends are supposed to take their departure. There small trays of food are left for them, but the larger offerings are deposited in the middle of the town. When smallpox first appeared amongst the Kumis of South-Eastern India, they thought it was a devil come from Aracan. The villages were placed in a state of siege, no one being allowed to leave or enter them. A monkey was killed by being dashed on the ground, and its body was hung at the village gate. Its blood, mixed with small river pebbles, was sprinkled on the houses, the threshold of every house was swept with the monkey's tail, and the fiend was adjured to depart. During the hot summer cholera is endemic in Southern China, and from time to time, when the mortality is great, vigorous attempts are made to expel the demons who do all the mischief. For this salutary purpose processions parade the streets by night; images of the gods are borne in them, torches waved, gongs beaten, guns fired, crackers popped, swords brandished, demon-dispelling trumpets blown, and priests in full canonicals trot up and down jingling hand-bells, winding blasts on buffalo horns, and reciting exorcisms. Sometimes the deities are represented in these processions by living men, who are believed to be possessed by the divine spirit. Such a man-god may be seen naked to the waist with his dishevelled hair streaming down his back; long daggers are stuck in his cheeks and arms, so that the blood drips from them. In his hand he carries a two-edged sword, with which he deals doughty blows at the invisible foes in the air; but sometimes he inflicts bloody wounds on his own back with the weapon or with a ball which is studded with long sharp nails. Other inspired men are carried in armchairs, of which the seat, back, arms, and foot-rest are set with nails or composed of rows of parallel sword-blades, that cut into the flesh of the wretches seated on them: others are stretched at full length on beds of nails. For hours these bleeding votaries are carried about the city. Again, it is not uncommon to see in the procession a medium or man-god with a thick needle thrust through his tongue. His bloody spittle drips on sheets of paper, which the crowd eagerly scrambles for, knowing that with the blood they have absorbed the devil-dispelling power inherent in the man-god. The bloody papers, pasted on the lintel, walls, or beds of a house or

on the bodies of the family, are supposed to afford complete protection against cholera. Such are the methods by which in Southern China the demons of disease are banished the city.

In Japan the old-fashioned method of staying an epidemic is to expel the demon of the plague from every house into which he has entered. The treatment begins with the house in which the malady has appeared in the mildest form. First of all a Shinto priest makes a preliminary visit to the sick-room and extracts from the demon a promise that he will depart with him at his next visit. The day after he comes again, and, seating himself near the patient, beseeches the evil spirit to come away with him. Meanwhile red rice, which is used only on special occasions, has been placed at the sufferer's head, a closed litter made of pine boughs has been brought in, and four men equipped with flags or weapons have taken post in the four corners of the room to prevent the demon from seeking refuge there. All are silent but the priest. The prayer being over, the sick man's pillow is hastily thrown into the litter, and the priest cries, "All right now!" At that the bearers double with it into the street, the people within and without beat the air with swords, sticks, or anything that comes to hand, while others assist in the cure by banging away at drums and gongs. A procession is now formed in which only men take part, some of them carrying banners, others provided with a drum, a bell, a flute, a horn, and all of them wearing fillets and horns of twisted straw to keep the demon away from themselves. As the procession starts an old man chants, "What god are you bearing away?" To which the others respond in chorus, "The god of the pest we are bearing away!" Then to the music of the drum, the bell, the flute, and the horn the litter is borne through the streets. During its passage all the people in the town who are not taking part in the ceremony remain indoors, every house along the route of the procession is carefully closed, and at the cross-roads swordsmen are stationed, who guard the street by hewing the air to right and left with their blades, lest the demon should escape by that way. The litter is thus carried to a retired spot between two towns and left there, while all who escorted it thither run away. Only the priest remains behind for half an hour to complete the exorcism and the cure. The bearers of the litter spend the night praying in a temple. Next day they return home, but not until they have plunged into a cold bath in the open air to prevent the demon from following them. The same litter serves to convey the evil spirit from every house in the town. In Corea, when a patient is recovering from the smallpox, a farewell dinner is given in honour of the departing spirit of the disease. Friends and relations are invited, and the spirit's share of the good things is packed on the back of a hobby-horse and despatched to the boundary of the town or village, while respectful farewells are spoken and hearty good wishes uttered for his prosperous journey to his own place. In Tonquin also a banquet is sometimes given to the demon of sickness to induce him to go quietly away from the house. The most honourable place at the festive board is reserved for the fiend; prayers, caresses, and presents are lavished on him; but if he proves obdurate, they assail him with coarse abuse and drive him from the house with musket-shots.

When an epidemic is raging on the Gold Coast of West Africa, the people will sometimes turn out, armed with clubs and torches, to drive the evil spirits away. At a given signal the whole population begin with frightful yells to beat in every corner of the houses, then rush like mad into the streets waving torches and striking frantically in the empty air. The uproar goes on till somebody reports that the cowed and daunted demons have made good their escape by a gate of the town or village; the people stream out after them, pursue them for some distance into the forest, and warn them never to return. The expulsion of the devils is followed by a general massacre of all the cocks in the village or town, lest by their unseasonable crowing they should betray to the banished demons the direction they must take to return to their old homes. For in that country the forest grows so thick or the grass so high that you can seldom see a village till you are close upon it; and the first warning of your

approach to human habitations is the crowing of the cocks. At Great Bassam, in Guinea, the French traveller Hecquard witnessed the exorcism of the evil spirit who was believed to make women barren. The women who wished to become mothers offered to the fetish wine-vessels or statuettes representing women suckling children. Then being assembled in the fetish hut, they were sprinkled with rum by the priest, while young men fired guns and brandished swords to drive away the demon. When smallpox breaks out in a village of the Cameroons, in West Africa, the spirit of the disease is driven out of the village by a "bushman" or member of the oppressed Bassa tribe, the members of which are reputed to possess high magical powers. The mode of expulsion consists in drumming and dancing for several days. Then the village is enclosed by ropes made of creepers in order that the disease may not return. Over the principal paths arches of bent poles are made, and fowls are buried as sacrifices. Plants of various sorts and the mushroom-shaped nests of termite ants are hung from the arches, and a dog, freshly killed, is suspended over the middle of the entrance. The Gallas try to drive away fever by firing guns, shouting, and lighting great fires. When sickness was prevalent in a Huron village, and all other remedies had been tried in vain, the Indians had recourse to the ceremony called *Lonouyroya*, "which is the principal invention and most proper means, so they say, to expel from the town or village the devils and evil spirits which cause, induce, and import all the maladies and infirmities which they suffer in body and mind." Accordingly, one evening the men would begin to rush like madmen about the village, breaking and upsetting whatever they came across in the wigwams. They threw fire and burning brands about the streets, and all night long they ran howling and singing without cessation. Then they all dreamed of something, a knife, dog, skin, or whatever it might be, and when morning came they went from wigwam to wigwam asking for presents. These they received silently, till the particular thing was given them which they had dreamed about. On receiving it they uttered a cry of joy and rushed from the hut, amid the congratulations of all present. The health of those who received what they had dreamed of was believed to be assured; whereas those who did not get what they had set their hearts upon regarded their fate as sealed.

Sometimes, instead of chasing the demon of disease from their homes, savages prefer to leave him in peaceable possession, while they themselves take to flight and attempt to prevent him from following in their tracks. Thus when the Patagonians were attacked by smallpox, which they attributed to the machinations of an evil spirit, they used to abandon their sick and flee, slashing the air with their weapons and throwing water about in order to keep off the dreadful pursuer; and when after several days' march they reached a place where they hoped to be beyond his reach, they used by way of precaution to plant all their cutting weapons with the sharp edges turned towards the quarter from which they had come, as if they were repelling a charge of cavalry. Similarly, when the Lules or Tonocotes Indians of the Gran Chaco were attacked by an epidemic, they regularly sought to evade it by flight, but in so doing they always followed a sinuous, not a straight, course; because they said that when the disease made after them he would be so exhausted by the turnings and windings of the route that he would never be able to come up with them. When the Indians of New Mexico were decimated by smallpox or other infectious disease, they used to shift their quarters every day, retreating into the most sequestered parts of the mountains and choosing the thorniest thickets they could find, in the hope that the smallpox would be too afraid of scratching himself on the thorns to follow them. When some Chins on a visit to Rangoon were attacked by cholera, they went about with drawn swords to scare away the demon, and they spent the day hiding under bushes so that he might not be able to find them.

§ 2. The Periodic Expulsion of Evils.

The expulsion of evils, from being occasional, tends to become periodic. It comes to be thought desirable to have a general riddance of evil spirits at fixed times, usually once a year,

in order that the people may make a fresh start in life, freed from all the malignant influences which have been long accumulating about them. Some of the Australian blacks annually expelled the ghosts of the dead from their territory. The ceremony was witnessed by the Rev. W. Ridley on the banks of the River Barwan. "A chorus of twenty, old and young, were singing and beating time with boomerangs.... Suddenly, from under a sheet of bark darted a man with his body whitened by pipeclay, his head and face coloured with lines of red and yellow, and a tuft of feathers fixed by means of a stick two feet above the crown of his head. He stood twenty minutes perfectly still, gazing upwards. An aboriginal who stood by told me he was looking for the ghosts of dead men. At last he began to move very slowly, and soon rushed to and fro at full speed, flourishing a branch as if to drive away some foes invisible to us. When I thought this pantomime must be almost over, ten more, similarly adorned, suddenly appeared from behind the trees, and the whole party joined in a brisk conflict with their mysterious assailants.... At last, after some rapid evolutions in which they put forth all their strength, they rested from the exciting toil which they had kept up all night and for some hours after sunrise; they seemed satisfied that the ghosts were driven away for twelve months. They were performing the same ceremony at every station along the river, and I am told it is an annual custom."

Certain seasons of the year mark themselves naturally out as appropriate moments for a general expulsion of devils. Such a moment occurs towards the close of an Arctic winter, when the sun reappears on the horizon after an absence of weeks or months. Accordingly, at Point Barrow, the most northerly extremity of Alaska, and nearly of America, the Esquimaux choose the moment of the sun's reappearance to hunt the mischievous spirit *Tuña* from every house. The ceremony was witnessed by the members of the United States Polar Expedition, who wintered at Point Barrow. A fire was built in front of the council-house, and an old woman was posted at the entrance to every house. The men gathered round the council-house, while the young women and girls drove the spirits out of every house with their knives, stabbing viciously under the bunk and deer-skins, and calling upon *Tuña* to be gone. When they thought he had been driven out of every hole and corner, they thrust him down through the hole in the floor and chased him into the open air with loud cries and frantic gestures. Meanwhile the old woman at the entrance of the house made passes with a long knife in the air to keep him from returning. Each party drove the spirit towards the fire and invited him to go into it. All were by this time drawn up in a semicircle round the fire, when several of the leading men made specific charges against the spirit; and each after his speech brushed his clothes violently, calling on the spirit to leave him and go into the fire. Two men now stepped forward with rifles loaded with blank cartridges, while a third brought a vessel of urine and flung it on the flames. At the same time one of the men fired a shot into the fire; and as the cloud of steam rose it received the other shot, which was supposed to finish *Tuña* for the time being.

In late autumn, when storms rage over the land and break the icy fetters by which the frozen sea is as yet but slightly bound, when the loosened floes are driven against each other and break with loud crashes, and when the cakes of ice are piled in wild disorder one upon another, the Esquimaux of Baffin Land fancy they hear the voices of the spirits who people the mischief-laden air. Then the ghosts of the dead knock wildly at the huts, which they cannot enter, and woe to the hapless wight whom they catch; he soon sickens and dies. Then the phantom of a huge hairless dog pursues the real dogs, which expire in convulsions and cramps at sight of him. All the countless spirits of evil are abroad, striving to bring sickness and death, foul weather and failure in hunting on the Esquimaux. Most dreaded of all these spectral visitants are *Sedna*, mistress of the nether world, and her father, to whose share dead Esquimaux fall. While the other spirits fill the air and the water, she rises from under ground.

It is then a busy season for the wizards. In every house you may hear them singing and praying, while they conjure the spirits, seated in a mystic gloom at the back of the hut, which is dimly lit by a lamp burning low. The hardest task of all is to drive away Sedna, and this is reserved for the most powerful enchanter. A rope is coiled on the floor of a large hut in such a way as to leave a small opening at the top, which represents the breathing hole of a seal. Two enchanters stand beside it, one of them grasping a spear as if he were watching a seal-hole in winter, the other holding the harpoon-line. A third sorcerer sits at the back of the hut chanting a magic song to lure Sedna to the spot. Now she is heard approaching under the floor of the hut, breathing heavily; now she emerges at the hole; now she is harpooned and sinks away in angry haste, dragging the harpoon with her, while the two men hold on to the line with all their might. The struggle is severe, but at last by a desperate wrench she tears herself away and returns to her dwelling in Adlivun. When the harpoon is drawn up out of the hole it is found to be splashed with blood, which the enchanters proudly exhibit as a proof of their prowess. Thus Sedna and the other evil spirits are at last driven away, and next day a great festival is celebrated by old and young in honour of the event. But they must still be cautious, for the wounded Sedna is furious and will seize any one she may find outside of his hut; so they all wear amulets on the top of their hoods to protect themselves against her. These amulets consist of pieces of the first garments that they wore after birth.

The Koryaks of the Taigonos Peninsula, in north-eastern Asia, celebrate annually a festival after the winter solstice. Rich men invite all their neighbours to the festival, offer a sacrifice to "The-One-on-High," and slaughter many reindeer for their guests. If there is a shaman present he goes all round the interior of the house, beating the drum and driving away the demons (*kalau*). He searches all the people in the house, and if he finds a demon's arrow sticking in the body of one of them, he pulls it out, though naturally the arrow is invisible to common eyes. In this way he protects them against disease and death. If there is no shaman present, the demons may be expelled by the host or by a woman skilled in incantations.

The Iroquois inaugurated the new year in January, February, or March (the time varied) with a "festival of dreams" like that which the Hurons observed on special occasions. The whole ceremonies lasted several days, or even weeks, and formed a kind of saturnalia. Men and women, variously disguised, went from wigwam to wigwam smashing and throwing down whatever they came across. It was a time of general license; the people were supposed to be out of their senses, and therefore not to be responsible for what they did. Accordingly, many seized the opportunity of paying off old scores by belabouring obnoxious persons, drenching them with ice-cold water, and covering them with filth or hot ashes. Others seized burning brands or coals and flung them at the heads of the first persons they met. The only way of escaping from these persecutors was to guess what they had dreamed of. On one day of the festival the ceremony of driving away evil spirits from the village took place. Men clothed in the skins of wild beasts, their faces covered with hideous masks, and their hands with the shell of the tortoise, went from hut to hut making frightful noises; in every hut they took the fuel from the fire and scattered the embers and ashes about the floor with their hands. The general confession of sins which preceded the festival was probably a preparation for the public expulsion of evil influences; it was a way of stripping the people of their moral burdens, that these might be collected and cast out. This New Year festival is still celebrated by some of the heathen Iroquois, though it has been shorn of its former turbulence. A conspicuous feature in the ceremony is now the sacrifice of the White Dog, but this appears to have been added to the festival in comparatively modern times, and does not figure in the oldest descriptions of the ceremonies. We shall return to it later on. A great annual festival of the Cherokee Indians was the Propitiation, "Cementation," or Purification festival. "It was celebrated shortly after the first new moon of autumn, and consisted of a multiplicity of

rigorous rites, fastings, ablutions, and purifications. Among the most important functionaries on the occasion were seven exorcisers or cleansers, whose duty it was, at a certain stage of the proceedings, to drive away evil and purify the town. Each one bore in his hand a white rod of sycamore. 'The leader, followed by the others, walked around the national heptagon, and coming to the treasure or store-house to the west of it, they lashed the eaves of the roofs with their rods. The leader then went to another house, followed by the others, singing, and repeated the same ceremony until every house was purified.' This ceremony was repeated daily during the continuance of the festival. In performing their ablutions they went into the water, and allowed their old clothes to be carried away by the stream, by which means they supposed their impurities removed."

In September the Incas of Peru celebrated a festival called Situa, the object of which was to banish from the capital and its vicinity all disease and trouble. The festival fell in September because the rains begin about this time, and with the first rains there was generally much sickness. And the melancholy begotten by the inclemency of the weather and the sickliness of the season may well have been heightened by the sternness of a landscape which at all times is fitted to oppress the mind with a sense of desolation and gloom. For Cuzco, the capital of the Incas and the scene of the ceremony, lies in a high upland valley, bare and treeless, shut in on every side by the most arid and forbidding mountains. As a preparation for the festival the people fasted on the first day of the moon after the autumnal equinox. Having fasted during the day, and the night being come, they baked a coarse paste of maize. This paste was made of two sorts. One was kneaded with the blood of children aged from five to ten years, the blood being obtained by bleeding the children between the eyebrows. These two kinds of paste were baked separately, because they were for different uses. Each family assembled at the house of the eldest brother to celebrate the feast; and those who had no elder brother went to the house of their next relation of greater age. On the same night all who had fasted during the day washed their bodies, and taking a little of the blood-kneaded paste, rubbed it over their head, face, breast, shoulders, arms, and legs. They did this in order that the paste might take away all their infirmities. After this the head of the family anointed the threshold with the same paste, and left it there as a token that the inmates of the house had performed their ablutions and cleansed their bodies. Meantime the High Priest performed the same ceremonies in the temple of the Sun. As soon as the Sun rose, all the people worshipped and besought him to drive all evils out of the city, and then they broke their fast with the paste that had been kneaded without blood. When they had paid their worship and broken their fast, which they did at a stated hour, in order that all might adore the Sun as one man, an Inca of the blood royal came forth from the fortress, as a messenger of the Sun, richly dressed, with his mantle girded round his body, and a lance in his hand. The lance was decked with feathers of many hues, extending from the blade to the socket, and fastened with rings of gold. He ran down the hill from the fortress brandishing his lance, till he reached the centre of the great square, where stood the golden urn, like a fountain, that was used for the sacrifice of the fermented juice of the maize. Here four other Incas of the blood royal awaited him, each with a lance in his hand, and his mantle girded up to run. The messenger touched their four lances with his lance, and told them that the Sun bade them, as his messengers, drive the evils out of the city. The four Incas then separated and ran down the four royal roads which led out of the city to the four quarters of the world. While they ran, all the people, great and small, came to the doors of their houses, and with great shouts of joy and gladness shook their clothes, as if they were shaking off dust, while they cried, "Let the evils be gone. How greatly desired has this festival been by us. O Creator of all things, permit us to reach another year, that we may see another feast like this." After they had shaken their clothes, they passed their hands over their heads, faces, arms, and legs, as if in the act of washing. All this was done to drive the evils out of their houses, that the messengers of the Sun might banish them from the city; and

it was done not only in the streets through which the Incas ran, but generally in all quarters of the city. Moreover, they all danced, the Inca himself amongst them, and bathed in the rivers and fountains, saying that their maladies would come out of them. Then they took great torches of straw, bound round with cords. These they lighted, and passed from one to the other, striking each other with them, and saying, "Let all harm go away." Meanwhile the runners ran with their lances for a quarter of a league outside the city, where they found four other Incas ready, who received the lances from their hands and ran with them. Thus the lances were carried by relays of runners for a distance of five or six leagues, at the end of which the runners washed themselves and their weapons in rivers, and set up the lances, in sign of a boundary within which the banished evils might not return.

The negroes of Guinea annually banish the devil from all their towns with much ceremony at a time set apart for the purpose. At Axim, on the Gold Coast, this annual expulsion is preceded by a feast of eight days, during which mirth and jollity, skipping, dancing, and singing prevail, and "a perfect lampooning liberty is allowed, and scandal so highly exalted, that they may freely sing of all the faults, villanies, and frauds of their superiors as well as inferiors, without punishment, or so much as the least interruption." On the eighth day they hunt out the devil with a dismal cry, running after him and pelting him with sticks, stones, and whatever comes to hand. When they have driven him far enough out of the town, they all return. In this way he is expelled from more than a hundred towns at the same time. To make sure that he does not return to their houses, the women wash and scour all their wooden and earthen vessels, "to free them from all uncleanness and the devil." A later writer tells us that "on the Gold Coast there are stated occasions, when the people turn out *en masse* (generally at night) with clubs and torches to drive away the evil spirits from their towns. At a given signal, the whole community start up, commence a most hideous howling, beat about in every nook and corner of their dwellings, then rush into the streets, with their torches and clubs, like so many frantic maniacs, beat the air, and scream at the top of their voices, until some one announces the departure of the spirits through some gate of the town, when they are pursued several miles into the woods, and warned not to come back. After this the people breathe easier, sleep more quietly, have better health, and the town is once more cheered by an abundance of food."

The ceremony as it is practised at Gatto, in Benin, has been described by an English traveller. He says: "It was about this time that I witnessed a strange ceremony, peculiar to this people, called the time of the 'grand devils.' Eight men were dressed in a most curious manner, having a dress made of bamboo about their bodies, and a cap on the head, of various colours and ornamented with red feathers taken from the parrot's tail; round the legs were twisted strings of shells, which made a clattering noise as they walked, and the face and hands of each individual were covered with a net. These strange beings go about the town, by day and by night, for the term of one month, uttering the most discordant and frightful noises; no one durst venture out at night for fear of being killed or seriously maltreated by these fellows, who are then especially engaged in driving the evil spirits from the town. They go round to all the chief's houses, and in addition to the noise they make, perform some extraordinary feats in tumbling and gymnastics, for which they receive a few cowries."

At Cape Coast Castle, on the Gold Coast, the ceremony was witnessed on the ninth of October 1844 by an Englishman, who has described it as follows: "To-night the annual custom of driving the evil spirit, Abonsam, out of the town has taken place. As soon as the eight o'clock gun fired in the fort the people began firing muskets in their houses, turning all their furniture out of doors, beating about in every corner of the rooms with sticks, etc., and screaming as loudly as possible, in order to frighten the devil. Being driven out of the houses, as they imagine, they sallied forth into the streets, throwing lighted torches about, shouting,

screaming, beating sticks together, rattling old pans, making the most horrid noise, in order to drive him out of the town into the sea. The custom is preceded by four weeks' dead silence; no gun is allowed to be fired, no drum to be beaten, no palaver to be made between man and man. If, during these weeks, two natives should disagree and make a noise in the town, they are immediately taken before the king and fined heavily. If a dog or pig, sheep or goat be found at large in the street, it may be killed, or taken by anyone, the former owner not being allowed to demand any compensation. This silence is designed to deceive Abonsam, that, being off his guard, he may be taken by surprise, and frightened out of the place. If anyone die during the silence, his relatives are not allowed to weep until the four weeks have been completed."

At Onitsha, on the Niger, Mr. J. C. Taylor witnessed the celebration of New Year's Day by the negroes. It fell on the twentieth of December 1858. Every family brought a firebrand out into the street, threw it away, and exclaimed as they returned, "The gods of the new year! New Year has come round again." Mr. Taylor adds, "The meaning of the custom seems to be that the fire is to drive away the old year with its sorrows and evils, and to embrace the new year with hearty reception." Of all Abyssinian festivals that of Mascal or the Cross is celebrated with the greatest pomp. During the whole of the interval between St. John's day and the feast a desultory warfare is waged betwixt the youth of opposite sexes in the towns. They all sally out in the evenings, the boys armed with nettles or thistles and the girls with gourds containing a filthy solution of all sorts of abominations. When any of the hostile parties meet, they begin by reviling each other in the foulest language, from which they proceed to personal violence, the boys stinging the girls with their nettles, while the girls discharge their stink-pots in the faces of their adversaries. These hostilities may perhaps be regarded as a preparation for the festival of the Cross. The eve of the festival witnesses a ceremony which doubtless belongs to the world-wide class of customs we are dealing with. At sunset a discharge of firearms takes place from all the principal houses. "Then every one provides himself with a torch, and during the early part of the night bonfires are kindled, and the people parade the town, carrying their lighted torches in their hands. They go through their houses, too, poking a light into every dark corner in the hall, under the couches, in the stables, kitchen, etc., as if looking for something lost, and calling out, 'Akho, akhoky! turn out the spinage, and bring in the porridge; Mascal is come!' ... After this they play, and poke fun and torches at each other." Next morning, while it is still dark, bonfires are kindled on the heights near the towns, and people rise early to see them. The rising sun of Mascal finds the whole population of Abyssinia awake.

Sometimes the date of the annual expulsion of devils is fixed with reference to the agricultural seasons. Thus at Kiriwina, in South-Eastern New Guinea, when the new yams had been harvested, the people feasted and danced for many days, and a great deal of property, such as armlets, native money, and so forth, was displayed conspicuously on a platform erected for the purpose. When the festivities were over, all the people gathered together and expelled the spirits from the village by shouting, beating the posts of the houses, and overturning everything under which a wily spirit might be supposed to lurk. The explanation which the people gave to a missionary was that they had entertained and feasted the spirits and provided them with riches, and it was now time for them to take their departure. Had they not seen the dances, and heard the songs, and gorged themselves on the souls of the yams, and appropriated the souls of the money and all the other fine things set out on the platform? What more could the spirits want? So out they must go. Among the Hos of Togoland in West Africa the expulsion of evils is performed annually before the people eat the new yams. The chiefs meet together and summon the priests and magicians. They tell them that the people are now to eat the new yams and to be merry, therefore they must

cleans the town and remove the evils. For that purpose they take leaves of the *adzu* and *wo* trees, together with creepers and ashes. The leaves and creepers they bind fast to a pole of an *adzu* tree, while they pray that the evil spirits, the witches, and all the ills in the town may pass into the bundle and be bound. Then they make a paste out of the ashes and smear it on the bundle, saying, "We smear it on the face of all the evil ones who are in this bundle, in order that they may not be able to see." With that they throw the bundle, that is, the pole wrapt in leaves and creepers, on the ground and they all mock at it. Then they prepare a medicine and take the various leaf-wrapt poles, into which they have conjured and bound up all mischief, carry them out of the town, and set them up in the earth on various roads leading into the town. When they have done this, they say that they have banished the evils from the town and shut the door in their face. With the medicine, which the elders have prepared, all men, women, children and chiefs wash their faces. After that everybody goes home to sweep out his house and homestead. The ground in front of the homesteads is also swept, so that the town is thoroughly cleansed. All the stalks of grass and refuse of stock yams that have been swept together they cast out of the town, and they rail at the stock yams. In the course of the night the elders assemble and bind a toad to a young palm-leaf. They say that they will now sweep out the town and end the ceremony. For that purpose they drag the toad through the whole town in the direction of Mount Adaklu. When that has been done, the priests say that they will now remove the sicknesses. In the evening they give public notice that they are about to go on the road, and that therefore no one may light a fire on the hearth or eat food. Next morning the women of the town sweep out their houses and hearths and deposit the sweepings on broken wooden plates. Many wrap themselves in torn mats and tattered clothes; others swathe themselves in grass and creepers. While they do so, they pray, saying, "All ye sicknesses that are in our body and plague us, we are come to-day to throw you out." When they start to do so, the priest gives orders that everybody is to scream once and at the same time to smite his mouth. In a moment they all scream, smite their mouths, and run as fast as they can in the direction of Mount Adaklu. As they run, they say, "Out to-day! Out to-day! That which kills anybody, out to-day! Ye evil spirits, out to-day! and all that causes our heads to ache, out to-day! Anlo and Adaklu are the places whither all ill shall betake itself!" Now on Mount Adaklu there grows a *klo* tree, and when the people have come to the tree they throw everything away and return home. On their return they wash themselves with the medicine which is set forth in the streets; then they enter their houses.

Among the Hos of North-Eastern India the great festival of the year is the harvest home, held in January, when the granaries are full of grain, and the people, to use their own expression, are full of devilry. "They have a strange notion that at this period, men and women are so overcharged with vicious propensities, that it is absolutely necessary for the safety of the person to let off steam by allowing for a time full vent to the passions." The ceremonies open with a sacrifice to the village god of three fowls, a cock and two hens, one of which must be black. Along with them are offered flowers of the Palas tree (*Butea frondosa*), bread made from rice-flour, and sesamum seeds. These offerings are presented by the village priest, who prays that during the year about to begin they and their children may be preserved from all misfortune and sickness, and that they may have seasonable rain and good crops. Prayer is also made in some places for the souls of the dead. At this time an evil spirit is supposed to infest the place, and to get rid of it men, women, and children go in procession round and through every part of the village with sticks in their hands, as if beating for game, singing a wild chant, and shouting vociferously, till they feel assured that the evil spirit must have fled. Then they give themselves up to feasting and drinking rice-beer, till they are in a fit state for the wild debauch which follows. The festival now "becomes a saturnale, during which servants forget their duty to their masters, children their reverence for parents, men their respect for women, and women all notions of modesty, delicacy, and gentleness; they

become raging bacchantes.” Usually the Hos are quiet and reserved in manner, decorous and gentle to women. But during this festival “their natures appear to undergo a temporary change. Sons and daughters revile their parents in gross language, and parents their children; men and women become almost like animals in the indulgence of their amorous propensities.” The festival is not held simultaneously in all the villages. The time during which it is celebrated in the different villages of a district may be from a month to six weeks, and by a preconcerted arrangement the celebration begins at each village on a different date and lasts three or four days; so the inhabitants of each may take part in a long series of orgies. On these occasions the utmost liberty is given to the girls, who may absent themselves for days with the young men of another village; parents at such times never attempt to lay their daughters under any restraint. The Mundaris, kinsmen and neighbours of the Hos, keep the festival in much the same manner. “The resemblance to a Saturnale is very complete, as at this festival the farm labourers are feasted by their masters, and allowed the utmost freedom of speech in addressing them. It is the festival of the harvest home; the termination of one year's toil, and a slight respite from it before they commence again.”

Amongst some of the Hindoo Koosh tribes, as among the Hos and Mundaris, the expulsion of devils takes place after harvest. When the last crop of autumn has been got in, it is thought necessary to drive away evil spirits from the granaries. A kind of porridge called *mool* is eaten, and the head of the family takes his matchlock and fires it into the floor. Then, going outside, he sets to work loading and firing till his powder-horn is exhausted, while all his neighbours are similarly employed. The next day is spent in rejoicings. In Chitral this festival is called “devil-driving.” On the other hand the Khonds of India expel the devils at seed-time instead of at harvest. At this time they worship Pitteri Pennu, the god of increase and of gain in every shape. On the first day of the festival a rude car is made of a basket set upon a few sticks, tied upon bamboo rollers for wheels. The priest takes this car first to the house of the lineal head of the tribe, to whom precedence is given in all ceremonies connected with agriculture. Here he receives a little of each kind of seed and some feathers. He then takes the car to all the other houses in the village, each of which contributes the same things. Lastly, the car is conducted to a field without the village, attended by all the young men, who beat each other and strike the air violently with long sticks. The seed thus carried out is called the share of the “evil spirits, spoilers of the seed.” “These are considered to be driven out with the car; and when it and its contents are abandoned to them, they are held to have no excuse for interfering with the rest of the seed-corn.” Next day each household kills a hog over the seed for the year, and prays to Pitteri Pennu, saying, “O Pitteri Pennu! this seed we shall sow to-morrow. Some of us, your suppliants, will have a great return, some a small return. Let the least favoured have a full basket, let the most favoured have many baskets. Give not this seed to ant, or rat, or hog. Let the stems which shall spring from it be so stout that the earth shall tremble under them. Let the rain find no hole or outlet whereby to escape from our fields. Make the earth soft like the ashes of cow-dung. To him who has no iron wherewith to shoe his plough, make the wood of the *doh*-tree like iron. Provide other food than our seed for the parrot, the crow, and all the fowls and beasts of the jungle. Let not the white ant destroy the roots, nor the wild hog crush the stem to get at the fruit; and make our crops of all kinds have a better flavour than that of those of any other country.” The elders then feast upon the hogs. The young men are excluded from the repast, but enjoy the privilege of waylaying and pelting with jungle-fruit their elders as they return from the feast. Upon the third day the lineal head of the tribe goes out and sows his seed, after which all the rest may do so.

In Ranchi, a district of Chota Nagpur in Bengal, a ceremony is performed every year by one of the clans to drive away disease. Should it prove ineffectual, all the villagers assemble by night and walk about the village in a body armed with clubs, searching for the disease.

Everything they find outside of the houses they smash. Hence on that day the people throw out their chipped crockery, old pots and pans, and other trash into the courtyard, so that when the search party comes along they may belabour the heap of rubbish to their heart's content; the crash of shattered crockery and the clatter of shivered pans indicates, we are told, that the disease has departed; perhaps it might be more strictly accurate to say that they have frightened it away. At all events a very loud noise is made "so that the disease may not remain hidden anywhere." In a village of the Mossos, an aboriginal tribe of south-western China, a French traveller witnessed the annual ceremony of the expulsion of devils. Two magicians, wearing mitres of red pasteboard, went from house to house, attended by a troop of children, their faces smeared with flour, some of whom carried torches and others cymbals, while all made a deafening noise. After dancing a wild dance in the courtyard of the house, they entered the principal room, where the performers were regaled with a draught of ardent spirits, of which they sprinkled a few drops on the floor. Then the magicians recited their spells to oblige the evil spirits to quit the chamber and the good spirits to enter it. At the end of each phrase, the children, speaking for the spirits, answered with a shout, "We go" or "We come." That concluded the ceremony in the house, and the noisy procession filed out to repeat it in the next.

The people of Bali, an island to the east of Java, have periodical expulsions of devils upon a great scale. Generally the time chosen for the expulsion is the day of the "dark moon" in the ninth month. When the demons have been long unmolested the country is said to be "warm," and the priest issues orders to expel them by force, lest the whole of Bali should be rendered uninhabitable. On the day appointed the people of the village or district assemble at the principal temple. Here at a cross-road offerings are set out for the devils. After prayers have been recited by the priests, the blast of a horn summons the devils to partake of the meal which has been prepared for them. At the same time a number of men step forward and light their torches at the holy lamp which burns before the chief priest. Immediately afterwards, followed by the bystanders, they spread in all directions and march through the streets and lanes crying, "Depart! go away!" Wherever they pass, the people who have stayed at home hasten, by a deafening clatter on doors, beams, rice-blocks, and so forth, to take their share in the expulsion of devils. Thus chased from the houses, the fiends flee to the banquet which has been set out for them; but here the priest receives them with curses which finally drive them from the district. When the last devil has taken his departure, the uproar is succeeded by a dead silence, which lasts during the next day also. The devils, it is thought, are anxious to return to their old homes, and in order to make them think that Bali is not Bali but some desert island, no one may stir from his own abode for twenty-four hours. Even ordinary household work, including cooking, is discontinued. Only the watchmen may shew themselves in the streets. Wreaths of thorns and leaves are hung at all the entrances to warn strangers from entering. Not till the third day is this state of siege raised, and even then it is forbidden to work at the rice-fields or to buy and sell in the market. Most people still stay at home, striving to while away the time with cards and dice.

The Shans of Southern China annually expel the fire-spirit. The ceremony was witnessed by the English Mission under Colonel Sladen on the thirteenth of August 1868. Bullocks and cows were slaughtered in the market-place; the meat was all sold, part of it was cooked and eaten, while the rest was fired out of guns at sundown. The pieces of flesh which fell on the land were supposed to become mosquitoes, those which fell in the water were believed to turn into leeches. In the evening the chief's retainers beat gongs and blew trumpets; and when darkness had set in, torches were lit, and a party, preceded by the musicians, searched the central court for the fire-spirit, who is supposed to lurk about at this season with evil intent. They then ransacked all the rooms and the gardens, throwing the light of the torches into

every nook and corner where the evil spirit might find a hiding-place. In some parts of Fiji an annual ceremony took place which has much the aspect of an expulsion of devils. The time of its celebration was determined by the appearance of a certain fish or sea-slug (*balolo*) which swarms out in dense shoals from the coral reefs on a single day of the year, usually in the last quarter of the moon in November. The appearance of the sea-slugs was the signal for a general feast at those places where they were taken. An influential man ascended a tree and prayed to the spirit of the sky for good crops, fair winds, and so on. Thereupon a tremendous clatter, with drumming and shouting, was raised by all the people in their houses for about half an hour. This was followed by a dead quiet for four days, during which the people feasted on the sea-slug. All this time no work of any kind might be done, not even a leaf plucked nor the offal removed from the houses. If a noise was made in any house, as by a child crying, a forfeit was at once exacted by the chief. At daylight on the expiry of the fourth night the whole town was in an uproar; men and boys scampered about, knocking with clubs and sticks at the doors of the houses and crying "Sinariba!" This concluded the ceremony. The natives of Tumleo, a small island off German New Guinea, also catch the sea-slug in the month of November, and at this season they observe a curious ceremony, which may perhaps be explained as an expulsion of evils or demons. The lads, and sometimes grown men with them, go in troops into the forest to search for grass-arrows (*räng*). When they have collected a store of these arrows, they take sides and, armed with little bows, engage in a regular battle. The arrows fly as thick as hail, and though no one is killed, many receive skin wounds and are covered with blood. The Catholic missionary who reports the custom could not ascertain the reasons for observing it. Perhaps one set of combatants represents the demons or embodied evils of the year, who are defeated and driven away by the champions of the people. The month in which these combats take place (November and the beginning of December) is sometimes named after the grass-arrows and sometimes after the sea-slug.

On the last night of the year there is observed in most Japanese houses a ceremony called "the exorcism of the evil spirit." It is performed by the head of the family. Clad in his finest robes, with a sword, if he has the right of bearing one, at his waist, he goes through all the rooms at the hour of midnight, carrying in his left hand a box of roasted beans on a lacquered stand. From time to time he dips his right hand into the box and scatters a handful of beans on a mat, pronouncing a cabalistic form of words of which the meaning is, "Go forth, demons! Enter riches!" According to another account, the ceremony takes place on the night before the beginning of spring, and the roasted beans are flung against the walls as well as on the floors of the houses. While the duty of expelling the devils should, strictly speaking, be discharged by the head of the house, it is often delegated to a servant. Whether master or servant, the performer goes by the name of year-man (*toshi-otoko*), the rite being properly performed on the last day of the year. The words "Out with the devils" (*Oni ha soto*) are pronounced by him in a loud voice, but the words "In with the luck" (*fuku ha uchi*) in a low tone. In the Shogun's palace the ceremony was performed by a year-man specially appointed for the purpose, who scattered parched beans in all the principal rooms. These beans were picked up by the women of the palace, who wrapped as many of them in paper as they themselves were years old, and then flung them backwards out of doors. Sometimes people who had reached an unlucky year would gather these beans, one for each year of their life and one over, and wrap them in paper together with a small copper coin which had been rubbed over their body to transfer the ill-luck. The packet was afterwards thrown away at a cross-road. This was called "flinging away ill-luck" (*yaku sute*). According to Lafcadio Hearn, the casting-out of devils from the houses is performed by a professional exorciser for a small fee, and the peas which he scatters about the house are afterwards swept up and carefully kept until the first peal of thunder is heard in spring, when it is customary to cook and eat some of

them. After the demons have been thoroughly expelled from a house, a charm is set up over the door to prevent them from returning: it consists of a wooden skewer with a holly leaf and the dried head of a fish like a sardine stuck on it.

On the third day of the tenth month in every year the Hak-Ka, a native race in the province of Canton, sweep their houses and turn the accumulated filth out of doors, together with three sticks of incense and some mock money made of paper. At the same time they call out, "Let the devil of poverty depart! Let the devil of poverty depart!" By performing this ceremony they hope to preserve their homes from penury. Among some of the Hindoos of the Punjab on the morning after Diwali or the festival of lamps, at which the souls of ancestors are believed to visit the house, the oldest woman of the family takes a corn-sieve or winnowing basket and a broom, to both of which magical virtues are ascribed, and beats them in every corner of the house, exclaiming, "God abide, and poverty depart!" The sieve is then carried out of the village, generally to the east or north, and being thrown away is supposed to bear away with it the poverty and distress of the household. Or the woman flings all the sweepings and rubbish out of doors, saying, "Let all dirt and wretchedness depart from here, and all good fortune come in." The Persians used annually to expel the demons or goblins (*Dives*) from their houses in the month of December. For this purpose the Magi wrote certain words with saffron on a piece of parchment or paper and then held the writing over a fire into which they threw cotton, garlic, grapes, wild rue, and the horn of an animal that had been killed on the sixteenth of September. The spell thus prepared was nailed or glued to the inside of the door, and the door was painted red. Next the priest took some sand and spread it out with a knife, while he muttered certain prayers. After that he strewed the sand on the floor, and the enchantment was complete. The demons now immediately vanished, or at least were deprived of all their malignant power.

For ages it has been customary in China to expel the demons from house and home, from towns and cities, at the end of every year. Such general expulsions of devils go by the name of *no*. They are often mentioned and described in Chinese literature. For example, under the Han dynasty, in the second century of our era, "it was ordered that *fang-siang shi* with four eyes of gold, masked with bearskins, and wearing black coats with red skirts, bearing lances and brandishing shields, should always perform at the end of the year in the twelfth month the *no* of the season, in the rear of hundreds of official servants and boys, and search the interior of the palace, in order to expel the demons of plague. With bows of peach wood and arrows of the thorny jujube they shoot at the spectres, and with porcelain drums they drum at them; moreover they throw red balls and cereals at them, in order to remove disease and calamity." Again, in a poem of the same period we read that "at the end of the year the great *no* takes place for the purpose of driving off all spectres. The *fang-siang* carry their spears, *wu* and *hih* hold their bundles of reed. Ten thousand lads with red heads and black clothes, with bows of peach wood and arrows of thorny jujube shoot at random all around. Showers of potsherds and pebbles come down like rain, infallibly killing strong spectres as well as the weak. Flaming torches run after these beings, so that a sparkling and streaming glare chases the red plague to all sides; thereupon they destroy them in the imperial moats and break down the suspension bridges (to prevent their return)." At a later period Chinese historians inform us that the house of Tsi caused the annual expulsion of demons to be performed on the last day of the year by two groups, each of one hundred and twenty lads, and twelve animals headed by drums and wind instruments. The gates of the wards and of the city walls were flung open, and the emperor witnessed the ceremony seated on his throne in the midst of his officers. With rolling drums the procession entered the palace through the western gate, and passed through all parts of it in two divisions, even ascending the towers, while they hopped, jumped and shrieked; and on quitting the palace they spread out in six

directions till they reached the city walls. At the present time it is customary in every part of China to fire off crackers on the last day and night of the year for the purpose of terrifying and expelling the devils: enormous quantities of the explosives are consumed at this season: the people seem to vie with one another as to who shall let off the most crackers and make the most noise. Sometimes long strings of these fireworks hang from balconies and eaves and keep up a continuous crackling for half an hour together or more; in great cities the prolonged and ear-splitting din is very annoying to foreigners. To the ears of the Chinese the noise appears to be agreeable, if not for its own sake, at least for the beneficial effect it is supposed to produce by driving demons away. Indeed they seem to be of opinion that any noise, provided it be sufficiently harsh and loud, serves this useful purpose. The sound of brass instruments is particularly terrifying to devils; hence the great use which the Chinese make of gongs in rites of exorcism. The clash of gongs, we are told, resounds through the Chinese empire daily, especially in summer, when a rise in the death-rate, which ignorant Europeans attribute to mere climatic influences, stimulates the people to redouble their efforts for the banishment of the fiends, who are the real cause of all the mischief. At such times you may see and hear groups of benevolent and public-spirited men and women banging gongs, clashing cymbals, and drubbing drums for hours together. No protest is made by their neighbours, no complaint that they disturb the night's rest of the sick and the tired. People listen with resignation or rather with gratitude and complacency to the deafening uproar raised by these generous philanthropists, who thus devote their services gratuitously to the cause of the public health. In Corea, also, the devils are driven out of the towns on New Year's Eve by the firing of guns and the popping of crackers.

In Tonquin a *theckydaw* or general expulsion of malevolent spirits commonly took place once a year, especially if there was a great mortality amongst men, the elephants or horses of the general's stable, or the cattle of the country, "the cause of which they attribute to the malicious spirits of such men as have been put to death for treason, rebellion, and conspiring the death of the king, general, or princes, and that in revenge of the punishment they have suffered, they are bent to destroy everything and commit horrible violence. To prevent which their superstition has suggested to them the institution of this *theckydaw*, as a proper means to drive the devil away, and purge the country of evil spirits." The day appointed for the ceremony was generally the twenty-fifth of February, one month after the beginning of the new year, which fell on the twenty-fifth of January. The intermediate month was a season of feasting, merry-making of all kinds, and general licence. During the whole month the great seal was kept shut up in a box, face downwards, and the law was, as it were, laid asleep. All courts of justice were closed; debtors could not be seized; small crimes, such as petty larceny, fighting, and assault, escaped with impunity; only treason and murder were taken account of and the malefactors detained till the great seal should come into operation again. At the close of the saturnalia the wicked spirits were driven away. Great masses of troops and artillery having been drawn up with flying colours and all the pomp of war, "the general beginneth then to offer meat offerings to the criminal devils and malevolent spirits (for it is usual and customary likewise amongst them to feast the condemned before their execution), inviting them to eat and drink, when presently he accuses them in a strange language, by characters and figures, etc., of many offences and crimes committed by them, as to their having disquieted the land, killed his elephants and horses, etc., for all which they justly deserve to be chastised and banished the country. Whereupon three great guns are fired as the last signal; upon which all the artillery and musquets are discharged, that, by their most terrible noise the devils may be driven away; and they are so blind as to believe for certain, that they really and effectually put them to flight."

In Cambodia the expulsion of evil spirits took place in March. Bits of broken statues and stones, considered as the abode of the demons, were collected and brought to the capital. Here as many elephants were collected as could be got together. On the evening of the full moon volleys of musketry were fired and the elephants charged furiously to put the devils to flight. The ceremony was performed on three successive days. In Siam the banishment of demons is annually carried into effect on the last day of the old year. A signal gun is fired from the palace; it is answered from the next station, and so on from station to station, till the firing has reached the outer gate of the city. Thus the demons are driven out step by step. As soon as this is done a consecrated rope is fastened round the circuit of the city walls to prevent the banished demons from returning. The rope is made of tough couch-grass and is painted in alternate stripes of red, yellow, and blue. According to a more recent account, the Siamese ceremony takes place at the New Year holidays, which are three in number, beginning with the first of April. For the feasting which accompanies these holidays a special kind of cake is made, "which is as much in demand as our own Shrove-Tuesday pancakes or our Good-Friday hot cross-buns. The temples are thronged with women and children making offerings to Buddha and his priests. The people inaugurate their New Year with numerous charitable and religious deeds. The rich entertain the monks, who recite appropriate prayers and chants. Every departed soul returns to the bosom of his family during these three days, freed from any fetters that may have bound him in the regions of indefinable locality. On the third day the religious observances terminate, and the remaining hours are devoted to 'the world, the flesh, and the devil.' Gambling is not confined to the licensed houses, but may be indulged in anywhere. Games of chance hold powerful sway in every house as long as the licence to participate in them lasts. Priests in small companies occupy posts at regular intervals round the city wall, and spend their time in chanting away the evil spirits. On the evening of the second day, the ghostly visitors from the lower realms lose the luxury of being exorcised with psalms. Every person who has a gun may fire it as often as he pleases, and the noise thus made is undoubtedly fearful enough in its intensity to cause any wandering traveller from the far-off fiery land to retrace his steps with speed. The bang and rattle of pistols, muskets, shot-guns, and rifles cease not till the break of day, by which time the city is effectually cleared of all its infernal visitors." From this account we learn that among the spirits thus banished are the souls of the dead, who revisit their living friends once a year. To the same effect, apparently, Bishop Bruguière, writing from Bangkok in 1829, tells us that "the three first days of the moon of April are days of solemn festivity for the pious Siamese. That day Lucifer opens all the gates of the abyss, the souls of the dead, which are shut up there, come forth and partake of a repast in the bosom of their family. They are treated splendidly. One of these three days a monk repairs to the palace to preach before the king. At the end of the sermon a preconcerted signal is given, and in a moment the cannons are fired in all the quarters of the city to chase the devil out of the walls or to kill him, if he dares to resist. On the first day a temporary king is named, who bears the title of *phaja-phollathep*; during these three days he enjoys all the royal prerogatives, the real king remaining shut up in his palace."

A similar belief and a similar custom prevail in Japan. There, too, the souls of the departed return to their old homes once a year, and a festival called the Feast of Lanterns is made to welcome them. They come at evening on the thirteenth day of the seventh month of the old calendar, which falls towards the end of August. It is needful to light them on their way. Accordingly bamboos with pretty coloured lanterns attached to them are fastened on the tombs, and being thickly set they make an illumination on the hills, where the burying-grounds are generally situated. Lamps of many hues or rows of tapers are also lit and set out in front of the houses and in the gardens, and small fires are kindled in the streets, so that the whole city is in a blaze of light. After the sun has set, a great multitude issues from the town,

for every family goes forth to meet its returning dead. When they come to the spot where they believe the souls to be, they welcome the unseen visitors and invite them to rest after their journey, and to partake of refreshments which they offer to them. Having allowed the souls time enough to satisfy their hunger and recover from their fatigue, they escort them by torchlight, chatting gaily with them, into the city and to the houses where they lived and died. These are also illuminated with brilliant lanterns; a banquet is spread on the tables; and the places of the dead, who are supposed to absorb the ethereal essence of the food, are laid for them as if they were alive. After the repast the living go from house to house to visit the souls of their dead friends and neighbours; and thus they spend the night running about the town. On the evening of the third day of the festival, which is the fifteenth day of the month, the time has come for the souls to return to their own place. Fires again blaze in the streets to light them on the road; the people again escort them ceremoniously to the spot where they met them two days before; and in some places they send the lanterns floating away on rivers or the sea in miniature boats, which are laden with provisions for the spirits on their way to their long home. But there is still a fear that some poor souls may have lagged behind, or even concealed themselves in a nook or corner, loth to part from the scenes of their former life and from those they love. Accordingly steps are taken to hunt out these laggards and send them packing after their fellow-ghosts. With this intention the people throw stones on the roofs of their houses in great profusion; and going through every room armed with sticks they deal swashing blows all about them in the empty air to chase away the lingering souls. This they do, we are told, out of a regard for their own comfort quite as much as from the affection they bear to the dead; for they fear to be disturbed by unseasonable apparitions if they suffered the airy visitors to remain in the house.

Thus in spite of the kindly welcome given to the souls, the fear which they inspire comes out plainly in the pains taken to ensure their departure; and this fear justifies us in including such forced departures among the ceremonies for the expulsion of evils with which we are here concerned. It may be remembered that the annual banishment of ghosts has been practised by savages so low in the scale of humanity as the Australian aborigines. At the other end of the scale it was observed in classical antiquity by the civilized Greeks and Romans. The Athenians believed that at the festival of the Anthesteria the souls of the dead came back from the nether world and went about the city. Accordingly ropes were fastened round the temples to keep out the wandering ghosts; and with a like intention the people chewed buckthorn in the morning and smeared the doors of their houses with pitch, apparently thinking that any rash spirits who might attempt to enter would stick fast in the pitch and be glued, like so many flies, to the door. But at the end of the festival the souls were bidden to depart in these words: "Out of the door with you, souls. The Anthesteria is over." Yet for the entertainment of the unseen guests during their short stay earthenware pots full of boiled food appear to have been everywhere prepared throughout the city; but probably these were placed in the street outside the houses, in order to give the ghosts no excuse for entering and disturbing the inmates. No priest would eat of the food thus offered to the dead, but prowling beggars probably had no such scruples. Similarly when the Sea Dyaks of Sarawak celebrate their great Festival of Departed Spirits at intervals which vary from one to three or four years, food is prepared for the dead and they are summoned from their far-off home to partake of it; but it is put outside at the entrance of the house. And before the general arrival of the souls, while the people are busy brewing the drink for the feast, each family takes care to hang an earthenware pot full of the liquor outside of the single room which it occupies in the large common house, lest some thirsty soul should arrive prematurely from the other world, and, forcing his way into the domestic circle, should not merely slake his thirst but carry off one of the living. During three days in May the Romans held a festival in honour of the ghosts. The temples were shut, doubtless to keep out the ghostly swarms; but, as in Japan, every house

seems to have been thrown open to receive the spirits of its own departed. When the reception was over, each head of a family arose at dead of night, washed his hands, and having made with fingers and thumb certain magic signs to ward off ghosts, he proceeded to throw black beans over his shoulder without looking behind him. As he did so, he said nine times, "With these beans I redeem me and mine"; and the ghosts, following unseen at his heels, picked up the beans and left him and his alone. Then he dipped his hands again in water, clashed bronze vessels together to make a din, and begged the ghosts to depart from his house, saying nine times, "Go forth, paternal shades!" After that he looked behind him, and the ceremony was over: the ghosts had taken their leave for another year.

Annual expulsions of demons, witches, or evil influences appear to have been common among the heathen of Europe, if we may judge from the relics of such customs among their descendants at the present day. Thus among the heathen Wotyaks, a Finnish people of Eastern Russia, all the young girls of the village assemble on the last day of the year or on New Year's Day, armed with sticks, the ends of which are split in nine places. With these they beat every corner of the house and yard, saying, "We are driving Satan out of the village." Afterwards the sticks are thrown into the river below the village, and as they float down stream Satan goes with them to the next village, from which he must be driven out in turn. In some villages the expulsion is managed otherwise. The unmarried men receive from every house in the village groats, flesh, and brandy. These they take to the fields, light a fire under a fir-tree, boil the groats, and eat of the food they have brought with them, after pronouncing the words, "Go away into the wilderness, come not into the house." Then they return to the village and enter every house where there are young women. They take hold of the young women and throw them into the snow, saying, "May the spirits of disease leave you." The remains of the groats and the other food are then distributed among all the houses in proportion to the amount that each contributed, and each family consumes its share.

According to a Wotyak of the Malmyz district the young men throw into the snow whomever they find in the houses, and this is called "driving out Satan"; moreover, some of the boiled groats are cast into the fire with the words, "O god, afflict us not with sickness and pestilence, give us not up as a prey to the spirits of the wood." But the most antique form of the ceremony is that observed by the Wotyaks of the Kasan Government. First of all a sacrifice is offered to the Devil at noon. Then all the men assemble on horseback in the centre of the village, and decide with which house they shall begin. When this question, which often gives rise to hot disputes, is settled, they tether their horses to the paling, and arm themselves with whips, clubs of lime-wood, and bundles of lighted twigs. The lighted twigs are believed to have the greatest terrors for Satan. Thus armed, they proceed with frightful cries to beat every corner of the house and yard, then shut the door, and spit at the ejected fiend. So they go from house to house, till the Devil has been driven from every one. Then they mount their horses and ride out of the village, yelling wildly and brandishing their clubs in every direction. Outside of the village they fling away the clubs and spit once more at the Devil. The Cheremiss, another Finnish people of Eastern Russia, chase Satan from their dwellings by beating the walls with cudgels of lime-wood. For the same purpose they fire guns, stab the ground with knives, and insert burning chips of wood in the crevices. Also they leap over bonfires, shaking out their garments as they do so; and in some districts they blow on long trumpets of lime-tree bark to frighten him away. When he has fled to the wood, they pelt the trees with some of the cheese-cakes and eggs which furnished the feast.

In Christian Europe the old heathen custom of expelling the powers of evil at certain times of the year has survived to modern times. Thus in some villages of Calabria the month of March is inaugurated with the expulsion of the witches. It takes place at night to the sound of the church bells, the people running about the streets and crying, "March is come." They say that

the witches roam about in March, and the ceremony is repeated every Friday evening during the month. Often, as might have been anticipated, the ancient pagan rite has attached itself to church festivals. For example, in Calabria at Eastertide every family provides itself in time with a supply of holy water, and when the church bells proclaim the resurrection of Christ the people sprinkle the house with the water, saying in a loud voice, "*Esciti fora sùrici uorvi, esciti fora tentaziuni, esca u malu ed entri u bene.*" At the same time they knock on doors and windows, on chests and other articles of furniture. Again, in Albania on Easter Eve the young people light torches of resinous wood and march in procession, swinging them, through the village. At last they throw the torches into the river, crying, "Ha, Kore! we throw you into the river, like these torches, that you may never return." Silesian peasants believe that on Good Friday the witches go their rounds and have great power for mischief. Hence about Oels, near Strehlitz, the people on that day arm themselves with old brooms and drive the witches from house and home, from farmyard and cattle-stall, making a great uproar and clatter as they do so.

The belief in the maleficent power and activity of witches and wizards would seem to have weighed almost as heavily on the heathen of Central and Northern Europe in prehistoric times as it still weighs on the minds of African negroes and other savages in many parts of the world. But while these unhallowed beings were always with our forefathers, there were times and seasons of the year when they were supposed to be particularly mischievous, and when accordingly special precautions had to be taken against them. Among such times were the twelve days from Christmas to Twelfth Night, the Eve of St. George, the Eve of May Day (Walpurgis Night), and Midsummer Eve.

In Central Europe it was apparently on Walpurgis Night, the Eve of May Day, above all other times that the baleful powers of the witches were exerted to the fullest extent; nothing therefore could be more natural than that men should be on their guard against them at that season, and that, not content with merely standing on their defence, they should boldly have sought to carry the war into the enemy's quarters by attacking and forcibly expelling the uncanny crew. Amongst the weapons with which they fought their invisible adversaries in these grim encounters were holy water, the fumes of incense or other combustibles, and loud noises of all kinds, particularly the clashing of metal instruments, amongst which the ringing of church bells was perhaps the most effectual. Some of these strong measures are still in use among the peasantry, or were so down to recent years, and there seems no reason to suppose that their magical virtue has been at all impaired by lapse of time. In the Tyrol, as in other places, the expulsion of the powers of evil at this season goes by the name of "Burning out the Witches." It takes place on May Day, but people have been busy with their preparations for days before. On a Thursday at midnight bundles are made up of resinous splinters, black and red spotted hemlock, caperspurge, rosemary, and twigs of the sloe. These are kept and burned on May Day by men who must first have received plenary absolution from the Church. On the last three days of April all the houses are cleansed and fumigated with juniper berries and rue. On May Day, when the evening bell has rung and the twilight is falling, the ceremony of "Burning out the Witches" begins. Men and boys make a racket with whips, bells, pots, and pans; the women carry censers; the dogs are unchained and run barking and yelping about. As soon as the church bells begin to ring, the bundles of twigs, fastened on poles, are set on fire and the incense is ignited. Then all the house-bells and dinner-bells are rung, pots and pans are clashed, dogs bark, every one must make a noise. And amid this hubbub all scream at the pitch of their voices,

*"Witch flee, flee from here,
Or it will go ill with thee."*

Then they run seven times round the houses, the yards, and the village. So the witches are smoked out of their lurking-places and driven away.

The custom of expelling the witches on Walpurgis Night is still, or was down to thirty or forty years ago, observed in many parts of Bavaria and among the Germans of Bohemia. Thus in the Böhmerwald Mountains, which divide Bavaria from Bohemia, all the young fellows of the village assemble after sunset on some height, especially at a cross-road, and crack whips for a while in unison with all their strength. This drives away the witches; for so far as the sound of the whips is heard, these maleficent beings can do no harm. The peasants believe firmly in the efficacy of this remedy. A yokel will tell his sons to be sure to crack their whips loudly and hit the witches hard; and to give more sting to every blow the whip-lashes are knotted. On returning to the village the lads often sing songs and collect contributions of eggs, lard, bread, and butter. In some places, while the young fellows are cracking their whips, the herdsmen wind their horns, and the long-drawn notes, heard far-off in the silence of night, are very effectual for banning the witches. In other places, again, the youth blow upon so-called shawms made of peeled willow-wood in front of every house, especially in front of such houses as are suspected of harbouring a witch. In Voigtland, a bleak mountainous region of Central Germany bordering on the Frankenwald Mountains, the belief in witchcraft is still widely spread. The time when the witches are particularly dreaded is Walpurgis Night, but they play their pranks also on Midsummer Eve, St. Thomas's Eve, and Christmas Eve. On these days they try to make their way into a neighbour's house and to borrow or steal something from it; and woe betide the man in whose house they have succeeded in their nefarious errand! It is on Walpurgis Night and Midsummer Eve that they ride through the air astride of pitchforks and churn-dashers. They also bewitch the cattle; so to protect the poor beasts from their hellish machinations the people on these days chalk up three crosses on the doors of the cattle-stalls or hang up St. John's wort, marjoram, and so forth. Very often, too, the village youth turn out in a body and drive the witches away with the cracking of whips, the firing of guns, and the waving of burning besoms through the air, not to mention shouts and noises of all sorts. Such customs appear to be observed generally in Thüringen, of which Voigtland is a part. The people think that the blows of the whip actually fall on the witches hovering unseen in the air, and that so far as the cracking of the whips is heard, the crops will be good and nothing will be struck by lightning, no doubt because the witches have been banished by the sound.

In Bohemia many are the precautions taken by the peasantry, both German and Czech, to guard themselves and their cattle against the witches on Walpurgis Night. Thorny branches are laid on the thresholds of cow-houses and dwellings to keep out the infernal crew, and after sunset boys armed with whips and guns drive them from the villages with a prodigious uproar and burn them in bonfires on the neighbouring heights. It is true that the witches themselves are not seen, though effigies of them are sometimes consumed in the bonfires. This "Burning of the Witches," as it is called, protects the crops from their ravages. German lads also employ goats' horns as a means of driving away the witches at the moment when they issue forth from kitchen-chimneys on their way to the witches' Sabbath. Some minor variations in the mode of expelling the witches on Walpurgis Night have been noted in the German villages of Western Bohemia. Thus in Absrot the village youth go out to cross-roads and there beat the ground with boards, no doubt for the purpose of thrashing the witches who are commonly supposed to assemble at such spots. In Deslawen, after the evening bells have rung, people go through the houses beating the walls or floors with boards; then they issue forth into the roads, headed by a boy who carries the effigy of a witch made up of rags. Thereupon grown-up folk crack whips and fire shots. In Schönwert the young people go in bands through the village and the meadows, making a great noise with bells, flutes, and

whips, for the more noise they make the more effectual is the ceremony supposed to be. Meantime the older men are busy firing shots over the fields and the dungheaps. In Hochofen troops of children go from house to house on Walpurgis Evening, making a great clatter with tin cans and kettles, while they scream, "Witch, go out, your house is burning." This is called "Driving out the Witches." The German peasants of Moravia, also, universally believe that on Walpurgis Night the witches ride through the air on broomsticks and pitchforks in order to revel with Satan, their master, at the old heathen places of sacrifice, which are commonly on heights. To guard the cattle and horses from their insidious attacks it is usual to put knives under the thresholds and to stick sprigs of birch in the dungheaps. Formerly lads used to gather on the heights where the witches were believed to assemble; and by hurling besoms, dipped in pitch and ignited, they attempted to banish the invisible foe.

In Silesia also, we are told, the belief in witchcraft still occupies a large space in the minds of the people. It is on Walpurgis Night that the witches are let loose and all the powers of magic have full sway. At that time the cottagers not uncommonly see a witch astride a hayfork or broomstick emerging from the chimney. Hence people are careful to remove all utensils from the fireplace, or the witches would ride on them, when they go with the Evil One to a cross-road or a gallows-hill, there to dance wild dances in a circle on the snow or to cut capers on the corn-fields. Steps are taken to guard village, house, and farmyard against their incursions. Three crosses are chalked up on every door, and little birch-trees fastened over the house-door, because the witches must count every leaf on the tree before they can cross the threshold, and while they are still counting, the day breaks and their power is gone. On that evening the cattle are especially exposed to the attacks of the witches, and prudent farmers resort to many expedients for the sake of protecting the animals from the wiles of these malignant beings. No wise man would sell milk or butter on Walpurgis Night; if he did, his cows would certainly be bewitched. And all the work of the byres should be finished and the cattle fed before sundown, which is the time when the witches begin to swarm in the air. Besides the usual crosses chalked on the door of the byre, it is customary to fasten over it three horse-shoes, or a holed flint, or a goat's horns with four branches; it is well, too, to nail bits of buckthorn crosswise over every entrance, and to lean pitchforks and harrows against the doors with the sharp points turned outwards. A sod freshly cut from a meadow and sprinkled with marsh-marigolds has likewise a very good effect when it is placed before a threshold. Moreover in the Grünberg district young men go clanking chains through the village and farmyards, for iron scares the witches; also they knock at the doors and they prance through the yards astride on pitchforks and broomsticks, all to drive away the witches, but in doing so they must be sure not to speak a word. A very powerful means of keeping witches at bay are the Walpurgis bonfires, which are still kindled in the Hoyerswerda district and the Iser Mountains. The fires are fed with the stumps of old brooms, and the people dance round them and wave burning besoms, just as they do at the Midsummer bonfires. About Hoyerswerda they call these fires, as usual, "Burning the Witches."

The Wends of Saxony adopt very similar precautions against witches on the evening of Walpurgis Day. Any one who has been in Lusatia on the last day of April must remember the fires which he saw blazing on the mountains and in the valleys and the plains. That is the Witch-burning (*kuzlarniče palič*). For weeks before that the boys and lads have been collecting old brooms, and when the time comes they sally forth and dance with the burning besoms on the fields; the fire is thought to ban the witches and foul fiends. Also on that day people march about the fields and meadows clinking stones on scythes; for the noise is also deemed effectual in driving the witches away. At Penzance in Cornwall boys run about blowing horns on the thirtieth of April (Walpurgis Day), and when questioned why they do so they say that they are "scaring away the devil." The horns used for this purpose are made of

tin and shaped like a herald's trumpet; they vary in length from a foot to a yard and can give forth a very loud blast. The custom is probably a relic of a general expulsion of witches and demons on that day.

Another witching time is the period of twelve days between Christmas (the twenty-fifth of December) and Epiphany (the sixth of January). A thousand quaint superstitions cluster round that mystic season. It is then that the Wild Huntsman sweeps through the air, the powers of evil are let loose, werewolves are prowling round, and the witches work their wicked will. Hence in some parts of Silesia the people burn pine-resin all night long between Christmas and the New Year in order that the pungent smoke may drive witches and evil spirits far away from house and homestead; and on Christmas Eve and New Year's Eve they fire shots over fields and meadows, into shrubs and trees, and wrap straw round the fruit-trees, to prevent the spirits from doing them harm. On New Year's Eve, which is Saint Sylvester's Day, Bohemian lads, armed with guns, form themselves into circles and fire thrice into the air. This is called "Shooting the Witches" and is supposed to frighten the witches away. While the young fellows are rendering this service to the community, the housewives go about their houses sprinkling holy water in all the rooms and chalking three crosses on every door, no doubt to accelerate the departure of the witches, and to prevent their return. At Trieste on St. Sylvester's Eve people form processions and drive the evil spirits with sticks and brooms out of the houses, while they invite the good spirits and good luck to come and dwell there. In the town of Biggar, in Lanarkshire, it has been customary from time immemorial to celebrate a custom called "burning out the Old Year" on the thirty-first of December. A large bonfire, to which all the onlookers think it their duty to contribute fuel, is kindled in the evening at the town cross, and fires are also lighted on the adjacent hills. When we remember how common it is in Central Europe to kindle fires at critical seasons for the purpose of burning the witches, we may suspect that what the good people of Biggar originally intended to burn on the last night of the year was not the Old Year but the witches. It would have been well for Scotland and for Europe if the practice of burning witches had always been carried out in this harmless fashion. A visitor to Scotland in 1644 saw nine witches of flesh and blood burned at one time on Leith Links.

The last of the mystic twelve days is Epiphany or Twelfth Night, and it has been selected as a proper season for the expulsion of the powers of evil in various parts of Europe. Thus at Brunnen on the Lake of Lucerne the boys go about in procession on Twelfth Night, carrying torches and lanterns, and making a great noise with horns, cow-bells, whips, and so forth. This is said to frighten away the two female spirits of the wood, Strudeli and Strätteli. Of these two names Strudeli seems to mean "witch" and Strätteli "nightmare." The people believe that if they do not make enough noise, there will be little fruit that year. On the same day the inhabitants of the Muota Valley, immediately to the east of Brunnen, used to make a similar racket, no doubt for a similar purpose. They collected chains, pots and pans, cow-bells, horns, and such like musical instruments. He who could borrow a number of horse's bells and wear them on his person so that the jangling sounded afar off was deemed uncommonly lucky. Thus equipped parties of people marched about making all the din they could; sometimes they would meet and joining all their efforts in one concerted burst of harmony or discord would raise such a hubbub that the surrounding rocks rang again with the sound. In Labruguière, also, a canton of Southern France, the evil spirits are expelled at the same season. The canton lies in the picturesque and little-known region of the Black Mountains, which form a sort of link between the Pyrenees and the Cevennes, and have preserved in their remote recesses certain types of life which have long disappeared elsewhere. On the eve of Twelfth Day the inhabitants rush through the streets jangling bells, clattering kettles, and doing everything to make a discordant noise. Then by the light of

torches and blazing faggots they set up a prodigious hue and cry, an ear-splitting uproar, hoping thereby to chase all the wandering ghosts and devils from the town.

With this noisy ceremony we may compare a similar custom which is still observed year by year at the same season in the long and spacious Piazza Navona at Rome. There on the night before Epiphany a dense crowd assembles, and diverts itself by raising a hideous uproar. Soon after supper troops of young folk and others march through the streets, preceded by puppets or pasteboard figures and all making the utmost possible din. They converge from different quarters on the Piazza Navona, there to unite in one prolonged and deafening outburst of clangorous discord. The favourite musical instruments employed in this cats' concert are penny trumpets, of which, together with tambourines, bells, and so forth, the shops take care to provide a large stock as a preparation for the pandemonium of the evening. The ceremony is supposed to be in honour of a certain mythical old hag called Befana, effigies of whom, made of rags, are put by women and children in the windows on Twelfth Night. Her name Befana is clearly a popular corruption of Epiphany, the ecclesiastical name of the festival; but viewed in connexion with the popular celebrations which we have examined she may be suspected to be of heathen rather than Christian origin. In fact we may conjecture that she was of old a witch, and that the noisy rite in the Piazza Navona is nothing but a relic of an annual expulsion of witches at this season. A ceremony of the same sort is annually observed on the same evening, the Eve of Epiphany, by the peasantry who inhabit the mountains of the Tuscan Romagna. A troop of lads parade the streets of the village making a fiendish noise by means of bells and kitchen utensils of tin and brass, while others blow blasts on horns and reed-pipes. They drag about a cart containing an effigy of an old woman made up of rags and tow, which represents Befana (Epiphany). When they come to the village square they put fire to the effigy, which soon vanishes in smoke and flames amid a chorus of cries, shrieks, and other forms of rustic melody. Similar ceremonies are probably observed on the same evening in other parts of Italy.

In the Shetland Islands the Yule or Christmas holidays begin, or used to begin, seven days before Christmas and last till Antinmas, that is, the twenty-fourth day after Christmas. In the Shetland parlance these holidays are known as "the Yules." On the first night, called Tul-ya's e'en, seven days before Christmas, certain mischievous elves, whom the Shetlanders name Trows, "received permission to leave their homes in the heart of the earth and dwell, if it so pleased them, above ground. There seemed to have been no doubt that those creatures preferred disporting themselves among the dwellings of men to residing in their own subterranean abodes, for they availed themselves of every permission given, and created no little disturbance among the mortals whom they visited. One of the most important of all Yule-tide observances was the 'saining' required to guard life or property from the Trows. If the proper observances were omitted, the 'grey-folk' were sure to take advantage of the opportunity." On the last day of the holidays, the twenty-fourth day after Christmas, which in Shetland goes by the name of Up-helly-a', Uphellia, or Uphaliday, "the doors were all opened, and a great deal of pantomimic chasing and driving and dispersing of unseen creatures took place. Many pious ejaculations were uttered, and iron was ostentatiously displayed, 'for Trows can never abide the sight o' iron.' The Bible was read and quoted. People moved about in groups or couples, never singly, and infants were carefully guarded as well as sained by vigilant and learned 'wise women.' Alas, the poor Trows! their time of frolic and liberty was ended, and on Twenty-fourth night they retired to their gloomy abodes beneath the sod, seldom finding opportunity to reappear again, and never with the same licence, until the Yules returned. All that pantomime, all that invoking of holier Powers, were but methods of 'speeding the parting guest,' and mortals were rejoicing that the unbidden, unwelcome grey-folk must depart. When day dawned after Twenty-fourth night the Trows

had vanished and the Yules were ended.” Of late years Up-helly-a' has been celebrated in Lerwick with pompous and elaborate masquerades. The chief event of the evening is a torch-light procession of maskers or “guizers,” as they are called, who escort the model of a Norse galley through the streets, and finally set it on fire by throwing their torches into it. But in this form the celebration seems to date only from the latter part of the nineteenth century; in former times an old boat filled with tar and ignited was dragged about and blazing tar-barrels were drawn or kicked through the streets. The fire, however procured, was probably in origin intended to chase away the lingering Trows from the town at the end of the holidays.

Thus it would seem that the custom of annually banishing witches and demons on a day or night set apart for the purpose has not been confined to Central Europe, but can be traced from Calabria and Rome in the south to the Shetland Islands in the far north.

IV. Public Scapegoats

§ 1. The Expulsion of Embodied Evils.

Thus far we have dealt with that class of the general expulsion of evils which I have called direct or immediate. In this class the evils are invisible, at least to common eyes, and the mode of deliverance consists for the most part in beating the empty air and raising such a hubbub as may scare the mischievous spirits and put them to flight. It remains to illustrate the second class of expulsions, in which the evil influences are embodied in a visible form or are at least supposed to be loaded upon a material medium, which acts as a vehicle to draw them off from the people, village, or town.

The Pomos of California celebrate an expulsion of devils every seven years, at which the devils are represented by disguised men. "Twenty or thirty men array themselves in harlequin rig and barbaric paint, and put vessels of pitch on their heads; then they secretly go out into the surrounding mountains. These are to personify the devils. A herald goes up to the top of the assembly-house, and makes a speech to the multitude. At a signal agreed upon in the evening the masqueraders come in from the mountains, with the vessels of pitch flaming on their heads, and with all the frightful accessories of noise, motion, and costume which the savage mind can devise in representation of demons. The terrified women and children flee for life, the men huddle them inside a circle, and, on the principle of fighting the devil with fire, they swing blazing firebrands in the air, yell, whoop, and make frantic dashes at the marauding and bloodthirsty devils, so creating a terrific spectacle, and striking great fear into the hearts of the assembled hundreds of women, who are screaming and fainting and clinging to their valorous protectors. Finally the devils succeed in getting into the assembly-house, and the bravest of the men enter and hold a parley with them. As a conclusion of the whole farce, the men summon courage, the devils are expelled from the assembly-house, and with a prodigious row and racket of sham fighting are chased away into the mountains." In spring, as soon as the willow-leaves were full grown on the banks of the river, the Mandan Indians celebrated their great annual festival, one of the features of which was the expulsion of the devil. A man, painted black to represent the devil, entered the village from the prairie, chased and frightened the women, and acted the part of a buffalo bull in the buffalo dance, the object of which was to ensure a plentiful supply of buffaloes during the ensuing year. Finally he was chased from the village, the women pursuing him with hisses and gibes, beating him with sticks, and pelting him with dirt. The Mayas of Yucatan divided the year into eighteen months of twenty days each, and they added five supplementary days at the end of the year in order to make a total of three hundred and sixty-five days. These five supplementary days were deemed unlucky. In the course of them the people banished the evils that might threaten them in the year on which they were about to enter. For that purpose they made a clay image of the demon of evil *Uuayayab*, that is *u-uayab-haab*, "He by whom the year is poisoned," confronted it with the deity who had supreme power over the coming year, and then carried it out of the village in the direction of that cardinal point to which, on the system of the Mayan calendar, the particular year was supposed to belong. Having thus rid themselves of the demon, they looked forward to a happy New Year.

