A DICTIONARY

OF

GREEK AND ROMAN ANTIQUITIES.

EDITED BY WILLIAM SMITH, Ph.D.

AND ILLUSTRATED BY NUMEROUS ENGRAVINGS ON WOOD.

AND

CONTAINING NUMEROUS ADDITIONAL ARTICLES RELATIVE TO THE BOTANY, MINERALOGY, AND ZOOLOGY OF THE ANCIENTS.

BY

CHARLES ANTHON, LL.D.,

PROFESSOR OF THE GREEK AND LATIN LANGUAGES IN COLUMBIA COLLEGE, NEW-YORK, AND

RECTOR OF THE GRAMMAR SCHOOL.

NEW YORK:

HARPER & BROTHERS, PUBLISHERS,

FRANKLIN SQUARE.

1884.
Entered, according to Act of Congress, in the year one thousand eight hundred and forty-three, by
CHARLES ANTHON.
in the Clerk's Office of the District Court of the Southern District of New York.
WILLIAM B. ASTOR, ESQ.,

AN ALUMNUS OF OUR COMMON ALMA MATER, AND A STRIKING PROOF HOW GREATLY AN UNCEASING ATTACHMENT TO CLASSICAL STUDIES TENDS TO ELEVATE AND ADORN THE CHARACTER OF THE AMERICAN MERCHANT,

This Work is Inscribed,

BY

HIS FRIEND AND WELL-WISHER,

C. A
PREFACE
TO THE AMERICAN EDITION

The merits of the present work are so fully set forth in the preface of the London editor as to render any additional remarks on this subject almost unnecessary. The student has here a guide to an accurate knowledge of Greek and Roman Antiquities, before which the meager compilations of Potter and Adams must sink into utter insignificance; and he is put in possession of a vast body of information in a most interesting department of study, which it might otherwise have cost him the labour of a whole life to accumulate. All the most recent and valuable discoveries of the German scholars are here placed within his reach, and there is nothing to prevent their speculations becoming as familiar to him as household words. The work is, in truth, a German one in an English garb, and will be found to contain all that fulness and accuracy of detail for which the scholars of Germany have so long and justly been celebrated. It is equally intended, also, for the general reader, and as a work of popular reference will be found to be invaluable, not only from its accuracy of research, but from the wide field over which it ranges. In a word, the present volume supplies what has long been felt as a great desideratum in English literature.

In order to render the work, however, if possible, still more useful, the American editor has added a large number of articles relative to the Botany, Mineralogy, and Zoolo- gy of the ancients, topics interesting and curious in themselves, and which, it is conceived, fall naturally within the scope of such a work as the present one. The contributions by the American editor are distinguished from those of the English writers by having an asterisk prefixed. In preparing them, the editor has availed himself of various sources of information, but more particularly of three, which it affords him great pleasure to mention here. The first is the Collection of Scientific and other Terms, by his learned friend, Francis Adams, Esq., of Scotland; and which has appeared as an Appendix to the Greek Lexicon of Professor Dunbar. It embraces the opinions, not only of the ancient naturalists, but of the most celebrated, also, among the moderns, and has afforded the American editor the most numerous, as well as the richest materials for his labours. The second source whence information has been obtained on various topics connected with the natural history of the ancients is the noble edition of Cuvier's Animal Kingdom, by Griffith and others, in 16 volumes, 8vo, a work full of curious learning, and replete with interesting observations on the naturalists of antiquity and the opinions entertained by them. On the subject of Ancient Mineralogy, the editor acknowledges himself deeply indebted to the excellent work published some years ago by Dr. Moore, at that time Professor of Ancient Languages in Columbia College, now President of that institution; and he takes the greater pleasure in stating his obligations to the labours of this distinguished scholar, since it affords him, also, the opportunity of congratulating his Alma Mater on having her highest office filled by one so well qualified to advance her best interests, and to gain for her the esteem and approbation of all who wish her well.

As regards the general appearance of the work, some changes of form have been made which may here be enumerated. In the English edition, the articles relating to Grecian Antiquities have their heading in Greek characters. This, although no obstacle, of course, to the student or professed scholar, is a serious impediment in the way of the general reader, and might mar the popularity of the work. To guard against such a result, great care has been taken to change all the headings of the Greek articles (except such as relate to legal matters) to Roman characters, while, at the same time, in order to satisfy the scholar, the Greek title is written immediately after the Roman. Should any words, by this arrangement, be thrown out of the alphabetical order, their places can be discovered in an instant by the General Index at the end of the volume. In the English edition, again, the references and authorities are given in the body of the article, a plan calculated to deter the general reader, and which, at best, is one of very doubtful propriety, since it mars the ap
PREFACE.

pearance of an English sentence, and destroys, in some degree, its continuity. This is remedied in the American edition by throwing all the authorities into foot-notes at the bottom of the page, an arrangement so natural, and, withal, so convenient, that it is surprising it should not have been adopted by the English editor.

Another blemish in the English edition is the plan of appending to each article the initials of the writer's name, which, to say the least of it, gives a very awkward and clumsy appearance to the page. In the American edition a different arrangement is adopted. A full reference is given at the end of the volume to the different articles furnished by the different contributors, and these are so classified that it can be ascertained at a glance what portions have been supplied by each. This, indeed, gives the American a decided advantage over the English edition.

We have remarked above, that the present work is intended to supersede the compilations of Potter and Adams. In order to facilitate this most desirable change, an Index Raisonné has been appended to the volume, in which the whole subject of Greek and Roman Antiquities is classified under appropriate heads, so that, by means of this index, the present work, though having the form of a Dictionary, may be made, with the utmost ease, to answer all the purposes of a College text-book. No conscientious and honest instructor, therefore, can hesitate for an instant between the work which is here presented to him and the ordinary text-books of the day. In the preparation of the indexes, and, indeed, in the arrangement of the entire work, the editor has to acknowledge the valuable aid of his friend, Mr. Henry Drisler, sub-rector of the Grammar-school of Columbia College, to whose accuracy and faithful care the previous volumes of the Classical Series are so largely indebted.

Before concluding the present preface, it may be proper to remark, that in a review of Mure's Tour in Greece, which appeared in the London Quarterly for June, 1842, mention is made of an ancient bridge, discovered by that traveller in Laconia, which the reviewer thinks disproves an assertion made in the present work relative to the arch, namely, that the Romans were undoubtedly the first people who applied the arch to the construction of bridges. The bridge discovered by Mr. Mure, over a tributary of the Eurotas, was regarded by him as a work of the remotest antiquity, probably of the heroic age itself; and he even goes so far as to suppose that either Homer himself or Telemachus may have crossed this bridge in travelling into Laconia! The visionary nature of such speculations must present itself to every mind; and we have preferred, therefore, waiting for farther information on this subject, and allowing the article in the Dictionary to remain unaltered. Mr. Mure's Homeric bridge may be found at last to be as modern a structure as Fourmont's temple of the goddess Oga or Onga, near Amycle, supposed to have been built about 1500 B.C., but which Lord Aberdeen proved to be a modern Greek chapel!
PREFACE

TO THE LONDON EDITION.

The study of Greek and Roman Antiquities has, in common with all other philosophical studies, made great progress in Europe within the last fifty years. The earlier writers on the subject, whose works are contained in the collections of Gröninger and Gravius, display little historical criticism, and give no comprehensive view or living idea of the public and private life of the ancients. They were contented, for the most part, with merely collecting facts, and arranging them in some systematic form, and seemed not to have felt the want of anything more: they wrote about antiquity as if the people had never existed: they did not attempt to realize to their own minds, or to represent to those of others, the living spirit of Greek and Roman civilization. But, by the labours of modern scholars, life has been breathed into the study: men are no longer satisfied with isolated facts on separate departments of the subject, but endeavour to form some conception of antiquity as an organic whole, and to trace the relation of one part to another.

There is scarcely a single subject included under the general name of Greek and Roman Antiquities which has not received elucidation from the writings of the modern scholars of Germany. The history and political relations of the nations of antiquity have been placed in an entirely different light since the publication of Niebuhr's Roman History, which gave a new impulse to the study, and has been succeeded by the works of Koch, K. O. Muller, Wachsmuth, K. F. Hermann, and other distinguished scholars. The study of the Roman law, which has been unaccountably neglected in this country, has been prosecuted with extraordinary success by the great jurists of Germany, among whom Savigny stands pre-eminent, and claims our profoundest admiration. The subject of Attic law, though in a scientific point of view one of much less interest and importance than the Roman law, but without a competent knowledge of which it is impossible to understand the Greek orators, has also received much elucidation from the writings of Meier, Schömann, Bunsen, Platner, Hudevychter, and others. Nor has the private life of the ancients been neglected. The discovery of Herculaneum and Pompeii has supplied us with important information on the subject, which has also been discussed with ability by several modern writers, among whom W. A. Becker, of Leipzig, deserves to be particularly mentioned. The study of ancient art likewise, to which our scholars have paid little attention, has been diligently cultivated in Germany from the time of Winckelmann and Lessing, who founded the modern school of criticism in art, to which we are indebted for so many valuable works.

While, however, so much has been done in every department of the subject, no attempt has hitherto been made, either in Germany or in this country, to make the results of modern researches available for the purposes of instruction, by giving them in a single work, adapted for the use of students. At present, correct information on many matters of antiquity can only be obtained by consulting a large number of costly works, which few students can have access to. It was therefore thought that a work on Greek and Roman Antiquities, which should be founded on a careful examination of the original sources, with such aids as could be derived from the best modern writers, and which should bring up the subject, so to speak, to the present state of philological learning, would form a useful acquisition to all persons engaged in the study of antiquity.

It was supposed that this work might fall into the hands of two different classes of readers, and it was therefore considered proper to provide for the probable wants of each, as far as was possible. It has been intended not only for schools, but also for the use of students at universities, and of other persons, who may wish to obtain more extensive information on the subject than an elementary work can supply. Accordingly, numerous references have been given, not only to the classical authors but also to the best modern writers, which will point out the sources of information on each subject, and enable the reader to extend his inquiries farther if he wishes.
At the same time, it must be observed, that it has been impossible to give at the end of each article the whole of the literature which belongs to it. Such a list of works as a full account of the literature would require would have swelled the work much beyond the limits of a single volume, and it has therefore only been possible to refer to the principal modern authorities. This has been more particularly the case with such articles as treat of the Roman constitution and law, on which the modern writers are almost innumerable.

A work like the present might have been arranged either in a systematic or an alphabetical form. Each plan has its advantages and disadvantages, but many reasons induced the editor to adopt the latter. Besides the obvious advantage of an alphabetical arrangement in a work of reference like the present, it enabled the editor to avail himself of the assistance of several scholars who had made certain departments of antiquity their particular study. It is quite impossible that a work which comprehends all the subjects included under Greek and Roman Antiquities can be written satisfactorily by any one individual. As it was therefore absolutely necessary to divide the labour, no other arrangement offered so many facilities for the purpose as that which has been adopted; in addition to which, the form of a Dictionary has the additional advantage of enabling the writer to give a complete account of a subject under one head, which cannot so well be done in a systematic work. An example will illustrate what is meant. A history of the patrician and plebeian orders at Rome can only be gained from a systematic work by putting together the statements contained in many different parts of the work, while in a Dictionary a connected view of their history is given, from the earliest to the latest times, under the respective words. The same remark will apply to numerous other subjects.

The initials of each writer’s name are given at the end of the articles he has written, and a list of the names of the contributors is prefixed to the work. It may be proper to state, that the editor is not answerable for every opinion or statement contained in the work: he has endeavoured to obtain the best assistance that he could; but he has not thought it proper or necessary to exercise more than a general superintendence, as each writer has attached his name to the articles he has written, and is therefore responsible for them. It may also not be unnecessary to remark, in order to guard against any misconception, that each writer is only responsible for his own articles, and for no other parts of the work.

Some subjects have been included in the present work which have not usually been treated of in works on Greek and Roman Antiquities. These subjects have been inserted on account of the important influence which they exercised upon the public and private life of the ancients. Thus, considerable space has been given to the articles on Painting and Statuary, and also to those on the different departments of the Drama. There may seem to be some inconsistency and apparent capriciousness in the admission and rejection of subjects, but it is very difficult to determine at what point to stop in a work of this kind. A Dictionary of Greek and Roman Antiquities, if understood in its most extensive signification, would comprehend an account of everything relating to antiquity. In its narrower sense, however, the term is confined to an account of the public and private life of the Greeks and Romans, and it is convenient to adhere to this signification of the word, however arbitrary it may be. For this reason, several articles have been inserted in the work which some persons may regard as out of place, and others have been omitted which have sometimes been improperly included in writings on Greek and Roman Antiquities. Neither the names of persons and divinities, nor those of places, have been inserted in the present work, as the former will be treated of in the “Dictionary of Greek and Roman Biography and Mythology,” and the latter in the “Dictionary of Greek and Roman Geography.”

The subjects of the woodcuts have been chosen by the writers of the articles which they illustrate, and the drawings have been made under their superintendence. Many of these have been taken from originals in the British Museum, and others from the different works which contain representations of works of ancient art, as the Museo Borbonico, Museo Capitolino, Millin’s Peintures de Vases Antiques, Tischbein’s and D’Hancarville’s engravings from Sir William Hamilton’s Vases, and other similar works. Hitherto little use has been made in this country of existing works of art for the purpose of illustrating antiquity. In many cases, however, the representation of an object gives a far better idea of the purposes for which it was intended and
the way in which it was used, than any explanation in words only can convey. Besides which, some acquaintance with the remains of ancient art is almost essential to a proper perception of the spirit of antiquity, and would tend to refine and elevate the taste, and lead to a just appreciation of works of art in general.

Considerable care has been taken in drawing up the list of articles, but it is feared that there may still be a few omissions. Some subjects, however, which do not occur in the alphabetical list, are treated of in other articles; and it will be found by reference to the Index, that many subjects are not omitted which appear to be so.

The reader will occasionally find some words referred for explanation to other articles, which are not treated of under the articles to which the references are made. Such instances, however, occur but rarely, and are rectified by the index, where the proper references are given. They have only arisen from the circumstance of its having been found advisable, in the course of the work, to treat of them under different heads from those which were originally intended. Some inconsistency may also be observed in the use of Greek, Latin, and English words for the names of the articles. The Latin language has generally been adopted for the purpose, and the subjects connected with Greek antiquity have been inserted under their Greek names, where no corresponding words existed in Latin. In some cases, however, it has, for various reasons, been found more convenient to insert subjects under their English names, but this has only been done to a limited extent. Any little difficulty which may arise from this circumstance is also remedied by the index, where the subjects are given under their Greek, Latin, and English titles, together with the page where they are treated of. The words have been arranged according to the order of the letters in the Latin alphabet.

Mr. George Long, who has contributed to this work the articles relating to Roman Law, has sent the editor the following remarks, which he wishes to make respecting the articles he has written, and which are accordingly subjoined in his own words:

"The writer of the articles marked with the letters G. L. considers some apology necessary in respect of what he has contributed to this work. He has never had the advantage of attending a course of lectures on Roman Law, and he has written these articles in the midst of numerous engagements, which left little time for other labour. The want of proper materials, also, was often felt, and it would have been sufficient to prevent the writer from venturing on such an undertaking, if he had not been able to avail himself of the library of his friend, Mr. William Wright, of Lincoln's Inn. These circumstances will, perhaps, be some excuse for the errors and imperfections which will be apparent enough to those who are competent judges. It is only those who have formed an adequate conception of the extent and variety of the matter of law, in general, and of the Roman Law in particular, who can estimate the difficulty of writing on such a subject in England, and they will allow to him who has attempted it a just measure of indulgence. The writer claims such indulgence from those living writers of whose labours he has availed himself, if any of these articles should ever fall in their way. It will be apparent that these articles have been written mainly with the view of illustrating the classical writers; and that a consideration of the persons for whose use they are intended, and the present state of knowledge of the Roman Law in this country, have been sufficient reasons for the omission of many important matters which would have been useless to most readers, and sometimes unintelligible.

"Though few modern writers have been used, compared with the whole number who might have been used, they are not absolutely few, and many of them, to Englishmen, are new. Many of them, also, are the best, and among the best of the kind. The difficulty of writing these articles was increased by the want of books in the English language; for, though we have many writers on various departments of the Roman Law, of whom two or three have been referred to, they have been seldom used, and with very little profit."

It would be improper to close these remarks without stating the obligations this work is under to Mr. Long. It was chiefly through his advice and encouragement that the editor was induced to undertake it, and during its progress he has always been ready to give his counsel whenever it was needed. It is, therefore, as much a matter of duty as it is of pleasure to make this public acknowledgment to him.

WILLIAM SMITH.

London, 1842
ABACUS.

*ABACULUS (ἄβακος), a diminutive of ABACUS, is principally applied, when used at all, to the tiles or squares of a tesselated pavement. (Vid. ABACUS, II.)

ABACUS (ἄβας) denoted generally and primarily a square tablet of any material. Hence we find it applied in the following special significations:

I. In architecture it denoted the flat square stone which constituted the highest member of a column, being placed immediately under the architrave. Its use is to be traced back to the very infancy of architecture. As the trunk of the tree, which supported the roof of the early log-hut, required to be placed upon a flat square stone, and to have a stone or tile of similar form fixed on its summit to preserve it from decay, so the stone column in after days was made with a square base, and was covered with an Abacus. The annexed figure is drawn from that in the British Museum, which was taken from the Parthenon at Athens, and is a perfect specimen of the capital of a Doric column.

In the more ornamented orders of architecture, such as the Corinthian, the sides of the abacus were curved inward, and a rose or some other decoration was frequently placed in the middle of each side; but the name Abacus was given to the stone thus diversified and enriched, as well as in its original form.

II. The diminutive ABACULUS (ἄβακος) denoted a tile of marble, glass, or any other substance used for making ornamental pavements.

Pliny, in his account of glass, says, "It is artificially stained as in making the small tiles, which some persons call abaculi." Moschion says that the magnificent ship built by Archimedes for Hiero, king of Syracuse, contained a pavement made of such tiles, of various colours and materials.

III. ABACUS was also employed in architecture to denote a panel, coffer, or square compartment in the wall or ceiling of a chamber. As panels are intended for variety and ornament, they were enriched with painting.

Pliny, in describing the progress of luxury with respect to the decoration of apartments, says that the Romans were now no longer satisfied with panels, and were beginning even to paint upon marble.

IV. Abacos or abaculi were sometimes represented as a wooden tray, i.e., a square board surrounded by a raised border. This may have been the article intended by Cato, when, in his enumeration of the things necessary in furnishing a farm (cultetum), he mentions "one abacus."

Such a tray would be useful for various purposes. It might very well be used for making bread and confectionary; and hence the name of abacus (ἄβας, ἀβάκος) was given to the μύκτρα, i.e., the board or tray for kneading dough.

V. A tray of the same description, covered with sand or dust, was used by mathematicians for drawing diagrams.

VI. It is evident that this contrivance would be no less serviceable to the arithmetician; and to this application of it Persius alludes, when he censures the man who ridiculed "the numbers on the abacus and the partitions in its divided dust." In this instance the poet seems to have supposed perpendicular lines or channels to have been drawn in the sand upon the board; and the instrument might thus, in the simplest and easiest manner, be adapted for arithmetical computation.

It appears that the same purpose was answered by having a similar tray with perpendicular wood-

divisions, the space on the right hand being intended for units, the next space for tens, the next for hundreds, and so on. Thus was constructed "the abacus on which they calculate,"* i.e., reckon by the use of stones." The figure following is designed to represent the probable form and appearance of such an abacus.

The reader will observe, that stone after stone might be put into the right-hand partition until they amounted to 10, when it would be necessary to take them all out as represented in the figure, and instead of them to put one stone into the next partition. The stones in this division might in like manner amount to 10, thus representing 10×10=100, when it would be necessary to take out the 10, and instead of them to put one stone into the third partition, and so on. On this principle, the stones in the abacus, as delineated in the figure, would be equivalent to 359,910.

It is said that the same method might be employed in adding, subtracting, or multiplying weights and measures, and sums of money. Thus the stones, as arranged in the figure, might stand for 3 stanes, 5 pietres, 9 falsoms, 3 cubits, and 1 foot. The abacus, however, can never be much used by us at the present day, owing to various divisions of weights and measures, &c. We should need one abacus for dollars, cents, &c.; another for avoirdupois weight; a third for troy weight, and so on. In China, however, where the whole system is decimal, that is, where every measure, weight, &c., is the tenth part of the next greater one, this instrument, called Shawaypoo, is very much used, and with astonishing rapidity. It is said that, while one man reads over rapidly a number of sums of money, another can add them so as to give the total as soon as the first has done reading.

That the spaces of the abacus actually denoted different values, may be inferred from the following comparison in Polybius: 1 All men are subject to be elevated and again depressed by the most fleeting events; but this is particularly the case with those who frequent the palaces of kings. They are like the stones upon abacii(2) which, according to the pleasure of the calculator, are at one time the value of a small copper coin, and immediately afterward are worth a talent of gold. Thus courtiers at the monarch's nod may suddenly become either happy or miserable.

VII. By another variation the abacus was adapted for playing with dice or counters. The Greeks and a tradition ascribing this contrivance to Palamedes; hence they called it "the abacus of Palamides. 14 It probably bore a considerable resemblance to the modern backgammon-board, dice being thrown for the moves, and the "men" placed according to the numbers thrown on the successive lines or spaces of the board.

VIII. The term abacus was also applied to a kind of cupboard, sideboard, or cabinet, the exact form of which can only be inferred from the incidental mention of it by ancient writers. It appears that it had partitions for holding cups and all kinds of valuable and ornamental utensils:—

"Non per multiplices abaco splendenter cavernas
Argenti nigri polula defodiam." 15

This passage must evidently have referred to a piece of furniture with numerous cells, and of a complicated construction. If we suppose it to have been a square frame with shelves or partitions, in some degree corresponding to the divisions which have been described under the last two heads, we shall see that the term might easily be transferred from all these other applications to the sense now under consideration.

We are informed that luxuries of this description were first introduced at Rome from Asia Minor after the victories of Cn. Manlius Vulso, A.U.C. 557.

In the above passage of Sidonius, the principal use of the abacus now described is indicated by the word argenti, referring to the vessels of silver which it contained, and being probably designed, like our word "plate," to include similar articles made of gold and other precious substances.

The term abacus must, however, have been applicable to cupboards of a simple and unadorned appearance. Juvenal says of the triclinium and drinking-vessels of a poor man,

"Lector erat Proco Praetoria minor, uriscoe sic
Ornamentum abaci, noemn et parvulus infra
Careherus," 16

The abacus was, in fact, part of the furniture of a triclinium, and it was intended to contain the vessels usually required at meals.

IX. Lastly, a part of the theatre was called abacii. 17 It seems to have been on or near the stage; farther than this its position cannot be at present determined. We may, however, infer that the general idea, characteristic of abaci in every other sense, viz., that of a square tablet, was applicable in this case also.

ABALIENA'TIO. (Vid. Mancipium; Mancipia; Patentia.)

ABDICAT'IIO. (Vid. Magistratus, Aposcrys-

*ABIES, the "Fir," a genus of trees of the coniferous tribe, well known for the valuable timber which is produced by many of the species. The origin of the Latin name is unknown; that of the English appellation is the Saxan fur-komb, "firwood."
The Abies Picea, or "Silver Fir," is the kind styled by Virgil pulcherrima ("most beautiful"), and richly merits the name. Antiquarians have lost themselves in vain attempts to reconcile the declaration of Caesar (6, 12), that he found in Britain all the trees of the genus, with the well-known fact that fir-wood is abundant in the ancient English mosaics, and has been met with even beneath the foundations of Roman roads. What Caesar meant was, no doubt, that he did not meet with the silver fir in Britain; of the pine he says nothing, and therefore it is to be presumed that he found it. The common Elytra of the Greeks must have been either the Pinus abies or the Pinus Orientalis (Tournafort). There is some difficulty in distinguishing the male and female species of Theophrastus. Stockhouse holds the former to be the Pinos abies, or common "Fir-tree," and the latter to be the Pinos sylvestris ("Spruce").

*ABIGA, the herb "ground-pine," called also "St. John's wort." The Latin name is derived from this plant's having been used to produce abortion. 8 The Abiga is the same with the Chamaepitys (Xaumari-

The three species of the latter described by Dioscorides have been the subject of much diversity of opinion. The 1st would seem to have been the Agiela Chamaepitys; the 2d the Agiela teae (according to Bauhin and Sprengel); while the 3d, according to the latter, is either the Teuvium supinum or monilatum. 6 These plants, rich in essential oil, are tonic and aromatic. All that we find in Dioscorides and in Pliny (who copies him), which does not refer to these properties, is merely hypothetical, and does not merit reflection.

ABLE'C'TI. (Vid. Extraordinarii.)

ABLEGMINA. (abalgynon) were the parts of the victim which were offered to the gods in sacrifice. The word is derived from allegere, in imitati-
the Greek ἀκάλυτος, which is used in a similar manner. These parts were also called Porritia, Prospigina, Proscole. (Vid. SACCARIS.)

ABOLLA, a woolen cloak or pall, is probably only a varied form of pallium (ἀποκέφαλον), with which this word is nearly, if not altogether, identical in signification. The form and manner of wearing the abolla may be seen in the figures annexed, which are taken from the bas-reliefs on the triunval arch of Septimius Severus at Rome.

ACANTHA.

the Greek ἀρκάλως, is used in a similar manner. These parts were also called Porritia, Prospigina, Proscole. (Vid. SACAEDES.)

ABOLLA, a woolen cloak or pall, is probably only a varied form of pallium (ἀποκέφαλον), with which this word is nearly, if not altogether, identical in signification. The form and manner of wearing the abolla may be seen in the figures annexed, which are taken from the bas-reliefs on the triumviral arch of Septimius Severus at Rome.

ACANTHA.

the Greek ἀρκάλως, which is used in a similar manner. These parts were also called Porritia, Prospigina, Proscole. (Vid. SACAEDES.)

ABOLLA, a woolen cloak or pall, is probably only a varied form of pallium (ἀποκέφαλον), with which this word is nearly, if not altogether, identical in signification. The form and manner of wearing the abolla may be seen in the figures annexed, which are taken from the bas-reliefs on the triumviral arch of Septimius Severus at Rome.

ACANTHA.

The word was in use before the Augustan age; for it occurs in a passage cited by Nonius Marcel-"lus from one of the sates of Varro. Nonius Mar-"cellus quotes the passage to show that this garment was worn by soldiers (vestis militaris), and thus op-"posed to the toga. There can be no doubt that it was more especially the dress of soldiers, because the toga, which was used instead of it in the time of peace, though of a similar form and application, was much too large, and wrapped in too many folds about the body to be convenient in time of war. But it is also clear, from many passages in ancient authors, that the abolla was by no means confined in its use to military occasions.1

Juvenal, speaking of a person who heard unexpectedly that it was necessary for him to attend upon the emperor, says, "He took up his cloak in a great hurry."2 This action suited the use of a garment, made simply to be thrown over the shoulders and fastened with a fibula. The same poet calls a very cruel and base action facinus majoris abollis, literally "a crime of a larger cloak." The expression has been explained as meaning "a crime of a deeper dye," and "a crime committed by a philos-"opher of a graver character." Probably it meant a "crime so enormous as to require a larger cloak to hide it. This is supported by the authority of the ancient scholar on Juvenal, who explains majoris abollis as equivalent to majoris pallii. (Vid. Palli-

The Periplus of the Erythraean Sea mentions aboll-"ale among the articles imported into the kingdom of the Axumites in Abyssinia; and the expression μαριών ἀβολλαί, used by the writer, is an additional proof that the abolla was a kind of μαριών, i.e. a square or rectangular piece of woollen cloth, a cloak, or pall.

*ABRAMIS* (Ἀβραμίς), the name of a fish mentioned by Oppian2 and Athenœus. According to Coray, it is the Bream, namely, the *Cyprius Brama, L.* or *Abramis Vulgaris* (Cuvier)." Rondelet, however, with whom Geenier is disposed to concur, supposes it to be a species or variety of the *Ophius* (Thrisia).3

1. (Sueton., Calig., c. 35.—Martial, l. 133; iv., 48.)—2. "Reptis properabat abolla." (Iv., 75.)—3 (Hali., 344.)—4 (Vit. H. 2, b.)—5 (Adams, Append., s. v.)

ABROGATIO. (Vid. Lex.)

*ABROTONUM (ἀβροτώνος), a plant, of which two species are described by Dioscorides, the male and female forms of these, by the almost general agreement of the commentators and botanical authorities, is referred to the *Artemisia abrotanum, L.* or *Southernwood.* About the other species there is great diversity of opinion. Fuch-"sinus makes it the *Artemisia Pontica;* Dodonæus, the *A. abrotanum,* and Matthiolus, the *Alicia symphytum*; or common Lavender Cotton... Adams decides in favour of the last. Galen recognises the two species described by Dioscorides; but Nicander, Paulus Aegineta, and most of the other writers on the Materia Medica, notice only one species, which he calls *Abrotanum lyco-"roides.*

*ABSENTHIIUM (ἀβσενθίων), a plant, of which Dioscorides describes three species. The first of these is pretty generally acknowledged to be the *Artemisia absinthium,* or common wormwood; but Sprengel hesitates whether he should not also com-"prehend the *A. Pontica* under it, which latter, indeed, Baulin held to be the true Roman wormwood. The second species is the *Artemisia marinum.* The third is held by Sprengel to be the *A. palmaris,* L., which, it appears, is indigenous in Sontonge. The *A. santonicum,* L., being confined to Tartary and the northern parts of Persia, it is not likely that the ancients were acquainted with it.4

ABSOLUTIO. (Vid. JUDICIA.)

ABSTINENTI DI BENEFICIAM. (Vid. HERES.)

*ACA'CALIS, or ACA'LLIS (ἀκαλλικός, ἀκαλλίδος), a plant; according to Sprengel, the *Tamarix ornata,* called *Tamaria articulata* by Vahl.5

*ACA'RIA (ἀκρία), a plant, which, according to Sprengel, and most of the authorities, is the *Acacia Vera,* Wild.; but, according to Dierbach, it is the *Acacia Senegal.* Hill remarks, that the tree which produces the *sucus acacia* is the same as that which yields the gum arabic. The acacia gets the English name of the Egyptian thorn.6

AICA'EΝΙΑ (ἀκαίνια), a measure of length, equiv-"alent to ten Greek feet.

*ACALE'PHΕ (ἀκαλέφη, or κυλόδρο) I. A kind of shellfish, belonging to the genus *Urtica* ("Sea-net-"tle"), of which there are several species. Linnæus places the *Urtica* among Zeophyta, but it belongs more properly to the class *Mollusca.* Sprengel rec-"ognises, that the *Urtica marinum* of the ancients is the *Actinia semila*. Coray gives its French name as *Ortie de mer.* Pennant says, the ancients divided their *κυλόδρο* into two classes, those which adhere to rocks (the *Actinia of Linnæus*), and those that wan-"der through the waves (the *A. semila*). The latter are called by late writers *Urtica voule*; by Linnæus, *Medusa*; by the common people, "Sea jellies," or "Sea bluff-"ers."—II. A species of plant, the "nettle." Dios-"corides describes two species, which Sprengel holds to be the *Urtica dioica* ("great nettle") and the *Urtica marina.*

*ACANTH'A (ἀκανθά), the Thorn. Eight spe-"cies are described by Theophrastus, none of which are satisfactorily determined by Stockhouse and Schneider. There is great diversity of opinion respecting the two species described by Dioscorides. Sprengel, upon the whole, inclines to the opinion of Silloth, that the *Acaena leucop* is the *Corium Arvens, Corn,* and the *Acantha Arabia* the *Onopordum Arable.* Botanists even yet find great difficulty in distinguishing the different species and genera of Thorns and Thistles, and the nomen-"clature of this tribe of plants is very unsettled.7

*ACANTH'IAS GALEOS (ἀκανθίας γάλακτος, a 1. (Mat. Med., i., 56.)—2. (Adams, Append., s. v.)—3 (Adams, Append., s. v. abro.)—4. (Adams, Append., s. v. abrot.)—5 (Adams, Append., s. v. abrot.)—6. (Dioscor., iv., 72.—Adams, Append., s. v.)—7 (Hali., 11.)—10 (Adams, Append., s. v.)

17
species of fish, the *Squalus Acantinus*, L., or *Squalus Acantinus* of later authors; in English, the "Finked Dog" or "Hound Fish." It is common on the shores of England and in the Mediterranean. Pennant also says that it swarms on the Scottish coast. It weighs about 30 lbs. This is the species of shark often taken between Edinburgh and Aberdeen.1

1. *Acantthus* (ωκάνθος), so called by Aristotle, is probably derived from the names of Aristocles, the *Acantophanes*, and the *Acanthophylla* of Hesychius. It is the Acanthus of Pliny and Virgil. Gesner, with great probability, refers it to the "Siskin," namely, *Fringilla spinus*, L., or *Carduelis spinus*, Cuvier. Professor Remey says it is called "Aberdevine" near London.2

2. *AcANTHUS* (ωκανθίς), I. the name by which the broad raffled leaf used in the enrichment of the Corinthian capital is known. It is thus called because of its general resemblance to the leaves of a species of the Acanthus plant. (Vid. Columna.)

II. Under this name have been described by ancient authors at least three totally different plants. First, a prickly tree, with smooth evergreen leaves, and small, round, saffron-coloured berries, frequently alluded to by Virgil; this is conjectured to have been the *Holley*. Secondly, a prickly Egyptian tree, described by Theophrastus as having pods like those of a bean; it is probable that this was the *Acanthus apicatus*, which is described by Dioscorides, with broad prickly leaves, which perish at the approach of winter, and again sprout forth with the return of spring. To this latter plant the name is now applied. The word in all cases alludes to the prickly nature of the leaves or stems. It is this last species which is usually supposed to have given rise to the notion of the Corinthian capital. But it appears from the investigation of Dr. Sibthorp, that it is nowhere to be found, either in the Greek islands, or in any part of the Peloponnesus; and that the plant which Dioscorides must have meant was the *Acanthus spinosus*, still called *ωκάνθος*, which is found, as he describes it, on the borders of cultivated grounds or of gardens, and is frequent in rocky moist situations.3

3. *AcANTHyllIs* (ωκανθύλλις). As has been stated under Acanthis, the *ωκανθύλλις* of Hesychius is most probably the "Siskin;" but that of Aristotle is certainly different, being *Pisces varius* and a shrub.4

4. *Acapna LIGNA* (a priv., and κανβον), called also *coca*, were logs of wood dried with great care in order to prevent smoke. Pliny says that wood soaked with the lees of oil (amudra) burned without smoke.5

5. *Acanthos mel*, which was considered the best kind of honey, was obtained without driving out the bees from their hives by smoke, which was the usual method of procuring it.6

6. *Acation* (ωκανθών, a diminutive of *ωκάνθος*, a small vessel), a small vessel or boat, which appears to have been the same as the Roman *scapha*; since *Acation* is the name of the small vessel sent from Alexandria, says that he jumped into the *scapha*, which Plutarch, in narrating the same events, calls an *ακανθίον*. Thucydides speaks of *ακάνθιον άμφόσιον*, which is explained by the scholiast, Πολύαιμον [καταφέρων ερωσίριου, εν θάλασσώ τού ηλεκτρυν των κυκλιαρ περιττά.7

7. The *Ακάνθια* were also sails, which, according to the description of Phoien, were adapted for fast sailing. They are opposed by him to the μεγάλα λίθα.8

ACERRA.

The acerra was also, according to Festus, a small alabaster placed before the dead, on which perfumes were burned. 

ACETABERUM.

From proper vinegar-cups, the Latin and Greek terms under consideration were transferred to all cups resembling them in size and form, to whatever use they might be applied.

As the vinegar-cup was always small, and probably varied little in size, it came to be used as a measure. Thus we read of an acetabulum of honey or of salt, which is agreeable to our practice of measuring by teacups, wine-glasses, or table-spoons. We are informed that, as a measure, the διψαμαν, or acetabulum, was a cyathus and a half, or the fourth part of a κολίνα, or hemina. The use of these cups by jugglers is distinctly mentioned. They put stones or other objects under certain cups, and then by sleight of hand abstracted them without being observed, so that the spectators, to their great amusement and surprise, found the stones under different cups from those which they expected. Those persons, who were called in Latin acetabulares, because they played with acetabulae, were in Greek called ψευδομαστοί, because they played with stones (ζηνίδοι); and under this name the same description of performers is mentioned by Sextus Empiricus.

In the Epistles of Aleiphon, a countryman who had brought to the city an ass laden with figs, and had been taken to the theatre, describes his speechless astonishment at the following spectacle: "A man came into the midst of us and set down a three-legged table (τρίποδος). He placed upon it three cups, and under these he concealed some
floor spar, containing, as it sometimes does, disseminated particles of iron pyrites. The agate was said to be called in Greek αξιωτικός.  

*AHERDUS (Αθερόδος), the wild pea-tree, also a kind of thorn of which heiles wined crawl. Sprengel suggests that it is the Cretan Aetheuros.*  

*AHERUSIS (Αθεροσία), the milk vetch.*  

*AHERUSIS (Αθεροσία), according to Hesychius, is the Cicer; but this is clearly either a mistake or an error of the text, as there can be no doubt that it is merely an ekphon applied to the larger species of Cicera, as signifying "vocal."* (Vid. Cicada.)  

*ACHILLES (Αχιλλης), a plant, failed to have been discovered by the Hilles, and with which the flowers of the genus of Telepus.* The commentators on Pliny make it merely the *Sideritis heraclea.* It is difficult, however, to decide the question from the text of the Roman writer merely. On recurring to that of Dioscorides, we may, perhaps, conclude as follows: the Achilleos with the golden flower is the *Pulmonaria tormentosa seu Albotramosella;* the kind with the purple flower is the *A. tanacetifolia;* and the one with white flowers, the *A. nobilis seu magnus.*  

*ACIES (Vid. Army).*  

*ACOLIA LEX. (Vid. REPETUNDE).*  

*ACOLIA CALPURNIA LEX. (Vid. Ambros.)*  

*ACINACES (άχινας), a poniard.* This word, as well as the weapon which it denotes, is Persian. Herodotus says* that when Xerxes was preparing to cross the Hellespont with his army, he threw it into, together with some other things, "a Persian sword, which they call an acines." As the root αχινος, denoting sharpness, an edge or a point, is common to the Persian, together with the Greek and Latin, and the rest of the Indo-European languages, we may ascribe to this word the same general origin with *αχινος, αχινος, acou, acis,* and many other Greek and Latin words allied to these in signification. Horace* calls the weapon in which the Medes to allure to the wars of Augustus and the Romans against Parthia.  

Acinaces is usually translated *a cimeter, a falchion,* a *sabre,* and is supposed to have been curved; but this assumption is unsupported by any evidence. It appears that the acinaces was short and straight. Justin* tells us that the Persian daggers were called *acinaces;* and of which the Romans call *dagger,* and from which well-known murderers are called *sercati.* *The curvature of the daggers here described was probably intended to allow them to fit closer to the body, and thus to be concealed with greater ease under the garments. Thus we see that the Persian acinaces differed from the Roman *sica* in this, that the former was straight, the latter curved.*  

Another peculiarity of the acinaces was, that it was made to be worn on the right side of the body, whereas the Greeks and Romans usually had their swords suspended on the left side. Hence Valerius Flaccus speaks of Myraces, a Parthian, as *In dignis mancipi, insignis acinace dexter.*  

*The same fact is illustrated by the account given by Ammianus Marcellinus of the death of Cambyses, king of Persia, which was occasioned by an accidental wound from his own acinaces: *Si ommet psogme, quem ope...* 

---

ACIPENSER. *Acorus* (De Pliny, 294.)—Leoch., is also called *çokkakos* by Durio in Athenaeus. ACLIS; a kind of dart.