Some of the native tribes of Central Queensland believe in a noxious being called *Molonga*, who prowls unseen and would kill men and violate women if certain ceremonies were not performed. These ceremonies last for five nights and consist of dances, in which only men, fantastically painted and adorned, take part. On the fifth night *Molonga* himself, personified by a man tricked out with red ochre and feathers and carrying a long feather-tipped spear,

rushes forth from the darkness at the spectators and makes as if he would run them through. Great is the excitement, loud are the shrieks and shouts, but after another feigned attack the demon vanishes in the gloom. On the last night of the year the palace of the Kings of Cambodia is purged of devils. Men painted as fiends are chased by elephants about the palace courts. When they have been expelled, a consecrated thread of cotton is stretched round the palace to keep them out. In Munzerabad, a district of Mysore in Southern India, when cholera or smallpox has broken out in a parish, the inhabitants assemble and conjure the demon of the disease into a wooden image, which they carry, generally at midnight, into the next parish. The inhabitants of that parish in like manner pass the image on to their neighbours, and thus the demon is expelled from one village after another, until he comes to the bank of a river into which he is finally thrown. Russian villagers seek to protect themselves against epidemics, whether of man or beast, by drawing a furrow with a plough right round the village. The plough is dragged by four widows and the ceremony is performed at night; all fires and lights must be extinguished while the plough is going the round. The people think that no unclean spirit can pass the furrow which has thus been traced. In the village of Dubrowitschi a puppet is carried before the plough with the cry, "Out of the village with the unclean spirit!" and at the end of the ceremony it is torn in pieces and the fragments scattered about. No doubt the demon of the disease is supposed to be in the puppet and to be destroyed with it. Sometimes in an Esthonian village a rumour will get about that the Evil One himself has been seen in the place. Instantly the whole village is in an uproar, and the entire population, armed with sticks, flails, and scythes, turns out to give him chase. They generally expel him in the shape of a wolf or a cat, occasionally they brag that they have beaten the devil to death. At Carmona, in Andalusia, on one day of the year, boys are stripped naked and smeared with glue in which feathers are stuck. Thus disguised, they run from house to house, the people trying to avoid them and to bar their houses against them. The ceremony is probably a relic of an annual expulsion of devils.

Some of the Khasis of Assam annually expel the demon of plague. The ceremony is called *Beh-dieng-khlam*, that is "Driving away (*beh*) the plague (*khlam*) with sticks (*dieng*)"; it takes place in the Deep-water month (June). On the day fixed for the expulsion the men rise early and beat the roof with sticks, calling upon the demon of the plague to leave the house. Later in the day they go down to the stream where the goddess Aitan dwells. Then long poles or bamboos, newly cut, are laid across the stream and the people jump on them, trying to break them; when they succeed, they give a great shout. Next a very large pole or bamboo is similarly laid across the stream, and the people divide themselves into two parties, one on each side of the stream, and pull against each other at opposite ends of the pole. According to one account the party which succeeds in dragging the pole to their side of the stream is supposed to gain health and prosperity during the coming year. According to another account, if the people on the east bank win in the contest or "tug-of-war," good luck and prosperity are assured; but if the people on the west bank are victorious, then everything will go wrong. On this occasion the people disguise themselves as giants and wild beasts, and they parade images of serpents, elephants, tigers, peacocks, and so on. The men dance with enthusiasm, and the girls, dressed in their best, look on. Before the assembly breaks up, the men play a sort of game of hockey with wooden balls. In this ceremonial contest or "tug of war" between two parties of the people, we may conjecture that the one party represents the expelled demons of the plague; and if that is so, we may perhaps assume that in the struggle the representatives of the demons generally allow themselves to be overcome by their adversaries, in order that the village may be free from pestilence in the coming year. Similarly in autumn the Central Esquimaux divide themselves into two parties, representing summer and winter respectively, which pull at opposite ends of a rope; and they draw omens of the weather to be expected in the coming winter according as the party of summer or of

winter prevails in the struggle. That in such contests, resembling our English game of "French and English" or the "Tug of War," the one side may represent demons is proved by a custom observed by the Chukmas, a tribe of the Chittagong Hill Tracts in South-Eastern India. "On the death of a Dewan or of a priest a curious sport is customary at the funeral. The corpse is conveyed to the place of cremation on a car; to this car ropes are attached, and the persons attending the ceremony are divided into two equal bodies and set to work to pull in opposite directions. One side represents the good spirits; the other, the powers of evil. The contest is so arranged that the former are victorious. Sometimes, however, the young men representing the demons are inclined to pull too vigorously, but a stick generally quells this unseemly ardour in the cause of evil." The contest is like that between the angels and devils depicted in the frescoes of the Campo Santo at Pisa. In Burma a similar struggle takes place at the funeral of a Buddhist monk who passed for a saint in the popular estimation: ropes are attached to opposite ends of the car on which the coffin is placed, all the able-bodied men of the neighbourhood hold on to one or other of the two ends and pull as if for dear life against each other; even the women and girls sometimes join in the tug of war, and policemen have been seen, in a state of frantic excitement, waving their batons to encourage the combatants and dragging back shirkers by main force into the fighting line. The struggle is sometimes prolonged for hours or even days. With the example of the Chukmas before us, we may conjecture that the original motive of this internecine strife was a persuasion that the eternal happiness or misery of the departed saint depended on the issue of this contest between the powers of good and evil for the possession of his mortal remains.

But in Burma the tug of war has been employed for more secular purposes than the salvation or perdition of souls. "The inhabitants," we are told, "still have a custom of pulling a rope to produce rain. A rain party and a drought party tug against each other, the rain party being allowed the victory, which in the popular notion is generally followed by rain." The mode in which this salutary result follows from tugging at a rope is explained by the Burmese doctrine of *nats* or spirits who cause rain. But it is only when these spirits sport in the air that rain falls; when they shut themselves up in their houses there is drought. Now in some Burmese writings "it is said, that when the sun is in the path of the goat, these *Nat* do not chuse to leave their houses on account of the great heat, whence there is then no rain. For this reason, the inhabitants of the Burma empire, in times of drought, are wont to assemble in great numbers, with drums and a long cable. Dividing themselves into two parties, with a vast shouting and noise, they drag the cable contrary ways, the one party endeavouring to get the better of the other: and they think, by this means, to invite the *Nat* to come out from their houses, and to sport in the air. The thunder and lightning, which frequently precede rain, are the clashing and shining of the arms of these *Nat*, who sometimes sport in mock battles." Apparently, therefore, in the tug of war, practised as a rain-charm, the one party represent the spirits who have to be dragged reluctantly from their houses in order to make rain in the sky. Similarly in the Timor-laut Islands, when the people want a rainy wind from the west, the population of the village, men, women, and children divide into two parties and pull against each other at the end of a long bamboo. But the party at the eastern end must pull the harder, in order to draw the desired wind out of the west. We can now perhaps understand why among the Khasis the victory of the eastern side in the tug of war is thought to prognosticate good luck and prosperity, and why the victory of the western side is believed to portend the contrary; the distinction is at once intelligible when we remember that in the country of the Khasis the rainy wind is the monsoon which blows from the south-west, whereas the wind which blows from the south-east is hot and dry. Thus a victory of the eastern party in the tug of war means that they have drawn rain and consequently fertility into the country from the west; whereas a victory of the western party signifies that they have dragged drought and consequently dearth into the country from the east.

However, a somewhat different turn is given to the ceremony of rope-pulling in the East Indies by another writer, who informs us, that while the contest only takes place in some of these islands when rain is wanted, it is closely connected with those licentious rites performed for the fertilization of the ground which have been described in another part of this work. According to this account the men and women appear to take opposite sides in the tug of war, and in pulling against each other they imitate by their movements the union of the sexes. If that is so, it would seem that the rite is a magical ceremony designed to promote the fertility of the ground by means of homoeopathic or imitative magic. The same may perhaps be the intention of the tug of war as it is practised for the benefit of the crops by some of the Naga tribes of Assam, and this is the more likely because in the case of these tribes we are definitely told that the sexes take opposite sides, the women and girls tugging against the men and boys. This is done by the Tangkhuls of Assam a month after the rice has been sown; the ceremony is performed "in order to take the omens for the future of the crops," and it "is followed by considerable license." The tug of war between the sexes with its attendant license is repeated before the first-fruits are cut by the sacred headman. In Corea about the fifteenth day of the first month villages engage in the same kind of contest with each other, and it is thought that the village which wins will have a good harvest. The rope which they pull is made of straw, two feet in diameter, with its ends divided into branches. The men lay hold of the main stem, while the women grasp the branches, and they often tug harder than the men, for they load their skirts with stones, which adds weight to the force of their muscles. In Kamtchatka, when the fishing season is over, the people used to divide into two parties, one of which tried to pull a birch-tree by a strap through the smoke-hole into their subterranean winter dwelling, while the other party outside, pulling at the end of the tree, endeavoured to hinder them. If the party in the house succeeded, they raised shouts of joy and set up a grass effigy of a wolf, which they preserved carefully throughout the year, believing that it espoused their young women and prevented them from giving birth to twins. For they deem the birth of twins a dreadful misfortune and a horrible sin; they put it down to the wolf in the forest, and all who chance to be in the house at the time shew a clean pair of heels, leaving the mother and her infants to shift for themselves. Should the twins be both girls, the calamity is even greater. In the village of Doreh, in Dutch New Guinea, when some of the inhabitants have gone on a long journey, the people who stay at home engage in a Tug of War among themselves to determine whether the journey will be prosperous or not. One side represents the voyagers and the other side those who are left behind. They pull at opposite ends of a long bamboo, and if the bamboo breaks or the side which represents the people at home is obliged to let go, the omen is favourable.

In Morocco, also, the Tug of War is resorted to as a means of influencing the weather, sometimes in order to procure rain and sometimes to procure sunshine; and here men and women appear usually to take opposite sides in the contest. For example, among the Igliwa, a Berber people of the Great Atlas, when rain is wanted, they take a rope and the men pull at one end and women at the other. While they are tugging away, a man suddenly cuts the rope and the women fall down. The same device for procuring rain in time of drought is practised by the Ait Warain, another Berber tribe of Morocco; but among them in the heat of the contest the women as well as the men will sometimes let go the rope and allow the opposite party to fall on their backs. However, the Tsûl, another Berber tribe of Morocco, employ the Tug of War for the opposite purpose of ensuring a supply of sunshine and heat in autumn, when they wish to dry their figs and grapes; the contest takes place at night by the light of the moon. The apparent contradiction of employing the same procedure for opposite purposes vanishes if we suppose that, as the Assamese custom seems to indicate, the intention is to draw either a rainy or a dry wind out of the quarters from which the breezes that bring rain or sunshine usually blow, and which will usually be on opposite sides of the sky. Hence in order

fully to understand the Tug of War, when it is practised for the purpose of influencing the weather, we should know, first, the directions from which the rainy and the dry winds respectively come in the country under consideration, and second, the direction in which the rope is stretched between the contending parties. If, for example, as happens in Assam, the rainy wind blows from the west, and a victory of the eastern party in the Tug of War is an omen of prosperity, we may conclude with a fair degree of probability that the intention of the contest is to draw the rain from the quarter of the sky in which it is lingering. But these niceties of observation have usually escaped the attention of those who have described the Tug of War.

In various parts of Morocco games of ball are played for the sake now of procuring rain and now of procuring dry weather; the ball is sometimes propelled with sticks and sometimes with the feet of the competitors. An Arab questioned as to why a game of ball should bring on rain explained that the ball is dark like a rain-cloud. Perhaps the answer furnishes the clue to the meaning of the rite. If in such games played to influence the weather the ball represents a rain-cloud, the success or failure of the charm will depend on which side contrives to get the ball home in the enemy's quarters. For example, if rain is desired and the rainy wind blows in Morocco, as may perhaps be assumed, from the west, then should the western side succeed in driving the ball through the eastern goal, there will be rain; but if the eastern party wins, then the rain is driven away and the drought will continue. Thus a game of ball would in theory and practice answer exactly to the Tug of War practised for the same purposes.

In Morocco, however, the Tug of War is apparently used also for the purpose of ensuring prosperity in general without any special reference to the weather. Dr. Westermarck was informed by an old Arab from the Hiaina that the Tug of War "is no longer practised at the Great Feast, as it was in his childhood, but that it is performed in the autumn when the threshing is going on and the fruits are ripe. Then men and women have a tug of war by moonlight so that the *bäs*, or evil, shall go away, that the year shall be good, and that the people shall live in peace. Some man secretly cuts two of the three cords of which the rope is made, with the result that both parties tumble down." In this contest one party perhaps represents the powers of good and the other the powers of evil in general. But why in these Moroccan cases of the Tug of War the rope should be so often cut and one or both sides laid on their backs, is not manifest. Perhaps the simple device of suddenly slacking the rope in order to make the opposite side lose their footing, and so to haul the rope away from them before they can recover themselves, may have led to the more trenchant measure of cutting it with a knife for the same purpose.

These examples make it probable that wherever the Tug of War is played only at certain definite seasons or on certain particular occasions, it was originally performed, not as a mere pastime, but as a magical ceremony designed to work some good for the community. Further, we may surmise that in many cases the two contending parties represent respectively the powers of good and evil struggling against each other for the mastery, and as the community has always an interest in the prevalence of the powers of good, it may well happen that the powers of evil do not always get fair play in these conflicts; though no doubt when it comes to be "pull devil, pull baker," the devil is apt, in the spirit of a true sportsman, to tug with as hearty good will as his far more deserving adversary the baker. To take cases in which the game is played without any alleged practical motive, the Roocooyen Indians of French Guiana engage in the Tug of War as a sort of interlude during the ceremonial tortures of the youth. Among the Cingalese the game "is connected with the superstitious worship of the goddess Patiné; and is more intended for a propitiation to that deity, than considered as an indulgence, or pursued as an exercise. Two opposite parties procure two sticks of the strongest and toughest wood, and so crooked as to hook into one another without slipping;

they then attach strong cords or cable-rattans of sufficient length to allow of every one laying hold of them. The contending parties then pull until one of the sticks gives way." The victorious piece of wood is gaily decorated, placed in a palanquin, and borne through the village amid noisy rejoicings, often accompanied with coarse and obscene expressions. The use of foul language on this occasion suggests that the ceremony is here, as elsewhere, observed for the purpose of ensuring fertility. In the North-Western provinces of India the game is played on the fourteenth day of the light half of the month Kuar. The rope (*barra*) is made of the grass called *makra*, and is thicker than a man's arm. The various quarters of a village pull against each other, and the one which is victorious keeps possession of the rope during the ensuing year. It is chiefly in the east of these provinces that the game is played; in the west it is unknown. Sometimes the contest is between the inhabitants of neighbouring villages, and the rope is stretched across the boundary; plenty is supposed to attend the victorious side. At the Great Feast, a yearly sacrificial festival of the Mohammedan world, some tribes in Morocco practise a Tug of War. Thus among the Ait Sadden it is observed on the first day of the festival before the sacrifice; among the Ait Yusi it is performed either before the religious service or in the afternoon of the same day, and also in the morning of the Little Feast. Both sexes generally take part in the contest, the men tugging at one end of the rope and the women at the other, and sometimes the weaker party applies for help to persons of the same sex in a neighbouring village. When they are all hard at it, the men may suddenly let go the rope and so send the women sprawling on their backs.

At Ludlow in Shropshire a grand Tug of War used to take place on Shrove Tuesday between the inhabitants of Broad Street Ward on the one side and of Corve Street Ward on the other. The rope was three inches thick and thirty-six yards long, with a red knob at one end and a blue knob at the other. The rope was paid out by the Mayor in person from a window in the Market Hall at four o'clock in the afternoon. The shops then put up their shutters, and the population engaged in the struggle with enthusiasm, gentle and simple, lawyers and parsons bearing a hand on one side or the other, till their clothes were torn to tatters on their backs. The injured were carried into the neighbouring houses, where their hurts were attended to. If the party of the Red Knob won, they carried the rope in triumph to the River Leme and dipped it in the water. Finally, the rope was sold, the money which it brought in was devoted to the purchase of beer, and drinking, squabbling, and fighting ended the happy day. This ancient and highly popular pastime was suppressed in 1851 on the frivolous pretext that it gave rise to disorderly scenes and dangerous accidents. A similar custom has long been observed on Shrove Tuesday at Presteign in Radnorshire. The rope is pulled by two parties representing the upper and the lower portions of the town, who strive to drag it either to a point in the west wall or to another point in Broad Street, where the River Lugg is reached. In the Bocage of Normandy most desperate struggles used to take place between neighbouring parishes on Shrove Tuesday for the possession of a large leathern ball stuffed with bran and called a *soule*. The ball was launched on the village green and contended for by representatives of different parishes, who sometimes numbered seven or eight hundred, while five or six thousand people might assemble to witness the combat; for indeed it was a fight rather than a game. The conflict was maintained with the utmost fury; old scores were paid off between personal enemies; there were always many wounded, and sometimes there were deaths. The aim of each side was to drive the ball over a stream and to lodge it in a house of their own parish. It was thought that the parish which was victorious in the struggle would have a better crop of apples that year than its neighbours. At Lande-Patry the ball was provided by the bride who had been last married, and she had the honour of throwing it into the arena. The scene of the fiercest battles was St. Pierre d'Entremont, on the highroad between Condé and Tinchebray. After several unsuccessful attempts the custom was suppressed at that village in 1852 with the help of four or five brigades of police. It is now

everywhere extinct. The belief that the parish which succeeded in carrying the ball home would have a better crop of apples that year raises a presumption that these conflicts were originally practised as magical rites to ensure fertility. The local custom of Lande-Patry, which required that the ball should be provided and thrown by the last bride, points in the same direction. It is possible that the popular English, or rather Scotch, game of football had a similar origin: the winning side may have imagined that they secured good crops, good weather, or other substantial advantages to their village or ward.

In like manner, wherever a sham or a real conflict takes place between two parties annually, above all at the New Year, we may suspect that the old intention was to ensure prosperity in some form for the people throughout the following year, whether by obtaining possession of a material object in which the luck of the year was supposed to be embodied, or by defeating and driving away a band of men who personated the powers of evil. For example, among the Tenggerese of eastern Java the New Year festival regularly includes a sham fight fought between two bands of men, who are armed with spears and swords and advance against each other again and again at a dancing step, thrusting at their adversaries with their spears, but always taking care to miss their aim. Again, in Ferghana, a province of Turkestan, it is or used to be customary on the first day of the year for the king and chiefs to divide into two parties, each of which chose a champion. Then the two champions, clad in armour, engaged in a combat with each other, while the crowd joined in with bricks and stones. When one of them was slain the scrimmage stopped, and omens were drawn as to whether the year on which they had entered would be prosperous or the reverse. In these combats it seems probable that one side represents the demons or other powers of evil whom the people hope to vanquish and expel at the beginning of the New Year.

Oftener, however, the expelled demons are not represented at all, but are understood to be present invisibly in the material and visible vehicle which conveys them away. Here, again, it will be convenient to distinguish between occasional and periodical expulsions. We begin with the former.

§ 2. The Occasional Expulsion of Evils in a Material Vehicle.

The vehicle which conveys away the demons may be of various kinds. A common one is a little ship or boat. Thus, in the southern district of the island of Ceram, when a whole village suffers from sickness, a small ship is made and filled with rice, tobacco, eggs, and so forth, which have been contributed by all the people. A little sail is hoisted on the ship. When all is ready, a man calls out in a very loud voice, "O all ye sicknesses, ye smallpoxes, agues, measles, etc., who have visited us so long and wasted us so sorely, but who now cease to plague us, we have made ready this ship for you and we have furnished you with provender sufficient for the voyage. Ye shall have no lack of food nor of betel-leaves nor of areca nuts nor of tobacco. Depart, and sail away from us directly; never come near us again; but go to a land which is far from here. Let all the tides and winds waft you speedily thither, and so convey you thither that for the time to come we may live sound and well, and that we may never see the sun rise on you again." Then ten or twelve men carry the vessel to the shore, and let it drift away with the land-breeze, feeling convinced that they are free from sickness for ever, or at least till the next time. If sickness attacks them again, they are sure it is not the same sickness, but a different one, which in due time they dismiss in the same manner. When the demon-laden bark is lost to sight, the bearers return to the village, whereupon a man cries out, "The sicknesses are now gone, vanished, expelled, and sailed away." At this all the people come running out of their houses, passing the word from one to the other with great joy, beating on gongs and on tinkling instruments.

Similar ceremonies are commonly resorted to in other East Indian islands. Thus in Timor-laut, to mislead the demons who are causing sickness, a small proa, containing the image of a man and provisioned for a long voyage, is allowed to drift away with wind and tide. As it is being launched, the people cry, "O sickness, go from here; turn back; what do you here in this poor land?" Three days after this ceremony a pig is killed, and part of the flesh is offered to Dudilaa, who lives in the sun. One of the oldest men says, "Old sir, I beseech you make well the grandchildren, children, women, and men, that we may be able to eat pork and rice and to drink palm-wine. I will keep my promise. Eat your share, and make all the people in the village well." If the proa is stranded at any inhabited spot, the sickness will break out there. Hence a stranded proa excites much alarm amongst the coast population, and they immediately burn it, because demons fly from fire. In the island of Buru the proa which carries away the demons of disease is about twenty feet long, rigged out with sails, oars, anchor, and so on, and well stocked with provisions. For a day and a night the people beat gongs and drums, and rush about to frighten the demons. Next morning ten stalwart young men strike the people with branches, which have been previously dipped in an earthen pot of water. As soon as they have done so, they run down to the beach, put the branches on board the proa, launch another boat in great haste, and tow the disease-burdened bark far out to sea. There they cast it off, and one of them calls out, "Grandfather Smallpox, go away—go willingly away—go visit another land; we have made you food ready for the voyage, we have now nothing more to give." When they have landed, all the people bathe together in the sea. In this ceremony the reason for striking the people with the branches is clearly to rid them of the disease-demons, which are then supposed to be transferred to the branches. Hence the haste with which the branches are deposited in the proa and towed away to sea. So in the inland districts of Ceram, when smallpox or other sickness is raging, the priest strikes all the houses with consecrated branches, which are then thrown into the river, to be carried down to the sea; exactly as amongst the Wotyaks of Russia the sticks which have been used for expelling the devils from the village are thrown into the river, that the current may sweep the baleful burden away. In Amboyna, for a similar purpose, the whole body of the patient is rubbed with a live white cock, which is then placed on a little proa and committed to the waves; and in the Babar archipelago the bark which is to carry away to sea the sickness of a whole village contains a bowl of ashes taken from every kitchen in the village, and another bowl into which all the sick people have spat. The plan of putting puppets in the boat to represent sick persons, in order to lure the demons after them, is not uncommon. For example, most of the pagan tribes on the coast of Borneo seek to drive away epidemic disease as follows. They carve one or more rough human images from the pith of the sago palm and place them on a small raft or boat or full-rigged Malay ship together with rice and other food. The boat is decked with blossoms of the areca palm and with ribbons made from its leaves, and thus adorned the little craft is allowed to float out to sea with the ebb-tide, bearing, as the people fondly think or hope, the sickness away with it.

In Selangor, one of the native states in the Malay Peninsula, the ship employed in the export of disease is, or used to be, a model of a special kind of Malay craft called a *lanchang*. This was a two-masted vessel with galleries fore and aft, armed with cannon, and used by Malay rajahs on the coast of Sumatra. So gallant a ship would be highly acceptable to the spirits, and to make it still more beautiful in their eyes it was not uncommonly stained yellow with turmeric or saffron, for among the Malays yellow is the royal colour. Some years ago a very fine model of a *lanchang*, with its cargo of sickness, was towed down the river to sea by the Government steam launch. A common spell uttered at the launching of one of these ships runs as follows:—

*“Ho, elders of the upper reaches,
 Elders of the lower reaches,
 Elders of the dry land,
 Elders of the river-flats,
 Assemble ye, O people, lords of hill and hill-foot,
 Lords of cavern and hill-locked basin,
 Lords of the deep primeval forest,
 Lords of the river-bends,
 Come on board this lanchang, assembling in your multitudes.
 So may ye depart with the ebbing stream,
 Depart on the passing breeze,
 Depart in the yawning earth,
 Depart in the red-dyed earth.
 Go ye to the ocean which has no wave,
 And the plain where no green herb grows,
 And never return hither.
 But if ye return hither,
 Ye shall be consumed by the curse.
 At sea ye shall get no drink,
 Ashore ye shall get no food,
 But gape in vain about the world.”*

The practice of sending away diseases in boats is known outside the limits of the Malay region. Thus when smallpox raged among the Yabim of German New Guinea, they used to make a little model of a canoe with mast, sail, and rudder. Then they said to the small vessel, on which the spirit of smallpox was supposed to have taken his passage, “Bear him away to another village. When the people come forth to draw you ashore, give them ‘the thing’ and do to them what you have done to us.” Lest the spirit should be hungry on the voyage, they put some taro on board, and to make sure of getting rid of the disease, they wiped their hands on the tiny canoe, after which they let it drift away. It often happened that the wind or tide drove the vessel back to the place from which it started. Then there would be a deafening rub-a-dub of drums and blowing of shell-trumpets; and the little ship, or rather its invisible passenger, would be again apostrophized, “Do go away, you have already raged among us so that the air is poisoned with the stench of corpses.” If this time it sailed away, they would stand on the shore and watch it with glad hearts disappearing; then they would climb the trees to get a last glimpse of it till it vanished in the distance. After that they came down joyfully and said to each other, “We have had enough of it. The sickness has happily gone away.” When the Tagbanuas and other tribes of the Philippines suffered from epidemics, they used to make little models of ships, supply them with rice and fresh drinking water, and launch them on the sea, in order that the evil spirits might sail away in them. When the people of Tikopia, a small island in the Pacific, to the north of the New Hebrides, were attacked by an epidemic cough, they made a little canoe and adorned it with flowers. Four sons of the principal chiefs carried it on their shoulders all round the island, accompanied by the whole population, some of whom beat the bushes, while others uttered loud cries. On returning to the spot from which they had set out, they launched the canoe on the sea. In the Nicobar Islands, in the Bay of Bengal, when there is much sickness in a village or no fish are caught, the blame is laid upon the spirits. They must be propitiated with offerings. All relations and friends are invited, a huge pig is roasted, and the best of it is eaten, but some parts are offered to the shades. The heap of offerings remains in front of the house till it is carried away by the rising tide. Then the priests, their faces reddened with paint and swine's blood, pretend to catch the demon of disease, and after a hand-to-hand tussle, force him into a model boat, made of leaves and

decked with garlands, which is then towed so far to sea that neither wind nor tide is likely to drive it back to the shore. In Annam, when the population of a village has been decimated by cholera, they make a raft and lade it with offerings of money and food, such as a sucking pig, bananas, and oranges. Sticks of incense also smoke on the floating altar; and when all is ready and earnest prayers have been uttered, the raft is abandoned to the current of the river. The people hope that the demon of cholera, allured and gratified by these offerings, will float away on the raft and trouble them no more.

Often the vehicle which carries away the collected demons or ills of a whole community is an animal or scapegoat. In the Central Provinces of India, when cholera breaks out in a village, every one retires after sunset to his house. The priests then parade the streets, taking from the roof of each house a straw, which is burnt with an offering of rice, ghee, and turmeric, at some shrine to the east of the village. Chickens daubed with vermilion are driven away in the direction of the smoke, and are believed to carry the disease with them. If they fail, goats are tried, and last of all pigs. When cholera rages among the Bhars, Malians, and Kurmis of India, they take a goat or a buffalo—in either case the animal must be a female, and as black as possible—then having tied some grain, cloves, and red lead in a yellow cloth on its back they turn it out of the village. The animal is conducted beyond the boundary and not allowed to return. Sometimes the buffalo is marked with a red pigment and driven to the next village, where he carries the plague with him. The people of the city and cantonments of Sagar being afflicted with a violent influenza, General Sir William Sleeman received a request from the old Queen Dowager of Sagar “to allow of a noisy religious procession for the purpose of imploring deliverance from this great calamity. Men, women, and children in this procession were to do their utmost to add to the noise by ‘raising their voices in psalmody,’ beating upon their brass pots and pans with all their might, and discharging firearms where they could get them; and before the noisy crowd was to be driven a buffalo, which had been purchased by general subscription, in order that every family might participate in the merit. They were to follow it out for eight miles, where it was to be turned loose for any man who would take it. If the animal returned, the disease, it was said, must return with it, and the ceremony be performed over again.... It was, however, subsequently determined that the animal should be a goat, and he was driven before the crowd accordingly. I have on several occasions been requested to allow of such noisy *pūjās* in cases of epidemics.” Once, when influenza was raging in Pithoria, a village to the north-west of Sagar, a man had a small carriage made, after a plan of his own, for a pair of scapegoats, which were harnessed to it and driven to a wood at some distance, where they were let loose. From that hour the disease entirely ceased in the town. The goats never returned; had they done so, it was affirmed that the disease must have come back with them.

The use of a scapegoat is not uncommon in the hills of the Eastern Ghats. In 1886, during a severe outbreak of smallpox, the people of Jepur did reverence to a goat, marched it to the Ghats, and let it loose on the plains. In Southern Konkan, on the appearance of cholera, the villagers went in procession from the temple to the extreme boundaries of the village, carrying a basket of cooked rice covered with red powder, a wooden doll representing the pestilence, and a cock. The head of the cock was cut off at the village boundary, and the body was thrown away. When cholera had thus been transferred from one village to another, the second village observed the same ceremony and passed on the scourge to its neighbours, and so on through a number of villages. Among the Korwas of Mirzapur, when cholera has broken out, the priest offers a black cock or, if the disease is very malignant, a black goat, at the shrine of the local deity, and then drives the animal away in the direction of some other village. But it has not gone far before he overtakes it, kills it, and eats it; which he may do with perfect safety in virtue of his sacred office. Again, when cholera is raging among the

Pataris, an aboriginal Dravidian race of South Mirzapur, the wizard and the village elders feed a black cock with grain and drive it beyond the boundaries, ordering the fowl to take the disease away with it. A little oil, red lead, and a spangle worn by a woman on her forehead are usually fastened to the bird's head before it is let loose. The cost of purchasing the cock is defrayed by public subscription. When such a bird of ill-omen appears in a village, the priest takes it to the shrine of the local deity and sacrifices it there; but sometimes he merely bows before it at the shrine and passes it on to some other village. If a murrain attacks their cattle, the Kharwars of Northern India take a black cock and put red lead on its head, antimony on its eyes, a spangle on its forehead, and a pewter bangle on its leg; thus arrayed they let it loose, calling out to the disease, "Mount on the fowl and go elsewhere into the ravines and thickets; destroy the sin." Perhaps, as has been suggested, this tricking out of the bird with women's ornaments may be a relic of some grosser form of expiation in which a human being was sacrificed or banished. Charms of this sort in India no doubt date from a remote antiquity. An ancient Indian book of magic, known as the *Kausika Sutra*, describes a ceremony of letting loose against a hostile army a white-footed ewe in which the power of disease was believed to be incarnate. In the same treatise we read of a mode of getting rid of ill-luck by fastening a hook to the left leg of a crow, attaching a sacrificial cake to the hook, and then letting the bird fly away in a south-westerly direction, while the priest or magician recites as usual the appropriate formula.

Amongst the Dinkas, a pastoral people of the White Nile, each family possesses a sacred cow. When the country is threatened with war, famine, or any other public calamity, the chiefs of the village require a particular family to surrender their sacred cow to serve as a scapegoat. The animal is driven by the women to the brink of the river and across it to the other bank, there to wander in the wilderness and fall a prey to ravening beasts. Then the women return in silence and without looking behind them; were they to cast a backward glance, they imagine that the ceremony would have no effect. When influenza broke out in a virulent form among the negroes of Togoland during the winter of 1892, the natives set the trouble down to the machinations of evil spirits, who must be expelled the country. The principal instrument of expulsion was a fat toad, which was dragged through the streets of every town or village, followed by an elder who sprinkled holy water to right and left. All the evil was thus concentrated in the toad, which was finally thrown away into the forest. Thus the natives expected to rid the village of the influenza. In 1857, when the Aymara Indians of Bolivia and Peru were suffering from a plague, they loaded a black llama with the clothes of the plague-stricken people, sprinkled brandy on the clothes, and then turned the animal loose on the mountains, hoping that it would carry the pest away with it.

In some parts of India a principal means of expelling an epidemic is a little toy chariot called a *ratha* or *rath*, in which the goddess of the disease is supposed to be carted away. It is carried or drawn in procession to the next village, the inhabitants of which pass it on in like manner, with great alacrity, to their neighbours. Thus the goddess and the plague are transferred from village to village, until at last they come to one which is so far away from its next neighbour that the people do not care to undertake the long weary journey. In that case they content themselves with conveying the chariot to a place so shut in by hills that the disease cannot possibly escape, and there they leave it to die. Or if the village is near the sea, they drown the sickness by throwing the chariot into the water. However, in Central India the real home of the goddess of cholera is at Unkareshwar; and accordingly the chariot in which she is politely escorted out of a village is finally deposited at or near that place. It is usual and proper for the people of a village to give a friendly notice to their neighbours that they are going to cart the cholera, smallpox, or whatever it may be, to their village, so that the inhabitants may be ready to receive the goddess with due honour and to escort her on her

progress. But some unneighbourly folk, without giving notice, go by night and stealthily deposit the chariot on the outskirts of the next village. If the inhabitants are not on the watch, and suffer the fatal little vehicle to remain there, the disease will naturally cleave to them. Sometimes, perhaps generally, the procession with the chariot is accompanied by a goat, a cock, and a pot of native beer or wine, which serve as additional attractions to the goddess to set out on her travels.

Occasionally the scapegoat is a man. For example, from time to time the gods used to warn the King of Uganda that his foes the Banyoro were working magic against him and his people to make them die of disease. To avert such a catastrophe the king would send a scapegoat to the frontier of Bunyoro, the land of the enemy. The scapegoat consisted of either a man and a boy or a woman and her child, chosen because of some mark or bodily defect, which the gods had noted and by which the victims were to be recognized. With the human victims were sent a cow, a goat, a fowl, and a dog; and a strong guard escorted them to the land which the god had indicated. There the limbs of the victims were broken and they were left to die a lingering death in the enemy's country, being too crippled to crawl back to Uganda. The disease or plague was thought to have been thus transferred to the victims and to have been conveyed back in their persons to the land from which it came. So, too, after a war the gods sometimes advised the king to send back a scapegoat in order to free the warriors from some evil that had attached itself to the army. One of the women slaves, a cow, a goat, a fowl, and a dog would be chosen from among the captives and sent back to the borders of the country whence they had come; there they were maimed and left to die. After that the army would be pronounced clean and allowed to return to the capital. In each case a bundle of herbs would be rubbed over the people and the cattle, and would then be tied to the victims, who would thus carry back the evil with them. A similar use of scapegoats, human and animal, was regularly made after a King of Uganda had been crowned. Two men were brought to the king; one of them he wounded slightly with an arrow shot from a bow. The man was then sent away, under a strong guard, as a scapegoat to Bunyoro, the enemy's country, and with him were sent a cow, a goat, and a dog. On his sad journey he took with him the dust and ashes of the sacred fire, which had burned day and night at the entrance to the late king's enclosure and had been extinguished, as usual, at his death. Arrived at their destination, the man and the animals were maimed and left to die. They were believed to bear away with them any uncleanness that might cleave to the new King or Queen.

Some of the aboriginal tribes of China, as a protection against pestilence, select a man of great muscular strength to act the part of scapegoat. Having besmeared his face with paint, he performs many antics with the view of enticing all pestilential and noxious influences to attach themselves to him only. He is assisted by a priest. Finally the scapegoat, hotly pursued by men and women beating gongs and tom-toms, is driven with great haste out of the town or village. In the Punjab a cure for the murrain is to hire a man of the Chamar caste, turn his face away from the village, brand him with a red-hot sickle, and let him go out into the jungle taking the murrain with him. He must not look back. When disease breaks out among a herd, the Oraons take the herdsman himself, tie a wooden bell from one of the cows round his neck, beat him with sticks, and drive him out of the village to a cross-road, where the bell and sticks are deposited. In the territory of Kumaon, lying on the southern slopes of the Western Himalayas, the custom of employing a human scapegoat appears to have taken a somewhat peculiar form in the ceremony known as Barat. First of all a thick rope of grass is stretched from the top of a cliff to the valley beneath, where it is made fast to posts driven into the ground. Next a wooden saddle, with a very sharp ridge and unpadded, is attached by thongs to the cable, along which it runs in a deep groove. A man now seats himself on the saddle and is strapped to it, while sand-bags or heavy stones are suspended from his feet to secure his

balance. Then, after various ceremonies have been performed and a kid sacrificed, he throws himself as far back in the saddle as he can go, and is started off to slide down the rope into the valley. Away he shoots at an ever-increasing speed; the saddle under him, however well greased, emits volumes of smoke during the greater part of his progress; and he is nearly senseless when he reaches the bottom. Here men are waiting to catch him and run forward with him some distance in order to break gradually the force of his descent. This ceremony, regarded as a propitiation of Mahadeva, is performed as a means of delivering a community from present or impending calamity. Thus, for example, it was performed when cholera was raging at Almora, and the people traced the immunity they enjoyed to the due observance of the rite. Each district has its hereditary Badi, as the performer is called; he is supported by annual contributions in grain from the inhabitants, as well as by special payments for each performance. When the ceremony is over, the grass rope is cut up and distributed among the villagers, who hang the pieces as charms at the eaves of their houses; and they preserve the hair of the Badi for a similar purpose. Yet while his severed locks bring fertility to other people's lands, he entails sterility on his own; and it is firmly believed that no seed sown by his hand could ever sprout. Formerly the rule prevailed that, if a Badi had the misfortune to fall from the rope in the course of his flying descent, he was immediately despatched with a sword by the spectators. The rule has naturally been abolished by the English Government; but its former observance seems to indicate that the custom of letting a man slide down a rope as a charm to avert calamity is only a mitigation of an older custom of putting him to death.

A somewhat similar ceremony is annually performed at Lhasa a few days after the beginning of the Tibetan New Year, which falls in spring. The scene of the performance is Potala Hill, on the summit and slope of which is built the superb castle of the Grand Lama of Tibet, a massive and imposing pile of buildings which attracts the eye and dominates the landscape from afar. On the day in question a rope of hide is stretched from the top to the bottom of the steep hill, and men from a distant province of Tibet climb up it with the agility of monkeys. They are called Flying Spirits. Arrived at the top, each of them places a piece of wood on his breast, stretches out his hands and feet, and letting himself go shoots down the rope (in the words of a Chinese writer) "like the bolt flying from the bow, or the swallow skimming the water. 'Tis a wondrous sight!" Considering that these performers are called Spirits, and that the performance takes place a few days after the New Year, a season so commonly selected for the expulsion of demons, we may conjecture that the Flying Spirits represent the powers of evil who are thus shot out of the Tibetan pope's palace at the beginning of the year.

§ 3. The Periodic Expulsion of Evils in a Material Vehicle.

In this last case the expulsion of evils, if I am right in so interpreting the ceremony, is periodic, not occasional, being repeated every spring at the beginning of a new year. It brings us accordingly to the consideration of a whole class of such cases, for the mediate expulsion of evils by means of a scapegoat or other material vehicle, like the immediate expulsion of them in invisible form, tends to become periodic, and for a like reason. Thus in Perak, a state on the west coast of the Malay Peninsula, it was in ancient times the custom to perform periodically a ceremony intended to ensure the prosperity of the country by the propitiation of friendly spirits and the expulsion of evil influences. The writer who records the custom is uncertain as to the period which elapsed between two successive celebrations; he suggests with hesitation that the rite was performed once in seven years or once in a Rajah's reign. The name of the ceremony was *pēlas negri*, which means "the cleansing of the country from evils." When the time came, the Rajah, the chiefs, and a great following of people assembled at a point as far up the river as possible, but short of the rapids which further up impede navigation. There a number of rafts were prepared, some of them elaborately built with houses on them. Four of them were devoted to the four great classes of spirits which are

found in Perak, namely the *Hantu Blian* or “Tiger-spirits,” the *Hantu Sungkei*, the *Hantu Malayu*, and the *Jin Raja*. In each of these rafts a number of wizards (*pawang*s) took up their post, according to the particular class of demon which they affected. The procession was headed by the raft devoted to the Tiger-spirits; and in it was set up a *prah* tree with all its branches, kept erect by stays. It was followed by the three rafts dedicated to the other three classes of spirits, and behind them came a train of other rafts bearing mere common mortals, the royal bandsmen, the Rajah himself, the chiefs, and the people. As the long procession floated down the river with the current, the wizards, standing on sheets of tin, waved white cloths and shouted invocations to the spirits and demons who inhabited the country through which the rafts were drifting seaward. The burden of the invocations was to invite the spirits and demons to come aboard the rafts and partake of the food which had been considerably made ready for them. At every village on the bank large enough to possess a mosque (for the Malays of Perak are professing Mohammedans) the procession halted; a buffalo, subscribed for by the inhabitants, was slaughtered, and its head placed on one of the spirit-barks, while people feasted on the flesh. The ceremony ended at Bras Basah, a village on the left bank of the Perak river, not far from its mouth. There the rafts were abandoned to the current, which swept them out to sea, doubtless bearing with them the hapless demons who had been lured by the tempting viands to embark and were now left to toss forlorn on the great deep at the mercy of the waves and the winds.

Again, every year, generally in March, the people of Leti, Moa, and Lakor, islands of the Indian Archipelago, send away all their diseases to sea. They make a proa about six feet long, rig it with sails, oars, rudder, and other gear, and every family deposits in it some rice, fruit, a fowl, two eggs, insects that ravage the fields, and so on. Then they let it drift away to sea, saying, “Take away from here all kinds of sickness, take them to other islands, to other lands, distribute them in places that lie eastward, where the sun rises.” The Biajas of Borneo annually send to sea a little bark laden with the sins and misfortunes of the people. The crew of any ship that falls in with the ill-omened bark at sea will suffer all the sorrows with which it is laden. A like custom is annually observed by the Dusuns of the Tuaran district in British North Borneo. The ceremony is the most important of the whole year. Its aim is to bring good luck to the village during the ensuing year by solemnly expelling all the evil spirits that may have collected in or about the houses throughout the last twelve months. The task of routing out the demons and banishing them devolves chiefly on women, who indeed play the principal part in all religious ceremonies among the Dusuns, while the humble duty of beating drums and banging gongs is discharged by members of the inferior sex. On this momentous occasion a procession of women, in full ceremonial dress, goes from house to house, stopping at each to go through their performances. At the head of the procession marches a boy carrying a spear on which is impaled a bundle of palm leaves containing rice. He is followed by two men, who carry a large gong and a drum slung on a pole between them. Then come the women. One of them carries a small sucking pig in a basket on her back; and all of them bear wands, with which they belabour the little pig at the appropriate moment; its squeals help to attract the vagrant spirits. At every house the women dance and sing, clashing castanets or cymbals of brass and jingling bunches of little brass bells in both hands. When the performance has been repeated at every house in the village, the procession defiles down to the river and all the evil spirits, which the performers have chased from the houses, follow them to the edge of the water. There a raft has been made ready and moored to the bank. It contains offerings of food, cloth, cooking-pots, and swords; and the deck is crowded with figures of men, women, animals, and birds, all made out of the leaves of the sago palm. The evil spirits now embark on the raft, and when they are all aboard, it is pushed off and allowed to float down with the current, carrying the demons with it. Should the raft run aground near the village, it is shoved off with all speed, lest the invisible passengers

should seize the opportunity of landing and returning to the village. Finally, the sufferings of the little pig, whose squeals served to decoy the demons from their lurking-places, are terminated by death, for it is killed and its carcase thrown away.

Every year, at the beginning of the dry season, the Nicobar Islanders carry the model of a ship through their villages. The devils are chased out of the huts, and driven on board the little ship, which is then launched and suffered to sail away with the wind. The ceremony has been described by a catechist, who witnessed it at Car Nicobar in July 1897. For three days the people were busy preparing two very large floating cars, shaped like canoes, fitted with sails, and loaded with certain leaves, which possessed the valuable property of expelling devils. While the young people were thus engaged, the exorcists and the elders sat in a house singing songs by turns; but often they would come forth, pace the beach armed with rods, and forbid the devil to enter the village. The fourth day of the solemnity bore the name of *Intō-nga-Sīya*, which means "Expelling the Devil by Sails." In the evening all the villagers assembled, the women bringing baskets of ashes and bunches of devil-expelling leaves. These leaves were then distributed to everybody, old and young. When all was ready, a band of robust men, attended by a guard of exorcists, carried one of the cars down to the sea on the right side of the village graveyard, and set it floating in the water. As soon as they had returned, another band of men carried the other car to the beach and floated it similarly in the sea to the left of the graveyard. The demon-laden barks being now launched, the women threw ashes from the shore, and the whole crowd shouted, saying, "Fly away, devil, fly away, never come again!" The wind and the tide being favourable, the canoes sailed quickly away; and that night all the people feasted together with great joy, because the devil had departed in the direction of Chowra. A similar expulsion of devils takes place once a year in other Nicobar villages; but the ceremonies are held at different times in different places.

At Sucla-Tirtha, in India, an earthen pot containing the accumulated sins of the people is (annually?) set adrift on the river. Legend says that the custom originated with a wicked priest who, after atoning for his guilt by a course of austerities and expiatory ceremonies, was directed to sail upon the river in a boat with white sails. If the white sails turned black, it would be a sign that his sins were forgiven him. They did so, and he joyfully allowed the boat to drift with his sins to sea. Amongst many of the aboriginal tribes of China, a great festival is celebrated in the third month of every year. It is held by way of a general rejoicing over what the people believe to be a total annihilation of the ills of the past twelve months. The destruction is supposed to be effected in the following way. A large earthenware jar filled with gunpowder, stones, and bits of iron is buried in the earth. A train of gunpowder, communicating with the jar, is then laid; and a match being applied, the jar and its contents are blown up. The stones and bits of iron represent the ills and disasters of the past year, and the dispersion of them by the explosion is believed to remove the ills and disasters themselves. The festival is attended with much revelling and drunkenness. On New Year's Day people in Corea seek to rid themselves of all their distresses by painting images on paper, writing against them their troubles of body or mind, and afterwards giving the papers to a boy to burn. Another method of effecting the same object at the same season is to make rude dolls of straw, stuff them with a few copper coins, and throw them into the street. Whoever picks up such an effigy gets all the troubles and thereby relieves the original sufferer. Again, on the fourteenth day of the first month the Coreans fly paper kites inscribed with a wish that all the ills of the year may fly away with them. Mr. George Bogle, the English envoy sent to Tibet by Warren Hastings, witnessed the celebration of the Tibetan New Year's Day at Teshu Lumbo, the capital of the Teshu Lama. Monks walked in procession round the court to the music of cymbals, tabors, trumpets, hautboys and drums. Then others, clad in masquerade dress and wearing masks which represented the heads of

animals, mostly wild beasts, danced with antic motions. "After this, the figure of a man, chalked upon paper, was laid upon the ground. Many strange ceremonies, which to me who did not understand them appeared whimsical, were performed about it; and a great fire being kindled in a corner of the court, it was at length held over it, and being formed of combustibles, vanished with much smoke and explosion. I was told it was a figure of the devil." Another Tibetan mode of expelling demons from a dwelling is to make a paste image, into which the lamas by their incantations conjure all the evil spirits that may be lurking in the house. This image is carried to a distance by a runner and thrown away. He is attended by men, who shout at the top of their voices, brandish swords, and fire guns, all to frighten the demons and drive them far from human habitations.

At Old Calabar on the coast of Guinea, the devils and ghosts are, or used to be, publicly expelled once in two years. Among the spirits thus driven from their haunts are the souls of all the people who died since the last lustration of the town. About three weeks or a month before the expulsion, which according to one account takes place in the month of November, rude effigies representing men and animals, such as crocodiles, leopards, elephants, bullocks, and birds, are made of wicker-work or wood, and being hung with strips of cloth and bedizened with gew-gaws, are set before the door of every house. About three o'clock in the morning of the day appointed for the ceremony the whole population turns out into the streets, and proceeds with a deafening uproar and in a state of the wildest excitement to drive all lurking devils and ghosts into the effigies, in order that they may be banished with them from the abodes of men. For this purpose bands of people roam through the streets knocking on doors, firing guns, beating drums, blowing on horns, ringing bells, clattering pots and pans, shouting and hallooing with might and main, in short making all the noise it is possible for them to raise. The hubbub goes on till the approach of dawn, when it gradually subsides and ceases altogether at sunrise. By this time the houses have been thoroughly swept, and all the frightened spirits are supposed to have huddled into the effigies or their fluttering drapery. In these wicker figures are also deposited the sweepings of the houses and the ashes of yesterday's fires. Then the demon-laden images are hastily snatched up, carried in tumultuous procession down to the brink of the river, and thrown into the water to the tuck of drums. The ebb-tide bears them away seaward, and thus the town is swept clean of ghosts and devils for another two years. This biennial expulsion of spirits goes by the name of *Ndok*, and the effigies by which it is effected are called *Nabikem* or *Nabikim*.

Further to the west similar ceremonies are or were till recently enacted at Porto Novo, the seaport of Dahomey. One of them has been described by an eye-witness, a Catholic missionary, who interpreted the rites as a Funeral of Death. He says: "Some time ago a curious event took place: the King had commanded to celebrate the funeral of Death. Every year, at the season of the rains, the predecessors of his sable Majesty, in order to preserve the life of their dear subjects, had caused the fetish of that terrible and pitiless enemy, who spares not even kings, to be drowned in the lagoon. Toffa wished to comply with the traditions of his ancestors." However, the ceremony as described by the missionary seems to conform closely to the type of the expulsion of ghosts and demons. Two days before the crowning act of the celebration the streets were carefully swept and all the filth which usually encumbered them was removed, "lest Death should there find a refuge." All the people from the neighbouring villages assembled; their fetishes, daubed with red paint, were carried in great pomp through the streets of the capital attended by noisy processions of mummers. A great multitude passed the night in the public square, drinking, singing, and shouting. Finally, a number of rude and hideous effigies were escorted by a noisy crowd to the shore of the lagoon; there canoes were waiting to receive them and paddle them out to deep water, where they were flung overboard. These effigies the missionary regarded as so many images of

Death, who thus received his passport and was dismissed from the territory of Porto Novo. But more probably they represented the hosts of demons and ghosts who were believed to lurk about the town and to massacre people under the form of sickness and disease. Having made a clean sweep of the whole baleful crew the inhabitants no doubt thought that they had removed the principal, if not the only, cause of death, and that accordingly they had taken out a new lease of life. It is not without interest to observe that in cleansing their streets the people did actually retrench one of the most fruitful sources of disease and death, especially in the sweltering heat of a damp tropical climate; hence the measures they took for the prolongation of their lives were really to a certain extent effectual, though they did not accomplish their object in the precise way they imagined. So curiously does it often happen that the savage reaches the goal of his wishes by a road which to civilized man might appear at first sight to lead far away from it.

Before the Hos of Togoland, to the west of Dahomey, celebrate their festival of the new yams, which has been described in another part of this work, they say that it is necessary to clean the town and to put it in order. The way in which they do so is this. They take leaves of two particular sorts of trees (the *adzu* and the *wo*), together with creepers and ashes, and bind all the leaves fast to a pole of the *adzu* tree. As they do so they pray or command the evil spirits, the witches, and all other evils in the town to enter into the band and be bound with it. Then they make a paste out of the ashes mixed with urine and smear it on the bundle of leaves, saying, "We smear it on the face of the Evil Ones who are in this bundle, in order that they may not be able to see any more." Then they throw the bundle on the ground and mock at it. Next they take all the similar poles, wrapt in creepers, in which they have bound up all the evil powers, and carry them out of the town and stick them in the ground on the various roads leading into the town. When they have done this, they say that they have driven the evils out of the town and shut the door against them. After that they wash the faces of all the people with a medicine which has been prepared by the oldest men. Thereupon they all return home to sweep out their houses and yards; they sweep even the ground in front of the yards, so that the whole town is thoroughly clean. All the grass-stalks and refuse of stock-yams which have been swept together are carried out of the town, and the people rail at the stock-yams. In the course of the night the oldest men assemble and tie a toad to a young palm-leaf. They say that they wish now to sweep the town and finish the ceremony. So they drag the toad behind them through the whole town in the direction of Mount Adaklu. When that has been done, the priests say that they will now remove the sicknesses. In the evening they give public notice that they are about to take to the road, so nobody may light a fire on the hearth or eat. At dead of night, when people are asleep, three men go through the town. One of them drags behind them a toad fastened to a bunch of herbs; another carries a calabash of holy herbs and water, with which he sprinkles the streets; and the third whistles softly. As soon as they have thus passed through the whole town, they throw away the toad and the holy herbs in the direction of Mount Adaklu. Next morning the women sweep out their houses and hearths and set the sweepings on broken wooden plates. Many put on torn mats or torn clothes; others tie grasses and creepers about them. While they do so, they pray, saying, "All ye sicknesses which are in our body and plague us, we are come this day to cast you out!" When they set out so to do, the priest commands every man to cry out thrice and thereby to smite himself on the mouth. In a moment they all cry out, smite themselves on the mouth, and run as fast as their legs can carry them in the direction of Mount Adaklu. As they run, they say, "Out to-day! Out to-day! What kills anybody, out to-day! Ye evil spirits, out to-day! And all that makes our heads to ache, out to-day! Anlo and Adaklu are the places whither all evil ought to go." Now on Mount Adaklu there stands a *klo* tree; and when they have come thither they throw everything away and return home. After their return every man washes himself with the medicine which is set forth for that purpose in the public street; then

he goes into his house. Such is the ceremony by which the Hos prepare themselves to eat the new yams. Thus among the Hos the public expulsion of evils is definitely connected with the crops and therefore takes place every year, not every two years, as at Old Calabar.

Similar annual expulsions of embodied evils are not unknown in Europe. On the evening of Easter Sunday the gypsies of Southern Europe take a wooden vessel like a band-box, which rests cradle-wise on two cross pieces of wood. In this they place herbs and simples, together with the dried carcass of a snake, or lizard, which every person present must first have touched with his fingers. The vessel is then wrapt in white and red wool, carried by the oldest man from tent to tent, and finally thrown into running water, not, however, before every member of the band has spat into it once, and the sorceress has uttered some spells over it. They believe that by performing this ceremony they dispel all the illnesses that would otherwise have afflicted them in the course of the year; and that if any one finds the vessel and opens it out of curiosity, he and his will be visited by all the maladies which the others have escaped.

The scapegoat by means of which the accumulated ills of a whole year are publicly expelled is sometimes an animal. For example, among the Garos of Assam, "besides the sacrifices for individual cases of illness, there are certain ceremonies which are observed once a year by a whole community or village, and are intended to safeguard its members from dangers of the forest, and from sickness and mishap during the coming twelve months. The principal of these is the *Asongtata* ceremony. Close to the outskirts of every big village a number of stones may be noticed stuck into the ground, apparently without order or method. These are known by the name of *asong*, and on them is offered the sacrifice which the *Asongtata* demands. The sacrifice of a goat takes place, and a month later, that of a *langur* (*Entellus* monkey) or a bamboo-rat is considered necessary. The animal chosen has a rope fastened round its neck and is led by two men, one on each side of it, to every house in the village. It is taken inside each house in turn, the assembled villagers, meanwhile, beating the walls from the outside, to frighten and drive out any evil spirits which may have taken up their residence within. The round of the village having been made in this manner, the monkey or rat is led to the outskirts of the village, killed by a blow of a *dao*, which disembowels it, and then crucified on bamboos set up in the ground. Round the crucified animal long, sharp bamboo stakes are placed, which form *chevaux de frise* round about it. These commemorate the days when such defences surrounded the villages on all sides to keep off human enemies, and they are now a symbol to ward off sickness and dangers to life from the wild animals of the forest. The *langur* required for the purpose is hunted down some days before, but should it be found impossible to catch one, a brown monkey may take its place; a hullock may not be used." Here the crucified ape or rat is the public scapegoat, which by its vicarious sufferings and death relieves the people from all sickness and mishap in the coming year.

Again, on one day of the year the Bhotiyas of Juhar, in the Western Himalayas, take a dog, intoxicate him with spirits and bhang or hemp, and having fed him with sweetmeats, lead him round the village and let him loose. They then chase and kill him with sticks and stones, and believe that, when they have done so, no disease or misfortune will visit the village during the year. In some parts of Breadalbane it was formerly the custom on New Year's Day to take a dog to the door, give him a bit of bread, and drive him out, saying, "Get away, you dog! Whatever death of men or loss of cattle would happen in this house to the end of the present year, may it all light on your head!" It appears that the white dogs annually sacrificed by the Iroquois at their New Year Festival are, or have been, regarded as scapegoats. According to Mr. J. V. H. Clark, who witnessed the ceremony in January 1841, on the first day of the festival all the fires in the village were extinguished, the ashes scattered to the winds, and a new fire kindled with flint and steel. On a subsequent day, men dressed in fantastic costumes

went round the village, gathering the sins of the people. When the morning of the last day of the festival was come, two white dogs, decorated with red paint, wampum, feathers, and ribbons, were led out. They were soon strangled, and hung on a ladder. Firing and yelling succeeded, and half an hour later the animals were taken into a house, "where the people's sins were transferred to them." The carcasses were afterwards burnt on a pyre of wood. According to the Rev. Mr. Kirkland, who wrote in the eighteenth century, the ashes of the pyre upon which one of the white dogs was burnt were carried through the village and sprinkled at the door of every house. Formerly, however, as we have seen, the Iroquois expulsion of evils was immediate and not by scapegoat. On the Day of Atonement, which was the tenth day of the seventh month, the Jewish high-priest laid both his hands on the head of a live goat, confessed over it all the iniquities of the Children of Israel, and, having thereby transferred the sins of the people to the beast, sent it away into the wilderness.

The scapegoat upon whom the sins of the people are periodically laid, may also be a human being. At Onitsha, on the Niger, two human beings used to be annually sacrificed to take away the sins of the land. The victims were purchased by public subscription. All persons who, during the past year, had fallen into gross sins, such as incendiarism, theft, adultery, witchcraft, and so forth, were expected to contribute 28 *ngugas*, or a little over £2. The money thus collected was taken into the interior of the country and expended in the purchase of two sickly persons "to be offered as a sacrifice for all these abominable crimes—one for the land and one for the river." A man from a neighbouring town was hired to put them to death. On the twenty-seventh of February 1858 the Rev. J. C. Taylor witnessed the sacrifice of one of these victims. The sufferer was a woman, about nineteen or twenty years of age. They dragged her alive along the ground, face downwards, from the king's house to the river, a distance of two miles, the crowds who accompanied her crying, "Wickedness! wickedness!" The intention was "to take away the iniquities of the land. The body was dragged along in a merciless manner, as if the weight of all their wickedness was thus carried away." Similar customs are said to be still secretly practised every year by many tribes on the delta of the Niger in spite of the vigilance of the British Government. Among the Yoruba negroes of West Africa "the human victim chosen for sacrifice, and who may be either a free-born or a slave, a person of noble or wealthy parentage, or one of humble birth, is, after he has been chosen and marked out for the purpose, called an *Oluwo*. He is always well fed and nourished and supplied with whatever he should desire during the period of his confinement. When the occasion arrives for him to be sacrificed and offered up, he is commonly led about and paraded through the streets of the town or city of the Sovereign who would sacrifice him for the well-being of his government and of every family and individual under it, in order that he might carry off the sin, guilt, misfortune and death of all without exception. Ashes and chalk would be employed to hide his identity by the one being freely thrown over his head, and his face painted with the latter, whilst individuals would often rush out of their houses to lay their hands upon him that they might thus transfer to him their sin, guilt, trouble, and death. This parading done, he is taken through a temporary sacred shed of palm and other tree branches, and especially of the former, the *Igbo*du and to its first division, where many persons might follow him, and through a second where only the chiefs and other very important persons might escort and accompany him to, and to a third where only the *Babalawo* [priest] and his official assistant, the *Ajigbona*, are permitted to enter with him. Here, after he himself has given out or started his last song, which is to be taken up by the large assembly of people who will have been waiting to hear his last word or his last groan, his head is taken off and his blood offered to the gods. The announcement of his last word or his last groan heard and taken up by the people, would be a signal for joy, gladness, and thanksgiving, and for drum beating and dancing, as an expression of their gratification

because their sacrifice has been accepted, the divine wrath is appeased, and the prospect of prosperity or increased prosperity assured.”

In Siam it used to be the custom on one day of the year to single out a woman broken down by debauchery, and carry her on a litter through all the streets to the music of drums and hautboys. The mob insulted her and pelted her with dirt; and after having carried her through the whole city, they threw her on a dunghill or a hedge of thorns outside the ramparts, forbidding her ever to enter the walls again. They believed that the woman thus drew upon herself all the malign influences of the air and of evil spirits. In Japan the “*tsuina* or *oni-yarahi*, that is to say, demon expelling, is a sort of drama in which disease, or more generally ill-luck, is personified, and driven away with threats and a show of violence. Like the *oho-harahi*, it was performed on the last day of the year. This association is only natural. The demons of the *tsuina* are personified wintry influences, with the diseases which they bring with them, while the *oho-harahi* is intended to cleanse the people from sin and uncleanness, things closely related to disease, as well as from disease itself. Though probably of Chinese origin, the *tsuina* is a tolerably ancient rite. It is alluded to in the *Nihongi* under the date a.d. 689. It was at one time performed at Court on an imposing scale. Four bands of twenty youths, each wearing a four-eyed mask, and each carrying a halberd in the left hand, marched simultaneously from the four gates of the palace, driving the devils before them. Another account of this ceremony says that a man disguised himself as the demon of pestilence, in which garb he was shot at and driven off by the courtiers armed with peach-wood bows and arrows of reed. Peach-wood staves were used for the same purpose. There was formerly a practice at Asakusa in Tokio on the last day of the year for a man got up as a devil to be chased round the pagoda there by another wearing a mask. After this 3,000 tickets were scrambled for by the spectators. These were carried away and pasted up over the doors as a charm against pestilence.” The Battas of Sumatra offer either a red horse or a buffalo as a public sacrifice to purify the land and obtain the favour of the gods. Formerly, it is said, a man was bound to the same stake as the buffalo, and when they killed the animal, the man was driven away; no one might receive him, converse with him, or give him food. Doubtless he was supposed to carry away the sins and misfortunes of the people.

Human scapegoats, as we shall see presently, were well known in classical antiquity, and even in mediæval Europe the custom seems not to have been wholly extinct. In the town of Halberstadt, in Thüringen, there was a church said to have been founded by Charlemagne. In this church every year they chose a man, who was believed to be stained with heinous sins. On the first day of Lent he was brought to the church, dressed in mourning garb, with his head muffled up. At the close of the service he was turned out of the church. During the forty days of Lent he perambulated the city barefoot, neither entering the churches nor speaking to any one. The canons took it in turn to feed him. After midnight he was allowed to sleep in the streets. On the day before Good Friday, after the consecration of the holy oil, he was readmitted to the church and absolved from his sins. The people gave him money. He was called Adam, and was now believed to be in a state of innocence. At Entlebuch, in Switzerland, down to the close of the eighteenth century, the custom of annually expelling a scapegoat was preserved in the ceremony of driving “Posterli” from the village into the lands of the neighbouring village. “Posterli” was represented by a lad disguised as an old witch or as a goat or an ass. Amid a deafening noise of horns, clarionets, bells, whips, and so forth, he was driven out. Sometimes “Posterli” was represented by a puppet, which was drawn on a sledge and left in a corner of the neighbouring village. The ceremony took place on the Thursday evening of the last week but one before Christmas.

In Munich down to about a hundred years ago the expulsion of the devil from the city used to be annually enacted on Ascension Day. On the Eve of Ascension Day a man disguised as a

devil was chased through the streets, which were then narrow and dirty in contrast to the broad, well-kept thoroughfares, lined with imposing buildings, which now distinguish the capital of Bavaria. His pursuers were dressed as witches and wizards and provided with the indispensable crutches, brooms, and pitchforks which make up the outfit of these uncanny beings. While the devil fled before them, the troop of maskers made after him with wild whoops and halloos, and when they overtook him they ducked him in puddles or rolled him on dunghills. In this way the demon at last succeeded in reaching the palace, where he put off his hideous and now filthy disguise and was rewarded for his vicarious sufferings by a copious meal. The devilish costume which he had thrown off was then stuffed with hay and straw and conveyed to a particular church (the Frauenkirche), where it was kept over night, being hung by a rope from a window in the tower. On the afternoon of Ascension Day, before the Vesper service began, an image of the Saviour was drawn up to the roof of the church, no doubt to symbolize the event which the day commemorates. Then burning tow and wafers were thrown on the people. Meantime the effigy of the devil, painted black, with a pair of horns and a lolling red tongue, had been dangling from the church tower, to the delight of a gaping crowd of spectators gathered before the church. It was now flung down into their midst, and a fierce struggle for possession of it took place among the rabble. Finally, it was carried out of the town by the Isar gate and burned on a neighbouring height, "in order that the foul fiend might do no harm to the city." The custom died out at Munich towards the end of the eighteenth century; but it is said that similar ceremonies are observed to this day in some villages of Upper Bavaria.

This quaint ceremony suggests that the pardoned criminal who used to play the principal part in a solemn religious procession on Ascension Day at Rouen may in like manner have originally served, if not as a representative of the devil, at least as a public scapegoat, who relieved the whole people of their sins and sorrows for a year by taking them upon himself. This would explain why the gaol had to be raked in order to furnish one who would parade with the highest ecclesiastical dignitaries in their gorgeous vestments through the streets of Rouen, while the church bells pealed out, the clergy chanted, banners waved, and every circumstance combined to enhance the pomp and splendour of the pageant. It would add a pathetic significance to the crowning act of the ceremony, when on a lofty platform in the public square, with the eyes of a great and silent multitude turned upon him, the condemned malefactor received from the Church the absolution and remission of his sins; for if the rite is to be interpreted in the way here suggested, the sins which were thus forgiven were those not of one man only but of the whole people. No wonder, then, that when the sinner, now a sinner no more, rose from his knees and thrice lifted the silver shrine of St. Romain in his arms, the whole vast assembly in the square broke out into joyous cries of "*Noel! Noel! Noel!*" which they understood to signify, "God be with us!" In Christian countries no more appropriate season could be selected for the ceremony of the human scapegoat than Ascension Day, which commemorates the departure from earth of Him who, in the belief of millions, took away the sins of the world.

Sometimes the scapegoat is a divine animal. The people of Malabar share the Hindoo reverence for the cow, to kill and eat which "they esteem to be a crime as heinous as homicide or wilful murder." Nevertheless the "Bramans transfer the sins of the people into one or more Cows, which are then carry'd away, both the Cows and the Sins wherewith these Beasts are charged, to what place the Braman shall appoint." When the ancient Egyptians sacrificed a bull, they invoked upon its head all the evils that might otherwise befall themselves and the land of Egypt, and thereupon they either sold the bull's head to the Greeks or cast it into the river. Now, it cannot be said that in the times known to us the Egyptians worshipped bulls in general, for they seem to have commonly killed and eaten them. But a

good many circumstances point to the conclusion that originally all cattle, bulls as well as cows, were held sacred by the Egyptians. For not only were all cows esteemed holy by them and never sacrificed, but even bulls might not be sacrificed unless they had certain natural marks; a priest examined every bull before it was sacrificed; if it had the proper marks, he put his seal on the animal in token that it might be sacrificed; and if a man sacrificed a bull which had not been sealed, he was put to death. Moreover, the worship of the black bulls Apis and Mnevis, especially the former, played an important part in Egyptian religion; all bulls that died a natural death were carefully buried in the suburbs of the cities, and their bones were afterwards collected from all parts of Egypt and interred in a single spot; and at the sacrifice of a bull in the great rites of Isis all the worshippers beat their breasts and mourned. On the whole, then, we are perhaps entitled to infer that bulls were originally, as cows were always, esteemed sacred by the Egyptians, and that the slain bull upon whose head they laid the misfortunes of the people was once a divine scapegoat. It seems not improbable that the lamb annually slain by the Madis of Central Africa is a divine scapegoat, and the same supposition may partly explain the Zuni sacrifice of the turtle.

Lastly, the scapegoat may be a divine man. Thus, in November the Gonds of India worship Ghansyam Deo, the protector of the crops, and at the festival the god himself is said to descend on the head of one of the worshippers, who is suddenly seized with a kind of fit and, after staggering about, rushes off into the jungle, where it is believed that, if left to himself, he would die mad. However, they bring him back, but he does not recover his senses for one or two days. The people think that one man is thus singled out as a scapegoat for the sins of the rest of the village. In the temple of the Moon the Albanians of the Eastern Caucasus kept a number of sacred slaves, of whom many were inspired and prophesied. When one of these men exhibited more than usual symptoms of inspiration or insanity, and wandered solitary up and down the woods, like the Gond in the jungle, the high priest had him bound with a sacred chain and maintained him in luxury for a year. At the end of the year he was anointed with unguents and led forth to be sacrificed. A man whose business it was to slay these human victims and to whom practice had given dexterity, advanced from the crowd and thrust a sacred spear into the victim's side, piercing his heart. From the manner in which the slain man fell, omens were drawn as to the welfare of the commonwealth. Then the body was carried to a certain spot where all the people stood upon it as a purificatory ceremony. This last circumstance clearly indicates that the sins of the people were transferred to the victim, just as the Jewish priest transferred the sins of the people to the scapegoat by laying his hands on the animal's head; and since the man was believed to be possessed by the divine spirit, we have here an undoubted example of a man-god slain to take away the sins and misfortunes of the people.

In Tibet the ceremony of the scapegoat presents some remarkable features. The Tibetan new year begins with the new moon which appears about the fifteenth of February. For twenty-three days afterwards the government of Lhasa, the capital, is taken out of the hands of the ordinary rulers and entrusted to the monk of the Debang monastery who offers to pay the highest sum for the privilege. The successful bidder is called the Jalno, and he announces his accession to power in person, going through the streets of Lhasa with a silver stick in his hand. Monks from all the neighbouring monasteries and temples assemble to pay him homage. The Jalno exercises his authority in the most arbitrary manner for his own benefit, as all the fines which he exacts are his by purchase. The profit he makes is about ten times the amount of the purchase money. His men go about the streets in order to discover any conduct on the part of the inhabitants that can be found fault with. Every house in Lhasa is taxed at this time, and the slightest offence is punished with unsparing rigour by fines. This severity of the Jalno drives all working classes out of the city till the twenty-three days are over. But if

the laity go out, the clergy come in. All the Buddhist monasteries of the country for miles round about open their gates and disgorge their inmates. All the roads that lead down into Lhasa from the neighbouring mountains are full of monks hurrying to the capital, some on foot, some on horseback, some riding asses or lowing oxen, all carrying their prayer-books and culinary utensils. In such multitudes do they come that the streets and squares of the city are encumbered with their swarms, and incarnadined with their red cloaks. The disorder and confusion are indescribable. Bands of the holy men traverse the streets chanting prayers or uttering wild cries. They meet, they jostle, they quarrel, they fight; bloody noses, black eyes, and broken heads are freely given and received. All day long, too, from before the peep of dawn till after darkness has fallen, these red-cloaked monks hold services in the dim incense-laden air of the great Machindranath temple, the cathedral of Lhasa; and thither they crowd thrice a day to receive their doles of tea and soup and money. The cathedral is a vast building, standing in the centre of the city, and surrounded by bazaars and shops. The idols in it are richly inlaid with gold and precious stones.

Twenty-four days after the Jalno has ceased to have authority, he assumes it again, and for ten days acts in the same arbitrary manner as before. On the first of the ten days the priests again assemble at the cathedral, pray to the gods to prevent sickness and other evils among the people, "and, as a peace-offering, sacrifice one man. The man is not killed purposely, but the ceremony he undergoes often proves fatal. Grain is thrown against his head, and his face is painted half white, half black." Thus grotesquely disguised, and carrying a coat of skin on his arm, he is called the King of the Years, and sits daily in the market-place, where he helps himself to whatever he likes and goes about shaking a black yak's tail over the people, who thus transfer their bad luck to him. On the tenth day, all the troops in Lhasa march to the great temple and form in line before it. The King of the Years is brought forth from the temple and receives small donations from the assembled multitude. He then ridicules the Jalno, saying to him, "What we perceive through the five senses is no illusion. All you teach is untrue," and the like. The Jalno, who represents the Grand Lama for the time being, contests these heretical opinions; the dispute waxes warm, and at last both agree to decide the questions at issue by a cast of the dice, the Jalno offering to change places with the scapegoat should the throw be against him. If the King of the Years wins, much evil is prognosticated; but if the Jalno wins, there is great rejoicing, for it proves that his adversary has been accepted by the gods as a victim to bear all the sins of the people of Lhasa. Fortune, however, always favours the Jalno, who throws sixes with unvarying success, while his opponent turns up only ones. Nor is this so extraordinary as at first sight it might appear; for the Jalno's dice are marked with nothing but sixes and his adversary's with nothing but ones. When he sees the finger of Providence thus plainly pointed against him, the King of the Years is terrified and flees away upon a white horse, with a white dog, a white bird, salt, and so forth, which have all been provided for him by the government. His face is still painted half white and half black, and he still wears his leathern coat. The whole populace pursues him, hooting, yelling, and firing blank shots in volleys after him. Thus driven out of the city, he is detained for seven days in the great chamber of horrors at the Samyas monastery, surrounded by monstrous and terrific images of devils and skins of huge serpents and wild beasts. Thence he goes away into the mountains of Chetang, where he has to remain an outcast for several months or a year in a narrow den. If he dies before the time is out, the people say it is an auspicious omen; but if he survives, he may return to Lhasa and play the part of scapegoat over again the following year.

This quaint ceremonial, still annually observed in the secluded capital of Buddhism—the Rome of Asia—is interesting because it exhibits, in a clearly marked religious stratification, a series of divine redeemers themselves redeemed, of vicarious sacrifices vicariously atoned for, of gods undergoing a process of fossilization, who, while they retain the privileges, have

disburdened themselves of the pains and penalties of divinity. In the Jalno we may without undue straining discern a successor of those temporary kings, those mortal gods, who purchase a short lease of power and glory at the price of their lives. That he is the temporary substitute of the Grand Lama is certain; that he is, or was once, liable to act as scapegoat for the people is made nearly certain by his offer to change places with the real scapegoat—the King of the Years—if the arbitrament of the dice should go against him. It is true that the conditions under which the question is now put to the hazard have reduced the offer to an idle form. But such forms are no mere mushroom growths, springing up of themselves in a night. If they are now lifeless formalities, empty husks devoid of significance, we may be sure that they once had a life and a meaning; if at the present day they are blind alleys leading nowhere, we may be certain that in former days they were paths that led somewhere, if only to death. That death was the goal to which of old the Tibetan scapegoat passed after his brief period of licence in the market-place, is a conjecture that has much to commend it. Analogy suggests it; the blank shots fired after him, the statement that the ceremony often proves fatal, the belief that his death is a happy omen, all confirm it. We need not wonder then that the Jalno, after paying so dear to act as deputy-deity for a few weeks, should have preferred to die by deputy rather than in his own person when his time was up. The painful but necessary duty was accordingly laid on some poor devil, some social outcast, some wretch with whom the world had gone hard, who readily agreed to throw away his life at the end of a few days if only he might have his fling in the meantime. For observe that while the time allowed to the original deputy—the Jalno—was measured by weeks, the time allowed to the deputy's deputy was cut down to days, ten days according to one authority, seven days according to another. So short a rope was doubtless thought a long enough tether for so black or sickly a sheep; so few sands in the hour-glass, slipping so fast away, sufficed for one who had wasted so many precious years. Hence in the jack-pudding who now masquerades with motley countenance in the market-place of Lhasa, sweeping up misfortune with a black yak's tail, we may fairly see the substitute of a substitute, the vicar of a vicar, the proxy on whose back the heavy burden was laid when it had been lifted from nobler shoulders. But the clue, if we have followed it aright, does not stop at the Jalno; it leads straight back to the pope of Lhasa himself, the Grand Lama, of whom the Jalno is merely the temporary vicar. The analogy of many customs in many lands points to the conclusion that, if this human divinity stoops to resign his ghostly power for a time into the hands of a substitute, it is, or rather was once, for no other reason than that the substitute might die in his stead. Thus through the mist of ages unilluminated by the lamp of history, the tragic figure of the pope of Buddhism—God's vicar on earth for Asia—looms dim and sad as the man-god who bore his people's sorrows, the Good Shepherd who laid down his life for the sheep.