Virgil attributes this weapon to the Osci, one of the ancient nations of Italy: *Verses simi alicies illis terrae sed hic lento mortis agrella.*

From this account it appears that the peculiarity of the acis consisted in having a leathern thong attached to it; and the design of this contrivance probably was, that, after it had been thrown at a distance, it might be drawn back again. The acis was certainly not a Roman weapon. It is described in as many different ways by ancient writers, and distinguishing them from Greeks and Romans.

ACNA, AC'NUA. (Vid. *Acorus*.)

A golden acinis was frequently worn by the Persian nobility. It was also often given to individuals by the kings of Persia as a mark of honour. After the defeat of the Persian army at the battle of Plataea, the Greeks found golden poniards on the bodies of the slain. That of Mardomus, the Persian general, was long kept as a trophy in the temple of Athena Parthenos, on the acropolis of Athens.

The acinis was also used by the Caspii. It was an object of religious worship among the Scythians and many of the northern nations of Europe.

The second class of ancient monuments consists of sculptures of the god Mithras, two of which are in the British Museum. The annexed woodcut is taken from the larger of the two, and clearly shows the straight form of the acinis.

*ACIPENSER* (Αχίπενσερ), the Sturgeon, or *Acipepsus Sturio*. L. Ludovicus Nonnus holds, that the Sturis of Acipepsus is the sturgeon, but this opinion is very questionable. The *Deo* and the

on the summit of a pediment. According to some writers, the word only means a piece of which the ornaments are placed. 11. It signifies also the wine-cap, or βατραχον of a ship, which were usually taken from a conquered vessel as a mark of victory. 11. It was also applied to the extremities of a statue, wings, feet, hands, &c. 12. 

ACROTHION (ἀκρόθιον), generally used in the plural, means properly the top of the heap (ἀκρος ὁ πῖς), and is thence applied to those parts of the ships of the same sort in war, which were offered to the gods. In the Phoenissae of Euripides, the chorus call themselves βατραχον ἀκρόθιον.

ACTA DIURNIA (proceedings of the day) was a kind of gazette published daily at Rome under the authority of the government. It contained an account of the proceedings of the public assembly, of the punishment of offenders, and a list of births, marriages, deaths, &c. The proceedings of the senate and the law courts were obtained by means of reporters (actuarii). The proceedings of the senate (acta senatus) were not published till the time of Julius Caesar, and this custom was continued by Augustus. An account of the proceedings of the senate was still preserved, though not published, and some senator seems to have been chosen by the emperor to compile the account. 11. The acta diurna were also called acta populi, acta publica, acta urbana, and usually by the simple name of acta. These acta were frequently quoted to later authors and are enumerated in the Acta Senatus.

ACTIA (άκτια) was a festival celebrated every three years at Actium in Epirus, with wrestling, horse-racing, and sea-fights, in honour of Apollo. There was a celebrated temple of Apollo at Actium, which is mentioned by Thucydides and Strabo. After the defeat of Antiochus of Actium, Actium was relinquished, and the festival was celebrated every five years in commemoration of his victory.

ACTIO is defined by Celsus 14 to be the right of pursuing by judicial means what is a man's due.

With respect to the subject-matter, the actio was divided into two great divisions, the in personam actio, and the suit against the state. The actio was against a person who was bound to the plaintiff by contract or delict; the in rem actio applied to those cases where a man claimed a corporeal thing (corporatis res) as his property, or claimed a right, as, for instance, the use and enjoyment of a thing, or the right to a road over a piece of ground (actus). The in rem actio was called vindicativa in the personam actio was called condicipia, because originally the plaintiff gave the defendant notice to appear on a given day for the purpose of choosing a judge.

The old actions of the Roman law were called leges actions, or legitima, either because they were governed by a different set of laws by the laws of the Twelve Tables, or because they were strictly adapted to the words of the laws, and therefore could not be varied. In like manner, the old writs in this country contained the matter or claim of the plaintiff expressed according to the legal form. 14

The five modes of proceeding by legal action, as a med and described by Gaius, were SACRAMENTO, PER JUDICIUM POSTULATIONEM, PER CONDITIONEM, PER MANUS INJECTIONEM, PER FICINORIS CAUTIONEM. But these forms of action gradually drifted into disuse, in consequence of the excessive nicety required, and the failure consequent on the slightest error in the pleadings; of which there is a notable example given by Gaius, in which a plaintiff who complained of his vines (vines) being cut down, and was told that his action was bad, inasmuch as he ought to have used the term trees (arboreis), and not vines; because the law of the Twelve Tables, which gave him the action for damage to his vines, contained the subsequent expression: "tremendis loricis, moribus, statuis, legalibus, sinistris, basilicae, ab uxoribus discantibus, ab adversis adversis, in decem cohortem frater, in quattuor cohortem uxor, in tres cohortes turbae." The Lex Ebulia and another Lex Julia abolished the old legitimate actions, except in the case of damnum infecundum (Vid. Damnum Infecundum), and in matters which fell under the cognizance of the Centumviri. (Vid. CENTUMVIRI.)

In the old Roman constitution, the knowledge of the law was most closely connected with the institutes and ceremonial of religion, and was accordingly in the hands of the patricians alone, whose aid their clients were obliged to ask in all their legal disputes. Appius Claudius Cæsus, perhaps one of the earliest writers on law, drew up the various legal forms in such a manner, and ordere and that of his friends: the manuscript was stolen n by a scriba Cæs. Flavius, who made it public; and thus, according to the story, the plebeians became acquainted with those legal forms which hitherto had been the exclusive property of the patricians.

Upon the old legal actions being abolished, it became the practice to prosecute suits according to certain prescribed forms, or formulae, as they were called, which will be explained after we have noticed various divisions of actions, as they are made by the modern jurists.

The division of actions in the Roman law is somewhat complicated, and some of the divisions must be considered rather as emanating from the schools of the rhetoricians than from any other source. But this division, though complicated, may be somewhat simplified, by at least, rendered more intelligible, if we consider that an action is a claim or demand made by one person against another, and that, in order to be a valid legal claim (actio utilis), it must be founded on a legal right. The main division of actions must therefore have a reference to the object of the right in question, and, for every system of law the form of the action must be the expression of the legal right. Now the general division of rights in the Roman law is into rights of dominion or ownership, which are rights against the whole world, and into rights arising from contract, and quasi contract, and delict. The actio in rem implies a complainant, who claims a certain right against every person who may dispute it, and the object and end of the action is to compel an acknowledgment of the right by the particular person who disputes it. By this action the plaintiff maintains his property in or to a thing, or his rights to the benefit of a thing (seruums). Thus the actio in rem is not so called on account of the subject-matter of the action, but the term is a technical phrase to express an action which is in no way founded on contract, and therefore has no determinate individual as the other necessary party to the action, and from which the action is derived, but from which the right, becomes, by such act of disputing, a party liable to such action. The actio in rem does not assert the complainant's right, and from the nature of the action the complainant's right cannot be ascertained by it, for it is a right against all the world; but the action determines that the defendant has or has not a claim which is valid against the plaintiff's claim. The actio in personam implies a determined person or persons against whom the action lies, the right of the plaintiff being founded on the acts of the defendant or defendants; it is therefore in respect of something which has been agreed to be done, or in respect of some injury for which the defendant is liable. The form of the action, "actio minuta of Justinian's legislation" was so called from its being supposed to partake of the nature of the actio in rem and the actio in personam. Such was the action among co-heirs as to the division of the inheritance, and the action for the purpose of settling the property of minors.

Rights, and the modes of enforcing them, may also be viewed with reference to the sources from which they flow. Thus the rights of Roman citizens flowed in part from the sovereign power, in part from those to whom power was delegated. That body of law which was founded, and flowed from, the edicts of the patrons and curule aediles, was called jus honorarium, as opposed to the jus civilis, in its narrower sense, which comprehend the legal, plebitica, senatus consulta, &c. The jus honorarium introduced new rights and modified existing rights; it also provided remedies suitable to the change of condition of men. The Romans, being a law-dwelling people, and this was effected by the actions which the patrons and aediles allowed. On this jurisdiction of the actions fell the distinction of actions to civiles and honorariae, or, as they are some times called, pretorius, from the greater importance of the pretor's jurisdiction.

There were several other divisions of actions, all of which had reference to the forms of procedure. A division of actions was sometimes made with reference to the object which the plaintiff had in view. If the object was to obtain a thing, the action was causa, if the object was to obtain damages (paeae) for an injury, as in the case of a thing stolen, the action was paelonialis for the thing itself could be claimed both by the vindicatio and the condicio. If the object was to obtain both the thing and damages, it was probably sometimes called action mixta, a term which had, however, another signification also, as already observed. The division of actions into directa or vulgares, and utiles, must be traced historically to the actions fictitia or ficticia, by which the rights of action were enlarged and extended. The origin of this division was such that a person was not free to grant an action in special cases where no action could legally be brought, and in which an action, if brought, would have been inanis or inutilis. After the decline of the pretor's power, the actions utiles were still extended by the contrivances of the juris prudentes and the rescripts of the emperors. Whenever an actio utilis was granted, it was framed on some analogy to a legally recognised right of action. Thus, in the examples given by Gaius, he who obtained the honorum possessio by the pretor's edict, succeeded to the deceased by the pretorian, and not the civil law: he had, therefore, no direct action (directa actio) in respect of the rights of the deceased, and could only bring his action on the fiction of his being what he was not, namely, heres.

Actions were also divided into ordinaria and extraordinaria. The ordinaria were those which were prosecuted in the usual way, first before the pretor, and then by the judge, and if the pretor and the pretor's judge agreed that the whole matter was settled before or by the pretor in a summary way, the name extraordinaria was applicable to such action. (Vid. INTERRICTA.)

The foundation of the division of actions into actiones directae jurid., bona fide, and arbitrarie, is not quite clear. In the actiones directae jurid., it appears
The formula of the praetor expressed in precise and strict terms the matter submitted to the judex, whose authority was thus confined within limits. In the actio bona fide, or ex fide bona, more latitude was permitted; but the praetor's action was implied in the kind of action, such as the action ex emplio, vendita, locato, &c., and the special circumstances of the case were to be taken into consideration by the judex. The actio arbitrariva were so called from the judex in such case being called an arbiter, probably, as Festus says, because the actio arbiterius was dispensed with his judgment; and he could decide according to the justice and equity of the case, without being fettered by the praetor's formula. It should be observed, also, that the judex properly could only condemn in a sum of money; but the arbiter might declare that any party was guilty of what he pleased to name, the party which was called his arbitratum, and was followed by the condictio if it was not obeyed.

The division of actions into perpetua and temporal had reference to the time within which an action might be brought, after the right of action had accrued. Originally those actions which were given by lex gentium were considered as an imperial constitution, might be brought without any limitation as to time; but those which were granted by the praetor's authority were generally limited to the year of his office. A time of limitation was, however, fixed for all actions by the late imperial constitutions.

The division of actions into actio in jus and in factum is properly no division of actions, but has merely reference to the nature of the formula. In the formula in factum concepta, the praetor might direct the judex barely to inquire as to the fact which was the only matter in issue; and on finding the fact, to make the proper condemnation; as in the case of a freedman bringing an action against his patronus. In the formula in jus the fact was not in issue, but the legal consequences of the fact were submitted to the discretion of the judex. The formula in factum commenced with the technical expression, Si perit, &c., "If it should appear," &c.; the formula in jus commenced, Quod A. A., &c., "Whereas A. A. did so and so." 1

The actions which had for their object the punishment of crimes were considered public, as opposed to those actions by which some particular person complained; the former were therefore called privata. The former were properly called judicia publica; and the latter, as contrasted with them, were called judicia privata. (Vid. JUDICUM.)

The actions called niscoles were where a filius familiae (a son in the power of his father), or a slave, committed a theft, or did any injury to another. In either case the father or owner might give up the wrong-doer to the person injured, or else he must pay competent damages. These actions, it appears, take their name either from the judgment of the jury or from the pecuniary compensation of the injured person. Some of these actions were of legal origin, as that of theft, which was given by the Twelve Tables; that of damnunm injuria, which was given by the Aquila Lex; and that of injuriwm et ut bonorum raptorum, which was given by the praetor's action, &c. The plaintiff was liable to be given up to punishment (peneas). The defendant who had brought a suit to recover for damages, &c., was said to claim the action of niscoles; unless the matter in dispute was settled at once.

The defendant, on finding a surety, was said vades dare, 2 vaditionum promittere or facere; the surety, was, was said spondere; the plaintiff, when satisfied with the surety, was said vadari reum, to take him on his sureties, or to have sureties from him. When a praetor proceeded to vada in jus vocatio on the day naturale, without giving any surety, this was called vaditionum porum. In some cases recuperatorum (vid. JUDEX) were named, who, in case

De Offic. 1, 36.)—8. (Gaius, iv, 26, seqq.)—9. (Hor., Serm., i, 1, 13.)
ACTIO.

If the defendant answered the replicatio, his answer was called duplicatio; and the parties might go on to the triplicatio and quadruplicatio, and even farther, if the matters in question were such that they could not otherwise be tried by suit. But if the plaintiff's answer was such that he could not get money, the defendant had to try to prove that he was solvent, or that a sum of money already due; but, in order to avoid making his demand for the future payments not yet due, it was necessary to use a prescription of the following form: *Ea res agatur cujus rei dies fuerit.*

A person might maintain or defend an action by his cognitor or procurator, or, as we should say, by his attorney. The plaintiff and defendant used a certain form of words in appointing a cognitor, and it would appear that the appointment was made in the presence of both parties. The cognitor needed not to be present, and his appointment was complete when he was sworn in as his attorney.

No form of words was necessary for appointing a procurator, and he might be appointed without the knowledge of the opposite party.

In many cases both plaintiff and defendant might be required to give security (sallabatur); for instance, if the plaintiff had a right in some possession which was in possession was required to give security, in order that, if he lost his cause and did not restore the thing, nor pay its estimated value, the plaintiff might have an action against him or his sureties.

When the *actio in rem* was prosecuted by the *formula publicatoria,* that stipulation was made which was called *judicium solvi.* As to its prosecution by the sponso, see *Sponsio et Centrumvir.* If the plaintiff sued in his own name, he gave no security; nor was any security required if a cognitor sued for him, either from the cognitor or the plaintiff himself, for the cognitor actually represented the plaintiff; and was personally liable. But if a procurator acted for him, he was obliged to give security that the plaintiff would adopt his acts; for the plaintiff was not prevented from bringing another action when a procurator acted for him. Tutors and curators generally gave security, like procurators, to the plaintiff or defendant, the same rules applied to the plaintiff as in the *actio in rem.* If the defendant appeared by a cognitor, the defendant had to give security; if by a procurator, the procurator had to give security.

When the cause was brought to an issue, a judex or judges might be demanded of the praeTOR who named or appointed a judex, and delivered to him the formula which contained his instructions. The judices were said dari or addici. So far the proceedings were said to be in iure: the prosecution of the *actio* before the judex requires a separate discussion.

The following is an example of a formula taken from Gaius: *Judex esto. Si parat Aulium Agerium apud Numerium Negidium mensam argentinam depoendo, quam dolo mali Numerii Aulio Agerio reddat non canente ea res erit tantum pecuniam judex Numerium Negidium Aulio Agerio condemnare si non parat, absolveto.*

The nature of the formula, however, will be better understood from the following analysis of it by Gaius: It consisted of four parts, the demonstratio, i.e., the facts, inaditatio, or adhesion; conseque, condemnation. The demonstratio must consist of facts that are certain and without exception, the subject-matter of the action is. For instance, if the subject-matter be a slave sold, the demonstratio would run thus: *Quod Aulus Agerius Numerio Negidio hom.
The intentio contains the claim or demand of the plaintiff: Si parét hominem ex iure Quaestum Aulum Aegeri esse. The adjudicatio is that part of the formula which gives the judge authority to adjudicate the thing which is the subject of dispute to one or other of the litigant parties. If the action be among partners for dividing that which belongs to them all, the adjudication would run thus: Quantum adjudicaturi opertel judex Titiljus adjudicatio. The condemnatio is that part of the formula which gives the judge authority to condemn the defendant in a sum of money, or to acquit him: for example, Judex Numerius Negitidus Aulo Aegeri scortinum milia condemnat: si non parat, abovoke. Sometimes the intentio alone was requisite, as in the formulæ called prejudiciales (which some modern writers make a class of actions), in which the matter for inquiry was, whether a certain person was a freedman, what was the amount of a debt, and other similar questions, when a fact solely was the thing to be ascertained.

Whenever the formula contained a condemnatio, it was framed with the view to pecuniary damages; and, accordingly, even when the plaintiff chose a procuratio, the judge did not adjudge the defendant to give the thing, as was the ancient practice at Rome, but condemned him in a sum of money equivalent to the value of the thing. The formula might either name a fixed sum, or leave the estimation of the value of the thing to the judge, who was bound to name a definite sum in the condemnation.

The formula then contained the pleadings, or the statements and counter-statements, of the plaintiff and the defendant; for the intentio, as we have seen, was the plaintiff's declaration; and if this was met by a plea it was necessary that this also should be inserted in the formula. The formula also contained the directions for the judge, and gave him the power to act. The resemblance between the English and Roman procedure is pointed out in a note in Starkie's Law of Evidence.

The following are the principal actions which we read of in the Roman writers, and which are briefly described under their several heads: Actio—Aqua pluviae arcœna; Bonorum vi reptatorum; Certi et Incerti; Commodii; Communi dividendo; Confessoria; Damni injuria data; Dejves vel effusi; Depesti; De non male Emi et venditi; Eecoretur; Actio regulamentaria; Itinerarum; Itinerarioatis; Judicatio; Judicat; Quod iusui; Legis Aquiliae; Locati et conduci; Mandati mutus; Negotiorum gestorum; Nocals; De pauperi; De peculi; Pignoriaque or Pignositi; Publicianam; Quinti minoris; Ratiemplus disratioendis; De recepta; Redhibitoria; Regis u woriae or Dolis; Restitutoria et Rescissoria; Ruttiliana; Serviana; Pro coe; Tributaria; Tutele.

ACTOR signified generally a plaintiff. In a civil or private action, the plaintiff was often called actor; in a public action (consortium action) he was called acumulator. The defendant was called reus, both in public and private causes: this term, however, according to Cicero, might signify either party, as indeed we might conclude from the word itself. In a private action the defendant was often called adversarius, but either party might be called adversarius, according to the distinct sense. No person who was not sui juris could maintain an action; a filius familias, therefore, and a slave, could not maintain an action; but in course of time certain actions were allowed to a filius familias in the absence of his parent or his procurator, and also in case the parent was incompetent to act from madness. This custom is still in force in the judgment of elections by their guardian or tutor: and in case they wished to bring an action against their tutor, the preator named a tutor for the purpose. Foreigners or aliens, originally brought their actions through their patrons; but afterwards in their own name, by a fiction of law, that they were Roman citizens. A Roman citizen might also generally bring his action by means of a cognitor or procurator. (Vid. Actio.) A universitas, or corporate body, sued and was sued by their act or synaxis.

Actor has also the sense of a defendant or manager of another's business generally. The actor publicus was an officer who had the superintendency or care of slaves and property belonging to the state. (Vid. Actor.)

ACTUS, a Roman measure of length. "Actus vocabatur, in quo hucus agerentur: cum aratrum, uno impetum. Hic erat cxx pedum; duplicabasque in longitudinem judicis, faciatis." This actus is called by Coloma: Actus quadratus; he says, "Actus quadratus venitque fictum pedibus cxx. Hic duplicatim facit judicium, et ab eo, quod erat junftum, judicis nemini usurpavit; sed hunc actum provincia Betica rustici actuam (or actum) vocat." Varro says, "Actus quadratus qui et latus est pedes cxx, et longus tekdam, est modus acusia Lathane appellation." The actus quadratus was therefore equal to half a jugerum, or 14,400 square Roman feet. The actus minimus or simplex, was 120 feet long and four broad, and therefore equal to 480 square Roman feet.

ACTUS, (Vid. Servitutes).

ACUS, dvn. ACICULA (βελονυ, βελονη, βοτις), a needle, a pin.

We may translate acus a needle, when we suppose it to have had at one end a hole or eye for the passage of thread; and a pin, when, instead of a hole, we suppose it to have had a knob, a small globe, or any other enlarged or ornamental termination.