V. On Scapegoats in General

The foregoing survey of the custom of publicly expelling the accumulated evils of a village or town or country suggests a few general observations.

In the first place, it will not be disputed that what I have called the immediate and the mediate expulsions of evil are identical in intention; in other words, that whether the evils are conceived of as invisible or as embodied in a material form, is a circumstance entirely subordinate to the main object of the ceremony, which is simply to effect a total clearance of all the ills that have been infesting a people. If any link were wanting to connect the two kinds of expulsion, it would be furnished by such a practice as that of sending the evils away in a litter or a boat. For here, on the one hand, the evils are invisible and intangible; and, on the other hand, there is a visible and tangible vehicle to convey them away. And a scapegoat is nothing more than such a vehicle.

In the second place, when a general clearance of evils is resorted to periodically, the interval between the celebrations of the ceremony is commonly a year, and the time of year when the ceremony takes place usually coincides with some well-marked change of season, such as the beginning or end of winter in the arctic and temperate zones, and the beginning or end of the rainy season in the tropics. The increased mortality which such climatic changes are apt to produce, especially amongst ill-fed, ill-clothed, and ill-housed savages, is set down by primitive man to the agency of demons, who must accordingly be expelled. Hence, in the tropical regions of New Britain and Peru, the devils are or were driven out at the beginning of the rainy season; hence, on the dreary coasts of Baffin Land, they are banished at the approach of the bitter arctic winter. When a tribe has taken to husbandry, the time for the general expulsion of devils is naturally made to agree with one of the great epochs of the agricultural year, as sowing, or harvest; but, as these epochs themselves naturally coincide with changes of season, it does not follow that the transition from the hunting or pastoral to the agricultural life involves any alteration in the time of celebrating this great annual rite. Some of the agricultural communities of India and the Hindoo Koosh, as we have seen, hold their general clearance of demons at harvest, others at sowing-time. But, at whatever season of the year it is held, the general expulsion of devils commonly marks the beginning of the new year. For, before entering on a new year, people are anxious to rid themselves of the troubles that have harassed them in the past; hence it comes about that in so many communities the beginning of the new year is inaugurated with a solemn and public banishment of evil spirits.

In the third place, it is to be observed that this public and periodic expulsion of devils is commonly preceded or followed by a period of general license, during which the ordinary restraints of society are thrown aside, and all offences, short of the gravest, are allowed to pass unpunished. In Guinea and Tonquin the period of license precedes the public expulsion of demons; and the suspension of the ordinary government in Lhasa previous to the expulsion of the scapegoat is perhaps a relic of a similar period of universal license. Amongst the Hos of India the period of license follows the expulsion of the devil. Amongst the Iroquois it hardly appears whether it preceded or followed the banishment of evils. In any case, the extraordinary relaxation of all ordinary rules of conduct on such occasions is doubtless to be explained by the general clearance of evils which precedes or follows it. On the one hand, when a general riddance of evil and absolution from all sin is in immediate prospect, men are encouraged to give the rein to their passions, trusting that the coming ceremony will wipe out the score which they are running up so fast. On the other hand, when the ceremony has

just taken place, men's minds are freed from the oppressive sense, under which they generally labour, of an atmosphere surcharged with devils; and in the first revulsion of joy they overleap the limits commonly imposed by custom and morality. When the ceremony takes place at harvest-time, the elation of feeling which it excites is further stimulated by the state of physical wellbeing produced by an abundant supply of food.

Fourthly, the employment of a divine man or animal as a scapegoat is especially to be noted; indeed, we are here directly concerned with the custom of banishing evils only in so far as these evils are believed to be transferred to a god who is afterwards slain. It may be suspected that the custom of employing a divine man or animal as a public scapegoat is much more widely diffused than appears from the examples cited. For, as has already been pointed out, the custom of killing a god dates from so early a period of human history that in later ages, even when the custom continues to be practised, it is liable to be misinterpreted. The divine character of the animal or man is forgotten, and he comes to be regarded merely as an ordinary victim. This is especially likely to be the case when it is a divine man who is killed. For when a nation becomes civilized, if it does not drop human sacrifices altogether, it at least selects as victims only such wretches as would be put to death at any rate. Thus the killing of a god may sometimes come to be confounded with the execution of a criminal.

If we ask why a dying god should be chosen to take upon himself and carry away the sins and sorrows of the people, it may be suggested that in the practice of using the divinity as a scapegoat we have a combination of two customs which were at one time distinct and independent. On the one hand we have seen that it has been customary to kill the human or animal god in order to save his divine life from being weakened by the inroads of age. On the other hand we have seen that it has been customary to have a general expulsion of evils and sins once a year. Now, if it occurred to people to combine these two customs, the result would be the employment of the dying god as a scapegoat. He was killed, not originally to take away sin, but to save the divine life from the degeneracy of old age; but, since he had to be killed at any rate, people may have thought that they might as well seize the opportunity to lay upon him the burden of their sufferings and sins, in order that he might bear it away with him to the unknown world beyond the grave.

The use of the divinity as a scapegoat clears up the ambiguity which, as we saw, appears to hang about the European folk-custom of "carrying out Death." Grounds have been shewn for believing that in this ceremony the so-called Death was originally the spirit of vegetation, who was annually slain in spring, in order that he might come to life again with all the vigour of youth. But, as I pointed out, there are certain features in the ceremony which are not explicable on this hypothesis alone. Such are the marks of joy with which the effigy of Death is carried out to be buried or burnt, and the fear and abhorrence of it manifested by the bearers. But these features become at once intelligible if we suppose that the Death was not merely the dying god of vegetation, but also a public scapegoat, upon whom were laid all the evils that had afflicted the people during the past year. Joy on such an occasion is natural and appropriate; and if the dying god appears to be the object of that fear and abhorrence which are properly due not to himself, but to the sins and misfortunes with which he is laden, this arises merely from the difficulty of distinguishing, or at least of marking the distinction, between the bearer and the burden. When the burden is of a baleful character, the bearer of it will be feared and shunned just as much as if he were himself instinct with those dangerous properties of which, as it happens, he is only the vehicle. Similarly we have seen that disease-laden and sin-laden boats are dreaded and shunned by East Indian peoples. Again, the view that in these popular customs the Death is a scapegoat as well as a representative of the divine spirit of vegetation derives some support from the circumstance that its expulsion is always celebrated in spring and chiefly by Slavonic peoples. For the Slavonic year began in

spring; and thus, in one of its aspects, the ceremony of “carrying out Death” would be an example of the widespread custom of expelling the accumulated evils of the old year before entering on a new one.

VI. Human Scapegoats in Classical Antiquity

§ 1. The Human Scapegoat in Ancient Rome.

We are now prepared to notice the use of the human scapegoat in classical antiquity. Every year on the fourteenth of March a man clad in skins was led in procession through the streets of Rome, beaten with long white rods, and driven out of the city. He was called Mamurius Veturius, that is, "the old Mars," and as the ceremony took place on the day preceding the first full moon of the old Roman year (which began on the first of March), the skin-clad man must have represented the Mars of the past year, who was driven out at the beginning of a new one. Now Mars was originally not a god of war but of vegetation. For it was to Mars that the Roman husbandman prayed for the prosperity of his corn and his vines, his fruit-trees and his copses; it was to Mars that the priestly college of the Arval Brothers, whose business it was to sacrifice for the growth of the crops, addressed their petitions almost exclusively; and it was to Mars, as we saw, that a horse was sacrificed in October to secure an abundant harvest. Moreover, it was to Mars, under his title of "Mars of the woods" (*Mars Silvanus*), that farmers offered sacrifice for the welfare of their cattle. We have already seen that cattle are commonly supposed to be under the special patronage of tree-gods. Once more, the consecration of the vernal month of March to Mars seems to point him out as the deity of the sprouting vegetation. Thus the Roman custom of expelling the old Mars at the beginning of the new year in spring is identical with the Slavonic custom of "carrying out Death," if the view here taken of the latter custom is correct. The similarity of the Roman and Slavonic customs has been already remarked by scholars, who appear, however, to have taken Mamurius Veturius and the corresponding figures in the Slavonic ceremonies to be representatives of the old year rather than of the old god of vegetation. It is possible that ceremonies of this kind may have come to be thus interpreted in later times even by the people who practised them. But the personification of a period of time is too abstract an idea to be primitive. However, in the Roman, as in the Slavonic, ceremony, the representative of the god appears to have been treated not only as a deity of vegetation but also as a scapegoat. His expulsion implies this; for there is no reason why the god of vegetation, as such, should be expelled the city. But it is otherwise if he is also a scapegoat; it then becomes necessary to drive him beyond the boundaries, that he may carry his sorrowful burden away to other lands. And, in fact, Mamurius Veturius appears to have been driven away to the land of the Oscans, the enemies of Rome.

The blows with which the "old Mars" was expelled the city seem to have been administered by the dancing priests of Mars, the Salii. At least we know that in their songs these priests made mention of Mamurius Veturius; and we are told that on a day dedicated to him they beat a hide with rods. It is therefore highly probable that the hide which they drubbed on that day was the one worn by the representative of the deity whose name they simultaneously chanted. Thus on the fourteenth day of March every year Rome witnessed the curious spectacle of the human incarnation of a god chased by the god's own priests with blows from the city. The rite becomes at least intelligible on the theory that the man so beaten and expelled stood for the outworn deity of vegetation, who had to be replaced by a fresh and vigorous young divinity at the beginning of a New Year, when everywhere around in field and meadow, in wood and thicket the vernal flowers, the sprouting grass, and the opening buds and blossoms testified to the stirring of new life in nature after the long torpor and stagnation of winter. The dancing priests of the god derived their name of Salii from the leaps or dances which they were bound to execute as a solemn religious ceremony every year in the

Comitium, the centre of Roman political life. Twice a year, in the spring month of March and the autumn month of October, they discharged this sacred duty; and as they did so they invoked Saturn, the Roman god of sowing. As the Romans sowed the corn both in spring and autumn, and as down to the present time in Europe superstitious rustics are wont to dance and leap high in spring for the purpose of making the crops grow high, we may conjecture that the leaps and dances performed by the Salii, the priests of the old Italian god of vegetation, were similarly supposed to quicken the growth of the corn by homoeopathic or imitative magic. The Salii were not limited to Rome; similar colleges of dancing priests are known to have existed in many towns of ancient Italy; everywhere, we may conjecture, they were supposed to contribute to the fertility of the earth by their leaps and dances. At Rome they were divided into two colleges, each composed of twelve members; and it is not impossible that the number twelve was fixed with reference to the twelve months of the old lunar year; the *Fratres Arvales*, or "Brethren of the Ploughed Fields," another Roman college of priests, whose functions were purely agricultural, and who wore as a badge of their office a wreath of corn-ears, were also twelve in number, perhaps for a similar reason. Nor was the martial equipment of the Salii so alien to this peaceful function as a modern reader might naturally suppose. Each of them wore on his head a peaked helmet of bronze, and at his side a sword; on his left arm he carried a shield of a peculiar shape, and in his right hand he wielded a staff with which he smote on the shield till it rang again. Such weapons in priestly hands may be turned against spiritual foes; in the preceding pages we have met with many examples of the use of material arms to rout the host of demons who oppress the imagination of primitive man, and we have seen that the clash and clangour of metal is often deemed particularly effective in putting these baleful beings to flight. May it not have been so with the martial priests of Mars? We know that they paraded the city for days together in a regular order, taking up their quarters for the night at a different place each day; and as they went they danced in triple time, singing and clashing on their shields and taking their time from a fugleman, who skipped and postured at their head. We may conjecture that in so doing they were supposed to be expelling the powers of evil which had accumulated during the preceding year or six months, and which the people pictured to themselves in the form of demons lurking in the houses, temples, and the other edifices of the city. In savage communities such tumultuous and noisy processions often parade the village for a similar purpose. Similarly, we have seen that among the Iroquois men in fantastic costume used to go about collecting the sins of the people as a preliminary to transferring them to the scapegoat dogs; and we have met with many examples of armed men rushing about the streets and houses to drive out demons and evils of all kinds. Why should it not have been so also in ancient Rome? The religion of the old Romans is full of relics of savagery.

If there is any truth in this conjecture, we may suppose that, as priests of a god who manifested his power in the vegetation of spring, the Salii turned their attention above all to the demons of blight and infertility, who might be thought by their maleficent activity to counteract the genial influence of the kindly god and to endanger the farmer's prospects in the coming summer or winter. The conjecture may be supported by analogies drawn from the customs of modern European peasants as well as of savages. Thus, to begin with savages, we have seen that at the time of sowing the Khonds drive out the "evil spirits, spoilers of the seed" from every house in the village, the expulsion being effected by young men who beat each other and strike the air violently with long sticks. If I am right in connecting the vernal and the autumnal processions of the Salii with the vernal and the autumnal sowing, the analogy between the Khond and the Roman customs would be very close. In West Africa the fields of the King of Whydah, according to an old French traveller, "are hoed and sowed before any of his subjects has leave to hoe and sow a foot of his own lands. These labours are performed thrice a year. The chiefs lead their people before the king's palace at daybreak, and

there they sing and dance for a full quarter of an hour. Half of these people are armed as in a day of battle, the other half have only their farm tools. They go all together singing and dancing to the scene of their labours, and there, keeping time to the sound of the instruments, they work with such speed and neatness that it is a pleasure to behold. At the end of the day they return and dance before the king's palace. This exercise refreshes them and does them more good than all the repose they could take." From this account we might infer that the dancing was merely a recreation of the field-labourers, and that the music of the band had no other object than to animate them in their work by enabling them to ply their mattocks in time to its stirring strains. But this inference, though it seems to have been drawn by the traveller who has furnished the account, would probably be erroneous. For if half of the men were armed as for war, what were they doing in the fields all the time that the others were digging? A clue to unravel the mystery is furnished by the description which a later French traveller gives of a similar scene witnessed by him near Timbo in French Guinea. He saw some natives at work preparing the ground for sowing. "It is a very curious spectacle: fifty or sixty blacks in a line, with bent backs, are smiting the earth simultaneously with their little iron tools, which gleam in the sun. Ten paces in front of them, marching backwards, the women sing a well marked air, clapping their hands as for a dance, and the hoes keep time to the song. Between the workers and the singers a man runs and dances, crouching on his hams like a clown, while he whirls about his musket and performs other manœuvres with it. Two others dance, also pirouetting and smiting the earth here and there with their little hoe. All that is necessary for exorcising the spirits and causing the grain to sprout." Here, while the song of the women gives the time to the strokes of the hoes, the dances and other antics of the armed man and his colleagues are intended to exorcise or ward off the spirits who might interfere with the diggers and so prevent the grain from sprouting.

Again, an old traveller in southern India tells us that "the men of Calicut, when they wish to sow rice, observe this practice. First, they plough the land with oxen as we do, and when they sow the rice in the field they have all the instruments of the city continually sounding and making merry. They also have ten or twelve men clothed like devils, and these unite in making great rejoicing with the players on the instruments, in order that the devil may make that rice very productive." We may suspect that the noisy music is played and the mummers cut their capers for the purpose rather of repelling demons than of inducing them to favour the growth of the rice. However, where our information is so scanty it would be rash to dogmatize. Perhaps the old traveller was right in thinking that the mummers personated devils. Among the Kayans of Central Borneo men disguised in wooden masks and great masses of green foliage certainly play the part of demons for the purpose of promoting the growth of the rice just before the seed is committed to the ground; and it is notable that among the performances which they give on this occasion are war dances. Again, among the Kaua and Kobeua Indians of North-Western Brazil masked men who represent spirits or demons of fertility perform dances or rather pantomimes for the purpose of stimulating the growth of plants, quickening the wombs of women, and promoting the multiplication of animals.

Further, we are told that "the natives of Aracan dance in order to render propitious the spirits whom they believe to preside over the sowing and over the harvest. There are definite times for doing it, and we may say that in their eyes it is, as it were, an act of religion." Another people who dance diligently to obtain good crops are the Tarahumare Indians of Mexico. They subsist by agriculture and their thoughts accordingly turn much on the supply of rain, which is needed for their fields. According to them, "the favour of the gods may be won by what for want of a better term may be called dancing, but what in reality is a series of monotonous movements, a kind of rhythmical exercise, kept up sometimes for two nights. By

dint of such hard work they think to prevail upon the gods to grant their prayers. The dancing is accompanied by the song of the shaman, in which he communicates his wishes to the unseen world, describing the beautiful effect of the rain, the fog, and the mist on the vegetable world. He invokes the aid of all the animals, mentioning each by name, and also calls on them, especially the deer and the rabbit, to multiply that the people may have plenty to eat. As a matter of fact, the Tarahumares assert that the dances have been taught them by the animals. Like all primitive people, they are close observers of nature. To them the animals are by no means inferior creatures; they understand magic and are possessed of much knowledge, and may assist the Tarahumares in making rain. In spring, the singing of the birds, the cooing of the dove, the croaking of the frog, the chirping of the cricket, all the sounds uttered by the denizens of the greensward, are to the Indian appeals to the deities for rain. For what other reason should they sing or call? For the strange behaviour of many animals in the early spring the Tarahumares can find no other explanation but that these creatures, too, are interested in rain. And as the gods grant the prayers of the deer expressed in its antics and dances, and of the turkey in its curious playing, by sending the rain, they easily infer that to please the gods they, too, must dance as the deer and play as the turkey. From this it will be understood that dance with these people is a very serious and ceremonious matter, a kind of worship and incantation rather than amusement.”

The two principal dances of these Indians, the *rutuburi* and the *yumari*, are supposed to have been taught them by the turkey and the deer respectively. They are danced by numbers of men and women, the two sexes keeping apart from each other in the dance, while the shaman sings and shakes his rattle. But “a large gathering is not necessary in order to pray to the gods by dancing. Sometimes the family dances alone, the father teaching the boys. While doing agricultural work, the Indians often depute one man to dance *yumari* near the house, while the others attend to the work in the fields. It is a curious sight to see a lone man taking his devotional exercise to the tune of his rattle in front of an apparently deserted dwelling. The lonely worshipper is doing his share of the general work by bringing down the fructifying rain and by warding off disaster, while the rest of the family and their friends plant, hoe, weed, or harvest. In the evening, when they return from the field, they may join him for a little while; but often he goes on alone, dancing all night, and singing himself hoarse, and the Indians told me that this is the very hardest kind of work, and exhausting even to them. Solitary worship is also observed by men who go out hunting deer or squirrels for a communal feast. Every one of them dances *yumari* alone in front of his house for two hours to insure success on the hunt; and when putting corn to sprout for the making of *tesvino* the owner of the house dances for a while, that the corn may sprout well.” Another dance is thought to cause the grass and funguses to grow, and the deer and rabbits to multiply; and another is supposed to draw the clouds together from the north and south, so that they clash and descend in rain.

The Cora Indians of Mexico celebrate a festival of sowing shortly before they commit the seed of the maize to the ground. The festival falls in June, because that is the month when the rainy season sets in, supplying the moisture needed for the growth of the maize. At the festival two old women, who represent the goddesses of sowing, dance side by side and imitate the process of sowing by digging holes in the earth with long sticks and inserting the seed of the maize in the holes; whereupon a man who represents the Morning Star pours water on the buried seeds. This solemn dance is accompanied by the singing of an appropriate hymn, which may be compared to the song of the Arval Brothers in ancient Rome.

We have seen that in many parts of Germany, Austria, and France the peasants are still, or were till lately, accustomed to dance and leap high in order that the crops may grow tall. Such leaps and dances are sometimes performed by the sower immediately before or after he sows

the seed; but often they are executed by the people on a fixed day of the year, which in some places is Twelfth Night (the sixth of January), or Candlemas (the second of February) or Walpurgis Night, that is, the Eve of May Day; but apparently the favourite season for these performances is the last day of the Carnival, namely Shrove Tuesday. In such cases the leaps and dances are performed by every man for his own behoof; he skips and jumps merely in order that his own corn, or flax, or hemp may spring up and thrive. But sometimes in modern Europe, as (if I am right) in ancient Rome, the duty of dancing for the crops was committed to bands or troops of men, who cut their capers for the benefit of the whole community. For example, at Grub, in the Swiss canton of the Grisons (Graubünden), the practice used to be as follows. "The peasants of Grub," we are informed, "have still some hereditary customs, in that they assembled in some years, mostly at the time of the summer solstice, disguised themselves as maskers so as to be unrecognizable, armed themselves with weapons defensive and offensive, took every man a great club or cudgel, marched in a troop together from one village to another, and executed high leaps and strange antics. They ran full tilt at each other, struck every man his fellow with all his might, so that the blow resounded, and clashed their great staves and cudgels. Hence they were called by the country folk the *Stopfer*. These foolish pranks they played from a superstitious notion that their corn would thrive the better; but now they have left off, and these *Stopfer* are no longer in any repute." Another authority, after describing the custom, remarks: "With this custom was formerly connected the belief that its observance brought a fruitful year."

In the Austrian provinces of Salzburg and Tyrol bands of mummers wearing grotesque masks, with bells jingling on their persons, and carrying long sticks or poles in their hands, used formerly to run and leap about on certain days of the year for the purpose of procuring good crops. They were called *Perchten*, a name derived from Perchta, Berchta, or Percht, a mythical old woman, whether goddess or elf, who is well known all over South Germany; Mrs. Perchta (*Frau Perchta*), as they call her, is to be met with in Elsass, Swabia, Bavaria, Austria, and Switzerland, but nowhere, perhaps, so commonly as in Salzburg and the Tyrol. In the Tyrol she appears as a little old woman with a very wrinkled face, bright lively eyes, and a long hooked nose; her hair is dishevelled, her garments tattered and torn. Hence they say to a slatternly wench, "You are a regular Perchta." She goes about especially during the twelve days from Christmas to Twelfth Night (Epiphany), above all on the Eve of Twelfth Night, which is often called Perchta's Day. Many precautions must be observed during these mystic days in order not to incur her displeasure, for she is mischievous to man and beast. If she appears in the byre, a distemper breaks out among the cows. That is why during these days the byres must be kept very clean and straw laid on the threshold; otherwise you will find bald patches on your sheep and goats next morning, and next summer the hair which has been filched from the animals will descend in hail-stones from the sky. Old Mrs. Perchta also keeps a very sharp eye on spinners during the twelve days; she inspects all distaffs and spinning-wheels in the houses, and if she finds any flax or tow unspun on them, she tears it to bits, and she does not spare the lazy spinner, for she scratches her and smacks her fingers so that they bear the marks of it for the rest of her life. Indeed she sometimes does much more; for she rips up the belly of the sluggard and stuffs it with flax. That is the punishment with which a Bavarian mother will threaten an idle jade of a girl who has left some flax on her distaff on New Year's Eve. However, they say in Bavaria that if you only eat plenty of the rich juicy cakes which are baked for Mrs. Perchta on her day, the old woman's knife will glance off your body without making any impression on it. Perchta often comes not alone but attended by many little children, who follow her as chickens waddle after the mother hen; and if you should see any little child lagging behind the rest and blubbering, you may be quite sure that that child has been baptized. On the Eve of Twelfth Night everybody should eat pancakes baked of meal and milk or water. If anybody does not do so, old Mrs. Perchta

comes and slits up his stomach, takes out the other food, fills up the vacuity so created with a tangled skein and bricks, and then sews up the orifice neatly, using, singularly enough, a ploughshare for a needle and an iron chain for thread. In other or the same places she does the same thing to anybody who does not eat herrings and dumplings on Twelfth Night. Some say that she rides on the storm like the Wild Huntsman, followed by a boisterous noisy pack, and carrying off people into far countries. Yet withal old Mrs. Perchta has her redeeming qualities. Good children who spin diligently and learn their lessons she rewards with nuts and sugar plums. It has even been affirmed that she makes the ploughed land fruitful and causes the cattle to thrive. When a mist floats over the fields, the peasants see her figure gliding along in a white mantle. On the Eve of Twelfth Night good people leave the remains of their supper for her on the table, and when they have gone to bed and all is quiet in the house, she comes in the likeness of an old wizened little woman, with all the children about her, and partakes of the broken victuals. But woe to the prying wight who peeps at her through the key-hole! Many a man has been blinded by her for a whole year as a punishment for his ill-timed curiosity.

The processions of maskers who took their name of *Perchten* from this quaint creation of the popular fancy were known as *Perchten*-running or *Perchten*-leaping from the runs and leaps which the men took in their wild headlong course through the streets and over the fields. They appear to have been held in all the Alpine regions of Germany, but are best known to us in the Tyrol and Salzburg. The appropriate season for the celebration of the rite was Perchta's Day, that is, Twelfth Night or Epiphany, the sixth of January, but in some places it was held on Shrove Tuesday, the last day of the Carnival, the very day when many farmers of Central Europe jump to make the crops grow tall. Corresponding to the double character of Perchta as a power for good and evil, the maskers are divided into two sets known respectively as the Beautiful and the Ugly *Perchten*. At Lienz in the Tyrol, where the maskers made their appearance on Shrove Tuesday, the Beautiful *Perchten* were decked with ribbons, galloons, and so forth, while the ugly *Perchten* made themselves as hideous as they could by hanging rats and mice, chains and bells about their persons. All wore on their heads tall pointed caps with bells attached to them; their faces were concealed by masks, and in their hands they all carried long sticks. The sticks of the Beautiful *Perchten* were adorned with ribbons; those of the Ugly *Perchten* ended in the heads of devils. Thus equipped they leaped and ran about the streets and went into the houses. Amongst them was a clown who blew ashes and soot in people's faces through a blow-pipe. It was all very merry and frolicsome, except when "the wild Perchta" herself came, invisible to ordinary eyes, upon the scene. Then her namesakes the *Perchten* grew wild and furious too; they scattered and fled for their lives to the nearest house, for as soon as they got under the gutter of a roof they were safe. But if she caught them, she tore them in pieces. To this day you may see the graves where the mangled bodies of her victims lie buried. When no such interruption took place, the noisy rout of maskers rushed madly about, with jingling bells and resounding cracks of whips, entering the houses, dancing here, drinking there, teasing wayfarers, or racing from village to village like the Wild Hunt itself in the sky; till at the close of the winter day the church bells rang the *Ave Maria*. Then at last the wild uproar died away into silence. Such tumultuous masquerades were thought to be very beneficial to the crops; a bad harvest would be set down to the omission of the *Perchten* to skip and jump about in their usual fashion.

In the province of Salzburg the *Perchten* mummers are also divided into two sets, the Beautiful *Perchten* and the Ugly *Perchten*. The Ugly *Perchten* are properly speaking twelve young men dressed in black sheepskins and wearing hoods of badger-skins and grotesque wooden masks, which represent either coarse human features with long teeth and horns, or else the features of fabulous animals with beaks and bristles or movable jaws. They all carry

bells, both large and small, fastened to broad leathern girdles. The procession was headed by a man with a big drum, and after him came lads bearing huge torches and lanterns fastened to tall poles; for in Salzburg or some parts of it these mummers played their pranks by night. Behind the torchbearers came two Fools, a male and a female, the latter acted by a lad in woman's clothes. The male Fool carried a sausage-like roll, with which he struck at all women or girls of his acquaintance when they shewed themselves at the open doors or windows. Along with the *Perchten* themselves went a train of young fellows cracking whips, blowing horns, or jingling bells. The ways might be miry and the night pitch dark, but with flaring lights the procession swept rapidly by, the men leaping along with the help of their long sticks and waking the echoes of the slumbering valley by their loud uproar. From time to time they stopped at a farm, danced and cut their capers before the house, for which they were rewarded by presents of food and strong drink; to offer them money would have been an insult. By midnight the performance came to an end, and the tired maskers dispersed to their homes.

The Beautiful *Perchten* in Salzburg are attired very differently from the Ugly *Perchten*, but their costume varies with the district. Thus in the Pongau district the distinctive feature of their costume is a tall and heavy framework covered with bright red cloth and decorated with a profusion of silver jewelry and filagree work. This framework is sometimes nine or ten feet high and forty or fifty pounds in weight. The performer carries it above his head by means of iron supports resting on his shoulders or his back. To run or jump under the weight of such an encumbrance is impossible; the dancer has to content himself with turning round and round slowly and clumsily. Very different is the headdress of the Beautiful *Perchten* in the Pinzgau district of Salzburg. There the performers are dressed in scarlet and wear straw hats, from which bunches of white feathers, arranged like fans, nod and flutter in the wind. Red shoes and white stockings complete their attire. Thus lightly equipped they hop and jump and stamp briskly in the dance. Unlike their Ugly namesakes, who seem now to be extinct, the Beautiful *Perchten* still parade from time to time among the peasantry of the Salzburg highlands; but the intervals between their appearances are irregular, varying from four to seven years or more. Unlike the Ugly *Perchten*, they wear no masks and appear in full daylight, always on Perchta's Day (Twelfth Night, the sixth of January) and the two following Sundays. They are attended by a train of followers who make a great din with bells, whips, pipes, horns, rattles, and chains. Amongst them one or two clowns, clothed in white and wearing tall pointed hats of white felt with many jingling bells attached to them, play a conspicuous part. They carry each a sausage-shaped roll stuffed with tow, and with this instrument they strike lightly such women and girls among the spectators as they desire particularly to favour. Another attendant carries the effigy of a baby in swaddling bands, made of linen rags, and fastened to a string; this effigy he throws at women and girls and then pulls back again, but he does this only to women and girls whom he respects and to whom he wishes well. At St. Johann the *Perchten* carry drawn swords; each is attended by a lad dressed as a woman; and they are followed by men clad in black sheepskins, wearing the masks of devils, and holding chains in their hands.

What is the meaning of the quaint performances still enacted by the *Perchten* and their attendants in the Austrian highlands? The subject has been carefully investigated by a highly competent enquirer, Mrs. Andree-Eysn. She has visited the districts, witnessed the performances, collected information, and studied the costumes. It may be well to quote her conclusion: "If we enquire into the inner meaning which underlies the *Perchten*-race and kindred processions, we must confess that it is not at first sight obvious, and that the original meaning appears blurred and indistinct. Nevertheless from many features which they present in common it can be demonstrated that the processions were held for the purpose of driving

away demons and had for their object to promote fertility. In favour of this view it may be urged, first of all, that their appearance is everywhere greeted with joy, because it promises fertility and a good harvest. 'It is a good year,' they say in Salzburg. If the processions are prevented from taking place, dearth and a bad harvest are to be apprehended. The peasants of the Tyrol still believe that the more *Perchten* run about, the better will the year be, and therefore they treat them to brandy and cakes. In Lienz, when the harvest turns out ill, they say that they omitted to let the *Perchten* run over the fields, and for that reason the peasant in the Sarn valley gets the *Perchten* to leap about on his fields, for then there will be a good year.

"If fertility and blessing are to be poured out on field, house, and homestead, it is obvious that everything that could hinder or harm must be averted and driven away. When we consider how even at the present time, and still more in times gone by, much that is harmful is attributed to the malevolence of invisible powers, we can readily understand why people should resort to measures which they deem effective for the purpose of disarming these malevolent beings. Now it is a common belief that certain masks possess the virtue of banning demons, and that loud noise and din are a means of keeping off evil spirits or hindering their activity. In the procession of the *Perchten* we see the principle of the banishment of evil carried out in practice. The people attack the evil spirits and seek to chase them away by putting on frightful masks, with which they confront the demon. For one sort of malevolent spirits one kind of mask appears suitable, and for another another; this spirit is daunted by this mask, and that spirit by that; and so they came to discriminate. Originally, particular masks may have been used against particular evil spirits, but in course of time they were confused, the individual taste of the maker of the mask counted for something, and so gradually it resulted in carving all kinds of horrible, fantastic, and hideous masks which had nothing in common but their general tendency to frighten away all evil spirits."

In support of her view that the procession of the *Perchten* aims chiefly at banishing demons who might otherwise blight the crops, Mrs. Andree-Eysn lays stress on the bells which figure so prominently in the costume of these maskers; for the sound of bells, as she reminds us, is commonly believed to be a potent means of driving evil spirits away. The notion is too familiar to call for proof, but a single case from Central Africa may be cited as an illustration. The Teso people, who inhabit a land of rolling plains between Mount Elgon and Lake Kioga, "make use of bells to exorcise the storm fiend; a person who has been injured by a flash or in the resulting fire wears bells round his ankles for weeks afterwards. Whenever rain threatens, and rain in Uganda almost always comes in company with thunder and lightning, this person will parade the village for an hour, with the jingling bells upon his legs and a wand of papyrus in his hand, attended by as many of his family as may happen to be at hand and not employed in necessary duties." The resemblance of such men, with their bells and wands, to the Austrian *Perchten* with their bells and wands is, on the theory in question, fairly close; both of them go about to dispel demons by the sound of their bells and probably also by the blows of their rods. Whatever may be thought of their efficacy in banning fiends, certain it is that in the Tyrol, where the *Perchten* play their pranks, the chime of bells is used for the express purpose of causing the grass to grow in spring. Thus in the lower valley of the Inn, especially at Schwaz, on the twenty-fourth of April (there reckoned St. George's Day) troops of young fellows go about ringing bells, some of which they hold in their hands, while others are attached to their persons; and the peasants say, "Wherever the Grass-ringers come, there the grass grows well, and the corn bears abundant fruit." Hence the bell-ringers are welcomed and treated wherever they go. Formerly, it is said, they wore masks, like the *Perchten*, but afterwards they contented themselves with blackening their faces with soot. In other parts of the Tyrol the bell-ringing processions take place at the Carnival, but

their object is the same; for “it is believed that by this noisy procession growth in general, but especially the growth of the meadows, is promoted.” Again, at Bergell, in the Swiss canton of the Grisons, children go in procession on the first of March ringing bells, “in order that the grass may grow.” So in Hildesheim, on the afternoon of Ascension Day, young girls ascend the church tower and ring all the church bells, “in order that they may get a good harvest of flax; the girl who, hanging on to the bell-rope, is swung highest by the swing of the bell, will get the longest flax.” Here the sound of the bells as a means of promoting the growth of the flax is reinforced by the upward swing of the bell, which, carrying with it the bell-ringer at the end of the rope, naturally causes the flax in like manner to rise high in the air. It is a simple piece of imitative magic, like the leaps and bounds which the peasants of Central Europe often execute for precisely the same purpose. Once more, in various parts of the Tyrol on Senseless Thursday, which is the last Thursday in Carnival, young men in motley attire, with whips and brooms, run about cracking their whips and making believe to sweep away the onlookers with their brooms. They are called *Huttler* or *Huddler*. The people say that if these fellows do not run about, the flax will not thrive, and that on the contrary the more of them run about, the better will the flax grow. And where there are many of them, there will be much maize. In this custom the cracking of the whips may be supposed to serve the same purpose as the ringing of the bells by frightening and banishing the demons of infertility and dearth. About Hall, in the northern Tyrol, the ceremony of the *Hudel*-running, as it is called, is or used to be as follows. A peasant-farmer, generally well-to-do and respected, rigs himself out in motley and hides his face under a mask; round his waist he wears a girdle crammed with rolls, while in his hand he wields a long whip, from which more than fifty cracknels dangle on a string. Thus arrayed he suddenly bursts from the ale-house door into the public view, solicited thereto by the cries of the street urchins, who have been anxiously waiting for his appearance. He throws amongst them the string of cracknels, and while they are scrambling for these dainties, he lays on to them most liberally with his whip. Having faithfully discharged this public duty, he marches down between rows of peasants, who have meantime taken up their position in a long street. Amongst them he picks out one who is to run before him. The man selected for the honour accordingly takes to his heels, hotly pursued by the other with the whip, who lashes the feet of the fugitive till he comes up with him. Having run him down, he leads him back to the alehouse, where he treats him to a roll and a glass of wine. After that the masker runs a similar race with another man; and so it goes on, one race after another, till the sun sets. Then the mummer doffs his mask and leads the dance in the alehouse. The object of these races is said to be to ensure a good crop of flax and maize.

In these races of mummers, whether known as *Perchten* or *Huttler*, there are certain features which it is difficult to explain on the theory that the aim of the performers is simply to drive away demons, and that the hideous masks which they assume have no other intention than that of frightening these uncanny beings. For observe that in the last example the blows of the whip fall not on the airy swarms of invisible spirits, but on the solid persons of street urchins and sturdy yokels, who can hardly be supposed to receive the chastisement vicariously for the demons. Again, what are we to make of the rolls and cracknels with which in this case the mummer is laden, and which he distributes among his victims, as if to console them in one part of their person for the pain which he has inflicted on another? Surely this bounty seems to invest him with something more than the purely negative character of an exorciser of evil; it appears to raise him to the positive character of a dispenser of good. The same remark applies to the action of the *Perchten* who strike women lightly, as a mark of friendship and regard, with the sausage-like rolls which they carry in their hands, or throw them, as a mark of favour, the effigy of a baby. The only probable explanation of these practices, as Mrs. Andree-Eysn rightly points out, is that the mummers thereby intend to fertilize the women

whom they honour by these attentions. Here, again, therefore the maskers appear as the actual dispensers of good, the bestowers of fruitfulness, not merely the averters of evil. If that is so, we seem bound to infer that these masked men represent or embody the spirits who quicken the seed both in the earth and in the wombs of women. That was the view of W. Mannhardt, the highest authority on the agricultural superstitions of European peasantry. After reviewing these and many more similar processions, he concludes that if the comparison which he has instituted between them holds good, all these various mummers "were intended by the original founders of the processions to represent demons of vegetation, who by their mere appearance and cries drove away the powers that hinder growth and woke to new life the slumbering spirits of the grasses and corn-stalks." Thus Mannhardt admitted that these noisy processions of masked men are really supposed to dispel the evil spirits of blight and infertility, while at the same time he held that the men themselves originally personated vegetation-spirits. And he thought it probable that the original significance of these performances was in later times misunderstood and interpreted as a simple expulsion of witches and other uncanny beings that haunt the fields.

On the whole this conclusion of an enquirer remarkable for a rare combination of learning, sobriety, and insight, is perhaps the most probable that can now be reached with the evidence at our disposal. It is confirmed by some of the savage masquerades in which the maskers definitely represent spirits of fertility in order to promote the fruitfulness of the earth and of women; and it is supported by the evidence of many other rustic mummeries in Europe, for example, by the English rites of Plough Monday, in which the dancers, or rather jumpers, who wore bunches of corn in their hats as they leaped into the air, are most naturally interpreted as agents or representatives of the corn-spirit. It is, therefore, worth observing that in some places the dancers of Plough Monday, who attended the plough in its peregrinations through the streets and fields, are described as morris-dancers. If the description is correct, it implies that they had bells attached to their costume, which would further assimilate them to the *Perchten* and other masqueraders of Central Europe; for the chief characteristic of the morris-dance is that the performers wear bells fastened to their legs which jingle at every step. We may suppose that if the men who ran and capered beside the plough on Plough Monday really wore bells, the original intention of this appendage to their costume was either to dispel the demons who might hinder the growth of the corn, or to waken the spirits of vegetation from their long winter sleep. In favour of the view which sees in all these dances and mummeries rather the banishment of what is evil than the direct promotion of what is good, it may be urged that some of the dancers wear swords, a weapon which certainly seems better fitted to combat demons than to prune fruit-trees or turn up the sod. Further, it deserves to be noted that many of the performances take place either on Twelfth Day or, like the celebration of Plough Monday, very shortly after it; and that in the Lord of Misrule, who reigned from Christmas to Twelfth Day, we have a clear trace of one of those periods of general licence and suspension of ordinary government, which so commonly occur at the end of the old year or the beginning of the new one in connexion with a general expulsion of evils.

Surveying these masquerades and processions, as they have been or still are celebrated in modern Europe, we may say in general that they appear to have been originally intended both to stimulate the growth of vegetation in spring and to expel the demoniac or other evil influences which were thought to have accumulated during the preceding winter or year; and that these two motives of stimulation and expulsion, blended and perhaps confused together, appear to explain the quaint costumes of the mummers, the multitudinous noises which they make, and the blows which they direct either at invisible foes or at the visible and tangible

persons of their fellows. In the latter case the beating may be supposed to serve as a means of forcibly freeing the sufferers from the demons or other evil things that cling to them unseen.

To apply these conclusions to the Roman custom of expelling Mamurius Veturius or "the Old Mars" every year in spring, we may say that they lend some support to the theory which sees in "the Old Mars" the outworn deity of vegetation driven away to make room, either for a younger and more vigorous personification of vernal life, or perhaps for the return of the same deity refreshed and renovated by the treatment to which he had been subjected, and particularly by the vigorous application of the rod to his sacred person. For, as we shall see presently, King Solomon was by no means singular in his opinion of the refreshing influence of a sound thrashing. So far as "the Old Mars" was supposed to carry away with him the accumulated weaknesses and other evils of the past year, so far would he serve as a public scapegoat, like the effigy in the Slavonic custom of "Carrying out Death," which appears not only to represent the vegetation-spirit of the past year, but also to act as a scapegoat, carrying away with it a heavy load of suffering, misfortune, and death.

§ 2. The Human Scapegoat in Ancient Greece.

The ancient Greeks were also familiar with the use of a human scapegoat. In Plutarch's native town of Chaeronea a ceremony of this kind was performed by the chief magistrate at the Town Hall, and by each householder at his own home. It was called the "expulsion of hunger." A slave was beaten with rods of the *agnus castus*, and turned out of doors with the words, "Out with hunger, and in with wealth and health." When Plutarch held the office of chief magistrate of his native town he performed this ceremony at the Town Hall, and he has recorded the discussion to which the custom afterwards gave rise. The ceremony closely resembles the Japanese, Hindoo, and Highland customs already described.

But in civilized Greece the custom of the scapegoat took darker forms than the innocent rite over which the amiable and pious Plutarch presided. Whenever Marseilles, one of the busiest and most brilliant of Greek colonies, was ravaged by a plague, a man of the poorer classes used to offer himself as a scapegoat. For a whole year he was maintained at the public expense, being fed on choice and pure food. At the expiry of the year he was dressed in sacred garments, decked with holy branches, and led through the whole city, while prayers were uttered that all the evils of the people might fall on his head. He was then cast out of the city or stoned to death by the people outside of the walls. The Athenians regularly maintained a number of degraded and useless beings at the public expense; and when any calamity, such as plague, drought, or famine, befell the city, they sacrificed two of these outcasts as scapegoats. One of the victims was sacrificed for the men and the other for the women. The former wore round his neck a string of black, the latter a string of white figs. Sometimes, it seems, the victim slain on behalf of the women was a woman. They were led about the city and then sacrificed, apparently by being stoned to death outside the city. But such sacrifices were not confined to extraordinary occasions of public calamity; it appears that every year, at the festival of the Thargelia in May, two victims, one for the men and one for the women, were led out of Athens and stoned to death. The city of Abdera in Thrace was publicly purified once a year, and one of the burghers, set apart for the purpose, was stoned to death as a scapegoat or vicarious sacrifice for the life of all the others; six days before his execution he was excommunicated, "in order that he alone might bear the sins of all the people."

From the Lover's Leap, a white bluff at the southern end of their island, the Leucadians used annually to hurl a criminal into the sea as a scapegoat. But to lighten his fall they fastened live birds and feathers to him, and a flotilla of small boats waited below to catch him and convey him beyond the boundary. Probably these humane precautions were a mitigation of an earlier custom of flinging the scapegoat into the sea to drown, just as in Kumaon the custom

of letting a man slide down a rope from the top of a cliff appears to be a modification of an older practice of putting him to death. The Leucadian ceremony took place at the time of a sacrifice to Apollo, who had a temple or sanctuary on the spot. Elsewhere it was customary to cast a young man every year into the sea, with the prayer, "Be thou our offscouring." This ceremony was supposed to rid the people of the evils by which they were beset, or according to a somewhat different interpretation it redeemed them by paying the debt they owed to the sea-god. As practised by the Greeks of Asia Minor in the sixth century before our era, the custom of the scapegoat was as follows. When a city suffered from plague, famine, or other public calamity, an ugly or deformed person was chosen to take upon himself all the evils which afflicted the community. He was brought to a suitable place, where dried figs, a barley loaf, and cheese were put into his hand. These he ate. Then he was beaten seven times upon his genital organs with squills and branches of the wild fig and other wild trees, while the flutes played a particular tune. Afterwards he was burned on a pyre built of the wood of forest trees; and his ashes were cast into the sea. A similar custom appears to have been annually celebrated by the Asiatic Greeks at the harvest festival of the Thargelia.

In the ritual just described the scourging of the victim with squills, branches of the wild fig, and so forth, cannot have been intended to aggravate his sufferings, otherwise any stick would have been good enough to beat him with. The true meaning of this part of the ceremony has been explained by W. Mannhardt. He points out that the ancients attributed to squills a magical power of averting evil influences, and that accordingly they hung them up at the doors of their houses and made use of them in purificatory rites. Hence the Arcadian custom of whipping the image of Pan with squills at a festival, or whenever the hunters returned empty-handed, must have been meant, not to punish the god, but to purify him from the harmful influences which were impeding him in the exercise of his divine functions as a god who should supply the hunter with game. Similarly the object of beating the human scapegoat on the genital organs with squills and so on, must have been to release his reproductive energies from any restraint or spell under which they might be laid by demoniacal or other malignant agency; and as the Thargelia at which he was annually sacrificed was an early harvest festival celebrated in May, we must recognize in him a representative of the creative and fertilizing god of vegetation. The representative of the god was annually slain for the purpose I have indicated, that of maintaining the divine life in perpetual vigour, untainted by the weakness of age; and before he was put to death it was not unnatural to stimulate his reproductive powers in order that these might be transmitted in full activity to his successor, the new god or new embodiment of the old god, who was doubtless supposed immediately to take the place of the one slain. Similar reasoning would lead to a similar treatment of the scapegoat on special occasions, such as drought or famine. If the crops did not answer to the expectation of the husbandman, this would be attributed to some failure in the generative powers of the god whose function it was to produce the fruits of the earth. It might be thought that he was under a spell or was growing old and feeble. Accordingly he was slain in the person of his representative, with all the ceremonies already described, in order that, born young again, he might infuse his own youthful vigour into the stagnant energies of nature. On the same principle we can understand why Mamurius Veturius was beaten with rods, why the slave at the Chaeronean ceremony was beaten with the *agnus castus* (a tree to which magical properties were ascribed), why the effigy of Death in some parts of Europe is assailed with sticks and stones, and why at Babylon the criminal who played the god was scourged before he was crucified. The purpose of the scourging was not to intensify the agony of the divine sufferer, but on the contrary to dispel any malignant influences by which at the supreme moment he might conceivably be beset.

Thus far I have assumed that the human victims at the Thargelia represented the spirits of vegetation in general, but it has been well remarked by Mr. W. R. Paton that these poor wretches seem to have masqueraded as the spirits of fig-trees in particular. He points out that the process of caprification, as it is called, that is, the artificial fertilization of the cultivated fig-trees by hanging strings of wild figs among the boughs, takes place in Greece and Asia Minor in June about a month after the date of the Thargelia, and he suggests that the hanging of the black and white figs round the necks of the two human victims, one of whom represented the men and the other the women, may have been a direct imitation of the process of caprification designed, on the principle of imitative magic, to assist the fertilization of the fig-trees. And since caprification is in fact a marriage of the male fig-tree with the female fig-tree, Mr. Paton further supposes that the loves of the trees may, on the same principle of imitative magic, have been simulated by a mock or even a real marriage between the two human victims, one of whom appears sometimes to have been a woman. On this view the practice of beating the human victims on their genitals with branches of wild fig-trees and with squills was a charm intended to stimulate the generative powers of the man and woman who for the time being personated the male and the female fig-trees respectively, and who by their union in marriage, whether real or pretended, were believed to help the trees to bear fruit.

The theory is ingenious and attractive; and to some extent it is borne out by the Roman celebration of the *Nonae Caprotinae*, which I have described in an earlier part of this work. For on the *Nonae Caprotinae*, the ninth of July, the female slaves, in the attire of free women, feasted under a wild fig-tree, cut a rod from the tree, beat each other, perhaps with the rod, and offered the milky juice of the tree to the goddess Juno Caprotina, whose surname seems to point her out as the goddess of the wild fig-tree (*caprificus*). Here the rites performed in July by women under the wild fig-tree, which the ancients rightly regarded as a male and employed to fertilize the cultivated female fig-tree, can hardly be dissociated from the caprification or artificial marriage of the fig-trees which, according to Columella, was best performed in July; and if the blows which the women gave each other on this occasion were administered, as seems highly probable, by the rod which they cut from the wild fig-tree, the parallel between the Roman and the Greek ceremony would be still closer; since the Greeks, as we saw, beat the genitals of the human victims with branches of wild fig-trees. It is true that the human sacrifices, which formed so prominent a feature in the Greek celebration of the Thargelia, do not figure in the Roman celebration of the *Nonae Caprotinae* within historical times; yet a trace of them may perhaps be detected in the tradition that Romulus himself mysteriously disappeared on that very day in the midst of a tremendous thunder-storm, while he was reviewing his army outside the walls of Rome at the Goat's Marsh ("*ad Caprae paludem*"), a name which suggests that the place was not far distant from the wild fig-tree or the goat-fig (*caprificus*), as the Romans called it, where the slave women performed their curious ceremonies. The legend that he was cut in pieces by the patricians, who carried away the morsels of his body under their robes and buried them in the earth, exactly describes the treatment which the Khonds used to accord to the bodies of the human victims for the purpose of fertilizing their fields. Can the king have played at Rome the same fatal part in the fertilization of fig-trees which, if Mr. Paton is right, was played in Greece by the male victim? The traditionary time, place, and manner of his death all suggest it. So many coincidences between the Greek and Roman ceremonies and traditions can hardly be wholly accidental; and accordingly I incline to think that there may well be an element of truth in Mr. Paton's theory, though it must be confessed that the ancient writers who describe the Greek custom appear to regard it merely as a purification of the city and not at all as a mode of fertilizing fig-trees. In similar ceremonies, which combine the elements of purification and fertilization, the notion of purification apparently tends gradually to

overshadow the notion of fertilization in the minds of those who practise the rites. It seems to have been so in the case of the annual expulsion of Mamurius Veturius from ancient Rome and in the parallel processions of the *Perchten* in modern Europe; it may have been so also in the case of the human sacrifices at the Thargelia.

The interpretation which I have adopted of the custom of beating the human scapegoat with certain plants is supported by many analogies. We have already met with examples of a practice of beating sick people with the leaves of certain plants or with branches in order to rid them of noxious influences. Some of the Dravidian tribes of Northern India, who attribute epilepsy, hysteria, and similar maladies to demoniacal possession, endeavour to cure the sufferer by thrashing him soundly with a sacred iron chain, which is believed to have the effect of immediately expelling the demon. When a herd of camels refuses to drink, the Arabs will sometimes beat the male beasts on the back to drive away the jinn who are riding them and frightening the females. In Bikol, the south-western part of Luzon, it was generally believed that if the evil spirit Aswang were not properly exorcised he took possession of the bodies of the dead and tormented them. Hence to deliver a corpse from his clutches the native priestesses used to beat it with a brush or whisk made of the leaves of the aromatic China orange, while they chanted a certain song, throwing their bodies into contortions and uttering shrill cries, as if the evil spirit had entered into themselves. The soul of the deceased, thus delivered from the cruel tyranny of Aswang, was then free to roam at pleasure along the charming lanes or in the thick shade of the forest.

Sometimes it appears that a beating is administered for the purpose of ridding people of a ghost who may be clinging too closely to their persons; in such cases the blows, though they descend on the bodies of the living, are really aimed at the spirit of the dead, and have no other object than to drive it away, just as a coachman will flick the back of a horse with his whip to rid the beast of a fly. At a funeral in the island of Halmahera, before the coffin is lowered into the grave, all the relations whip themselves on the head and shoulders with wands made of plants which are believed to possess the power of keeping off evil spirits. The intention of the custom is said to be to bring back their own spectres or souls and to prevent them from following the ghost; but this may fairly be interpreted to mean that the blows are directed to brushing off the ghost, who would otherwise abstract the soul of the person on whose body he was allowed to settle. This interpretation is strongly confirmed by the practice, observed by the same people on the same occasion, of throwing the trunk of a banana-tree into the grave, and telling the dead man that it is a companion for him; for this practice is expressly intended to prevent the deceased from feeling lonely, and so coming back to fetch away a friend. When Mr. Batchelor returned to a hut after visiting the grave of an old Aino woman, her relations brought him a bowl of water to the door and requested him to wash his face and hands. While he did so, the women beat him and brushed him down with sacred whittled sticks (*inao*). On enquiring into the meaning of this treatment, he discovered that it was intended to purify him from all uncleanness contracted at the grave through contact with the ghost of the deceased, and that the beating and brushing with the whittled sticks had for its object to drive away all evil influences and diseases with which the ghost of the old woman might have attempted to infect him out of spite for his trespassing on her domain. The Banmanas of Senegambia think that the soul of a dead infant becomes for a time a wandering and maleficent spirit. Accordingly when a baby dies, all the uncircumcised children of the same sex in the village run about the streets in a band, each armed with three or four supple rods. Some of them enter every house to beg, and while they are doing so, one of the troop, propping himself against the wall with his hands, is lashed by another of the children on his back or legs till the blood flows. Each of the children takes it in turn to be thus whipped. The object of the whipping, we are told, "appears to be to preserve the

uncircumcised child from being carried off by its comrade who has just died.” The severe scourgings inflicted on each other by some South American Indians at ceremonies connected with the dead may be similarly intended to chase away the dangerous ghost, who is conceived as sticking like a leech or a bur to the skin of the living. The ancient Greeks employed the laurel very commonly as an instrument of ceremonial purification; and from the monuments which represent the purgation of Orestes from the guilt of matricide it seems probable that the regular rite of cleansing a homicide consisted essentially in sprinkling him with pig's blood and beating him with a laurel bough, for the purpose, as we may conjecture, of whisking away the wrathful ghost of his victim, who was thought to buzz about him like an angry wasp in summer. If that was so, the Greek ritual of purification singularly resembles the Nicobarese ceremony of exorcism; for when a man is supposed to be possessed by devils, the Nicobarese rub him all over with pig's blood and beat him with bunches of certain leaves, to which a special power of exorcising demons is attributed. As fast as each devil is thus disengaged from his person, it is carefully folded up in leaves, to be afterwards thrown into the sea at daybreak.

At the autumn festival in Peru people used to strike each other with torches, saying, “Let all harm go away.” Every year when the Pleiades reappeared in the sky, the Guaycurus, an Indian nation of the Gran Chaco, held a festival of rejoicing, at which men, women, and children all thrashed each other, expecting thereby to procure health, abundance, and victory over their enemies. Indians of the Quixos, in South America, before they set out on a long hunting expedition, cause their wives to whip them with nettles, believing that this renders them fleeter, and helps them to overtake the peccaries. They resort to the same proceeding as a cure for sickness. The Roocooyen Indians of French Guiana train up young people in the way they should go by causing them to be stung by ants and wasps; and at the ceremony held for this purpose the grown-up people improve the occasion by allowing themselves to be whacked by the chief with a stick over the arms, the legs, and the chest. They appear to labour under an impression that this conveys to them all sorts of moral and physical excellences. One of the tribe, ambitious of acquiring the European virtues, begged a French traveller to be so kind as to give him a good hiding. The traveller obligingly did his best to gratify him, and the face of the Indian beamed with gratitude as the blows fell on his naked back. The Delaware Indians had two sovereign remedies for sin; one was an emetic, the other a thrashing. In the latter case, the remedy was administered by means of twelve different sticks, with which the sinner was belaboured from the soles of his feet up to his neck. In both cases the sins were supposed to be expelled from the body, and to pass out through the throat. At the inauguration of a king in ancient India it was customary for the priests to strike him lightly on the back with sticks. “By beating him with sticks,” it was said, “they guide him safely over judicial punishment; whence the king is exempt from punishment, because they guide him safely over judicial punishment.” On the thirtieth of December the heathen of Harran used to receive three, five, or seven blows apiece from a priest with a tamarisk branch. After the beating had been duly administered the priest on behalf of the whole community prayed for long life, much offspring, power and glory over all peoples, and the restoration of their ancient kingdom.

Sometimes, in the opinion of those who resort to it, the effect of a beating is not merely the negative one of dispelling demoniac or other baneful influences; it confers positive benefits by virtue of certain useful properties supposed to inhere in the instrument with which the beating is administered. Thus among the Kai of German New Guinea, when a man wishes to make his banana shoots bear fruit quickly, he beats them with a stick cut from a banana-tree which has already borne fruit. Here it is obvious that fruitfulness is believed to inhere in a stick cut from a fruitful tree and to be imparted by contact to the young banana plants.

Similarly in New Caledonia a man will beat his taro plants lightly with a branch, saying as he does so, "I beat this taro that it may grow," after which he plants the branch in the ground at the end of the field. Among the Indians of Brazil at the mouth of the Amazon, when a man wishes to increase the size of his generative organ, he strikes it with the fruit of a white aquatic plant called an *aninga*, which grows luxuriantly on the banks of the river. The fruit, which is inedible, resembles a banana, and is clearly chosen for this purpose on account of its shape. The ceremony should be performed three days before or after the new moon. In the county of Bekes, in Hungary, barren women are fertilized by being struck with a stick which has first been used to separate pairing dogs. Here a fertilizing virtue is clearly supposed to be inherent in the stick and to be conveyed by contact to the women. The Toradjas of Central Celebes think that the plant *Dracaena terminalis* has a strong soul, because when it is lopped, it soon grows up again. Hence when a man is ill, his friends will sometimes beat him on the crown of the head with *Dracaena* leaves in order to strengthen his weak soul with the strong soul of the plant. At Mowat in British New Guinea small boys are beaten lightly with sticks during December "to make them grow strong and hardy."

Among the Arabs of Morocco the Great Feast, which is the annual sacrificial festival of Mohammedan peoples, is the occasion when men go about beating people with the kindly intention of healing or preventing sickness and benefiting the sufferers generally. In some tribes the operator is muffled in the bloody skins of sacrificed sheep, and he strikes everybody within reach of him with a flap of the skin or a foot of the sheep which dangles loose from his arm; sick people present themselves to him in order to receive the health-giving blows, and mothers bring their little children to him for the same purpose. Anybody whom he hits on the head will be free from headache. Nor does he confine his attention to people; he goes about striking the tents also, in order that they too may receive their share of the blessed influence (*baraka*) that radiates like sunshine from a bloody sheepskin. From the costume which he wears the masker is known as the "Lion with Sheepskins"; and he himself participates in the blessings which he diffuses so liberally around him. Hence in at least one tribe he is generally a person who suffers from some illness, because he expects to be healed by the magic virtue or holiness of the bloody skins. Similarly, as we shall see presently, in ancient Mexico the men who masqueraded in the skins of the human victims were commonly persons who suffered from skin disease, because they thought that the bleeding skin of a man who had been killed in the character of a god must surely possess a sovereign virtue for the healing of disease. In Morocco the skin-clad mummer sometimes operates with sticks instead of a flap of the skin, and sometimes the skins in which he is muffled are those of goats instead of sheep, but in all cases the effect, or at least the intention, is probably the same.

In some parts of Eastern and Central Europe a similar custom is very commonly observed in spring. On the first of March the Albanians strike men and beast with cornel branches, believing that this is very good for their health. In March the Greek peasants of Cos switch their cattle, saying, "It is March, and up with your tail!" They think that the ceremony benefits the animals, and brings good luck. It is never observed at any other time of the year. In some parts of Mecklenburg it is customary to beat the cattle before sunrise on the morning of Good Friday with rods of buckthorn, which are afterwards concealed in some secret place where neither sun nor moon can shine on them. The belief is that though the blows light upon the animals, the pain of them is felt by the witches who are riding the beasts. In the neighbourhood of Iserlohn, in Westphalia, the herdsman rises at peep of dawn on May morning, climbs a hill, and cuts down the young rowan-tree which is the first to catch the beams of the rising sun. With this he returns to the farm-yard. The heifer which the farmer desires to "quicken" is then led to the dunghill, and the herdsman strikes it over the hind-quarters, the haunches, and the udders with a branch of the rowan-tree, saying,

*“Quick, quick, quick!
Bring milk into the dugs.
The sap is in the birches.
The heifer receives a name.*

*“Quick, quick, quick!
Bring milk into the dugs.
The sap comes in the beeches,
The leaf comes on the oak.*

*“Quick, quick, quick!
Bring milk into the dugs.
In the name of the sainted Greta,
Gold-flower shall be thy name,”*

and so on. The intention of the ceremony appears to be to make sure that the heifer shall in due time yield a plentiful supply of milk; and this is perhaps supposed to be brought about by driving away the witches, who are particularly apt, as we have seen, to rob the cows of their milk on the morning of May Day. Certainly in the north-east of Scotland pieces of rowan-tree and woodbine used to be placed over the doors of the byres on May Day to keep the witches from the cows; sometimes a single rod of rowan, covered with notches, was found to answer the purpose. An even more effectual guard against witchcraft was to tie a small cross of rowan-wood by a scarlet thread to each beast's tail; hence people said,

*“Rawn-tree in red-threed
Pits the witches t' their speed.”*

In Germany also the rowan-tree is a protection against witchcraft; and Norwegian sailors and fishermen carry a piece of it in their boats for good luck. Thus the benefit to young cows of beating them with rowan appears to be not so much the positive one of pouring milk into their udders, as merely the negative one of averting evil influence; and the same may perhaps be said of most of the beatings with which we are here concerned.

On Good Friday and the two previous days people in Croatia and Slavonia take rods with them to church, and when the service is over they beat each other “fresh and healthy.” In some parts of Russia people returning from the church on Palm Sunday beat the children and servants who have stayed at home with palm branches, saying, “Sickness into the forest, health into the bones.” A similar custom is widely known under the name of *Schmeckostern* or “Easter Smacks” in some parts of Germany and Austria. The regions in which the practice prevails are for the most part districts in which the people either are or once were predominantly of Slavonic blood, such as East and West Prussia, Voigtland, Silesia, Bohemia, and Moravia. While the German population call the custom *Schmeckostern*, the Slavonic inhabitants give it, according to their particular language or dialect, a variety of names which signify to beat or scourge. It is usually observed on Easter Monday, less frequently on Easter Saturday or Easter Sunday. Troops of boys or lads go from house to house on the morning of Easter Monday beating every girl or woman whom they meet; they even make their way into the bedrooms, and if they find any girls or women still abed, they compel them with blows to get up. Even grown-up men indulge themselves in the pastime of going to the houses of friends and relations to inflict the “Easter Smacks.” In some places, for example in the Leobschütz district of Silesia, the boys and men further claim and exercise the right of drenching all the girls and women with water on Easter Monday; and for this purpose they generally go about armed with squirts, which are not always charged with eau de Cologne. Next day, Easter Tuesday, the women have the right to retaliate on the men;

however, they do not as a rule go about the streets but confine their operations to their own houses, beating and chasing from their beds any lads or men they can find lying in them. Children are less discriminating in their "Easter Smacks," which they bestow impartially on parents and relations, friends and strangers, without observing the subtle distinction of sex. In many places it is only the women who are privileged to receive the smacks. The instrument with which the beating is administered is in some districts, such as Lithuania, Samland, and Neumark, a twig or branch of birch on which the fresh green leaves have just sprouted. If the birch-trees have not budded in time, it is customary to keep the rods in pickle for days or even weeks, nursing them tenderly in warm water; and if that measure also fails, they are heated in the stove-pipe. But more commonly the instrument of torture is a branch of willow with catkins on it, which has also been nursed in warm water or the chimney so as to be ripe for execution on Easter Monday. A number of these birch or willow twigs are usually tied together into a switch, and ornamented with motley ribbons and pieces of silk paper, so that they present the appearance of a nosegay; indeed, in northern Bohemia spring flowers form part of the decoration. In some places, particularly in Silesia and Moravia, pieces of licorice root are substituted for willow twigs; or again in the vine-growing districts of Bohemia vine-branches are used for the same purpose. Sometimes a scourge made of leather straps of various colours takes the place of a green bough. The blows are commonly inflicted on the hands and feet; and in some places, particularly in Bohemia, the victims are expected to reward their tormentors with a present of red Easter eggs; nay sometimes a woman is bound to give an egg for every blow she receives. In the afternoon the lads carry their eggs to high ground and let them roll down the slope; he whose egg reaches the bottom first, wins all the rest. The beating is supposed to bring good luck to the beaten, or to warrant them against flies and vermin during the summer, or to save them from pains in their back throughout the whole year. At Gilgenburg in Masuren the rods or bundles of twigs are afterwards laid by and used to drive the cattle out to pasture for the first time after their winter confinement.

In some parts of Germany and Austria a custom like that of "Easter Smacks" is observed at the Christmas holidays, especially on Holy Innocents' Day, the twenty-eighth of December. Young men and women beat each other mutually, but on different days, with branches of fresh green, whether birch, willow, or fir. Thus, for example, among the Germans of western Bohemia it is customary on St. Barbara's Day (the fourth of December) to cut twigs or branches of birch and to steep them in water in order that they may put out leaves or buds. They are afterwards used by each sex to beat the other on subsequent days of the Christmas holidays. In some villages branches of willow or cherry-trees or rosemary are employed for the same purpose. With these green boughs, sometimes tied in bundles with red or green ribbons, the young men go about beating the young women on the morning of St. Stephen's Day (the twenty-sixth of December) and also on Holy Innocents' Day (the twenty-eighth of December). The beating is inflicted on the hands, feet, and face; and in Neugramatin it is said that she who is not thus beaten with fresh green will not herself be fresh and green. As the blows descend, the young men recite verses importing that the beating is administered as a compliment and in order to benefit the health of the victim. For the service which they thus render the damsels they are rewarded by them with cakes, brandy, or money. Early in the morning of New Year's Day the lasses pay off the lads in the same kind. A similar custom is also observed in central and south-west Germany, especially in Voigtland. Thus in Voigtland and the whole of the Saxon Erz-gebirge the lads beat the lasses and women on the second day of the Christmas holidays with something green, such as rosemary or juniper; and if possible the beating is inflicted on the women as they lie in bed. As they beat them, the lads say

*"Fresh and green! Pretty and fine!
Gingerbread and brandy-wine!"*

The last words refer to the present of gingerbread and brandy which the lads expect to receive from the lasses for the trouble of thrashing them. Next day the lasses and women retaliate on the lads and men. In Thüringen on Holy Innocents' Day (the twenty-eighth of December) children armed with rods and green boughs go about the streets beating passers-by and demanding a present in return; they even make their way into the houses and beat the maid-servants. In Orlagau the custom is called "whipping with fresh green." On the second day of the Christmas holidays the girls go to their parents, godparents, relations, and friends, and beat them with fresh green branches of fir; next day the boys and lads do the same. The words spoken while the beating is being administered are "Good morning! fresh green! Long life! You must give us a bright thaler," and so on.

In these European customs the intention of beating persons, especially of the other sex, with fresh green leaves appears unquestionably to be the beneficent one of renewing their life and vigour, whether the purpose is supposed to be accomplished directly and positively by imparting the vital energy of the fresh green to the persons, or negatively and indirectly by dispelling any injurious influences, such as the machinations of witches and demons, by which the persons may be supposed to be beset. The application of the blows by the one sex to the other, especially by young men to young women, suggests that the beating is or was originally intended above all to stimulate the reproductive powers of the men or women who received it; and the pains taken to ensure that the branches with which the strokes are given should have budded or blossomed out just before their services are wanted speak strongly in favour of the view that in these customs we have a deliberate attempt to transfuse a store of vital energy from the vegetable to the animal world.

These analogies, accordingly, support the interpretation which, following my predecessors W. Mannhardt and Mr. W. R. Paton, I have given of the beating inflicted on the human victims at the Greek harvest festival of the Thargelia. That beating, being administered to the generative organs of the victims by fresh green plants and branches, is most naturally explained as a charm to increase the reproductive energies of the men or women either by communicating to them the fruitfulness of the plants and branches, or by ridding them of maleficent influences; and this interpretation is confirmed by the observation that the two victims represented the two sexes, one of them standing for the men in general and the other for the women. The season of the year when the ceremony was performed, namely the time of the corn harvest, tallies well with the theory that the rite had an agricultural significance. Further, that it was above all intended to fertilize the fig-trees is strongly suggested by the strings of black and white figs which were hung round the necks of the victims, as well as by the blows which were given their genital organs with the branches of a wild fig-tree; since this procedure closely resembles the procedure which ancient and modern husbandmen in Greek lands have regularly resorted to for the purpose of actually fertilizing their fig-trees. When we remember what an important part the artificial fertilization of the date palm-tree appears to have played of old not only in the husbandry but in the religion of Mesopotamia, there seems no reason to doubt that the artificial fertilization of the fig-tree may in like manner have vindicated for itself a place in the solemn ritual of Greek religion.

If these considerations are just, we must apparently conclude that while the human victims at the Thargelia certainly appear in later classical times to have figured chiefly as public scapegoats, who carried away with them the sins, misfortunes, and sorrows of the whole people, at an earlier time they may have been looked on as embodiments of vegetation, perhaps of the corn but particularly of the fig-trees; and that the beating which they received and the death which they died were intended primarily to brace and refresh the powers of vegetation then beginning to droop and languish under the torrid heat of the Greek summer.

The view here taken of the Greek scapegoat, if it is correct, obviates an objection which might otherwise be brought against the main argument of this book. To the theory that the priest of Aricia was slain as a representative of the spirit of the grove, it might have been objected that such a custom has no analogy in classical antiquity. But reasons have now been given for believing that the human being periodically and occasionally slain by the Asiatic Greeks was regularly treated as an embodiment of a divinity of vegetation. Probably the persons whom the Athenians kept to be sacrificed were similarly treated as divine. That they were social outcasts did not matter. On the primitive view a man is not chosen to be the mouth-piece or embodiment of a god on account of his high moral qualities or social rank. The divine afflatus descends equally on the good and the bad, the lofty and the lowly. If then the civilized Greeks of Asia and Athens habitually sacrificed men whom they regarded as incarnate gods, there can be no inherent improbability in the supposition that at the dawn of history a similar custom was observed by the semi-barbarous Latins in the Arician Grove.

VII. Killing the God in Mexico

By no people does the custom of sacrificing the human representative of a god appear to have been observed so commonly and with so much solemnity as by the Aztecs of ancient Mexico. With the ritual of these remarkable sacrifices we are well acquainted, for it has been fully described by the Spaniards who conquered Mexico in the sixteenth century, and whose curiosity was naturally excited by the discovery in this distant region of a barbarous and cruel religion which presented many curious points of analogy to the doctrine and ritual of their own church. "They took a captive," says the Jesuit Acosta, "such as they thought good; and afore they did sacrifice him unto their idols, they gave him the name of the idol, to whom he should be sacrificed, and apparelled him with the same ornaments like their idol, saying, that he did represent the same idol. And during the time that this representation lasted, which was for a year in some feasts, in others six months, and in others less, they revered and worshipped him in the same manner as the proper idol; and in the meantime he did eat, drink, and was merry. When he went through the streets, the people came forth to worship him, and every one brought him an alms, with children and sick folks, that he might cure them, and bless them, suffering him to do all things at his pleasure, only he was accompanied with ten or twelve men lest he should fly. And he (to the end he might be revered as he passed) sometimes sounded upon a small flute, that the people might prepare to worship him. The feast being come, and he grown fat, they killed him, opened him, and ate him, making a solemn sacrifice of him."

This general description of the custom may now be illustrated by particular examples. Thus at the festival called *Toxcatl*, the greatest festival of the Mexican year, a young man was annually sacrificed in the character of *Tezcatlipoca*, "the god of gods," after having been maintained and worshipped as that great deity in person for a whole year. According to the old Franciscan monk *Sahagun*, our best authority on the Aztec religion, the sacrifice of the human god fell at Easter or a few days later, so that, if he is right, it would correspond in date as well as in character to the Christian festival of the death and resurrection of the Redeemer. More exactly he tells us that the sacrifice took place on the first day of the fifth Aztec month, which according to him began on the twenty-third or twenty-seventh day of April. However, according to other Spanish authorities of the sixteenth century the festival lasted from the ninth to the nineteenth day of May, and the sacrifice of the human victim in the character of the god was performed on the last of these days. An eminent modern authority, Professor E. Seler, is of opinion that the festival originally celebrated the beginning of the year, and that it fell on the day when the sun on his passage northward to the tropic of Cancer stood in the zenith over the city of Mexico, which in the early part of the sixteenth century would be the ninth or tenth day of May (old style) or the nineteenth or twentieth day of May (new style). Whatever the exact date of the celebration may have been, we are told that the "feast was not made to any other end, but to demand rain, in the same manner that we solemnize the Rogations; and this feast was always in May, which is the time that they have most need of rain in those countries."

At this festival the great god died in the person of one human representative and came to life again in the person of another, who was destined to enjoy the fatal honour of divinity for a year and to perish, like all his predecessors, at the end of it. The young man singled out for this high dignity was carefully chosen from among the captives on the ground of his personal beauty. He had to be of unblemished body, slim as a reed and straight as a pillar, neither too tall nor too short. If through high living he grew too fat, he was obliged to reduce himself by

drinking salt water. And in order that he might behave in his lofty station with becoming grace and dignity he was carefully trained to comport himself like a gentleman of the first quality, to speak correctly and elegantly, to play the flute, to smoke cigars and to snuff at flowers with a dandified air. He was honourably lodged in the temple where the nobles waited on him and paid him homage, bringing him meat and serving like a prince. The king himself saw to it that he was apparelled in gorgeous attire, "for already he esteemed him as a god." Eagle down was gummed to his head and white cock's feathers were stuck in his hair, which drooped to his girdle. A wreath of flowers like roasted maize crowned his brows, and a garland of the same flowers passed over his shoulders and under his arm-pits. Golden ornaments hung from his nose, golden armlets adorned his arms, golden bells jingled on his legs at every step he took; earrings of turquoise dangled from his ears, bracelets of turquoise bedecked his wrists; necklaces of shells encircled his neck and depended on his breast; he wore a mantle of network, and round his middle a rich waist-cloth. When this bejewelled exquisite lounged through the streets playing on his flute, puffing at a cigar, and smelling at a nosegay, the people whom he met threw themselves on the earth before him and prayed to him with sighs and tears, taking up the dust in their hands and putting it in their mouths in token of the deepest humiliation and subjection. Women came forth with children in their arms and presented them to him, saluting him as a god. For "he passed for our Lord God; the people acknowledged him as the Lord." All who thus worshipped him on his passage he saluted gravely and courteously. Lest he should flee, he was everywhere attended by a guard of eight pages in the royal livery, four of them with shaven crowns like the palace-slaves, and four of them with the flowing locks of warriors; and if he contrived to escape, the captain of the guard had to take his place as the representative of the god and to die in his stead. Twenty days before he was to die, his costume was changed, and four damsels, delicately nurtured and bearing the names of four goddesses—the Goddess of Flowers, the Goddess of the Young Maize, the Goddess "Our Mother among the Water," and the Goddess of Salt—were given him to be his brides, and with them he consorted. During the last five days divine honours were showered on the destined victim. The king remained in his palace while the whole court went after the human god. Solemn banquets and dances followed each other in regular succession and at appointed places. On the last day the young man, attended by his wives and pages, embarked in a canoe covered with a royal canopy and was ferried across the lake to a spot where a little hill rose from the edge of the water. It was called the Mountain of Parting, because here his wives bade him a last farewell. Then, accompanied only by his pages, he repaired to a small and lonely temple by the wayside. Like the Mexican temples in general, it was built in the form of a pyramid; and as the young man ascended the stairs he broke at every step one of the flutes on which he had played in the days of his glory. On reaching the summit he was seized and held down by the priests on his back upon a block of stone, while one of them cut open his breast, thrust his hand into the wound, and wrenching out his heart held it up in sacrifice to the sun. The body of the dead god was not, like the bodies of common victims, sent rolling down the steps of the temple, but was carried down to the foot, where the head was cut off and spitted on a pike. Such was the regular end of the man who personated the greatest god of the Mexican pantheon.