The annexed figures of needles and pins, chiefly taken from originals in bronze, vary in length from an inch and a half to about eight inches.
This fashion has been continued to our own times by the females of Italy. Martial alludes to it in the following epigram, in which he supposes the hair to be anointed with perfumes and decorated with ribbons:

"Terenia ne mataliss violent bombuestra crines,
Fugax acuta tor Hod substinentem come.

The acure was employed as an instrument of torture, bein inserted under the nails. Honesty was enjoined upon children by telling them that it was wrong even to steal a pin.

"ADAMAS (άδαμας), a name given by the ancients to several hard substances, and among the rest, probably to the Diamond. Psellus describes the gem adamas as follows: "χρῡσιν μεν ἔχει ἐλευθερηστην καὶ στειρηστην, its colour resembles crystal, and its Bpiolusid." It is probable, observes Dr. Moore, "that Pliny, when speaking of the gem called adamas, had in view, among other things, the diamond; but it is plain, from the fables he relates of it, that this substance 'of highest value, not only among gems, but all human things, and for a long time known to kings only, and to very few of the rest, was unknown to him. He has evidently confounded in his description several widely different minerals; to which, from their hardness, or their, in some respect or other, indistinguishable nature, the Greeks gave the name adamas, that stone. Thus steel was very frequently called adamas, and those grains of native gold, which, when the gangue containing them was reduced to powder in a mortar, resisted the pestle and could not be comminuted by it, were called adamas. Something of this sort Pollux meant by that 'flower of gold;' or choicest gold, which he calls adamas and Plato, too, by 'the branch or knot of gold,' which, from its density, very hard and deep coloured, was called adamas. It was, no doubt, this native gold that was spoken of in the authors from whom Pliny drew, when he wrote that adamas is found in gold mines: that it accompanies gold; that it seems to occur nowhere but in gold, that it is not larger than a cucumber seed, nor unlike to it in colour. Of the six kinds he mentions, that described as occurring in India, in not gold, but bearing some resemblance to crystal, may have been the diamond; though even here it is probable that adamas was also used to designate such crystals as adamas. The description given is precisely that of a crystal of quartz, in which the prism has entirely disappeared, leaving a double six-sided figure upon a common base. In the manner in which Dioscorides characterizes adamas may lead us to suspect that he also spoke of crystals of quartz; for the diamond in its unpolished state, as known to the ancients, would hardly have been styled 'all-represented,' and afterward 'brilliant.' The locally, too, in the former case, being Scythia. The variety of adamas which Pliny calls siderites, was magnetic iron ore; and the Cyprian was probably emery, or some similar substance used in engraving gems.

*ADARKES (άδαρκης). Matthioli admits his ignorance of what this substance is, and Matthias Fabris was pleased to refer it to the Lapis Spongites. From the description of it given by Dioscorides and Paulus Eginita, it was evidently nothing but the efflorescence which gathers about reeds in certain salt lakes.

ADDIC'TI. (Vid. nexi.)

ADDIXI. ADDIXIS (άδηχι, άδεχι), a Greek measure, according to Hesychius equal to four χωίγκες.

ADEIA (άδεια). When any one in Athens, who had not the full privileges of an Athenian citizen, such as a foreigner, a slave, &c., wished to accuse a person of any offence against the people, he was obliged on the first permission to do so, which permission was called adeia. An Athenian citizen who had incurred ἀντίμα (vid. Atimia) was also obliged to obtain adeia before he could lay an information against any one.

ADEMP'TIO. (Vid. Logatum.)

ADONAT'IO. (Vid. Heres; Tentamentum.)

ADONAT'IO. (Vid. Cononata.)

AD'ANTIION. A plant. There can be no doubt that it is the Adiantum Capillus, or "Maiden-hair." Both Nicander and Theophrastus say of it, that it derives its name from the circumstance of its not being wet by rain (τι, neg., and ἄνω, "to wet"). Apuleius mentions Callithricum, Polythricum, and Asphales as synonyms of it.

'ΑΔΙΚΙΑΣ προς τον θόνον γραφώ, καὶ ύπατογερος το θόνον γραφώ, were actions brought in the Athenian courts against persons who were considered to have misled the people, the courts of justice, or the senate of Five Hundred, by misrepresentations or false promises, into acts of injustice, or into measures injurious to the interests of Athens. If an individual was found guilty, he was punished with death. The law relating to these offences is preserved by Demosthenes.

ADIT'IO HEREDITAT'IS. (Vid. Hereditas.)

AUDID'ICAT'IO. (Vid. Actio.)

ADLEC'TI were those persons who were admitted to the privileges and honours of the praetorship, quareship, edileship, and other public offices, without having any duties to perform. In inscriptions we constantly find adlectores inter tribunos, inter quaestores, inter praetores, &c. The name also was applied, according to Festus, to those who were chosen from the equites on account of the small number of senators; but it appears more probable that the adlectes were the same as the conscript. Livy says, Conspectus in novum stratum appellaretur.

ADLECT'OR, a collector of taxes in the provinces in the time of the Roman emperors.

ADOPITION.

ADMISSIONALES were chamberlains at
the imperial court, who introduced persons to the
presence of the emperor.1 They were divided into
four classes; the chief officer of each class was
called proxucus admissionum; and the proximi were
under the master admissionum.2 The admission-
als were usually freedmen.3

Friends appear to have been called amis admissi-
ationum, at least in the later ages.4 Accord-
ing to some writers, they were so called in conse-
cquence of the order in which they were adopted; accord-
ing to others, because the atrium was divided into
different parts, separated from one another by hang-
gings, into which persons were admitted according to
different degrees of favour in which they were held.6

ADONIA (ἀδωνία), a festival celebrated in hon-
our of Aphrodite and Adonis in most of the Grecian
cities. It lasted two days, and was celebrated by
women exclusively. On the first day they brought
into the streets statues of Adonis, which were laid
outside, and then observed all the rites cus-
tomary at funerals, beating themselves and uttering
lamentations.7 The second day was spent in mer-
riment and feasting, because Adonis was allowed to
return to life, and spend half of the year with
Aphrodite.8

ADONIS (ἀδωνις, or ἀδώνις), the Flying-fish,
or Acroterion volitans. 1, 9

ADOPITION (GREEK). Adoption was called
by the Athenians εἰσποίσις, or sometimes simply
ποίσις or θέσις. The adoptive father was said
ποιέωσις, εἰσποίσις, or sometimes ποιεῖν; and
the father or mother (for a mother after the death
of her husband could consent to her son being
adopted) was said to have εἰσποίσις, to have a
εἰσποίσας, with reference to the family which he left,
and εἰσποίσιας with reference to the family into
which he was received. The son, when adopted,
was called πατερός, εἰσποίσιος, or ἤτος; in opposi-
tion to the legitimate son born of the body of the
father, who was called γενειακός.

A man might adopt a son either in his lifetime or
by his testament; provided he had no male offspring
and was of sound mind. He might also, by testa-
ment, name a person to take his property, in case
his son or sons should die under age.10 If he had
male offspring, he could not dispose of his property.
This rule of law was closely connected with the
rule requiring the illegal birth of a child, on the
condition that when he had male children, such son
would have shared his property with the rest of his male
children, and to that extent the father would have
exercised a power of disposition which the law de-
nied him.

Only Athenian citizens could be adopted; but fe-
cmales could be adopted (by testament at least) as
well as males.11 The adopted child was transferred
from his own family and demus into those of the
adopitive father; he inherited his property, and main-
tained the sacra of his adoptive father. It was not
necessary for him to take his new father's name,
his name being the same as that of his own adoptive
son might return to his former family, in case he left
a child to represent the family of his adoptive father:
unless he so returned, he lost all right which he
might have had on his father's side if he had not
been adopted; but he retained all rights which he
might have on his mother's side, for the act of adop-
tion had no effect so far as concerned the mother of
the adopted person; she still continued his auctrix
after the act of adoption.

The next of kin of an Athenian citizen were en-
titled to his property if he made no disposition of it
by will, or made no valid adoption during his life-
time; they were, therefore, interested in preventing
fraudulent adoptions. The whole community were
also interested in preventing the next of kin from
being adopted as the new adopted father might not be
an Athenian citizen. To protect the rights of the next of
kin against unjust claims by persons who alleged them-
seves to be adopted sons, it was required that the
father should enter his son, whether born of his
body or adopted, in the register of his phratry
(προταιρίῳ γραμματείῳ) at a certain time, the Ther-
masia, according to this custom (γενεαίοι λόγοι).
Subsequently to this, it was necessary to enter him in
the register of the adoptive father's demus (λαβορίων γραμματείων),
without which registration it appears that he did not possess
the full rights of citizenship as a member of his new
demus.

If the adoption was by testament, registration
was also required, which we may presume that the
person himself might procure to be done if he was
of age, or if not, his guardian or next friend. If a
dispute arose as to the property of the deceased
(κλῆρον διαδοχαί), between the son adopted by
testament and the next of kin, there could properly
be no doubt as to the adopted son; for the next of
kin to him in testament was established. If a man died childless
and intestate; his next of kin, according to the
Athenian rules of succession, took his property by
the right of blood (ἀγγελεία χαίτα γένους). Though
registration might in this case also be required,
there was no adoption properly so called, as some
modern writers suppose; for the next of kin neces-
sarily belonged to the family of the intestate.

The rules as to adoption among the Athenians
are not quite free from difficulty, and it is not easy:
 avoids all error in stating them. The general
doctrines may be mainly deduced from the oon
of Isaeus, and those of Demosthenes against Macar-
taurus and Leochares.

ADOPITION (ROMAN). The Roman ele-
ation of parent and child arose either from a lawful
marriage or from adoption. Adoption was the
general name which comprehended the two species,
demus adagoreo, and as the adopted person passed
from the authority of his father to that of his adoptive
father, adopting, adoptio caused a caesis eliminatio,
and the lowest of the three kinds. Adoption, in its specific
sense, was the ceremony by which a person who,
was in the power of his parent (in postestate paren-
tium), whether a child or grandchild, male or fe-
male, was transferred to the power of the person
adopting him. It was affected under the authority
of a magistrate (magistratus), the praetor, for in-
stance, at Rome, or a governor (praeses) in the
provinces. The person to be adopted was emanci-
pated (sed. Mancipatio) by his natural father before
the competent authority, and surrendered to the
adopting father by the legal form called in jur'a
cessio.

When a person was sui juris, i.e. not in the
power of his parent, the ceremony of adoption was
called adagoreio. Originally it could only be effect-
ed at Rome, and only by a vote of the popular
populi auctoritate in the comitia curiata (lege curt-
aria). When a person was not yet of age, the
statutes of a Roman citizen could not be affected
by the laws of the Twelve Tables, be excepted
affected by a vote of the populus in the comitia curiata.
Codium, the enemy of Cicero, was adopted as a
plebeian family in order to qualify himself to be
elected a tribune of the plebs.4 Females could not be

ADORTIO.

ADULTERIUM.

adopted by the adrogatio. Under the emperors it became the practice to effect the adrogatio by an imperial rescript (principis auditoriae, ex rescripto principii); but this practice had not become established in the time of Gaius, or, if it appears, of Ulpian. It would seem, however, from a passage in the Commentaries of Ulpian that the adrogatio was adopted by another person, both himself and his children became in the power of the adoptive father. All the property of the adopted son became at once the property of the adoptive father. A person could not legally be adopted by the adrogatio till he had made out a satisfactory case (judicatura, causa) to the pontificates, who had the right of insisting on certain preliminary conditions. This power of the pontificates was probably founded on their right to preserve the due observance of the sacra of each genus.4 It would, accordingly, have been a good ground of refusing their consent to an adoption, if the pontificates had not in practice allowed his gens, for the sacra would in such case be lost. It was required that the adoptive father also had no children, and no reasonable hopes of any; and, as a consequence of this condition, that he should be older than the person to be adopted.

A person thus adopted, for even her own children were not in her power. Finally, all adoption was effected by the imperial rescript. The effect of adoption was to create the legal relation of father and son, just as if the adopted son were born of the blood of the adoptive father in lawful marriage. The adopted child was entitled to the name and sacra privata of the adopting parent, and it appears that the preservation of the sacra privata, which by the laws of the Twelve Tables were made perpetual, was frequently one of the reasons for the childless person adopting a son. In case of incest, the adopted child might be the heres of his adoptive father. He became the brother of his adoptive father's daughter, and therefore could not marry her; but he did not become the son of the adoptive father's wife, for adoption only gave the name and sacra privata and not the natural ties of the name. The phrase of "adoption by testament" seems to be rather a misapplication of the term; for, though a man or woman might by testament name a heres, and impose the condition of the heres taking the name of the testator or testamentarix, this so-called adoption could not produce the effects of proper adoption. It could give to the person so said to be adopted the name or property of the testator or testamentarix, but nothing more. A person on passing from one gens into another, and taking the name of his new family, generally retained the name of his adoptive family. If, however, the adoption was in imitation annis. Thus C. Octavius, afterward the Emperor Augustus, upon being adopted by the testament of his uncle the dictator, assumed the name of Caius Julius Caesar Octavianus; but he caused the adoption to be confirmed by the curiae.5

ADORATIO (προσευχή) was paid to the gods in the hour of the birth of the adoptive father. The person stretched out his right hand to the statue of the god whom he wished to honour, then kissed his hand and waved it to the statue. Hence we have in Apuleius, "Nulli Deo devocum supplicat; nullum templum fre-

47eruntem; si fames aliquid pretreat, neeis habe adoravitne gratia manuum labris adorem." The adoration differed from the oratio or prayers, supplications, which were offered with the hands extended and the palms turned upward.6 The adoration paid to the Roman emperors was borrowed from the eastern empire, and consisted in protrusion on the ground, and kissing the feet and knees of the emperor.7

ADROGATIO. (Vid. Adoption.)

ADSCRIPTIVI. (Vid. Accensi.)

ADSTIPULATIO. (Vid. Sypricula.)

ADULTERIUM, was treated by the law of the Roman law, the offence committed by a man having sexual intercourse with another man's wife. Stuprum (called by the Greeks ἔφοβοά) signifies the like offence with a widow or virgin. It was the condition of the female which determined the legal character of the offence; there was, therefore, no adultery unless the female was married.

In the time of Augustus a lex was enacted (probably about B.C. 17) entitled Lex Julia de adulteriis coerendis, the first chapter of which repealed some prior enactments on the same subject, with the provisions of which prior enactments we are, however, restricted to the thirty-sixth and thirty-seventh years of the emperor. If adultery and stuprum are used indifferently; but, strictly speaking, these two terms differed as above stated. The chief provisions of this law may be collected from the Digest and from Paulus.

It seems not unlikely that the enactments repealed by this lex were of a similar nature to the civil or personal penal provisions against adultery; and it is also improbable that, by the old law or custom, if the adulterer was caught in the fact, he was at the mercy of the injured husband, and that the husband might punish with death his adulterous wife.8 If adultery and stuprum were treated as crimes, a conviction of either of these crimes in half of her dowry and a part of her property (bona); and banished, (relegated) to some miserable island, such as "Seriphos, for instance." The adulterer was mulcted in half his property, and banished in like manner. This law did not inflict the punishment of death on either party; and in those instances under the emperors in which death was inflicted, it must be considered as an extraordinary punishment, and beyond the provisions of the Julian law.9 But, by a constitution of Constantine (if it is genuine), the offense in the adulterer was made capital. 10 By this conversion of the law, the legal character of the offence of this nature was probably only confirmed; but the adulterer was put into a convent, after being first whipped. If her husband did not take her out in two years, she was compelled to assume the habit, and to spend the rest of her life in the convent.

The Julian law permitted the father (both adoptive and natural) to adopt and adulterous in certain cases, as to which there were several disjunctions established by the law. If the

euce over buying and selling, and, as a consequence, the supervision of the markets, of things exposed to sale, such as slaves, and of weights and measures; from this part of their duty is derived the name under which the ediles are to decency, and the inspection of the baths and houses of entertainment, of brothels, and of prostitutes, who, it appears, were registered by the ediles. The ediles had various officers under them, as praecores, scribae, and viatores.

**Arr. Curules, who were also two in number, were originally chosen only from the patricians, afterward alternately from the patricians and the plebes, and at last indifferently from both.**

The office of curule ediles was instituted B.C. 365, and, according to Livy, on the occasion of the plebeian ediles retiring the curule ediles, who were called ordinarii, for the space of four days instead of three; upon which a senatorial consultum was passed, by which two ediles were to be chosen from the patricians.**From this time four ediles, two plebeian and two curule, were annually elected.**

The office of an edile was one of the most important in the state, and the title of the soldiary was bestowed on him.**The name Aurelius, the title seviri, and the sella curulis, from whence their title is derived, the toga praetexta, precedence in speaking in the seans, and the jus imaginum.**

The curule ediles not only had the jus ediciendi, or the right of promulgating edicts; but the rules comprised in their edicta served for the guidance of the ediles. The ediles of the curule ediles were founded on their authority as superintendents of the markets, and of buying and selling in general. Accordingly, their edicta had mainly, or perhaps solely, reference to the rules of buying and selling, and contracts for bargain and sale. They were the foundation of the actio redhibitorum and quanti minoris.**A great part of the provisions of the ediles' edict relate to the buying and selling of slaves. The persons both of the plebeian and curule ediles were sacrosancti.**

After the battle of Actium, the plebeian ediles were voted by the plebeians, who were remunerated for their expenses, and the function of the curule ediles, the functions formerly exercised by the plebeian ediles were exercised, with some few exceptions, by all the ediles indifferently. Within five days after being elected or entering on office, they were required to determine by lot, or by agreement among themselves, what parts of the city each should take under his superintendence; and each edile alone had the care of looking after the paying and cleansing of the streets, and other matters; it may be presumed, of the same local character within his district. The other duties of the office seem to have been exercised by themself.**The celebration of the ludi magni or Romani, of the ludi scenici or dramatic representations, and the ludi Magnae, were performed especially to the curule ediles, and it was on such occasions that they often incurred a prodigious expense, with the view of pleasing the people and securing their votes in future elections.**This extravagant expenditure of the ediles arose after the close of the second Punic war, when the nobles, and the wealthy individuals had of enriching themselves after the Roman arms were carried into Greece, Africa, and Spain.**Even the prodigality of the emperors hardly surpassed that of individual curule ediles under the Republic; such as C. J. Cesar the dictator, P. C. Laelius, and also the pontifex maximus; Aemilius Scamurus, whose expenditure was not limited to rare shows, but comprehended objects of public utility, as the reparation of walls, dockyards, ports, and aqueducts.**An instance is mentioned by Dion Cassius8 of the ludi Megalésii being supervised by the plebeian ediles; it was done pursuant to a senatorial consultum, and thus the particular exception confirms the general rule.**

In B.C. 45, J. Cesar caused two curule ediles and four plebeian ediles to be elected; and thenceforward, at least so long as the office of edile was of any importance, six ediles were annually elected by the people in unison to exercise the functions of the city, and their duty was to look after the supply of corn. Though their office may not have been of any great importance after the institution of a prefectus annonae by Augustus, there is no doubt that it existed for several centuries, and at least as late as the time of Tacitus.**The ediles belonged to the class of the minoris magistratus. The plebeian ediles were originally chosen at the comitia centuriata, but afterward at the comitia tributa, in which comitia the curule ediles also were chosen. It appears that, until the lex annalis was passed, a Roman citizen might be a candidate for any office after completing his twenty-seventh year. This lex annalis, which was passed at the instance of the tribune L. V. Tappulus, B.C. 180, fixed the age at which each office might be enjoyed.**The passage of Livy does not mention what were the ages fixed by this law, but it is collected, from various passages of Roman writers, that the age fixed for the adileship was thirty-six. This, at least, was the age at which a man could be a candidate for the curule adileship, and it does not appear that there was a different rule for the plebeian adileship.**The ediles existed under the emperors; but their powers were gradually diminished, and their functions exercised by new officers created by the emperors. After the battle of Actium, Augustus appointed a prefectus urbs, who exercised the general administration of the city with much success. He had been one of the ediles of the plebeian adiles. Augustus also took from the ediles, or exercised himself, the office of superintending the religious rites, and the hinting from the city of all foreign ceremonial; he also assumed the superintendence of the temples, and thus may be said to have turned the adileship by depriving it of its old and original functions. He well deserves to be explained the curious fact mentioned by Dion Cassius, that no one was willing to hold so contemptible an office, and Augustus therefore reduced to the necessity of compelling persons to take it: persons were accordingly chosen by lot, out of those who had served the office of questor or tribune; and this was done more than once. The last recorded instance of the splendor of the adileship is the administration of Agrippa, who volunteered to take the office, and repaired all the public buildings and all the roads at his own expense, without drawing anything from the treasury.**The adileship had, however, lost its true character before this time. Agrippa had a
The consul before he accepted the office of aedile, and his munificent expenditure in this nominal office was the close of the splendour of the aedileship. Augustus appointed the aediles specially to the office of putting out fires, and placed a body of 600 slaves at their command; but the pretreat vigilum afterwards performed this duty. In like manner, the curatores viarum were appointed by him to superintend the roads near the city, and the quattuorviri to superintend those within Rome. The curatores viarum, or curatores aediles, also appointed by Augustus, stripped the aediles of the remaining few duties that might be called honourable. They lost also the superintendence of wells or springs, and of the aqueducts. They retained, under the early emperors, a kind of police, for the purpose of repressing open licentiousness and disorder: thus the baths, eating-houses, and brothels were still subject to their inspection, and the registration of prostitutes was still within their duties. We read of the aediles under Augustus making search after libellous books, in order that they might be burned.

The colonia, and the municipia of the later period, had also their aediles, whose numbers and functions varied in different places. They seem, however, as to their powers and duties, to have resembled the aediles of Rome. They were elected annually.

The history, powers, and duties of the aediles are stated with great minuteness and accuracy by Schnatter, De Romanorum Aedibus, lib. iv., Reprint, 1828.

ÆGIS. AEgis, AEtit, AEtitum, AEtiti (called by the Greeks τούγαντα, θύελα, and θυελακτορας), were persons who took care of the temples, attended to the cleaning of them, &c. They appear to have lived in the temples, or near them, and to have acted as ciceronii to those persons who wished to see them. In ancient times, the ædisæ were citizens, but under the virtutes trecenti. 7

ÆDON (ἀειδών) was the name doubtless of the Mactellum, L. aed. Laetacensia (Latham), or the Nightingale. We sometimes read aedών, or ἀειδώς in Doric. The nightingale is also called φίλονδα and πρόδων by the poets. That it is the male bird only which sings, was well understood by the ancients. Virgil, however, has on one occasion given the power of song to the female bird. From some papers in the Classical Journal, it would appear that the nightingale sings by day as well as by night. 8

ÆGIS is a Greek word (ἀείς, -δος), signifying literally, a goatskin, and formed on the same analogy with velvis, a fawnskin. 9

According to ancient mythology, the ægis worn by Jupiter was the hide of the goat Amalthea, which had suckled him in his infancy. Hyginus relates 10 that, when he was preparing to resist the Titans, he was directed, if he wished to conquer, to wear a goatskin with the head of the Gorgon. To this particular goatskin the term ægis was afterwards confined. Homer always represents it as part of the armour of Jupiter, whom, on this account, he distinguishes by the epithet ægis-bearing (αἰγιοχος). He, however, asserts that it was borrowed on different occasions both by Apollo 12 and by Minerva. 13

The skins of various quadrupeds having been used by the most ancient inhabitants of Greece for clothing and defence, we cannot wonder that the goatskin was employed in the same manner; and the particular application of it which we have now to consider will be understood from the fact that the shields of the ancient Greeks were in part spport ed by a belt or strap (τεκέλατον, θυελατόν) passing over the right shoulder, and, when not elevated with the shield, descending transversely to the left hip. In order that a goatskin might serve this purpose, two of its legs would probably be tied over the right shoulder of the wearer, the other extremity being fastened to the inside of the shield. In combat, the left arm would be passed under the hide, and would raise it together with the shield, as is shown in a marble statue of Minerva, preserved in the museum at Naples, which, from its style or art, may be reckoned among the most ancient in existence.

Other statues of Minerva, also of very high antiquity, and derived, no doubt, from some still more ancient type, represent her in a state of repose, and with the goatskin falling obliquely from its loose fastening over her right shoulder, so as to pass round the body under the left arm. The annexed figure is taken from a colossal statue of Minerva at Dresden. The softness and flexibility of the goatskin are here expressed by the folds produced by the girdle with which it is encircled.

Another mode of wearing this garment, also in peaceful expression, is seen in a statue of Minerva at Dresden, of still higher antiquity than that last referred to, and in the very ancient image of the same goddess from the Temple of Jupiter at Egïna. In both of these the ægis covers the right as
AEGIS.

well as the left shoulder, the breast, and the back, falling behind so as almost to reach the feet. Schoen considers this as the original form of the aegis.

By a figure of speech, Homer uses the term aegis to denote not only the goatskin, which it properly signifies, but, together with it, the shield to which it belonged. By thus understanding the word, it is easy to comprehend both why Minerva is said to throw her father's aegis around her shoulders, and why, on one occasion, Apollo is said to hold it in his hand, and to shake it so as to terrify and confound his enemies with the shock of the dark body of Hector, in order to protect itself from insult. In these passages we must suppose the aegis to mean the shield, together with the large expanded skin or belt by which it was suspended from the right shoulder.

As the Greeks prided themselves greatly on the rich and splendid ornaments of their shields, they supposed the aegis to be adorned in a style corresponding to the might and majesty of the father of the gods. In the middle of it was fixed the appalling Gorgon's head, and its border was surrounded with golden tassels (diadema), each of which was worth a heart's blood. In the figures above exhibited, the serpents of the Gorgon's head are transferred to the border of the skin.

By the later poets and artist, the original conception of the aegis appears to have been forgotten or disregarded. They represent it as a breastplate covered with metal in the form of scales, not used to support the shield, but extending on both sides from shoulder to shoulder, as in the annexed figure, taken from a statue at Florence.

With this appearance the descriptions of the aegis by the Latin poets generally correspond. It is remarkable that, although the aegis properly belonged to Jupiter, and was only borrowed from him by his daughter, and although she is commonly exhibited either with the aegis itself, or with some emblem of it; yet we seldom find it as an attribute of Jupiter in works of art. There is, however, in the museum at Leyden a marble statue of Jupiter, found at Utica, in which the aegis hangs over his left shoulder. It has the Gorgon's head, serpents on the border, and a hole for the left arm to pass through. The annexed figure is taken from a cameo engraved by the Italians, a Greek artist. Jupiter is here represented with the aegis wrapped round the fore part of his left arm. The shield is placed under it, at his feet. In his right hand he holds a thunderbolt.

The Roman emperors also assumed the aegis, extending thereby to exhibit themselves in the character of Jupiter. Of this the armed statue of Hadrian in the British Museum presents an example. In these cases the more recent Roman conception of the aegis is of course followed, coinciding with the remark of Servius, that this breast-armor was called aegis when worn by a god; loricà, when worn by a man.

Hence Martial, in an epigram on the breastplate of Domitian, says,

"Dum vacat haec, Caesar, poterit loricà vocari. Pectora cum sacro sedeter, aegis crîbrà." 7

In these lines he in fact addresses the emperor as a divinity.

ÆGYPTILÀ, a name common to several species of agate. It was, perhaps, the ancient denomination of what is still called Egyptian pebble; a striped Jasper, the quarto agate oryx of Haly. 2

ÆLIZON (ælizón), a plant, of which Dioscorides describes three species: the first, or á, to μύσα, being the Semperwinni arborum, according to Sibthorp and Sprengel; the second, or á, to μύσαν, the Stærum erectre or reflexum (Rock or Yellow Stonecrop); and the third, the Stærum stellatum, according to Columella and Sprengel. "The aelizum or Theo-

phrasingus is the same as the first species of Diocori- des, the characters of which, notwithstanding the high authority of Sibthorp and Sprengel, who are of a different opinion, Dr. Adams thinks he is justified in identifying with those of the Semperwinni tectorum, or Houseleek. 6

AEISITOL. (Vid. Pytanion).

ÆLIA SENTIA LEX. This law, which was passed in the time of Augustus (about A.D. 3), contained various provisions. By one clause it was provided that manumitted slaves, who, during their servitude, had undergone certain punishments for offences, should not become either Roman citizens or Latins, but should belong to the class of peregrini dediticii. (Vid. Dedittii.) The law also contained various provisions as to the manumission of slaves, and as to the mode in which a manumitted slave, who had only obtained the privileges of a Latinus, might become a Roman citizen. The law also made void all manumission of slaves effected for the purpose of defrauding a creditor or a patron, whether such manumission was effected in the life-

time of the master, or by his testament. It prescribed certain formalities to be observed in the case of manumission when the owner of the slave (dominus) was under twenty; the effect of which was, that though a person of the age of fourteen could make a will, he could not by will give a slave his freedom.  

ENKATORES (akmatōres) were those who blew upon wind instruments in the Roman army; namely, the bucinatoribus, cornicines, and tubiiotibus. Theae were also employed in the public games. A collegia ancanorum is mentioned in this connexion.

EOLYPYLE (aiotwv ñwaiwv) were, according to the description of Vitruvius, hollow vessels, made of brass, which were used in explaining the origin, &c., of the winds. These vessels, which had a very small orifice, were filled with water and placed on the fire, by which, of course, steam was created.

ÆQUITAS. (Vid. Just.)  

ÆRA, a point of time from which subsequent or preceding years may be counted. The Greeks had no common era till a comparatively late period. The Athenians reckoned their years by the name of the chief archon of each year; whereas he was called the king from the beginning of the Leonids by the Argives, and the Argives by the chief priestess of Juno, who held her office for life. The following eras were adopted in later times: 1. The æra of the Trojan war, B.C. 1184, which was first made use of by Eratosthenes. 2. The Olympic æra, which began B.C. 776, and was first made use of by Thucydides of Sicily, and was adopted by Polybius, Diodorus, Dionysius of Halicarnassus, and Pausianias. (Vid. Olym. æra.) 3. The Philippic or Alexandrian æra, which began B.C. 332. 4. The æra of the Seleucids, which began in the autumn of B.C. 312. 5. The æra of Antioch, of which there were several, the most common used began in November, B.C. 49.

The Romans reckoned their years from the foundation of the city (ab urbe condita) in the time of Augustus and subsequently, but in earlier times the years were reckoned by the names of the consuls. We also find traces of an æra from the banishment of the kings, and of another from the taking of the city by the Gauls. The date of the foundation of Rome is given differently by different authors. That which is most commonly followed is the one given by Varro, which corresponds to B.C. 753, or 754, in which case that, as the æarist were protected by the state without being bound to military service, they naturally had to pay the æas militares, which was thus originally a charge on them, in the same way as the sums for knights' horses were levied on the estates of rich widows and orphans. (Vid. æas Hordeariurn.) The persons who constituted the æarist was either the heads of the public magistrates of the town, or was a hereditary office.
or example, 'the efflorescence upon stones which contained copper,' and what was 'scrapped from the stone out of which copper was melted.' Various modes of making verdigris are described by Theophrastus and Pliny, who agree in principle, and some of them even as to their details, with the processes now employed. Among the various adulterations of it, that which was made with the sulphate of iron (\textit{aetrumenium \textit{subtorium}}) was, as we learn from Pliny, the one best calculated to deceive; and its distinctiveness, as well as its proportion, was sufficiently noticeable. It was to rub the counterfeit arguro on pappus steeped with gallnut, which immediately thereon turned black.

\textit{Æruscatores} were vagrants who obtained their living by fortune-telling and begging. They were called by the Greeks \textit{pharsanai}. (\textit{Vid. Agurtal.}) Persius explains \textit{aruscatares} by \textit{arv indique collaerere}.

\textit{Æs (\textit{χαλέκος})}, a composition of metals, in which copper is the predominant ingredient. Its etymology is not known. The Italians and French often use the words \textit{rame} and \textit{ellone}, and \textit{airavi}, to translate the word \textit{æs}; but, like the English term \textit{brass}, which is also employed in a general way to denominate the same composition, all are incorrect, and are calculated to mislead. Brass, to confine ourselves to our own language, is a combination of \textit{copper and zinc}, while all the specimens of ancient objects formed of the material called \textit{æs}, are found upon and near the earth, and, for the most part, are seen and not exceptions, to be composed entirely of \textit{copper and tin}.

To this mixture the term \textit{bronze} is now exclusively applied by artists and founders; and it is desirable that, being now generally received, it should always be used, in order to prevent misconception, and to distinguish it from the two compositions.

The word \textit{bronze} is of Italian origin, and of comparatively modern date, and derived in all probability from the brown colour (\textit{bruno}) which the artists of the period of the revival (as it is called) of the Arts, and those who followed them, gave their metal works; various fine specimens of such productions of the \textit{cinquecento} age are still preserved in the Museum of Florence and in other collections; and when the surface of the cast has not been injured by accident or by exposure to the weather, the rich brown tint originally imparted to it is seen upon it in its pristine state.

The natural colour of bronze, \textit{when first cast}, is a reddish brown; the different tints which are seen on works of sculpture of this class being almost always given by artificial means: that which modern taste prefers, and which is now usually seen on bronze, was obtained by the experiment of Varro, but may, however, be considered natural to it, as it is simply the effect of oxidation, from exposure to the influence of the atmosphere. Sometimes the operations of time and weather are anticipated by the skilful application of an acid over the surface of the metal. The effects of age upon works of antiquity are remarkable for the colour of this patina, as it is called by antiquaries.

The employment of \textit{æs (bronze)} was very general among the ancients; money, vases, and utensils of all sorts, whether for domestic or sacrificial purposes, ornaments, arms offensive and defensive, furniture, tablets for inscription, musical instruments, and, indeed, every object to which it could be applied, being made of it. The proportions in which the component parts were mixed seem to have been much studied; and the peculiarities and excellence of the different sorts of bronze were marked by the use of it, as the \textit{æs Deliciae}, \textit{æs Staedes}, \textit{æs Dellicinum}, \textit{æs Egothnicum}, \textit{æs Haphtion}, and others; but of which, it must be confessed, we know little or nothing beyond the titles, except that we collect from some of the writers of antiquity, that, with the view of producing effects of colour or variety of texture, the artists sometimes mixed small proportions of gold, silver, lead, and even iron, in the composition of which bronze was good for some accident of nature than to design. For further particulars on the composition of bronze, and the practice of the ancients in different processes of metal-working, the reader is referred to the article on bronze.

\textit{Æs (\textit{monetae argenti or æreis}). Since the most ancient coins in Rome and the old Italian states were made of \textit{æs}, this name was given to money in general, so that Ulpius says, \textit{Biuram aureos nummos æ destinum.} For the same reason we have \textit{æs cædiwm}, meaning debt, and \textit{ære} in the plural, pay to the soldiers. The Romans had no coined money until the time of Sulla, about A.U.C. 456 (B.C. 269), five years before the first Punic war, when silver was first coined; gold was not coined till sixty-two years after silver. For this reason, Asquinius, in the Italian mythology, was made the son of \textit{Æsculapius.}

The term \textit{æs} was applied to little cast, not struck. In the collection of coins at the British Museum there are four ases joined together, as they were taken from the mould, in which many were cast at once. In most ases the edge shows where they were severed from each other. The first coinage of \textit{æs} was adopted by the Romans under S Marcus Titius, who is said to have stamped the money with the image of cattle \textit{(pecus)}, whence it was called \textit{pecunia.}

According to some accounts, it was coined from the commencement of the city, and according to others, the first coinage was attributed to Janus or Saturn. We know that the old Italian states possessed a bronze or copper coinage from the earliest times.

The first coinage was the \textit{as (vid. As)}, which originally was a pound weight; but as, in course of time, the weight of the as was reduced not only in Rome, but in all Italy, a new standard was adopted. The weight in weight was not uniform in the different states, it became usual in all bargains to pay the asses according to their weight, and not according to their nominal value. The \textit{æs grave*} was not, as has been supposed by some, the old heavy coins as distinguished from the latter modern; but, as Niebuhr has remarked, it signified any number of copper coins reckoned according to the old style, by weight. There was, therefore, no occasion for the state to suppress the circulation of the old copper coins, since in all bargains the axes were not reckoned by as in the old style. Then, the weight of an axe was applied as a common measure for the national money, and for that of the different states of Italy; and, accordingly, a hundred pounds, whether of the old or modern money, were of the same value. The name of \textit{æs grave} was also applied to the uncoined metal.

Under the Roman empire, the right of coinage of silver and gold belonged only to the emperors; but the copper coinage was left to the senator, which was under the jurisdiction of the senate.
by the Greeks for money in early times. Silver was originally the universal currency, and copper appears to have been seldom coined till after the time of Alexander the Great. At Athens a copper coin was established as early as B.C. 406, in the archonship of Callias; 1 but it seems to have consisted of larger pieces of money, and not merely of the χαλκός, which appears to have been used previously on account of the difficulty of coining silver in such minute pieces. The χαλκός in later times was divided into δύοτα, of which, according to Suidas (s. v. Τυλεον and Οδολικόν), it contained seven. There was another copper coin current in Greece, called πυθόλαγον, of which the value is not known. Pollux 2 also mentions κόλπνδοσ as a copper coin of an early age; but, as Mr. Hussey has remarked, this may have been a common name for small money; and χαλκόδοσ signifies generally "changing money," and πουλλακτις "a money-changer." In later times, the Romans coined copper as well as silver. As truly as B.C. 165, we find tinels paid in copper by Ptolemy Epiphanes. 3

ÆS CIRCUMFORA NEUM, money borrowed from the Roman bankers (argentarii), who had shops in porticos round the forum.

ÆS EQUESTRE, the sum of money given by the Roman state for the purchase of the knight's horse (ex poeninis, quae exopus emendus erat). This sum, according to Livy, 4 amounted to 10,000 asses.

ÆS HOREARIUM, or HORDIARIUM, the sum of money paid yearly for the keep of a knight's horse; in other words, a knight's pay. This is paid in silver and sometimes in copper. In the time of Agricola, horse was charged upon the rich widows and orphans, on the principle that, in a military state, the women and children ought to contribute largely for those who fought to behalf of them and the commonwealth. 5

The knights had a right to disdain for this money, if it was not paid, in the same manner as they had the right to disdain for the æs equestre, and the soldiers for the æs militare. 6 It has been remarked by Niebuhr, 7 that a knight's monthly pay, if his yearly pension of 3000 asses be divided by twelve, does not come to anything like an even sum; besides, if we have recourse to a year of ten months, which is the year of the Samnites, Cicero says, Rome in very remote times, a knight's monthly pay will be 200 asses, which was just double the pay of a foot soldier.

ÆS MILITARIE. (Vid. ÆARAIN)

ÆS MANUA'RIUM was the money won in playing with dice, manibus collectum. Manus was the throw in the game. All who threw certain numbers were obliged to put down a piece of money; and whoever threw the Venus (the highest throw) won the whole sum, which was called the æmancipatio. 8

ÆS TIRO. (Vid. MARRIAGE)

*ÆSCULUS, a species of tree commonly ranked in the family of oaks. Martyn 9 is inclined to make it what with what is called, in some parts of England, the bay-oak, and corresponds to the Quercus laitifolia, mas, quae brevis pediculus est, as described by Bauhin. 10 Fée, however, 11 condemns this opinion, on the ground that Virgil, in the passage on which Martyn is commenting, places the Æsculapium in oak wood, and Euclid states it to be in another, as distinct kinds of trees. Martyn therefore is wrong, according to this writer, in making the Æsculus identical with the Quercus laitifolia of Bauhin, since this last is only a variety of, and very little distinct from, the Quercus arbor. 12 If it were certain that the Æsculus of Virgil was the oak of Martyn, it would not be difficult whatever in determining its botanical character; for the Æsculus of Pliny is well known being the φυκος of Theophrastus, 13 or our Quercus Æsculus. Pliny’s Fagus is our beech, and not an oak; and the description which he gives of the tree shows this very clearly. On the other hand, Theophrastus ranks his φυκος among the trees; and this, thus places his Æsculus among the quercus, the robin, the ilex, and the suhcr. Everything then agrees; and, besides, the etymology of Æsculus from esca ("food"), like that of φυκος from φαγει ("to eat"), is not unreasonable. But the Æsculus of Pliny does not correspond to the Æsculus of Virgil. The former is one of the smallest kind, but the later is mentioned by the proper "maxima," and in figurative language as touching the skies with its top, and reaching to Tartarus with its roots. Pliny, too, considers the Æsculus as rare in Italy, whereas Horace speaks of wide groves of the Æsculus in Daunia. This poet, therefore, like Virgil, takes the Æsculus as a symbol of the Æsculapium. In order to relieve the question from the embarrassment in which it is thus left, some botanists have imagined that Virgil means the chestnut, a bold but not very reasonable idea.