But he was not the only man who played the part of a god and was sacrificed as such in the month of May. The great god Vitzilopochtli or Huitzilopochtli was also worshipped at the same season. An image of him was made out of dough in human shape, arrayed in all the ornaments of the deity, and set up in his temple. But the god had also his living representative in the person of a young man, who, like the human representative of Tezcatlipoca, personated the divinity for a whole year and was sacrificed at the end. In the month of May it was the duty of the divine man, destined so soon to die, to lead the dances which formed a conspicuous feature of the festivities. Courtiers and warriors, old and young, danced in

winding figures, holding each other by the hand; and with them danced young women, who had taken a vow to dance with roasted maize. On their heads these damsels wore crowns of roasted maize; festoons of maize hung from their shoulders and crossed on their breasts; their faces were painted, and their arms and legs were covered with red feathers. Dancing in this attire the damsels were said to hold the god Vitzilopochtli in their arms; but they conducted themselves with the utmost gravity and decorum. If any man so far forgot himself as to toy with one of the maidens, the elder warriors dealt with him promptly and severely, reproaching him for the sacrilege of which he had been guilty. Sahagun compares these May dances to the dances of peasant men and women in old Castile, and the crowns of maize worn by the girls he compares to the garlands of flowers worn by rustic Castilian maidens in the month of May. So they danced till nightfall. Next morning they danced again, and in the course of the day the man who represented the god Vitzilopochtli was put to death. He had the privilege of choosing the hour when he was to die. When the fatal moment drew near, they clothed him in a curious dress of paper painted all over with black circles; on his head they clapped a paper mitre decked with eagle feathers and nodding plumes, among which was fastened a blood-stained obsidian knife. Thus attired, with golden bells jingling at his ankles, he led the dance at all the balls of the festival, and thus attired he went to his death. The priests seized him, stretched him out, gripped him tight, cut out his heart, and held it up to the sun. His head was severed from the trunk and spiked beside the head of the other human god, who had been sacrificed not long before.

In Cholula, a wealthy trading city of Mexico, the merchants worshipped a god named Quetzalcoatl. His image, set upon a richly decorated altar or pedestal in a spacious temple, had the body of a man but the head of a bird, with a red beak surmounted by a crest, the face dyed yellow, with a black band running from the eyes to below the beak, and the tongue lolling out. On its head was a paper mitre painted black, white, and red; on its neck a large golden jewel in the shape of butterfly wings; about its body a feather mantle, black, red, and white; golden socks and golden sandals encased its legs and feet. In the right hand the image wielded a wooden instrument like a sickle, and in the left a buckler covered with the black and white plumage of sea-birds. The festival of this god was celebrated on the third day of February. Forty days before the festival "the merchants bought a slave well proportioned, without any fault or blemish, either of sickness or of hurt, whom they did attire with the ornaments of the idol, that he might represent it forty days. Before his clothing they did cleanse him, washing him twice in a lake, which they called the lake of the gods; and being purified, they attired him like the idol. During these forty days, he was much respected for his sake whom he represented. By night they did imprison him (as hath been said) lest he should fly, and in the morning they took him out of prison, setting him upon an eminent place, where they served him, giving him exquisite meats to eat. After he had eaten, they put a chain of flowers about his neck, and many nosegays in his hands. He had a well-appointed guard, with much people to accompany him. When he went through the city, he went dancing and singing through all the streets, that he might be known for the resemblance of their god, and when he began to sing, the women and little children came forth of their houses to salute him, and to offer unto him as to their god. Two old men of the ancients of the temple came unto him nine days before the feast, and humbling themselves before him, they said with a low and submissive voice, 'Sir, you must understand that nine days hence the exercise of dancing and singing doth end, and thou must then die'; and then he must answer, 'In a good hour.' They call this ceremony *Neyòlo Maxilt Ileztli*, which is to say, the advertisement; and when they did thus advertise him, they took very careful heed whether he were sad, or if he danced as joyfully as he was accustomed, the which if he did not as cheerfully as they desired, they made a foolish superstition in this manner. They presently took the sacrificing razors, the which they washed and cleansed from the blood of men which remained of the former

sacrifices. Of this washing they made a drink mingled with another liquor made of cacao, giving it him to drink; they said that this would make him forget what had been said unto him, and would make him in a manner insensible, returning to his former dancing and mirth. They said, moreover, that he would offer himself cheerfully to death, being enchanted with this drink. The cause why they sought to take from him this heaviness, was, for that they held it for an ill augury, and a fore-telling of some great harm. The day of the feast being come, after they had done him much honour, sung, and given him incense, the sacrificers took him about midnight and did sacrifice him, as hath been said, offering his heart unto the Moon, the which they did afterwards cast against the idol, letting the body fall to the bottom of the stairs of the temple, where such as had offered him took him up, which were the merchants, whose feast it was. Then having carried him into the chiefest man's house amongst them, the body was drest with diverse sauces, to celebrate (at the break of day) the banquet and dinner of the feast, having first bid the idol good morrow, with a small dance, which they made whilst the day did break, and that they prepared the sacrifice. Then did all the merchants assemble at this banquet, especially those which made it a traffick to buy and sell slaves, who were bound every year to offer one, for the resemblance of their god. This idol was one of the most honoured in all the land; and therefore the temple where he was, was of great authority.”

The honour of living for a short time in the character of a god and dying a violent death in the same capacity was not restricted to men in Mexico; women were allowed, or rather compelled, to enjoy the glory and to share the doom as representatives of goddesses. Thus in the seventh month of their year, which corresponded roughly to June, the Aztecs celebrated a festival in honour of Huixtocihuatl, the Goddess of Salt. She was said to be a sister of the Rain Gods, but having quarrelled with them she was banished and driven to take up her abode in the salt water. Being of an ingenious turn of mind, she invented the process of extracting salt by means of pans; hence she was worshipped by all salt-makers as their patron goddess. Her garments were yellow; on her head she wore a mitre surmounted by bunches of waving green plumes, which shone with greenish iridescent hues in the sun. Her robe and petticoats were embroidered with patterns simulating the waves of the sea. Golden ear-rings in the form of flowers dangled at her ears; golden bells jingled at her ankles. In one hand she carried a round shield painted with the leaves of a certain plant and adorned with drooping fringes of parrots' feathers; in the other hand she carried a stout baton ending in a knob and bedecked with paper, artificial flowers, and feathers. For ten days before her festival a woman personated the goddess and wore her gorgeous costume. It was her duty during these days to lead the dances which at this season were danced by the women and girls of the salt-makers. They danced, young, old, and children, in a ring, all holding a cord, their heads crowned with garlands of a fragrant flower (*Artemisia laciniata*) and singing airs in a shrill soprano. In the middle of the ring danced the woman who represented the goddess, with her golden bells jingling at every step, brandishing her shield, and marking the time of the dance and song with her baton. On the last day, the eve of the festival, she had to dance all night without resting till break of day, when she was to die. Old women supported her in the weary task, and they all danced together, arm in arm. With her, too, danced the slaves who were to die with her in the morning. When the hour was come, they led her, still personating the goddess, up the steps of the temple of Tlaloc, followed by the doomed captives. Arrived at the summit of the pyramid, the butchery began with the captives, while the woman stood looking on. Her turn being come, they threw her on her back on the block, and while five men held her down and two others compressed her throat with a billet of wood or the sword of a sword-fish to prevent her from screaming, the priest cut open her breast with his knife, and thrusting his hand into the wound tore out her heart and flung it into a bowl. When all was over, the salt-makers who had witnessed the sacrifice went home to drink and make merry.

Again, in the eighth month of the Mexican year, which answered to the latter end of June and the early part of July, the Aztecs sacrificed a woman who personated Xilonen, the goddess of the young maize-cobs (*xilotl*). The festival at which the sacrifice took place was held on the tenth day of the month about the time when the maize is nearly ripe, and when fibres shooting forth from the green ear shew that the grain is fully formed. For eight days before the festival men and women, clad in rich garments and decked with jewels, danced and sang together in the courts of the temples, which were brilliantly illuminated for the purpose. Rows of tall braziers sent up a flickering blaze, and torchbearers held aloft huge torches of pinewood. Some of the dancers themselves carried heavy torches, which flared and spluttered as they danced. The dances began at sundown and lasted till about nine o'clock. None but tried and distinguished warriors might take part in them. The women wore their long hair hanging loose on their back and shoulders, in order that the tassels of the maize might likewise grow long and loose, for the more tassels the more grain in the ear. Men and women danced holding each other by the hand or with their arms round each other's waists, marking time exactly with their feet to the music of the drums and moving out and in among the flaming braziers and torches. The dances were strictly decorous. If any man was detected making love to one of the women dancers, he was publicly disgraced, severely punished, and never allowed to dance and sing in public again. On the eve of the festival the woman who was to die in the character of the Goddess of the Young Maize was arrayed in the rich robes and splendid jewels of the divinity whom she personated. The upper part of her face was painted red and the lower part yellow, probably to assimilate her to the ruddy and orange hues of the ripe maize. Her legs and arms were covered with red feathers. She wore a paper crown decked with a bunch of feathers; necklaces of gems and gold encircled her neck; her garments were embroidered with quaint figures; her shoes were striped with red. In her left hand she held a round shield, in her right a crimson baton. Thus arrayed, she was led by other women to offer incense in four different places. All the rest of the night she and they danced and sang in front of the temple of the goddess Xilonen, whose living image she was supposed to be. In the morning the nobles danced a solemn dance by themselves, leaning, or making believe to lean, on stalks of maize. The women, pranked with garlands and festoons of yellow flowers, danced also by themselves along with the victim. Among the priests the one who was to act as executioner wore a fine bunch of feathers on his back. Another shook a rattle before the doomed woman as she mounted up the steps of the temple of Cinteotl, the Goddess of the Maize. On reaching the summit she was seized by a priest, who threw her on his back, while the sacrificer severed her head from her body, tore out her heart, and threw it in a saucer. When this sacrifice had been performed in honour of Xilonen, the Goddess of the Young Maize, the people were free to eat the green ears of maize and the bread that was baked of it. No one would have dared to eat of these things before the sacrifice.

Again, in the seventeenth month of the Mexican year, which corresponded to the latter part of December and the early part of January, the Aztecs sacrificed a woman, who personated the goddess Ilamatecutli or Tonan, which means "Our Mother." Her festival fell on Christmas Day, the twenty-fifth of December. The image of the goddess wore a two-faced mask with large mouths and protruding eyes. The woman who represented her was dressed in white robes and shod with white sandals. Over her white mantle she wore a leathern jerkin, the lower edge of which was cut into a fringe of straps, and to the end of each strap was fastened a small shell. As she walked, the shells clashed together and made a noise which was heard afar off. The upper half of her face was painted yellow and the lower half black; and she wore a wig. In her hand she carried a round whitewashed shield decorated in the middle with a circle of eagle feathers, while white heron plumes, ending in eagle feathers, drooped from it. Thus arrayed and personating the goddess, the woman danced alone to music played by old men, and as she danced she sighed and wept at the thought of the death that was so near. At

noon or a little later the dance ceased; and when the sun was declining in the west, they led her up the long ascent to the summit of Huitzilopochtli's temple. Behind her marched the priests clad in the trappings of all the gods, with masks on their faces. One of them wore the costume and the mask of the goddess Ilamatecutli, whom the victim also represented. On reaching the lofty platform which crowned the pyramidal temple, they slew her in the usual fashion, wrenched out her heart, and cut off her head. The dripping head was given to the priest who wore the costume and mask of the goddess and waving it up and down he danced round the platform, followed by all the other priests in the attire and masks of the gods. When the dance had lasted a certain time, the leader gave the signal, and they all trooped down the long flight of stairs to disrobe themselves and deposit the masks and costumes in the chapels where they were usually kept. Next day the people indulged in a certain pastime. Men and boys furnished themselves with little bags or nets stuffed with paper, flowers of galingale, or green leaves of maize, which they tied to strings, and used them as instruments to strike any girl or woman they might meet in the streets. Sometimes three or four urchins would gather round one girl, beating her till she cried; but some shrewd wenches went about that day armed with sticks, with which they retaliated smartly on their assailants. It was a penal offence to put stones or anything else that could hurt in the bags.

In the preceding custom, what are we to make of the sacrifice of a woman, who personated the goddess, by a man who also wore the costume and mask of the goddess, and who immediately after the sacrifice danced with the bleeding head of the victim? Perhaps the intention of the strange rite was to represent the resurrection of the slain goddess in the person of the priest who wore her costume and mask and dangled the severed head of her slaughtered representative. If that was so, it would explain another and still ghastlier rite, in which the Mexicans seem to have set forth the doctrine of the divine resurrection. This was to skin the slain woman who had personated the goddess and then to clothe in the bloody skin a man, who pranced about in it, as if he were the dead woman or rather goddess come to life again. Thus in the eleventh Mexican month, which corresponded to the latter part of August and the early part of September, they celebrated a festival in honour of a goddess called the Mother of the Gods (*Teteo innan*) or Our Ancestress (*Toci*), or the Heart of the Earth, and they sacrificed a woman clad in the costume and ornaments of the goddess. She was a slave bought for the purpose by the guilds of physicians, surgeons, blood-letters, midwives and fortune-tellers, who particularly worshipped this deity. When the poor wretch came forth decked in all the trappings of the goddess, the people, we are told, looked on her as equivalent to the Mother of the Gods herself and paid her as much honour and reverence as if she had indeed been that great divinity. For eight days they danced silently in four rows, if dance it could be called in which the dancers scarcely stirred their legs and bodies, but contented themselves with moving their hands, in which they held branches of blossoms, up and down in time to the tuck of drum. These dances began in the afternoon and lasted till the sun went down. No one might speak during their performance; only some lively youths mimicked by a booming murmur of the lips the rub-a-dub of the drums. When the dances were over, the medical women, young and old, divided themselves into two parties and engaged in a sham fight before the woman who acted the part of the Mother of the Gods. This they did to divert her and keep her from being sad and shedding tears; for if she wept, they deemed it an omen that many men would die in battle and many women in childbed. The fight between the women consisted in throwing balls of moss, leaves, or flowers at each other; and she who personated the goddess led one of the parties to the attack. These mock battles lasted four days.

After that they led the woman who was to die to the market-place, that she might bid it farewell; and by way of doing so she scattered the flour of maize wherever she went. The

priests then attended her to a building near the temple in which she was to be sacrificed. The knowledge of her doom was kept from her as far as possible. The medical women and the midwives comforted her, saying, "Be not cast down, sweetheart; this night thou shalt sleep with the king; therefore rejoice." Then they put on her the ornaments of the goddess, and at midnight led her to the temple where she was to die. On the passage not a word was spoken, not a cough was heard; crowds were gathered to see her pass, but all kept a profound silence. Arrived at the summit of the temple she was hoisted on to the back of one priest, while another adroitly cut off her head. The body, still warm, was skinned, and a tall robust young man clothed himself in the bleeding skin and so became in turn a living image of the goddess. One of the woman's thighs was flayed separately, and the skin carried to another temple, where a young man put it over his face as a mask and so personated the maize-goddess Cinteotl, daughter of the Mother of the Gods. Meantime the other, clad in the rest of the woman's skin, hurried down the steps of the temple. The nobles and warriors fled before him, carrying blood-stained besoms of couchgrass, but turned to look back at him from time to time and smote upon their shields as if to bid him come on. He followed hard after them and all who saw that flight and pursuit quaked with fear. On arriving at the foot of the temple of Huitzilopochtli, the man who wore the skin of the dead woman and personated the Mother of the Gods, lifted up his arms and stood like a cross before the image of the god; this action he repeated four times. Then he joined the man who personated the maize-goddess Cinteotl, and together they went slowly to the temple of the Mother of the Gods, where the woman had been sacrificed. All this time it was night. Next morning at break of day the man who personated the Mother of the Gods took up his post on the highest point of the temple; there they decked him in all the gorgeous trappings of the goddess and set a splendid crown on his head. Then the captives were set in a row before him, and arrayed in all his finery he slaughtered four of them with his own hand: the rest he left to be butchered by the priests. A variety of ceremonies and dances followed. Amongst others, the blood of the human victims was collected in a bowl and set before the man who personated the Mother of the Gods. He dipped his finger into the blood and then sucked his bloody finger; and when he had sucked it he bowed his head and uttered a dolorous groan, whereat the Indians believed the earth itself shook and trembled, as did all who heard it. Finally the skin of the slain woman and the skin of her thigh were carried away and deposited separately at two towers, one of which stood on the border of the enemy's country.

This remarkable festival in honour of the Mother of the Gods is said to have been immediately preceded by a similar festival in honour of the Maize Goddess Chicomecohuatl. The image of this goddess was of wood and represented her as a girl of about twelve years of age wearing feminine ornaments painted in gay colours. On her head was a pasteboard mitre; her long hair fell on her shoulders; in her ears she had golden earrings; round her neck she wore a necklace of golden maize-cobs strung on a blue ribbon, and in her hands she held the likeness of maize-cobs made of feathers and garnished with gold. Her festival, which was observed throughout the whole country with great devotion on the fifteenth day of September, was preceded by a strict fast of seven days, during which old and young, sick and whole, ate nothing but broken victuals and dry bread and drank nothing but water, and did penance by drawing blood from their ears. The blood so drawn was kept in vessels, which were not scoured, so that a dry crust formed over it. On the day before the fast began the people ate and drank to their heart's content, and they sanctified a woman to represent Atlatatonan, the Goddess of Lepers, dressing her up in an appropriate costume. When the fast was over, the high priest of the temple of Tlaloc sacrificed the woman in the usual way by tearing out her heart and holding it up as an offering to the sun. Her body, with all the robes and ornaments she had worn, was cast into a well or vault in the temple, and along with the corpse were thrown in all the plates and dishes out of which the people had

eaten, and all the mats on which they had sat or slept during the fast, as if, says the historian, they had been infected with the plague of leprosy. After that the people were free to eat bread, salt, and tomatoes; and immediately after the sacrifice of the woman who personated the Goddess of Leprosy they sanctified a young slave girl of twelve or thirteen years, the prettiest they could find, to represent the Maize Goddess Chicomecohuatl. They invested her with the ornaments of the goddess, putting the mitre on her head and the maize-cobs round her neck and in her hands, and fastening a green feather upright on the crown of her head to imitate an ear of maize. This they did, we are told, in order to signify that the maize was almost ripe at the time of the festival, but because it was still tender they chose a girl of tender years to play the part of the Maize Goddess. The whole long day they led the poor child in all her finery, with the green plume nodding on her head, from house to house dancing merrily to cheer people after the dulness and privations of the fast.

In the evening all the people assembled at the temple, the courts of which they lit up by a multitude of lanterns and candles. There they passed the night without sleeping, and at midnight, while the trumpets, flutes, and horns discoursed solemn music, a portable framework or palanquin was brought forth, bedecked with festoons of maize-cobs and peppers and filled with seeds of all sorts. This the bearers set down at the door of the chamber in which the wooden image of the goddess stood. Now the chamber was adorned and wreathed, both outside and inside, with wreaths of maize-cobs, peppers, pumpkins, roses, and seeds of every kind, a wonder to behold; the whole floor was covered deep with these verdant offerings of the pious. When the music ceased, a solemn procession came forth of priests and dignitaries, with flaring lights and smoking censers, leading in their midst the girl who played the part of the goddess. Then they made her mount the framework, where she stood upright on the maize and peppers and pumpkins with which it was strewed, her hands resting on two bannisters to keep her from falling. Then the priests swung the smoking censers round her; the music struck up again, and while it played, a great dignitary of the temple suddenly stepped up to her with a razor in his hand and adroitly shore off the green feather she wore on her head, together with the hair in which it was fastened, snipping the lock off by the root. The feather and the hair he then presented to the wooden image of the goddess with great solemnity and elaborate ceremonies, weeping and giving her thanks for the fruits of the earth and the abundant crops which she had bestowed on the people that year; and as he wept and prayed, all the people, standing in the courts of the temple, wept and prayed with him. When that ceremony was over, the girl descended from the framework and was escorted to the place where she was to spend the rest of the night. But all the people kept watch in the courts of the temple by the light of torches till break of day.

The morning being come, and the courts of the temple being still crowded by the multitude, who would have deemed it sacrilege to quit the precincts, the priests again brought forth the damsel attired in the costume of the goddess, with the mitre on her head and the cobs of maize about her neck. Again she mounted the portable framework or palanquin and stood on it, supporting herself by her hands on the bannisters. Then the elders of the temple lifted it on their shoulders, and while some swung burning censers and others played on instruments or sang, they carried it in procession through the great courtyard to the hall of the god Huitzilopochtli and then back to the chamber, where stood the wooden image of the Maize Goddess, whom the girl personated. There they caused the damsel to descend from the palanquin and to stand on the heaps of corn and vegetables that had been spread in profusion on the floor of the sacred chamber. While she stood there all the elders and nobles came in a line, one behind the other, carrying the saucers of dry and clotted blood which they had drawn from their ears by way of penance during the seven days' fast. One by one they squatted on their haunches before her, which was the equivalent of falling on their knees with

us, and scraping the crust of blood from the saucer cast it down before her as an offering in return for the benefits which she, as the embodiment of the Maize Goddess, had conferred upon them. When the men had thus humbly offered their blood to the human representative of the goddess, the women, forming a long line, did so likewise, each of them dropping on her hams before the girl and scraping her blood from the saucer. The ceremony lasted a long time, for great and small, young and old, all without exception had to pass before the incarnate deity and make their offering. When it was over, the people returned home with glad hearts to feast on flesh and viands of every sort as merrily, we are told, as good Christians at Easter partake of meat and other carnal mercies after the long abstinence of Lent. And when they had eaten and drunk their fill and rested after the night watch, they returned quite refreshed to the temple to see the end of the festival. And the end of the festival was this. The multitude being assembled, the priests solemnly incensed the girl who personated the goddess; then they threw her on her back on the heap of corn and seeds, cut off her head, caught the gushing blood in a tub, and sprinkled the blood on the wooden image of the goddess, the walls of the chamber, and the offerings of corn, peppers, pumpkins, seeds, and vegetables which cumbered the floor. After that they flayed the headless trunk, and one of the priests made shift to squeeze himself into the bloody skin. Having done so they clad him in all the robes which the girl had worn; they put the mitre on his head, the necklace of golden maize-cobs about his neck, the maize-cobs of feathers and gold in his hands; and thus arrayed they led him forth in public, all of them dancing to the tuck of drum, while he acted as fogleman, skipping and posturing at the head of the procession as briskly as he could be expected to do, incommoded as he was by the tight and clammy skin of the girl and by her clothes, which must have been much too small for a grown man.

In the foregoing custom the identification of the young girl with the Maize Goddess appears to be complete. The golden maize cobs which she wore round her neck, the artificial maize cobs which she carried in her hands, the green feather which was stuck in her hair in imitation (we are told) of a green ear of maize, all set her forth as a personification of the corn-spirit; and we are expressly informed that she was specially chosen as a young girl to represent the young maize, which at the time of the festival had not yet fully ripened. Further, her identification with the corn and the corn-goddess was clearly announced by making her stand on the heaps of maize and there receive the homage and blood-offerings of the whole people, who thereby returned her thanks for the benefits which in her character of a divinity she was supposed to have conferred upon them. Once more, the practice of beheading her on a heap of corn and seeds and sprinkling her blood, not only on the image of the Maize Goddess, but on the piles of maize, peppers, pumpkins, seeds, and vegetables, can seemingly have had no other object but to quicken and strengthen the crops of corn and the fruits of the earth in general by infusing into their representatives the blood of the Corn Goddess herself. The analogy of this Mexican sacrifice, the meaning of which appears to be indisputable, may be allowed to strengthen the interpretation which I have given of other human sacrifices offered for the crops. If the Mexican girl, whose blood was sprinkled on the maize, indeed personated the Maize Goddess, it becomes more than ever probable that the girl whose blood the Pawnees similarly sprinkled on the seed corn personated in like manner the female Spirit of the Corn; and so with the other human beings whom other races have slaughtered for the sake of promoting the growth of the crops.

Lastly, the concluding act of the sacred drama, in which the body of the dead Maize Goddess was flayed and her skin worn, together with all her sacred insignia, by a man who danced before the people in this grim attire, seems to be best explained on the hypothesis that it was intended to ensure that the divine death should be immediately followed by the divine resurrection. If that was so, we may infer with some degree of probability that the practice of

killing a human representative of a deity has commonly, perhaps always, been regarded merely as a means of perpetuating the divine energies in the fulness of youthful vigour, untainted by the weakness and frailty of age, from which they must have suffered if the deity had been allowed to die a natural death.

This interpretation of the Mexican custom of flaying human beings and permitting or requiring other persons to parade publicly in the skins of the victims may perhaps be confirmed by a consideration of the festival at which this strange rite was observed on the largest scale, and which accordingly went by the name of the Festival of the Flaying of Men (*Tlacaxipeualiztli*). It was celebrated in the second month of the Aztec year, which corresponded to the last days of February and the early part of March. The exact day of the festival was the twentieth of March, according to one pious chronicler, who notes with unction that the bloody rite fell only one day later than the feast which Holy Church solemnizes in honour of the glorious St. Joseph. The god whom the Aztecs worshipped in this strange fashion was named Xipe, "the Flayed One," or Totec, "Our Lord." On this occasion he also bore the solemn name of Youallauan, "He who drinks in the Night." His image was of stone and represented him in human form with his mouth open as if in the act of speaking; his body was painted yellow on the one side and drab on the other; he wore the skin of a flayed man over his own, with the hands of the victim dangling at his wrists. On his head he had a hood of various colours, and about his loins a green petticoat reaching to his knees with a fringe of small shells. In his two hands he grasped a rattle like the head of a poppy with the seeds in it; while on his left arm he supported a yellow shield with a red rim. At his festival the Mexicans killed all the prisoners they had taken in war, men, women, and children. The number of the victims was very great. A Spanish historian of the sixteenth century estimated that in Mexico more people used to be sacrificed on the altar than died a natural death. All who were sacrificed to Xipe, "the Flayed God," were themselves flayed, and men who had made a special vow to the god put on the skins of the human victims and went about the city in that guise for twenty days, being everywhere welcomed and revered as living images of the deity. Forty days before the festival, according to the historian Duran, they chose a man to personate the god, clothed him in all the insignia of the divinity, and led him about in public, doing him as much reverence all these days as if he had really been what he pretended to be. Moreover, every parish of the capital did the same; each of them had its own temple and appointed its own human representative of the deity, who received the homage and worship of the parishioners for the forty days.

On the day of the festival these mortal gods and all the other prisoners, with the exception of a few who were reserved for a different death, were killed in the usual way. The scene of the slaughter was the platform on the summit of the god Huitzilopochtli's temple. Some of the poor wretches fainted when they came to the foot of the steps and had to be dragged up the long staircase by the hair of their heads. Arrived at the summit they were slaughtered one by one on the sacrificial stone by the high priest, who cut open their breasts, tore out their hearts, and held them up to the sun, in order to feed the great luminary with these bleeding relics. Then the bodies were sent rolling down the staircase, clattering and turning over and over like gourds as they bumped from step to step till they reached the bottom. There they were received by other priests, or rather human butchers, who with a dexterity acquired by practice slit the back of each body from the nape of the neck to the heels and peeled off the whole skin in a single piece as neatly as if it had been a sheepskin. The skinless body was then fetched away by its owner, that is, by the man who had captured the prisoner in war. He took it home with him, carved it, sent one of the thighs to the king, and other joints to friends, or invited them to come and feast on the carcase in his house. The skins of the human victims were also a perquisite of their captors, and were lent or hired out by them to men who had made a vow

of going about clad in the hides for twenty days. Such men clothed in the reeking skins of the butchered prisoners were called Xixipeme or Tototectin after the god Xipe or Totec, whose living image they were esteemed and whose costume they wore. Among the devotees who bound themselves to this pious exercise were persons who suffered from loathsome skin diseases, such as smallpox, abscesses, and the itch; and among them there was a fair sprinkling of debauchees, who had drunk themselves nearly blind and hoped to recover the use of their precious eyes by parading for a month in this curious mantle. Thus arrayed, they went from house to house throughout the city, entering everywhere and asking alms for the love of God. On entering a house each of these reverend palmers was made to sit on a heap of leaves; festoons of maize and wreaths of flowers were placed round his body; and he was given wine to drink and cakes to eat. And when a mother saw one of these filthy but sanctified ruffians passing along the street, she would run to him with her infant and put it in his arms that he might bless it, which he did with unction, receiving an alms from the happy mother in return. The earnings of these begging-friars on their rounds were sometimes considerable, for the rich people rewarded them handsomely. Whatever they were, the collectors paid them in to the owners of the skins, who thus made a profit by hiring out these valuable articles of property. Every night the wearers of the skins deposited them in the temple and fetched them again next morning when they set out on their rounds. At the end of the twenty days the skins were dry, hard, shrivelled and shrunken, and they smelt so villainously that people held their noses when they met the holy beggars arrayed in their fetid mantles. The time being come to rid themselves of these encumbrances, the devotees walked in solemn procession, wearing the rotten skins and stinking like dead dogs, to the temple called Yopico, where they stripped themselves of the hides and plunged them into a tub or vat, after which they washed and scrubbed themselves thoroughly, while their friends smacked their bare bodies loudly with wet hands in order to squeeze out the human grease with which they were saturated. Finally, the skins were solemnly buried, as holy relics, in a vault of the temple. The burial service was accompanied by chanting and attended by the whole people; and when it was over, one of the high dignitaries preached a sermon to the assembled congregation, in which he dwelt with pathetic eloquence on the meanness and misery of human existence and exhorted his hearers to lead a sober and quiet life, to cultivate the virtues of reverence, modesty, humility and obedience, to be kind and charitable to the poor and to strangers; he warned them against the sins of robbery, fornication, adultery, and covetousness; and kindling with the glow of his oratory, he passionately admonished, entreated, and implored all who heard him to choose the good and shun the evil, drawing a dreadful picture of the ills that would overtake the wicked here and hereafter, while he painted in alluring colours the bliss in store for the righteous and the rewards they might expect to receive at the hands of the deity in the life to come.

While most of the men who masqueraded in the skins of the human victims appear to have personated the Flayed God Xipe, whose name they bore in the form Xixipeme, others assumed the ornaments and bore the names of other Mexican deities, such as Huitzilopochtli and Quetzalcoatl; the ceremony of investing them with the skins and the insignia of divinity was called *netcotoquiliztli*, which means "to think themselves gods." Amongst the gods thus personated was Totec. His human representative wore, over the skin of the flayed man, all the splendid trappings of the deity. On his head was placed a curious crown decorated with rich feathers. A golden crescent dangled from his nose, golden earrings from his ears, and a necklace of hammered gold encircled his neck. His feet were shod in red shoes decorated with quail's feathers; his loins were begirt with a petticoat of gorgeous plumage; and on his back three small paper flags fluttered and rustled in the wind. In his left hand he carried a golden shield and in his right a rattle, which he shook and rattled as he walked with a majestic dancing step. Seats were always prepared for this human god; and when he sat

down, they offered him a paste made of uncooked maize-flour. Also they presented to him little bunches of cobs of maize chosen from the seed-corn; and he received as offerings the first fruits and the first flowers of the season.

In the eighteenth and last month of their year, which fell in January, the Mexicans held a festival in honour of the god of fire. Every fourth year the festival was celebrated on a grand scale by the sacrifice of a great many men and women, husbands and wives, who were dressed in the trappings of the fire-god and regarded as his living images. Bound hand and foot, they were thrown alive into a great furnace, and after roasting in it for a little were raked out of the fire before they were dead in order to allow the priest to cut the hearts out of their scorched, blistered, and still writhing bodies in the usual way. The intention of the sacrifice probably was to maintain the Fire-god in full vigour, lest he should grow decrepit or even die of old age, and mankind should thus be deprived of his valuable services. This important object was attained by feeding the fire with live men and women, who thus as it were poured a fresh stock of vital energy into the veins of the Fire-god and perhaps of his wife also. But they had to be raked out of the flames before they were dead; for clearly it would never do to let them die in the fire, else the Fire-god whom they personated would die also. For the same reason their hearts had to be torn from their bodies while they were still palpitating; what use could the Fire-god make of human hearts that were burnt to cinders?

This was the ordinary mode of sacrificing the human representatives of the Fire-god every fourth year. But in Quauhtitlan, a city distant four leagues from the city of Mexico, the custom was different. On the eve of the festival two women were beheaded on the altar of the temple and afterwards flayed, faces and all, and their thigh bones extracted. Next morning two men of high rank clothed themselves in the skins, including the skins of the women's faces, which they put over their own; and thus arrayed and carrying in their hands the thigh bones of the victims they came down the steps of the temple roaring like wild beasts. A vast crowd of people had assembled to witness the spectacle, and when they saw the two men coming down the steps in the dripping skins, brandishing the bones, and bellowing like beasts, they were filled with fear and said, "There come our gods!" Arrived at the foot of the staircase these human gods engaged in a dance, which they kept up for the rest of the day, never divesting themselves of the bloody skins till the festival was over.

The theory that the custom of wearing the skin of a flayed man or woman and personating a god in that costume is intended to represent the resurrection of the deity derives some support from the class of persons who made a vow to masquerade in the skins. They were, as we have seen, especially men who suffered from diseases of the skin and the eyes: they hoped, we are told, by wearing the skins to be cured of their ailments, and the old Spanish monk who records the belief adds dryly that some were cured and some were not. We may conjecture that by donning the skins of men who had acted the part of gods they expected to slough off their own diseased old skins and to acquire new and healthy skins, like those of the deities. This notion may have been suggested to them by the observation of certain animals, such as serpents and lizards, which seem to renew their youth by casting their skins and appear refreshed and renovated in new integuments. That many savages have noticed such transformations in the animal world is proved by the tales which some of them tell to account for the origin of death among mankind. For example, the Arawaks of British Guiana say that man was created by a good being whom they call Kururumany. Once on a time this kindly creator came to earth to see how his creature man was getting on. But men were so ungrateful that they tried to kill their Maker. Hence he took from them the gift of immortality and bestowed it upon animals that change their skins, such as snakes, lizards, and beetles. Again, the Tamanachiers, an Indian tribe of the Orinoco, tell how the creator kindly intended to make men immortal by telling them that they should change their skins. He meant to say that

by so doing they should renew their youth like serpents and beetles. But the glad tidings were received with such incredulity by an old woman that the creator in a huff changed his tune and said very curtly, "Ye shall die."

In Annam they say that Ngoc hoang sent a messenger from heaven to inform men that when they reached old age they should change their skins and live for ever, but that when serpents grew old, they must die. Unfortunately for the human race the message was perverted in the transmission, so that men do not change their skins and are therefore mortal, whereas serpents do cast their old skins and accordingly live for ever. According to the natives of Nias the personage who was charged by the creator with the duty of putting the last touches to man broke his fast on bananas instead of on river-crabs, as he should have done; for had he only eaten river-crabs, men would have changed their skins like crabs, and like crabs would have never died. But the serpents, wiser in their generation than men, ate the crabs, and that is why they too are immortal. Stories of the same sort are current among the Melanesians. Thus the natives of the Gazelle Peninsula in New Britain account for the origin of death by a tale very like that told in Annam. The Good Spirit, they say, loved men and wished to make them immortal, but he hated serpents and wished to kill them. So he despatched his brother to mankind with this cheering message: "Go to men and take them the secret of immortality. Tell them to cast their skin every year. So will they be protected from death, for their life will be constantly renewed. But tell the serpents that they must henceforth die." Through the carelessness or treachery of the messenger this message was reversed; so that now, as we all know, men die and serpents live for ever by annually casting their skins. Again, if we can trust the traditions of the Banks' Islanders and New Hebrideans, there was a time when men did really cast their skins and renew their youth. The melancholy change to mortality was brought about by an old woman, who most unfortunately resumed her old cast-off skin to please an infant, which squalled at seeing her in her new integument. The Gallas of East Africa say that God sent a certain bird (*holawaka*, "the sheep of God") to tell men that they would not die, but that when they grew old they would slough their skins and so renew their youth. But the bird foolishly or maliciously delivered the message to serpents instead of to men, and that is why ever since men have been mortal and serpents immortal. For that evil deed God punished the bird with a painful malady from which it suffers to this day, and it sits on the tops of trees and moans and wails perpetually.

Thus it appears that some peoples have not only observed the curious transformations which certain animals undergo, but have imagined that by means of such transformations the animals periodically renew their youth and live for ever. From such observations and fancies it is an easy step to the conclusion that man might similarly take a fresh lease of life and renew the lease indefinitely, if only he could contrive like the animals to get a new skin. This desirable object the Mexicans apparently sought to accomplish by flaying men and wearing their bleeding skins like garments thrown over their own. By so doing persons who suffered from cutaneous diseases hoped to acquire a new and healthy skin; and by so doing the priests attempted not merely to revive the gods whom they had just slain in the persons of their human representatives, but also to restore to their wasting and decaying frames all the vigour and energy of youth.

The rites described in the preceding pages suffice to prove that human sacrifices of the sort I suppose to have prevailed at Aricia were, as a matter of fact, systematically offered on a large scale by a people whose level of culture was probably not inferior, if indeed it was not distinctly superior, to that occupied by the Italian races at the early period to which the origin of the Arician priesthood must be referred. The positive and indubitable evidence of the prevalence of such sacrifices in one part of the world may reasonably be allowed to strengthen the probability of their prevalence in places for which the evidence is less full and

trustworthy. Taken all together, the facts which we have passed in review seem to shew that the custom of killing men whom their worshippers regard as divine has prevailed in many parts of the world. But to clinch the argument, it is clearly desirable to prove that the custom of putting to death a human representative of a god was known and practised in ancient Italy elsewhere than in the Arician Grove. This proof I now propose to adduce.

VIII. The Saturnalia and Kindred Festivals

§ 1. The Roman Saturnalia.

In an earlier part of this book we saw that many peoples have been used to observe an annual period of license, when the customary restraints of law and morality are thrown aside, when the whole population give themselves up to extravagant mirth and jollity, and when the darker passions find a vent which would never be allowed them in the more staid and sober course of ordinary life. Such outbursts of the pent-up forces of human nature, too often degenerating into wild orgies of lust and crime, occur most commonly at the end of the year, and are frequently associated, as I have had occasion to point out, with one or other of the agricultural seasons, especially with the time of sowing or of harvest. Now, of all these periods of license the one which is best known and which in modern languages has given its name to the rest, is the Saturnalia. This famous festival fell in December, the last month of the Roman year, and was popularly supposed to commemorate the merry reign of Saturn, the god of sowing and of husbandry, who lived on earth long ago as a righteous and beneficent king of Italy, drew the rude and scattered dwellers on the mountains together, taught them to till the ground, gave them laws, and ruled in peace. His reign was the fabled Golden Age: the earth brought forth abundantly: no sound of war or discord troubled the happy world: no baleful love of lucre worked like poison in the blood of the industrious and contented peasantry. Slavery and private property were alike unknown: all men had all things in common. At last the good god, the kindly king, vanished suddenly; but his memory was cherished to distant ages, shrines were reared in his honour, and many hills and high places in Italy bore his name. Yet the bright tradition of his reign was crossed by a dark shadow: his altars are said to have been stained with the blood of human victims, for whom a more merciful age afterwards substituted effigies. Of this gloomy side of the god's religion there is little or no trace in the descriptions which ancient writers have left us of the Saturnalia. Feasting and revelry and all the mad pursuit of pleasure are the features that seem to have especially marked this carnival of antiquity, as it went on for seven days in the streets and public squares and houses of ancient Rome from the seventeenth to the twenty-third of December.

But no feature of the festival is more remarkable, nothing in it seems to have struck the ancients themselves more than the license granted to slaves at this time. The distinction between the free and the servile classes was temporarily abolished. The slave might rail at his master, intoxicate himself like his betters, sit down at table with them, and not even a word of reproof would be administered to him for conduct which at any other season might have been punished with stripes, imprisonment, or death. Nay, more, masters actually changed places with their slaves and waited on them at table; and not till the serf had done eating and drinking was the board cleared and dinner set for his master. So far was this inversion of ranks carried, that each household became for a time a mimic republic in which the high offices of state were discharged by the slaves, who gave their orders and laid down the law as if they were indeed invested with all the dignity of the consulship, the praetorship, and the bench. Like the pale reflection of power thus accorded to bondsmen at the Saturnalia was the mock kingship for which freemen cast lots at the same season. The person on whom the lot fell enjoyed the title of king, and issued commands of a playful and ludicrous nature to his temporary subjects. One of them he might order to mix the wine, another to drink, another to sing, another to dance, another to speak in his own dispraise, another to carry a flute-girl on his back round the house.

Now, when we remember that the liberty allowed to slaves at this festive season was supposed to be an imitation of the state of society in Saturn's time, and that in general the Saturnalia passed for nothing more or less than a temporary revival or restoration of the reign of that merry monarch, we are tempted to surmise that the mock king who presided over the revels may have originally represented Saturn himself. The conjecture is strongly confirmed, if not established, by a very curious and interesting account of the way in which the Saturnalia was celebrated by the Roman soldiers stationed on the Danube in the reign of Maximian and Diocletian. The account is preserved in a narrative of the martyrdom of St. Dasius, which was unearthed from a Greek manuscript in the Paris library, and published by Professor Franz Cumont of Ghent. Two briefer descriptions of the event and of the custom are contained in manuscripts at Milan and Berlin; one of them had already seen the light in an obscure volume printed at Urbino in 1727, but its importance for the history of the Roman religion, both ancient and modern, appears to have been overlooked until Professor Cumont drew the attention of scholars to all three narratives by publishing them together some years ago. According to these narratives, which have all the appearance of being authentic, and of which the longest is probably based on official documents, the Roman soldiers at Durostorum in Lower Moesia celebrated the Saturnalia year by year in the following manner. Thirty days before the festival they chose by lot from amongst themselves a young and handsome man, who was then clothed in royal attire to resemble Saturn. Thus arrayed and attended by a multitude of soldiers he went about in public with full license to indulge his passions and to taste of every pleasure, however base and shameful. But if his reign was merry, it was short and ended tragically; for when the thirty days were up and the festival of Saturn had come, he cut his own throat on the altar of the god whom he personated. In the year 303 a.d. the lot fell upon the Christian soldier Dasius, but he refused to play the part of the heathen god and soil his last days by debauchery. The threats and arguments of his commanding officer Bassus failed to shake his constancy, and accordingly he was beheaded, as the Christian martyrologist records with minute accuracy, at Durostorum by the soldier John on Friday the twentieth day of November, being the twenty-fourth day of the moon, at the fourth hour.

Since this narrative was published by Professor Cumont, its historical character, which had been doubted or denied, has received strong confirmation from an interesting discovery. In the crypt of the cathedral which crowns the promontory of Ancona there is preserved, among other remarkable antiquities, a white marble sarcophagus bearing a Greek inscription, in characters of the age of Justinian, to the following effect: "Here lies the holy martyr Dasius, brought from Durostorum." The sarcophagus was transferred to the crypt of the cathedral in 1848 from the church of San Pellegrino, under the high altar of which, as we learn from a Latin inscription let into the masonry, the martyr's bones still repose with those of two other saints. How long the sarcophagus was deposited in the church of San Pellegrino, we do not know; but it is recorded to have been there in the year 1650. We may suppose that the saint's relics were transferred for safety to Ancona at some time in the troubled centuries which followed his martyrdom, when Moesia was occupied and ravaged by successive hordes of barbarian invaders. At all events it appears certain from the independent and mutually confirmatory evidence of the martyrology and the monuments that Dasius was no mythical saint, but a real man, who suffered death for his faith at Durostorum in one of the early centuries of the Christian era. Finding the narrative of the nameless martyrologist thus established as to the principal fact recorded, namely, the martyrdom of St. Dasius, we may reasonably accept his testimony as to the manner and cause of the martyrdom, all the more because his narrative is precise, circumstantial, and entirely free from the miraculous element. Accordingly I conclude that the account which he gives of the celebration of the Saturnalia among the Roman soldiers is trustworthy.

This account sets in a new and lurid light the office of the King of the Saturnalia, the ancient Lord of Misrule, who presided over the winter revels at Rome in the time of Horace and of Tacitus. It seems to prove that his business had not always been that of a mere harlequin or merry-andrew whose only care was that the revelry should run high and the fun grow fast and furious, while the fire blazed and crackled on the hearth, while the streets swarmed with festive crowds, and through the clear frosty air, far away to the north, Soracte shewed his coronal of snow. When we compare this comic monarch of the gay, the civilized metropolis with his grim counterpart of the rude camp on the Danube, and when we remember the long array of similar figures, ludicrous yet tragic, who in other ages and in other lands, wearing mock crowns and wrapped in sceptred palls, have played their little pranks for a few brief hours or days, then passed before their time to a violent death, we can hardly doubt that in the King of the Saturnalia at Rome, as he is depicted by classical writers, we see only a feeble emasculated copy of that original, whose strong features have been fortunately preserved for us by the obscure author of the *Martyrdom of St. Dasius*. In other words, the martyrologist's account of the Saturnalia agrees so closely with the accounts of similar rites elsewhere, which could not possibly have been known to him, that the substantial accuracy of his description may be regarded as established; and further, since the custom of putting a mock king to death as a representative of a god cannot have grown out of a practice of appointing him to preside over a holiday revel, whereas the reverse may very well have happened, we are justified in assuming that in an earlier and more barbarous age it was the universal practice in ancient Italy, wherever the worship of Saturn prevailed, to choose a man who played the part and enjoyed all the traditionary privileges of Saturn for a season, and then died, whether by his own or another's hand, whether by the knife or the fire or on the gallows-tree, in the character of the good god who gave his life for the world. In Rome itself and other great towns the growth of civilization had probably mitigated this cruel custom long before the Augustan age, and transformed it into the innocent shape it wears in the writings of the few classical writers who bestow a passing notice on the holiday King of the Saturnalia. But in remoter districts the older and sterner practice may long have survived; and even if after the unification of Italy the barbarous usage was suppressed by the Roman government, the memory of it would be handed down by the peasants and would tend from time to time, as still happens with the lowest forms of superstition among ourselves, to lead to a recrudescence of the practice, especially among the rude soldiery on the outskirts of the empire over whom the once iron hand of Rome was beginning to relax its grasp.

The resemblance between the Saturnalia of ancient and the Carnival of modern Italy has often been remarked; but in the light of all the facts that have come before us, we may well ask whether the resemblance does not amount to identity. We have seen that in Italy, Spain, and France, that is, in the countries where the influence of Rome has been deepest and most lasting, a conspicuous feature of the Carnival is a burlesque figure personifying the festive season, which after a short career of glory and dissipation is publicly shot, burnt, or otherwise destroyed, to the feigned grief or genuine delight of the populace. If the view here suggested of the Carnival is correct, this grotesque personage is no other than a direct successor of the old King of the Saturnalia, the master of the revels, the real man who personated Saturn and, when the revels were over, suffered a real death in his assumed character. The King of the Bean on Twelfth Night and the mediaeval Bishop of Fools, Abbot of Unreason, or Lord of Misrule are figures of the same sort and may perhaps have had a similar origin. We will consider them in the following section.

§ 2. The King of the Bean and the Festival of Fools.

The custom of electing by lot a King and often also a Queen of the Bean on Twelfth Night (Epiphany, the sixth of January) or on the eve of that festival used to prevail in France,

Belgium, Germany, and England, and it is still kept up in some parts of France. It may be traced back to the first half of the sixteenth century at least, and no doubt dates from a very much more remote antiquity. At the French court the Kings themselves did not disdain to countenance the mock royalty, and Louis XIV. even supported with courtly grace the shadowy dignity in his own person. Every family as a rule elected its own King. On the eve of the festival a great cake was baked with a bean in it; the cake was divided in portions, one for each member of the family, together with one for God, one for the Virgin, and sometimes one also for the poor. The person who obtained the portion containing the bean was proclaimed King of the Bean. Where a Queen of the Bean was elected as well as a King, a second bean was sometimes baked in the cake for the Queen. Thus at Blankenheim, near Neuerburg, in the Eifel, a black and a white bean were baked in the cake; he who drew the piece with the black bean was King, and she who drew the white bean was Queen. In Franche-Comté, at the beginning of the nineteenth century, they used to put as many white haricot beans in a hat as there were persons present, and two coloured beans were added; the beans were drawn at haphazard from the hat by a child, and they who got the coloured beans were King and Queen. In England and perhaps elsewhere the practice was to put a bean in the cake for the King and a pea for the Queen. But in some places only the King was elected by lot, and after his election he chose his Queen for himself. Sometimes a coin was substituted for the bean in the cake; but though this usage was followed in southern Germany as early as the first half of the sixteenth century, it is probably an innovation on the older custom of employing a bean as the lot. In France the distribution of the pieces of the cake among the persons present was made in accordance with the directions of a child, the youngest boy present, who was placed under or on the table and addressed by the name of "Phoebe" or "Tébé"; he answered in Latin "*Domine.*" The master of the house, holding a piece of the cake in his hand, asked the child to whom he should give it, and the child named any person he pleased. Sometimes the first slice of cake was regularly assigned to "the good God" and set aside for the poor. In the name "Phoebe" or "Tébé," by which the child was addressed, learned antiquaries have detected a reference to the oracle of Apollo; but more probably the name is a simple corruption of the Latin or French word for bean (Latin *faba*, French *fève*). Immediately on his election the King of the Bean was enthroned, saluted by all, and thrice lifted up, while he made crosses with chalk on the beams and rafters of the ceiling. Great virtue was attributed to these white crosses. They were supposed to protect the house for the whole year against

"all injuryes and harmes

Of cursed devils, sprites, and bugges, of conjurings and charmes."

Then feasting and revelry began and were kept up merrily without respect of persons. Every time the King or Queen drank, the whole company was expected to cry, "The King drinks!" or "The Queen drinks!" Any person who failed to join in the cry was punished by having his face blackened with soot or a burned cork or smeared with the lees of wine. In some parts of the Ardennes the custom was to fasten great horns of paper in the hair of the delinquent and to put a huge pair of spectacles on his nose; and he had to wear these badges of infamy till the end of the festival. The custom of electing a King and Queen of the Bean on Twelfth Day is still kept up all over the north of France. A miniature porcelain figure of a child is sometimes substituted for the bean in the cake. If the lot, whether bean or doll, falls to a boy he becomes King and chooses his Queen; if it falls to a girl she becomes Queen and chooses her King.

So far, apart from the crosses chalked up to ban hobgoblins, witches, and bugs, the King and Queen of the Bean might seem to be merely playful personages appointed at a season of festivity to lead the revels. However, a more serious significance was sometimes attached to

the office and to the ceremonies of Twelfth Day in general. Thus in Lorraine the height of the hemp crop in the coming year was prognosticated from the height of the King and Queen; if the King was the taller of the two, it was supposed that the male hemp would be higher than the female, but that the contrary would happen if the Queen were taller than the King. Again, in the Vosges Mountains, on the borders of Franche-Comté, it is customary on Twelfth Day for people to dance on the roofs in order to make the hemp grow tall. Further, in many places the beans used in the cake were carried to the church to be blessed by the clergy, and people drew omens from the cake as to the good or ill that would befall them throughout the year. Moreover, certain forms of divination were resorted to on Twelfth Night for the purpose of ascertaining in which month of the year wheat would be dearest.

In Franche-Comté, particularly in the Montagne du Doubs, it is still the custom on the Eve of Twelfth Night (the fifth of January) to light bonfires, which appear to have, in the popular mind, some reference to the crops. The whole population takes part in the festivity. In the afternoon the young folk draw a cart about the street collecting fuel. Some people contribute faggots, others bundles of straw or of dry hemp stalks. Towards evening the whole of the fuel thus collected is piled up a little way from the houses and set on fire. While it blazes, the people dance round it, crying, "Good year, come back! Bread and wine, come back!" In the district of Pontarlier the young folk carry lighted torches about the fields, shaking sparks over the sowed lands and shouting, "*Couaille, couaille, blanconnie!*"—words of which the meaning has been forgotten. A similar custom is commonly observed on the same day (the Eve of Twelfth Night, the fifth of January) in the Bocage of Normandy, except that it is the fruit-trees rather than the sowed fields to which the fire is applied. When the evening shadows have fallen on the landscape, the darkness begins to be illuminated here and there by twinkling points of fire, which multiply as the night grows late, till they appear as numerous on earth as the stars in the sky. About every village, in the fields and orchards, on the crests of the hills, wandering lights may be discerned, vanishing and suddenly reappearing, gathering together and then dispersing, pursuing each other capriciously, and tracing broken lines, sparkling arabesques of fire in the gloom of night. The peasants are observing the ceremony of the "Moles and Field-mice" (*Taupes et Mulots*); and that evening there is not a hamlet, not a farm, hardly a solitary cottage that does not contribute its flame to the general illumination, till the whole horizon seems in a blaze, and houses, woods, and hills stand out in dark relief against the glow of the sky. The villages vie with each other in the number and brilliancy of the fires they can exhibit on this occasion. Woods and hedges are scoured to provide the materials for the blaze. Torches of straw wound about poles are provided in abundance; and armed with them men and women, lads and lasses, boys and girls, pour forth from the houses at nightfall into the fields and orchards. There they run about among the trees, waving the lighted torches under the branches and striking the trunks with them so that the sparks fly out in showers. And as they do so they sing or scream at the top of their voices certain traditional curses against the animals and insects that injure the fruit-trees. They bid the moles and field-mice to depart from their orchards, threatening to break their bones and burn their beards if they tarry. The more they do this, the larger, they believe, will be the crop of fruit in the following autumn. When everybody has rushed about his own orchard, meadow or pasture in this fashion, they all assemble on a height or crest of a hill, where they picnic, each bringing his share of provisions, cider, or brandy to the feast. There, too, they kindle a huge bonfire, and dance round it, capering and brandishing their torches in wild enthusiasm. Customs of the same sort used to be observed on the same day (the Eve of Epiphany, the fifth of January) in the Ardennes. People ran about with burning torches, commanding the moles and field-mice to go forth. Then they threw the torches on the ground, and believed that by this proceeding they purified the earth and made it fruitful.

This ceremony appears to be intended to ensure a good crop of fruit by burning out the animals and insects that harm the fruit-trees. In some parts of England it used to be customary to light fires at the same season for the purpose, apparently, of procuring a plentiful crop of wheat in the ensuing autumn. Thus, "in the parish of Pauntley, a village on the borders of the county of Gloucester, next Worcestershire, and in the neighbourhood, a custom prevails, which is intended to prevent the smut in wheat. On the Eve of Twelfth-day, all the servants of every farmer assemble together in one of the fields that has been sown with wheat. At the end of twelve lands, they make twelve fires in a row with straw, around one of which, much larger than the rest, they drink a cheerful glass of cider to their master's health, and success to the future harvest; then, returning home, they feast on cakes soaked in cider, which they claim as a reward for their past labours in sowing the grain." Similarly in Herefordshire, "on the Eve of Twelfth Day, at the approach of evening, the farmers, their friends, servants, etc., all assemble, and, near six o'clock, all walk together to a field where wheat is growing. The highest part of the ground is always chosen, where twelve small fires, and one large one are lighted up. The attendants, headed by the master of the family, pledge the company in old cyder, which circulates freely on these occasions. A circle is formed round the large fire, when a general shout and hallooing takes place, which you hear answered from all the villages and fields near; as I have myself counted fifty or sixty fires burning at the same time, which are generally placed on some eminence. This being finished, the company all return to the house, where the good housewife and her maids are preparing a good supper, which on this occasion is very plentiful. A large cake is always provided, with a hole in the middle. After supper, the company all attend the bailiff (or head of the oxen) to the wain-house, where the following particulars are observed. The master, at the head of his friends, fills the cup (generally of strong ale), and stands opposite the first or finest of the oxen (twenty-four of which I have often seen tied up in their stalls together); he then pledges him in a curious toast; the company then follow his example with all the other oxen, addressing each by their name. This being over, the large cake is produced, and is, with much ceremony, put on the horn of the first ox, through the hole in the cake; he is then tickled to make him toss his head: if he throws the cake behind, it is the mistress's perquisite; if before (in what is termed the *boosy*), the bailiff claims this prize. This ended, the company all return to the house, the doors of which are in the meantime locked, and not opened till some joyous songs are sung. On entering, a scene of mirth and jollity commences, and reigns thro' the house till a late, or rather an early, hour, the next morning."

The custom was known as Wassailing and it was believed to have a beneficial effect on the crops. According to one Herefordshire informant, "on Twelfth Day they make twelve fires of straw and one large one to burn the old witch; they sing, drink, and dance round it; without this festival they think they should have no crop." This explanation of the large fire on Twelfth Day is remarkable and may supply the key to the whole custom of kindling fires on the fields or in the orchards on that day. We have seen that witches and fiends of various sorts are believed to be let loose during the Twelve Days and that in some places they are formally driven away on Twelfth Night. It may well be that the fires lighted on that day were everywhere primarily intended to burn the witches and other maleficent beings swarming invisible in the mischief-laden air, and that the benefit supposed to be conferred by the fires on the crops was not so much the positive one of quickening the growth of vegetation by genial warmth as the negative one of destroying the baleful influences which would otherwise blast the fruits of the earth and of the trees. This interpretation of the English and French custom of lighting fires in fields and orchards on Twelfth Night is confirmed by a parallel custom observed by Macedonian peasants for the express purpose of burning up certain malicious fiends, who are believed to be abroad at this season. These noxious beings are known as *Karkantzari* or *Skatsantzari*. They are thought to be living people, whether men

or women, who during the Twelve Days are transformed into horrible monsters, with long nails, red faces, bloodshot eyes, snottling noses, and slobbering mouths. In this hideous guise they roam about by night haunting houses and making the peasant's life well-nigh unbearable; they knock at the doors and should they be refused admittance they will scramble down the chimney and pinch, worry, and defile the sleepers in their beds. The only way to escape from these tormenters is to seize and bind them fast with a straw rope. If you have no such rope or your heart fails you, there is nothing for it but to shut yourself up in the house before dark, fasten the door tight, block up the chimney, and wait for daylight; for it is only at night that the monsters are on the prowl, during the day they resume their ordinary human shape. However, in some places strenuous efforts are made during the Twelve Days to destroy these hateful nocturnal goblins by fire. For example, on Christmas Eve some people burn the *Karkantzari* by lighting faggots of holm-oak and throwing them out into the streets at early dawn. In other places, notably at Melenik, they scald the fiends to death on New Year's Eve by means of pancakes frizzling and hissing in a pan. While the goodwife is baking the cakes, the goodman disguises himself as one of the fiends in a fur coat turned inside out, and in his assumed character dances and sings outside the door, while he invites his wife to join him in the dance. In other districts people collect faggots during the whole of the Twelve Days and lay them up on the hearth. Then on the Eve of Twelfth Night they set fire to the pile in order that the goblins, who are supposed to be lurking under the ashes, may utterly perish. Thus the view that the large fire in Herefordshire on Twelfth Night is intended "to burn the old witch" is far more probable than the opinion that it represents the Virgin Mary, and that the other twelve fires stand for the twelve apostles. This latter interpretation is in all probability nothing more than a Christian gloss put upon an old heathen custom of which the meaning was forgotten.

The Gloucestershire custom was described by the English traveller Thomas Pennant in the latter part of the eighteenth century. He says: "A custom savouring of the Scotch Bel-tien prevales in Gloucestershire, particularly about Newent and the neighbouring parishes, on the twelfth day, or on the Epiphany, in the evening. All the servants of every particular farmer assemble together in one of the fields that has been sown with wheat; on the border of which, in the most conspicuous or most elevated place, they make twelve fires of straw, in a row; around one of which, made larger than the rest, they drink a cheerful glass of cyder to their master's health, success to the future harvest, and then returning home, they feast on cakes made of carraways, etc., soaked in cyder, which they claim as a reward for their past labours in sowing the grain." In Shropshire also it used to be customary to kindle festal fires on the tops of hills and other high places on Twelfth Night. Again, in Ireland "on Twelfth-Eve in Christmas, they use to set up as high as they can a sieve of oats, and in it a dozen of candles set round, and in the centre one larger, all lighted. This in memory of our Saviour and his Apostles, lights of the world." Down to the present time, apparently, in the county of Roscommon, "Twelfth Night, which is Old Christmas Day, is a greater day than Christmas Day itself. Thirteen rushlights are made in remembrance of the numbers at the Last Supper, and each is named after some member of the family. If there are not enough in the household other relations' names are added. The candles are stuck in a cake of cow-dung and lighted, and as each burns out, so will be the length of each person's life. Rushlights are only used for this occasion."

In these English and Irish customs observed on Twelfth Night the twelve fires or candles probably refer either to the twelve days from Christmas to Epiphany or to the twelve months of the year. In favour of this view it may be said that according to a popular opinion, which has been reported in England and is widely diffused in Germany and the German provinces of Austria, the weather of the twelve days in question determines the weather of the twelve

following months, so that from the weather on each of these days it is possible to predict the weather of the corresponding month in the ensuing year. Hence in Swabia the days are called “the Twelve Lot Days”; and many people seek to pry into the future with scientific precision by means of twelve circles, each subdivided into four quadrants, which they chalk up over the parlour door or inscribe on paper. Each circle represents a month, and each quadrant represents a quarter of a month; and according as the sky is overcast or clear during each quarter of a day from Christmas to Epiphany, you shade the corresponding quadrant of a circle or leave it a blank. By this contrivance, as simple as it is ingenious, you may forecast the weather for the whole year with more or less of accuracy. At Hosskirch in Swabia they say that you can predict the weather for the twelve months from the weather of the twelve hours of Twelfth Day alone. A somewhat different system of meteorology is adopted in various parts of Switzerland, Germany, and Austria. On Christmas, New Year's Day, or another of the twelve days you take an onion, slice it in two, peel off twelve coats, and sprinkle a pinch of salt in each of them. The twelve coats of the onion stand for the twelve months of the year, and from the amount of moisture which has gathered in each of them next morning you may foretell the amount of rain that will fall in the corresponding month.

But the belief that the weather of the twelve months can be predicted from the weather of the twelve days is not confined to the Germanic peoples. It occurs also in France and among the Celts of Brittany and Scotland. Thus in the Bocage of Normandy “the village old wives have a very simple means of divining the general temperature of the coming season. According to them, the twelve days between Christmas and Epiphany, including Epiphany, represent the twelve months of the year. So the thing to do is to mark the temperature of each of these days, for the temperature of the corresponding month will be relatively the same. Some people say that this experience is rarely at fault, and more trust is put in it than in the predictions of the *Double-Liégois*.” In Cornouaille, Brittany, it is popularly believed that the weather of the last six days of December and the first six of January prognosticates the weather of the twelve months; but in other parts of Brittany it is the first twelve days of January that are supposed to be ominous of the weather for the year. These days are called *gour-deziou*, which is commonly interpreted “male days,” but is said to mean properly “additional or supplementary days.” Again, in the Highlands of Scotland the twelve days of Christmas (*Da latha dheug na Nollaig*) “were the twelve days commencing from the Nativity or Big *Nollaig*, and were deemed to represent, in respect of weather, the twelve months of the year. Some say the days should be calculated from New Year's Day.” Others again reckon the Twelve Days from the thirty-first of December. Thus Pennant tells us that “the Highlanders form a sort of almanack or presage of the weather of the ensuing year in the following manner: they make observation on twelve days, beginning at the last of December, and hold as an infallible rule, that whatsoever weather happens on each of those days, the same will prove to agree in the correspondent months. Thus, January is to answer to the weather of December 31st; February to that of January 1st; and so with the rest. Old people still pay great attention to this augury.” It is interesting to observe that in the Celtic regions of Scotland and France popular opinion hesitates as to the exact date of the twelve days, some people dating them from Christmas, others from the New Year, and others again from the thirty-first of December. This hesitation has an important bearing on the question of the origin of the twelve days' period, as I shall point out immediately.

Thus in the popular mind the twelve days from Christmas to Epiphany are conceived as a miniature of the whole year, the character of each particular day answering to the character of a particular month. The conception appears to be very ancient, for it meets us again among the Aryans of the Vedic age in India. They, too, appear to have invested twelve days in midwinter with a sacred character as a time when the three Ribhus or genii of the seasons

rested from their labours in the home of the sun-god; and these twelve rest-days they called "an image or copy of the year."

This curious coincidence, if such it is, between the winter festivals of the ancient Aryans of India and their modern kinsfolk in Europe seems to be best explained on the theory that the twelve days in question derive their sanctity from the position which they occupied in the calendar of the primitive Aryans. The coincidence of the name for month with the name for moon in the various Aryan languages points to the conclusion that the year of our remote ancestors was primarily based on observation of the moon rather than of the sun; but as a year of twelve lunar months or three hundred and fifty-four days (reckoning the months at twenty-nine and thirty days alternately) falls short of the solar year of three hundred and sixty-five and a quarter days by roundly twelve days, the discrepancy could not fail to attract the attention of an intelligent people, such as the primitive Aryans must be supposed to have been, who had made some progress in the arts of life; and the most obvious way of removing the discrepancy and equating the lunar with the solar year is to add twelve days at the end of each period of twelve lunar months so as to bring the total days of the year up to three hundred and sixty-six. The equation is not indeed perfectly exact, but it may well have been sufficiently so for the rudimentary science of the primitive Aryans. As many savage races in modern times have observed the discrepancy between solar and lunar time and have essayed to correct it by observations of the sun or the constellations, especially the Pleiades, there seems no reason to doubt that the ancestors of the Indo-European peoples in prehistoric times were able to make similar observations, and that they were not, as has been suggested, reduced to the necessity of borrowing the knowledge of such simple and obvious facts from the star-gazers of ancient Babylonia. Learned men who make little use of their eyes except to read books are too apt to underrate the observational powers of the savage, who lives under totally different conditions from us, spending most of his time in the open air and depending for his very existence on the accuracy with which he notes the varied and changing aspects of nature.

It has been proposed to explain the manifold superstitions which cluster round the Twelve Days, or rather the Twelve Nights, as they are more popularly called, by reference to the place which they occupy in the Christian calendar, beginning as they do immediately after Christmas and ending with Epiphany. But, in the first place, it is difficult to see why the interval between these two particular festivals should have attracted to itself a greater mass of superstitious belief and custom than the interval between any other two Christian festivals in the calendar; if it really did so, the ground of its special attraction is still to seek, and on this essential point the advocates of the Christian origin of the Twelve Nights throw no light. In the second place, the superstitious beliefs and customs themselves appear to have no relation to Christianity but to be purely pagan in character. Lastly, a fatal objection to the theory in question is that the place of the Twelve Days in the calendar is not uniformly fixed to the interval between Christmas and Epiphany; it varies considerably in popular opinion in different places, but it is significant that the variations never exceed certain comparatively narrow limits. The twelve-days' festival, so to speak, oscillates to and fro about a fixed point, which is either the end of the year or the winter solstice. Thus in Silesia the Twelve Days are usually reckoned to fall before Christmas instead of after it; though in the Polish districts and the mountainous region of the country the ordinary German opinion prevails that the days immediately follow Christmas. In some parts of Bavaria the Twelve Days are counted from St. Thomas's Day (the twenty-first of December) to New Year's Day; while in parts of Mecklenburg they begin with New Year's Day and so coincide with the first twelve days of January, and this last mode of reckoning finds favour, as we saw, with some Celts of Brittany and Scotland. These variations in the dating of the Twelve Days seem irreconcilable with the

theory that they derive their superstitious character purely from the accident that they fall between Christmas and Epiphany; accordingly we may safely dismiss the theory of their Christian origin and recognize, with many good authorities, in the Twelve Days the relics of a purely pagan festival, which was probably celebrated long before the foundation of Christianity. In truth the hypothesis of the Christian derivation of the Twelve Days in all probability exactly inverts the historical order of the facts. On the whole the evidence goes to shew that the great Christian festivals were arbitrarily timed by the church so as to coincide with previously existing pagan festivals for the sake of weaning the heathen from their old faith and bringing them over to the new religion. To make the transition as easy as possible the ecclesiastical authorities, in abolishing the ancient rites, appointed ceremonies of somewhat similar character on the same days, or nearly so, thus filling up the spiritual void by a new creation which the worshipper might accept as an adequate substitute for what he had lost. Christmas and Easter, the two pivots on which the Christian calendar revolves, appear both to have been instituted with this intention: the one superseded a midwinter festival of the birth of the sun-god, the other superseded a vernal festival of the death and resurrection of the vegetation-god.

If the twelve days from Christmas to Epiphany were indeed an ancient intercalary period inserted for the purpose of equating the lunar to the solar year, we can better understand the curious superstitions that have clustered round them and the quaint customs that have been annually observed during their continuance. To the primitive mind it might well seem that an intercalary period stands outside of the regular order of things, forming part neither of the lunar nor of the solar system; it is an excrescence, inevitable but unaccountable, which breaks the smooth surface of ordinary existence, an eddy which interrupts the even flow of months and years. Hence it may be inferred that the ordinary rules of conduct do not apply to such extraordinary periods, and that accordingly men may do in them what they would never dream of doing at other times. Thus intercalary days tend to degenerate into seasons of unbridled license; they form an interregnum during which the customary restraints of law and morality are suspended and the ordinary rulers abdicate their authority in favour of a temporary regent, a sort of puppet king, who bears a more or less indefinite, capricious, and precarious sway over a community given up for a time to riot, turbulence, and disorder. If that is so—though it must be confessed that the view here suggested is to a great extent conjectural—we may perhaps detect the last surviving representatives of such puppet kings in the King of the Bean and other grotesque figures of the same sort who used to parade with the mimic pomp of sovereignty on one or other of the twelve days between Christmas and Epiphany. For the King of the Bean was by no means the only such ruler of the festive season, nor was Twelfth Night the only day on which he and his colleagues played their pranks. We will conclude this part of our subject with a brief notice of some of these mummers.

In the first place it deserves to be noticed that in many parts of the continent, such as France, Spain, Belgium, Germany, and Austria, Twelfth Day is regularly associated with three mythical kings named Caspar, Melchior, and Balthasar, and derives its popular appellation from them, being known in Germany and Austria as the Day of the Three Kings (*Dreikönigstag*) and in France as the Festival of the Kings (*Fête des Rois*). Further, it has been customary in many places to represent the three kings by mummers, who go about arrayed in royal costume from door to door, singing songs and collecting contributions from the households which they visit. The custom may very well be older than Christianity, though it has received a Christian colouring; for the mythical kings are commonly identified with the wise men of the East, who are said to have been attracted to the infant Christ at Bethlehem by the sight of his star in the sky. Yet there is no Biblical authority for regarding these wise men

as kings or for fixing their number at three. In Franche-Comté the old custom is still observed, or at all events it was so down to recent years. The Three Kings are personated by three boys dressed in long white shirts with coloured sashes round their waists; on their heads they wear pointed mitres of pasteboard decorated with a gilt star and floating ribbons. Each carries a long wand topped by a star, which he keeps constantly turning. The one who personates Melchior has his face blackened with soot, because Melchior is supposed to have been a negro king. When they enter a house, they sing a song, setting forth that they are three kings who have come from three different countries, led by a star, to adore the infant Jesus at Bethlehem. After the song the negro king solicits contributions by shaking his money-box or holding out a basket, in which the inmates of the house deposit eggs, nuts, apples and so forth. By way of thanks for this liberality the three kings chant a stave in which they call down the blessing of God on the household. The custom is similar in the Vosges Mountains, where the Three Kings are held in great veneration and invoked by hedge doctors to effect various cures. For example, if a man drops to the ground with the falling sickness, you need only whisper in his right ear, "*Gaspard fert myrrham, thus Melchior, Balthasar aurum,*" and he will get up at once. But to make the cure complete you must knock three nails into the earth on the precise spot where he fell; each nail must be exactly of the length of the patient's little finger, and as you knock it in you must take care to utter the sufferer's name. In many Czech villages of Bohemia the children who play the part of the Three Kings assimilate themselves to the wise men of the East in the gospel by carrying gilt paper, incense, and myrrh with them on their rounds, which they distribute as gifts in the houses they visit, receiving in return money or presents in kind. Moreover they fumigate and sprinkle the houses and describe crosses and letters on the doors. Amongst the Germans of West Bohemia it is the schoolmaster who, accompanied by some boys, goes the round of the village on Twelfth Day. He chalks up the letters C. M. B. (the initials of Caspar, Melchior, and Balthasar), together with three crosses, on every door, and fumigates the house with a burning censer in order to guard it from evil influences and infectious diseases. Some people used to wear as an amulet a picture representing the adoration of the Three Kings with a Latin inscription to the following effect: "Holy three kings, Caspar, Melchior, Balthasar, pray for us, now and in the hour of our death." The picture was thought to protect the wearer not only from epilepsy, headache, and fever, but also from the perils of the roads, from the bite of mad dogs, from sudden death, from sorcery and witchcraft. Whatever its origin, the festival of the Three Kings goes back to the middle ages, for it is known to have been celebrated with great pomp at Milan in 1336. On that occasion the Three Kings appeared wearing crowns, riding richly caparisoned horses, and surrounded by pages, bodyguards, and a great retinue of followers. Before them was carried a golden star, and they offered gifts of gold, frankincense, and myrrh to the infant Christ cradled in a manger beside the high altar of the church of St. Eustorgius.