ÆSTIMA'TΙΟ LI'I'TIS. (Vid. JExEDES)

ÆSTYNE'NES, AE'NEMUSNES (Vid. AM'ANE'TES)

Æ'TI'TES (p. 465), the Eagles. It is the same with the ετος τικτων of Theophrastus, or the Prolific stone, of which the ancient gives such wonderful accounts, making it famous for assisting in delivery, preventing abortions, and discovering thieves. Pliny says of it, "Est autem lapis usque praecox usque quodam, also reluit in ursi somno," and Dioscorides remarks, àriettis, Æ'tiaus, λευκος ὡς ἀκραπ ἐγκυμόνων λίθων ὕπαρχον. Sir John Hill says, that custom has given the name of Ætites to every stone having a loose nucleus in it. Cleave- land observes, that the ancient gave it the name of Eagle-stone (Ætros, "an eagle"), from an opinion that this bird transports them to its nest to facilitate the hatching of its eggs. It is an argillaceous oxide of iron.

Æ'TOS (Ætros). I. The Eagle. (Vid. AQUILA)

II. A species of Ray fish, called by Pliny Aquila, and now known as the Rain Aquila. Oppian enumerates it among the viviparous fishes.

Æ'FINES, AE'FINITES, OR AE'FINITAS, AE'FINITAS. Affines are the children of the husband and wife; and the relationship called affinitas can only be the result of a lawful marriage. There are no degrees of affinitas corresponding to those of cognatio, though there are terms to express the various kinds of affinitas. The father of a husband is the socer of the husband's wife, and the father of a wife is the socer of the wife's husband; the testis and socrus expresses the same affinity with respect to the husband's and wife's mothers. A son's wife is nurus or daughter-in-law to the son's parents; a wife's husband is generis or son-in-law to the wife's parents.

Thus the avus, avia; pater, mater; of the wife

become by the marriage respectively the sower magnus, proserius, or soror magnus—soror, soror—of the husband, who becomes with respect to them severally progener and gener. In like manner, the corresponding ancestors of the husband respectively assume the same, names with respect to the son's with whom he becomes. The husband's brother becomes lector in respect to with respect to them progener and nurus. The son and daughter of a husband or wife born of a prior marriage are called privus and privignus with respect to their stepfather or stepmother; and, with respect to such children, the stepfather and stepmother are severally called major and minor. The husband's brother becomes lector in respect to with respect to the wife, and his sister becomes glos (the Greek γελος). Marriage was unlawful among persons who had become such affines as above mentioned. A person who had sustained such a capitis dimissio as to lose both his freedom and the civitas, lost also all his affines.

A GALL OCHON (γαλλοχόν), the Ligerus Agalclomus, of Alyxylon Agallacorn, Lour. Such, at least, is the opinion of the commentators on Mesale, of Celsus, Bergius, Matthiolius, Lamarck and Sprengel. Avicenna and Abul I Fadlī describe several species, or, more properly, varieties of it.

A GATHY PAPER (αγαθος γαρος). (Vid. Man- riate.)

*AGAR'IKON (αγαρικον), the Beletus igniarius, called in English Torchwood or Sprud, a luminous excrescence, which grows on the trunk of the oak and other trees. Dioscorides, Paulus Egineta, and others, ascribed to it the mention of a black or poisonous Agaric, which may be decided to have been the Agaricus Muscarious. Dr. Christi- son confirms the ancient statements of its poisonous nature.

AGA'GOS, a groom, a slave whose duty it was to take care of the house. The word is also used for a driver of beasts of burden, and is sometimes applied to a slave who had to perform the lowest menial duties.

*AGASS'ES (αγασης), a species of dog described by Oppian. It may be conjectured to have been either the Harrier or the Beagle. Pennant is in favour of the latter.

AGATHERO'GIOI (αγαθοργοι). In time of war, the kings of Sparta had a body-guard of three hundred of the noblest of the Spartan youths (ιπτέρες), of whom the five eldest retired every year, and were employed for one year, under the name of στρατιώτης. 

AGRE 'ΕΝI (αγρενι), an assembly of young men in Crete, who became together from their eighteenth year till the time of their marriage. An αγελος consisted of the sons of the most noble citizens, who were usually under the jurisdiction of the father of the youth who had been the means of collecting the αγελος. It was the duty of this person, called αγελεντης, to superintend the military and gymnastic exercises of the youths (who were called αγελενται), to accompany them to the chase, and to punish them when disobedient. He was accountable, however, in the state, which supported the αγελος at the public expense. All the members of an αγελος were obliged to marry at the same time.

AGEMAG (αγημαγ) from γεμαγ, the name of a chosen body of troops in the Macedonian army, which usually consisted of horsemen. The agema seems to have varied in number; sometimes it consisted of 150 men, at other times of 300, and in later times it contained as many as 1000 or 2000 men.

*AGEDATION (αγηδαγον), a plant, which Mathi- olus speaks of as having been seen by Achilleus ageratum. Donuromus and Sprengel, however, are undecided about it. It would appear to be the Eu- porium of the translator of Mesale.

*AGETTI'PIAOI ΔΙΚΗ (αγηττιπιαοι δικη), an au- tion which might be brought in the Athenian courts by a landlord against the farmer who had injured his land by neglect, or an improper mode of cultivation.

*AGER AEC'ENIUS. (Vid. AGERIMENTI.)

AGER DECUM'ANIUS. (Vid. AGERILEGUS.)

AGER LIMITA'TUS. (Vid. AGERILEGUS.)

AGER RELIGIO'SUS. (Vid. AGERILEGUS.)

AGER SACER. (Vid. AGERILEGUS.)

AGER SANCTUS (τιτευωκος). *Ti τευωκος originally signified a piece of ground, appropriated for the support of some particular hero or hero. In the Ho- meric times, the kings of the Greek states seem to have had a piece of ground specially reserved to them, or the progeny of these chiefs. The word was afterward applied to land dedicated to a divinity. In Attica, there appears to have been a considerable quantity of such sacred lands (τευωκον), which were let out by the state to farm; and the income arising from them was applied to the support of the temples and the maintenance of public worship.

According to Dionysius, land was set apart at Rome as early as the time of Romulus, for the support of the temples. The property belonging to the temples increased considerably in later times, es- pecially under the Emperors.

Lands dedicated to the gods were also called Agri consecrati. Houses, also, were consecrated; as, for instance, Cicero's, by Clodius. By the provisions of the Lex Papia, no land or houses could be dedi- cated to the gods without the consent of the plebs.

The time when this law was passed is uncertain; but it was probably brought forward about B.C. 305, if Livy alludes to the same law.

A'ER VECTIGALI'GIS. (Vid. AGERILEGUS.)

AG. TORIA (αγητορια). (Vid. CARNEIA.)

AGGER (αγγερ), from ad and ger, was used in general for any elevated ground, or a mound, and more particularly applied to a mound, usually composed of earth, which was raised round a besieged town, and was gradually increased in breadth and height till it equalled or overtopped the walls. At the siege of Avaricum, Caesar raised in 25 days an agger 300 feet broad US, 80 feet high. The agger was sometimes made not only of earth, but of wood, hurdles, &c.; whence we read of the ager temp set on fire. The agger was also applied to the earthen wall surrounding a Roman encampment, composed of the earth dug from the ditch (fosso), which usually 9 feet broad and 7 feet deep; but, if any attack was impending, was increased to 12 feet or 12 feet, and the breadth to 13 feet. Sharp stakes, &c., were usually fixed upon the agger, which was then called valgium. When both words are used (as in Caesar, agger ac valgium), the ager means the mound of earth, and the valgium the sharp stakes, &c., which were fixed upon the agger.

AGMEN (agmen prope dictum, cum exercitus iter facit, ab agendo, id est, vendo vocabulis), the marching order of the Roman army. According to Polybius, in the Roman armies commonly marched in his time in the following manner: in the van are usually placed the rear; for ourselves (tribus, extraordinarii); and after these the right and left wings of the army, which is followed by the baggage of both these bodies. Next to these marches the first of the Roman legions, with its baggage also behind it. The second legion follows, having behind it, likewise, both its own baggage and the baggage of the allies, who are in the rear; for all the marching order, and with the left wing of the allies. The cavalry marches sometimes in the rear of the respective bodies to which it belongs, and sometimes on the flank of the beasts that are loaded with the baggage, keeping them together in due order, and covering them from insult. When an army is expected to be made upon the rear, the extraordinaries of the allies, instead of leading the van, are posted in the rear; in all the other parts the disposition remains the same. Of the two legions, and the two wings of the allies, those that are on one day foremost in the march, on the following day are placed in the rear; and by this means every day altered. All the troops may obtain the same advantage in their turn of arriving first at water and at forage. There is also another disposition which is used when any immediate danger threatens, and the march is made through an open country. At some distance from the enemy, the order of the army is ranged in three parallel lines, each behind the other, with the baggage of the last in the front. The baggage is placed the baggage of the pedites, who are followed likewise by that of the triarii; so that the baggage of the several bodies is placed in alternate order. The marching thus disposed, the troops in the rear attack the enemy, turning either to the left or to the right, advance forward from the baggage towards that side upon which the enemy appears; and thus, in a moment of time, and by one single movement, the whole army is formed at once in order of battle, except only that the hastati are perhaps obliged to make an evolution; and the beasts of burden, also, with all those that attend upon the baggage, being now thrown into the rear of all the troops, are covered by them from danger.—(Hampton's translation.) An account of the marching order of a Roman army is also given by Caesar, Josephus, and Vegetius.

The form of the army on march differed, however, according to circumstances, and the nature of the ground. An agmen planum was an army in close array, quod sine jumentis incutis, sed uter se dexter ed, quia facilius per remota loca transmittatur. The agmen quadratum was the army arranged in a form of a square, with the baggage in the middle. The form of the Grecian army on march in the time of Xenophon is described in the Anabasis. It was thus formed when marching a day distance in the daytime, either the cavalry in the front, the allies, or the hastati, were placed behind the van, according to the nature of the ground; but that in the nighttime the strongest troops always marched first, by which plan the army was less likely to be separated, and the soldiers had fewer opportunities of leaving the ranks which are the following:

AGNA'TI. (Vid. Cognati.)

AGNOMEN. (Vid. Cognomens.)

AGNUM (ânum âgene) All are agreed, as Schneider remarks, that this is the Vetus agnum caesus, i. e. Chaste-tree. Galen makes it to be the same as the Chaste-tree. The latter occurs in the Odyssey of Homer, and also in the Iliad, and may there mean any flexible twig.

AGONIA, AGONIAE, AGONIOUM, a Roman festival, instituted by Numæ Pomponius in honour of Janus, and celebrated on the 9th of January, the 20th of May, and the 10th of December. The morning of these festivals, or, at least, the morning of the 10th of December, was considered a dies nefastus. The etymology of this name was differently explained by the ancients; some derived it from Agonius, a surname of Janus; some from the word agone, because the attendant, whose duty it was to sacrifice the victim, could not do so till he had asked the rex sacrificius, Agonius? and others from agone, because the origin of it was from the augeo, to augur. The Circus Agonialus, built by the Emperor Alexander, is supposed by some writers to have been erected on the spot where the victims were sacrificed during the agonalia.

AGNUNES 1tâgmati kai tâgmatoi. All causes in the Athenian courts were distinguished by classes as: tâgmati, i. e. not to be assessed, in which the fine or other penalty was determined by the laws; and âgones tâgmati, swis to be assessed, in which the penalty had to be fixed by the judges. When the judges had given their votes in favour of the plaintiff, they next had to determine, provided that the suit was an âgones tâgmati, what fine or compensation was to be derived from the defendant. The Cirrus Agonas, says Polybius, and other writers who have been erected on the spot where the victims were sacrificed during the agonalia.

AGNUNES 1tâgmati kai tâgmatoi. All causes in the Athenian courts were distinguished by classes as: tâgmati, i. e. not to be assessed, in which the fine or other penalty was determined by the laws; and âgones tâgmati, swis to be assessed, in which the penalty had to be fixed by the judges. The Cirrus Agonas, says Polybius, and other writers who have been erected on the spot where the victims were sacrificed during the agonalia.
AGRARΙE LEGES.

"full market," was used to signify the time from morning to noon, that is, from about nine to twelve o'clock.

AGORANOMI (ἀγορανόμοι) were public functionaries in most of the Grecian states, whose duties corresponded in many respects to those of the Roman aediles. At Athens their number was ten, five for the city and five for the Piraeus, and not twenty, as Meier erroneously states, misled by a false report preserved by Thucydides. They had the inspection of goods which were sold in the market, with the exception of corn, which was subject to the jurisdiction of the ἀυτώμικος. They regulated the price and quantity of all things which were brought into the market, and punished all persons convicted of cheating, especially by false weights and measures. They, in general, the power of punishing all infraction of the laws and regulations relating to the market, by inflicting a fine upon the citizens, and personal chastisement upon foreigners and slaves, for which purpose they usually carried a whip. They had also the care of the market-place, and received the tax (τέμνου τέλος) which foreigners and aliens were obliged to pay for the privilege of exposing their goods for sale in the market. The public prostitutes were also subject to their regulations.

AGRA'NIA (ἀγρανία), a festival celebrated at Argos, in memory of one of the daughters of Proetus, who had been afflicted with madness.

ΑΡΑΦΑ'ΟΤΙΟΥ ΓΡΑΦΗ (ἀράφαφος γράφη). The names of all persons at Athens who owed any sum of money to the state (ὁ τῶν δημοσίων δηλούτερ) were registered by the practores (πράξατορες) upon tablets kept for that purpose in the Temple of Minerva, on the Acropolis; and hence the expression of being registered on the Acropolis (ἀγεγραμμένος ἐν ἀκρόπολις) always means indebted to the state. If the name of an individual was improperly erased, he was subject to the action for non-registration (ἀραφαφόν γραφῆ), which was under the jurisdiction of the sixty tribes. If the name of an individual was not registered, he could only be proceeded against by ἐνδείξεως, and was not liable to the ἀράφαφον γραφῆ.

Hesychius, whose account has been followed by Hensterhys and Wesseling, appears to have been mistaken in saying that the ἀράφαφον γραφῆ could be instituted against debtors who had not been registered.

ΑΓΡΑ'ΦΟΙ ΝΟΜΟΛ (Vid. NOMOL).

ΑΡΑΦΑ'ΟΤΙΟΥ ΜΕΤΑΛΛΟΥ ΓΡΑΦΗ (ἀράφαφος μετάλλον γραφῆ) was an action brought before the thesometheς at Athens, against an individual who worked a mine without having previously registered the mine.

Among the Athenians, the proper name for the assembly of the people was ἐκκλησία, and among the foreigners the term ἐκκλήσια was used. The first time at Athens to the assemblies of the phyllum and deme. In Crete the original name ἀγώρα continued to be applied to the popular assemblies till a late period.

The name ἀγώρα was early transferred from the assembly itself to the place in which the assembly was used to meet. It alone was used to mark the meeting-place, where goods of all descriptions were bought and sold. The expression ἀγώρα πλῆθος, (πλῆθος ἀγώρα)
all; as, for instance, that by which the domain of the kings was parcelled out among the commonalty, in which case the communal lands were planted. Even in the narrower sense of a law whereby the state exercised its ownership in removing the old possessors from a part of its domain, and making over its right of property therein, such a law existed among those of Servius Tullius.1

The history of the enactments called agrarian laws is one of the most correct sense, or in the narrower sense of the term, as explained in this extract, would be out of place here. The particular objects of each agrarian law must be ascertained from its provisions. But all these numerous enactments had reference to the public land; and, as the great majority of them had for their purpose the settling of Roman colonies in conquered districts, and assigning to the veteran soldiers, who formed a large part of such colonists, their shares in such lands. The true meaning of all or any of these enactments can only be understood when we have formed a correct notion of property in land, as recognised by Roman law. It is not necessary, in order to obtain this correct notion, to ascend to the origin of the Roman state, though, if a complete history of Rome could be written, our conception of the real character of property in land, as recognised by Roman law, would be more enlarged and more extensive. Such a method of reasoning, however, existed under the emperors, contained both the terms and the notions which belonged to those early ages, of which they are the most faithful historical monuments. In an inquiry of the present kind, we may begin at any point in the historical series which is definite, and we may ascend from known and intelligible notions which belong to a later age, towards their historical origin, though we may never be able to reach it.

Gaius,2 who probably wrote under the Antonines, made two chief divisions of Roman land; that which was divini juris, and that which was humani juris. Land which was divini juris was either sacrum or religiosum.3 Land which was sacrum was consecrated to the Dio Superi; land which was religiosum belonged to the Dio Manes. Land was made sacrum by a lex or senatus consultum; and, as the context shows, such land was land which belonged to the gods or to religion. An individual could make a portion of his own land religious by the interment in it of one of his family: but it was the better opinion that land in the provinces could not thus be made religious; and the reason given is, that the ownership or property in provincial lands is either in the state (pop. Rom.) or in the Caesar, and that individuals had only the possession and enjoyment of it (possessio et usus fructus). Provincial lands were either stipendiaria or tributaria: the stipendiaria were in those provinces which were considered to belong to the Roman state; the tributaria were in those provinces which were subject to no municipal laws, and were governed by the Caesar. Land which was humani juris was divided into public and private: the former belonged to the state, the latter to individuals.

It would seem to follow, from the legal form observed in making land sacrum, that it thereby ceased to be publicus; for if it still continued publicus, it has no meaning. The commentator Niebuhr has stated that "all Roman land was either the property of the state (common land, domain) or private property—aut publicus aut privatus," and he adds that "the landed property of the state was either consecrated to the gods (sacrum), or allotted to men to reap its fruits (publicum et religiosum)." It is evident that the view of Gaius of the latter makes the latter the primary division; but he relies on the authority of Frontinus, supported by Livy, as evidence of the correctness of his own division, in which he breaks as in a passage in Frontinus (De Re Agraria, xi., xiii.), that Niebuhr has mistaken the meaning of the writer, who clearly intends it to be inferred that the sacred land was not public land. Besides, if the meaning of Frontinus was what Niebuhr has supposed it to be, his authority is not sufficient to prove it, inasmuch as it clearly belongs to the province of the jurist, and is foreign to that of the agrimensor. The passage of Livy, also, certainly does not prove Niebuhr's assertion. The form of dedication in Livy may be easily explained.

Though the origin of that kind of property called publicus seems to be referred to the earliest ages of the Roman state, it appears from Gaius that under the emperors there was still land within the limits of the Empire, the ownership of which was not in the individuals who possessed and enjoyed it, but in the populous Romanus or the Caesar. This possession and enjoyment are distinguished by him from ownership (dominium). The term possession frequently occurs in those jurists from whom the Digest was compiled; but in these writers, as they are known to us, it applies only to private land, and the ager publicus is hardly, if at all, ever noticed by them. Now this term Possessio, as used in the Digest, is generally considered to mean anything which an individual has no kind of right to; and this possession was protected by the praetor's interdict, even when it was without bona fides or justa causa: but the term Possessio in the Roman historians—Livy, for instance—signifies the occupation and enjoyment of public land; and the true notion of this, the original possession, contains the whole solution of the question of the agrarian laws. For this solution we are mainly indebted to Niebuhr and Savigny.

This latter kind of possession, that which has private land for its object, is demonstrated by Savigny (the term here used can hardly be said to be too strong) to have arisen from the first kind of possession: and thus it might readily be supposed that the Roman doctrine of possession, as applied to the occupation of private land, would throw some light on the nature of that original possession out of which it grew. In the imperial period, public land had almost ceased to exist in the Italian peninsula; but the subject of possession in this has become a well-understood branch of Roman law. The remarks in the three following paragraphs are from Savigny's valuable work, Des Recht des Besitzes.

1. There were two kinds of land in the Roman state; ager publicus and ager privatus; in the latter alone private property existed. But, conformably to the old constitution, the greater part of the ager publicus was given over to individual citizens to occupy and enjoy; yet the state had the right of resuming the possession at pleasure. Now we find no provision of any legal form for the protection of the occupation of the ager publicus, as there was for that of the public land against any other individual, though it cannot be doubted that such a form actually existed. But if we assume that the interdict which protected the possession of an individual in private land was the form which protected the possession of the public, the two problems are solved at the same time: an historical origin for the possession in private land, and a legal form for the protection of possession in public land.

An hypothesis, which so clearly connects into one consistent whole facts otherwise incapable of such connexion, must be considered rather as evolved by placing other known facts in their true relative positions, than involving any independent assumption. But there is historical evidence in support of the hypothesis.

The words possessio, possessor, and possidere are the technical terms used by writers of very different ages, to express the occupation and the enjoyment of the public lands; that is, the notion of a right to occupy and enjoy public land was in the early ages of the Roman state only transferred from public to private property in it. Nothing was so natural as to apply this notion, when once fixed, to the possession of private land as distinct from the ownership; and, accordingly, the same technical terms were applied to the possession of private land. Various applications of the word possessio, with reference to private land, appear in the Roman law, in the honorarium possessio of the pretorian heres and others. But all the uses of the word possessio, as applied to agrar privatus, however they may differ in other respects, agreed in this: they denoted an actual exclusive right to the enjoyment of this land, without the strict Roman (Quiritarian) ownership.

3. The word possessio, which originally signified the right of the possessor, was in time used to signify the object of the right. Thus agrar signified a piece of land, viewed as an object of Quiritarian ownership; possessio, a piece of land, in which a man had an agrar right. But, for instance, Italic land not transferred by mancipatio, or land which from its nature could not be the subject of Quiritarian ownership, as provincial lands and the old agrar publicus. Possessio accordingly implies possidere, agrar implies proprietas or ownership. Thus when it is said that a person is from a jurist of the imperial times, quoted by Savigny; but its value for the purpose of the present inquiry is not on that account the less. The agrar publicus, and all the old notions attached to it, as already observed, hardly occur in the extant Roman jurists; but the possessio, as applied to private land, and the legal notions attached to it, are of frequent occurrence. The form of the interdict

uter possidetis — as it appears in the Digest, is this: uti eas aedes... possidetis... vln fieri veto. But the original form of the interdict was: uti nunc possidetis sum fundum, &c. (Fustus in Possessio); the word fundus, for which aedes was afterward substituted, appears to indicate an original connection between the interdict and the agrar publicus.

We know nothing of the origin of the Roman public lands. It is generally supposed that it was acquired by conquest, and when the conquered lands, what we should call now the state, is to the publicus, as the name publicus (populici) imports. We may suppose that in the early periods of the Roman state, the conquered lands being the property of the publicus, might be used by those who may be called the rulers of that body, in any way that the body might determine. But it is not quite clear how these conquered lands were originally occupied. The following passage from Appian appears to give a probable account of the matter, and which is not inconsistent with such facts as are otherwise known. The Romans, he says, "...used, not to possess any part of the conquered lands, and either build cities in them, or sent Roman colonists to settle in the cities which already existed. Such cities were considered as garrison places. As to the land thus acquired from time to time, they either divided the cultivated part among the colonists, or sold it, or let it to tenants." As to the land which had fallen out of cultivation in consequence of war, for which, indeed, was the agrar part, having no time to allot it, they gave public notice that any one who chose might in the mean time cultivate this land, on payment of one-tenth of the produce. The same privilege was extended to arable land, and a fifth of the produce of oliveyards and vineyards. A rate was also fixed to be paid by those who pastured cattle on this undivided land, both for the larger and smaller animals. The rich occupied the greater part of this undivided land, and at length, feeling confident that they should never be deprived of it, and getting hold of such portions as bordered on their shares, and also of the smaller portions in the possession of the public, they became cultivators of extensive districts instead of mere farms. And, in order that their cultivators and shepherds might be free from military service, they employed slaves instead of free men; and they derived great profit from their rapid increase, which was favored by the immense amount of the slaves from military service. In this way the land became very rich, and slaves were numerous all through the country. But this system reduced the numbers of the Italians, who were grown down by poverty, taxes, and military service; and whenever they had a respite from these evils, they had nothing to do, the land being occupied by the rich, who also employed slaves instead of freemen.

This passage, though it appears to contain much historical truth, leaves the difficulty as to the original mode of occupation unsettled; for we can scarcely suppose that there were not some rules respecting the grants of land, and the terms on which land more precise than such a permission or invitation for a general scramble. It must, indeed, have happened occasionally, particularly in the later times of the Republic, that public land was occupied, or squatted on (to use a North American phrase), by soldiers, who had been discharged.

But, whatever was the mode in which these lands were occupied, the possessor, when once in possession, was, as we have seen, protected by the praeator's interdict. The patron who permitted his client to occupy any part of his possessions as tenant at will (interdictum de precario; for the client did but obtain a possession by such permission of his patron). The patron would, of course, have the same remedy against a trespasser. But any individual, however humble, who had a possession, was also protected in it against the aggression of the rich; and it was "one of the grievances bitterly complained of by the Gracchi, and all the pa. s of their age, that while a soldier was serving against the enemy, his powerful neighbour, who coveted his small estate, ejected his wife and children."—Nicolson.

Nico:son.

The public lands were divided into districts, called possessed, or the possession of its public land, but could sell it, and thus convert public into private land. A remarkable passage in Orosius shows that public lands, which had been given to certain religious corporations to possess, were sold in order to raise money for the repaire of the state. The possession of that land which was possessed, and the circumstance of the possession having been a {grant or public act, are both contained in this passage.

The public lands which were occupied by possessors were sometimes called, with reference to the "possession," agrar publicus, the same lands were called state, concess. Public land which became private by sale was called questeatorius; that is often spoken of as assigned (assignatus) was marked out and divided (limitatus) among all the plebeians in equal lots, and given to them in absolute ownership, or it was transferred to the persons who were sent out as a colony. Whether the land to be granted to the colony should become Roman or not, depended on the nature of the colony. The name aeger publicus was given to public lands which were acquired even after the plebs had become one of the estates in the Roman Constitution, though the name publicus, for it had never fallen. So no longer be strictly applicable to such public lands. It should be observed, that after the establishment of the plebs, the possession of public land was the peculiar privi-

1. (Jardineus Dig. 50, tit. 16, s. 115, 1—9. (Boll) Civ., l. 7.)
2. (Savigny, p. 176, note.)
lege of the patricians, as before the establishment of the plebs it seems to have been the only way in which public lands were enjoyed by the populii: the assignment, that is, the grant by the state of the ownership of public land in fixed shares, was the privilege of the plebs. In the early ages, when the populi was the state, it does not appear that there was any assignment of public lands among them, though occasionally some of them might be sold; the mode of enjoyment of public land was that of possession, subject, as already observed, to an annual payment to the state. It may be conjectured that this ancient possessio, which we cannot consider as having its origin in anything else than the consent of the public at large, was disregarded as a good mode of tenure of the land, as long as the annual payments were made. At any rate, the plebs had no claim upon such ancient possessions. But with the introduction of the plebs as a separate estate, and the constant acquisition of new lands by conquest, it would seem that the plebs had as good a title to a share of the newly-conquered lands, as the patricians to the exclusive enjoyment of those lands which had been acquired by conquest before the plebs had become an estate. The determination of what part of newly-conquered lands (arable and vineyards) should remain public, and what part should be assigned to the plebs, as the plebs, says, would be observed, was done after the completion of every conquest, 1ought to have been an efectual way of settling all disputes between the patricians and plebs as to the possession of the former; for such an appropriation, if it were actually made, could have no other meaning than that the patricians were to have as good title to possess their share as the plebs to the ownership of their assigned portions. The plebs, at least, could never fairly claim an assignment of public land, appropriated to remain such, at the time when they received the share of the conquered lands to which they were entitled. But the fact is, that we have no evidence at all as to such division between lands appropriated to remain public and lands assigned in ownership, as Niebuhr assumes. All that we do know is, that the patricians possessed large tracts of public land, and that the plebs from time to time claimed to possess a certain portion of part of them. In such a condition of affairs, many difficult questions might arise; and it is quite as possible to conceive that the claims of the plebs might in some cases be as unjust and ill-founded as the conduct of the patricians was alleged to be rapacious in extending their possessions. It is impossible to fix in either case the exact title of the possession, owing to sales of possessions, family settlements, and other causes, boundaries had often become so confused that the equitable adjustment of rights under an agrarian law was impossible; and this is a difficulty which Appian particularly mentions.

Pasture-lands, it appears, were not the subject of assignment, and were probably possessed by the patricians and the plebs indifferently.

The property of the Roman people consisted of many things besides land. The conquest of a territory, unless special terms were granted to the conquered, seems to have implied the acquisition by the Roman state of the conquered territory and all that it contained. Thus no; only would land be acquired, which was available for corn, vineyards, and pasture, but mines, roads, rivers, harbours, and, as a consequence, tolls and duties. If a Roman colony was sent out to occupy a conquered territory or town, it might be divided among the colonists in complete ownership. (Vid. Colonia.) The remainder, it appears, was left or restored to the inhabitants. Not that we are to understand that they had the property in the land as they had before; but it appears that they were subject to a tax, the produce of which belonged to the Roman people. Niebuhr seems to suppose that the Roman state might at any time resume such restored lands; and, no doubt, the right ofquisition was involved in the tenure by which such lands were held. But it was doubted if the resumption of such lands was ever resorted to except in extraordinary cases, and except as to conquered lands which were the public lands of the conquered state.

Private persons, who were permitted to retain their lands subject to the payment of a tax, were not the possessors to whom the agrarian law was applied. In many cases of land were absolutely privatized, their owners having perished in battle or been driven away, and extensive districts, either not cultivated at all or very imperfectly cultivated, became the property of the state. Such lands as were unoccupied could become the subject of possession, and the possession would in all cases, and in whatever manner be obtained the land, be liable to a payment to the state, as above mentioned in the extract from Appian. This possesso was a real interest, for it was the subject of sale: it was the usufruct of the land; but it was not the aeger or property. The possession strictly could not pass by testament, with the exception of at least not by the scission. 2 It is not easy, therefore, to imagine any mode by which the possession of the heirs was protected, unless there was a legal form, such as Savigny has assumed to exist for the general protection of possessiones in the public lands.

The possessor of public land never acquired the ownership by virtue of this possession; it was not subject to usucaption. The ownership of the land which belonged to the state could only be acquired by the grant of the ownership, or by purchase from the state. The state could at any time, according to strict right, sell that land which was only possessed, or assign it to another person. The possession was, in fact, with respect to the state, a precarious; and we may suppose that the lands so held would at first receive few permanent improvements. In course of time, and particularly when the possessors had been undisturbed for many years, possession would appear, in an equitable way, to be fully and fairly owned by the person who had in fact the enjoyment of the land. It is true, the possession is merely right and title; and the hardship of removing the possessors by an agrarian law would appear the greater, after the state had long acquiesced in their use and occupation of the public land.

In order to form a correct judgment of some of these enactments which were most frequently called agrarian laws, it must be borne in mind that the possessors of public lands owed a yearly tenth, or fifth, as the case might be, to the state. Indeed, it is clear, from several passages, 3 that, under the Republic at least, the receipt of anything by the state from the occupier of land was a legal proof that the land was public; and conversely, public land always owed this annual payment. These annual payments were, it seems, often withheld by the possessors, and thus the state was deprived of a fund for the expenses of war.

The object of the agrarian law of Sp. Cassius is supposed by Niebuhr to have been that the portion of the public in the public lands should be set apart; that the rest should be divided among the plebeians; that the title should again be levied, and applied to paying the army. 4 The agrarian law of Licinius Sesto limited each individual’s possession of public land to 500 jugera, and imposed some other restrictions; but the possessor had no better title than an usucaption which the law left him than he formerly had to what the law took from him. The surplus land, according to the provisions of the law, was to be formed among the plebeians.
The Lictorian law not effecting its object, T. S. Gracchus revived the measure for limiting the possessions of cultivators on 500,000 acres to ten, the argument of the possessors against this measure, as they are stated by Appian, 1 are such as might reasonably be urged; but he adds that Gracchus proposed to give to each possessor, by way of compensation for improvements made on the public land, the full ownership of 600 jugera, and he assigns the quantity to each of them, if he had any. If it is true, as Appian states, that the law of Gracchus forbade the rich from purchasing any of the lands which might be allotted to the plebeians by his agrarian law, this part of the measure was as unjust as it was impolitic. The lands which the Roman people, and, indeed, the public good, could lose, the conquest were greatly reduced in amount by the laws of Gracchus and by sale. Confiscations in the civil wars, and conquests abroad, were indeed continually increasing the public lands; but these lands were allotted to the soldiers and the numerous colonists to whom the state was continually giving lands (see the list in Frontinus, De Colomia Italiae). The system of colonization which prevailed during the Republic was continued under the emperors, and considerable tracts of Italian land were disposed of in this manner by Augustus and his successors. Such tracts of land were paid for by the pay of his soldiers, and grants of Italian lands are mentioned by subsequent emperors, though we may infer that, at the close of the second century of our era, there was little public land left in the peninsula. Vespasian sold part of the public lands called subscusa, a term which expressed such parts as had not been assigned, when the other parts of the same district had been measured and distributed. Domitian, according to Aggenus, gave the remainder of such lands all through Italy to the possessors. The conquests beyond the limits of Italy furnished the emperor with revenue by the taxation of the conquered territories, by grants of land; and in this way the institutions of Rome were planted on a foreign soil. But, according to Gaius, property in the land was not acquired by such grant; the ownership was still in the state, and the provincial landholder had only the possession, or the power of disposition, of the land. The first measure of the Caesar, his interest in the land was one that might be resumed at any time, according to the strict rules of law, though it is easily conceived that such foreign possessions would daily acquire strength, and could not safely be dealt with as possessors. The question is consequently put in the way by the special laws which had convulsed the Roman state. This assertion of the right of the populus Romanus and of the emperor might be no wrong "inflicted on provincial land-owners by the Roman jurisprudence," as Niebuhr affirms. This same writer also observes, that Frontinus speaks of the "area publica in the provinces, in contradistinction to the agri privati there;" but this he does not. This contradistinction is made by his commentator Aggenus, who, as he himself says, only conceives the meaning of Frontinus; and, as we think, he has not distinguished true publica and privata at a paid for the holders of ager privatus in the province was the only thing which distinguished the beneficial interest in such land from Italian land, and might be, in legal effect, a recognition of the ownership according to Roman law. And this was Saviug's earlier opinion with respect to the tax paid by provincial lands; he considered such property as belonging to the person possessing temporary or ultimate owner of the lands. His later opinion, as expressed in the Zeitschrift für Geschichtliche Rechtswissenschaft, is, that under the Caesars a uniform system of direct taxation was established in the provinces, to which all provincial land was subject; but land in Italy was free from this tax, and a provincial town could only acquire the title freedom by receiving the privilege expressed by the term municipia. The completion of this question here under discussion could only be effected by ascertaining the origin and real nature of this provincial land-tax; and as it may be difficult, if not impossible, to ascertain such facts, we must endeavour to give a probable solution. Now it is consistent with Roman notions that all conquered land should be the property of the Roman state; and it is certain that such land, though assigned to individuals, did not by that circumstance alone become invested with all the characters of Roman land which was private property. It had not the privilege of the jus italicum, and, in short, could not be the property of the privatian ownership, with its incidents of mancipatio, &c. All land in the provinces, including even that of the liberae civitates, and the ager publicus so called, could only become an object of Quiritarian ownership by having conferred upon it the privilege of Italian land, by which it was also released from the payment of the tax. It is clear that there might be and was ager privatus, or private property, in provincial land; but this land had not the privileges of Italian land, unless such privilege was expressly given to it; and, accordingly, it may be asserted that there were in all countries seem to suppose a complete ownership residing in some person, and as the provincial landowner, whose lands had not the privilege of the jus italicum, had not that kind of ownership which, according to the notions of Roman law, was complete ownership, it is difficult to conceive that the ultimate ownership of provincial lands (with the exception of those of the liberae civitates) could reside anywhere else than in the populus Romanus, and, after the establishment of the imperial power, in the populus Romanus or the Cesar. This question, however, one of some difficulty, and which deserves farther examination. It may be doubted, however, if Gaius means to say that there could be no Quiritarian ownership of private land in the provinces; at least this would not be the case in those districts to which the jus italicum was extended. As to the laws of landed property, the passage is quoted by Niebuhr; 2 may be explained. The land here spoken of was land in Sicily. One object of the measure of Rullus was to exact certain extraordinary payments (rectigum) from the public lands, that is, from the possessors of them; but he was not content with this mode of extending the operation of his measure. If this is private land, Cicero argues, the exception is unnecessary. The argument, of course, assumes that there was or might be private land in Sicily; that is, there was or might be land which would not be affected by this part of the measure of Rullus. Now the opposition of public and private land in this passage certainly proves, what can easily be proved without it, that individuals in the provinces owned land as individuals did in Italy; and such land might with propriety be called privatus, as contrasted with that called publicus in the provinces: in fact, it would not be easy to have found another name for it. But we know that ager privatvs in the provinces, unless it had received the jus italicum, was not the same thing as ager privatvs in Italy, though both were private property. Such a passage, then, leads to no necessary conclusion that the ultimate ownership of land in those districts was in the Roman people. It may be as well here to remark farther, that any conclusions as to Roman law, derived solely from the orations of Cicero, are to be received with caution; first, because on several occasions (in the Pro Caelio for instance) he states that to be law which was not, for the purpose

1. (Bell. Civ., i., 10.)—2. (Frontinus, de Re Agraria.)—3. (Hel.
p. 954.)
maintaining his argument; and, secondly, because it was a subject on which his knowledge was probably not very exact.

He briefly notices the condition of the public land with respect to the fructus, or vesti-

gal, which belonged to the state. This, as already observed, was generally a tenth, and hence the ager publicus was sometimes called decumanus; it was also sometimes called ager vectigal. The tithe was generally farmed by the publicani, who paid their rent in produce, not in money.

The letting was managed by the census, and the lease was for five years. The form, however, of

leasing the tenth was that of a sale, mercatissimo. In course of time, the word locatio was applied to these leases. The phrase used by the Roman writers was onerum fructus, which was the proper expression; but we find the phrase ager vectigal locare also used in the same sense, an expression which might appear somewhat ambiguous; and even ager locare, which might mean the leasing of the public lands, and not of the tenth due from the possessors of them. It is, however, made clear by Niebuhr, that in some instances, at least, the phrase ager locare does mean the leasing of the tenths; whether this was always the meaning of the phrase, it is not possible to affirm.

Though the term ager vectigal is originally expressed the public land, of which the tithe was levied, as was the custom in Italy, to signify lands which were leased by the state or by different corporations. This latter description would comprehend even the ager publicus; but this kind of public property was gradually reduced to a small amount; and we find the term ager vectigal, in the latter period, applied to the lands of towns which were so leased that the lessee, or who those derived their tithe from him, could not be ejected so long as they paid the vectigal. This is the ager vectigal of the Digest, on the model of which was formed the emphyteusis, or ager emphyteuticus. (Vid. Emph.)

The rights of the lessee of the ager vectigal were different from those of a possessor of the old ager publicus, though the ager vectigal was derived from, and was only a new form of, the ager publicus. Though he had only a jus in re, and though he is distinguished from the owner (dominus), yet he was considered as having the possession of the land, and was subject to suit in the town, if he was ejected from his land, provided he had always paid his aigongal

AGRAULIA (άγραυλία) was a festival celebrated by the Athenians in honour of Agraulos, the daughter of Cecrops. We possess no particulars respecting the time or mode of its celebration; but it was, perhaps, connected with the solemn oath, which all Athenians, when they arrived at manhood (κόριον), where obliged to take in the temple of Agraulos, that they would fight for their country, and always observe its laws.