In our own country a popular figure during the Christmas holidays used to be the Lord of Misrule, or, as he was called in Scotland, the Abbot of Unreason, who led the revels at that merry season in the halls of colleges, the Inns of Court, the palace of the king, and the mansions of nobles. Writing at the end of the sixteenth century, the antiquary John Stow tells us that, "in the feast of Christmas, there was in the King's house, wheresoever he was lodged, a Lord of Misrule, or Master of Merry Disports; and the like had ye in the house of every nobleman of honour or good worship, were he spiritual or temporal. Amongst the which the Mayor of London, and either of the Sheriffs, had their several Lords of Misrule, ever contending, without quarrel or offence, who should make the rarest pastimes to delight the beholders. These Lords beginning their rule on Alhollon eve, continued the same til the morrow after the Feast of the Purification, commonly called Candlemas day. In all which space there were fine and subtle disguisings, masks and mummeries, with playing at cards for

counters, nails, and points, in every house, more for pastime than for gain.” Again, in the seventeenth century the ardent royalist Sir Thomas Urquhart wrote that “they may be likewise said to use their king ... as about Christmas we do the King of Misrule; whom we invest with that title to no other end, but to countenance the Bacchanalian riots and preposterous disorders of the family, where he is installed.” From the former passage it appears that the Lords of Misrule often or even generally reigned for more than three months in winter, namely from Allhallow Even (the thirty-first of October, the Eve of All Saints' Day) till Candlemas (the second of February). Sometimes, however, their reign seems to have been restricted to the Twelve Nights. Thus we are told that George Ferrers of Lincoln's Inn was Lord of Misrule for twelve days one year when King Edward VI. kept his Christmas with open house at Greenwich. At Trinity College, Cambridge, a Master of Arts used to be appointed to this honourable office, which he held for the twelve days from Christmas to Twelfth Day, and he resumed office on Candlemas Day. His duty was to regulate the games and diversions of the students, particularly the plays which were acted in the college hall. Similar masters of the revels were commonly instituted in the colleges at Oxford; for example, at Merton College the fellows annually elected about St. Edmund's Day, in November a Lord of Misrule or, as he was called in the registers, a King of the Bean (*Rex Fabarum*), who held office till Candlemas and sometimes assumed a number of ridiculous titles. In the Inner Temple a Lord of Misrule used to be appointed on St. Stephen's Day (the twenty-sixth of December); surrounded by his courtiers, who were dubbed by various derogatory or ribald names, he presided at the dancing, feasting, and minstrelsy in the hall. Of the mock monarch who in the Christmas holidays of 1635 held office in the Middle Temple the jurisdiction, privileges, and parade have been minutely described. He was attended by his lord keeper, lord treasurer, with eight white staves, a band of gentleman pensioners with poleaxes, and two chaplains. He dined under a canopy of state both in the hall and in his own chambers. He received many petitions, which he passed on in regal style to his Master of Requests; and he attended service in the Temple church, where his chaplains preached before him and did him reverence. His expenses, defrayed from his own purse, amounted to no less than two thousand pounds. “I remember to have heard a Bencher of the Temple tell a story of a tradition in their house, where they had formerly a custom of choosing kings for such a season, and allowing him his expences at the charge of the society: One of our kings, said my friend, carried his royal inclination a little too far, and there was a committee ordered to look into the management of his treasury. Among other things it appeared, that his Majesty walking *incog.* in the cloister, had overheard a poor man say to another, Such a small sum would make me the happiest man in the world. The king out of his royal compassion privately inquired into his character, and finding him a proper object of charity, sent him the money. When the committee read the report, the house passed his accounts with a plaudite without further examination, upon the recital of this article in them, ‘For making a man happy, £10:0:0.’ ”

At the English court the annual Lord of Misrule is not to be confounded with the Master of the Revels, who was a permanent official and probably despised the temporary Lord as an upstart rival and intruder. Certainly there seems to have been at times bad blood between them. Some correspondence which passed between the two merry monarchs in the reign of Edward VI. has been preserved, and from it we learn that on one occasion the Lord of Misrule had much difficulty in extracting from the Master of the Revels the fool's coat, hobby-horses, and other trumpery paraphernalia which he required for the proper support of his dignity. Indeed the costumes furnished by his rival were so shabby that his lordship returned them with a note, in which he informed the Master of the Revels that the gentlemen of rank and position who were to wear these liveries stood too much on their dignity to be

seen prancing about the streets of London rigged out in such old slops. The Lords of Council had actually to interpose in the petty squabble between the two potentates.

In France the counterparts of these English Lords of Misrule masqueraded in clerical attire as mock Bishops, Archbishops, Popes, or Abbots. The festival at which they disported themselves was known as the Festival of Fools (*Fête des Fous*), which fell in different places at different dates, sometimes on Christmas Day, sometimes on St. Stephen's Day (the twenty-sixth of December), sometimes on New Year's Day, and sometimes on Twelfth Day. According to one account "on the first day, which was the festival of Christmas, the lower orders of clergy and monks cried in unison *Noël* (Christmas) and gave themselves up to jollity. On the morrow, St. Stephen's Day, the deacons held a council to elect a Pope or Patriarch of Fools, a Bishop or Archbishop of Innocents, an Abbot of Ninnies; next day, the festival of St. John, the subdeacons began the dance in his honour; afterwards, on the fourth day, the festival of the Holy Innocents, the choristers and minor clergy claimed the Pope or Bishop or Abbot elect, who made his triumphal entry into the church on Circumcision Day (the first of January) and sat enthroned pontifically till the evening of Epiphany. It was then the joyous reign of this Pope or this Bishop or this Abbot of Folly which constituted the Festival of Fools and dominated its whimsical phases, the grotesque and sometimes impious masquerades, the merry and often disgusting scenes, the furious orgies, the dances, the games, the profane songs, the impudent parodies of the catholic liturgy." At these parodies of the most solemn rites of the church the priests, wearing grotesque masks and sometimes dressed as women, danced in the choir and sang obscene chants: laymen disguised as monks and nuns mingled with the clergy: the altar was transformed into a tavern, where the deacons and subdeacons ate sausages and black-puddings or played at dice and cards under the nose of the celebrant; and the censers smoked with bits of old shoes instead of incense, filling the church with a foul stench. After playing these pranks and running, leaping, and cutting capers through the whole church, they rode about the town in mean carts, exchanging scurrilities with the crowds of laughing and jeering spectators.

Amongst the buffooneries of the Festival of Fools one of the most remarkable was the introduction of an ass into the church, where various pranks were played with the animal. At Autun the ass was led with great ceremony to the church under a cloth of gold, the corners of which were held by four canons; and on entering the sacred edifice the animal was wrapt in a rich cope, while a parody of the mass was performed. A regular Latin liturgy in glorification of the ass was chanted on these occasions, and the celebrant priest imitated the braying of an ass. At Beauvais the ceremony was performed every year on the fourteenth of January. A young girl with a child in her arms rode on the back of the ass in imitation of the Flight into Egypt. Escorted by the clergy and the people she was led in triumph from the cathedral to the parish church of St. Stephen. There she and her ass were introduced into the chancel and stationed on the left side of the altar; and a long mass was performed which consisted of scraps borrowed indiscriminately from the services of many church festivals throughout the year. In the intervals the singers quenched their thirst: the congregation imitated their example; and the ass was fed and watered. The services over, the animal was brought from the chancel into the nave, where the whole congregation, clergy and laity mixed up together, danced round the animal and brayed like asses. Finally, after vespers and compline, the merry procession, led by the precentor and preceded by a huge lantern, defiled through the streets to wind up the day with indecent farces in a great theatre erected opposite the church.

A pale reflection or diminutive copy of the Festival of Fools was the Festival of the Innocents, which was celebrated on Childermas or Holy Innocents' Day, the twenty-eighth of December. The custom was widely observed both in France and England. In France on Childermas or the eve of the festival the choristers assembled in the church and chose one of

their number to be a Boy Bishop, who officiated in that character with mock solemnity. Such burlesques of ecclesiastical ritual appear to have been common on that day in monasteries and convents, where the offices performed by the clergy and laity were inverted for the occasion. At the Franciscan monastery of Antibes, for example, the lay brothers, who usually worked in the kitchen and the garden, took the place of the priests on Childermas and celebrated mass in church, clad in tattered sacerdotal vestments turned inside out, holding the books upside down, wearing spectacles made of orange peel, mumbling an unintelligible jargon, and uttering frightful cries. These buffooneries were kept up certainly as late as the eighteenth century, and probably later. In the great convent of the *Congrégation de Notre Dame* at Paris down to the latter part of the nineteenth century the nuns and their girl pupils regularly exchanged parts on Holy Innocents' Day. The pupils pretended to be nuns and a select few of them were attired as such, while the nuns made believe to be pupils, without however changing their dress.

In England the Boy Bishop was widely popular during the later Middle Ages and only succumbed to the austerity of the Reformation. He is known, for example, to have officiated in St. Paul's, London, in the cathedrals of Salisbury, Exeter, Hereford, Gloucester, Lichfield, Norwich, Lincoln, and York, in great collegiate churches such as Beverley minster, St. Peter's, Canterbury, and Ottery St. Mary's, in college chapels such as Magdalen and All Souls' at Oxford, in the private chapels of the king, and in many parish churches throughout the country. The election was usually made on St. Nicholas's Day (the sixth of December), but the office and authority lasted till Holy Innocents' Day (the twenty-eighth of December). Both days were appropriate, for St. Nicholas was the patron saint of school children, and Holy Innocents' Day commemorates the slaughter of the young children by Herod. In cathedrals the Bishop was chosen from among the choir boys. After his election he was completely apparelled in the episcopal vestments, with a mitre and crosier, bore the title and displayed the state of a Bishop, and exacted ceremonial obedience from his fellows, who were dressed like priests. They took possession of the church and, with the exception of mass, performed all the ceremonies and offices. The Boy Bishop preached from the pulpit. At Salisbury the ceremonies at which he presided are elaborately regulated by the statutes of Roger de Mortival, enacted in 1319; and two of the great service-books of the Sarum use, the Breviary and the Processional, furnish full details of the ministrations of the Boy Bishop and his fellows. He is even said to have enjoyed the right of disposing of such prebends as happened to fall vacant during the days of his episcopacy. But the pranks of the mock bishop were not confined to the church. Arrayed in full canonicals he was led about with songs and dances from house to house, blessing the grinning people and collecting money in return for his benedictions. At York in the year 1396 the Boy Bishop is known to have gone on his rounds to places so far distant as Bridlington, Leeds, Beverley, Fountains Abbey, and Allerton; and the profits which he made were considerable. William of Wykeham ordained in 1400 that a Boy Bishop should be chosen at Winchester College and another at New College, Oxford, and that he should recite the office at the Feast of the Innocents. His example was followed some forty years afterwards in the statutes of the royal foundations of Eton College and of King's College, Cambridge. From being elected on St. Nicholas's Day the Boy Bishop was sometimes called a Nicholas Bishop (*Episcopus Nicholatensis*). In Spanish cathedrals, also, it appears to have been customary on St. Nicholas's Day to elect a chorister to the office of Bishop. He exercised a certain jurisdiction till Holy Innocents' Day, and his prebendaries took secular offices, acting in the capacity of alguazils, catchpoles, dog-whippers, and sweepers.

On the whole it seems difficult to suppose that the a curious superstitions and quaint ceremonies, the outbursts of profanity and the inversions of ranks, which characterize the

popular celebration of the twelve days from Christmas to Epiphany, have any connexion with the episodes of Christian history believed to be commemorated by these two festivals. More probably they are relics of an old heathen festival celebrated during the twelve intercalary days which our forefathers annually inserted in their calendar at midwinter in order to equalize the short lunar year of twelve months with the longer solar year of three hundred and sixty-five or sixty-six days. We need not assume that the license and buffooneries of the festive season were borrowed from the Roman Saturnalia; both celebrations may well have been parallel and independent deductions from a like primitive philosophy of nature. There is not indeed, so far as I am aware, any direct evidence that the Saturnalia at Rome was an intercalary festival; but the license which characterized it, and the temporary reign of a mock king, who personated Saturn, suggest that it may have been so. If we were better acquainted with the intercalary periods of peoples at a comparatively low level of culture, we might find that they are commonly marked by similar outbreaks of lawlessness and similar reigns of more or less nominal and farcical rulers. But unfortunately we know too little about the observance of such periods among primitive peoples to be warranted in making any positive affirmation on the subject.

However, there are grounds for thinking that intercalary periods have commonly been esteemed unlucky. The Aztecs certainly regarded as very unlucky the five supplementary days which they added at the end of every year in order to make up a total of three hundred and sixty-five days. These five supplementary days, corresponding to the last four of January and the first of February, were called *nemontemi*, which means "vacant," "superfluous," or "useless." Being dedicated to no god, they were deemed inauspicious, equally unfit for the services of religion and the transaction of civil business. During their continuance no sacrifices were offered by the priests and no worshippers frequented the temples. No cases were tried in the courts of justice. The houses were not swept. People abstained from all actions of importance and confined themselves to performing such as could not be avoided, or spent the time in paying visits to each other. In particular they were careful during these fatal days not to fall asleep in the daytime, not to quarrel, and not to stumble; because they thought that if they did such things at that time they would continue to do so for ever. Persons born on any of these days were deemed unfortunate, destined to fail in their undertakings and to live in wretchedness and poverty all their time on earth. The Mayas of Yucatan employed a calendar like that of the Aztecs, and they too looked upon the five supplementary days at the end of the year as unlucky and of evil omen; hence they gave no names to these days, and while they lasted the people stayed for the most part at home; they neither washed themselves, nor combed their hair, nor loused each other; and they did no servile or fatiguing work lest some evil should befall them.

The ancient Egyptians like the Aztecs considered a year to consist of three hundred and sixty ordinary days divided into months and eked out with five supplementary days so as to bring the total number of days in the year up to three hundred and sixty-five; but whereas the Aztecs divided the three hundred and sixty ordinary days into eighteen arbitrary divisions or months of twenty days each, the Egyptians, keeping much closer to the natural periods marked by the phases of the moon, divided these days into twelve months of thirty days each. This mode of regulating the calendar appears to be exceedingly ancient in Egypt and may even date from the prehistoric period; for the five days over and above the year (*haru duait hiru ronpit*) are expressly mentioned in the texts of the pyramids. The myth told to explain their origin was as follows. Once on a time the earth-god Keb lay secretly with the sky-goddess Nut, and the sun-god Ra in his anger cursed the goddess, saying that she should give birth to her offspring neither in any month nor in any year. He thought, no doubt, by this imprecation to prevent her from bringing forth the fruit of her womb. But he was outwitted

by the wily Thoth, who engaged the goddess of the moon in a game of draughts and having won the game took as a forfeit from her the seventieth part of every day in the year, and out of the fractions thus abstracted he made up five new days, which he added to the old year of three hundred and sixty days. As these days formed no part either of a month or of a year, the goddess Nut might be delivered in them without rendering the sun-god's curse void and of no effect. Accordingly she bore Osiris on the first of the days, Horus on the second, Set or Typhon on the third, Isis on the fourth, and Nephthys on the fifth. Of these five supplementary or intercalary days the third, as the birthday of the evil deity Set or Typhon, was deemed unlucky, and the Egyptian kings neither transacted business on it nor attended to their persons till nightfall. Thus it appears that the ancient Egyptians regarded the five supplementary or intercalary days as belonging neither to a month nor to a year, but as standing outside of both and forming an extraordinary period quite apart and distinct from the ordinary course of time. It is probable, though we cannot prove it, that in all countries intercalary days or months have been so considered by the primitive astronomers who first observed the discrepancy between solar and lunar time and attempted to reconcile it by the expedient of intercalation.

Thus we infer with some probability that the sacred Twelve Days or Nights at midwinter derive their peculiar character in popular custom and superstition from the circumstance that they were originally an intercalary period inserted annually at the end of a lunar year of three hundred and fifty-four days for the purpose of equating it to a solar year reckoned at three hundred and sixty-six days. However, there are grounds for thinking that at a very early time the Aryan peoples sought to correct their lunar year, not by inserting twelve supplementary days every year, but by allowing the annual deficiency to accumulate for several years and then supplying it by a whole intercalary month. In India the Aryans of the Vedic age appear to have adopted a year of three hundred and sixty days, divided into twelve months of thirty days each, and to have remedied the annual deficiency of five days by intercalating a whole month of thirty days every fifth year, thus regulating their calendar according to a five years' cycle. The Celts of Gaul, as we learn from the Coligny calendar, also adopted a five years' cycle, but they managed it differently. They retained the old lunar year of three hundred and fifty-four days divided into twelve months, six of thirty days and six of twenty-nine days; but instead of intercalating twelve days every year to restore the balance between lunar and solar time they intercalated a month of thirty days every two and a half years, so that in each cycle of five years the total number of intercalary days was sixty, which was equivalent to intercalating twelve days annually. Thus the result at the end of each cycle of five years was precisely the same as it would have been if they had followed the old system of annual intercalation. Why they abandoned the simple and obvious expedient of annually intercalating twelve days, and adopted instead the more recondite system of intercalating a month of thirty days every two and a half years, is not plain. It may be that religious or political motives unknown to us concurred with practical considerations to recommend the change. One result of the reform would be the abolition of the temporary king who, if I am right, used to bear a somewhat tumultuary sway over the community during the saturnalia of the Twelve Days. Perhaps the annually recurring disorders which attended that period of license were not the least urgent of the reasons which moved the rulers to strike the twelve intercalary days out of the year and to replace them by an intercalary month at longer intervals.

However that may be, the equivalence of the new intercalary month to the old intercalary Twelve Days multiplied by two and a half is strongly suggested by a remarkable feature of the Coligny calendar; for in it the thirty days of the intercalary month, which bore the name of Ciallos, are named after the ordinary twelve months of the year. Thus the first day of the

intercalary month is called Samon, which is the name of the first month of the year; the second day of the month is called Dumannos, which is the name of the second month of the year; the third day of the month is called Rivros, which is the name of the third month of the year; the fourth day of the month is called Anacan, which is the name of the fourth month of the year; and so on with all the rest, so that the thirty days of the intercalary month bear the names of the twelve months of the year repeated two and a half times. This seems to shew that, just as our modern peasants regard the Twelve Days as representing each a month of the year in their chronological order, so the old Celts of Gaul who drew up the Coligny calendar regarded the thirty days of the intercalary month as representing the thirty ordinary months which were to follow it till the next intercalation took place. And we may conjecture that just as our modern peasants still draw omens from the Twelve Days for the twelve succeeding months, so the old Celts drew omens from the thirty days of the intercalary month for the thirty months of the two and a half succeeding years. Indeed we may suppose that the reformers of the calendar transferred, or attempted to transfer, to the new intercalary month the whole of the quaint customs and superstitions which from time immemorial had clustered round the twelve intercalary days of the old year. Thus, like the old Twelve Days of midwinter, the thirty days of the new intercalary month may have formed an interregnum or break in the ordinary course of government, a tumultuary period of general license, during which the ordinary rules of law and morality were suspended and the direction of affairs committed to a temporary and more or less farcical ruler or King of the Bean, who may possibly have had to pay with his life for his brief reign of thirty days. The floating traditions of such merry monarchs and of the careless happy-go-lucky life under them may have crystallized in after ages into the legend of Saturn and the Golden Age. If that was so—and I put forward the hypothesis for no more than a web of conjectures woven from the gossamer threads of popular superstition—we can understand why the Twelve Days, intercalated every year in the old calendar, should have survived to the present day in the memory of the people, whereas the thirty days, intercalated every two and a half years in the new calendar, have long been forgotten. It is the simplest ideas that live longest in the simple minds of the peasantry; and since the intercalation of twelve days in every year to allow the lagging moon to keep pace with the longer stride of the sun is certainly an easier and more obvious expedient than to wait for two and a half years till he has outrun her by thirty days, we need not wonder that this ancient mode of harmonizing lunar and solar time should have lingered in the recollection and in the usages of the people ages after the more roundabout method, which reflective minds had devised for accomplishing the same end, had faded alike from the memory of the peasant and the page of the historian.

§ 3. The Saturnalia and Lent.

As the Carnival is always held on the last three days before the beginning of Lent, its date shifts somewhat from year to year, but it invariably falls either in February or March. Hence it does not coincide with the date of the Saturnalia, which within historical times seems to have been always celebrated in December even in the old days, before Caesar's reform of the calendar, when the Roman year ended with February instead of December. Yet if the Saturnalia, like many other seasons of license, was originally celebrated as a sort of public purification at the end of the old year or the beginning of the new one, it may at a still more remote period, when the Roman year began with March, have been regularly held either in February or March and therefore at approximately the same date as the modern Carnival. So strong and persistent are the conservative instincts of the peasantry in respect to old custom, that it would be no matter for surprise if, in rural districts of Italy, the ancient festival continued to be celebrated at the ancient time long after the official celebration of the Saturnalia in the towns had been shifted from February to December. Latin Christianity,

which struck at the root of official or civic paganism, has always been tolerant of its rustic cousins, the popular festivals and ceremonies which, unaffected by political and religious revolutions, by the passing of empires and of gods, have been carried on by the people with but little change from time immemorial, and represent in fact the original stock from which the state religions of classical antiquity were comparatively late offshoots. Thus it may very well have come about that while the new faith stamped out the Saturnalia in the towns, it suffered the original festival, disguised by a difference of date, to linger unmolested in the country; and so the old feast of Saturn, under the modern name of the Carnival, has reconquered the cities, and goes on merrily under the eye and with the sanction of the Catholic Church.

The opinion that the Saturnalia originally fell in February or the beginning of March receives some support from the circumstance that the festival of the Matronalia, at which mistresses feasted their slaves just as masters did theirs at the Saturnalia, always continued to be held on the first of March, even when the Roman year began with January. It is further not a little recommended by the consideration that this date would be eminently appropriate for the festival of Saturn, the old Italian god of sowing and planting. It has always been a puzzle to explain why such a festival should have been held at midwinter; but on the present hypothesis the mystery vanishes. With the Italian farmer February and March were the great season of the spring sowing and planting; nothing could be more natural than that the husbandman should inaugurate the season with the worship of the deity to whom he ascribed the function of quickening the seed. It is no small confirmation of this theory that the last day of the Carnival, namely Shrove Tuesday, is still, or was down to recent times, the customary season in Central Europe for promoting the growth of the crops by means of leaps and dances. The custom fits in very well with the view which derives the Carnival from an old festival of sowing such as the Saturnalia probably was in its origin. Further, the orgiastic character of the festival is readily explained by the help of facts which met us in a former part of our investigation. We have seen that between the sower and the seed there is commonly supposed to exist a sympathetic connexion of such a nature that his conduct directly affects and can promote or retard the growth of the crops. What wonder then if the simple husbandman imagined that by cramming his belly, by swilling and guzzling just before he proceeded to sow his fields, he thereby imparted additional vigour to the seed?

But while his crude philosophy may thus have painted gluttony and intoxication in the agreeable colours of duties which he owed to himself, to his family, and to the commonwealth, it is possible that the zest with which he acquitted himself of his obligations may have been whetted by a less comfortable reflection. In modern times the indulgence of the Carnival is immediately followed by the abstinence of Lent; and if the Carnival is the direct descendant of the Saturnalia, may not Lent in like manner be merely the continuation, under a thin disguise, of a period of temperance which was annually observed, from superstitious motives, by Italian farmers long before the Christian era? Direct evidence of this, so far as I am aware, is not forthcoming; but we have seen that a practice of abstinence from fleshly lusts has been observed by various peoples as a sympathetic charm to foster the growth of the seed; and such an observance would be an appropriate sequel to the Saturnalia, if that festival was indeed, as I conjecture it to have been, originally held in spring as a religious or magical preparation for sowing and planting. When we consider how widely diffused is the belief in the sympathetic influence which human conduct, and especially the intercourse of the sexes, exerts on the fruits of the earth, we may be allowed to conjecture that the Lenten fast, with the rule of continence which is recommended, if not strictly enjoined, by the Catholic and Coptic churches during that season, was in its origin intended, not so much to commemorate the sufferings of a dying god, as to foster the growth of the

seed, which in the bleak days of early spring the husbandman commits with anxious care and misgiving to the bosom of the naked earth. Ecclesiastical historians have been puzzled to say why after much hesitation and great diversity of usage in different places the Christian church finally adopted forty days as the proper period for the mournful celebration of Lent. Perhaps in coming to this decision the authorities were guided, as so often, by a regard for an existing pagan celebration of similar character and duration which they hoped by a change of name to convert into a Christian solemnity. Such a heathen Lent they may have found to hand in the rites of Persephone, the Greek goddess of the corn, whose image, carved out of a tree, was annually brought into the cities and mourned for forty nights, after which it was burned. The time of year when these lamentations took place is not mentioned by the old Christian writer who records them; but they would fall most appropriately at the season when the seed was sown or, in mythical language, when the corn-goddess was buried, which in ancient Italy, as we saw, was done above all in the months of February and March. We know that at the time of the autumnal sowing Greek women held a sad and serious festival because the Corn-goddess Persephone or the Maiden, as they called her, then went down into the earth with the sown grain, and Demeter fondly mourned her daughter's absence; hence in sympathy with the sorrowful mother the women likewise mourned and observed a solemn fast and abstained from the marriage bed. It is reasonable, therefore, to suppose that they practised similar rules of mourning and abstinence for a like reason at the time of the spring sowing, and that the ancient ritual survives in the modern Lent, which preserves the memory of the *Mater Dolorosa*, though it has substituted a dead Son for a dead Daughter.

Be that as it may, it is worthy of note that in Burma a similar fast, which English writers call the Buddhist Lent, is observed for three months every year while the ploughing and sowing of the fields go forward; and the custom is believed to be far older than Buddhism, which has merely given it a superficial tinge like the veneer of Christianity which, if I am right, has overlaid an old heathen observance in Lent. This Burmese Lent, we are told, covers the rainy season from the full moon of July to the full moon of October. "This is the time to plough, this is the time to sow; on the villagers' exertions in these months depends all their maintenance for the rest of the year. Every man, every woman, every child, has hard work of some kind or another. And so, what with the difficulties of travelling, what with the work there is to do, and what with the custom of Lent, every one stays at home. It is the time for prayer, for fasting, for improving the soul. Many men during these months will live even as the monks live, will eat but before midday, will abstain from tobacco. There are no plays during Lent, and there are no marriages. It is the time for preparing the land for the crop; it is the time for preparing the soul for eternity. The congregations on the Sundays will be far greater at this time than at any other; there will be more thought of the serious things of life."

§ 4. Saturnalia in Ancient Greece.

Beyond the limits of Italy festivals of the same general character as the Saturnalia appear to have been held over a considerable area of the ancient world. A characteristic feature of the Saturnalia, as we saw, was an inversion of social ranks, masters changing places with their slaves and waiting upon them, while slaves were indulged with a semblance not merely of freedom but even of power and office. In various parts of Greece the same hollow show of granting liberty to slaves was made at certain festivals. Thus at a Cretan festival of Hermes the servants feasted and their masters waited upon them. In the month of Geraestius the Troezenians observed a certain solemnity lasting many days, on one of which the slaves played at dice with the citizens and were treated to a banquet by their lords. The Thessalians held a great festival called Peloria, which Baton of Sinope identified with the Saturnalia, and of which the antiquity is vouched for by a tradition that it originated with the Pelasgians. At this festival sacrifices were offered to Pelorian Zeus, tables splendidly adorned were set out,

all strangers were invited to the feast, all prisoners released, and the slaves sat down to the banquet, enjoyed full freedom of speech, and were served by their masters.

But the Greek festival which appears to have corresponded most closely to the Italian Saturnalia was the Cronia or festival of Cronus, a god whose barbarous myth and cruel ritual clearly belong to a very early stratum of Greek religion, and who was by the unanimous voice of antiquity identified with Saturn. We are told that his festival was celebrated in most parts of Greece, but especially at Athens, where the old god and his wife Rhea had a shrine near the stately, but far more modern, temple of Olympian Zeus. A joyous feast, at which masters and slaves sat down together, formed a leading feature of the solemnity. At Athens the festival fell in the height of summer, on the twelfth day of the month Hecatombaeon, formerly called the month of Cronus, which answered nearly to July; and tradition ran that Cecrops, the first king of Attica, had founded an altar in honour of Cronus and Rhea, and had ordained that master and man should share a common meal when the harvest was got in. Yet there are indications that at Athens the Cronia may once have been a spring festival. For a cake with twelve knobs, which perhaps referred to the twelve months of the year, was offered to Cronus by the Athenians on the fifteenth day of the month Elaphebolion, which corresponded roughly to March, and there are traces of a license accorded to slaves at the Dionysiac festival of the opening of the wine-jars, which fell on the eleventh day of the preceding month Anthesterion. At Olympia the festival of Cronus undoubtedly occurred in spring; for here a low but steep hill, now covered with a tangled growth of dark holly-oaks and firs, was sacred to him, and on its top certain magistrates, who bore the title of kings, offered sacrifice to the old god at the vernal equinox in the Elean month Elaphius.

In this last ceremony, which probably went on year by year long before the upstart Zeus had a temple built for himself at the foot of the hill, there are two points of special interest, first the date of the ceremony, and second the title of the celebrants. First, as to the date, the spring equinox, or the twenty-first of March, must have fallen so near the fifteenth day of the Athenian month Elaphebolion, that we may fairly ask whether the Athenian custom of offering a cake to Cronus on that day may not also have been an equinoctial ceremony. In the second place, the title of kings borne by the magistrates who sacrificed to Cronus renders it probable that, like magistrates with similar high-sounding titles elsewhere in republican Greece, they were the lineal descendants of sacred kings whom the superstition of their subjects invested with the attributes of divinity. If that was so, it would be natural enough that one of these nominal kings should pose as the god Cronus in person. For, like his Italian counterpart Saturn, the Greek Cronus was believed to have been a king who reigned in heaven or on earth during the blissful Golden Age, when men passed their days like gods without toil or sorrow, when life was a long round of festivity, and death came like sleep, sudden but gentle, announced by none of his sad forerunners, the ailments and infirmities of age. Thus the analogy of the Olympian Cronia, probably one of the oldest of Greek festivals, to the Italian Saturnalia would be very close if originally, as I conjecture, the Saturnalia fell in spring and Saturn was personated at it, as we have good reason to believe, by a man dressed as a king. May we go a step further and suppose that, just as the man who acted King Saturn at the Saturnalia was formerly slain in that character, so one of the kings who celebrated the Cronia at Olympia not only played the part of Cronus, but was sacrificed, as god and victim in one, on the top of the hill? Cronus certainly bore a sinister reputation in antiquity. He passed for an unnatural parent who had devoured his own offspring, and he was regularly identified by the Greeks with the cruel Semitic Baals who delighted in the sacrifice of human victims, especially of children. A legend which savours strongly of infant sacrifice is reported of a shrine that stood at the very foot of the god's own hill at Olympia; and a quite unambiguous story was told of the sacrifice of a babe to Lycaean Zeus on Mount Lycaeus in

Arcadia, where the worship of Zeus was probably nothing but a continuation, under a new name, of the old worship of Cronus, and where human victims appear to have been regularly offered down to the Christian era. The Rhodians annually sacrificed a man to Cronus in the month Metageitnion; at a later time they kept a condemned criminal in prison till the festival of the Cronia was come, then led him forth outside the gates, made him drunk with wine, and cut his throat. With the parallel of the Saturnalia before our eyes, we may surmise that the victim who thus ended his life in a state of intoxication at the Cronia perhaps personated King Cronus himself, the god who reigned in the happy days of old when men had nothing to do but to eat and drink and make merry. At least the Rhodian custom lends some countenance to the conjecture that formerly a human victim may have figured at the sacrifice which the so-called kings offered to Cronus on his hill at Olympia. In this connexion it is to be remembered that we have already found well-attested examples of a custom of sacrificing the scions of royal houses in ancient Greece. If the god to whom, or perhaps rather in whose character, the princes were sacrificed, was Cronus, it would be natural that the Greeks of a later age should identify him with Baal or Moloch, to whom in like manner Semitic kings offered up their children. The Laphystian Zeus of Thessaly and Boeotia, whom tradition associated with these human sacrifices, was probably, like the Lycaean Zeus of Arcadia, nothing but the aboriginal deity, commonly known as Cronus, whose gloomy rites the Greek invaders suffered the priests of the vanquished race to continue after the ancient manner, while they quieted their scruples of conscience or satisfied their pride as conquerors by investing the bloodthirsty old savage with the name, if not with the character, of their own milder deity, the humane and gracious Zeus.

§ 5. Saturnalia in Western Asia.

When we pass from Europe to western Asia, from ancient Greece to ancient Babylon and the regions where Babylonian influence penetrated, we are still met with festivals which bear the closest resemblance to the oldest form of the Italian Saturnalia. The reader may remember the festival of the Sacaea, on which I had occasion to touch in an earlier part of this work. It was held at Babylon during five days of the month Lous, beginning with the sixteenth day of the month. During its continuance, just as at the Saturnalia, masters and servants changed places, the servants issuing orders and the masters obeying them; and in each house one of the servants, dressed as a king and bearing the title of Zoganes, bore rule over the household. Further, just as at the Saturnalia in its original form a man was dressed as King Saturn in royal robes, allowed to indulge his passions and caprices to the full, and then put to death, so at the Sacaea a condemned prisoner, who probably also bore for the time being the title of Zoganes, was arrayed in the king's attire and suffered to play the despot, to use the king's concubines, and to give himself up to feasting and debauchery without restraint, only however in the end to be stript of his borrowed finery, scourged, and hanged or crucified. From Strabo we learn that this Asiatic counterpart of the Saturnalia was celebrated in Asia Minor wherever the worship of the Persian goddess Anaitis had established itself. He describes it as a Bacchic orgy, at which the revellers were disguised as Scythians, and men and women drank and dallied together by day and night.

As the worship of Anaitis, though of Persian origin, appears to have been deeply leavened with coarse elements which it derived from the religion of Babylon, we may perhaps regard Mesopotamia as the original home from which the Sacaeian festival spread westward into other parts of Asia Minor. Now the Sacaeian festival, described by the Babylonian priest Berosus in the first book of his history of Babylon, has been plausibly identified with the great Babylonian festival of the New year called Zakmuk, Zagmuk, Zakmuku, or Zagmuku, which has become known to us in recent times through inscriptions. The Babylonian year began with the spring month of Nisan, which seems to have covered the second half of March

and the first half of April. Thus the New Year festival, which occupied at least the first eleven days of Nisan, probably included the spring equinox. It was held in honour of Marduk or Merodach, the chief god of Babylon, whose great temple of Esagila in the city formed the religious centre of the solemnity. For here, in a splendid chamber of the vast edifice, all the gods were believed to assemble at this season under the presidency of Marduk for the purpose of determining the fates for the new year, especially the fate of the king's life. On this occasion the king of Babylon was bound annually to renew his regal power by grasping the hands of the image of Marduk in his temple, as if to signify that he received the kingdom directly from the deity and was unable without the divine assistance and authority to retain it for more than a year. Unless he thus formally reinstated himself on the throne once a year, the king ceased to reign legitimately. When Babylonia was conquered by Assyria, the Assyrian monarchs themselves used to come to Babylon and perform the ceremony of grasping the god's hands in order to establish by this solemn act their title to the kingdom which they had won for themselves by the sword; until they had done so, they were not recognized as kings by their Babylonian subjects. Some of them indeed found the ceremony either so burdensome or so humiliating to their pride as conquerors, that rather than perform it they renounced the title of king of Babylon altogether and contented themselves with the more modest title of regent. Another notable feature of the Babylonian festival of the New Year appears to have been a ceremonial marriage of the god Marduk; for in a hymn relating to the solemnity it is said of the deity that "he hastened to his bridal." The festival was of hoar antiquity, for it was known to Gudea, an old king of Southern Babylonia who flourished between two and three thousand years before the beginning of our era, and it is mentioned in an early account of the Great Flood. At a much later period it is repeatedly referred to by King Nebuchadnezzar and his successors. Nebuchadnezzar records how he built of bricks and bitumen a chapel or altar, "a thing of joy and rejoicing," for the great festival of Marduk, the lord of the gods; and we read of the rich and abundant offerings which were made by the high priest at this time.

Unfortunately the notices of this Babylonian festival of the New Year which have come down to us deal chiefly with its mythical aspect and throw little light on the mode of its celebration. Hence its identity with the Sacaea must remain for the present a more or less probable hypothesis. In favour of the hypothesis may be alleged in the first place the resemblance of the names Sacaea and Zoganes to Zakmuk or Zagmuku, if that was the real pronunciation of the name, and in the second place the very significant statement that the fate of the king's life was supposed to be determined by the gods, under the presidency of Marduk, at the Zakmuk or New Year's festival. When we remember that the central feature of the Sacaea appears to have been the saving of the king's life for another year by the vicarious sacrifice of a criminal on the cross or the gallows, we can understand that the season was a critical one for the king, and that it may well have been regarded as determining his fate for the ensuing twelve months. The annual ceremony of renewing the king's power by contact with the god's image, which formed a leading feature of the Zakmuk festival, would be very appropriately performed immediately after the execution or sacrifice of the temporary king who died in the room of the real monarch.

A difficulty, however, in the way of identifying the Sacaea with the Zakmuk arises from the statement of Berossus that the Sacaea fell on the sixteenth day of Lous, which was the tenth month of the Syro-Macedonian calendar and appears to have nearly coincided with July. Thus if the Sacaea occurred in July and the Zakmuk in March, the theory of their identity could not be maintained. But the dating of the months of the Syro-Macedonian calendar is a matter of some uncertainty; the month of Lous in particular appears to have fallen at different times of the year in different places, and until we have ascertained beyond the reach of doubt when Lous fell at Babylon in the time of Berossus, it would be premature to allow much

weight to the seeming discrepancy in the dates of the two festivals. At all events, whether the festivals were the same or different, we are confronted with difficulties which in the present state of our knowledge may be pronounced insoluble. If the festivals were the same, we cannot explain their apparent difference of date: if they were different, we cannot explain their apparent similarity of character. In what follows I shall, with some eminent Oriental scholars, provisionally assume the identity of Zakmuk and Sacaea, but I would ask the reader to bear clearly in mind that the hypothesis leaves the apparent discrepancy of their dates unexplained. Towards a solution of the problem I can only suggest conjecturally either that the date of the festival had been for some reason shifted in the time of Berosus, or that two different festivals of the same type may have been held at different seasons of the year, one in spring and one in summer, perhaps by two distinct but kindred tribes, who retained their separate religious rites after they had coalesced in the Babylonian empire. Both conjectures might be supported by analogies. On the one hand, for example, in the Jewish calendar New Year's Day was shifted under Babylonian influence from autumn to spring, and in a later part of this work we shall see that the Chinese festival of new fire, at first celebrated in spring, was afterwards shifted to the summer solstice, only however to be brought back at a later time to its original date. On the other hand, the popular festivals of our European peasantry afford many examples of rites which appear to be similar in character, though they fall at different times of the year; such, for instance, are the ceremonies concerned with vegetation on May Day, Whitsuntide, and Midsummer Day, and the fire festivals which are distributed at still wider intervals throughout the months. Similarly in ancient Italy the agricultural festival of the Ambarvalia was celebrated by Italian farmers at different dates in different places. These cases may warn us against the danger of hastily inferring an essential difference between Zakmuk and Sacaea on the ground of a real or apparent difference in their dates.

A fresh and powerful argument in favour of the identity of the two festivals is furnished by the connexion which has been traced between both of them and the Jewish feast of Purim. There are good grounds for believing that Purim was unknown to the Jews until after the exile, and that they learned to observe it during their captivity in the East. The festival is first mentioned in the book of Esther, which by the majority of critics is assigned to the fourth or third century b.c., and which certainly cannot be older than the Persian period, since the scene of the narrative is laid in Susa at the court of a Persian king Ahasuerus, whose name appears to be the Hebrew equivalent of Xerxes. The next reference to Purim occurs in the second book of Maccabees, a work written probably about the beginning of our era. Thus from the absence of all notice of Purim in the older books of the Bible, we may fairly conclude that the festival was instituted or imported at a comparatively late date among the Jews. The same conclusion is supported by the book of Esther itself, which was manifestly written to explain the origin of the feast and to suggest motives for its observance. For, according to the author of the book, the festival was established to commemorate the deliverance of the Jews from a great danger which threatened them in Persia under the reign of King Xerxes. Thus the opinion of modern scholars that the feast of Purim, as celebrated by the Jews, was of late date and oriental origin, is borne out by the tradition of the Jews themselves. An examination of that tradition and the mode of celebrating the feast renders it probable that Purim is nothing but a more or less disguised form of the Babylonian festival of the Sacaea or Zakmuk.

In the first place, the feast of Purim was and is held on the fourteenth and fifteenth days of Adar, the last month of the Jewish year, which corresponds roughly to March. Thus the date agrees nearly, though not exactly, with the date of the Babylonian Zakmuk, which fell a fortnight later in the early days of the following month Nisan. A trace of the original celebration of Purim in Nisan may perhaps be found in the statement that "they cast Pur, that

is, the lot, before Haman” in Nisan, the first month of the year. It has been suggested with some plausibility that the Jews may have shifted the date of Purim in order that the new and foreign festival might not clash with their own old festival of the Passover, which began on the fourteenth day of Nisan. Another circumstance which speaks at once for the alien origin of Purim and for its identity with Zakmuk is its name. The author of the book of Esther derives the name Purim from *pur*, “a lot,” but no such word with this signification exists in Hebrew, and hence we are driven to look for the meaning and etymology of Purim in some other language. A specious theory is that the name was derived from an Assyrian word *puvru*, “an assembly,” and referred primarily to the great assembly of the gods which, as we have seen, formed a chief feature of the festival of Zakmuk, and was held annually in the temple of Marduk at Babylon for the purpose of determining the fates or lots of the new year; the august assembly appears to have been occasionally, if not regularly, designated by the very name *puvru*. On this hypothesis the traditional Jewish explanation of the name Purim preserved a genuine kernel of historical truth, or at least of mythical fancy, under the husk of a verbal error; for the name, if this derivation of it is correct, really signified, not “the lots,” but the assembly for drawing or otherwise determining the lots. Another explanation which has been offered is “that *pūr* or *būr* seems to be an old Assyrian word for ‘stone,’ and that therefore it is possible that the word was also used to signify ‘lot,’ like the Hebrew גורל ‘lot,’ which originally, no doubt, meant ‘little stone.’” Either of these explanations of the name Purim, by tracing it back to the New Year assembly of the gods at Babylon for settling the lots, furnishes an adequate explanation of the traditional association of Purim with the casting of lots—an association all the more remarkable and all the more likely to be ancient because there is nothing to justify it either in the Hebrew language or in the Jewish mode of celebrating the festival. When to this we add the joyous, nay, extravagant festivity which has always been characteristic of Purim, and is entirely in keeping with a New Year celebration, we may perhaps be thought to have made out a fairly probable case for holding that the Jewish feast is derived from the Babylonian New Year festival of Zakmuk. Whether the Jews borrowed the feast directly from the Babylonians or indirectly through the Persian conquerors of Babylon is a question which deserves to be considered; but the Persian colouring of the book of Esther speaks strongly for the view that Purim came to Israel by way of Persia, or at all events from Babylon under Persian rule, and this view is confirmed by other evidence, to which I shall have to ask the reader's attention a little later on.

If the links which bind Purim to Zakmuk are reasonably strong, the chain of evidence which connects the Jewish festival with the Sacaea is much stronger. Nor is this surprising when we remember that, while the popular mode of celebrating Zakmuk is unknown, we possess important and trustworthy details as to the manner of holding the Sacaea. We have seen that the Sacaea was a wild Bacchanalian revel at which men and women disguised themselves and drank and played together in a fashion that was more gay than modest. Now this is, or used to be, precisely the nature of Purim. The two days of the festival, according to the author of the book of Esther, were to be kept for ever as “days of feasting and gladness, and of sending portions one to another, and gifts to the poor.” And this joyous character the festival seems always to have retained. The author of a tract in the Talmud lays it down as a rule that at the feast of Purim every Jew is bound to drink until he cannot distinguish between the words “Cursed be Haman” and “Blessed be Mordecai”; and he tells how on one occasion a certain Rabba drank so deep at Purim that he murdered a rabbi without knowing what he was about. Indeed Purim has been described as the Jewish Bacchanalia, and we are told that at this season everything is lawful which can contribute to the mirth and gaiety of the festival. Writers of the seventeenth century assert that during the two days, and especially on the evening of the second day, the Jews did nothing but feast and drink to repletion, play, dance, sing, and make merry; in particular they disguised themselves, men and women

exchanging clothes, and thus attired ran about like mad, in open defiance of the Mosaic law, which expressly forbids men to dress as women and women as men. Among the Jews of Frankfort, who inhabited the squalid but quaint and picturesque old street known as the Judengasse, which many of us still remember, the revelry at Purim ran as high as ever in the eighteenth century. The gluttony and intoxication began punctually at three o'clock in the afternoon of the first day and went on until the whole community seemed to have taken leave of their senses. They ate and drank, they frolicked and cut capers, they reeled and staggered about, they shrieked, yelled, stamped, clattered, and broke each other's heads with wooden hammers till the blood flowed. On the evening of the first day the women were allowed, as a special favour, to open their latticed window and look into the men's synagogue, because the great deliverance of the Jews from their enemies in the time of King Ahasuerus was said to have been effected by a woman. A feature of the festival which should not be overlooked was the acting of the story of Esther as a comedy, in which Esther, Ahasuerus, Haman, Mordecai, and others played their parts after a fashion that sometimes degenerated from farce into ribaldry. Thus on the whole we may take it that Purim has always been a Saturnalia, and therefore corresponds in character to the Sacaea as that festival has been described for us by Strabo.

But further, when we examine the narrative which professes to account for the institution of Purim, we discover in it not only the strongest traces of Babylonian origin, but also certain singular analogies to those very features of the Sacaeian festival with which we are here more immediately concerned. The book of Esther turns upon the fortunes of two men, the vizier Haman and the despised Jew Mordecai, at the court of a Persian king. Mordecai, we are told, had given mortal offence to the vizier, who accordingly prepares a tall gallows on which he hopes to see his enemy hanged, while he himself expects to receive the highest mark of the king's favour by being allowed to wear the royal crown and the royal robes, and thus attired to parade the streets mounted on the king's own horse and attended by one of the noblest princes, who should proclaim to the multitude his temporary exaltation and glory. But the artful intrigues of the wicked vizier miscarried and resulted in precisely the opposite of what he had hoped and expected; for the royal honours which he had looked for fell to his rival Mordecai, and he himself was hanged on the gallows which he had made ready for his foe. In this story we seem to detect a reminiscence, more or less confused, of the Zoganes of the Sacaea, in other words, of the custom of investing a private man with the insignia of royalty for a few days and then putting him to death on the gallows or the cross. It is true that in the narrative the part of the Zoganes is divided between two actors, one of whom hopes to play the king but is hanged instead, while the other acts the royal part and escapes the gallows to which he was destined by his enemy. But this bisection, so to say, of the Zoganes may have been deliberately invented by the Jewish author of the book of Esther for the sake of setting the origin of Purim, which it was his purpose to explain, in a light that should reflect glory on his own nation. Or, perhaps more probably, it points back to a custom of appointing two mock kings at the Sacaea, one of whom was put to death at the end of the festival, while the other was allowed to go free, at least for a time. We shall be the more inclined to adopt the latter hypothesis when we observe that corresponding to the two rival aspirants to the temporary kingship there appear in the Jewish narrative two rival queens, Vashti and Esther, one of whom succeeds to the high estate from which the other has fallen. Further, it is to be noted that Mordecai, the successful candidate for the mock kingship, and Esther, the successful candidate for the queenship, are linked together by close ties both of interest and blood, the two being said to be cousins. This suggests that in the original story or the original custom there may have figured two pairs of kings and queens, of whom one pair is represented in the Jewish narrative by Mordecai and Esther and the other by Haman and Vashti.

Some confirmation of this view is furnished by the names of two at least out of the four personages. It seems to be now generally recognized by Biblical scholars that the name Mordecai, which has no meaning in Hebrew, is nothing but a slightly altered form of Marduk or Merodach, the name of the chief god of Babylon, whose great festival was the Zakmuk; and further, it is generally admitted that Esther in like manner is equivalent to Ishtar, the great Babylonian goddess whom the Greeks called Astarte, and who is more familiar to English readers as Ashtaroath. The derivation of the names of Haman and Vashti is less certain, but some high authorities are disposed to accept the view of Jensen that Haman is identical with Humman or Homman, the national god of the Elamites, and that Vashti is in like manner an Elamite goddess whose name Jensen read as Mashti in inscriptions. Now, when we consider that the Elamites were from time immemorial the hereditary foes of the Babylonians and had their capital at Susa, the very place in which the scene of the book of Esther is laid, we can hardly deny the plausibility of the theory that Haman and Vashti on the one side and Mordecai and Esther on the other represent the antagonism between the gods of Elam and the gods of Babylon, and the final victory of the Babylonian deities in the very capital of their rivals. "It is therefore possible," says Professor Nöldeke, "that we here have to do with a feast whereby the Babylonians commemorated a victory gained by their gods over the gods of their neighbours the Elamites, against whom they had so often waged war. The Jewish feast of Purim is an annual merrymaking of a wholly secular kind, and it is known that there were similar feasts among the Babylonians. That the Jews in Babylonia should have adopted a festival of this sort cannot be deemed improbable, since in modern Germany, to cite an analogous case, many Jews celebrate Christmas after the manner of their Christian fellow-countrymen, in so far at least as it is a secular institution. It is true that hitherto no Babylonian feast coinciding, like Purim, with the full moon of the twelfth month has been discovered; but our knowledge of the Babylonian feasts is derived from documents of an earlier period. Possibly the calendar may have undergone some change by the time when the Jewish feast of Purim was established. Or it may be that the Jews intentionally shifted the date of the festival which they borrowed from the heathen."

However, the theory of an opposition between the gods of Babylon and the gods of Elam at the festival appears to break down at a crucial point; for the latest and most accurate reading of the Elamite inscriptions proves, I am informed, that the name of the goddess which Jensen read as Mashti, and which on that assumption he legitimately compared to the Hebrew Vashti, must really be read as Parti, between which and Vashti there is no connexion. Accordingly, in a discussion of the origin of Purim it is safer at present to lay no weight on the supposed religious antagonism between the deities of Babylon and Elam.

If we are right in tracing the origin of Purim to the Babylonian Sacaea and in finding the counterpart of the Zoganes in Haman and Mordecai, it would appear that the Zoganes during his five days of office personated not merely a king but a god, whether that god was the Babylonian Marduk or some other deity not yet identified. The union of the divine and royal characters in a single person is so common that we need not be surprised at meeting with it in ancient Babylon. And the view that the mock king of the Sacaea died as a god on the cross or the gallows is no novelty. The acute and learned Movers long ago observed that "we should be overlooking the religious significance of oriental festivals and the connexion of the Sacaea with the worship of Anaitis, if we were to treat as a mere jest the custom of disguising a slave as a king. We may take it for certain that with the royal dignity the king of the Sacaea assumed also the character of an oriental ruler as representative of the divinity, and that when he took his pleasure among the women of the king's harem, he played the part of Sandan or Sardanapalus himself. For according to ancient oriental ideas the use of the king's concubines constituted a claim to the throne, and we know from Dio that the five-days' king received full

power over the harem. Perhaps he began his reign by publicly cohabiting with the king's concubines, just as Absalom went in to his father's concubines in a tent spread on the roof of the palace before all Israel, for the purpose of thereby making known and strengthening his claim to the throne.”

Whatever may be thought of this latter conjecture, there can be no doubt that Movers is right in laying great stress both on the permission given to the mock king to invade the real king's harem, and on the intimate connexion of the Sacaea with the worship of Anaitis. That connexion is vouched for by Strabo, and when we consider that in Strabo's time the cult of the old Persian goddess Anaitis was thoroughly saturated with Babylonian elements and had practically merged in the sensual worship of the Babylonian Ishtar or Astarte, we shall incline to view with favour Movers's further conjecture, that a female slave may have been appointed to play the divine queen to the part of the divine king supported by the Zoganes, and that reminiscences of such a queen have survived in the myth or legend of Semiramis. According to tradition, Semiramis was a fair courtesan beloved by the king of Assyria, who took her to wife. She won the king's heart so far that she persuaded him to yield up to her the kingdom for five days, and having assumed the sceptre and the royal robes she made a great banquet on the first day, but on the second day she shut up her husband in prison or put him to death and thenceforward reigned alone. Taken with Strabo's evidence as to the association of the Sacaea with the worship of Anaitis, this tradition seems clearly to point to a custom of giving the Zoganes, during his five days' reign, a queen who represented the goddess Anaitis or Semiramis or Astarte, in short the great Asiatic goddess of love and fertility, by whatever name she was called. For that in Eastern legend Semiramis was a real queen of Assyria, who had absorbed many of the attributes of the goddess Astarte, appears to be established by the researches of modern scholars; in particular it has been shewn by Robertson Smith that the worship of Anaitis is not only modelled on Astarte worship in general, but corresponds to that particular type of it which was specially associated with the name of Semiramis. The identity of Anaitis and the mythical Semiramis is clearly proved by the circumstance that the great sanctuary of Anaitis at Zela in Pontus was actually built upon a mound of Semiramis; probably the old worship of the Semitic goddess always continued there even after her Semitic name of Semiramis or Astarte had been exchanged for the Persian name of Anaitis, perhaps in obedience to a decree of the Persian king Artaxerxes II., who first spread the worship of Anaitis in the west of Asia. It is highly significant, not only that the Sacaeen festival was annually held at this ancient seat of the worship of Semiramis or Astarte; but further, that the whole city of Zela was formerly inhabited by sacred slaves and harlots, ruled over by a supreme pontiff, who administered it as a sanctuary rather than as a city. Formerly, we may suppose, this priestly king himself died a violent death at the Sacaea in the character of the divine lover of Semiramis, while the part of the goddess was played by one of the sacred prostitutes. The probability of this is greatly strengthened by the existence of the so-called mound of Semiramis under the sanctuary. For the mounds of Semiramis, which were pointed out all over Western Asia, were said to have been the graves of her lovers whom she buried alive. The tradition ran that the great and lustful queen Semiramis, fearing to contract a lawful marriage lest her husband should deprive her of power, admitted to her bed the handsomest of her soldiers, only, however, to destroy them all afterwards. Now this tradition is one of the surest indications of the identity of the mythical Semiramis with the Babylonian goddess Ishtar or Astarte. For the famous Babylonian epic which recounts the deeds of the hero Gilgamesh tells how, when he clothed himself in royal robes and put his crown on his head, the goddess Ishtar was smitten with love of him and wooed him to be her mate. But Gilgamesh rejected her insidious advances, for he knew the sad fate that had overtaken all her lovers, and he reproached the cruel goddess, saying:—

*“Tammuz, the lover of thy youth,
 Thou causest to weep every year.
 The bright-coloured allallu bird thou didst love.
 Thou didst crush him and break his pinions.
 In the woods he stands and laments, ‘O my pinions!’
 Thou didst love the lion of perfect strength,
 Seven and seven times thou didst dig pit-falls for him.
 Thou didst love the horse that joyed in the fray,
 With whip and spur and lash thou didst urge him on.
 Thou didst force him on for seven double hours,
 Thou didst force him on when wearied and thirsty;
 His mother the goddess Silili thou madest weep.
 Thou didst also love a shepherd of the flock,
 Who continually poured out for thee the libation,
 And daily slaughtered kids for thee;
 But thou didst smite him, and didst change him into a wolf,
 So that his own sheep-boys hunted him,
 And his own hounds tore him to pieces.”*

The hero also tells the miserable end of a gardener in the service of the goddess's father. The hapless swain had once been honoured with the love of the goddess, but when she tired of him she changed him into a cripple so that he could not rise from his bed. Therefore Gilgamesh fears to share the fate of all her former lovers and spurns her proffered favours. But it is not merely that the myth of Ishtar thus tallies with the legend of Semiramis; the worship of the goddess was marked by a profligacy which has found its echo in the loose character ascribed by tradition to the queen. Inscriptions, which confirm and supplement the evidence of Herodotus, inform us that Ishtar was served by harlots of three different classes all dedicated to her worship. Indeed, there is reason to think that these women personated the goddess herself, since one of the names given to them is applied also to her.

Thus we can hardly doubt that the mythical Semiramis is substantially a form of Ishtar or Astarte, the great Semitic goddess of love and fertility; and if this is so, we may assume with at least a fair degree of probability that the high pontiff of Zela or his deputy, who played the king of the Sacaea at the sanctuary of Semiramis, perished as one of the unhappy lovers of the goddess, perhaps as Tammuz, whom she caused “to weep every year.” When he had run his brief meteoric career of pleasure and glory, his bones would be laid in the great mound which covered the mouldering remains of many mortal gods, his predecessors, whom the goddess had honoured with her fatal love.

Here then at the great sanctuary of the goddess in Zela it appears that her myth was regularly translated into action; the story of her love and the death of her divine lover was performed year by year as a sort of mystery-play by men and women who lived for a season and sometimes died in the character of the visionary beings whom they personated. The intention of these sacred dramas, we may be sure, was neither to amuse nor to instruct an idle audience, and as little were they designed to gratify the actors, to whose baser passions they gave the reins for a time. They were solemn rites which mimicked the doings of divine beings, because man fancied that by such mimicry he was able to arrogate to himself the divine functions and to exercise them for the good of his fellows. The operations of nature, to his thinking, were carried on by mythical personages very like himself; and if he could only assimilate himself to them completely he would be able to wield all their powers. This is probably the original motive of most religious dramas or mysteries among rude peoples. The dramas are played, the mysteries are performed, not to teach the spectators the doctrines of

their creed, still less to entertain them, but for the purpose of bringing about those natural effects which they represent in mythical disguise; in a word, they are magical ceremonies and their mode of operation is mimicry or sympathy. We shall probably not err in assuming that many myths, which we now know only as myths, had once their counterpart in magic; in other words, that they used to be acted as a means of producing in fact the events which they describe in figurative language. Ceremonies often die out while myths survive, and thus we are left to infer the dead ceremony from the living myth. If myths are, in a sense, the reflections or shadows of men cast upon the clouds, we may say that these reflections continue to be visible in the sky and to inform us of the doings of the men who cast them, long after the men themselves are not only beyond our range of vision but sunk beneath the horizon.

The principle of mimicry is implanted so deep in human nature and has exerted so far-reaching an influence on the development of religion as well as of the arts that it may be well, even at the cost of a short digression, to illustrate by example some of the modes in which primitive man has attempted to apply it to the satisfaction of his wants by means of religious or magical dramas. For it seems probable that the masked dances and ceremonies, which have played a great part in the social life of savages in many quarters of the world, were primarily designed to subserve practical purposes rather than simply to stir the emotions of the spectators and to while away the languor and tedium of idle hours. The actors sought to draw down blessings on the community by mimicking certain powerful superhuman beings and in their assumed character working those beneficent miracles which in the capacity of mere men they would have confessed themselves powerless to effect. In fact the aim of these elementary dramas, which contain in germ the tragedy and comedy of civilized nations, was the acquisition of superhuman power for the public good. That this is the real intention of at least many of these dramatic performances will appear from the following accounts, which for the sake of accuracy I will quote for the most part in the words of the original observers.

A conspicuous feature in the social life of the Indian tribes of North-Western America are the elaborate masked dances or pantomimes in which the actors personate spirits or legendary animals. Most of them appear designed to bring before the eyes of the people the guardian spirits of the clans. "Owing to the fact that these spirits are hereditary, their gifts are always contained in the legend detailing their acquisition by the ancestor of a clan. The principal gifts in these tales are the magic harpoon which insures success in sea-otter hunting; the death bringer which, when pointed against enemies, kills them; the water of life which resuscitates the dead; the burning fire which, when pointed against an object, burns it; and a dance, a song, and cries which are peculiar to the spirit. The gift of this dance means that the protégé of the spirit is to perform the same dances which have been shown to him. In these dances he personates the spirit. He wears his mask and his ornaments. Thus the dance must be considered a dramatic performance of the myth relating to the acquisition of the spirit, and shows to the people that the performer by his visit to the spirit has obtained his powers and desires. When nowadays a spirit appears to a young Indian, he gives him the same dance, and the youth also returns from the initiation filled with the powers and desires of the spirit. He authenticates his initiation by his dance in the same way as his mythical ancestor did. The obtaining of the magical gifts from these spirits is called *lokoala*, while the person who has obtained them becomes *naualaku*, supernatural, which is also the quality of the spirit himself. The ornaments of all these spirits are described as made of cedar bark, which is dyed red in the juice of alder bark. They appear to their devotees only in winter, and therefore the dances are also performed only in winter." In some of the dances the performers imitate animals, and the explanation which the Indians give of these dances is that "the ceremonial was instituted at the time when men had still the form of animals; before the transformer had put everything

into its present shape. The present ceremonial is a repetition of the ceremonial performed by the man animals or, as we may say, a dramatization of the myth. Therefore the people who do not represent spirits, represent these animals.”

Another observer of these Indians writes on the same subject as follows: “The *dukwally* (*i.e.*, *lokoala*) and other *tamanawas* performances are exhibitions intended to represent incidents connected with their mythological legends. There are a great variety, and they seem to take the place, in a measure, of theatrical performances or games during the season of the religious festivals. There are no persons especially set apart as priests for the performance of these ceremonies, although some, who seem more expert than others, are usually hired to give life to the scenes, but these performers are quite as often found among the slaves or common people as among the chiefs, and excepting during the continuance of the festivities are not looked on as of any particular importance. On inquiring the origin of these ceremonies, I was informed that they did not originate with the Indians, but were revelations of the guardian spirits, who made known what they wished to be performed. An Indian, for instance, who has been consulting with his guardian spirit, which is done by going through the washing and fasting process before described, will imagine or think he is called upon to represent the owl. He arranges in his mind the style of dress, the number of performers, the songs and dances or other movements, and, having the plan perfected, announces at a *tamanawas* meeting that he has had a revelation which he will impart to a select few. These are then taught and drilled in strict secrecy, and when they have perfected themselves, will suddenly make their appearance and perform before the astonished tribe. Another Indian gets up the representation of the whale, others do the same of birds, and in fact of everything that they can think of. If any performance is a success, it is repeated, and gradually comes to be looked upon as one of the regular order in the ceremonies; if it does not satisfy the audience, it is laid aside. Thus they have performances that have been handed down from remote ages, while others are of a more recent date.”

Another writer, who travelled among the Indians of North-Western America, has expressed himself on this subject as follows: “The task of representing the gods is undertaken in every tribe by some intelligent and, according to their own account, inspired men; they form the Secret Societies, in order that their secret arts and doctrines, their mummeries and masquerades may not be revealed to the uninitiated and to the public. The intention of these exhibitions is to confirm the faith of the young people and the women in the ancient traditions as to the intercourse of the gods with men and as to their own intimate relations to the gods. In order to convince possible doubters, the members of the Secret Societies have had recourse to all kinds of mysterious means, which to a civilized man must appear the height of savagery; for example, they mutilate their bodies, rend corpses in pieces and devour them, tear pieces out of the bodies of living men, and so on. Further, the almost morbid vanity of the North-Western Indians and their desire to win fame, respect, and distinction may have served as a motive for joining the Secret Societies; since every member of them enjoys great respect.

“There were and still are hundreds of masks in use, every one of which represents a spirit who occurs in their legends. In the exhibitions they appear singly or in groups, according as the legend to be represented requires, and the masked men are then looked upon by the astonished crowd, not only as actors representing the gods, but as the very gods themselves who have come down from heaven to earth. Hence every such representative must do exactly what legend says the spirit did. If the representative wears no mask, as often happens with the *Hametzes* (the Cannibals or Biters) or the *Pakwalla* (Medicine-men), then the spirit whom he represents has passed into his body, and accordingly the man possessed by the spirit is not responsible for what he does amiss in this condition. As the use of masks throws a sort of

mysterious glamour over the performance and at the same time allows the actor to remain unknown, the peculiarly sacred festivals are much oftener celebrated with masks than without them. In every Secret Society there are definite rules as to how often and how long a mask may be used. Amongst the Kwakiutl the masks may not, under the heaviest penalties, be disposed of for four winters, the season when such festivals are usually celebrated. After that time they may be destroyed or hidden in the forest, that no uninitiated person may find them, or they may be finally sold. The masks are made only in secret, generally in the deep solitude of the woods, in order that no uninitiated person may detect the maker at work....

“The dance is accompanied by a song which celebrates in boastful words the power of the gods and the mighty deeds represented in the performance. At the main part of the performance all present join in the song, for it is generally known to everybody and is repeated in recitative again and again. It seems that new songs and new performances are constantly springing up in one or other of the villages through the agency of some intelligent young man, hitherto without a song of his own, who treats in a poetical fashion some legend which has been handed down orally from their forefathers. For every man who takes part in the performances and festivals must make his *début* with a song composed by himself. In this way new songs and dances are constantly originating, the material for them being, of course, always taken from the tribal deities of the particular singer and poet.”

Similar masquerades are in vogue among the neighbours of these Indians, the Esquimaux of Bering Strait, and from the following account it will appear that the performances are based on similar ideas and beliefs. “Shamans make masks representing grotesque faces of supernatural beings which they claim to have seen. These may be *yu-ā*, which are the spirits of the elements, of places, and of inanimate things in general; the *tunghät*, or wandering genii, or the shades of people and animals. The first-named are seen in lonely places, on the plains and mountains or at sea, and more rarely about the villages, by the clairvoyant vision of the shamans. They are usually invisible to common eyes, but sometimes render themselves visible to the people for various purposes.

“Many of them, especially among the *tunghät*, are of evil character, bringing sickness and misfortune upon people from mere wantonness or for some fancied injury. The Eskimo believe that everything, animate or inanimate, is possessed of a shade, having semihuman form and features, enjoying more or less freedom of motion; the shamans give form to their ideas of them in masks, as well as of others which they claim inhabit the moon and the sky-land. In their daily life, if the people witness some strange occurrence, are curiously affected, or have a remarkable adventure, during which they seem to be influenced or aided in a supernatural manner, the shamans interpret the meaning and describe the appearance of the being that exerted its power.

“Curious mythological beasts are also said to inhabit both land and sea, but to become visible only on special occasions. These ideas furnish material upon which their fancy works, conjuring up strange forms that are usually modifications of known creatures. It is also believed that in early days all animate beings had a dual existence, becoming at will either like man or the animal forms they now wear. In those early days there were but few people; if an animal wished to assume its human form, the forearm, wing, or other limb was raised and pushed up the muzzle or beak as if it were a mask, and the creature became manlike in form and features. This idea is still held, and it is believed that many animals now possess this power. The manlike form thus appearing is called the *inua*, and is supposed to represent the thinking part of the creature, and at death becomes its shade. Shamans are believed to have the power of seeing through the animal mask to the manlike features behind. The ideas held

on this subject are well illustrated in the Raven legends, where the changes are made repeatedly from one form to another.

“Masks may also represent totemic animals, and the wearers during the festivals are believed actually to become the creature represented or at least to be endowed with its spiritual essence. Some of the masks of the lower Yukon and the adjacent territory to the Kuskokwim are made with double faces. This is done by having the muzzle of the animal fitted over and concealing the face of the *inua* below, the outer mask being held in place by pegs so arranged that it can be removed quickly at a certain time in the ceremony, thus symbolizing the transformation. Another style of mask from the lower Kuskokwim has the under face concealed by a small hinged door on each side, which opens out at the proper time in a ceremony, indicating the metamorphosis. When the mask represents a totemic animal, the wearer needs no double face, since he represents in person the shade of the totemic animal.

“When worn in any ceremonial, either as a totem mask or as representing the shade, *yu-ă* or *tunghâk*, the wearer is believed to become mysteriously and unconsciously imbued with the spirit of the being which his mask represents, just as the namesakes are entered into and possessed by the shades at certain parts of the Festival to the Dead...

“Mask festivals are usually held as a species of thanksgiving to the shades and powers of earth, air, and water for giving the hunter success. The *inuas* or shades of the powers and creatures of the earth are represented that they may be propitiated, thus insuring further success.”

The religious ritual of the Cora Indians of Mexico comprises elaborate dramatic ceremonies or dances, in which the actors or dancers identify themselves with the gods, such as the god of the Morning Star, the goddess of the Moon, and the divinities of the Rain. These dances form the principal part of the Cora festivals and are accompanied by liturgical songs, the words of which the Indians believe to have been revealed to their forefathers by the gods and to exercise a direct magical influence upon the deities themselves and through them upon nature. The Kobeua and Kaua Indians of North-Western Brazil perform masked dances at their festivals in honour of the dead. The maskers imitate the actions and the habits of birds, beasts, and insects. For example, there is a large azure-blue butterfly which delights the eye with the splendour of its colour, like a fallen fragment of the sky; and in the butterfly dance two men represent the play of these brilliant insects in the sunshine, fluttering on the wing and settling on sandbanks and rocks. Again, the sloth is acted by a masker who holds on to a cross-beam of the house by means of a hooked stick, in imitation of the sluggish creature which will hang by its claws from the bough of a tree for hours together without stirring. Again, the darting of swallows, as they flit to and fro across a river, is mimicked by masked men dancing side by side: the swarming of sandflies in the air is acted by a swarm of maskers; and so with the movements of the black vulture, the owl, the jaguar, the *aracu* fish, the house-spider, and the dung-beetle. Yet these representations are not simple dramas designed to amuse and divert the mourners in their hour of sorrow; the Indian attributes to them a much deeper significance, for under the outer husk of beasts and birds and insects he believes that there lurk foul fiends and powerful spirits. “All these mimicries are based on an idea of magical efficiency. They are intended to bring blessing and fertility to the village and its inhabitants, to the plantations, and to the whole of surrounding nature, thereby compensating, as it were, for the loss of the dead man in whose honour the festival is held. By copying as faithfully as possible the movements and actions of the being whom he personates, the actor identifies himself with him. The mysterious force which resides in the mask passes into the dancer, turns the man himself into a mighty demon, and endows him with the power of banishing demons or earning their favour. Especially is it the intention by

means of mimicry to obtain for man control over the demons of growth and the spirits of game and fish.” When the festival is over, the masks are burned, and the demons, which are thought to have animated them, take flight to their own place, it may be to the other world or to a mountain top, or to the side of a thundering cascade.

The Monumbo of German New Guinea perform masked dances in which the dancers personate supernatural beings or animals, such as kangaroos, dogs, and cassowaries. They consecrate the masks by fumigating them with the smoke of a certain creeper, and believe that by doing so they put life into them. Accordingly they afterwards treat the masks with respect, talk to them as if they were alive, and refuse to part with them to Europeans. Certain of the masks they even regard as guardian spirits and appeal to them for fine weather, help in the chase or in war, and so forth. Every clan owns some masks and the head man of the clan makes all the arrangements for a masquerade. The dances are accompanied by songs of which the words are unintelligible even to the natives themselves. Again, the Kayans of Central Borneo perform masked dances for the purpose of ensuring abundant crops of rice. The actors personate demons, wearing grotesque masks on their faces, their bodies swathed in cumbrous masses of green leaves. “In accordance with their belief that the spirits are more powerful than men, the Kayans assume that when they imitate the form of spirits and play their part, they acquire superhuman power. Hence just as their spirits can fetch back the souls of men, so they imagine that they can lure to themselves the souls of the rice.”

When the Sea Dyaks of Borneo have taken a human head, they hold a Head-feast (*Gawè Pala*) in honour of the war-god or bird-chief Singalang Burong, who lives far away above the sky. At this festival a long liturgy called *mengap* is chanted, the god is invoked, and is believed to be present in the person of an actor, who poses as the deity and blesses the people in his name. “But the invocation is not made by the human performer in the manner of a prayer direct to this great being; it takes the form of a story, setting forth how the mythical hero Kling or Klieng made a head-feast and fetched Singalang Burong to it. This Kling, about whom there are many fables, is a spirit, and is supposed to live somewhere or other not far from mankind, and to be able to confer benefits upon them. The Dyak performer or performers then, as they walk up and down the long verandah of the house singing the *mengap*, in reality describe Kling's *Gawè Pala* [head-feast], and how Singalang Burong was invited and came. In thought the Dyaks identify themselves with Kling, and the resultant signification is that the recitation of this story is an invocation to Singalang Burong, who is supposed to come not to Kling's house only, but to the actual Dyak house where the feast is celebrated; and he is received by a particular ceremony, and is offered food or sacrifice.” At the close of the ceremony “the performer goes along the house, beginning with the head man, touches each person in it, and pronounces an invocation upon him. In this he is supposed to personate Singalang Burong and his sons-in-law, who are believed to be the real actors. Singalang Burong himself *nenjangs* the headmen, and his sons-in-law, the birds, bless the rest. The touch of the human performer, and the accompanying invocation are thought to effect a communication between these bird-spirits from the skies and each individual being. The great bird-chief and his dependants come from above to give men their charms and their blessings. Upon the men the performer invokes physical strength and bravery in war; and upon the women luck with paddy, cleverness in Dyak feminine accomplishments, and beauty in form and complexion.”

Thus the dramatic performances of these primitive peoples are in fact religious or oftener perhaps magical ceremonies, and the songs or recitations which accompany them are spells or incantations, though the real character of both is apt to be overlooked by civilized man, accustomed as he is to see in the drama nothing more than an agreeable pastime or at best a vehicle of moral instruction. Yet if we could trace the drama of the civilized nations back to

its origin, we might find that it had its roots in magical or religious ideas like those which still mould and direct the masked dances of many savages. Certainly the Athenians in the heyday of their brilliant civilization retained a lively sense of the religious import of dramatic performances; for they associated them directly with the worship of Dionysus and allowed them to be enacted only during the festivals of the god. In India, also, the drama appears to have been developed out of religious dances or pantomimes, in which the actors recited the deeds and played the parts of national gods and heroes. Hence it is at least a legitimate hypothesis that the criminal, who masqueraded as a king and perished in that character at the Bacchanalian festival of the Sacaëa, was only one of a company of actors, who figured on that occasion in a sacred drama of which the substance has been preserved to us in the book of Esther.

When once we perceive that the gods and goddesses, the heroes and heroines of mythology have been represented officially, so to say, by a long succession of living men and women who bore the names and were supposed to exercise the functions of these fabulous creatures, we have attained a point of vantage from which it seems possible to propose terms of peace between two rival schools of mythologists who have been waging fierce war on each other for ages. On the one hand it has been argued that mythical beings are nothing but personifications of natural objects and natural processes; on the other hand, it has been maintained that they are nothing but notable men and women who in their lifetime, for one reason or another, made a great impression on their fellows, but whose doings have been distorted and exaggerated by a false and credulous tradition. These two views, it is now easy to see, are not so mutually exclusive as their supporters have imagined. The personages about whom all the marvels of mythology have been told may have been real human beings, as the Euhemerists allege; and yet they may have been at the same time personifications of natural objects or processes, as the adversaries of Euhemerism assert. The doctrine of incarnation supplies the missing link that was needed to unite the two seemingly inconsistent theories. If the powers of nature or a certain department of nature be conceived as personified in a deity, and that deity can become incarnate in a man or woman, it is obvious that the incarnate deity is at the same time a real human being and a personification of nature. To take the instance with which we are here concerned, Semiramis may have been the great Semitic goddess of love, Ishtar or Astarte, and yet she may be supposed to have been incarnate in a woman or even in a series of real women, whether queens or harlots, whose memory survives in ancient history. Saturn, again, may have been the god of sowing and planting, and yet may have been represented on earth by a succession or dynasty of sacred kings, whose gay but short lives may have contributed to build up the legend of the Golden Age. The longer the series of such human divinities, the greater, obviously, the chance of their myth or legend surviving; and when moreover a deity of a uniform type was represented, whether under the same name or not, over a great extent of country by many local dynasties of divine men or women, it is clear that the stories about him would tend still further to persist and be stereotyped.

The conclusions which we have reached in regard to the legend of Semiramis and her lovers probably holds good of all the similar tales that were current in antiquity throughout the East; in particular, it may be assumed to apply to the myths of Aphrodite and Adonis in Syria, of Cybele and Attis in Phrygia, and of Isis and Osiris in Egypt. If we could trace these stories back to their origin, we might find that in every case a human couple acted year by year the parts of the loving goddess and the dying god. We know that down to Roman times Attis was personated by priests who bore his name; and if within the period of which we have knowledge the dead Attis and the dead Adonis were represented only by effigies, we may surmise that it had not always been so, and that in both cases the dead god was once represented by a dead man. Further, the license accorded to the man who played the dying

god at the Sacaea speaks strongly in favour of the hypothesis that before the incarnate deity was put to a public death he was in all cases allowed, or rather required, to enjoy the embraces of a woman who played the goddess of love. The reason for such an enforced union of the human god and goddess is not hard to divine. If primitive man believes that the growth of the crops can be stimulated by the intercourse of common men and women, what showers of blessings will he not anticipate from the commerce of a pair whom his fancy invests with all the dignity and powers of deities of fertility?

Thus the theory of Movers, that at the Sacaea the Zoganes represented a god and paired with a woman who personated a goddess, turns out to rest on deeper and wider foundations than that able scholar was aware of. He thought that the divine couple who figured by deputy at the ceremony were Semiramis and Sandan or Sardanapalus. It now appears that he was substantially right as to the goddess; but we have still to enquire into the god. There seems to be no doubt that the name Sardanapalus is only the Greek way of representing Ashurbanapal, the name of the greatest and nearly the last king of Assyria. But the records of the real monarch which have come to light within recent years give little support to the fables that attached to his name in classical tradition. For they prove that, far from being the effeminate weakling he seemed to the Greeks of a later age, he was a warlike and enlightened monarch, who carried the arms of Assyria to distant lands and fostered at home the growth of science and letters. Still, though the historical reality of King Ashurbanapal is as well attested as that of Alexander or Charlemagne, it would be no wonder if myths gathered, like clouds, round the great figure that loomed large in the stormy sunset of Assyrian glory. Now the two features that stand out most prominently in the legends of Sardanapalus are his extravagant debauchery and his violent death in the flames of a great pyre, on which he burned himself and his concubines to save them from falling into the hands of his victorious enemies. It is said that the womanish king, with painted face and arrayed in female attire, passed his days in the seclusion of the harem, spinning purple wool among his concubines and wallowing in sensual delights; and that in the epitaph which he caused to be carved on his tomb he recorded that all the days of his life he ate and drank and toyed, remembering that life is short and full of trouble, that fortune is uncertain, and that others would soon enjoy the good things which he must leave behind. These traits bear little resemblance to the portrait of Ashurbanapal either in life or in death; for after a brilliant career of conquest the Assyrian king died in old age, at the height of human ambition, with peace at home and triumph abroad, the admiration of his subjects and the terror of his foes. But if the traditional characteristics of Sardanapalus harmonize but ill with what we know of the real monarch of that name, they fit well enough with all that we know or can conjecture of the mock kings who led a short life and a merry during the revelry of the Sacaea, the Asiatic equivalent of the Saturnalia. We can hardly doubt that for the most part such men, with death staring them in the face at the end of a few days, sought to drown care and deaden fear by plunging madly into all the fleeting joys that still offered themselves under the sun. When their brief pleasures and sharp sufferings were over, and their bones or ashes mingled with the dust, what more natural that on their tomb—those mounds in which the people saw, not untruly, the graves of the lovers of Semiramis—there should be carved some such lines as those which tradition placed in the mouth of the great Assyrian king, to remind the heedless passer-by of the shortness and vanity of life?

When we turn to Sandan, the other legendary or mythical being whom Movers thought that the Zoganes may have personated, we find the arguments in support of his theory still stronger. The city of Tarsus in Cilicia is said to have been founded by a certain Sandan whom the Greeks identified with Hercules; and at the festival of this god or hero an effigy of him was burned on a great pyre. This Sandan is doubtless the same with the Sandes whom

Agathias calls the old Persian Hercules. Professing to give a list of the gods whom the Persians worshipped before the days of Zoroaster, the Byzantine historian mentions Bel, Sandes, and Anaitis, whom he identifies with Zeus, Hercules, and Aphrodite respectively. As we know that Bel was a Babylonian, not a Persian deity, and that in later times Anaitis was practically equivalent to the Babylonian Ishtar or Astarte, a strong presumption is raised that Sandes also was a Babylonian or at all events Semitic deity, and that in speaking of him as Persian the historian confused the ancient Persians with the Babylonians and perhaps other stocks of Western Asia. The presumption is strengthened when we find that in Lydia the surname of Sandon, doubtless equivalent to Sandan, is said to have been borne by Hercules because he wore a woman's garment called a *sandyx*, fine and diaphanous as gossamer, at the bidding of Queen Omphale, whom the hero served for three years in the guise of a female slave, clad in purple, humbly carding wool and submitting to be slapped by the saucy queen with her golden slipper. The familiar legend that Hercules burned himself alive on a great pyre completes the parallel between the effeminate Hercules Sandon of Lydia and the Assyrian Sardanapalus. So exact a parallel must surely rest on a common base of custom as well as of myth. That base, according to the conjecture of the admirable scholar K. O. Müller, may have been a custom of dressing up an effigy of an effeminate Asiatic deity in the semblance of a reveller, and then publicly burning it on a pyre. Such a custom appears to have prevailed not only at Tarsus in Cilicia, but also in Lydia; for a coin of the Lydian Philadelphia, a city which lay not far from the old royal capital Sardes, exhibits a device like that on coins of Tarsus, consisting of a figure stretched on a pyre. "We may suppose," says Müller, "that in the old Assyrian mythology a certain being called Sandan, or perhaps Sardan, figured beside Baal and Mylitta or Astarte. The character of this mythical personage is one which often meets us in oriental religion—the extreme of voluptuousness and sensuality combined with miraculous force and heroic strength. We may imagine that at the great festivals of Nineveh this Sandan or Sardan was exhibited as a buxom figure with womanish features, the pale face painted with white lead, the eyebrows and eyelashes blackened with kohl, his person loaded with golden chains, rings, and earrings, arrayed in a bright red transparent garment, grasping a goblet in one hand and perhaps, as a symbol of strength, a double axe in the other, while he sat cross-legged and surrounded by women on a splendidly adorned couch under a purple canopy, altogether not unlike the figure of Adonis at the court festivals of Alexandria. Then the people of 'mad Nineveh,' as the poet Phocylides called it, 'the well-favoured harlot,' as the prophet Nahum has it, would rejoice and make merry with this their darling hero. Afterwards there may have been another show, when this gorgeous Sandan or Sardan was to be seen on a huge pyre of precious wood, draped in gold-embroidered tapestry and laden with incense and spices of every sort, which being set on fire, to the howling of a countless multitude and the deafening din of shrill music, sent up a monstrous pillar of fire whirling towards heaven and flooded half Nineveh with smoke and smell."

The distinguished scholar whom I have just quoted does not fail to recognize the part which imagination plays in the picture he has set before us; but he reminds us very properly that in historical enquiries imagination must always supply the cement that binds together the broken fragments of tradition. One thing, he thinks, emerges clearly from the present investigation: the worship and legend of an effeminate hero like Sandan appear to have spread, by means of an early diffusion of the Semitic stock, first to the neighbourhood of Tarsus in Cilicia and afterwards to Sardes in Lydia. In favour of the former prevalence of the rite in Lydia it may be added that the oldest dynasty of Lydian kings traced their descent, not only from the mythical Assyrian hero Ninus, but also from the Greek hero Hercules, whose legendary death in the fire finds at least a curious echo in the story that Croesus, the last king of Lydia, was laid by his Persian conqueror Cyrus on a great pyre of wood, and was only saved at the last

moment from being consumed in the flames. May not this story embody a reminiscence of the manner in which the ancient kings of Lydia, as living embodiments of their god, formerly met their end? It was thus, as we have seen, that the old Prussian rulers used to burn themselves alive in front of the sacred oak; and by an odd coincidence, if it is nothing more, the Greek Hercules directed that the pyre on which he was to be consumed should be made of the wood of the oak and the wild olive. Some grounds have also been shewn for thinking that in certain South African tribes the chiefs may formerly have been burnt alive as a religious or magical ceremony. All these facts and indications tend to support the view of Movers that at the Sacaea also the man who played the god for five days was originally burnt at the end of them. Death by hanging or crucifixion may have been a later mitigation of his sufferings, though it is quite possible that both forms of execution or rather of sacrifice may have been combined by hanging or crucifying the victim first and burning him afterwards, much as our forefathers used to disembowel traitors after suspending them for a few minutes on a gibbet. At Tarsus apparently the custom was still further softened by burning an effigy instead of a man; but on this point the evidence is not explicit. It is worth observing that as late as Lucian's time the principal festival of the year at Hierapolis—the great seat of the worship of Astarte—fell at the beginning of spring and took its name of the Pyre or the Torch from the tall masts which were burnt in the court of the temple with sheep, goats, and other animals hanging from them. Here the season, the fire, and the gallows-tree all fit our hypothesis; only the man-god is wanting.

If the Jewish festival of Purim was, as I have attempted to shew, directly descended either from the Sacaea or from some other Semitic festival, of which the central feature was the sacrifice of a man in the character of a god, we should expect to find traces of human sacrifice lingering about it in one or other of those mitigated forms to which I have just referred. This expectation is fully borne out by the facts. For from an early time it has been customary with the Jews at the feast of Purim to burn or otherwise destroy effigies of Haman. The practice was well known under the Roman empire, for in the year 408 a.d. the emperors Honorius and Theodosius issued a decree commanding the governors of the provinces to take care that the Jews should not burn effigies of Haman on a cross at one of their festivals. We learn from the decree that the custom gave great offence to the Christians, who regarded it as a blasphemous parody of the central mystery of their own religion, little suspecting that it was nothing but a continuation, in a milder form, of a rite that had probably been celebrated in the East long ages before the birth of Christ. Apparently the custom long survived the publication of the edict, for in a form of abjuration which the Greek church imposed on Jewish converts and which seems to date from the tenth century, the renegade is made to speak as follows: "I curse also those who celebrate the festival of the so-called Mordecai on the first Sabbath (Saturday) of the Christian fast, and who nail Haman forsooth to the tree, attaching to it the symbol of the cross and burning him along with it, while they heap all sorts of imprecations and curses on the Christians." A Jewish account of the custom as it was observed in Babylonia and Persia in the tenth century of our era runs as follows: "It is customary in Babylonia and Elam for boys to make an effigy resembling Haman; this they suspend on their roofs, four or five days before Purim. On Purim day they erect a bonfire, and cast the effigy into its midst, while the boys stand round about it jesting and singing. And they have a ring suspended in the midst of the fire, which (ring) they hold and wave from one side of the fire to the other." Again, the Arab historian Albîrûnî, who wrote in the year 1000 a.d., informs us that at Purim the Jews of his time rejoiced greatly over the death of Haman, and that they made figures which they beat and burned, "imitating the burning of Haman." Hence one name for the festival was Hâmân-Sûr. Another Arabic writer, Makrîzî, who died in 1442 a.d., says that at the feast of Purim, which fell on the fifteenth day of the month Adar, some of the Jews used to make effigies of Haman which they first played with

and then threw into the fire. During the Middle Ages the Italian Jews celebrated Purim in a lively fashion which has been compared by their own historians to that of the Carnival. The children used to range themselves in rows opposite each other and pelt one another with nuts, while grown-up people rode on horseback through the streets with pine branches in their hands or blew trumpets and made merry round a puppet representing Haman, which was set on a platform or scaffold and then solemnly burnt on a pyre. In the eighteenth century the Jews of Frankfort used at Purim to make pyramids of thin wax candles, which they set on fire; also they fashioned images of Haman and his wife out of candles and burned them on the reading-desk in the synagogue.

Now, when we consider the close correspondence in character as well as in date between the Jewish Purim and the Christian Carnival, and remember further that the effigy of Carnival, which is now destroyed at this merry season, had probably its prototype in a living man who was put to a violent death in the character of Saturn at the Saturnalia, analogy of itself would suggest that in former times the Jews, like the Babylonians, from whom they appear to have derived their Purim, may at one time have burned, hanged, or crucified a real man in the character of Haman. There are some positive grounds for thinking that this was so. The early church historian Socrates informs us that at Inmestar, a town in Syria, the Jews were wont to observe certain sports among themselves, in the course of which they played many foolish pranks. In the year 416 a.d., being heated with wine, they carried these sports further than usual and began deriding Christians and even Christ himself, and to give the more zest to their mockery they seized a Christian child, bound him to a cross, and hung him up. At first they only laughed and jeered at him, but soon, their passions getting the better of them, they ill-treated the child so that he died under their hands. The thing got noised abroad, and resulted in a serious brawl between the Jews and their Christian neighbours. The authorities then stepped in, and the Jews had to pay dear for the crime they had perpetrated in sport. The Christian historian does not mention, and perhaps did not know, the name of the drunken and jovial festival which ended so tragically; but we can hardly doubt that it was Purim, and that the boy who died on the cross represented Haman. In mediæval and modern times many accusations of ritual murders, as they are called, have been brought against the Jews, and the arguments for and against the charge have been discussed on both sides with a heat which, however natural, has tended rather to inflame the passions of the disputants than to elicit the truth. Into this troubled arena I prefer not to enter; I will only observe that, so far as I have looked into the alleged cases, and these are reported in sufficient detail, the majority of the victims are said to have been children and to have met their fate in spring, often in the week before Easter. This last circumstance points, if there is any truth in the accusations, to a connexion of the human sacrifice with the Passover, which falls in this week, rather than with Purim, which falls a month earlier. Indeed it has often been made a part of the accusation that the blood of the youthful victims was intended to be used at the Passover. If all the charges of ritual murder which have been brought against the Jews in modern times are not, as seems most probable, mere idle calumnies, the baneful fruit of bigotry, ignorance, and malice, the extraordinary tenacity of life exhibited by the lowest forms of superstition in the minds of ignorant people, whether they are Jews or Gentiles, would suffice to account for an occasional recrudescence of primitive barbarity among the most degraded part of the Jewish community. To make the Jews as a nation responsible for outrages which, if they occur at all, are doubtless quite as repugnant to them as they are to every humane mind, would be a monstrous injustice; it would be as fair to charge Christians in general with complicity in the incalculably greater number of massacres and atrocities of every kind that have been perpetrated by Christians in the name of Christianity, not merely on Jews and heathen, but on men and women and children who professed—and died for—the same faith as their torturers and murderers. If deeds of the sort alleged have been really done by Jews—a question on

which I must decline to pronounce an opinion—they would interest the student of custom as isolated instances of reversion to an old and barbarous ritual which once flourished commonly enough among the ancestors both of Jews and Gentiles, but on which, as on a noxious monster, an enlightened humanity has long set its heel. Such customs die hard; it is not the fault of society as a whole if sometimes the reptile has strength enough left to lift its venomous head and sting.

But between the stage when human sacrifice goes on unabashed in the light of common day, and the stage when it has been driven out of sight into dark holes and corners, there intervenes a period during which the custom is slowly dwindling away under the growing light of knowledge and philanthropy. In this middle period many subterfuges are resorted to for the sake of preserving the old ritual in a form which will not offend the new morality. A common and successful device is to consummate the sacrifice on the person of a malefactor, whose death at the altar or elsewhere is little likely to excite pity or indignation, since it partakes of the character of a punishment, and people recognize that if the miscreant had not been dealt with by the priest, it would have been needful in the public interest to hand him over to the executioner. We have seen that in the Rhodian sacrifices to Cronus a condemned criminal was after a time substituted for an innocent victim; and there can be little doubt that at Babylon the criminals, who perished in the character of gods at the Sacaea, enjoyed an honour which, at an earlier period, had been reserved for more respectable persons. It seems therefore by no means impossible that the Jews, in borrowing the Sacaea from Babylon under the new name of Purim, should have borrowed along with it the custom of putting to death a malefactor who, after masquerading as Mordecai in a crown and royal robe, was hanged or crucified in the character of Haman. There are some grounds for thinking that this or something of this sort was done; but a consideration of them had better be deferred till we have cleared up some points which still remain obscure in Purim, and in the account which the Jews give of its origin.

In the first place, then, it deserves to be remarked that the joyous festival of Purim on the fourteenth and fifteenth days of the month Adar is invariably preceded by a fast, known as the fast of Esther, on the thirteenth; indeed, some Jews fast for several days before Purim. In the book of Esther the fast is traditionally explained as a commemoration of the mourning and lamentation excited among the Jews by the decree of King Ahasuerus that they should all be massacred on the thirteenth day of the month Adar; for “in every province, whithersoever the king's commandment and his decree came, there was great mourning among the Jews, and fasting, and weeping, and wailing; and many lay in sackcloth and ashes.” And Esther, before she went into the presence of the king to plead for the lives of her people, “bade them return answer unto Mordecai, Go, gather together all the Jews that are present in Shushan, and fast ye for me, and neither eat nor drink three days, night or day: I also and my maidens will fast in like manner.” Hence fasting and lamentation were ordained as the proper preparation for the happy feast of Purim which commemorated the great deliverance of the Jews from the destruction that had threatened them on the thirteenth day of Adar. Now we have seen that, in the opinion of some eminent modern scholars, the basis of the book of Esther is not history but a Babylonian myth, which celebrated the triumphs and sufferings of deities rather than of men. On this hypothesis, how is the fast that precedes Purim to be explained? The best solution appears to be that of Jensen, that the fasting and mourning were originally for the supposed annual death of a Semitic god or hero of the type of Tammuz or Adonis, whose resurrection on the following day occasioned that outburst of joy and gladness which is characteristic of Purim. The particular god or hero, whose death and resurrection thus touched with sorrow and filled with joy the hearts of his worshippers, may have been, according to Jensen, either the great hero Gilgamesh, or his comrade and friend Eabani. The

doughty deeds and adventures of this mighty pair are the theme of the longest Babylonian poem that has been as yet discovered. It is recorded on twelve tablets, and this circumstance has suggested to some scholars the view that the story may be a solar myth, descriptive of the sun's annual course through the twelve months or the twelve signs of the zodiac. However that may be, the scene of the poem is laid chiefly at the very ancient Babylonian city of Erech, the chief seat of the worship of the goddess Ishtar or Astarte, who plays an important part in the story. For the goddess is said to have been smitten with the charms of Gilgamesh, and to have made love to him; but he spurned her proffered favours, and thereafter fell into a sore sickness, probably through the wrath of the offended goddess. His comrade Eabani also roused the fury of Ishtar, and was wounded to death. For twelve days he lingered on a bed of pain, and, when he died, his friend Gilgamesh mourned and lamented for him, and rested not until he had prevailed on the god of the dead to suffer the spirit of Eabani to return to the upper world. The resurrection of Eabani, recorded on the twelfth tablet, forms the conclusion of the long poem. Jensen's theory is that the death and resurrection of a mythical being, who combined in himself the features of a solar god and an ancient king of Erech, were celebrated at the Babylonian Zakmuk or festival of the New Year, and that the transference of the drama from Erech, its original seat, to Babylon led naturally to the substitution of Marduk, the great god of Babylon, for Gilgamesh or Eabani in the part of the hero. Although Jensen apparently does not identify the Zakmuk with the Sacaea, a little consideration will shew how well his general theory of Zakmuk fits in with those features of the Sacaeian festival which have emerged in the course of our enquiry. At the Sacaeian festival, if I am right, a man, who personated a god or hero of the type of Tammuz or Adonis, enjoyed the favours of a woman, probably a sacred harlot, who represented the great Semitic goddess Ishtar or Astarte; and after he had thus done his part towards securing, by means of sympathetic magic, the revival of plant life in spring, he was put to death. We may suppose that the death of this divine man was mourned over by his worshippers, and especially by women, in much the same fashion as the women of Jerusalem wept for Tammuz at the gate of the temple, and as Syrian damsels mourned the dead Adonis, while the river ran red with his blood. Such rites appear, in fact, to have been common all over Western Asia; the particular name of the dying god varied in different places, but in substance the ritual was the same. Fundamentally, the custom was a religious or rather magical ceremony intended to ensure the revival and reproduction of life in spring.

Now, if this interpretation of the Sacaea is correct, it is obvious that one important feature of the ceremony is wanting in the brief notices of the festival that have come down to us. The death of the man-god at the festival is recorded, but nothing is said of his resurrection. Yet if he really personated a being of the Adonis or Attis type, we may feel pretty sure that his dramatic death was followed at a shorter or longer interval by his dramatic revival, just as at the festivals of Attis and Adonis the resurrection of the dead god quickly succeeded to his mimic death. Here, however, a difficulty presents itself. At the Sacaea the man-god died a real, not a mere mimic death; and in ordinary life the resurrection even of a man-god is at least not an everyday occurrence. What was to be done? The man, or rather the god, was undoubtedly dead. How was he to come to life again? Obviously the best, if not the only way, was to set another and living man to support the character of the reviving god, and we may conjecture that this was done. We may suppose that the insignia of royalty which had adorned the dead man were transferred to his successor, who, arrayed in them, would be presented to his rejoicing worshippers as their god come to life again; and by his side would probably be displayed a woman in the character of his divine consort, the goddess Ishtar or Astarte. In favour of this hypothesis it may be observed that it at once furnishes a clear and intelligible explanation of a remarkable feature in the book of Esther which has not yet, so far as I am aware, been adequately elucidated; I mean that apparent duplication of the principal

characters to which I have already directed the reader's attention. If I am right, Haman represents the temporary king or mortal god who was put to death at the Sacaea; and his rival Mordecai represents the other temporary king who, on the death of his predecessor, was invested with his royal insignia, and exhibited to the people as the god come to life again. Similarly Vashti, the deposed queen in the narrative, corresponds to the woman who played the part of queen and goddess to the first mock king, the Haman; and her successful rival, Esther or Ishtar, answers to the woman who figured as the divine consort of the second mock king, the Mordecai or Marduk. A trace of the sexual license accorded to the mock king of the festival seems to be preserved in the statement that King Ahasuerus found Haman fallen on the bed with Esther and asked, "Will he even force the queen before me in the house?" We have seen that the mock king of the Sacaea did actually possess the right of using the real king's concubines, and there is much to be said for the view of Movers that he began his short reign by exercising the right in public. In the parallel ritual of Adonis the marriage of the goddess with her ill-fated lover was publicly celebrated the day before his mimic death. A clear reminiscence of the time when the relation between Esther and Mordecai was conceived as much more intimate than mere cousinship appears to be preserved in some of the Jewish plays acted at Purim, in which Mordecai appears as the lover of Esther; and this significant indication is confirmed by the teaching of the rabbis that King Ahasuerus never really knew Esther, but that a phantom in her likeness lay with him while the real Esther sat on the lap of Mordecai.

The Persian setting, in which the Hebrew author of the book of Esther has framed his highly-coloured picture, naturally suggests that the Jews derived their feast of Purim not directly from the old Babylonians, but from their Persian conquerors. Even if this could be demonstrated, it would in no way invalidate the theory that Purim originated in the Babylonian festival of the Sacaea, since we know that the Sacaea was celebrated by the Persians. Hence it becomes worth while to enquire whether in the Persian religion we can detect any traces of a festival akin to the Sacaea or Purim. Here Lagarde has shewn the way by directing attention to the old Persian ceremony known as the "Ride of the Beardless One." This was a rite performed both in Persia and Babylonia at the beginning of spring, on the first day of the first month, which in the most ancient Persian calendar corresponded to March, so that the date of the ceremony agrees with that of the Babylonian New Year festival of Zakmuk. A beardless and, if possible, one-eyed buffoon was set naked on an ass, a horse, or a mule, and conducted in a sort of mock triumph through the streets of the city. In one hand he held a crow and in the other a fan, with which he fanned himself, complaining of the heat, while the people pelted him with ice and snow and drenched him with cold water. He was supposed to drive away the cold, and to aid him perhaps in discharging this useful function he was fed with hot food, and hot stuffs were smeared on his body. Riding on his ass and attended by all the king's household, if the city happened to be the capital, or, if it was not, by all the retainers of the governor, who were also mounted, he paraded the streets and extorted contributions. He stopped at the doors of the rich, and if they did not give him what he asked for, he befouled their garments with mud or a mixture of red ochre and water, which he carried in an earthenware pot. If a shopkeeper hesitated a moment to respond to his demands, the importunate beggar had the right to confiscate all the goods in the shop; so the tradesmen who saw him bearing down on them, not unnaturally hastened to anticipate his wants by contributing of their substance before he could board them. Everything that he thus collected from break of day to the time of morning prayers belonged to the king or governor of the city; but everything that he laid hands on between the first and the second hour of prayer he kept for himself. After the second prayers he disappeared, and if the people caught him later in the day they were free to beat him to their heart's content. "In like manner," proceeds one of the native writers who has described the custom, "people at the

present time appoint a New Year Lord and make merry. And this they do because the season, which is the beginning of Azur or March, coincides with the sun's entry into Aries, for on that day they disport themselves and rejoice because the winter is over."

Now in this harlequin, who rode through the streets attended by all the king's men, and levying contributions which went either to the royal treasury or to the pocket of the collector, we recognize the familiar features of the mock or temporary king, who is invested for a short time with the pomp and privileges of royalty for reasons which have been already explained. The abrupt disappearance of the Persian clown at a certain hour of the day, coupled with the leave given to the populace to thrash him if they found him afterwards, points plainly enough to the harder fate that probably awaited him in former days, when he paid with his life for his brief tenure of a kingly crown. The resemblance between his burlesque progress and that of Mordecai through the streets of Susa is obvious; though the Jewish author of Esther has depicted in brighter colours the pomp of his hero "in royal apparel of blue and white, and with a great crown of gold, and with a robe of fine linen and purple," riding the king's own charger, and led through the city by one of the king's most noble princes. The difference between the two scenes is probably not to be explained simply by the desire of the Jewish writer to shed a halo of glory round the personage whom he regarded as the deliverer of his people. So long as the temporary king was a real substitute for the reigning monarch, and had to die sooner or later in his stead, it was natural that he should be treated with a greater show of deference, and should simulate his royal brother more closely than a clown who had nothing worse than a beating to fear when he laid down his office. In short, after the serious meaning of the custom had been forgotten, and the substitute was allowed to escape with his life, the high tragedy of the ancient ceremony would rapidly degenerate into farce.

But while the "Ride of the Beardless One" is, from one point of view, a degenerate copy of the original, regarded from another point of view, it preserves some features which are almost certainly primitive, though they do not appear in the kindred Babylonian and Jewish festivals. The Persian custom bears the stamp of a popular festivity rather than of a state ceremonial, and everywhere it seems as if popular festivals, when left to propagate themselves freely among the folk, reveal their old meaning and intention more transparently than when they have been adopted into the official religion and enshrined in a ritual. The simple thoughts of our simple forefathers are better understood by their unlettered descendants than by the majority of educated people; their rude rites are more faithfully preserved and more truly interpreted by a rude peasantry than by the priest, who wraps up their nakedness in the gorgeous pall of religious pomp, or by the philosopher, who dissolves their crudities into the thin air of allegory. In the present instance the purpose of the "Ride of the Beardless One" at the beginning of spring is sufficiently obvious; it was meant to hasten the departure of winter and the approach of summer. We are expressly told that the clown who went about fanning himself and complaining of the heat, while the populace snowballed him, was supposed to dispel the cold; and even without any such assurance we should be justified in inferring as much from his behaviour. On the principles of homoeopathic or imitative magic, which is little more than an elaborate system of make-believe, you can make the weather warm by pretending that it is so; or if you cannot, you may be sure that there is some person wiser than yourself who can. Such a wizard, in the estimation of the Persians, was the beardless one-eyed man who went through the performance I have described; and no doubt his physical defects were believed to contribute in some occult manner to the success of the rite. The ceremony was thus, as Lagarde acutely perceived, the oriental equivalent of those popular European customs which celebrate the advent of spring by representing in a dramatic form the expulsion or defeat of winter by the victorious summer. But whereas in Europe the two

rival seasons are often, if not regularly, personated by two actors or two effigies, in Persia a single actor sufficed. Whether he definitely represented winter or summer is not quite clear; but his pretence of suffering from heat and his final disappearance suggest that, if he personified either of the seasons, it was the departing winter rather than the coming summer.

If there is any truth in the connexion thus traced between Purim and the "Ride of the Beardless One," we are now in a position finally to unmask the leading personages in the book of Esther. I have attempted to shew that Haman and Vashti are little more than doubles of Mordecai and Esther, who in turn conceal under a thin disguise the features of Marduk and Ishtar, the great god and goddess of Babylon. But why, the reader may ask, should the divine pair be thus duplicated and the two pairs set in opposition to each other? The answer is suggested by the popular European celebrations of spring to which I have just adverted. If my interpretation of these customs is right, the contrast between the summer and winter, or between the life and death, which figure in effigy or in the persons of living representatives at the spring ceremonies of our peasantry, is fundamentally a contrast between the dying or dead vegetation of the old and the sprouting vegetation of the new year—a contrast which would lose nothing of its point when, as in ancient Rome and Babylon and Persia, the beginning of spring was also the beginning of the new year. In these and in all the ceremonies we have been examining the antagonism is not between powers of a different order, but between the same power viewed in different aspects as old and young; it is, in short, nothing but the eternal and pathetic contrast between youth and age. And as the power or spirit of vegetation is represented in religious ritual and popular custom by a human pair, whether they be called Ishtar and Tammuz, or Venus and Adonis, or the Queen and King of May, so we may expect to find the old decrepit spirit of the past year personated by one pair, and the fresh young spirit of the new year by another. This, if my hypothesis is right, is the ultimate explanation of the struggle between Haman and Vashti on the one side, and their doubles Mordecai and Esther on the other. In the last analysis both pairs stood for the powers that make for the fertility of plants and perhaps also of animals; but the one pair embodied the failing energies of the past, and the other the vigorous and growing energies of the coming year. Both powers, on my hypothesis, were personified not merely in myth, but in custom; for year by year a human couple undertook to quicken the life of nature by a union in which, as in a microcosm, the loves of tree and plant, of herb and flower, of bird and beast were supposed in some mystic fashion to be summed up. Originally, we may conjecture, such couples exercised their functions for a whole year, on the conclusion of which the male partner—the divine king—was put to death; but in historical times it seems that, as a rule, the human god—the Saturn, Zoganes, Tammuz, or whatever he was called—enjoyed his divine privileges, and discharged his divine duties only for a short part of the year. This curtailment of his reign on earth was probably introduced at the time when the old hereditary divinities or deified kings contrived to shift the most painful part of their duties to a substitute, whether that substitute was a son or a slave or a malefactor. Having to die as a king, it was necessary that the substitute should also live as a king for a season; but the real monarch would naturally restrict within the narrowest limits both of time and of power a reign which, so long as it lasted, necessarily encroached upon and indeed superseded his own. What became of the divine king's female partner, the human goddess who shared his bed and transmitted his beneficent energies to the rest of nature, we cannot say. So far as I am aware, there is little or no evidence that she like him suffered death when her primary function was discharged. The nature of maternity suggests an obvious reason for sparing her a little longer, till that mysterious law, which links together woman's life with the changing aspects of the nightly sky, had been fulfilled by the birth of an infant god, who should in his turn, reared perhaps by her tender care, grow up to live and die for the world.

§ 6. Conclusion.

We may now sum up the general results of the enquiry which we have pursued in the present chapter. We have found evidence that festivals of the type of the Saturnalia, characterized by an inversion of social ranks and the sacrifice of a man in the character of a god, were at one time held all over the ancient world from Italy to Babylon. Such festivals seem to date from an early age in the history of agriculture, when people lived in small communities, each presided over by a sacred or divine king, whose primary duty was to secure the orderly succession of the seasons, the fertility of the earth, and the fecundity both of cattle and of women. Associated with him was his wife or other female consort, with whom he performed some of the necessary ceremonies, and who therefore shared his divine character. Originally his term of office appears to have been limited to a year, on the conclusion of which he was put to death; but in time he contrived by force or craft to extend his reign and sometimes to procure a substitute, who after a short and more or less nominal tenure of the crown was slain in his stead. At first the substitute for the divine father was probably the divine son, but afterwards this rule was no longer insisted on, and still later the growth of a humane feeling demanded that the victim should always be a condemned criminal. In this advanced stage of degeneration it is no wonder if the light of divinity suffered eclipse, and many should fail to detect the god in the malefactor. Yet the downward career of fallen deity does not stop here; even a criminal comes to be thought too good to personate a god on the gallows or in the fire; and then there is nothing left but to make up a more or less grotesque effigy, and so to hang, burn, or otherwise destroy the god in the person of this sorry representative. By this time the original meaning of the ceremony may be so completely forgotten that the puppet is supposed to represent some historical personage, who earned the hatred and contempt of his fellows in his life, and whose memory has ever since been held up to eternal execration by the annual destruction of his effigy. The figures of Haman, of the Carnival, and of Winter or Death which are or used to be annually destroyed in spring by Jews, Catholics, and the peasants of Central Europe respectively, appear to be all lineal descendants of those human incarnations of the powers of nature whose life and death were deemed essential to the welfare of mankind. But of the three the only one which has preserved a clear trace of its original meaning is the effigy of Winter or Death. In the others the ancient significance of the custom as a magical ceremony designed to direct the course of nature has been almost wholly obscured by a thick aftergrowth of legend and myth. The cause of this distinction is that, whereas the practice of destroying an effigy of Winter or Death has been handed down from time immemorial through generations of simple peasants, the festivals of Purim and the Carnival, as well as their Babylonian and Italian prototypes, the Sacaea and the Saturnalia, were for centuries domesticated in cities, where they were necessarily exposed to those thousand transforming and disintegrating currents of speculation and enquiry, of priestcraft and policy, which roll their turbid waters through the busy haunts of men, but leave undefiled the limpid springs of mythic fancy in the country.

If there is any truth in the analysis of the Saturnalia and kindred festivals which I have now brought to a close, it seems to point to a remarkable homogeneity of civilization throughout Southern Europe and Western Asia in prehistoric times. How far such homogeneity of civilization may be taken as evidence of homogeneity of race is a question for the ethnologist; it does not concern us here. But without discussing it, I may remind the reader that in the far east of Asia we have met with temporary kings whose magical functions and intimate relation to agriculture stand out in the clearest light; while India furnishes examples of kings who have regularly been obliged to sacrifice themselves at the end of a term of years. All these things appear to hang together; all of them may, perhaps, be regarded as the shattered remnants of a uniform zone of religion and society which at a remote era belted the

Old World from the Mediterranean to the Pacific. Whether that was so or not, I may at least claim to have made it probable that if the King of the Wood at Aricia lived and died as an incarnation of a sylvan deity, the functions he thus discharged were by no means singular, and that for the nearest parallel to them we need not go beyond the bounds of Italy, where the divine king Saturn—the god of the sown and sprouting seed—was annually slain in the person of a human representative at his ancient festival of the Saturnalia.

It is possible that such sacrifices of deified men, performed for the salvation of the world, may have helped to beget the notion that the universe or some part of it was originally created out of the bodies of gods offered up in sacrifice. Certainly it is curious that notions of this sort meet us precisely in parts of the world where such sacrifices appear to have been regularly accomplished. Thus in ancient Mexico, where the sacrifice of human beings in the character of gods formed a conspicuous feature of the national religion, it is said that in the beginning, when as yet the light of day was not, the gods created the sun to illumine the earth by voluntarily burning themselves in the fire, leaping one after the other into the flames of a great furnace. Again, in the Babylonian Genesis the great god Bel created the world by cleaving the female monster Tiamat in twain and using the severed halves of her body to form the heaven and the earth. Afterwards, perceiving that the earth was waste and void, he obligingly ordered one of the gods to cut off his, the Creator's, head, and with the flowing blood mixed with clay he kneaded a paste out of which he moulded men and animals. Similarly in a hymn of the Rig Veda we read how the gods created the world out of the dismembered body of the great primordial giant Purushu. The sky was made out of his head, the earth out of his feet, the sun out of his eye, and the moon out of his mind; animals and men were also engendered from his dripping fat or his limbs, and the great gods Indra and Agni sprang from his mouth. The crude, nay savage, account of creation thus set forth by the poet was retained by the Brahman doctors of a later age and refined by them into a subtle theory of sacrifice in general. According to them the world was not only created in the beginning by the sacrifice of the creator Prajapati, the Lord of Creatures; to this day it is renewed and preserved solely by a repetition of that mystic sacrifice in the daily sacrificial ritual celebrated by the Brahmans. Every day the body of the Creator and Saviour is broken anew, and every day it is pieced together for the restoration and conservation of a universe which otherwise must dissolve and be shattered into fragments. Thus is the world continually created afresh by the self-sacrifice of the deity; and, wonderful to relate, the priest who offers the sacrifice identifies himself with the Creator, and so by the very act of sacrificing renews the universe and keeps up uninterrupted the revolution of time and matter. All things depend on his beneficent, nay divine activity, from the heaven above to the earth beneath, from the greatest god to the meanest worm, from the sun and moon to the humblest blade of grass and the minutest particle of dust. Happily this grandiose theory of sacrifice as a process essential to the salvation of the world does not oblige the priest to imitate his glorious prototype by dismembering his own body and shedding his blood on the altar; on the contrary a comfortable corollary deduced from it holds out to him the pleasing prospect of living for the unspeakable benefit of society to a good old age, indeed of stretching out the brief span of human existence to a full hundred years. Well is it, not only for the priest but for mankind, when with the slow progress of civilization and humanity the hard facts of a cruel ritual have thus been softened and diluted into the nebulous abstractions of a mystical theology.

Note. The Crucifixion Of Christ

An eminent scholar has recently pointed out the remarkable resemblance between the treatment of Christ by the Roman soldiers at Jerusalem and the treatment of the mock king of the Saturnalia by the Roman soldiers at Durostorum; and he would explain the similarity by supposing that the soldiers ridiculed the claims of Christ to a divine kingdom by arraying him in the familiar garb of old King Saturn, whose quaint person figured so prominently at the winter revels. Even if the theory should prove to be right, we can hardly suppose that Christ played the part of the regular Saturn of the year, since at the beginning of our era the Saturnalia fell at midwinter, whereas Christ was crucified at the Passover in spring. There is, indeed, as I have pointed out, some reason to think that when the Roman year began in March the Saturnalia was held in spring, and that in remote districts the festival always continued to be celebrated at the ancient date. If the Roman garrison of Jerusalem conformed to the old fashion in this respect, it seems not quite impossible that their celebration of the Saturnalia may have coincided with the Passover; and that thus Christ, as a condemned criminal, may have been given up to them to make sport with as the Saturn of the year. But on the other hand it is rather unlikely that the officers, as representatives of the State, would have allowed their men to hold the festival at any but the official date; even in the distant town of Durostorum we saw that the Roman soldiers celebrated the Saturnalia in December. Thus if the legionaries at Jerusalem really intended to mock Christ by treating him like the burlesque king of the Saturnalia, they probably did so only by way of a jest which was in more senses than one unseasonable.

But closely as the passion of Christ resembles the treatment of the mock king of the Saturnalia, it resembles still more closely the treatment of the mock king of the Sacaea. The description of the mockery by St. Matthew is the fullest. It runs thus: "Then released he Barabbas unto them: and when he had scourged Jesus, he delivered him to be crucified. Then the soldiers of the governor took Jesus into the common hall, and gathered unto him the whole band of soldiers. And they stripped him, and put on him a scarlet robe. And when they had platted a crown of thorns, they put it upon his head, and a reed in his right hand: and they bowed the knee before him, and mocked him, saying, Hail, King of the Jews! And they spit upon him, and took the reed, and smote him on the head. And after that they had mocked him, they took the robe off from him, and put his own raiment on him, and led him away to crucify him." Compare with this the treatment of the mock king of the Sacaea, as it is described by Dio Chrysostom: "They take one of the prisoners condemned to death and seat him upon the king's throne, and give him the king's raiment, and let him lord it and drink and run riot and use the king's concubines during these days, and no man prevents him from doing just what he likes. But afterwards they strip and scourge and crucify him." Now it is quite possible that this remarkable resemblance is after all a mere coincidence, and that Christ was executed in the ordinary way as a common malefactor; but on the other hand there are so many scattered hints and indications of something unusual, so many broken lines seemingly converging towards the cross on Calvary, that it is worth while to follow them up and see where they lead us. In attempting to draw these fragmentary data together, to bridge the chasms, and to restore the shattered whole, we must beware of mistaking hypothesis for the facts which it only professes to cement; yet even if our hypothesis should be thought to bear a somewhat undue proportion to the facts, the excess may perhaps be overlooked in consideration of the obscurity and the importance of the enquiry.

We have seen reason to think that the Jewish festival of Purim is a continuation, under a changed name, of the Babylonian Sacaea, and that in celebrating it by the destruction of an effigy of Haman the modern Jews have kept up a reminiscence of the ancient custom of crucifying or hanging a man in the character of a god at the festival. Is it not possible that at an earlier time they may, like the Babylonians themselves, have regularly compelled a condemned criminal to play the tragic part, and that Christ thus perished in the character of Haman? The resemblance between the hanged Haman and the crucified Christ struck the early Christians themselves; and whenever the Jews destroyed an effigy of Haman they were accused by their Christian neighbours of deriding the most sacred mystery of the new faith. It is probable that on this painful subject the Christians were too sensitive; remembering the manner of their Founder's death it was natural that they should wince at any pointed allusion to a cross, a gallows, or a public execution, even when the shaft was not aimed at them. An objection to supposing that Christ died as the Haman of the year is that according to the Gospel narrative the crucifixion occurred at the Passover, on the fourteenth day of the month Nisan, whereas the feast of Purim, at which the hanging of Haman would naturally take place, fell exactly a month earlier, namely, on the fourteenth day of the month Adar. I have no wish to blink or extenuate the serious nature of the difficulty arising from this discrepancy of dates, but I would suggest some considerations which may make us hesitate to decide that the discrepancy is fatal. In the first place, it is possible, though perhaps not probable, that Christian tradition shifted the date of the crucifixion by a month in order to make the great sacrifice of the Lamb of God coincide with that annual sacrifice of the Passover lamb which in the belief of pious hearts had so long foreshadowed it and was thenceforth to cease. Instances of gentle pressure brought to bear, for purposes of edification, on stubborn facts are perhaps not wholly unknown in the annals of religion. But the express testimony of history is never to be lightly set aside; and in the investigation of its problems a solution which assumes the veracity and accuracy of the historian is, on an even balance of probabilities, always to be preferred to one which impugns them both. Now in the present case we have seen reason to think that the Babylonian New Year festival, of which Purim was a continuation, did fall in Nisan at or near the time of the Passover, and that when the Jews borrowed the festival they altered the date from Nisan to Adar in order to prevent the new feast from clashing with the old Passover. A reminiscence of the original date of Purim perhaps survives, as I have already pointed out, in the statement in the book of Esther that Haman caused *pur* or lots to be cast before him from the month of Nisan onward. It thus seems not impossible that occasionally, for some special reason, the Jews should have celebrated the feast of Purim, or at least the death of Haman, at or about the time of the Passover. But there is another possibility which, remote and fanciful as it may appear, deserves at least to be mentioned. The mock king of the Saturnalia, whose resemblance to the dying Christ was first pointed out by Mr. Wendland, was allowed a period of license of thirty days before he was put to death. If we could suppose that in like manner the Jews spared the human representative of Haman for one month from Purim, the date of his execution would fall exactly on the Passover. Which, if any, of these conjectural solutions of the difficulty is the true one, I will not undertake to say. I am fully conscious of the doubt and uncertainty that hang round the whole subject; and if in this and what follows I throw out some hints and suggestions, it is more in the hope of stimulating and directing further enquiry than with any expectation of reaching definite conclusions.

It may be objected that the mockery of Christ was done, not by the Jews, but by the Roman soldiers, who knew and cared nothing about Haman; how then can we suppose that the purple or scarlet robe, the sceptre of reed, and the crown of thorns, which the soldiers thrust upon Christ, were the regular insignia of the Haman of the year? To this we may reply, in the first place, that even if the legions stationed in Syria were not recruited in the country, they may

have contracted some of the native superstitions and have fallen in with the local customs. This is not an idle conjecture. We know that the third legion during its stay in Syria learned the Syrian custom of saluting the rising sun, and that this formal salute, performed by the whole regiment as one man at a critical moment of the great battle of Bedriacum, actually helped to turn the scale when the fortune of empire hung trembling in the balance. But it is not necessary to suppose that the garrison of Jerusalem really shared the beliefs and prejudices of the mob whom they overawed; soldiers everywhere are ready to go with a crowd bent on sport, without asking any curious questions as to the history or quality of the entertainment, and we should probably do the humanity of Roman soldiers too much honour if we imagined that they would be deterred by any qualm of conscience from joining in the pastime, which is still so popular, of baiting a Jew to death. But in the second place it should be observed that, according to one of the Evangelists, it was not the soldiers of Pilate who mocked Jesus, but the soldiers of Herod, and we may fairly assume that Herod's guards were Jews.

The hypothesis that the crucifixion with all its cruel mockery was not a punishment specially devised for Christ, but was merely the fate that annually befell the malefactor who played Haman, appears to go some way towards relieving the Gospel narrative of certain difficulties which otherwise beset it. If, as we read in the Gospels, Pilate was really anxious to save the innocent man whose fine bearing seems to have struck him, what was to hinder him from doing so? He had the power of life and death; why should he not have exercised it on the side of mercy, if his own judgment inclined that way? His reluctant acquiescence in the importunate demand of the rabble becomes easier to understand if we assume that custom obliged him annually at this season to give up to them a prisoner on whom they might play their cruel pranks. On this assumption Pilate had no power to prevent the sacrifice; the most he could do was to choose the victim.

Again, consider the remarkable statement of the Evangelists that Pilate set up over the cross a superscription stating that the man who hung on it was king of the Jews. Is it likely that in the reign of Tiberius a Roman governor, with the fear of the jealous and suspicious old emperor before his eyes, would have ventured, even in mockery, to blazon forth a seditious claim of this sort unless it were the regular formula employed on such occasions, recognized by custom, and therefore not liable to be misconstrued into treason by the malignity of informers and the fears of a tyrant?

But if the tragedy of the ill-fated aspirant after royal honours was annually enacted at Jerusalem by a prisoner who perished on the cross, it becomes probable that the part of his successful rival was also played by another actor who paraded in the same kingly trappings but did not share the same fate. If Jesus was the Haman of the year, where was the Mordecai? Perhaps we may find him in Barabbas.

We are told by the Evangelists that at the feast which witnessed the crucifixion of Christ it was the custom for the Roman governor to release one prisoner, whomsoever the people desired, and that Pilate, convinced of the innocence of Jesus, attempted to persuade the multitude to choose him as the man who should go free. But, hounded on by the priests and elders who had marked out Jesus for destruction, the rabble would not hear of this, and clamoured for the blood of Jesus, while they demanded the release of a certain miscreant, by name Barabbas, who lay in gaol for murder and sedition. Accordingly Pilate had to give way: Christ was crucified and Barabbas set at liberty. Now what, we may ask, was the reason for setting free a prisoner at this festival? In the absence of positive information, we may conjecture that the gaol-bird whose cage was thrown open at this time had to purchase his freedom by performing some service from which decent people would shrink. Such a service

may very well have been that of going about the streets, rigged out in tawdry splendour with a tinsel crown on his head and a sham sceptre in his hand, preceded and followed by all the tag-rag and bobtail of the town hooting, jeering, and breaking coarse jests at his expense, while some pretended to salaam his mock majesty, and others belaboured the donkey on which he rode. It was in this fashion, probably, that in Persia the beardless and one-eyed man made his undignified progress through the town, to the delight of ragamuffins and the terror of shopkeepers, whose goods he unceremoniously confiscated if they did not hasten to lay their peace-offerings at his feet. So, perhaps, the ruffian Barabbas, when his irons were knocked off and the prison door had grated on its hinges to let him forth, tasted the first sweets of liberty in this public manner, even if he was not suffered, like his one-eyed brother, to make raids with impunity on the stalls of the merchants and the tables of the money-changers. A curious confirmation of this conjecture is supplied by a passage in the writings of Philo the Jew, who lived at Alexandria in the time of Christ. He tells us that when Agrippa, the grandson of Herod, had received the crown of Judaea from Caligula at Rome, the new king passed through Alexandria on his way to his own country. The disorderly populace of that great city, animated by a hearty dislike of his nation, seized the opportunity of venting their spite by publicly defaming and ridiculing the Jewish monarch. Among other things they laid hold of a certain harmless lunatic named Carabas, who used to roam the streets stark naked, the butt and laughing-stock of urchins and idlers. This poor wretch they set up in a public place, clapped a paper crown on his head, thrust a broken reed into his hand by way of a sceptre, and having huddled a mat instead of a royal robe about his naked body, and surrounded him with a guard of bludgeon-men, they did obeisance to him as to a king and made a show of taking his opinion on questions of law and policy. To point the jest unmistakably at the Syrian king Agrippa, the bystanders raised cries of "Marin! Marin!" which they understood to be the Syrian word for "lord." This mockery of the Jewish king closely resembles the mockery of Christ; and the joke, such as it was, would receive a keener edge if we could suppose that the riff-raff of Alexandria were familiar with the Jewish practice of setting up a sham king on certain occasions, and that they meant by implication to ridicule the real King Agrippa by comparing him to his holiday counterfeit. May we go a step further and conjecture that one at least of the titles of the mock king of the Jews was regularly Barabbas? The poor imbecile who masqueraded in a paper crown at Alexandria was probably a Jew, otherwise the jest would have lost much of its point; and his name, according to the Greek manuscripts of Philo, was Carabas. But Carabas is meaningless in Hebrew, whereas Barabbas is a regularly formed Hebrew word meaning "Son of the Father." The palaeographic difference between the two forms is slight, and perhaps we shall hardly be deemed very rash if we conjecture that in the passage in question Philo himself wrote Barabbas, which a Greek copyist, ignorant of Hebrew, afterwards corrupted into Carabas. If this were granted, we should still have to assume that both Philo and the authors of the Gospels fell into the mistake of treating as the name of an individual what in fact was a title of office.

Thus the hypothesis which, with great diffidence, I would put forward for consideration is this. It was customary, we may suppose, with the Jews at Purim, or perhaps occasionally at Passover, to employ two prisoners to act the parts respectively of Haman and Mordecai in the passion-play which formed a central feature of the festival. Both men paraded for a short time in the insignia of royalty, but their fates were different; for while at the end of the performance the one who played Haman was hanged or crucified, the one who personated Mordecai and bore in popular parlance the title of Barabbas was allowed to go free. Pilate, perceiving the trumpery nature of the charges brought against Jesus, tried to persuade the Jews to let him play the part of Barabbas, which would have saved his life; but the merciful attempt failed and Jesus perished on the cross in the character of Haman. The description of

his last triumphal ride into Jerusalem reads almost like an echo of that brilliant progress through the streets of Susa which Haman aspired to and Mordecai accomplished; and the account of the raid which he immediately afterwards made upon the stalls of the hucksters and money-changers in the temple, may raise a question whether we have not here a trace of those arbitrary rights over property which it has been customary on such occasions to accord to the temporary king.

If it be asked why one of these temporary kings should bear the remarkable title of Barabbas or "Son of the Father," I can only surmise that the title may perhaps be a relic of the time when the real king, the deified man, used to redeem his own life by deputing his son to reign for a short time and to die in his stead. We have seen that the custom of sacrificing the son for the father was common, if not universal, among Semitic peoples; and if we are right in our interpretation of the Passover, that festival—the traditional date of the crucifixion—was the very season when the dreadful sacrifice of the first-born was consummated. Hence Barabbas or the "Son of the Father" would be a natural enough title for the man or child who reigned and died as a substitute for his royal sire. Even in later times, when the father provided a less precious substitute than his own offspring, it would be quite in accordance with the formal conservatism of religion that the old title should be retained after it had ceased to be appropriate; indeed the efficacy of the sacrifice might be thought to require and justify the pious fiction that the substitute was the very son of that divine father who should have died, but who preferred to live, for the good of his people. If in the time of Christ, as I have conjectured, the title of Barabbas or Son of the Father was bestowed on the Mordecai, the mock king who lived, rather than on the Haman, the mock king who died at the festival, this distinction can hardly have been original; for at first, we may suppose, the same man served in both capacities at different times, as the Mordecai of one year and the Haman of the next. The two characters, as I have attempted to shew, are probably nothing but two different aspects of the same deity considered at one time as dead and at another as risen; hence the human being who personated the risen god would in due time, after he had enjoyed his divine honours for a season, act the dead god by dying in good earnest in his own person; for it would be unreasonable to expect of the ordinary man-god that he should play the two parts in the reverse order by dying first and coming to life afterwards. In both parts the substitute would still be, whether in sober fact or in pious fiction, the Barabbas or Son of that divine Father who generously gave his own son to die for the world.

To conclude this speculation, into which I have perhaps been led by the interest and importance of the subject somewhat deeper than the evidence warrants, I venture to urge in its favour that it seems to shed fresh light on some of the causes which contributed to the remarkably rapid diffusion of Christianity in Asia Minor. We know from a famous letter of the younger Pliny addressed to the Emperor Trajan in the year 112 a.d. that by the beginning of our era, less than a hundred years after the Founder's death, Christianity had made such strides in Bithynia and Pontus that not only cities but villages and rural districts were affected by it, and that multitudes of both sexes and of every age and every rank professed its tenets; indeed things had gone so far that the temples were almost deserted, the sacred rites of the public religion discontinued, and hardly a purchaser could be found for the sacrificial victims. It is obvious, therefore, that the new faith had elements in it which appealed powerfully to the Asiatic mind. What these elements were, the present investigation has perhaps to some extent disclosed. We have seen that the conception of the dying and risen god was no new one in these regions. All over Western Asia from time immemorial the mournful death and happy resurrection of a divine being appear to have been annually celebrated with alternate rites of bitter lamentation and exultant joy; and through the veil which mythic fancy has woven round this tragic figure we can still detect the features of

those great yearly changes in earth and sky which, under all distinctions of race and religion, must always touch the natural human heart with alternate emotions of gladness and regret, because they exhibit on the vastest scale open to our observation the mysterious struggle between life and death. But man has not always been willing to watch passively this momentous conflict; he has felt that he has too great a stake in its issue to stand by with folded hands while it is being fought out; he has taken sides against the forces of death and decay—has flung into the trembling scale all the weight of his puny person, and has exulted in his fancied strength when the great balance has slowly inclined towards the side of life, little knowing that for all his strenuous efforts he can as little stir that balance by a hair's-breadth as can the primrose on a mossy bank in spring or the dead leaf blown by the chilly breath of autumn. Nowhere do these efforts, vain and pitiful, yet pathetic, appear to have been made more persistently and systematically than in Western Asia. In name they varied from place to place, but in substance they were all alike. A man, whom the fond imagination of his worshippers invested with the attributes of a god, gave his life for the life of the world; after infusing from his own body a fresh current of vital energy into the stagnant veins of nature, he was cut off from among the living before his failing strength should initiate a universal decay, and his place was taken by another who played, like all his predecessors, the ever-recurring drama of the divine resurrection and death. Such a drama, if our interpretation of it is right, was the original story of Esther and Mordecai or, to give them their older names, of Ishtar and Marduk. It was played in Babylonia, and from Babylonia the returning captives brought it to Judaea, where it was acted, rather as an historical than a mythical piece, by players who, having to die in grim earnest on a cross or gallows, were naturally drawn rather from the gaol than the green-room. A chain of causes which, because we cannot follow them, might in the loose language of daily life be called an accident, determined that the part of the dying god in this annual play should be thrust upon Jesus of Nazareth, whom the enemies he had made in high places by his outspoken strictures were resolved to put out of the way. They succeeded in ridding themselves of the popular and troublesome preacher; but the very step by which they fancied they had simultaneously stamped out his revolutionary doctrines contributed more than anything else they could have done to scatter them broadcast not only over Judaea but over Asia; for it impressed upon what had been hitherto mainly an ethical mission the character of a divine revelation culminating in the passion and death of the incarnate Son of a heavenly Father. In this form the story of the life and death of Jesus exerted an influence which it could never have had if the great teacher had died, as is commonly supposed, the death of a vulgar malefactor. It shed round the cross on Calvary a halo of divinity which multitudes saw and worshipped afar off; the blow struck on Golgotha set a thousand expectant strings vibrating in unison wherever men had heard the old, old story of the dying and risen god. Every year, as another spring bloomed and another autumn faded across the earth, the field had been ploughed and sown and borne fruit of a kind till it received that seed which was destined to spring up and overshadow the world. In the great army of martyrs who in many ages and in many lands, not in Asia only, have died a cruel death in the character of gods, the devout Christian will doubtless discern types and forerunners of the coming Saviour—stars that heralded in the morning sky the advent of the Sun of Righteousness—earthen vessels wherein it pleased the divine wisdom to set before hungering souls the bread of heaven. The sceptic, on the other hand, with equal confidence, will reduce Jesus of Nazareth to the level of a multitude of other victims of a barbarous superstition, and will see in him no more than a moral teacher, whom the fortunate accident of his execution invested with the crown, not merely of a martyr, but of a god. The divergence between these views is wide and deep. Which of them is the truer and will in the end prevail? Time will decide the question of prevalence, if not of truth. Yet we would fain

believe that in this and in all things the old maxim will hold good—*Magna est veritas et praevalebit.*

Part VII. Balder the Beautiful

(Originally published in Volumes X and XI)

Preface

In this concluding part of *The Golden Bough* I have discussed the problem which gives its title to the whole work. If I am right, the Golden Bough over which the King of the Wood, Diana's priest at Aricia, kept watch and ward was no other than a branch of mistletoe growing on an oak within the sacred grove; and as the plucking of the bough was a necessary prelude to the slaughter of the priest, I have been led to institute a parallel between the King of the Wood at Nemi and the Norse god Balder, who was worshipped in a sacred grove beside the beautiful Sogne fiord of Norway and was said to have perished by a stroke of mistletoe, which alone of all things on earth or in heaven could wound him. On the theory here suggested both Balder and the King of the Wood personified in a sense the sacred oak of our Aryan forefathers, and both had deposited their lives or souls for safety in the parasite which sometimes, though rarely, is found growing on an oak and by the very rarity of its appearance excites the wonder and stimulates the devotion of ignorant men. Though I am now less than ever disposed to lay weight on the analogy between the Italian priest and the Norse god, I have allowed it to stand because it furnishes me with a pretext for discussing not only the general question of the external soul in popular superstition, but also the fire-festivals of Europe, since fire played a part both in the myth of Balder and in the ritual of the Arician grove. Thus Balder the Beautiful in my hands is little more than a stalking-horse to carry two heavy pack-loads of facts. And what is true of Balder applies equally to the priest of Nemi himself, the nominal hero of the long tragedy of human folly and suffering which has unrolled itself before the readers of these volumes, and on which the curtain is now about to fall. He, too, for all the quaint garb he wears and the gravity with which he stalks across the stage, is merely a puppet, and it is time to unmask him before laying him up in the box.

To drop metaphor, while nominally investigating a particular problem of ancient mythology, I have really been discussing questions of more general interest which concern the gradual evolution of human thought from savagery to civilization. The enquiry is beset with difficulties of many kinds, for the record of man's mental development is even more imperfect than the record of his physical development, and it is harder to read, not only by reason of the incomparably more subtle and complex nature of the subject, but because the reader's eyes are apt to be dimmed by thick mists of passion and prejudice, which cloud in a far less degree the fields of comparative anatomy and geology. My contribution to the history of the human mind consists of little more than a rough and purely provisional classification of facts gathered almost entirely from printed sources. If there is one general conclusion which seems to emerge from the mass of particulars, I venture to think that it is the essential similarity in the working of the less developed human mind among all races, which corresponds to the essential similarity in their bodily frame revealed by comparative anatomy. But while this general mental similarity may, I believe, be taken as established, we must always be on our guard against tracing to it a multitude of particular resemblances which may be and often are due to simple diffusion, since nothing is more certain than that the various races of men have borrowed from each other many of their arts and crafts, their ideas, customs, and institutions. To sift out the elements of culture which a race has independently evolved and to distinguish them accurately from those which it has derived from other races is a task of extreme difficulty and delicacy, which promises to occupy students of man for a long time to come; indeed so complex are the facts and so imperfect in most cases is the historical record that it may be doubted whether in regard to many of the lower races we shall ever arrive at more than probable conjectures.

Since the last edition of *The Golden Bough* was published some thirteen years ago, I have seen reason to change my views on several matters discussed in this concluding part of the work, and though I have called attention to these changes in the text, it may be well for the sake of clearness to recapitulate them here.

In the first place, the arguments of Dr. Edward Westermarck have satisfied me that the solar theory of the European fire-festivals, which I accepted from W. Mannhardt, is very slightly, if at all, supported by the evidence and is probably erroneous. The true explanation of the festivals I now believe to be the one advocated by Dr. Westermarck himself, namely that they are purificatory in intention, the fire being designed not, as I formerly held, to reinforce the sun's light and heat by sympathetic magic, but merely to burn or repel the noxious things, whether conceived as material or spiritual, which threaten the life of man, of animals, and of plants. This aspect of the fire-festivals had not wholly escaped me in former editions; I pointed it out explicitly, but, biassed perhaps by the great authority of Mannhardt, I treated it as secondary and subordinate instead of primary and dominant. Out of deference to Mannhardt, for whose work I entertain the highest respect, and because the evidence for the purificatory theory of the fires is perhaps not quite conclusive, I have in this edition repeated and even reinforced the arguments for the solar theory of the festivals, so that the reader may see for himself what can be said on both sides of the question and may draw his own conclusion; but for my part I cannot but think that the arguments for the purificatory theory far outweigh the arguments for the solar theory. Dr. Westermarck based his criticisms largely on his own observations of the Mohammedan fire-festivals of Morocco, which present a remarkable resemblance to those of Christian Europe, though there seems no reason to assume that herein Africa has borrowed from Europe or Europe from Africa. So far as Europe is concerned, the evidence tends strongly to shew that the grand evil which the festivals aimed at combating was witchcraft, and that they were conceived to attain their end by actually burning the witches, whether visible or invisible, in the flames. If that was so, the wide prevalence and the immense popularity of the fire-festivals provides us with a measure for estimating the extent of the hold which the belief in witchcraft had on the European mind before the rise of Christianity or rather of rationalism; for Christianity, both Catholic and Protestant, accepted the old belief and enforced it in the old way by the faggot and the stake. It was not until human reason at last awoke after the long slumber of the Middle Ages that this dreadful obsession gradually passed away like a dark cloud from the intellectual horizon of Europe.

Yet we should deceive ourselves if we imagined that the belief in witchcraft is even now dead in the mass of the people; on the contrary there is ample evidence to shew that it only hibernates under the chilling influence of rationalism, and that it would start into active life if that influence were ever seriously relaxed. The truth seems to be that to this day the peasant remains a pagan and savage at heart; his civilization is merely a thin veneer which the hard knocks of life soon abrade, exposing the solid core of paganism and savagery below. The danger created by a bottomless layer of ignorance and superstition under the crust of civilized society is lessened, not only by the natural torpidity and inertia of the bucolic mind, but also by the progressive decrease of the rural as compared with the urban population in modern states; for I believe it will be found that the artisans who congregate in towns are far less retentive of primitive modes of thought than their rustic brethren. In every age cities have been the centres and as it were the lighthouses from which ideas radiate into the surrounding darkness, kindled by the friction of mind with mind in the crowded haunts of men; and it is natural that at these beacons of intellectual light all should partake in some measure of the general illumination. No doubt the mental ferment and unrest of great cities have their dark as

well as their bright side; but among the evils to be apprehended from them the chances of a pagan revival need hardly be reckoned.

Another point on which I have changed my mind is the nature of the great Aryan god whom the Romans called Jupiter and the Greeks Zeus. Whereas I formerly argued that he was primarily a personification of the sacred oak and only in the second place a personification of the thundering sky, I now invert the order of his divine functions and believe that he was a sky-god before he came to be associated with the oak. In fact, I revert to the traditional view of Jupiter, recant my heresy, and am gathered like a lost sheep into the fold of mythological orthodoxy. The good shepherd who has brought me back is my friend Mr. W. Warde Fowler. He has removed the stone over which I stumbled in the wilderness by explaining in a simple and natural way how a god of the thundering sky might easily come to be afterwards associated with the oak. The explanation turns on the great frequency with which, as statistics prove, the oak is struck by lightning beyond any other tree of the wood in Europe. To our rude forefathers, who dwelt in the gloomy depths of the *primaeval* forest, it might well seem that the riven and blackened oaks must indeed be favourites of the sky-god, who so often descended on them from the murky cloud in a flash of lightning and a crash of thunder.

This change of view as to the great Aryan god necessarily affects my interpretation of the King of the Wood, the priest of Diana at Aricia, if I may take that discarded puppet out of the box again for a moment. On my theory the priest represented Jupiter in the flesh, and accordingly, if Jupiter was primarily a sky-god, his priest cannot have been a mere incarnation of the sacred oak, but must, like the deity whose commission he bore, have been invested in the imagination of his worshippers with the power of overcasting the heaven with clouds and eliciting storms of thunder and rain from the celestial vault. The attribution of weather-making powers to kings or priests is very common in primitive society, and is indeed one of the principal levers by which such personages raise themselves to a position of superiority above their fellows. There is therefore no improbability in the supposition that as a representative of Jupiter the priest of Diana enjoyed this reputation, though positive evidence of it appears to be lacking.

Lastly, in the present edition I have shewn some grounds for thinking that the Golden Bough itself, or in common parlance the mistletoe on the oak, was supposed to have dropped from the sky upon the tree in a flash of lightning and therefore to contain within itself the seed of celestial fire, a sort of smouldering thunderbolt. This view of the priest and of the bough which he guarded at the peril of his life has the advantage of accounting for the importance which the sanctuary at Nemi acquired and the treasure which it amassed through the offerings of the faithful; for the shrine would seem to have been to ancient what Loreto has been to modern Italy, a place of pilgrimage, where princes and nobles as well as commoners poured wealth into the coffers of Diana in her green recess among the Alban hills, just as in modern times kings and queens vied with each other in enriching the black Virgin who from her Holy House on the hillside at Loreto looks out on the blue Adriatic and the purple Apennines. Such pious prodigality becomes more intelligible if the greatest of the gods was indeed believed to dwell in human shape with his wife among the woods of Nemi.

These are the principal points on which I have altered my opinion since the last edition of my book was published. The mere admission of such changes may suffice to indicate the doubt and uncertainty which attend enquiries of this nature. The whole fabric of ancient mythology is so foreign to our modern ways of thought, and the evidence concerning it is for the most part so fragmentary, obscure, and conflicting that in our attempts to piece together and interpret it we can hardly hope to reach conclusions that will completely satisfy either ourselves or others. In this as in other branches of study it is the fate of theories to be washed

away like children's castles of sand by the rising tide of knowledge, and I am not so presumptuous as to expect or desire for mine an exemption from the common lot. I hold them all very lightly and have used them chiefly as convenient pegs on which to hang my collections of facts. For I believe that, while theories are transitory, a record of facts has a permanent value, and that as a chronicle of ancient customs and beliefs my book may retain its utility when my theories are as obsolete as the customs and beliefs themselves deserve to be.

I cannot dismiss without some natural regret a task which has occupied and amused me at intervals for many years. But the regret is tempered by thankfulness and hope. I am thankful that I have been able to conclude at least one chapter of the work I projected a long time ago. I am hopeful that I may not now be taking a final leave of my indulgent readers, but that, as I am sensible of little abatement in my bodily strength and of none in my ardour for study, they will bear with me yet a while if I should attempt to entertain them with fresh subjects of laughter and tears drawn from the comedy and the tragedy of man's endless quest after happiness and truth.

J. G. FRAZER.

I. Between Heaven And Earth

§ 1. Not to touch the Earth.

We have travelled far since we turned our backs on Nemi and set forth in quest of the secret of the Golden Bough. With the present volume we enter on the last stage of our long journey. The reader who has had the patience to follow the enquiry thus far may remember that at the outset two questions were proposed for answer: Why had the priest of Aricia to slay his predecessor? And why, before doing so, had he to pluck the Golden Bough? Of these two questions the first has now been answered. The priest of Aricia, if I am right, was one of those sacred kings or human divinities on whose life the welfare of the community and even the course of nature in general are believed to be intimately dependent. It does not appear that the subjects or worshippers of such a spiritual potentate form to themselves any very clear notion of the exact relationship in which they stand to him; probably their ideas on the point are vague and fluctuating, and we should err if we attempted to define the relationship with logical precision. All that the people know, or rather imagine, is that somehow they themselves, their cattle, and their crops are mysteriously bound up with their divine king, so that according as he is well or ill the community is healthy or sickly, the flocks and herds thrive or languish with disease, and the fields yield an abundant or a scanty harvest. The worst evil which they can conceive of is the natural death of their ruler, whether he succumb to sickness or old age, for in the opinion of his followers such a death would entail the most disastrous consequences on themselves and their possessions; fatal epidemics would sweep away man and beast, the earth would refuse her increase, nay the very frame of nature itself might be dissolved. To guard against these catastrophes it is necessary to put the king to death while he is still in the full bloom of his divine manhood, in order that his sacred life, transmitted in unabated force to his successor, may renew its youth, and thus by successive transmissions through a perpetual line of vigorous incarnations may remain eternally fresh and young, a pledge and security that men and animals shall in like manner renew their youth by a perpetual succession of generations, and that seedtime and harvest, and summer and winter, and rain and sunshine shall never fail. That, if my conjecture is right, was why the priest of Aricia, the King of the Wood at Nemi, had regularly to perish by the sword of his successor.

But we have still to ask, What was the Golden Bough? and why had each candidate for the Arician priesthood to pluck it before he could slay the priest? These questions I will now try to answer.

It will be well to begin by noticing two of those rules or taboos by which, as we have seen, the life of divine kings or priests is regulated. The first of the rules to which I desire to call the reader's attention is that the divine personage may not touch the ground with his foot. This rule was observed by the supreme pontiff of the Zapotecs in Mexico; he profaned his sanctity if he so much as touched the ground with his foot. Montezuma, emperor of Mexico, never set foot on the ground; he was always carried on the shoulders of noblemen, and if he lighted anywhere they laid rich tapestry for him to walk upon. For the Mikado of Japan to touch the ground with his foot was a shameful degradation; indeed, in the sixteenth century, it was enough to deprive him of his office. Outside his palace he was carried on men's shoulders; within it he walked on exquisitely wrought mats. The king and queen of Tahiti might not touch the ground anywhere but within their hereditary domains; for the ground on which they trod became sacred. In travelling from place to place they were carried on the shoulders of sacred men. They were always accompanied by several pairs of these sanctified attendants;

and when it became necessary to change their bearers, the king and queen vaulted on to the shoulders of their new bearers without letting their feet touch the ground. It was an evil omen if the king of Dosuma touched the ground, and he had to perform an expiatory ceremony. Within his palace the king of Persia walked on carpets on which no one else might tread; outside of it he was never seen on foot but only in a chariot or on horseback. In old days the king of Siam never set foot upon the earth, but was carried on a throne of gold from place to place. Formerly neither the kings of Uganda, nor their mothers, nor their queens might walk on foot outside of the spacious enclosures in which they lived. Whenever they went forth they were carried on the shoulders of men of the Buffalo clan, several of whom accompanied any of these royal personages on a journey and took it in turn to bear the burden. The king sat astride the bearer's neck with a leg over each shoulder and his feet tucked under the bearer's arms. When one of these royal carriers grew tired he shot the king on to the shoulders of a second man without allowing the royal feet to touch the ground. In this way they went at a great pace and travelled long distances in a day, when the king was on a journey. The bearers had a special hut in the king's enclosure in order to be at hand the moment they were wanted. Among the Bakuba or rather Bushongo, a nation in the southern region of the Congo, down to a few years ago persons of the royal blood were forbidden to touch the ground; they must sit on a hide, a chair, or the back of a slave, who crouched on hands and feet; their feet rested on the feet of others. When they travelled they were carried on the backs of men; but the king journeyed in a litter supported on shafts. Among the Ibo people about Awka, in Southern Nigeria, the priest of the Earth has to observe many taboos; for example, he may not see a corpse, and if he meets one on the road he must hide his eyes with his wristlet. He must abstain from many foods, such as eggs, birds of all sorts, mutton, dog, bush-buck, and so forth. He may neither wear nor touch a mask, and no masked man may enter his house. If a dog enters his house, it is killed and thrown out. As priest of the Earth he may not sit on the bare ground, nor eat things that have fallen on the ground, nor may earth be thrown at him. According to ancient Brahmanic ritual a king at his inauguration trod on a tiger's skin and a golden plate; he was shod with shoes of boar's skin, and so long as he lived thereafter he might not stand on the earth with his bare feet.

But besides persons who are permanently sacred or tabooed and are therefore permanently forbidden to touch the ground with their feet, there are others who enjoy the character of sanctity or taboo only on certain occasions, and to whom accordingly the prohibition in question only applies at the definite seasons during which they exhale the odour of sanctity. Thus among the Kayans or Bahaus of Central Borneo, while the priestesses are engaged in the performance of certain rites they may not step on the ground, and boards are laid for them to tread on. At a funeral ceremony observed by night among the Michemis, a Tibetan tribe near the northern frontier of Assam, a priest fantastically bedecked with tiger's teeth, many-coloured plumes, bells, and shells, executed a wild dance for the purpose of exorcising the evil spirits; then all fires were extinguished and a new light was struck by a man suspended by his feet from a beam in the ceiling; "he did not touch the ground," we are told, "in order to indicate that the light came from heaven." Again, newly born infants are strongly tabooed; accordingly in Loango they are not allowed to touch the earth. Among the Iluvans of Malabar the bridegroom on his wedding-day is bathed by seven young men and then carried or walks on planks from the bathing-place to the marriage booth; he may not touch the ground with his feet. With the Dyaks of Landak and Tajan, two districts of Dutch Borneo, it is a custom that for a certain time after marriage neither bride nor bridegroom may tread on the earth. Warriors, again, on the war-path are surrounded, so to say, by an atmosphere of taboo; hence some Indians of North America might not sit on the bare ground the whole time they were out on a warlike expedition. In Laos the hunting of elephants gives rise to many taboos; one of them is that the chief hunter may not touch the earth with his foot. Accordingly, when

he alights from his elephant, the others spread a carpet of leaves for him to step upon. German wiseacres recommended that when witches were led to the block or the stake, they should not be allowed to touch the bare earth, and a reason suggested for the rule was that if they touched the earth they might make themselves invisible and so escape. The sagacious author of *The Striped-petticoat Philosophy* in the eighteenth century ridicules the idea as mere silly talk. He admits, indeed, that the women were conveyed to the place of execution in carts; but he denies that there is any deep significance in the cart, and he is prepared to maintain this view by a chemical analysis of the timber of which the cart was built. To clinch his argument he appeals to plain matter of fact and his own personal experience. Not a single instance, he assures us with apparent satisfaction, can be produced of a witch who escaped the axe or the fire in this fashion. "I have myself," says he, "in my youth seen divers witches burned, some at Arnstadt, some at Ilmenau, some at Schwenda, a noble village between Arnstadt and Ilmenau, and some of them were pardoned and beheaded before being burned. They were laid on the earth in the place of execution and beheaded like any other poor sinner; whereas if they could have escaped by touching the earth, not one of them would have failed to do so."

Apparently holiness, magical virtue, taboo, or whatever we may call that mysterious quality which is supposed to pervade sacred or tabooed persons, is conceived by the primitive philosopher as a physical substance or fluid, with which the sacred man is charged just as a Leyden jar is charged with electricity; and exactly as the electricity in the jar can be discharged by contact with a good conductor, so the holiness or magical virtue in the man can be discharged and drained away by contact with the earth, which on this theory serves as an excellent conductor for the magical fluid. Hence in order to preserve the charge from running to waste, the sacred or tabooed personage must be carefully prevented from touching the ground; in electrical language he must be insulated, if he is not to be emptied of the precious substance or fluid with which he, as a vial, is filled to the brim. And in many cases apparently the insulation of the tabooed person is recommended as a precaution not merely for his own sake but for the sake of others; for since the virtue of holiness or taboo is, so to say, a powerful explosive which the smallest touch may detonate, it is necessary in the interest of the general safety to keep it within narrow bounds, lest breaking out it should blast, blight, and destroy whatever it comes into contact with.

But things as well as persons are often charged with the mysterious quality of holiness or taboo; hence it frequently becomes necessary for similar reasons to guard them also from coming into contact with the ground, lest they should in like manner be drained of their valuable properties and be reduced to mere commonplace material objects, empty husks from which the good grain has been eliminated. Thus, for example, the most sacred object of the Arunta tribe in Central Australia is, or rather used to be, a pole about twenty feet high, which is completely smeared with human blood, crowned with an imitation of a human head, and set up on the ground where the final initiatory ceremonies of young men are performed. A young gum-tree is chosen to form the pole, and it must be cut down and transported in such a way that it does not touch the earth till it is erected in its place on the holy ground. Apparently the pole represents some famous ancestor of the olden time.

Again, at a great dancing festival celebrated by the natives of Bartle Bay, in British New Guinea, a wild mango tree plays a prominent part. The tree must be self-sown, that is, really wild and so young that it has never flowered. It is chosen in the jungle some five or six weeks before the festival, and a circle is cleared round its trunk. From that time the master of the ceremonies and some eight to twenty other men, who have aided him in choosing the tree and in clearing the jungle, become strictly holy or tabooed. They sleep by themselves in a house into which no one else may intrude: they may not wash or drink water, nor even allow it

accidentally to touch their bodies: they are forbidden to eat boiled food and the fruit of mango trees: they may drink only the milk of a young coco-nut which has been baked, and they may eat certain fruits and vegetables, such as paw-paws (*Carica papaya*) and sugar-cane, but only on condition that they have been baked. All refuse of their food is kept in baskets in their sleeping-house and may not be removed from it till the festival is over. At the time when the men begin to observe these rules of abstinence, some six to ten women, members of the same clan as the master of the ceremonies, enter on a like period of mortification, avoiding the company of the other sex, and refraining from water, all boiled food, and the fruit of the mango tree. These fasting men and women are the principal dancers at the festival. The dancing takes place on a special platform in a temporary village which has been erected for the purpose. When the platform is about to be set up, the fasting men rub the stepping posts and then suck their hands for the purpose of extracting the ghost of any dead man that might chance to be in the post and might be injured by the weight of the platform pressing down on him. Having carefully extracted these poor souls, the men carry them away tenderly and set them free in the forest or the long grass.

On the day before the festival one of the fasting men cuts down the chosen mango tree in the jungle with a stone adze, which is never afterwards put to any other use; an iron tool may not be used for the purpose, though iron tools are now common enough in the district. In cutting down the mango they place nets on the ground to catch any leaves or twigs that might fall from the tree as it is being felled, and they surround the trunk with new mats to receive the chips which fly out under the adze of the woodman; for the chips may not drop on the earth. Once the tree is down, it is carried to the centre of the temporary village, the greatest care being taken to prevent it from coming into contact with the ground. But when it is brought into the village, the houses are connected with the top of the mango by means of long vines decorated with streamers. In the afternoon the fasting men and women begin to dance, the men bedizened with gay feathers, armlets, streamers, and anklets, the women flaunting in parti-coloured petticoats and sprigs of croton leaves, which wave from their waistbands as they dance. The dancing stops at sundown, and when the full moon rises over the shoulder of the eastern hill (for the date of the festival seems to be determined with reference to the time of the moon), two chiefs mount the gables of two houses on the eastern side of the square, and, their dusky figures standing sharply out against the moonlight, pray to the evil spirits to go away and not to hurt the people. Next morning pigs are killed by being speared as slowly as possible in order that they may squeal loud and long; for the people believe that the mango trees hear the squealing, and are pleased at the sound, and bear plenty of fruit, whereas if they heard no squeals they would bear no fruit. However, the trees have to content themselves with the squeals; the flesh of the pigs is eaten by the people. This ends the festival.

Next day the mango is taken down from the platform, wrapt in new mats, and carried by the fasting men to their sleeping house, where it is hung from the roof. But after an interval, it may be of many months, the tree is brought forth again. As to the reason for its reappearance in public opinions are divided; but some say that the tree itself orders the master of the ceremonies to bring it forth, appearing to him in his dreams and saying, "Let me smell the smoking fat of pigs. So will your pigs be healthy and your crops will grow." Be that as it may, out it comes, conducted by the fasting men in their dancing costume; and with it come in the solemn procession all the pots, spoons, cups and so forth used by the fasting men during their period of holiness or taboo, also all the refuse of their food which has been collected for months, and all the fallen leaves and chips of the mango in their bundles of mats. These holy relics are carried in front and the mango tree itself brings up the rear of the procession. While these sacred objects are being handed out of the house, the men who are present rush up, wipe off the hallowed dust which has accumulated on them, and smear it

over their own bodies, no doubt in order to steep themselves in their blessed influence. Thus the tree is carried as before to the centre of the temporary village, care being again taken not to let it touch the ground. Then one of the fasting men takes from a basket a number of young green mangoes, cuts them in pieces, and places them with his own hands in the mouths of his fellows, the other fasting men, who chew the pieces small and turning round spit the morsels in the direction of the setting sun, in order that "the sun should carry the mango bits over the whole country and everyone should know." A portion of the mango tree is then broken off and in the evening it is burnt along with the bundles of leaves, chips, and refuse of food, which have been stored up. What remains of the tree is taken to the house of the master of the ceremonies and hung over the fire-place; it will be brought out again at intervals and burned bit by bit, till all is consumed, whereupon a new mango will be cut down and treated in like manner. The ashes of the holy fire on each occasion are gathered by the people and preserved in the house of the master of the ceremonies.

The meaning of these ceremonies is not explained by the authorities who describe them; but we may conjecture that they are intended to fertilize the mango trees and cause them to bear a good crop of fruit. The central feature of the whole ritual is a wild mango tree, so young that it has never flowered: the men who cut it down, carry it into the village, and dance at the festival, are forbidden to eat mangoes: pigs are killed in order that their dying squeals may move the mango trees to bear fruit: at the end of the ceremonies pieces of young green mangoes are solemnly placed in the mouths of the fasting men and are by them spurted out towards the setting sun in order that the luminary may carry the fragments to every part of the country; and finally when after a longer or shorter interval the tree is wholly consumed, its place is supplied by another. All these circumstances are explained simply and naturally by the supposition that the young mango tree is taken as a representative of mangoes generally, that the dances are intended to quicken it, and that it is preserved, like a May-pole of old in England, as a sort of general fund of vegetable life, till the fund being exhausted by the destruction of the tree it is renewed by the importation of a fresh young tree from the forest. We can therefore understand why, as a storehouse of vital energy, the tree should be carefully kept from contact with the ground, lest the pent-up and concentrated energy should escape and dribbling away into the earth be dissipated to no purpose.

To take other instances of what we may call the conservation of energy in magic or religion by insulating sacred bodies from the ground, the natives of New Britain have a secret society called the Duk-duk, the members of which masquerade in petticoats of leaves and tall headdresses of wickerwork shaped like candle extinguishers, which descend to the shoulders of the wearers, completely concealing their faces. Thus disguised they dance about to the awe and terror, real or assumed, of the women and uninitiated, who take, or pretend to take, them for spirits. When lads are being initiated into the secrets of this august society, the adepts cut down some very large and heavy bamboos, one for each lad, and the novices carry them, carefully wrapt up in leaves, to the sacred ground, where they arrive very tired and weary, for they may not let the bamboos touch the ground nor the sun shine on them. Outside the fence of the enclosure every lad deposits his bamboo on a couple of forked sticks and covers it up with nut leaves. Among the Carrier Indians of North-Western America, who burned their dead, the ashes of a chief used to be placed in a box and set on the top of a pole beside his hut: the box was never allowed to touch the ground. In the Omaha tribe of North American Indians the sacred clam shell of the Elk clan was wrapt up from sight in a mat, placed on a stand, and never suffered to come in contact with the earth. The Cherokees and kindred Indian tribes of the United States used to have certain sacred boxes or arks, which they regularly took with them to war. Such a holy ark consisted of a square wooden box, which contained "certain consecrated vessels made by beloved superannuated women, and of such

various antiquated forms, as would have puzzled Adam to have given significant names to each." The leader of a war party and his attendant bore the ark by turns, but they never set it on the ground nor would they themselves sit on the bare earth while they were carrying it against the enemy. Where stones were plentiful they rested the ark on them; but where no stones were to be found, they deposited it on short logs. "The Indian ark is deemed so sacred and dangerous to be touched, either by their own sanctified warriors, or the spoiling enemy, that they durst not touch it upon any account. It is not to be meddled with by any, except the war chieftain and his waiter, under the penalty of incurring great evil. Nor would the most inveterate enemy touch it in the woods, for the very same reason." After their return home they used to hang the ark on the leader's red-painted war pole. At Sipi, near Simla, in Northern India, an annual fair is held, at which men purchase wives. A square box with a domed top figures prominently at the fair. It is fixed on two poles to be carried on men's shoulders, and long heavily-plaited petticoats hang from it nearly to the ground. Three sides of the box are adorned with the head and shoulders of a female figure and the fourth side with a black yak's tail. Four men bear the poles, each carrying an axe in his right hand. They dance round, with a swinging rhythmical step, to the music of drums and a pipe. The dance goes on for hours and is thought to avert ill-luck from the fair. It is said that the box is brought to Simla from a place sixty miles off by relays of men, who may not stop nor set the box on the ground the whole way. In Scotland, when water was carried from sacred wells to sick people, the water-vessel might not touch the earth. In some parts of Aberdeenshire the last bunch of standing corn, which is commonly viewed as very sacred, being the last refuge of the corn-spirit retreating before the reapers, is not suffered to touch the ground; the master or "guedman" sits down and receives each handful of corn as it is cut on his lap.

Again, sacred food may not under certain circumstances be brought into contact with the earth. Some of the aborigines of Victoria used to regard the fat of the emu as sacred, believing that it had once been the fat of the black man. In taking it from the bird or giving it to another they handled it reverently. Any one who threw away the fat or flesh of the emu was held accursed. "The late Mr. Thomas observed on one occasion, at Nerrennerre-Warreen, a remarkable exhibition of the effects of this superstition. An aboriginal child—one attending the school—having eaten some part of the flesh of an emu, threw away the skin. The skin fell to the ground, and this being observed by his parents, they showed by their gestures every token of horror. They looked upon their child as one utterly lost. His desecration of the bird was regarded as a sin for which there was no atonement." The Roumanians of Transylvania believe that "every fresh-baked loaf of wheaten bread is sacred, and should a piece inadvertently fall to the ground, it is hastily picked up, carefully wiped and kissed, and if soiled, thrown into the fire—partly as an offering to the dead, and partly because it were a heavy sin to throw away or tread upon any particle of it." At certain festivals in south-eastern Borneo the food which is consumed in the common house may not touch the ground; hence, a little before the festivals take place, foot-bridges made of thin poles are constructed from the private dwellings to the common house. When Hall was living with the Esquimaux and grew tired of eating walrus, one of the women brought the head and neck of a reindeer for him to eat. This venison had to be completely wrapt up before it was brought into the house, and once in the house it could only be placed on the platform which served as a bed. "To have placed it on the floor or on the platform behind the fire-lamp, among the walrus, musk-ox, and polar-bear meat which occupy a goodly portion of both of these places, would have horrified the whole town, as, according to the actual belief of the Innuits, not another walrus could be secured this year, and there would ever be trouble in catching any more." But in this case the real scruple appears to have been felt not so much at placing the venison on the ground as at bringing it into contact with walrus meat.

Sometimes magical implements and remedies are supposed to lose their virtue by contact with the ground, the volatile essence with which they are impregnated being no doubt drained off into the earth. Thus in the Boulia district of Queensland the magical bone, which the native sorcerer points at his victim as a means of killing him, is never by any chance allowed to touch the earth. The wives of rajahs in Macassar, a district of southern Celebes, pride themselves on their luxuriant tresses and are at great pains to oil and preserve them. Should the hair begin to grow thin, the lady resorts to many devices to stay the ravages of time; among other things she applies to her locks a fat extracted from crocodiles and venomous snakes. The unguent is believed to be very efficacious, but during its application the woman's feet may not come into contact with the ground, or all the benefit of the nostrum would be lost. Some people in antiquity believed that a woman in hard labour would be delivered if a spear, which had been wrenched from a man's body without touching the ground, were thrown over the house where the sufferer lay. Again, according to certain ancient writers, arrows which had been extracted from a body without coming into contact with the earth and laid under sleepers, acted as a love-charm. Among the peasantry of the north-east of Scotland the prehistoric weapons called celts went by the name of "thunderbolts" and were coveted as the sure bringers of success, always provided that they were not allowed to fall to the ground.

In ancient Gaul certain glass or paste beads attained great celebrity as amulets under the name of serpents' eggs; it was believed that serpents, coiling together in a wriggling, writhing mass, generated them from their slaver and shot them into the air from their hissing jaws. If a man was bold and dexterous enough to catch one of these eggs in his cloak before it touched the ground, he rode off on horseback with it at full speed, pursued by the whole pack of serpents, till he was saved by the interposition of a river, which the snakes could not pass. The proof of the egg being genuine was that if it were thrown into a stream it would float up against the current, even though it were hooped in gold. The Druids held these beads in high esteem; according to them, the precious objects could only be obtained on a certain day of the moon, and the peculiar virtue that resided in them was to secure success in law suits and free access to kings. Pliny knew of a Gaulish knight who was executed by the emperor Claudius for wearing one of these amulets. Under the name of Snake Stones (*glain neidr*) or Adder Stones the beads are still known in those parts of our own country where the Celtic population has lingered, with its immemorial superstitions, down to the present or recent times; and the old story of the origin of the beads from the slaver of serpents was believed by the modern peasantry of Cornwall, Wales, and Scotland as by the Druids of ancient Gaul. In Cornwall the time when the serpents united to fashion the beads was commonly said to be at or about Midsummer Eve; in Wales it was usually thought to be spring, especially the Eve of May Day, and even within recent years persons in the Principality have affirmed that they witnessed the great vernal congress of the snakes and saw the magic stone in the midst of the froth. The Welsh peasants believe the beads to possess medicinal virtues of many sorts and to be particularly efficacious for all maladies of the eyes. In Wales and Ireland the beads sometimes went by the name of the Magician's or Druid's Glass (*Gleini na Droedh* and *Glaine nan Druidhe*). Specimens of them may be seen in museums; some have been found in British barrows. They are of glass of various colours, green, blue, pink, red, brown, and so forth, some plain and some ribbed. Some are streaked with brilliant hues. The beads are perforated, and in the Highlands of Scotland the hole is explained by saying that when the bead has just been conflated by the serpents jointly, one of the reptiles sticks his tail through the still viscous glass. An Englishman who visited Scotland in 1699 found many of these beads in use throughout the country. They were hung from children's necks to protect them from whooping cough and other ailments. Snake Stones were, moreover, a charm to ensure prosperity in general and to repel evil spirits. When one of these priceless treasures

was not on active service, the owner kept it in an iron box to guard it against fairies, who, as is well known, cannot abide iron.

Pliny mentions several medicinal plants, which, if they were to retain their healing virtue, ought not to be allowed to touch the earth. The curious medical treatise of Marcellus, a native of Bordeaux in the fourth century of our era, abounds with prescriptions of this sort; and we can well believe the writer when he assures us that he borrowed many of his quaint remedies from the lips of common folk and peasants rather than from the books of the learned. Thus he tells us that certain white stones found in the stomachs of young swallows assuage the most persistent headache, always provided that their virtue be not impaired by contact with the ground. Another of his cures for the same malady is a wreath of fleabane placed on the head, but it must not touch the earth. On the same condition a decoction of the root of elecampane in wine kills worms; a fern, found growing on a tree, relieves the stomach-ache; and the pastern-bone of a hare is an infallible remedy for colic, provided, first, it be found in the dung of a wolf, second, that it does not touch the ground, and, third, that it is not touched by a woman. Another cure for colic is effected by certain hocus-pocus with a scrap of wool from the forehead of a first-born lamb, if only the lamb, instead of being allowed to fall to the ground, has been caught by hand as it dropped from its dam. In Andjra, a district of Morocco, the people attribute many magical virtues to rain-water which has fallen on the twenty-seventh day of April, Old Style; accordingly they collect it and use it for a variety of purposes. Mixed with tar and sprinkled on the door-posts it prevents snakes and scorpions from entering the house: sprinkled on heaps of threshed corn it protects them from the evil eye: mixed with an egg, henna, and seeds of cress it is an invaluable medicine for sick cows: poured over a plate, on which a passage of the Koran has been written, it strengthens the memory of schoolboys who drink it; and if you mix it with cowdung and red earth and paint rings with the mixture round the trunks of your fig-trees at sunset on Midsummer Day, you may depend on it that the trees will bear an excellent crop and will not shed their fruit untimely on the ground. But in order to preserve these remarkable properties it is absolutely essential that the water should on no account be allowed to touch the ground; some say too that it should not be exposed to the sun nor breathed upon by anybody. Again, the Moors ascribe great magical efficacy to what they call "the sultan of the oleander," which is a stalk of oleander with a cluster of four pairs of leaves springing from it. They think that the magical virtue is greatest if the stalk has been cut immediately before midsummer. But when the plant is brought into the house, the branches may not touch the ground, lest they should lose their marvellous qualities. In the olden days, before a Lithuanian or Prussian farmer went forth to plough for the first time in spring, he called in a wizard to perform a certain ceremony for the good of the crops. The sage seized a mug of beer with his teeth, quaffed the liquor, and then tossed the mug over his head. This signified that the corn in that year should grow taller than a man. But the mug might not fall to the ground; it had to be caught by somebody stationed at the wizard's back, for if it fell to the ground the consequence naturally would be that the corn also would be laid low on the earth.

§ 2. Not to see the Sun.

The second rule to be here noted is that the sun may not shine upon the divine person. This rule was observed both by the Mikado and by the pontiff of the Zapotecs. The latter "was looked upon as a god whom the earth was not worthy to hold, nor the sun to shine upon." The Japanese would not allow that the Mikado should expose his sacred person to the open air, and the sun was not thought worthy to shine on his head. The Indians of Granada, in South America, "kept those who were to be rulers or commanders, whether men or women, locked up for several years when they were children, some of them seven years, and this so close that they were not to see the sun, for if they should happen to see it they forfeited their

lordship, eating certain sorts of food appointed; and those who were their keepers at certain times went into their retreat or prison and scourged them severely.” Thus, for example, the heir to the throne of Bogota, who was not the son but the sister's son of the king, had to undergo a rigorous training from his infancy: he lived in complete retirement in a temple, where he might not see the sun nor eat salt nor converse with a woman: he was surrounded by guards who observed his conduct and noted all his actions: if he broke a single one of the rules laid down for him, he was deemed infamous and forfeited all his rights to the throne. So, too, the heir to the kingdom of Sogamoso, before succeeding to the crown, had to fast for seven years in the temple, being shut up in the dark and not allowed to see the sun or light. The prince who was to become Inca of Peru had to fast for a month without seeing light. On the day when a Brahman student of the Veda took a bath, to signify that the time of his studentship was at an end, he entered a cow-shed before sunrise, hung over the door a skin with the hair inside, and sat there; on that day the sun should not shine upon him.

Again, women after childbirth and their offspring are more or less tabooed all the world over; hence in Corea the rays of the sun are rigidly excluded from both mother and child for a period of twenty-one or a hundred days, according to their rank, after the birth has taken place. Among some of the tribes on the north-west coast of New Guinea a woman may not leave the house for months after childbirth. When she does go out, she must cover her head with a hood or mat; for if the sun were to shine upon her, it is thought that one of her male relations would die. Again, mourners are everywhere taboo; accordingly in mourning the Ainos of Japan wear peculiar caps in order that the sun may not shine upon their heads. During a solemn fast of three days the Indians of Costa Rica eat no salt, speak as little as possible, light no fires, and stay strictly indoors, or if they go out during the day they carefully cover themselves from the light of the sun, believing that exposure to the sun's rays would turn them black. On Yule Night it has been customary in parts of Sweden from time immemorial to go on pilgrimage, whereby people learn many secret things and know what is to happen in the coming year. As a preparation for this pilgrimage, “some secrete themselves for three days previously in a dark cellar, so as to be shut out altogether from the light of heaven. Others retire at an early hour of the preceding morning to some out-of-the-way place, such as a hay-loft, where they bury themselves in the hay, that they may neither see nor hear any living creature; and here they remain, in silence and fasting, until after sundown; whilst there are those who think it sufficient if they rigidly abstain from food on the day before commencing their wanderings. During this period of probation a man ought not to see fire, but should this have happened, he must strike a light with flint and steel, whereby the evil that would otherwise have ensued will be obviated.” During the sixteen days that a Pima Indian is undergoing purification for killing an Apache he may not see a blazing fire.

Acarmanian peasants tell of a handsome prince called Sunless, who would die if he saw the sun. So he lived in an underground palace on the site of the ancient Oeniadae, but at night he came forth and crossed the river to visit a famous enchantress who dwelt in a castle on the further bank. She was loth to part with him every night long before the sun was up, and as he turned a deaf ear to all her entreaties to linger, she hit upon the device of cutting the throats of all the cocks in the neighbourhood. So the prince, whose ear had learned to expect the shrill clarion of the birds as the signal of the growing light, tarried too long, and hardly had he reached the ford when the sun rose over the Aetolian mountains, and its fatal beams fell on him before he could regain his dark abode.

II. The Seclusion of Girls at Puberty

§ 1. Seclusion of Girls at Puberty in Africa.

Now it is remarkable that the foregoing two rules—not to touch the ground and not to see the sun—are observed either separately or conjointly by girls at puberty in many parts of the world. Thus amongst the negroes of Loango girls at puberty are confined in separate huts, and they may not touch the ground with any part of their bare body. Among the Zulus and kindred tribes of South Africa, when the first signs of puberty shew themselves “while a girl is walking, gathering wood, or working in the field, she runs to the river and hides herself among the reeds for the day, so as not to be seen by men. She covers her head carefully with her blanket that the sun may not shine on it and shrivel her up into a withered skeleton, as would result from exposure to the sun's beams. After dark she returns to her home and is secluded” in a hut for some time. During her seclusion, which lasts for about a fortnight, neither she nor the girls who wait upon her may drink any milk, lest the cattle should die. And should she be overtaken by the first flow while she is in the fields, she must, after hiding in the bush, scrupulously avoid all pathways in returning home. A reason for this avoidance is assigned by the A-Kamba of British East Africa, whose girls under similar circumstances observe the same rule. “A girl's first menstruation is a very critical period of her life according to A-Kamba beliefs. If this condition appears when she is away from the village, say at work in the fields, she returns at once to her village, but is careful to walk through the grass and not on a path, for if she followed a path and a stranger accidentally trod on a spot of blood and then cohabited with a member of the opposite sex before the girl was better again, it is believed that she would never bear a child.” She remains at home till the symptoms have ceased, and during this time she may be fed by none but her mother. When the flux is over, her father and mother are bound to cohabit with each other, else it is believed that the girl would be barren all her life. Similarly, among the Baganda, when a girl menstruated for the first time she was secluded and not allowed to handle food; and at the end of her seclusion the kinsman with whom she was staying (for among the Baganda young people did not reside with their parents) was obliged to jump over his wife, which with the Baganda is regarded as equivalent to having intercourse with her. Should the girl happen to be living near her parents at the moment when she attained to puberty, she was expected on her recovery to inform them of the fact, whereupon her father jumped over her mother. Were this custom omitted, the Baganda, like the A-Kamba, thought that the girl would never have children or that they would die in infancy. Thus the pretence of sexual intercourse between the parents or other relatives of the girl was a magical ceremony to ensure her fertility. It is significant that among the Baganda the first menstruation was often called a marriage, and the girl was spoken of as a bride. These terms so applied point to a belief like that of the Siamese, that a girl's first menstruation results from her defloration by one of a host of aerial spirits, and that the wound thus inflicted is repeated afterwards every month by the same ghostly agency. For a like reason, probably, the Baganda imagine that a woman who does not menstruate exerts a malign influence on gardens and makes them barren if she works in them. For not being herself fertilized by a spirit, how can she fertilize the garden?

Among the Amambwe, Winamwanga, Alungu, and other tribes of the great plateau to the west of Lake Tanganyika, “when a young girl knows that she has attained puberty, she forthwith leaves her mother's hut, and hides herself in the long grass near the village, covering her face with a cloth and weeping bitterly. Towards sunset one of the older women—who, as directress of the ceremonies, is called *nachimbusa*—follows her, places a

cooking-pot by the cross-roads, and boils therein a concoction of various herbs, with which she anoints the neophyte. At nightfall the girl is carried on the old woman's back to her mother's hut. When the customary period of a few days has elapsed, she is allowed to cook again, after first whitewashing the floor of the hut. But, by the following month, the preparations for her initiation are complete. The novice must remain in her hut throughout the whole period of initiation, and is carefully guarded by the old women, who accompany her whenever she leaves her quarters, veiling her head with a native cloth. The ceremonies last for at least one month." During this period of seclusion, drumming and songs are kept up within the mother's hut by the village women, and no male, except, it is said, the father of twins, is allowed to enter. The directress of the rites and the older women instruct the young girl as to the elementary facts of life, the duties of marriage, and the rules of conduct, decorum, and hospitality to be observed by a married woman. Amongst other things the damsel must submit to a series of tests such as leaping over fences, thrusting her head into a collar made of thorns, and so on. The lessons which she receives are illustrated by mud figures of animals and of the common objects of domestic life. Moreover, the directress of studies embellishes the walls of the hut with rude pictures, each with its special significance and song, which must be understood and learned by the girl. In the foregoing account the rule that a damsel at puberty may neither see the sun nor touch the ground seems implied by the statement that on the first discovery of her condition she hides in long grass and is carried home after sunset on the back of an old woman.

Among the Nyanja-speaking tribes of Central Angoniland, in British Central Africa, when a young girl finds that she has become a woman, she stands silent by the pathway leading to the village, her face wrapt in her calico. An old woman, finding her there, takes her off to a stream to bathe; after that the girl is secluded for six days in the old woman's hut. She eats her porridge out of an old basket and her relish, in which no salt is put, from a potsherd. The basket is afterwards thrown away. On the seventh day the aged matrons gather together, go with the girl to a stream, and throw her into the water. In returning they sing songs, and the old woman, who directs the proceedings, carries the maiden on her back. Then they spread a mat and fetch her husband and set the two down on the mat and shave his head. When it is dark, the old women escort the girl to her husband's hut. There the *ndiwo* relish is cooking on the fire. During the night the woman rises and puts some salt in the pot. Next morning, before dawn, while all is dark and the villagers have not yet opened their doors, the young married woman goes off and gives some of the relish to her mother and to the old woman who was mistress of the ceremony. This relish she sets down at the doors of their houses and goes away. And in the morning, when the sun has risen and all is light in the village, the two women open their doors, and there they find the relish with the salt in it; and they take of it and rub it on their feet and under their arm-pits; and if there are little children in the house, they eat of it. And if the young wife has a kinsman who is absent from the village, some of the relish is put on a splinter of bamboo and kept against his return, that when he comes he, too, may rub his feet with it. But if the woman finds that her husband is impotent, she does not rise betimes and go out in the dark to lay the relish at the doors of her mother and the old woman. And in the morning, when the sun is up and all the village is light, the old women open their doors, and see no relish there, and they know what has happened, and so they go wilily to work. For they persuade the husband to consult the diviner that he may discover how to cure his impotence; and while he is closeted with the wizard, they fetch another man, who finishes the ceremony with the young wife, in order that the relish may be given out and that people may rub their feet with it. But if it happens that when a girl comes to maturity she is not yet betrothed to any man, and therefore has no husband to go to, the matrons tell her that she must go to a lover instead. And this is the custom which they call *chigango*. So in the evening she takes her cooking pot and relish and hies away to the quarters of the young

bachelors, and they very civilly sleep somewhere else that night. And in the morning the girl goes back to the *kuka* hut.

From the foregoing account it appears that among these tribes no sooner has a girl attained to womanhood than she is expected and indeed required to give proof of her newly acquired powers by cohabiting with a man, whether her husband or another. And the abstinence from salt during the girl's seclusion is all the more remarkable because as soon as the seclusion is over she has to use salt for a particular purpose, to which the people evidently attach very great importance, since in the event of her husband proving impotent she is even compelled, apparently, to commit adultery in order that the salted relish may be given out as usual. In this connexion it deserves to be noted that among the Wagogo of German East Africa women at their monthly periods may not sleep with their husbands and may not put salt in food. A similar rule is observed by the Nyanja-speaking tribes of Central Angoniland, with whose puberty customs we are here concerned. Among them, we are told, "some superstition exists with regard to the use of salt. A woman during her monthly sickness must on no account put salt into any food she is cooking, lest she give her husband or children a disease called *tsempo* (*chitsoko soko*), but calls a child to put it in, or, as the song goes, '*Natira mchere ni bondo chifukwa n'kupanda mwana,*' and pours in the salt by placing it on her knee, because there is no child handy. Should a party of villagers have gone to make salt, all sexual intercourse is forbidden among the people of the village, until the people who have gone to make the salt (from grass) return. When they do come back, they must make their entry into the village at night, and no one must see them. Then one of the elders of the village sleeps with his wife. She then cooks some relish, into which she puts some of the salt. This relish is handed round to the people who went to make the salt, who rub it on their feet and under their armpits." Hence it would seem that in the mind of these people abstinence from salt is somehow associated with the idea of chastity. The same association meets us in the customs of many peoples in various parts of the world. For example, ancient Hindoo ritual prescribed that for three nights after a husband had brought his bride home, the two should sleep on the ground, remain chaste, and eat no salt. Among the Baganda, when a man was making a net, he had to refrain from eating salt and meat and from living with his wife; these restrictions he observed until the net took its first catch of fish. Similarly, so long as a fisherman's nets or traps were in the water, he must live apart from his wife, and neither he nor she nor their children might eat salt or meat. Evidence of the same sort could be multiplied, but without going into it further we may say that for some reason which is not obvious to us primitive man connects salt with the intercourse of the sexes and therefore forbids the use of that condiment in a variety of circumstances in which he deems continence necessary or desirable. As there is nothing which the savage regards as a greater bar between the sexes than the state of menstruation, he naturally prohibits the use of salt to women and girls at their monthly periods.

With the Awa-nkonde, a tribe at the northern end of Lake Nyassa, it is a rule that after her first menstruation a girl must be kept apart, with a few companions of her own sex, in a darkened house. The floor is covered with dry banana leaves, but no fire may be lit in the house, which is called "the house of the Awasungu," that is, "of maidens who have no hearts." When a girl reaches puberty, the Wafiomi of Eastern Africa hold a festival at which they make a noise with a peculiar kind of rattle. After that the girl remains for a year in the large common hut (*tembe*), where she occupies a special compartment screened off from the men's quarters. She may not cut her hair or touch food, but is fed by other women. At night, however, she quits the hut and dances with young men. Among the Barotse or Marotse of the upper Zambesi, "when a girl arrives at the age of puberty she is sent into the fields, where a hut is constructed far from the village. There, with two or three companions, she spends a

month, returning home late and starting before dawn in order not to be seen by the men. The women of the village visit her, bringing food and honey, and singing and dancing to amuse her. At the end of a month her husband comes and fetches her. It is only after this ceremony that women have the right to smear themselves with ochre." We may suspect that the chief reason why the girl during her seclusion may visit her home only by night is a fear, not so much lest she should be seen by men, as that she might be seen by the sun. Among the Wafiomi, as we have just learned, the young woman in similar circumstances is even free to dance with men, provided always that the dance is danced at night. The ceremonies among the Barotse or Marotse are somewhat more elaborate for a girl of the royal family. She is shut up for three months in a place which is kept secret from the public; only the women of her family know where it is. There she sits alone in the darkness of the hut, waited on by female slaves, who are strictly forbidden to speak and may communicate with her and with each other only by signs. During all this time, though she does nothing, she eats much, and when at last she comes forth, her appearance is quite changed, so fat has she grown. She is then led by night to the river and bathed in presence of all the women of the village. Next day she flaunts before the public in her gayest attire, her head bedecked with ornaments and her face mottled with red paint. So everybody knows what has happened.

Among the northern clans of the Thonga tribe, in South-Eastern Africa, about Delagoa Bay, when a girl thinks that the time of her nubility is near, she chooses an adoptive mother, perhaps in a neighbouring village. When the symptoms appear, she flies away from her own village and repairs to that of her adopted mother "to weep near her." After that she is secluded with several other girls in the same condition for a month. They are shut up in a hut, and whenever they come outside they must wear a dirty greasy cloth over their faces as a veil. Every morning they are led to a pool and plunged in the water up to their necks. Initiated girls or women accompany them, singing obscene songs and driving away with sticks any man who meets them; for no man may see a girl during this time of seclusion. If he saw her, it is said that he would be struck blind. On their return from the river, the girls are again imprisoned in the hut, where they remain wet and shivering, for they may not go near the fire to warm themselves. During their seclusion they listen to lascivious songs sung by grown women and are instructed in sexual matters. At the end of the month the adoptive mother brings the girl home to her true mother and presents her with a pot of beer.

Among the Caffre tribes of South Africa the period of a girl's seclusion at puberty varies with the rank of her father. If he is a rich man, it may last twelve days; if he is a chief, it may last twenty-four days. And when it is over, the girl rubs herself over with red earth, and strews finely powdered red earth on the ground, before she leaves the hut where she has been shut up. Finally, though she was forbidden to drink milk all the days of her separation, she washes out her mouth with milk, and is from that moment regarded as a full-grown woman. Afterwards, in the dusk of the evening, she carries away all the objects with which she came into contact in the hut during her seclusion and buries them secretly in a sequestered spot. When the girl is a chief's daughter the ceremonies at her liberation from the hut are more elaborate than usual. She is led forth from the hut by a son of her father's councillor, who, wearing the wings of a blue crane, the badge of bravery, on his head, escorts her to the cattle kraal, where cows are slaughtered and dancing takes place. Large skins full of milk are sent to the spot from neighbouring villages; and after the dances are over the girl drinks milk for the first time since the day she entered into retreat. But the first mouthful is drunk by the girl's aunt or other female relative who had charge of her during her seclusion; and a little of it is poured on the fire-place. Amongst the Zulus, when the girl was a princess royal, the end of her time of separation was celebrated by a sort of saturnalia: law and order were for the time being in abeyance: every man, woman, and child might appropriate any

article of property: the king abstained from interfering; and if during this reign of misrule he was robbed of anything he valued he could only recover it by paying a fine. Among the Basutos, when girls at puberty are bathed as usual by the matrons in a river, they are hidden separately in the turns and bends of the stream, and told to cover their heads, as they will be visited by a large serpent. Their limbs are then plastered with clay, little masks of straw are put on their faces, and thus arrayed they daily follow each other in procession, singing melancholy airs, to the fields, there to learn the labours of husbandry in which a great part of their adult life will be passed. We may suppose, though we are not told, that the straw masks which they wear in these processions are intended to hide their faces from the gaze of men and the rays of the sun.

Among the tribes in the lower valley of the Congo, such as the Bavili, when a girl arrives at puberty, she has to pass two or three months in seclusion in a small hut built for the purpose. The hair of her head is shaved off, and every day the whole of her body is smeared with a red paint (*takulla*) made from a powdered wood mixed with water. Some of her companions reside in the hut with her and prepare the paint for her use. A woman is appointed to take charge of the hut and to keep off intruders. At the end of her confinement she is taken to water by the women of her family and bathed; the paint is rubbed off her body, her arms and legs are loaded with brass rings, and she is led in solemn procession under an umbrella to her husband's house. If these ceremonies were not performed, the people believe that the girl would be barren or would give birth to monsters, that the rain would cease to fall, the earth to bear fruit, and the fishing to be successful. Such serious importance do these savages ascribe to the performance of rites which to us seem so childish.

§ 2. Seclusion of Girls at Puberty in New Ireland, New Guinea, and Indonesia.

In New Ireland girls are confined for four or five years in small cages, being kept in the dark and not allowed to set foot on the ground. The custom has been thus described by an eye-witness. "I heard from a teacher about some strange custom connected with some of the young girls here, so I asked the chief to take me to the house where they were. The house was about twenty-five feet in length, and stood in a reed and bamboo enclosure, across the entrance to which a bundle of dried grass was suspended to show that it was strictly '*tabu*.' Inside the house were three conical structures about seven or eight feet in height, and about ten or twelve feet in circumference at the bottom, and for about four feet from the ground, at which point they tapered off to a point at the top. These cages were made of the broad leaves of the pandanus-tree, sewn quite close together so that no light and little or no air could enter. On one side of each is an opening which is closed by a double door of plaited cocoa-nut tree and pandanus-tree leaves. About three feet from the ground there is a stage of bamboos which forms the floor. In each of these cages we were told there was a young woman confined, each of whom had to remain for at least four or five years, without ever being allowed to go outside the house. I could scarcely credit the story when I heard it; the whole thing seemed too horrible to be true. I spoke to the chief, and told him that I wished to see the inside of the cages, and also to see the girls that I might make them a present of a few beads. He told me that it was '*tabu*,' forbidden for any men but their own relations to look at them; but I suppose the promised beads acted as an inducement, and so he sent away for some old lady who had charge, and who alone is allowed to open the doors. While we were waiting we could hear the girls talking to the chief in a querulous way as if objecting to something or expressing their fears. The old woman came at length and certainly she did not seem a very pleasant jailor or guardian; nor did she seem to favour the request of the chief to allow us to see the girls, as she regarded us with anything but pleasant looks. However, she had to undo the door when the chief told her to do so, and then the girls peeped out at us, and, when told to do so, they held out their hands for the beads. I, however, purposely sat at some

distance away and merely held out the beads to them, as I wished to draw them quite outside, that I might inspect the inside of the cages. This desire of mine gave rise to another difficulty, as these girls were not allowed to put their feet to the ground all the time they were confined in these places. However, they wished to get the beads, and so the old lady had to go outside and collect a lot of pieces of wood and bamboo, which she placed on the ground, and then going to one of the girls, she helped her down and held her hand as she stepped from one piece of wood to another until she came near enough to get the beads I held out to her. I then went to inspect the inside of the cage out of which she had come, but could scarcely put my head inside of it, the atmosphere was so hot and stifling. It was clean and contained nothing but a few short lengths of bamboo for holding water. There was only room for the girl to sit or lie down in a crouched position on the bamboo platform, and when the doors are shut it must be nearly or quite dark inside. The girls are never allowed to come out except once a day to bathe in a dish or wooden bowl placed close to each cage. They say that they perspire profusely. They are placed in these stifling cages when quite young, and must remain there until they are young women, when they are taken out and have each a great marriage feast provided for them. One of them was about fourteen or fifteen years old, and the chief told us that she had been there for five years, but would soon be taken out now. The other two were about eight and ten years old, and they have to stay there for several years longer." A more recent observer has described the custom as it is observed on the western coast of New Ireland. He says: "A *buck* is the name of a little house, not larger than an ordinary hen-coop, in which a little girl is shut up, sometimes for weeks only, and at other times for months.... Briefly stated, the custom is this. Girls, on attaining puberty or betrothal, are enclosed in one of these little coops for a considerable time. They must remain there night and day. We saw two of these girls in two coops; the girls were not more than ten years old, still they were lying in a doubled-up position, as their little houses would not admit of them lying in any other way. These two coops were inside a large house; but the chief, in consideration of a present of a couple of tomahawks, ordered the ends to be torn out of the house to admit the light, so that we might photograph the *buck*. The occupant was allowed to put her face through an opening to be photographed, in consideration of another present." As a consequence of their long enforced idleness in the shade the girls grow fat and their dusky complexion bleaches to a more pallid hue. Both their corpulence and their pallor are regarded as beauties.

In Kabadi, a district of British New Guinea, "daughters of chiefs, when they are about twelve or thirteen years of age, are kept indoors for two or three years, never being allowed, under any pretence, to descend from the house, and the house is so shaded that the sun cannot shine on them." Among the Yabim and Bukaua, two neighbouring and kindred tribes on the coast of German New Guinea, a girl at puberty is secluded for some five or six weeks in an inner part of the house; but she may not sit on the floor, lest her uncleanness should cleave to it, so a log of wood is placed for her to squat on. Moreover, she may not touch the ground with her feet; hence if she is obliged to quit the house for a short time, she is muffled up in mats and walks on two halves of a coco-nut shell, which are fastened like sandals to her feet by creeping plants. During her seclusion she is in charge of her aunts or other female relatives. At the end of the time she bathes, her person is loaded with ornaments, her face is grotesquely painted with red stripes on a white ground, and thus adorned she is brought forth in public to be admired by everybody. She is now marriageable. Among the Ot Danoms of Borneo girls at the age of eight or ten years are shut up in a little room or cell of the house, and cut off from all intercourse with the world for a long time. The cell, like the rest of the house, is raised on piles above the ground, and is lit by a single small window opening on a lonely place, so that the girl is in almost total darkness. She may not leave the room on any pretext whatever, not even for the most necessary purposes. None of her family may see her

all the time she is shut up, but a single slave woman is appointed to wait on her. During her lonely confinement, which often lasts seven years, the girl occupies herself in weaving mats or with other handiwork. Her bodily growth is stunted by the long want of exercise, and when, on attaining womanhood, she is brought out, her complexion is pale and wax-like. She is now shewn the sun, the earth, the water, the trees, and the flowers, as if she were newly born. Then a great feast is made, a slave is killed, and the girl is smeared with his blood. In Ceram girls at puberty were formerly shut up by themselves in a hut which was kept dark. In Yap, one of the Caroline Islands, should a girl be overtaken by her first menstruation on the public road, she may not sit down on the earth, but must beg for a coco-nut shell to put under her. She is shut up for several days in a small hut at a distance from her parents' house, and afterwards she is bound to sleep for a hundred days in one of the special houses which are provided for the use of menstruous women.

§ 3. Seclusion of Girls at Puberty in the Torres Straits Islands and Northern Australia.

In the island of Mabuiag, Torres Straits, when the signs of puberty appear on a girl, a circle of bushes is made in a dark corner of the house. Here, decked with shoulder-belts, armllets, leglets just below the knees, and anklets, wearing a chaplet on her head, and shell ornaments in her ears, on her chest, and on her back, she squats in the midst of the bushes, which are piled so high round about her that only her head is visible. In this state of seclusion she must remain for three months. All this time the sun may not shine upon her, but at night she is allowed to slip out of the hut, and the bushes that hedge her in are then changed. She may not feed herself or handle food, but is fed by one or two old women, her maternal aunts, who are especially appointed to look after her. One of these women cooks food for her at a special fire in the forest. The girl is forbidden to eat turtle or turtle eggs during the season when the turtles are breeding; but no vegetable food is refused her. No man, not even her own father, may come into the house while her seclusion lasts; for if her father saw her at this time he would certainly have bad luck in his fishing, and would probably smash his canoe the very next time he went out in it. At the end of the three months she is carried down to a fresh-water creek by her attendants, hanging on to their shoulders in such a way that her feet do not touch the ground, while the women of the tribe form a ring round her, and thus escort her to the beach. Arrived at the shore, she is stripped of her ornaments, and the bearers stagger with her into the creek, where they immerse her, and all the other women join in splashing water over both the girl and her bearers. When they come out of the water one of the two attendants makes a heap of grass for her charge to squat upon. The other runs to the reef, catches a small crab, tears off its claws, and hastens back with them to the creek. Here in the meantime a fire has been kindled, and the claws are roasted at it. The girl is then fed by her attendants with the roasted claws. After that she is freshly decorated, and the whole party marches back to the village in a single rank, the girl walking in the centre between her two old aunts, who hold her by the wrists. The husbands of her aunts now receive her and lead her into the house of one of them, where all partake of food, and the girl is allowed once more to feed herself in the usual manner. A dance follows, in which the girl takes a prominent part, dancing between the husbands of the two aunts who had charge of her in her retirement.

Among the Yaraikanna tribe of Cape York Peninsula, in Northern Queensland, a girl at puberty is said to live by herself for a month or six weeks; no man may see her, though any woman may. She stays in a hut or shelter specially made for her, on the floor of which she lies supine. She may not see the sun, and towards sunset she must keep her eyes shut until the sun has gone down, otherwise it is thought that her nose will be diseased. During her seclusion she may eat nothing that lives in salt water, or a snake would kill her. An old woman waits upon her and supplies her with roots, yams, and water. Some tribes are wont to bury their girls at such seasons more or less deeply in the ground, perhaps in order to hide

them from the light of the sun. Thus the Larrakeeyah tribe in the northern territory of South Australia used to cover a girl up with dirt for three days at her first monthly period. In similar circumstances the Otati tribe, on the east coast of the Cape York Peninsula, make an excavation in the ground, where the girl squats. A bower is then built over the hole, and sand is thrown on the young woman till she is covered up to the hips. In this condition she remains for the first day, but comes out at night. So long as the period lasts, she stays in the bower during the day-time, but is not again covered with sand. Afterwards her body is painted red and white from the head to the hips, and she returns to the camp, where she squats first on the right side, then on the left side, and then on the lap of her future husband, who has been previously selected for her. Among the natives of the Pennefather River, in the Cape York Peninsula, Queensland, when a girl menstruates for the first time, her mother takes her away from the camp to some secluded spot, where she digs a circular hole in the sandy soil under the shade of a tree. In this hole the girl squats with crossed legs and is covered with sand from the waist downwards. A digging-stick is planted firmly in the sand on each side of her, and the place is surrounded by a fence of bushes except in front, where her mother kindles a fire. Here the girl stays all day, sitting with her arms crossed and the palms of her hands resting on the sand. She may not move her arms except to take food from her mother or to scratch herself; and in scratching herself she may not touch herself with her own hands, but must use for the purpose a splinter of wood, which, when it is not in use, is stuck in her hair. She may speak to nobody but her mother; indeed nobody else would think of coming near her. At evening she lays hold of the two digging-sticks and by their help frees herself from the superincumbent weight of sand and returns to the camp. Next morning she is again buried in the sand under the shade of the tree and remains there again till evening. This she does daily for five days. On her return at evening on the fifth day her mother decorates her with a waist-band, a forehead-band, and a necklet of pearl-shell, ties green parrot feathers round her arms and wrists and across her chest, and smears her body, back and front, from the waist upwards with blotches of red, white, and yellow paint. She has in like manner to be buried in the sand at her second and third menstruations, but at the fourth she is allowed to remain in camp, only signifying her condition by wearing a basket of empty shells on her back. Among the Kia blacks of the Prosperine River, on the east coast of Queensland, a girl at puberty has to sit or lie down in a shallow pit away from the camp; a rough hut of bushes is erected over her to protect her from the inclemency of the weather. There she stays for about a week, waited on by her mother and sister, the only persons to whom she may speak. She is allowed to drink water, but may not touch it with her hands; and she may scratch herself a little with a mussel-shell. This seclusion is repeated at her second and third monthly periods, but when the third is over she is brought to her husband bedecked with savage finery. Eagle-hawk or cockatoo feathers are stuck in her hair: a shell hangs over her forehead: grass bugles encircle her neck and an apron of opossum skin her waist: strings are tied to her arms and wrists; and her whole body is mottled with patterns drawn in red, white, and yellow pigments and charcoal.

Among the Uiyumkwi tribe in Red Island the girl lies at full length in a shallow trench dug in the foreshore, and sand is lightly thrown over her legs and body up to the breasts, which appear not to be covered. A rough shelter of boughs is then built over her, and thus she remains lying for a few hours. Then she and her attendant go into the bush and look for food, which they cook at a fire close to the shelter. They sleep under the boughs, the girl remaining secluded from the camp but apparently not being again buried. At the end of the symptoms she stands over hot stones and water is poured over her, till, trickling from her body on the stones, it is converted into steam and envelops her in a cloud of vapour. Then she is painted with red and white stripes and returns to the camp. If her future husband has already been chosen, she goes to him and they eat some food together, which the girl has previously brought from the bush. In Prince of Wales Island, Torres Strait, the treatment of

the patient is similar, but lasts for about two months. During the day she lies covered up with sand in a shallow hole on the beach, over which a hut is built. At night she may get out of the hole, but she may not leave the hut. Her paternal aunt looks after her, and both of them must abstain from eating turtle, dugong, and the heads of fish. Were they to eat the heads of fish no more fish would be caught. During the time of the girl's seclusion, the aunt who waits upon her has the right to enter any house and take from it anything she likes without payment, provided she does so before the sun rises. When the time of her retirement has come to an end, the girl bathes in the sea while the morning star is rising, and after performing various other ceremonies is readmitted to society. In Saibai, another island of Torres Straits, at her first monthly sickness a girl lives secluded in the forest for about a fortnight, during which no man may see her; even the women who have spoken to her in the forest must wash in salt water before they speak to a man. Two girls wait upon and feed the damsel, putting the food into her mouth, for she is not allowed to touch it with her own hands. Nor may she eat dugong and turtle. At the end of a fortnight the girl and her attendants bathe in salt water while the tide is running out. Afterwards they are clean, may again speak to men without ceremony, and move freely about the village. In Yam and Tutu a girl at puberty retires for a month to the forest, where no man nor even her own mother may look upon her. She is waited on by women who stand to her in a certain relationship (*mowai*), apparently her paternal aunts. She is blackened all over with charcoal and wears a long petticoat reaching below her knees. During her seclusion the married women of the village often assemble in the forest and dance, and the girl's aunts relieve the tedium of the proceedings by thrashing her from time to time as a useful preparation for matrimony. At the end of a month the whole party go into the sea, and the charcoal is washed off the girl. After that she is decorated, her body blackened again, her hair reddened with ochre, and in the evening she is brought back to her father's house, where she is received with weeping and lamentation because she has been so long away.

§ 4. Seclusion of Girls at Puberty among the Indians of North America.

Among the Indians of California a girl at her first menstruation "was thought to be possessed of a particular degree of supernatural power, and this was not always regarded as entirely defiling or malevolent. Often, however, there was a strong feeling of the power of evil inherent in her condition. Not only was she secluded from her family and the community, but an attempt was made to seclude the world from her. One of the injunctions most strongly laid upon her was not to look about her. She kept her head bowed and was forbidden to see the world and the sun. Some tribes covered her with a blanket. Many of the customs in this connection resembled those of the North Pacific Coast most strongly, such as the prohibition to the girl to touch or scratch her head with her hand, a special implement being furnished her for the purpose. Sometimes she could eat only when fed and in other cases fasted altogether. Some form of public ceremony, often accompanied by a dance and sometimes by a form of ordeal for the girl, was practised nearly everywhere. Such ceremonies were well developed in Southern California, where a number of actions symbolical of the girl's maturity and subsequent life were performed." Thus among the Maidu Indians of California a girl at puberty remained shut up in a small separate hut. For five days she might not eat flesh or fish nor feed herself, but was fed by her mother or other old woman. She had a basket, plate, and cup for her own use, and a stick with which to scratch her head, for she might not scratch it with her fingers. At the end of five days she took a warm bath and, while she still remained in the hut and plied the scratching-stick on her head, was privileged to feed herself with her own hands. After five days more she bathed in the river, after which her parents gave a great feast in her honour. At the feast the girl was dressed in her best, and anybody might ask her parents for anything he pleased, and they had to give it, even if it was the hand of their daughter in

marriage. During the period of her seclusion in the hut the girl was allowed to go by night to her parents' house and listen to songs sung by her friends and relations, who assembled for the purpose. Among the songs were some that related to the different roots and seeds which in these tribes it is the business of women to gather for food. While the singers sang, she sat by herself in a corner of the house muffled up completely in mats and skins; no man or boy might come near her. Among the Hupa, another Indian tribe of California, when a girl had reached maturity her male relatives danced all night for nine successive nights, while the girl remained apart, eating no meat and blindfolded. But on the tenth night she entered the house and took part in the last dance. Among the Wintun, another Californian tribe, a girl at puberty was banished from the camp and lived alone in a distant booth, fasting rigidly from animal food; it was death to any person to touch or even approach her.

In the interior of Washington State, about Colville, "the customs of the Indians, in relation to the treatment of females, are singular. On the first appearance of the menses, they are furnished with provisions, and sent into the woods, to remain concealed for two days; for they have a superstition, that if a man should be seen or met with during that time, death will be the consequence. At the end of the second day, the woman is permitted to return to the lodge, when she is placed in a hut just large enough for her to lie in at full length, in which she is compelled to remain for twenty days, cut off from all communication with her friends, and is obliged to hide her face at the appearance of a man. Provisions are supplied her daily. After this, she is required to perform repeated ablutions, before she can resume her place in the family. At every return, the women go into seclusion for two or more days." Among the Chinook Indians who inhabited the coast of Washington State, from Shoalwater Bay as far as Grey's Harbour, when a chief's daughter attained to puberty, she was hidden for five days from the view of the people; she might not look at them nor at the sky, nor might she pick berries. It was believed that if she were to look at the sky, the weather would be bad; that if she picked berries, it would rain; and that when she hung her towel of cedar-bark on a spruce-tree, the tree withered up at once. She went out of the house by a separate door and bathed in a creek far from the village. She fasted for some days, and for many days more she might not eat fresh food.

Amongst the Aht or Nootka Indians of Vancouver Island, when girls reach puberty they are placed in a sort of gallery in the house "and are there surrounded completely with mats, so that neither the sun nor any fire can be seen. In this cage they remain for several days. Water is given them, but no food. The longer a girl remains in this retirement the greater honour is it to the parents; but she is disgraced for life if it is known that she has seen fire or the sun during this initiatory ordeal." Pictures of the mythical thunder-bird are painted on the screens behind which she hides. During her seclusion she may neither move nor lie down, but must always sit in a squatting posture. She may not touch her hair with her hands, but is allowed to scratch her head with a comb or a piece of bone provided for the purpose. To scratch her body is also forbidden, as it is believed that every scratch would leave a scar. For eight months after reaching maturity she may not eat any fresh food, particularly salmon; moreover, she must eat by herself, and use a cup and dish of her own.

Among the Haida Indians of the Queen Charlotte Islands girls at puberty were secluded behind screens in the house for about twenty days. In some parts of the islands separate fires were provided for the girls, and they went out and in by a separate door at the back of the house. If a girl at such a time was obliged to go out by the front door, all the weapons, gambling-sticks, medicine, and other articles had to be removed from the house till her return, for otherwise it was thought that they would be unlucky; and if there was a good hunter in the house, he also had to go out at the same time on pain of losing his good luck if he remained. During several months or even half a year the girl was bound to wear a peculiar

cloak or hood made of cedar-bark, nearly conical in shape and reaching down below the breast, but open before the face. After the twenty days were over the girl took a bath; none of the water might be spilled, it had all to be taken back to the woods, else the girl would not live long. On the west coast of the islands the damsel might eat nothing but black cod for four years; for the people believed that other kinds of fish would become scarce if she partook of them. At Kloo the young woman at such times was forbidden to look at the sea, and for forty days she might not gaze at the fire; for a whole year she might not walk on the beach below high-water mark, because then the tide would come in, covering part of the food supply, and there would be bad weather. For five years she might not eat salmon, or the fish would be scarce; and when her family went to a salmon-creek, she landed from the canoe at the mouth of the creek and came to the smoke-house from behind; for were she to see a salmon leap, all the salmon might leave the creek. Among the Haidas of Masset it was believed that if the girl looked at the sky, the weather would be bad, and that if she stepped over a salmon-creek, all the salmon would disappear.

Amongst the Tlingit (Thlinkeet) or Kolosh Indians of Alaska, when a girl shewed signs of womanhood she used to be confined to a little hut or cage, which was completely blocked up with the exception of a small air-hole. In this dark and filthy abode she had to remain a year, without fire, exercise, or associates. Only her mother and a female slave might supply her with nourishment. Her food was put in at the little window; she had to drink out of the wing-bone of a white-headed eagle. The time of her seclusion was afterwards reduced in some places to six or three months or even less. She had to wear a sort of hat with long flaps, that her gaze might not pollute the sky; for she was thought unfit for the sun to shine upon, and it was imagined that her look would destroy the luck of a hunter, fisher, or gambler, turn things to stone, and do other mischief. At the end of her confinement her old clothes were burnt, new ones were made, and a feast was given, at which a slit was cut in her under lip parallel to the mouth, and a piece of wood or shell was inserted to keep the aperture open.

In the Tsetsaut tribe of British Columbia a girl at puberty wears a large hat of skin which comes down over her face and screens it from the sun. It is believed that if she were to expose her face to the sun or to the sky, rain would fall. The hat protects her face also against the fire, which ought not to strike her skin; to shield her hands she wears mittens. In her mouth she carries the tooth of an animal to prevent her own teeth from becoming hollow. For a whole year she may not see blood unless her face is blackened; otherwise she would grow blind. For two years she wears the hat and lives in a hut by herself, although she is allowed to see other people. At the end of two years a man takes the hat from her head and throws it away. In the Bilkula or Bella Coola tribe of British Columbia, when a girl attains puberty she must stay in the shed which serves as her bedroom, where she has a separate fireplace. She is not allowed to descend to the main part of the house, and may not sit by the fire of the family. For four days she is bound to remain motionless in a sitting posture. She fasts during the day, but is allowed a little food and drink very early in the morning. After the four days' seclusion she may leave her room, but only through a separate opening cut in the floor, for the houses are raised on piles. She may not yet come into the chief room. In leaving the house she wears a large hat which protects her face against the rays of the sun. It is believed that if the sun were to shine on her face her eyes would suffer. She may pick berries on the hills, but may not come near the river or sea for a whole year. Were she to eat fresh salmon she would lose her senses, or her mouth would be changed into a long beak.

Among the Tinneh Indians about Stuart Lake, Babine Lake, and Fraser Lake in British Columbia "girls verging on maturity, that is when their breasts begin to form, take swans' feathers mixed with human hair and plait bands, which they tie round their wrists and ankles to secure long life. At this time they are careful that the dishes out of which they eat, are used

by no other person, and wholly devoted to their own use; during this period they eat nothing but dog fish, and starvation *only* will drive them to eat either fresh fish or meat. When their first periodical sickness comes on, they are fed by their mothers or nearest female relation by *themselves*, and on no account will they touch their food with their own hands. They are at this time also careful not to touch their heads with their hands, and keep a small stick to scratch their heads with. They remain outside the lodge, all the time they are in this state, in a hut made for the purpose. During all this period they wear a skull-cap made of skin to fit very tight; this is never taken off until their first monthly sickness ceases; they also wear a strip of black paint about one inch wide across their eyes, and wear a fringe of shells, bones, etc., hanging down from their foreheads to below their eyes; and this is never taken off till the second monthly period arrives and ceases, when the nearest male relative makes a feast; after which she is considered a fully matured woman; but she has to refrain from eating anything fresh for one year after her first monthly sickness; she may however eat partridge, but it must be cooked in the crop of the bird to render it harmless. I would have thought it impossible to perform this feat had I not seen it done. The crop is blown out, and a small bent willow put round the mouth; it is then filled with water, and the meat being first minced up, put in also, then put on the fire and boiled till cooked. Their reason for hanging fringes before their eyes, is to hinder any bad medicine man from harming them during this critical period: they are very careful not to drink whilst facing a medicine man, and do so only when their backs are turned to him. All these habits are left off when the girl is a recognised woman, with the exception of their going out of the lodge and remaining in a hut, every time their periodical sickness comes on. This is a rigidly observed law with both single and married women.”

Among the Hareskin Tinnah a girl at puberty was secluded for five days in a hut made specially for the purpose; she might only drink out of a tube made from a swan's bone, and for a month she might not break a hare's bones, nor taste blood, nor eat the heart or fat of animals, nor birds' eggs. Among the Tinnah Indians of the middle Yukon valley, in Alaska, the period of the girl's seclusion lasts exactly a lunar month; for the day of the moon on which the symptoms first occur is noted, and she is sequestered until the same day of the next moon. If the season is winter, a corner of the house is curtained off for her use by a blanket or a sheet of canvas; if it is summer, a small tent is erected for her near the common one. Here she lives and sleeps. She wears a long robe and a large hood, which she must pull down over her eyes whenever she leaves the hut, and she must keep it down till she returns. She may not speak to a man nor see his face, much less touch his clothes or anything that belongs to him; for if she did so, though no harm would come to her, he would grow unmanly. She has her own dishes for eating out of and may use no other; at Kaltag she must suck the water through a swan's bone without applying her lips to the cup. She may eat no fresh meat or fish except the flesh of the porcupine. She may not undress, but sleeps with all her clothes on, even her mittens. In her socks she wears, next to the skin, the horny soles cut from the feet of a porcupine, in order that for the rest of her life her shoes may never wear out. Round her waist she wears a cord to which are tied the heads of femurs of a porcupine; because of all animals known to the Tinnah the porcupine suffers least in parturition, it simply drops its young and continues to walk or skip about as if nothing had happened. Hence it is easy to see that a girl who wears these portions of a porcupine about her waist, will be delivered just as easily as the animal. To make quite sure of this, if anybody happens to kill a porcupine big with young while the girl is undergoing her period of separation, the foetus is given to her, and she lets it slide down between her shirt and her body so as to fall on the ground like an infant. Here the imitation of childbirth is a piece of homoeopathic or imitative magic designed to facilitate the effect which it simulates.

Among the Thompson Indians of British Columbia, when a girl attained puberty, she was at once separated from all the people. A conical hut of fir branches and bark was erected at some little distance from the other houses, and in it the girl had to squat on her heels during the day. Often a deep circular hole was dug in the hut and the girl squatted in the hole, with her head projecting above the surface of the ground. She might quit the hut for various purposes in the early morning, but had always to be back at sunrise. On the first appearance of the symptoms her face was painted red all over, and the paint was renewed every morning during her term of seclusion. A heavy blanket swathed her body from top to toe, and during the first four days she wore a conical cap made of small fir branches, which reached below the breast but left an opening for the face. In her hair was fastened an implement made of deer-bone with which she scratched herself. For the first four days she might neither wash nor eat, but a little water was given her in a birch-bark cup painted red, and she sucked up the liquid through a tube made out of the leg of a crane, a swan, or a goose, for her lips might not touch the surface of the water. After the four days she was allowed, during the rest of the period of isolation, to eat, to wash, to lie down, to comb her hair, and to drink of streams and springs. But in drinking at these sources she had still to use her tube, otherwise the spring would dry up. While her seclusion lasted she performed by night various ceremonies, which were supposed to exert a beneficial influence on her future life. For example, she ran as fast as she could, praying at the same time to the Earth or Nature that she might be fleet of foot and tireless of limb. She dug trenches, in order that in after life she might be able to dig well and to work hard. These and other ceremonies she repeated for four nights or mornings in succession, four times each morning, and each time she supplicated the Dawn of the Day. Among the Lower Thompson Indians she carried a staff for one night; and when the day was breaking she leaned the staff against the stump of a tree and prayed to the Dawn that she might be blessed with a good husband, who was symbolized by the staff. She also wandered some nights to lonely parts of the mountains, where she would dance, imploring the spirits to pity and protect her during her future life; then, the dance and prayer over, she would lie down on the spot and fall asleep. Again, she carried four stones in her bosom to a spring, where she spat upon the stones and threw them one after the other into the water, praying that all disease might leave her, as these stones did. Also she ran four times in the early morning with two small stones in her bosom; and as she ran the stones slipped down between her bare body and her clothes and fell to the ground. At the same time she prayed to the Dawn that when she should be with child, she might be delivered as easily as she was delivered of these stones. But whatever exercises she performed or prayers she offered on the lonely mountains during the hours of darkness or while the morning light was growing in the east, she must always be back in her little hut before the sun rose. There she often passed the tedious hours away picking the needles, one by one, from the cones on two large branches of fir, which hung from the roof of her hut on purpose to provide her with occupation. And as she picked she prayed to the fir-branch that she might never be lazy, but always quick and active at work. During her seclusion, too, she had to make miniatures of all the articles that Indian women make, or used to make, such as baskets, mats, ropes, and thread. This she did in order that afterwards she might be able to make the real things properly. Four large fir-branches also were placed in front of the hut, so that when she went out or in, she had to step over them. The branches were renewed every morning and the old ones thrown away into the water, while the girl prayed, "May I never bewitch any man, nor my fellow-women! May it never happen!" The first four times that she went out and in, she prayed to the fir-branches, saying, "If ever I step into trouble or difficulties or step unknowingly inside the magical spell of some person, may you help me, O Fir-branches, with your power!" Every day she painted her face afresh, and she wore strings of parts of deer-hoofs round her ankles and knees, and tied to her waistband on either side, which rattled when she walked or ran. Even the shape of

the hut in which she lived was adapted to her future rather than to her present needs and wishes. If she wished to be tall, the hut was tall; if she wished to be short, it was low, sometimes so low that there was not room in it for her to stand erect, and she would lay the palm of her hand on the top of her head and pray to the Dawn that she might grow no taller. Her seclusion lasted four months. The Indians say that long ago it extended over a year, and that fourteen days elapsed before the girl was permitted to wash for the first time. The dress which she wore during her time of separation was afterwards taken to the top of a hill and burned, and the rest of her clothes were hung up on trees.

Among the Lillooet Indians of British Columbia, neighbours of the Thompsons, the customs observed by girls at puberty were similar. The damsels were secluded for a period of not less than one year nor more than four years, according to their own inclination and the wishes of their parents. Among the Upper Lillooets the hut in which the girl lodged was made of bushy fir-trees set up like a conical tent, the inner branches being lopped off, while the outer branches were closely interwoven and padded to form a roof. Every month or half-month the hut was shifted to another site or a new one erected. By day the girl sat in the hut; for the first month she squatted in a hole dug in the middle of it; and she passed the time making miniature baskets of birch-bark and other things, praying that she might be able to make the real things well in after years. At the dusk of the evening she left the hut and wandered about all night, but she returned before the sun rose. Before she quitted the hut at nightfall to roam abroad, she painted her face red and put on a mask of fir-branches, and in her hand, as she walked, she carried a basket-rattle to frighten ghosts and guard herself from evil. Among the Lower Lillooets, the girl's mask was often made of goat-skin, covering her head, neck, shoulders and breast, and leaving only a narrow opening from the brow to the chin. During the nocturnal hours she performed many ceremonies. Thus she put two smooth stones in her bosom and ran, and as they fell down between her body and her clothes, she prayed, saying, "May I always have easy child-births!" Now one of these stones represented her future child and the other represented the afterbirth. Also she dug trenches, praying that in the years to come she might be strong and tireless in digging roots; she picked leaves and needles from the fir-trees, praying that her fingers might be nimble in picking berries; and she tore sheets of birch-bark into shreds, dropping the shreds as she walked and asking that her hands might never tire and that she might make neat and fine work of birch-bark. Moreover, she ran and walked much that she might be light of foot. And every evening, when the shadows were falling, and every morning, when the day was breaking, she prayed to the Dusk of the Evening or to the Dawn of Day, saying, "O Dawn of Day!" or "O Dusk," as it might be, "may I be able to dig roots fast and easily, and may I always find plenty!" All her prayers were addressed to the Dusk of the Evening or the Dawn of Day. She supplicated both, asking for long life, health, wealth, and happiness.

Among the Shuswap Indians of British Columbia, who are neighbours of the Thompsons and Lillooets, "a girl on reaching maturity has to go through a great number of ceremonies. She must leave the village and live alone in a small hut on the mountains. She cooks her own food, and must not eat anything that bleeds. She is forbidden to touch her head, for which purpose she uses a comb with three points. Neither is she allowed to scratch her body, except with a painted deer-bone. She wears the bone and the comb suspended from her belt. She drinks out of a painted cup of birch-bark, and neither more nor less than the quantity it holds. Every night she walks about her hut, and plants willow twigs, which she has painted, and to the ends of which she has attached pieces of cloth, into the ground. It is believed that thus she will become rich in later life. In order to become strong she should climb trees and try to break off their points. She plays with *lehal* sticks that her future husbands might have good luck when gambling." During the day the girl stays in her hut and occupies herself in making

miniature bags, mats, and baskets, in sewing and embroidery, in manufacturing thread, twine, and so forth; in short she makes a beginning of all kinds of woman's work, in order that she may be a good housewife in after life. By night she roams the mountains and practises running, climbing, carrying burdens, and digging trenches, so that she may be expert at digging roots. If she has wandered far and daylight overtakes her, she hides herself behind a veil of fir branches; for no one, except her instructor or nearest relatives, should see her face during her period of seclusion. She wore a large robe painted red on the breast and sides, and her hair was done up in a knot at each ear.

Ceremonies of the same general type were probably observed by girls at puberty among all the Indian tribes of North America. But the record of them is far less full for the Central and Eastern tribes, perhaps because the settlers who first came into contact with the Red Man in these regions were too busy fighting him to find leisure, even if they had the desire, to study his manners and customs. However, among the Delaware Indians, a tribe in the extreme east of the continent, we read that "when a Delaware girl has her first monthly period, she must withdraw into a hut at some distance from the village. Her head is wrapped up for twelve days, so that she can see nobody, and she must submit to frequent vomits and fasting, and abstain from all labor. After this she is washed and new clothed, but confined to a solitary life for two months, at the close of which she is declared marriageable." Again, among the Cheyennes, an Indian tribe of the Missouri valley, a girl at her first menstruation is painted red all over her body and secluded in a special little lodge for four days. However, she may remain in her father's lodge provided that there are no charms ("medicine"), no sacred bundle, and no shield in it, or that these and all other objects invested with a sacred character have been removed. For four days she may not eat boiled meat; the flesh of which she partakes must be roasted over coals. Young men will not eat from the dish nor drink from the pot, which has been used by her; because they believe that were they to do so they would be wounded in the next fight. She may not handle nor even touch any weapon of war or any sacred object. If the camp moves, she may not ride a horse, but is mounted on a mare.

Among the Esquimaux also, in the extreme north of the continent, who belong to an entirely different race from the Indians, the attainment of puberty in the female sex is, or used to be, the occasion of similar observances. Thus among the Koniags, an Esquimau people of Alaska, a girl at puberty was placed in a small hut in which she had to remain on her hands and knees for six months; then the hut was enlarged a little so as to allow her to straighten her back, but in this posture she had to remain for six months more. All this time she was regarded as an unclean being with whom no one might hold intercourse. At the end of the year she was received back by her parents and a great feast held. Again, among the Malemut, and southward from the lower Yukon and adjacent districts, when a girl reaches the age of puberty she is considered unclean for forty days and must therefore live by herself in a corner of the house with her face to the wall, always keeping her hood over her head and her hair hanging dishevelled over her eyes. But if it is summer, she commonly lives in a rough shelter outside the house. She may not go out by day, and only once at night, when every one else is asleep. At the end of the period she bathes and is clothed in new garments, whereupon she may be taken in marriage. During her seclusion she is supposed to be enveloped in a peculiar atmosphere of such a sort that were a young man to come near enough for it to touch him, it would render him visible to every animal he might hunt, so that his luck as a hunter would be gone.

§ 5. Seclusion of Girls at Puberty among the Indians of South America.

When symptoms of puberty appeared on a girl for the first time, the Guaranis of Southern Brazil, on the borders of Paraguay, used to sew her up in her hammock, leaving only a small

opening in it to allow her to breathe. In this condition, wrapt up and shrouded like a corpse, she was kept for two or three days or so long as the symptoms lasted, and during this time she had to observe a most rigorous fast. After that she was entrusted to a matron, who cut the girl's hair and enjoined her to abstain most strictly from eating flesh of any kind until her hair should be grown long enough to hide her ears. Meanwhile the diviners drew omens of her future character from the various birds or animals that flew past or crossed her path. If they saw a parrot, they would say she was a chatterbox; if an owl, she was lazy and useless for domestic labours, and so on. In similar circumstances the Chiriguanos of south-eastern Bolivia hoisted the girl in her hammock to the roof, where she stayed for a month: the second month the hammock was let half-way down from the roof; and in the third month old women, armed with sticks, entered the hut and ran about striking everything they met, saying they were hunting the snake that had wounded the girl. The Lengua Indians of the Paraguayan Chaco under similar circumstances hang the girl in her hammock from the roof of the house, but they leave her there only three days and nights, during which they give her nothing to eat but a little Paraguay tea or boiled maize. Only her mother or grandmother has access to her; nobody else approaches or speaks to her. If she is obliged to leave the hammock for a little, her friends take great care to prevent her from touching the *Boyrusu*, which is an imaginary serpent that would swallow her up. She must also be very careful not to set foot on the droppings of fowls or animals, else she would suffer from sores on the throat and breast. On the third day they let her down from the hammock, cut her hair, and make her sit in a corner of the room with her face turned to the wall. She may speak to nobody, and must abstain from flesh and fish. These rigorous observances she must practise for nearly a year. Many girls die or are injured for life in consequence of the hardships they endure at this time. Their only occupations during their seclusion are spinning and weaving.

Among the Yuracares, an Indian tribe of Bolivia, at the eastern foot of the Andes, when a girl perceives the signs of puberty, she informs her parents. The mother weeps and the father constructs a little hut of palm leaves near the house. In this cabin he shuts up his daughter so that she cannot see the light, and there she remains fasting rigorously for four days. Meantime the mother, assisted by the women of the neighbourhood, has brewed a large quantity of the native intoxicant called *chicha*, and poured it into wooden troughs and palm leaves. On the morning of the fourth day, three hours before the dawn, the girl's father, having arrayed himself in his savage finery, summons all his neighbours with loud cries. The damsel is seated on a stone, and every guest in turn cuts off a lock of her hair, and running away hides it in the hollow trunk of a tree in the depths of the forest. When they have all done so and seated themselves again gravely in the circle, the girl offers to each of them a calabash full of very strong *chicha*. Before the wassailing begins, the various fathers perform a curious operation on the arms of their sons, who are seated beside them. The operator takes a very sharp bone of an ape, rubs it with a pungent spice, and then pinching up the skin of his son's arm he pierces it with the bone through and through, as a surgeon might introduce a seton. This operation he repeats till the young man's arm is riddled with holes at regular intervals from the shoulder to the wrist. Almost all who take part in the festival are covered with these wounds, which the Indians call *culucute*. Having thus prepared themselves to spend a happy day, they drink, play on flutes, sing and dance till evening. Rain, thunder, and lightning, should they befall, have no effect in damping the general enjoyment or preventing its continuance till after the sun has set. The motive for perforating the arms of the young men is to make them skilful hunters; at each perforation the sufferer is cheered by the promise of another sort of game or fish which the surgical operation will infallibly procure for him. The same operation is performed on the arms and legs of the girls, in order that they may be brave and strong; even the dogs are operated on with the intention of making them run down the game better. For five or six months afterwards the damsel must cover her head with bark and

refrain from speaking to men. The Yuracares think that if they did not submit a young girl to this severe ordeal, her children would afterwards perish by accidents of various kinds, such as the sting of a serpent, the bite of a jaguar, the fall of a tree, the wound of an arrow, or what not.

Among the Maticos or Mataguayos, an Indian tribe of the Gran Chaco, a girl at puberty has to remain in seclusion for some time. She lies covered up with branches or other things in a corner of the hut, seeing no one and speaking to no one, and during this time she may eat neither flesh nor fish. Meantime a man beats a drum in front of the house. Similarly among the Tobas, another Indian tribe of the same region, when a chief's daughter has just attained to womanhood, she is shut up for two or three days in the house, all the men of the tribe scour the country to bring in game and fish for a feast, and a Matico Indian is engaged to drum, sing, and dance in front of the house without cessation, day and night, till the festival is over. As the merrymaking lasts for two or three weeks, the exhaustion of the musician at the end of it may be readily conceived. Meat and drink are supplied to him on the spot where he pays his laborious court to the Muses. The proceedings wind up with a saturnalia and a drunken debauch. Among the Yaguas, an Indian tribe of the Upper Amazon, a girl at puberty is shut up for three months in a lonely hut in the forest, where her mother brings her food daily. When a girl of the Peguenches tribe perceives in herself the first signs of womanhood, she is secluded by her mother in a corner of the hut screened off with blankets, and is warned not to lift up her eyes on any man. Next day, very early in the morning and again after sunset, she is taken out by two women and made to run till she is tired; in the interval she is again secluded in her corner. On the following day she lays three packets of wool beside the path near the house to signify that she is now a woman. Among the Passes, Mauhes, and other tribes of Brazil the young woman in similar circumstances is hung in her hammock from the roof and has to fast there for a month or as long as she can hold out. One of the early settlers in Brazil, about the middle of the sixteenth century, has described the severe ordeal which damsels at puberty had to undergo among the Indians on the south-east coast of that country, near what is now Rio de Janeiro. When a girl had reached this critical period of life, her hair was burned or shaved off close to the head. Then she was placed on a flat stone and cut with the tooth of an animal from the shoulders all down the back, till she ran with blood. Next the ashes of a wild gourd were rubbed into the wounds; the girl was bound hand and foot, and hung in a hammock, being enveloped in it so closely that no one could see her. Here she had to stay for three days without eating or drinking. When the three days were over, she stepped out of the hammock upon the flat stone, for her feet might not touch the ground. If she had a call of nature, a female relation took the girl on her back and carried her out, taking with her a live coal to prevent evil influences from entering the girl's body. Being replaced in her hammock, she was now allowed to get some flour, boiled roots, and water, but might not taste salt or flesh. Thus she continued to the end of the first monthly period, at the expiry of which she was gashed on the breast and belly as well as all down the back. During the second month she still stayed in her hammock, but her rule of abstinence was less rigid, and she was allowed to spin. The third month she was blackened with a certain pigment and began to go about as usual.

Amongst the Macuis of British Guiana, when a girl shews the first signs of puberty, she is hung in a hammock at the highest point of the hut. For the first few days she may not leave the hammock by day, but at night she must come down, light a fire, and spend the night beside it, else she would break out in sores on her neck, throat, and other parts of her body. So long as the symptoms are at their height, she must fast rigorously. When they have abated, she may come down and take up her abode in a little compartment that is made for her in the darkest corner of the hut. In the morning she may cook her food, but it must be at a separate

fire and in a vessel of her own. After about ten days the magician comes and undoes the spell by muttering charms and breathing on her and on the more valuable of the things with which she has come in contact. The pots and drinking-vessels which she used are broken and the fragments buried. After her first bath, the girl must submit to be beaten by her mother with thin rods without uttering a cry. At the end of the second period she is again beaten, but not afterwards. She is now "clean," and can mix again with people. Other Indians of Guiana, after keeping the girl in her hammock at the top of the hut for a month, expose her to certain large ants, whose bite is very painful. Sometimes, in addition to being stung with ants, the sufferer has to fast day and night so long as she remains slung up on high in her hammock, so that when she comes down she is reduced to a skeleton. The intention of stinging her with ants is said to be to make her strong to bear the burden of maternity. Amongst the Uaupes of Brazil a girl at puberty is secluded in the house for a month, and allowed only a small quantity of bread and water. Then she is taken out into the midst of her relations and friends, each of whom gives her four or five blows with pieces of *sipo* (an elastic climber), till she falls senseless or dead. If she recovers, the operation is repeated four times at intervals of six hours, and it is considered an offence to the parents not to strike hard. Meantime, pots of meats and fish have been made ready; the *sipos* are dipped into them and then given to the girl to lick, who is now considered a marriageable woman.

The custom of stinging the girl at such times with ants or beating her with rods is intended, we may be sure, not as a punishment or a test of endurance, but as a purification, the object being to drive away the malignant influences with which a girl in this condition is believed to be beset and enveloped. Examples of purification, by beating, by incisions in the flesh, and by stinging with ants, have already come before us. In some Indian tribes of Brazil and Guiana young men do not rank as warriors and may not marry till they have passed through a terrible ordeal, which consists in being stung by swarms of venomous ants whose bite is like fire. Thus among the Mauhes on the Tapajós river, a southern tributary of the Amazon, boys of eight to ten years are obliged to thrust their arms into sleeves stuffed with great ferocious ants, which the Indians call *tocandeira* (*Cryptocerus atratus*, F.). When the young victim shrieks with pain, an excited mob of men dances round him, shouting and encouraging him till he falls exhausted to the ground. He is then committed to the care of old women, who treat his fearfully swollen arms with fresh juice of the manioc; and on his recovery he has to shew his strength and skill in bending a bow. This cruel ordeal is commonly repeated again and again, till the lad has reached his fourteenth year and can bear the agony without betraying any sign of emotion. Then he is a man and can marry. A lad's age is reckoned by the number of times he has passed through the ordeal. An eye-witness has described how a young Mauhe hero bore the torture with an endurance more than Spartan, dancing and singing, with his arms cased in the terrible mittens, before every cabin of the great common house, till pallid, staggering, and with chattering teeth he triumphantly laid the gloves before the old chief and received the congratulations of the men and the caresses of the women; then breaking away from his friends and admirers he threw himself into the river and remained in its cool soothing water till nightfall. Similarly among the Ticunas of the Upper Amazon, on the border of Peru, the young man who would take his place among the warriors must plunge his arm into a sort of basket full of venomous ants and keep it there for several minutes without uttering a cry. He generally falls backwards and sometimes succumbs to the fever which ensues; hence as soon as the ordeal is over the women are prodigal of their attentions to him, and rub the swollen arm with a particular kind of herb. Ordeals of this sort appear to be in vogue among the Indians of the Rio Negro as well as of the Amazon. Among the Rucuyennes, a tribe of Indians in the north of Brazil, on the borders of Guiana, young men who are candidates for marriage must submit to be stung all over their persons not only with ants but with wasps, which are applied to their naked bodies in curious instruments of trellis-

work shaped like fantastic quadrupeds or birds. The patient invariably falls down in a swoon and is carried like dead to his hammock, where he is tightly lashed with cords. As they come to themselves, they writhe in agony, so that their hammocks rock violently to and fro, causing the hut to shake as if it were about to collapse. This dreadful ordeal is called by the Indians a *maraké*.

The same ordeal, under the same name, is also practised by the Wayanas, an Indian tribe of French Guiana, but with them, we are told, it is no longer deemed an indispensable preliminary to marriage; "it is rather a sort of national medicine administered chiefly to the youth of both sexes." Applied to men, the *maraké*, as it is called, "sharpen them, prevents them from being heavy and lazy, makes them active, brisk, industrious, imparts strength, and helps them to shoot well with the bow; without it the Indians would always be slack and rather sickly, would always have a little fever, and would lie perpetually in their hammocks. As for the women, the *maraké* keeps them from going to sleep, renders them active, alert, brisk, gives them strength and a liking for work, makes them good housekeepers, good workers at the stockade, good makers of *cachiri*. Every one undergoes the *maraké* at least twice in his life, sometimes thrice, and oftener if he likes. It may be had from the age of about eight years and upward, and no one thinks it odd that a man of forty should voluntarily submit to it." Similarly the Indians of St. Juan Capistrano in California used to be branded on some part of their bodies, generally on the right arm, but sometimes on the leg also, not as a proof of manly fortitude, but because they believed that the custom "added greater strength to the nerves, and gave a better pulse for the management of the bow." Afterwards "they were whipped with nettles, and covered with ants, that they might become robust, and the infliction was always performed in summer, during the months of July and August, when the nettle was in its most fiery state. They gathered small bunches, which they fastened together, and the poor deluded Indian was chastised, by inflicting blows with them upon his naked limbs, until unable to walk; and then he was carried to the nest of the nearest and most furious species of ants, and laid down among them, while some of his friends, with sticks, kept annoying the insects to make them still more violent. What torments did they not undergo! What pain! What hellish inflictions! Yet their faith gave them power to endure all without a murmur, and they remained as if dead. Having undergone these dreadful ordeals, they were considered as invulnerable, and believed that the arrows of their enemies could no longer harm them." Among the Alur, a tribe inhabiting the south-western region of the upper Nile, to bury a man in an ant-hill and leave him there for a while is the regular treatment for insanity.

In like manner it is probable that beating or scourging as a religious or ceremonial rite was originally a mode of purification. It was meant to wipe off and drive away a dangerous contagion, whether personified as demoniacal or not, which was supposed to be adhering physically, though invisibly, to the body of the sufferer. The pain inflicted on the person beaten was no more the object of the beating than it is of a surgical operation with us; it was a necessary accident, that was all. In later times such customs were interpreted otherwise, and the pain, from being an accident, became the prime object of the ceremony, which was now regarded either as a test of endurance imposed upon persons at critical epochs of life, or as a mortification of the flesh well pleasing to the god. But asceticism, under any shape or form, is never primitive. The savage, it is true, in certain circumstances will voluntarily subject himself to pains and privations which appear to us wholly needless; but he never acts thus unless he believes that some solid temporal advantage is to be gained by so doing. Pain for the sake of pain, whether as a moral discipline in this life or as a means of winning a glorious immortality hereafter, is not an object which he sets himself deliberately to pursue.

If this view is correct, we can understand why so many Indian tribes of South America compel the youth of both sexes to submit to these painful and sometimes fatal ordeals. They

imagine that in this way they rid the young folk of certain evils inherent in youth, especially at the critical age of puberty; and when they picture to themselves the evils in a personal form as dangerous spirits or demons, the ceremony of their expulsion may in the strict sense be termed an exorcism. This certainly appears to be the interpretation which the Banivas of the Orinoco put upon the cruel scourgings which they inflict on girls at puberty. At her first menstruation a Baniva girl must pass several days and nights in her hammock, almost motionless and getting nothing to eat and drink but water and a little manioc. While she lies there, the suitors for her hand apply to her father, and he who can afford to give most for her or can prove himself the best man, is promised the damsel in marriage. The fast over, some old men enter the hut, bandage the girl's eyes, cover her head with a bonnet of which the fringes fall on her shoulders, and then lead her forth and tie her to a post set up in an open place. The head of the post is carved in the shape of a grotesque face. None but the old men may witness what follows. Were a woman caught peeping and prying, it would go ill with her; she would be marked out for the vengeance of the demon, who would make her expiate her crime at the very next moon by madness or death. Every participant in the ceremony comes armed with a scourge of cords or of fish skins; some of them reinforce the virtue of the instrument by tying little sharp stones to the end of the thongs. Then, to the dismal and deafening notes of shell-trumpets blown by two or three supernumeraries, the men circle round and round the post, every one applying his scourge as he passes to the girl's back, till it streams with blood. At last the musicians, winding tremendous blasts on their trumpets against the demon, advance and touch the post in which he is supposed to be incorporate. Then the blows cease to descend; the girl is untied, often in a fainting state, and carried away to have her wounds washed and simples applied to them. The youngest of the executioners, or rather of the exorcists, hastens to inform her betrothed husband of the happy issue of the exorcism. "The spirit," he says, "had cast thy beloved into a sleep as deep almost as that of death. But we have rescued her from his attacks, and laid her down in such and such a place. Go seek her." Then going from house to house through the village he cries to the inmates, "Come, let us burn the demon who would have taken possession of such and such a girl, our friend." The bridegroom at once carries his wounded and suffering bride to his own house; and all the people gather round the post for the pleasure of burning it and the demon together. A great pile of firewood has meanwhile been heaped up about it, and the women run round the pyre cursing in shrill voices the wicked spirit who has wrought all this evil. The men join in with hoarser cries and animate themselves for the business in hand by deep draughts of an intoxicant which has been provided for the occasion by the parents-in-law. Soon the bridegroom, having committed the bride to the care of his mother, appears on the scene brandishing a lighted torch. He addresses the demon with bitter mockery and reproaches; informs him that the fair creature on whom he, the demon, had nefarious designs, is now his, the bridegroom's, blooming spouse; and shaking his torch at the grinning head on the post, he screams out, "This is how the victims of thy persecution take vengeance on thee!" With these words he puts a light to the pyre. At once the drums strike up, the trumpets blare, and men, women, and children begin to dance. In two long rows they dance, the men on one side, the women on the other, advancing till they almost touch and then retiring again. After that the two rows join hands, and forming a huge circle trip it round and round the blaze, till the post with its grotesque face is consumed in the flames and nothing of the pyre remains but a heap of red and glowing embers. "The evil spirit has been destroyed. Thus delivered from her persecutor, the young wife will be free from sickness, will not die in childbed, and will bear many children to her husband." From this account it appears that the Banivas attribute the symptoms of puberty in girls to the wounds inflicted on them by an amorous devil, who, however, can be not only exorcised but burnt to ashes at the stake.

§ 6. Seclusion of Girls at Puberty in India and Cambodia.

When a Hindoo maiden reaches maturity she is kept in a dark room for four days, and is forbidden to see the sun. She is regarded as unclean; no one may touch her. Her diet is restricted to boiled rice, milk, sugar, curd, and tamarind without salt. On the morning of the fifth day she goes to a neighbouring tank, accompanied by five women whose husbands are alive. Smearred with turmeric water, they all bathe and return home, throwing away the mat and other things that were in the room. The Rarhi Brahmans of Bengal compel a girl at puberty to live alone, and do not allow her to see the face of any male. For three days she remains shut up in a dark room, and has to undergo certain penances. Fish, flesh, and sweetmeats are forbidden her; she must live upon rice and ghee. Among the Tiyans of Malabar a girl is thought to be polluted for four days from the beginning of her first menstruation. During this time she must keep to the north side of the house, where she sleeps on a grass mat of a particular kind, in a room festooned with garlands of young coco-nut leaves. Another girl keeps her company and sleeps with her, but she may not touch any other person, tree or plant. Further, she may not see the sky, and woe betide her if she catches sight of a crow or a cat! Her diet must be strictly vegetarian, without salt, tamarinds, or chillies. She is armed against evil spirits by a knife, which is placed on the mat or carried on her person. Among the Kappiliyans of Madura and Tinnevely a girl at her first monthly period remains under pollution for thirteen days, either in a corner of the house, which is screened off for her use by her maternal uncle, or in a temporary hut, which is erected by the same relative on the common land of the village. On the thirteenth day she bathes in a tank, and, on entering the house, steps over a pestle and a cake. Near the entrance some food is placed and a dog is allowed to partake of it; but his enjoyment is marred by suffering, for while he eats he receives a sound thrashing, and the louder he howls the better, for the larger will be the family to which the young woman will give birth; should there be no howls, there will be no children. The temporary hut in which the girl passed the days of her seclusion is burnt down, and the pots which she used are smashed to shivers. Similarly among the Parivarams of Madura, when a girl attains to puberty she is kept for sixteen days in a hut, which is guarded at night by her relations; and when her sequestration is over the hut is burnt down and the pots she used are broken into very small pieces, because they think that if rain-water gathered in any of them, the girl would be childless. The Pulayars of Travancore build a special hut in the jungle for the use of a girl at puberty; there she remains for seven days. No one else may enter the hut, not even her mother. Women stand a little way off and lay down food for her. At the end of the time she is brought home, clad in a new or clean cloth, and friends are treated to betel-nut, toddy, and arack. Among the Singhalese a girl at her first menstruation is confined to a room, where she may neither see nor be seen by any male. After being thus secluded for two weeks she is taken out, with her face covered, and is bathed by women at the back of the house. Near the bathing-place are kept branches of any milk-bearing tree, usually of the *jak*-tree. In some cases, while the time of purification or uncleanness lasts, the maiden stays in a separate hut, which is afterwards burnt down.

In Cambodia a girl at puberty is put to bed under a mosquito curtain, where she should stay a hundred days. Usually, however, four, five, ten, or twenty days are thought enough; and even this, in a hot climate and under the close meshes of the curtain, is sufficiently trying. According to another account, a Cambodian maiden at puberty is said to "enter into the shade." During her retirement, which, according to the rank and position of her family, may last any time from a few days to several years, she has to observe a number of rules, such as not to be seen by a strange man, not to eat flesh or fish, and so on. She goes nowhere, not even to the pagoda. But this state of seclusion is discontinued during eclipses; at such times she goes forth and pays her devotions to the monster who is supposed to cause eclipses by catching the heavenly bodies between his teeth. This permission to break her rule of

retirement and appear abroad during an eclipse seems to shew how literally the injunction is interpreted which forbids maidens entering on womanhood to look upon the sun.

§ 7. Seclusion of Girls at Puberty in Folk-tales.

A superstition so widely diffused as this might be expected to leave traces in legends and folk-tales. And it has done so. In a Danish story we read of a princess who was fated to be carried off by a warlock if ever the sun shone on her before she had passed her thirtieth year; so the king her father kept her shut up in the palace, and had all the windows on the east, south, and west sides blocked up, lest a sunbeam should fall on his darling child, and he should thus lose her for ever. Only at evening, when the sun was down, might she walk for a little in the beautiful garden of the castle. In time a prince came a-wooing, followed by a train of gorgeous knights and squires on horses all ablaze with gold and silver. The king said the prince might have his daughter to wife on condition that he would not carry her away to his home till she was thirty years old but would live with her in the castle, where the windows looked out only to the north. The prince agreed, so married they were. The bride was only fifteen, and fifteen more long weary years must pass before she might step out of the gloomy donjon, breathe the fresh air, and see the sun. But she and her gallant young bridegroom loved each other and they were happy. Often they sat hand in hand at the window looking out to the north and talked of what they would do when they were free. Still it was a little dull to look out always at the same window and to see nothing but the castle woods, and the distant hills, and the clouds drifting silently over them. Well, one day it happened that all the people in the castle had gone away to a neighbouring castle to witness a tournament and other gaieties, and the two young folks were left as usual all alone at the window looking out to the north. They sat silent for a time gazing away to the hills. It was a grey sad day, the sky was overcast, and the weather seemed to draw to rain. At last the prince said, "There will be no sunshine to-day. What if we were to drive over and join the rest at the tournament?" His young wife gladly consented, for she longed to see more of the world than those eternal green woods and those eternal blue hills, which were all she ever saw from the window. So the horses were put into the coach, and it rattled up to the door, and in they got and away they drove. At first all went well. The clouds hung low over the woods, the wind sighed in the trees, a drearier day you could hardly imagine. So they joined the rest at the other castle and took their seats to watch the jousting in the lists. So intent were they in watching the gay spectacle of the prancing steeds, the fluttering pennons, and the glittering armour of the knights, that they failed to mark the change, the fatal change, in the weather. For the wind was rising and had begun to disperse the clouds, and suddenly the sun broke through, and the glory of it fell like an aureole on the young wife, and at once she vanished away. No sooner did her husband miss her from his side than he, too, mysteriously disappeared. The tournament broke up in confusion, the bereft father hastened home, and shut himself up in the dark castle from which the light of life had departed. The green woods and the blue hills could still be seen from the window that looked to the north, but the young faces that had gazed out of it so wistfully were gone, as it seemed, for ever.

A Tyrolese story tells how it was the doom of a lovely maiden with golden hair to be transported into the belly of a whale if ever a sunbeam fell on her. Hearing of the fame of her beauty the king of the country sent for her to be his bride, and her brother drove the fair damsel to the palace in a carefully closed coach, himself sitting on the box and handling the reins. On the way they overtook two hideous witches, who pretended they were weary and begged for a lift in the coach. At first the brother refused to take them in, but his tender-hearted sister entreated him to have compassion on the two poor footsore women; for you may easily imagine that she was not acquainted with their true character. So down he got rather surlily from the box, opened the coach door, and in the two witches stepped, laughing

in their sleeves. But no sooner had the brother mounted the box and whipped up the horses, than one of the two wicked witches bored a hole in the closed coach. A sunbeam at once shot through the hole and fell on the fair damsel. So she vanished from the coach and was spirited away into the belly of a whale in the neighbouring sea. You can imagine the consternation of the king, when the coach door opened and instead of his blooming bride out bounced two hideous hags!

In a modern Greek folk-tale the Fates predict that in her fifteenth year a princess must be careful not to let the sun shine on her, for if this were to happen she would be turned into a lizard. In another modern Greek tale the Sun bestows a daughter upon a childless woman on condition of taking the child back to himself when she is twelve years old. So, when the child was twelve, the mother closed the doors and windows, and stopped up all the chinks and crannies, to prevent the Sun from coming to fetch away her daughter. But she forgot to stop up the key-hole, and a sunbeam streamed through it and carried off the girl. In a Sicilian story a seer foretells that a king will have a daughter who, in her fourteenth year, will conceive a child by the Sun. So, when the child was born, the king shut her up in a lonely tower which had no window, lest a sunbeam should fall on her. When she was nearly fourteen years old, it happened that her parents sent her a piece of roasted kid, in which she found a sharp bone. With this bone she scraped a hole in the wall, and a sunbeam shot through the hole and got her with child.

The old Greek story of Danae, who was confined by her father in a subterranean chamber or a brazen tower, but impregnated by Zeus, who reached her in the shape of a shower of gold, perhaps belongs to the same class of tales. It has its counterpart in the legend which the Kirghiz of Siberia tell of their ancestry. A certain Khan had a fair daughter, whom he kept in a dark iron house, that no man might see her. An old woman tended her; and when the girl was grown to maidenhood she asked the old woman, "Where do you go so often?" "My child," said the old dame, "there is a bright world. In that bright world your father and mother live, and all sorts of people live there. That is where I go." The maiden said, "Good mother, I will tell nobody, but shew me that bright world." So the old woman took the girl out of the iron house. But when she saw the bright world, the girl tottered and fainted; and the eye of God fell upon her, and she conceived. Her angry father put her in a golden chest and sent her floating away (fairy gold can float in fairyland) over the wide sea. The shower of gold in the Greek story, and the eye of God in the Kirghiz legend, probably stand for sunlight and the sun.

The idea that women may be impregnated by the sun is not uncommon in legends. Thus, for example, among the Indians of Guacheta in Colombia, it is said, a report once ran that the sun would impregnate one of their maidens, who should bear a child and yet remain a virgin. The chief had two daughters, and was very desirous that one of them should conceive in this miraculous manner. So every day he made them climb a hill to the east of his house in order to be touched by the first beams of the rising sun. His wishes were fulfilled, for one of the damsels conceived and after nine months gave birth to an emerald. So she wrapped it in cotton and placed it in her bosom, and in a few days it turned into a child, who received the name of Garanchacha and was universally recognized as a son of the sun. Again, the Samoans tell of a woman named Mangamangai, who became pregnant by looking at the rising sun. Her son grew up and was named "Child of the Sun." At his marriage he applied to his mother for a dowry, but she bade him apply to his father, the sun, and told him how to go to him. So one morning he took a long vine and made a noose in it; then climbing up a tree he threw the noose over the sun and caught him fast. Thus arrested in his progress, the luminary asked him what he wanted, and being told by the young man that he wanted a present for his

bride, the sun obligingly packed up a store of blessings in a basket, with which the youth descended to the earth.

Even in the marriage customs of various races we may perhaps detect traces of this belief that women can be impregnated by the sun. Thus amongst the Chaco Indians of South America a newly married couple used to sleep the first night on a mare's or bullock's skin with their heads towards the west, "for the marriage is not considered ratified till the rising sun shines on their feet the succeeding morning." At old Hindoo marriages the first ceremony was the "Impregnation-rite" (*Garbhādhāna*); during the previous day the bride was made to look towards the sun or to be in some way exposed to its rays. Amongst the Turks of Siberia it was formerly the custom on the morning after the marriage to lead the young couple out of the hut to greet the rising sun. The same custom is said to be still practised in Iran and Central Asia under a belief that the beams of the rising sun are the surest means of impregnating the new bride. And as some people think that women may be gotten with child by the sun, so others imagine that they can conceive by the moon. According to the Greenlanders the moon is a young man, and he "now and then comes down to give their wives a visit and caress them; for which reason no woman dare sleep lying upon her back, without she first spits upon her fingers and rubs her belly with it. For the same reason the young maids are afraid to stare long at the moon, imagining they may get a child by the bargain." Similarly Breton peasants are reported to believe that women or girls who expose their persons to the moonlight may be impregnated by it and give birth to monsters.

§ 8. Reasons for the Seclusion of Girls at Puberty.

The motive for the restraints so commonly imposed on girls at puberty is the deeply engrained dread which primitive man universally entertains of menstruous blood. He fears it at all times but especially on its first appearance; hence the restrictions under which women lie at their first menstruation are usually more stringent than those which they have to observe at any subsequent recurrence of the mysterious flow. Some evidence of the fear and of the customs based on it has been cited in an earlier part of this work; but as the terror, for it is nothing less, which the phenomenon periodically strikes into the mind of the savage has deeply influenced his life and institutions, it may be well to illustrate the subject with some further examples.

Thus in the Encounter Bay tribe of South Australia there is, or used to be, a "superstition which obliges a woman to separate herself from the camp at the time of her monthly illness, when, if a young man or boy should approach, she calls out, and he immediately makes a circuit to avoid her. If she is neglectful upon this point, she exposes herself to scolding, and sometimes to severe beating by her husband or nearest relation, because the boys are told from their infancy, that if they see the blood they will early become grey-headed, and their strength will fail prematurely." And of the South Australian aborigines in general we read that there is a "custom requiring all boys and uninitiated young men to sleep at some distance from the huts of the adults, and to remove altogether away in the morning as soon as daylight dawns, and the natives begin to move about. This is to prevent their seeing the women, some of whom may be menstruating; and if looked upon by the young males, it is supposed that dire results will follow." And amongst these tribes women in their courses "are not allowed to eat fish of any kind, or to go near the water at all; it being one of their superstitions, that if a female, in that state, goes near the water, no success can be expected by the men in fishing." Similarly, among the natives of the Murray River, menstruous women "were not allowed to go near water for fear of frightening the fish. They were also not allowed to eat them, for the same reason. A woman during such periods would never cross the river in a canoe, or even fetch water for the camp. It was sufficient for her to say *Thama*, to ensure her

husband getting the water himself.” The Dieri of Central Australia believe that if women at these times were to eat fish or bathe in a river, the fish would all die and the water would dry up. In this tribe a mark made with red ochre round a woman's mouth indicates that she has her courses; no one would offer fish to such a woman. The Arunta of Central Australia forbid menstruous women to gather the *irriakura* bulbs, which form a staple article of diet for both men and women. They believe that were a woman to break this rule, the supply of bulbs would fail. Among the aborigines of Victoria the wife at her monthly periods had to sleep on the opposite side of the fire from her husband; she might partake of nobody's food, and nobody would partake of hers, for people thought that if they ate or drank anything that had been touched by a woman in her courses, it would make them weak or ill. Unmarried girls and widows at such times had to paint their heads and the upper parts of their bodies red, no doubt as a danger signal.

In some Australian tribes the seclusion of menstruous women was even more rigid, and was enforced by severer penalties than a scolding or a beating. Thus with regard to certain tribes of New South Wales and Southern Queensland we are told that “during the monthly illness, the woman is not allowed to touch anything that men use, or even to walk on a path that any man frequents, on pain of death.” Again, “there is a regulation relating to camps in the Wakelbura tribe which forbids the women coming into the encampment by the same path as the men. Any violation of this rule would in a large camp be punished with death. The reason for this is the dread with which they regard the menstrual period of women. During such a time, a woman is kept entirely away from the camp, half a mile at least. A woman in such a condition has boughs of some tree of her totem tied round her loins, and is constantly watched and guarded, for it is thought that should any male be so unfortunate as to see a woman in such a condition, he would die. If such a woman were to let herself be seen by a man, she would probably be put to death. When the woman has recovered, she is painted red and white, her head covered with feathers, and returns to the camp.”

In Muralug, one of the Torres Straits Islands, a menstruous woman may not eat anything that lives in the sea, else the natives believe that the fisheries would fail. Again, in Mabuiag, another of these islands, women who have their courses on them may not eat turtle flesh nor turtle eggs, probably for a similar reason. And during the season when the turtles are pairing the restrictions laid on such a woman are much severer. She may not even enter a house in which there is turtle flesh, nor approach a fire on which the flesh is cooking; she may not go near the sea and she should not walk on the beach below high-water mark. Nay, the infection extends to her husband, who may not himself harpoon or otherwise take an active part in catching turtle; however, he is permitted to form one of the crew on a turtling expedition, provided he takes the precaution of rubbing his armpits with certain leaves, to which no doubt a disinfectant virtue is ascribed. Among the Kai of German New Guinea women at their monthly sickness must live in little huts built for them in the forest; they may not enter the cultivated fields, for if they did go to them, and the pigs were to taste of the blood, it would inspire the animals with an irresistible desire to go likewise into the fields, where they would commit great depredations on the growing crops. Hence the issue from women at these times is carefully buried to prevent the pigs from getting at it. And conversely, if the pigs often break into the fields, the blame is laid on the women who by the neglect of these elementary precautions have put temptation in the way of the swine. In Galela, to the west of New Guinea, women at their monthly periods may not enter a tobacco-field, or the plants would be attacked by disease. The Minangkabauers of Sumatra are persuaded that if a woman in her unclean state were to go near a rice-field, the crop would be spoiled.

The Bushmen of South Africa think that, by a glance of a girl's eye at the time when she ought to be kept in strict retirement, men become fixed in whatever position they happen to

occupy, with whatever they were holding in their hands, and are changed into trees that talk. Cattle-rearing tribes of South Africa hold that their cattle would die if the milk were drunk by a menstruous woman; and they fear the same disaster if a drop of her blood were to fall on the ground and the oxen were to pass over it. To prevent such a calamity women in general, not menstruous women only, are forbidden to enter the cattle enclosure; and more than that, they may not use the ordinary paths in entering the village or in passing from one hut to another. They are obliged to make circuitous tracks at the back of the huts in order to avoid the ground in the middle of the village where the cattle stand or lie down. These women's tracks may be seen at every Caffre village. Similarly among the Bahima, a cattle-breeding tribe of Ankole, in Central Africa, no menstruous woman may drink milk, lest by so doing she should injure the cows; and she may not lie on her husband's bed, no doubt lest she should injure him. Indeed she is forbidden to lie on a bed at all and must sleep on the ground. Her diet is restricted to vegetables and beer. Among the Baganda, in like manner, no menstruous woman might drink milk or come into contact with any milk-vessel; and she might not touch anything that belonged to her husband, nor sit on his mat, nor cook his food. If she touched anything of his at such a time it was deemed equivalent to wishing him dead or to actually working magic for his destruction. Were she to handle any article of his, he would surely fall ill; were she to handle his weapons, he would certainly be killed in the next battle. Even a woman who did not menstruate was believed by the Baganda to be a source of danger to her husband, indeed capable of killing him. Hence, before he went to war, he used to wound her slightly with his spear so as to draw blood; this was thought to ensure his safe return. Apparently the notion was that if the wife did not lose blood in one way or another, her husband would be bled in war to make up for her deficiency; so by way of guarding against this undesirable event, he took care to relieve her of a little superfluous blood before he repaired to the field of honour. Further, the Baganda would not suffer a menstruous woman to visit a well; if she did so, they feared that the water would dry up, and that she herself would fall sick and die, unless she confessed her fault and the medicine-man made atonement for her. Among the Akikuyu of British East Africa, if a new hut is built in a village and the wife chances to menstruate in it on the day she lights the first fire there, the hut must be broken down and demolished the very next day. The woman may on no account sleep a second night in it; there is a curse (*thahu*) both on her and on it. In the Suk tribe of British East Africa warriors may not eat anything that has been touched by menstruous women. If they did so, it is believed that they would lose their virility; "in the rain they will shiver and in the heat they will faint." Suk men and women take their meals apart, because the men fear that one or more of the women may be menstruating. The Anyanja of British Central Africa, at the southern end of Lake Nyassa, think that a man who should sleep with a woman in her courses would fall sick and die, unless some remedy were applied in time. And with them it is a rule that at such times a woman should not put any salt into the food she is cooking, otherwise the people who partook of the food salted by her would suffer from a certain disease called *tsempo*; hence to obviate the danger she calls a child to put the salt into the dish.

Among the Hos, a tribe of Ewe negroes of Togoland in West Africa, so long as a wife has her monthly sickness she may not cook for her husband, nor lie on his bed, nor sit on his stool; an infraction of these rules would assuredly, it is believed, cause her husband to die. If her husband is a priest, or a magician, or a chief, she may not pass the days of her uncleanness in the house, but must go elsewhere till she is clean. Among the Ewe negroes of this region each village has its huts where women who have their courses on them must spend their time secluded from intercourse with other people. Sometimes these huts stand by themselves in public places; sometimes they are mere shelters built either at the back or front of the ordinary dwelling-houses. A woman is punishable if she does not pass the time of her

monthly sickness in one of these huts or shelters provided for her use. Thus, if she shews herself in her own house or even in the yard of the house, she may be fined a sheep, which is killed, its flesh divided among the people, and its blood poured on the image of the chief god as a sin-offering to expiate her offence. She is also forbidden to go to the place where the villagers draw water, and if she breaks the rule, she must give a goat to be killed; its flesh is distributed, and its blood, diluted with water and mixed with herbs, is sprinkled on the watering-place and on the paths leading to it. Were any woman to disregard these salutary precautions, the chief fetish-man in the village would fall sick and die, which would be an irreparable loss to society.

The miraculous virtue ascribed to menstruous blood is well illustrated in a story told by the Arab chronicler Tabari. He relates how Sapor, king of Persia, besieged the strong city of Atræ, in the desert of Mesopotamia, for several years without being able to take it. But the king of the city, whose name was Daizan, had a daughter, and when it was with her after the manner of women she went forth from the city and dwelt for a time in the suburb, for such was the custom of the place. Now it fell out that, while she tarried there, Sapor saw her and loved her, and she loved him; for he was a handsome man and she a lovely maid. And she said to him, "What will you give me if I shew you how you may destroy the walls of this city and slay my father?" And he said to her, "I will give you what you will, and I will exalt you above my other wives, and will set you nearer to me than them all." Then she said to him, "Take a greenish dove with a ring about its neck, and write something on its foot with the menstruous blood of a blue-eyed maid; then let the bird loose, and it will perch on the walls of the city, and they will fall down." For that, says the Arab historian, was the talisman of the city, which could not be destroyed in any other way. And Sapor did as she bade him, and the city fell down in a heap, and he stormed it and slew Daizan on the spot.

According to the Talmud, if a woman at the beginning of her period passes between two men, she thereby kills one of them; if she passes between them towards the end of her period, she only causes them to quarrel violently. Maimonides tells us that down to his time it was a common custom in the East to keep women at their periods in a separate house and to burn everything on which they had trodden; a man who spoke with such a woman or who was merely exposed to the same wind that blew over her, became thereby unclean. Peasants of the Lebanon think that menstruous women are the cause of many misfortunes; their shadow causes flowers to wither and trees to perish, it even arrests the movements of serpents; if one of them mounts a horse, the animal might die or at least be disabled for a long time. In Syria to this day a woman who has her courses on her may neither salt nor pickle, for the people think that whatever she pickled or salted would not keep. The Toaripi of New Guinea, doubtless for a similar reason, will not allow women at such times to cook. The Bhuiyars, a Dravidian tribe of South Mirzapur, are said to feel an intense dread of menstrual pollution. Every house has two doors, one of which is used only by women in this condition. During her impurity the wife is fed by her husband apart from the rest of the family, and whenever she has to quit the house she is obliged to creep out on her hands and knees in order not to defile the thatch by her touch. The Kharwars, another aboriginal tribe of the same district, keep their women at such seasons in the outer verandah of the house for eight days, and will not let them enter the kitchen or the cow-house; during this time the unclean woman may not cook nor even touch the cooking vessels. When the eight days are over, she bathes, washes her clothes, and returns to family life. Hindoo women seclude themselves at their monthly periods and observe a number of rules, such as not to drink milk, not to milk cows, not to touch fire, not to lie on a high bed, not to walk on common paths, not to cross the track of animals, not to walk by the side of flowering plants, and not to observe the heavenly bodies. The motive for these restrictions is not mentioned, but probably it is a dread of the

baleful influence which is supposed to emanate from women at these times. The Parsees, who reverence fire, will not suffer menstruous women to see it or even to look on a lighted taper; during their infirmity the women retire from their houses to little lodges in the country, whither victuals are brought to them daily; at the end of their seclusion they bathe and send a kid, a fowl, or a pigeon to the priest as an offering. In Annam a woman at her monthly periods is deemed a centre of impurity, and contact with her is avoided. She is subject to all sorts of restrictions which she must observe herself and which others must observe towards her. She may not touch any food which is to be preserved by salting, whether it be fish, flesh, or vegetables; for were she to touch it the food would putrefy. She may not enter any sacred place, she may not be present at any religious ceremony. The linen which she wears at such times must be washed by herself at sunrise, never at night. On reaching puberty girls may not touch flowers or the fruits of certain trees, for touched by them the flowers would fade and the fruits fall to the ground. "It is on account of their reputation for impurity that the women generally live isolated. In every house they have an apartment reserved for them, and they never eat at the same table as the men. For the same reason they are excluded from all religious ceremonies. They may only be present at family ceremonies, but without ever officiating in them."

The Guayquiries of the Orinoco think that when a woman has her courses, everything upon which she steps will die, and that if a man treads on the place where she has passed, his legs will immediately swell up. Among the Guaraunos of the same great river, women at their periods are regarded as unclean and kept apart in special huts, where all that they need is brought to them. In like manner among the Piapocos, an Indian tribe on the Guayabero, a tributary of the Orinoco, a menstruous woman is secluded from her family every month for four or five days. She passes the time in a special hut, whither her husband brings her food; and at the end of the time she takes a bath and resumes her usual occupations. So among the Indians of the Mosquito territory in Central America, when a woman is in her courses, she must quit the village for seven or eight days. A small hut is built for her in the wood, and at night some of the village girls go and sleep with her to keep her company. Or if the nights are dark and jaguars are known to be prowling in the neighbourhood, her husband will take his gun or bow and sleep in a hammock near her. She may neither handle nor cook food; all is prepared and carried to her. When the sickness is over, she bathes in the river, puts on clean clothes, and returns to her household duties. Among the Bri-bri Indians of Costa Rica a girl at her first menstruation retires to a hut built for the purpose in the forest, and there she must stay till she has been purified by a medicine-man, who breathes on her and places various objects, such as feathers, the beaks of birds, the teeth of beasts, and so forth, upon her body. A married woman at her periods remains in the house with her husband, but she is reckoned unclean (*bukuru*) and must avoid all intimate relations with him. She uses for plates only banana leaves, which, when she has done with them, she throws away in a sequestered spot; for should a cow find and eat them, the animal would waste away and perish. Also she drinks only out of a special vessel, because any person who should afterwards drink out of the same vessel would infallibly pine away and die.

Among most tribes of North American Indians the custom was that women in their courses retired from the camp or the village and lived during the time of their uncleanness in special huts or shelters which were appropriated to their use. There they dwelt apart, eating and sleeping by themselves, warming themselves at their own fires, and strictly abstaining from all communications with men, who shunned them just as if they were stricken with the plague. No article of furniture used in these menstrual huts might be used in any other, not even the flint and steel with which in the old days the fires were kindled. No one would borrow a light from a woman in her seclusion. If a white man in his ignorance asked to light

his pipe at her fire, she would refuse to grant the request, telling him that it would make his nose bleed and his head ache, and that he would fall sick in consequence. If an Indian's wooden pipe cracked, his friends would think that he had either lit it at one of these polluted fires or had held some converse with a woman during her retirement, which was esteemed a most disgraceful and wicked thing to do. Decent men would not approach within a certain distance of a woman at such times, and if they had to convey anything to her they would stand some forty or fifty paces off and throw it to her. Everything which was touched by her hands during this period was deemed ceremonially unclean. Indeed her touch was thought to convey such pollution that if she chanced to lay a finger on a chief's lodge or his gun or anything else belonging to him, it would be instantly destroyed. If she crossed the path of a hunter or a warrior, his luck for that day at least would be gone. Were she not thus secluded, it was supposed that the men would be attacked by diseases of various kinds, which would prove mortal. In some tribes a woman who infringed the rules of separation might have to answer with her life for any misfortunes that might happen to individuals or to the tribe in consequence, as it was supposed, of her criminal negligence. When she quitted her tent or hut to go into retirement, the fire in it was extinguished and the ashes thrown away outside of the village, and a new fire was kindled, as if the old one had been defiled by her presence. At the end of their seclusion the women bathed in running streams and returned to their usual occupations.

Thus, to take examples, the Creek and kindred Indians of the United States compelled women at menstruation to live in separate huts at some distance from the village. There the women had to stay, at the risk of being surprised and cut off by enemies. It was thought "a most horrid and dangerous pollution" to go near the women at such times; and the danger extended to enemies who, if they slew the women, had to cleanse themselves from the pollution by means of certain sacred herbs and roots. Similarly, the Choctaw women had to quit their huts during their monthly periods, and might not return till after they had been purified. While their uncleanness lasted they had to prepare their own food. The men believed that if they were to approach a menstruous woman, they would fall ill, and that some mishap would overtake them when they went to the wars. When an Omaha woman has her courses on her, she retires from the family to a little shelter of bark or grass, supported by sticks, where she kindles a fire and cooks her victuals alone. Her seclusion lasts four days. During this time she may not approach or touch a horse, for the Indians believe that such contamination would impoverish or weaken the animal. Among the Potawatomis the women at their monthly periods "are not allowed to associate with the rest of the nation; they are completely laid aside, and are not permitted to touch any article of furniture or food which the men have occasion to use. If the Indians be stationary at the time, the women are placed outside of the camp; if on a march, they are not allowed to follow the trail, but must take a different path and keep at a distance from the main body." Among the Cheyennes menstruous women slept in special lodges; the men believed that if they slept with their wives at such times, they would probably be wounded in their next battle. A man who owned a shield had very particularly to be on his guard against women in their courses. He might not go into a lodge where one of them happened to be, nor even into a lodge where one of them had been, until a ceremony of purification had been performed. Sweet grass and juniper were burnt in the tent, and the pegs were pulled up and the covering thrown back, as if the tent were about to be struck. After this pretence of decamping from the polluted spot the owner of the shield might enter the tent.

The Stseelis Indians of British Columbia imagined that if a menstruous woman were to step over a bundle of arrows, the arrows would thereby be rendered useless and might even cause the death of their owner; and similarly that if she passed in front of a hunter who carried a

gun, the weapon would never shoot straight again. Neither her husband nor her father would dream of going out to hunt while she was in this state; and even if he had wished to do so, the other hunters would not go with him. Hence to keep them out of harm's way, the women, both married and unmarried, were secluded at these times for four days in shelters. Among the Thompson Indians of British Columbia every woman had to isolate herself from the rest of the people during every recurring period of menstruation, and had to live some little way off in a small brush or bark lodge made for the purpose. At these times she was considered unclean, must use cooking and eating utensils of her own, and was supplied with food by some other woman. If she smoked out of a pipe other than her own, that pipe would ever afterwards be hot to smoke. If she crossed in front of a gun, that gun would thenceforth be useless for the war or the chase, unless indeed the owner promptly washed the weapon in "medecine" or struck the woman with it once on each principal part of her body. If a man ate or had any intercourse with a menstruous woman, nay if he merely wore clothes or mocassins made or patched by her, he would have bad luck in hunting and the bears would attack him fiercely. Before being admitted again among the people, she had to change all her clothes and wash several times in clear water. The clothes worn during her isolation were hung on a tree, to be used next time, or to be washed. For one day after coming back among the people she did not cook food. Were a man to eat food cooked by a woman at such times, he would have incapacitated himself for hunting and exposed himself to sickness or death.

Among the Chippeways and other Indians of the Hudson Bay Territory, menstruous women are excluded from the camp, and take up their abode in huts of branches. They wear long hoods, which effectually conceal the head and breast. They may not touch the household furniture nor any objects used by men; for their touch "is supposed to defile them, so that their subsequent use would be followed by certain mischief or misfortune," such as disease or death. They must drink out of a swan's bone. They may not walk on the common paths nor cross the tracks of animals. They "are never permitted to walk on the ice of rivers or lakes, or near the part where the men are hunting beaver, or where a fishing-net is set, for fear of averting their success. They are also prohibited at those times from partaking of the head of any animal, and even from walking in or crossing the track where the head of a deer, moose, beaver, and many other animals have lately been carried, either on a sledge or on the back. To be guilty of a violation of this custom is considered as of the greatest importance; because they firmly believe that it would be a means of preventing the hunter from having an equal success in his future excursions." So the Lapps forbid women at menstruation to walk on that part of the shore where the fishers are in the habit of setting out their fish; and the Esquimaux of Bering Strait believe that if hunters were to come near women in their courses they would catch no game.

But the beliefs and superstitions of this sort that prevail among the western tribes of the great Déné or Tinné stock, to which the Chippeways belong, have been so well described by an experienced missionary, that I will give his description in his own words. Prominent among the ceremonial rites of these Indians, he says, "are the observances peculiar to the fair sex, and many of them are remarkably analogous to those practised by the Hebrew women, so much so that, were it not savouring of profanity, the ordinances of the Déné ritual code might be termed a new edition 'revised and considerably augmented' of the Mosaic ceremonial law. Among the Carriers, as soon as a girl has experienced the first flow of the menses which in the female constitution are a natural discharge, her father believed himself under the obligation of atoning for her supposedly sinful condition by a small impromptu distribution of clothes among the natives. This periodical state of women was considered as one of legal impurity fateful both to the man who happened to have any intercourse, however indirect,

with her, and to the woman herself who failed in scrupulously observing all the rites prescribed by ancient usage for persons in her condition.

“Upon entering into that stage of her life, the maiden was immediately sequestered from company, even that of her parents, and compelled to dwell in a small branch hut by herself away from beaten paths and the gaze of passers-by. As she was supposed to exercise malefic influence on any man who might inadvertently glance at her, she had to wear a sort of head-dress combining in itself the purposes of a veil, a bonnet, and a mantlet. It was made of tanned skin, its forepart was shaped like a long fringe completely hiding from view the face and breasts; then it formed on the head a close-fitting cap or bonnet, and finally fell in a broad band almost to the heels. This head-dress was made and publicly placed on her head by a paternal aunt, who received at once some present from the girl's father. When, three or four years later, the period of sequestration ceased, only this same aunt had the right to take off her niece's ceremonial head-dress. Furthermore, the girl's fingers, wrists, and legs at the ankles and immediately below the knees, were encircled with ornamental rings and bracelets of sinew intended as a protection against the malign influences she was supposed to be possessed with. To a belt girding her waist were suspended two bone implements called respectively *Tsoenkuz* (bone tube) and *Tsiltsoet* (head scratcher). The former was a hollowed swan bone to drink with, any other mode of drinking being unlawful to her. The latter was fork-like and was called into requisition whenever she wanted to scratch her head—immediate contact of the fingers with the head being reputed injurious to her health. While thus secluded, she was called *asta*, that is ‘interred alive’ in Carrier, and she had to submit to a rigorous fast and abstinence. Her only allowed food consisted of dried fish boiled in a small bark vessel which nobody else must touch, and she had to abstain especially from meat of any kind, as well as fresh fish. Nor was this all she had to endure; even her contact, however remote, with these two articles of diet was so dreaded that she could not cross the public paths or trails, or the tracks of animals. Whenever absolute necessity constrained her to go beyond such spots, she had to be packed or carried over them lest she should contaminate the game or meat which had passed that way, or had been brought over these paths; and also for the sake of self-preservation against tabooed, and consequently to her, deleterious food. In the same way she was never allowed to wade in streams or lakes, for fear of causing death to the fish.

“It was also a prescription of the ancient ritual code for females during this primary condition to eat as little as possible, and to remain lying down, especially in course of each monthly flow, not only as a natural consequence of the prolonged fast and resulting weakness; but chiefly as an exhibition of a becoming penitential spirit which was believed to be rewarded by long life and continual good health in after years.

“These mortifications or seclusion did not last less than three or four years. Useless to say that during all that time marriage could not be thought of, since the girl could not so much as be seen by men. When married, the same sequestration was practised relatively to husband and fellow-villagers—without the particular head-dress and rings spoken of—on the occasion of every recurring menstruation. Sometimes it was protracted as long as ten days at a time, especially during the first years of cohabitation. Even when she returned to her mate, she was not permitted to sleep with him on the first nor frequently on the second night, but would choose a distant corner of the lodge to spread her blanket, as if afraid to defile him with her dread uncleanness.” Elsewhere the same writer tells us that most of the devices to which these Indians used to resort for the sake of ensuring success in the chase “were based on their regard for continence and their excessive repugnance for, and dread of, menstruating women.” But the strict observances imposed on Tinneh or Déné women at such times were designed at the same time to protect the women themselves from the evil consequences of

their dangerous condition. Thus it was thought that women in their courses could not partake of the head, heart, or hind part of an animal that had been caught in a snare without exposing themselves to a premature death through a kind of rabies. They might not cut or carve salmon, because to do so would seriously endanger their health, and especially would enfeeble their arms for life. And they had to abstain from cutting up the grebes which are caught by the Carriers in great numbers every spring, because otherwise the blood with which these fowls abound would occasion hæmorrhage or an unnaturally prolonged flux in the transgressor. Similarly Indian women of the Thompson tribe abstained from venison and the flesh of other large game during menstruation, lest the animals should be displeased and the menstrual flow increased. For a similar reason, probably, Shuswap girls during their seclusion at puberty are forbidden to eat anything that bleeds. The same principle may perhaps partly explain the rule, of which we have had some examples, that women at such times should refrain from fish and flesh, and restrict themselves to a vegetable diet.

The philosophic student of human nature will observe, or learn, without surprise that ideas thus deeply ingrained in the savage mind reappear at a more advanced stage of society in those elaborate codes which have been drawn up for the guidance of certain peoples by lawgivers who claim to have derived the rules they inculcate from the direct inspiration of the deity. However we may explain it, the resemblance which exists between the earliest official utterances of the deity and the ideas of savages is unquestionably close and remarkable; whether it be, as some suppose, that God communed face to face with man in those early days, or, as others maintain, that man mistook his wild and wandering thoughts for a revelation from heaven. Be that as it may, certain it is that the natural uncleanness of woman at her monthly periods is a conception which has occurred, or been revealed, with singular unanimity to several ancient legislators. The Hindoo lawgiver Manu, who professed to have received his institutes from the creator Brahman, informs us that the wisdom, the energy, the strength, the sight, and the vitality of a man who approaches a woman in her courses will utterly perish; whereas, if he avoids her, his wisdom, energy, strength, sight, and vitality will all increase. The Persian lawgiver Zoroaster, who, if we can take his word for it, derived his code from the mouth of the supreme being Ahura Mazda, devoted special attention to the subject. According to him, the menstuous flow, at least in its abnormal manifestations, is a work of Ahriman, or the devil. Therefore, so long as it lasts, a woman “is unclean and possessed of the demon; she must be kept confined, apart from the faithful whom her touch would defile, and from the fire which her very look would injure; she is not allowed to eat as much as she wishes, as the strength she might acquire would accrue to the fiends. Her food is not given her from hand to hand, but is passed to her from a distance, in a long leaden spoon.” The Hebrew lawgiver Moses, whose divine legation is as little open to question as that of Manu and Zoroaster, treats the subject at still greater length; but I must leave to the reader the task of comparing the inspired ordinances on this head with the merely human regulations of the Carrier Indians which they so closely resemble.

Amongst the civilized nations of Europe the superstitions which cluster round this mysterious aspect of woman's nature are not less extravagant than those which prevail among savages. In the oldest existing cyclopaedia—the *Natural History* of Pliny—the list of dangers apprehended from menstruation is longer than any furnished by mere barbarians. According to Pliny, the touch of a menstuous woman turned wine to vinegar, blighted crops, killed seedlings, blasted gardens, brought down the fruit from trees, dimmed mirrors, blunted razors, rusted iron and brass (especially at the waning of the moon), killed bees, or at least drove them from their hives, caused mares to miscarry, and so forth. Similarly, in various parts of Europe, it is still believed that if a woman in her courses enters a brewery the beer will turn sour; if she touches beer, wine, vinegar, or milk, it will go bad; if she makes jam, it

will not keep; if she mounts a mare, it will miscarry; if she touches buds, they will wither; if she climbs a cherry tree, it will die. In Brunswick people think that if a menstruous woman assists at the killing of a pig, the pork will putrefy. In the Greek island of Calymnos a woman at such times may not go to the well to draw water, nor cross a running stream, nor enter the sea. Her presence in a boat is said to raise storms.

Thus the object of secluding women at menstruation is to neutralize the dangerous influences which are supposed to emanate from them at such times. That the danger is believed to be especially great at the first menstruation appears from the unusual precautions taken to isolate girls at this crisis. Two of these precautions have been illustrated above, namely, the rules that the girl may not touch the ground nor see the sun. The general effect of these rules is to keep her suspended, so to say, between heaven and earth. Whether enveloped in her hammock and slung up to the roof, as in South America, or raised above the ground in a dark and narrow cage, as in New Ireland, she may be considered to be out of the way of doing mischief, since, being shut off both from the earth and from the sun, she can poison neither of these great sources of life by her deadly contagion. In short, she is rendered harmless by being, in electrical language, insulated. But the precautions thus taken to isolate or insulate the girl are dictated by a regard for her own safety as well as for the safety of others. For it is thought that she herself would suffer if she were to neglect the prescribed regimen. Thus Zulu girls, as we have seen, believe that they would shrivel to skeletons if the sun were to shine on them at puberty, and in some Brazilian tribes the young women think that a transgression of the rules would entail sores on the neck and throat. In short, the girl is viewed as charged with a powerful force which, if not kept within bounds, may prove destructive both to herself and to all with whom she comes in contact. To repress this force within the limits necessary for the safety of all concerned is the object of the taboos in question.

The same explanation applies to the observance of the same rules by divine kings and priests. The uncleanness, as it is called, of girls at puberty and the sanctity of holy men do not, to the primitive mind, differ materially from each other. They are only different manifestations of the same mysterious energy which, like energy in general, is in itself neither good nor bad, but becomes beneficent or maleficent according to its application. Accordingly, if, like girls at puberty, divine personages may neither touch the ground nor see the sun, the reason is, on the one hand, a fear lest their divinity might, at contact with earth or heaven, discharge itself with fatal violence on either; and, on the other hand, an apprehension that the divine being, thus drained of his ethereal virtue, might thereby be incapacitated for the future performance of those magical functions, upon the proper discharge of which the safety of the people and even of the world is believed to hang. Thus the rules in question fall under the head of the taboos which we examined in the second part of this work; they are intended to preserve the life of the divine person and with it the life of his subjects and worshippers. Nowhere, it is thought, can his precious yet dangerous life be at once so safe and so harmless as when it is neither in heaven nor in earth, but, as far as possible, suspended between the two.

In legends and folk-tales, which reflect the ideas of earlier ages, we find this suspension between heaven and earth attributed to beings who have been endowed with the coveted yet burdensome gift of immortality. The wizened remains of the deathless Sibyl are said to have been preserved in a jar or urn which hung in a temple of Apollo at Cumae; and when a group of merry children, tired, perhaps, of playing in the sunny streets, sought the shade of the temple and amused themselves by gathering underneath the familiar jar and calling out, "Sibyl, what do you wish?" a hollow voice, like an echo, used to answer from the urn, "I wish to die." A story, taken down from the lips of a German peasant at Thomsdorf, relates that once upon a time there was a girl in London who wished to live for ever, so they say:

*“London, London is a fine town.
A maiden prayed to live for ever.”*

And still she lives and hangs in a basket in a church, and every St. John's Day, about the hour of noon, she eats a roll of bread. Another German story tells of a lady who resided at Danzig and was so rich and so blest with all that life can give that she wished to live always. So when she came to her latter end, she did not really die but only looked like dead, and very soon they found her in a hollow of a pillar in the church, half standing and half sitting, motionless. She stirred never a limb, but they saw quite plainly that she was alive, and she sits there down to this blessed day. Every New Year's Day the sacristan comes and puts a morsel of the holy bread in her mouth, and that is all she has to live on. Long, long has she rued her fatal wish who set this transient life above the eternal joys of heaven. A third German story tells of a noble damsel who cherished the same foolish wish for immortality. So they put her in a basket and hung her up in a church, and there she hangs and never dies, though many a year has come and gone since they put her there. But every year on a certain day they give her a roll, and she eats it and cries out, “For ever! for ever! for ever!” And when she has so cried she falls silent again till the same time next year, and so it will go on for ever and for ever. A fourth story, taken down near Oldenburg in Holstein, tells of a jolly dame that ate and drank and lived right merrily and had all that heart could desire, and she wished to live always. For the first hundred years all went well, but after that she began to shrink and shrivel up, till at last she could neither walk nor stand nor eat nor drink. But die she could not. At first they fed her as if she were a little child, but when she grew smaller and smaller they put her in a glass bottle and hung her up in the church. And there she still hangs, in the church of St. Mary, at Lübeck. She is as small as a mouse, but once a year she stirs.

III. The Myth of Balder

A deity whose life might in a sense be said to be neither in heaven nor on earth but between the two, was the Norse Balder, the good and beautiful god, the son of the great god Odin, and himself the wisest, mildest, best beloved of all the immortals. The story of his death, as it is told in the younger or prose *Edda*, runs thus. Once on a time Balder dreamed heavy dreams which seemed to forebode his death. Thereupon the gods held a council and resolved to make him secure against every danger. So the goddess Frigg took an oath from fire and water, iron and all metals, stones and earth, from trees, sicknesses and poisons, and from all four-footed beasts, birds, and creeping things, that they would not hurt Balder. When this was done Balder was deemed invulnerable; so the gods amused themselves by setting him in their midst, while some shot at him, others hewed at him, and others threw stones at him. But whatever they did, nothing could hurt him; and at this they were all glad, Only Loki, the mischief-maker, was displeased, and he went in the guise of an old woman to Frigg, who told him that the weapons of the gods could not wound Balder, since she had made them all swear not to hurt him. Then Loki asked, "Have all things sworn to spare Balder?" She answered, "East of Walhalla grows a plant called mistletoe; it seemed to me too young to swear." So Loki went and pulled the mistletoe and took it to the assembly of the gods. There he found the blind god Hother standing at the outside of the circle. Loki asked him, "Why do you not shoot at Balder?" Hother answered, "Because I do not see where he stands; besides I have no weapon." Then said Loki, "Do like the rest and shew Balder honour, as they all do. I will shew you where he stands, and do you shoot at him with this twig." Hother took the mistletoe and threw it at Balder, as Loki directed him. The mistletoe struck Balder and pierced him through and through, and he fell down dead. And that was the greatest misfortune that ever befell gods and men. For a while the gods stood speechless, then they lifted up their voices and wept bitterly. They took Balder's body and brought it to the sea-shore. There stood Balder's ship; it was called Ringhorn, and was the hugest of all ships. The gods wished to launch the ship and to burn Balder's body on it, but the ship would not stir. So they sent for a giantess called Hyrrockin. She came riding on a wolf and gave the ship such a push that fire flashed from the rollers and all the earth shook. Then Balder's body was taken and placed on the funeral pile upon his ship. When his wife Nanna saw that, her heart burst for sorrow and she died. So she was laid on the funeral pile with her husband, and fire was put to it. Balder's horse, too, with all its trappings, was burned on the pile.

In the older or poetic *Edda* the tragic tale of Balder is hinted at rather than told at length. Among the visions which the Norse Sibyl sees and describes in the weird prophecy known as the *Voluspa* is one of the fatal mistletoe. "I behold," says she, "Fate looming for Balder, Woden's son, the bloody victim. There stands the Mistletoe slender and delicate, blooming high above the ground. Out of this shoot, so slender to look on, there shall grow a harmful fateful shaft. Hod shall shoot it, but Frigga in Fen-hall shall weep over the woe of Wal-hall." Yet looking far into the future the Sibyl sees a brighter vision of a new heaven and a new earth, where the fields unsown shall yield their increase and all sorrows shall be healed; then Balder will come back to dwell in Odin's mansions of bliss, in a hall brighter than the sun, shingled with gold, where the righteous shall live in joy for ever more.

Writing about the end of the twelfth century, the old Danish historian Saxo Grammaticus tells the story of Balder in a form which professes to be historical. According to him, Balder and Hother were rival suitors for the hand of Nanna, daughter of Gewar, King of Norway. Now Balder was a demigod and common steel could not wound his sacred body. The two rivals

encountered each other in a terrific battle, and though Odin and Thor and the rest of the gods fought for Balder, yet was he defeated and fled away, and Hother married the princess. Nevertheless Balder took heart of grace and again met Hother in a stricken field. But he fared even worse than before; for Hother dealt him a deadly wound with a magic sword, which he had received from Miming, the Satyr of the woods; and after lingering three days in pain Balder died of his hurt and was buried with royal honours in a barrow.

Whether he was a real or merely a mythical personage, Balder was worshipped in Norway. On one of the bays of the beautiful Sogne Fiord, which penetrates far into the depths of the solemn Norwegian mountains, with their sombre pine-forests and their lofty cascades dissolving into spray before they reach the dark water of the fiord far below, Balder had a great sanctuary. It was called Balder's Grove. A palisade enclosed the hallowed ground, and within it stood a spacious temple with the images of many gods, but none of them was worshipped with such devotion as Balder. So great was the awe with which the heathen regarded the place that no man might harm another there, nor steal his cattle, nor defile himself with women. But women cared for the images of the gods in the temple; they warmed them at the fire, anointed them with oil, and dried them with cloths.

It might be rash to affirm that the romantic figure of Balder was nothing but a creation of the mythical fancy, a radiant phantom conjured up as by a wizard's wand to glitter for a time against the gloomy background of the stern Norwegian landscape. It may be so; yet it is also possible that the myth was founded on the tradition of a hero, popular and beloved in his lifetime, who long survived in the memory of the people, gathering more and more of the marvellous about him as he passed from generation to generation of story-tellers. At all events it is worth while to observe that a somewhat similar story is told of another national hero, who may well have been a real man. In his great poem, *The Epic of Kings*, which is founded on Persian traditions, the poet Firdusi tells us that in the combat between Rustem and Isfendiyar the arrows of the former did no harm to his adversary, "because Zerdusht had charmed his body against all dangers, so that it was like unto brass." But Simurgh, the bird of God, shewed Rustem the way he should follow in order to vanquish his redoubtable foe. He rode after her, and they halted not till they came to the sea-shore. There she led him into a garden, where grew a tamarisk, tall and strong, and the roots thereof were in the ground, but the branches pierced even unto the sky. Then the bird of God bade Rustem break from the tree a branch that was long and slender, and fashion it into an arrow, and she said, "Only through his eyes can Isfendiyar be wounded. If, therefore, thou wouldst slay him, direct this arrow unto his forehead, and verily it shall not miss its aim." Rustem did as he was bid; and when next he fought with Isfendiyar, he shot the arrow at him, and it pierced his eye, and he died. Great was the mourning for Isfendiyar. For the space of one year men ceased not to lament for him, and for many years they shed bitter tears for that arrow, and they said, "The glory of Iran hath been laid low."

Whatever may be thought of an historical kernel underlying a mythical husk in the legend of Balder, the details of the story suggest that it belongs to that class of myths which have been dramatized in ritual, or, to put it otherwise, which have been performed as magical ceremonies for the sake of producing those natural effects which they describe in figurative language. A myth is never so graphic and precise in its details as when it is, so to speak, the book of the words which are spoken and acted by the performers of the sacred rite. That the Norse story of Balder was a myth of this sort will become probable if we can prove that ceremonies resembling the incidents in the tale have been performed by Norsemen and other European peoples. Now the main incidents in the tale are two—first, the pulling of the mistletoe, and second, the death and burning of the god; and both of them may perhaps be found to have had their counterparts in yearly rites observed, whether separately or

conjointly, by people in various parts of Europe. These rites will be described and discussed in the following chapters. We shall begin with the annual festivals of fire and shall reserve the pulling of the mistletoe for consideration later on.

IV. The Fire-Festivals of Europe

§ 1. The Lenten Fires.

All over Europe the peasants have been accustomed from time immemorial to kindle bonfires on certain days of the year, and to dance round or leap over them. Customs of this kind can be traced back on historical evidence to the Middle Ages, and their analogy to similar customs observed in antiquity goes with strong internal evidence to prove that their origin must be sought in a period long prior to the spread of Christianity. Indeed the earliest proof of their observance in Northern Europe is furnished by the attempts made by Christian synods in the eighth century to put them down as heathenish rites. Not uncommonly effigies are burned in these fires, or a pretence is made of burning a living person in them; and there are grounds for believing that anciently human beings were actually burned on these occasions. A general survey of the customs in question will bring out the traces of human sacrifice, and will serve at the same time to throw light on their meaning.

The seasons of the year when these bonfires are most commonly lit are spring and midsummer; but in some places they are kindled also at the end of autumn or during the course of the winter, particularly on Hallow E'en (the thirty-first of October), Christmas Day, and the Eve of Twelfth Day. We shall consider them in the order in which they occur in the calendar year. The earliest of them is the winter festival of the Eve of Twelfth Day (the fifth of January); but as it has been already described in an earlier part of this work we shall pass it over here and begin with the fire-festivals of spring, which usually fall on the first Sunday of Lent (*Quadragesima* or *Invocavit*), Easter Eve, and May Day.

The custom of kindling bonfires on the first Sunday in Lent has prevailed in Belgium, the north of France, and many parts of Germany. Thus in the Belgian Ardennes for a week or a fortnight before the "day of the great fire," as it is called, children go about from farm to farm collecting fuel. At Grand Halleux any one who refuses their request is pursued next day by the children, who try to blacken his face with the ashes of the extinct fire. When the day has come, they cut down bushes, especially juniper and broom, and in the evening great bonfires blaze on all the heights. It is a common saying that seven bonfires should be seen if the village is to be safe from conflagrations. If the Meuse happens to be frozen hard at the time, bonfires are lit also on the ice. At Grand Halleux they set up a pole called *makral*, or "the witch," in the midst of the pile, and the fire is kindled by the man who was last married in the village. In the neighbourhood of Morlanwelz a straw man is burnt in the fire. Young people and children dance and sing round the bonfires, and leap over the embers to secure good crops or a happy marriage within the year, or as a means of guarding themselves against colic. In Brabant on the same Sunday, down to the beginning of the nineteenth century, women and men disguised in female attire used to go with burning torches to the fields, where they danced and sang comic songs for the purpose, as they alleged, of driving away "the wicked sower," who is mentioned in the Gospel for the day. At Maeseyck and in many villages of Limburg, on the evening of the day children run through the streets carrying lighted torches; then they kindle little fires of straw in the fields and dance round them. At Ensival old folks tell young folks that they will have as many Easter eggs as they see bonfires on this day. At Pâturages, in the province of Hainaut, down to about 1840 the custom was observed under the name of *Escouvion* or *Scouvion*. Every year on the first Sunday of Lent, which was called the Day of the Little Scouvion, young folks and children used to run with lighted torches through the gardens and orchards. As they ran they cried at the pitch of their voices,

“Bear apples, bear pears
And cherries all black
To Scouvion!”

At these words the torch-bearer whirled his blazing brand and hurled it among the branches of the apple-trees, the pear-trees, and the cherry-trees. The next Sunday was called the Day of the Great Scouvion, and the same race with lighted torches among the trees of the orchards was repeated in the afternoon till darkness fell. The same custom was observed on the same two days at Wasmes. In the neighbourhood of Liège, where the Lenten fires were put down by the police about the middle of the nineteenth century, girls thought that by leaping over the fires without being smirched they made sure of a happy marriage. Elsewhere in order to get a good husband it was necessary to see seven of the bonfires from one spot. In Famenne, a district of Namur, men and cattle who traversed the Lenten fires were thought to be safe from sickness and witchcraft. Anybody who saw seven such fires at once had nothing to fear from sorcerers. An old saying ran, that if you do not light “the great fire,” God will light it for you; which seems to imply that the kindling of the bonfires was deemed a protection against conflagrations throughout the year.

In the French department of the Ardennes the whole village used to dance and sing round the bonfires which were lighted on the first Sunday in Lent. Here, too, it was the person last married, sometimes a man and sometimes a woman, who put the match to the fire. The custom is still kept up very commonly in the district. Cats used to be burnt in the fire or roasted to death by being held over it; and while they were burning the shepherds drove their flocks through the smoke and flames as a sure means of guarding them against sickness and witchcraft. In some communes it was believed that the livelier the dance round the fire, the better would be the crops that year. In the Vosges Mountains it is still customary to light great fires on the heights and around the villages on the first Sunday in Lent; and at Rupt and elsewhere the right of kindling them belongs to the person who was last married. Round the fires the people dance and sing merrily till the flames have died out. Then the master of the fire, as they call the man who kindled it, invites all who contributed to the erection of the pile to follow him to the nearest tavern, where they partake of good cheer. At Dommartin they say that, if you would have the hemp tall, it is absolutely necessary that the women should be tipsy on the evening of this day. At Épinal in the Vosges, on the first Sunday in Lent, bonfires used to be kindled at various places both in the town and on the banks of the Moselle. They consisted of pyramids of sticks and faggots, which had been collected some days earlier by young folks going from door to door. When the flames blazed up, the names of various couples, whether young or old, handsome or ugly, rich or poor, were called out, and the persons thus linked in mock marriage were forced, whether they liked it or not, to march arm in arm round the fire amid the laughter and jests of the crowd. The festivity lasted till the fire died out, and then the spectators dispersed through the streets, stopping under the windows of the houses and proclaiming the names of the *fêchenots* and *fêchenottes* or Valentines whom the popular voice had assigned to each other. These couples had to exchange presents; the mock bridegroom gave his mock bride something for her toilet, while she in turn presented him with a cockade of coloured ribbon. Next Sunday, if the weather allowed it, all the couples, arrayed in their best attire and attended by their relations, repaired to the wood of Saint Antony, where they mounted a famous stone called the *danserosse* or *danseresse*. Here they found cakes and refreshments of all sorts, and danced to the music of a couple of fiddlers. The evening bell, ringing the Angelus, gave the signal to depart. As soon as its solemn chime was heard, every one quitted the forest and returned home. The exchange of presents between the Valentines went by the name of ransom or redemption (*rachat*), because it was supposed to redeem the couple from the flames of the bonfire. Any pair who failed

thus to ransom themselves were not suffered to share the merrymaking at the great stone in the forest; and a pretence was made of burning them in small fires kindled before their own doors.

In the French province of Franche-Comté, to the west of the Jura Mountains, the first Sunday of Lent is known as the Sunday of the Firebrands (*Brandons*), on account of the fires which it is customary to kindle on that day. On the Saturday or the Sunday the village lads harness themselves to a cart and drag it about the streets, stopping at the doors of the houses where there are girls and begging for a faggot. When they have got enough, they cart the fuel to a spot at some little distance from the village, pile it up, and set it on fire. All the people of the parish come out to see the bonfire. In some villages, when the bells have rung the Angelus, the signal for the observance is given by cries of, "To the fire! to the fire!" Lads, lasses, and children dance round the blaze, and when the flames have died down they vie with each other in leaping over the red embers. He or she who does so without singeing his or her garments will be married within the year. Young folk also carry lighted torches about the streets or the fields, and when they pass an orchard they cry out, "More fruit than leaves!" Down to recent years at Laviron, in the department of Doubs, it was the young married couples of the year who had charge of the bonfires. In the midst of the bonfire a pole was planted with a wooden figure of a cock fastened to the top. Then there were races, and the winner received the cock as a prize.

In Auvergne fires are everywhere kindled on the evening of the first Sunday in Lent. Every village, every hamlet, even every ward, every isolated farm has its bonfire or *figo*, as it is called, which blazes up as the shades of night are falling. The fires may be seen flaring on the heights and in the plains; the people dance and sing round about them and leap through the flames. Then they proceed to the ceremony of the *Grannas-mias*. A *granno-mio* is a torch of straw fastened to the top of a pole. When the pyre is half consumed, the bystanders kindle the torches at the expiring flames and carry them into the neighbouring orchards, fields, and gardens, wherever there are fruit-trees. As they march they sing at the top of their voices,

"*Granno, mo mio,
Granno, mon pouère,
Granno, mo mouère!*"

that is, "Grannus my friend, Grannus my father, Grannus my mother." Then they pass the burning torches under the branches of every tree, singing,

"*Brando, brandounci
Tsaque brantso, in plan panei!*"

that is, "Firebrand burn; every branch a basketful!" In some villages the people also run across the sown fields and shake the ashes of the torches on the ground; also they put some of the ashes in the fowls' nests, in order that the hens may lay plenty of eggs throughout the year. When all these ceremonies have been performed, everybody goes home and feasts; the special dishes of the evening are fritters and pancakes. Here the application of the fire to the fruit-trees, to the sown fields, and to the nests of the poultry is clearly a charm intended to ensure fertility; and the Granno to whom the invocations are addressed, and who gives his name to the torches, may possibly be, as Dr. Pommerol suggests, no other than the ancient Celtic god Grannus, whom the Romans identified with Apollo, and whose worship is attested by inscriptions found not only in France but in Scotland and on the Danube. If the name Grannus is derived, as the learned tell us, from a root meaning "to glow, burn, shine," the deity who bore the name and was identified with Apollo may well have been a sun-god; and in that case the prayers addressed to him by the peasants of the Auvergne, while they wave

the blazing, crackling torches about the fruit-trees, would be eminently appropriate. For who could ripen the fruit so well as the sun-god? and what better process could be devised to draw the blossoms from the bare boughs than the application to them of that genial warmth which is ultimately derived from the solar beams? Thus the fire-festival of the first Sunday in Lent, as it is observed in Auvergne, may be interpreted very naturally and simply as a religious or rather perhaps magical ceremony designed to procure a due supply of the sun's heat for plants and animals. At the same time we should remember that the employment of fire in this and kindred ceremonies may have been designed originally, not so much to stimulate growth and reproduction, as to burn and destroy all agencies, whether in the shape of vermin, witches, or what not, which threatened or were supposed to threaten the growth of the crops and the multiplication of animals. It is often difficult to decide between these two different interpretations of the use of fire in agricultural rites. In any case the fire-festival of Auvergne on the first Sunday in Lent may date from Druidical times.

The custom of carrying lighted torches of straw (*brandons*) about the orchards and fields to fertilize them on the first Sunday of Lent seems to have been common in France, whether it was accompanied with the practice of kindling bonfires or not. Thus in the province of Picardy "on the first Sunday of Lent people carried torches through the fields, exorcising the field-mice, the darnel, and the smut. They imagined that they did much good to the gardens and caused the onions to grow large. Children ran about the fields, torch in hand, to make the land more fertile. All that was done habitually in Picardy, and the ceremony of the torches is not entirely forgotten, especially in the villages on both sides the Somme as far as Saint-Valery." "A very agreeable spectacle, said the curate of l'Étoile, is to survey from the portal of the church, situated almost on the top of the mountain, the vast plains of Vimeux all illuminated by these wandering fires. The same pastime is observed at Poix, at Conty, and in all the villages round about." Again, in the district of Beauce a festival of torches (*brandons* or *brandelons*) used to be held both on the first and on the second Sunday in Lent; the first was called "the Great Torches" and the second "the Little Torches." The torches were, as usual, bundles of straw wrapt round poles. In the evening the village lads carried the burning brands through the country, running about in disorder and singing,

"Torches burn

At these vines, at this wheat;

Torches burn

For the maidens that shall wed!"

From time to time the bearers would stand still and smite the earth all together with the blazing straw of the torches, while they cried, "A sheaf of a peck and a half!" (*Gearbe à boissiaux*). If two torchbearers happened to meet each other on their rounds, they performed the same ceremony and uttered the same words. When the straw was burnt out, the poles were collected and a great bonfire made of them. Lads and lasses danced round the flames, and the lads leaped over them. Afterwards it was customary to eat a special sort of hasty-pudding made of wheaten flour. These usages were still in vogue at the beginning of the nineteenth century, but they have now almost disappeared. The peasants believed that by carrying lighted torches through the fields they protected the crops from field-mice, darnel, and smut. "At Dijon, in Burgundy, it is the custom upon the first Sunday in Lent to make large fires in the streets, whence it is called Firebrand Sunday. This practice originated in the processions formerly made on that day by the peasants with lighted torches of straw, to drive away, as they called it, the bad air from the earth." In some parts of France, while the people scoured the country with burning brands on the first Sunday in Lent, they warned the fruit-trees that if they did not take heed and bear fruit they would surely be cut down and cast into the fire. On the same day peasants in the department of Loiret used to run about the sowed