Agraulos was also honoured with a festival in Cyprus, in the time of Agrippidus, at which human sacrifices were offered.

AGRTALIA (άγρταλία), the name of nine maidens, who were chosen every year, in the Island of Cos, as priestesses of Athena (Minerva).

AGRIA'NIA (άγριανια) was, according to Hec.

yclus, a festival celebrated at Argos, in memory of a deceased man, and was, probably, the same as the festival called AGRANIA. The Agrinia was also celebrated at Thebes, with solemn sports.

AGRIMENSO'RES, or "land-surveyors," a col-

lege established under the Roman emperors. Like the jurisconsults, they had regular schools, and were paid handsome salaries for their labours. Their functions consisted in measuring unassigned lands for the state, and ordinary lands for the proprietors, and to fix and maintain boundaries. Their writings on the subject of art were very numerous; and we have still scientific treatises on the law of boundaries, such as those by Frontinus and Hyg.

They were sometimes called spectacoles and clarissimi in the time of Theodosius and Valentinian. As part-

itioners of land, the agrimensores were the successors of the augurs, and the mode of their limitatio was derived from the old augural method of forming the termphum. The word termphum, like the Greek rets, signifies the circle or arc application to signify the vault of the heavens was due to the fact that the directions were always ascertained according to the true cardinal points. At the inauguration of a king or consul, the augur looked towards the east, and the person to be inaugurated was conformity with the sun and the direction in which he looked was the main direction. Thus we find that in the case of land-surveying the augur looked towards the south, for the gods were supposed to be in the north, and the augur was considered as looking in the same manner in which the gods looked upon the earth. Hence the main line land-surveying was drawn from north to south, and was called cardo, as corresponding to the axis of the world; the line which cut it was termed decumanus, because it made the figure of c, like the numeral X. These two lines were produced to the extremity of the ground which was to be laid out, and parallel to these were drawn other lines, according to the size of the quadrangle required. The limits of these divisions were inci-

cated by barks, called limites, which were left as high roads, the ground for them being dedicated from the land to be divided. As every sixth was wider than the others, the square bordering upon this would lose pro loco. The opposition of via and times in this rectangular division of property has not been sufficiently attended to by scholars. It appears that, if the line from north to south was called unes, that from east to west was called unes, and vice versa. Virgil was, as is well known, very fond of words and figures which entirely depend on inferences drawn from his language. First, he uses times in its stricter sense as a term of land-surveying: "Ante Jovem nulli subjacentur aera coloni, Nespigni violidem, aut partiri limites campum Fasc rat." Again, in speaking of planting vines in regular rows, he says: "Omnis in auguram Arboribus gesitis secta via limite quadratr." i. e., "let every via be exactly perpendicular to the times which it cuts." He says quadratr, for the term via might be used in speaking of a line which cut another obliquely, as it is used in the description of the eclipsc, in Virgil:

"Via secta per ambar, Obstips qua se signorum vertetur ordo." These passages are sufficient to prove that via and times are used in opposition to one another. The following authorities will shew that via means the principal or south road, and times means the cross road, where roads are spoken of. In the first place, the Twelve Tables laid down that the via should be eight feet wide when straight, but twelve

feet at the turning; and it is expressly distinguished by Festus from the tier of two feet wide, and the actus of four feet wide. Secondly, in Livy we have "extra vas (portae) extusque lata sunt vidit, et cachina (pl.) extusque lata sunt vidit; and in the same author," "transieritis limitibus in viam Laetamnam est egressum" and Tacitus says, "Por limia viae sparguntur solutae consortae victores." When land was not divided, it was called areasinus, or areasialis; the aeger publicus belonged to this class.

The reader will find two very valuable articles on the Limitatio and the Agrimensorum in the Appendices to Niehbr's Roman History, vol. ii.

- **AGRIMONIA**, the herb Agrimony, called also Empatorum (Sorbus aucuparia), from its having been discovered by Mithradates Empator. 

- **AGRIO-NIA** (アグリオーニア), a festival which was celebrated by the women and priestesses of Dionysus, surnamed Αγριωνός. It appears from Plutarch that this festival was solemnized only by women and priests of Dionysus. It consisted of a kind of game, in which the women for a long time acted as if seeking Dionysus, and at last called out "one another that he had escaped to the Muses, and had concealed himself with them. After this they prepared a repast; and having enjoyed it, amused themselves with solving riddles. This festival was remarkable for a feature which proves its great antiquity. Some virgins, who were descended from the Muses, were occasionally used to assemble around the temple on the occasion, fled, and were followed by the priest armed with a sword, who was allowed to kill the one whom he first caught. This sacrifice of a human being, though originally it must have formed a regular part of the festival, seems to have been avoided in later times. One instance, however, occurred in the days of Plutarch. But, as the priest who had killed the woman was afterward attacked by disease, and several extraordinary accidents occurred to the Minyans, the priest and his family were deprived of their offices, power. The festival is said to have been derived from the daughters of Minyas, who, after having for a long time resisted the Baccanalian fury, were at length seized by an invincible desire of eating human flesh. They therefore cast lots on their own children, and as Hippasus, son of Lapicippus, the eldest, was killed and offered him, whereas the belonging to that race were at the time of Plutarch still called the destroyers (κλέος or αιόλαια), and the men mourners (φυλόκτητοι). 

- **AGRIOPHYLLON** (αγριοφύλλον), a plant, the same with the Poecileum (Ποεκίθευμα), our "Hogs-fennel," or "Fennel," or "Foxtail." 

- **AGRONOMI** (αγρόνομοι) are described by Aristotle as the country police, whose duties corresponded in most respects to those of the astynomi in the city. They appear to have performed nearly the same duties as the hylotri (θυλοτρί). Aristotle does not inform us in what state they existed; but, from the time at which the sons of them by their children. It appears probable that they belonged to Attica.

- **AGROSTIS** (αγρωστικός), a plant. Schneider and Sprangel remark, that nearly all the commentators agree in referring it to the Tritium repens, L., or Cichorium grass. Stackhouse, however, is content with simply marking the Δίωμος of Theophrastus as Αγρωστία of Galen. The brief description of the Δίωμος by το Παρασκευά, given by Dioscorides, would seem to point to the Parnassia palustris, or "Grass of Parnassus."

---

AIIKAS DIKE

•AIGITHALOS (αιγιθάλος), a species of bird. Aristotle applies this term to the genus Parus, of which there are a great number of species. It is a genus of small passerine birds, and includes the following species: 1. The **Parus major**, the Great Titmouse or Ox-eye. 2. The **Parus caudatus**, L., or Long-tailed Titmouse. 3. The **Parus cristatus**, which answers to the **Parus carolinus**, L., or Blue Titmouse.

•AIGIPYROS (αιγιπυρός), a plant about which there has been much difference of opinion. Robert Sipman and most of the older commentators contend that it is the **Avena sterilis**, or Polie avamite of the French. Matthioli rejects this opinion, and holds it to be an herb called *Cyniodite* in French, which grows in fields of barley. Dodonaeus, Sibthorp, Stackhouse, and Sprengel agree in referring it to the genus *Avena*. It is generally supposed that the name of the *Avena* is the same as the *Oenanthe* of Classical authors, or the *Quercus* of the Otho. This, however, is merely conjectural.

•AIGOTHELAS (αιγοθήλας), the Goat-sucker, a bird of the genus *Caprimulgus*. It applies more especially to the species called *Fenn-owl* in England, to which Professor Rennie gives the scientific name of *A. s. Fenni*.

•AIGIOPLOS (αιγιοπλός). *Albin* describes it as being a bird intermediate between the Eagle and the Vulture. Gezer decides that it is the same as the *vulturio* and the *Vultur niger* of Pliny; and Schneider suggests that it probably was the *Vultur perornatus*, or Alpine eagle. (Vid. Gryph.)

•AILEA (αίλεα), a woman of the rapacious tribe, briefly noticed by Aristotle. It is rendered *Uly* by Gaea, but cannot satisfactorily determined. (Vid. Glaux.)

•AIKIAS DIIKH (αικίας δίκη), an action brought at Athens before the court of the Forty (οι τετραάκουσαι), against any individual who had stricken a citizen. Any citizen who had thus been insulted might proceed in two ways against the offending party, either by the aikias dikē, which was a private action, or by the *equivos graiotes*, which was looked upon in the light of a public prosecution, since the state was considered to be wronged in any injury done to any citizen. It appears to have been one of the special cases of the *bôngos* or the *politeia* which was given to persons who had been injured more than the amount of the obligation.

It was necessary to prove in two facts in bringing the aikias dikē before the Forty. First, That the defendant had struck the plaintiff with the intention of insulting him (*eis ἐπόρος*), which, however, was always presumed to have been the intention, unless the defendant could prove that he only struck the plaintiff in joke. Thus Ariston, after proving that he had been struck by Conon, tells the judges that Conon will attempt to show that he had only struck him in play. Secondly, It was necessary to prove that the defendant struck the plaintiff first, and did not merely return the blows which had been given by the plaintiff (*ἀρχέται χειρὸς ἄδικον*, or merely *ἄδικον ἄρχεται*). In this action, the sum of money to be paid by the defendant as damages was not fixed by "the laws; but the plaintiff assessed the amount according to the injury which he thought he had received, and the judges determined on the justice of the measure.

AIKLON (αἰκλόν, αἰκλών, or ἀἰκλῶν), is said by Polemo to be a Doric word; its derivatives *ἐπικλέα* and *μεικλία* were used only by the Dorians. Modern writers differ greatly respecting its meaning; but, from an examination of the passages in which it occurs, it appears to be a term employed in the senses: 1. A meal in general. Thus Alcman uses σμείναι of a meal. II. The chief dish or course in a meal. The dessert or after-course was called ἐπικλέα. The *ἐπικλέα* among the Spartans was composed of the contributions which every one who came to the public banquets (*σφαῖρα*) was bound to bring, and consisted chiefly of pork and black broth, or blood-broth (*μέλος ἄφως, ἀφρός *); the additional contributions of other persons were received merely as a sacrifice, and were eaten by the guests. But, if their flavour was not approved, they were made up afresh into a savoury mess called a μαστίγι. Boys were allowed an *ἐπικλέα* consisting of barley meal kneaded with oil, and baked in laurel leaves.

ALTHYN THIÉRTH (αλθυνθίρθ), a festival of the Athenians, in honour of Poseidon, which lasted sixteen days, during which time every family took its meals quietly and alone, no slave being allowed to wait, and no stranger invited to partake of them. From the circumstance of each family being closely confined to itself, those who solemnized this festival were called *μουσίφαι*. Plutarch traces its origin to the Trojan war, and says that, as many of the *Eginetans* had lost their lives, partly in the siege of Troy and partly on their return home, those who reached their native island were received indeed with joy by their kinsmen; but, in order to avoid hurting the feelings of those families who had to lament the loss of their friends, they thought it proper neither to show them their grief, nor to prevent them from eating together in public. Every family, therefore, entertained privately their friends who had returned, and acted themselves as attendants, though not without rejoicing.

ATHTIVA (αθτίβα), the Mercus of the Latins, the modern Cormorant. As there are several species of this genus, it is difficult to say, in general, to which of them the ancient name is most applicable. The *Pelicanus corbo* is a common species.

AIX (αἴξ). I. (Vid. *Tragos*). —II. The name of a bird briefly noticed by Aristotle. Below conjectures that it was the *Lapwing*, namely, the *Palaicus Cristatus*.

AIIKIAS PROS (αἰκιαρός), the Felis Catus, or Wild Cat. Some apply the name κατηγός to the Domestic Cat. —(Vid. Felis.)

AIMA'I'THIE (αἰμαίτης), the well-known stone called Bloodstone. (Vid. HEMATITE.)

Theodorus of Colophon, which persons used to sing while swinging themselves (δρα ράλομα). It is therefore probable that the Athenian maidens, in remembrance of Erigone and the other Athenian women who had hung themselves, swung themselves during this festival, at the same time singing the above-mentioned song of Theodorus.

A B. 405, 6. 1, 2. 3. 4. 5. Used by artists and antiquaries to that variety of marble which mineralogists call gypsum. Alabaster is sometimes described as of two kinds; but this is an error, as one of the substances so called is a carbonate of lime, and therefore not alabaster in the common acceptance of the term, while the other, the real alabaster or gypsum, is a sulphate of lime. Alabaster (gypsum) is translucent or semi-transparent, and is usually of a white—a yellowish white—and greenish colour, though sometimes strong brown tints and spots appear in it. When the varieties of colour occur in the same stone, and are disposed by us or horizontal strata, it is often called onyx alabaster; and when dispersed irregularly, as if in clouds, it is in like manner distinguished as agate alabaster. These varieties in the colour are alluded to by Pliny: "Candore interstincto variis coloribus."

Their [the Athenian women's] other ornaments, and on that account ill adapted for sculpture on a large scale, it is capable of being worked to a very fine surface, and of receiving a polish.

Alabaster has been supposed to derive its name originally from Alabaster, a town of Egypt, where there was a manufactury of vessels made of a stone which was found not only in the immediate vicinity of the town of Alabaster; but Pliny speaks of alabstraries, using that term for the various kinds of this marble, as well as onyx, probably from the texture being somewhat different from that of the Greek, Sicilian, and Italian marbles, which he was more accustomed to see, and which were much used for sculpture. A very few specimens of what he thus desired to distinguish it. He observes that it was chiefly procured in his time from Alabstron and Damascus.

Alabaster, both in its form of carbonate of lime and gypsum (for, from the confusion that exists in the description of some ornaments of antiquity, it becomes necessary to advert to both varieties under that denomination), was employed very extensively by the ancients. It was much used by the Egyptians for different sorts of vases, rilievi, ornaments, covers of sarcophagi, canopies, and sculpture in general. The term "alabaster" has remained in use in this sense. If we examine the remains of sculpture in that material, it may be assumed that alabaster (gypsum) was little, if ever, used by the artists of ancient Greece and Italy for statues, rilievi, or busts. Vessels or pots used for containing perfumes, or, rather, ointments, were often called by the ancient alabstron or alabaster. It appears, from the account of Pliny, that these pots were usually made of the onyx alabaster, which was considered to be better adapted than any other stone for the preservation of perfumes. Martial says "comps redolent alabastros," and Horace appears to refer to it as one of the "perfusorios:" "alabaster." Virgil.

The term seems to have been employed to denote vessels appropriated to these uses, even when they were not made of the material from which it is supposed they originally received their name. Theocritus thus speaks of golden alabaster (αλαβαστρων χρυσος). These vessels were of a tapering shape, and very often had a large mouth, which was sealed; so that when Mary, the sister of Lazarus, is said by St. Mark to break the alabaster-box of ointment for the purposes of anointing our Saviour, it appears probable that she only broke the extremity of the neck, which was thus

---

ALEC.

used. The alabaster mentioned by the Evangelists was, according to Ephraemi, a measure, which contained $\frac{1}{2}$ ετρικόν, or one κοτιλία (16 47 cubic inches, or 48 pints).

ALABASTRISTES. (Vid. Alabaster.)

ALAJA (Δαία) is the name of the games which were annually celebrated at the festival of Minerva, summoned Alea, near Tegea, in the neighbourhood of which was the temple of the goddess.

ALARII were the troops of the allies in the Roman army, and were so called because they were usually stationed in the wings (Alar).

The alarri consisted both of horse and foot soldiers, and were commanded by praefecti, in the same manner as the auxilia were commanded by tribuni. The cavalry of the alarri was light, equipped to distinguish them from the cavalry of the legions (equites legionares); and the infantry was called alarri alae, in order to distinguish them from the cohortes legionaries.

*ALANA (αλανα) of the Romans, and is clearly the species alluded to by Aristophanes in his Ayes.

ALBUM is defined to be a tablet of any material on which the poet's edicts, and the rules relating to adding deer to the lists of victors, were put up in a public place, in order that all the world might have notice of its contents. According to some authorities, the album was so called, because it was either a white material or a material whitened, and of course, the writing would be a different colour. According to other authorities, it was so called because the writing was in white letters. If any person wilfully altered or erased (corruptit) anything in the album, he was liable to an action alii corruptit, and to a heavy penalty.

Probably the word album originally meant any tablet containing anything of a public nature. Thus, Cicero informs us that the Annales Maccabaei were written on the album by the pontiff maximus. But, however this may be, it was, in course of time, used to signify a list of any public body; thus we find the expression album senatorium, used by Tacitus, to express the list of senators, and corresponding lists, used by Dion Cassius. The phrase album decurionum signifies the list of decurions whose names were entered on the album of a municipality, in the order prescribed by the lex municipalis, so far as the provisions of the lex express the contrary.

ALBUS GALERIUS, or ALBOGALEIUS, a white cap worn by the famed dials at Rome. According to Festus (s. v.), it was made of the skin of a white victim sacrificed to Jupiter, and had an olive twig inserted in the top. Its supposed form, as derived from coins, and from a bas-relief on a Roman temple, is that of a cap fitted closely to the head, and tied under the chin. (Vid. APER.)

ALCATHOIA (άλκαθοια) is the name of games celebrated at Megara, in commemoration of the hero Alcathous, son of Pelops, who had killed a lion which had destroyed Epilus, son of King Megareus.

ALCABRA or ALCEA (in Greek Άλκεα), the name of an animal described by Caesar and other ancient writers, and the same with the modern Elk or Moose Deer. *It was the opinion of Buffon, that the Euro-

pean Elk was not known to the Greeks, but it appear to have been noticed by Aristotle. That it was, however, the *Άλκεα of Panathiana, the Aige of Caesar and Pliny, the Elch of the Celts, and the *Elig or Elgin of the northern Europeans, there can be little doubt. Panathiana describes it as being "between a stag and a camel," and though the accounts are not always consistent, and they are mingled with fable, and though the former states that his Aige is "wältile corinthus" (which might arise from the accounts of those who had seen the animal at the period when the horns had exfoliated), the general description and the localities given by both are almost conclusive as to the animal meant to be designated. The "laurum superius praegrande," a "slightly upper lip," of Pliny is very expressive, and the extraordinary development of this part might well recall to a casual observer the general traits of the head of a camel. Whether it was the *ιπποθαλαι (hippopathus) of Aristotle, it is a question which will admit of much discussion. (Vid. EUPHRAEUS.)

The movements of the Elk are rather heavy, and, the shoulders being higher than the crown, it can never gallop, but shuffles or amblest along, its joints cracking at every step, with a sound heard a some distance. Increasing its speed, the hind foot straddles to avoid treading on its fore heels, and it tosses the head and shoves its horns forward to make a jump, and then returns to gallop. It does not leap, but steps without effort over a fallen tree, a gate, or a split fence. During its progress, it holds the nose up, so as to lay the horns horizontally back. This attitude prevents its seeing the ground distinctly; and, as the weight is carried very high upon the elevated legs, it is said sometimes to trip by treading on its fore heels, or otherwise, and occasionally to give itself a heavy fall. It is probably owing to this occurrence that the Elk was believed by the ancients to have frequent attacks of epilepsy, and to be obliged to smell its hoof before it could recover; hence the Teutonic names Elk, ("miserable"), and the reputation especial, of the loves of the specific against the disease.

ALCEA (άλκεα or άλκαια), most probably the Malus alceae, or Vervain Mallow.

ALCIEC: (Vid. MALAY.)

ALCIBIIDUM (άλκιβιδιον), a species of Anchusa.

ALCYONE. (Vid. MALAY.)

ALEA, gaming, or playing at a game of chance of any kind. Hence aleo, aleator, a gamester, a gambler. Playing with tall, or tessera, was generally understood, because this was far the most common game of chance among the Romans.

Gaming or playing at a game of chance by dice or cards, was legal, and was practised both during the times of the Republic and under the emperors. Hence Horace, alluding to the progress of effeminate and licentious manners, says that boys of rank, instead of riding and hunting, now showed their skill in playing the hoop, or even games of chance. Although they were illegal (sacra legis), Cicero recommends them, if contracted by public opinion. "In his gregibus," says Cicero, "omnes aleatores, omnes adulatori, omnes impudique versatuli." To detect and punish excesses of this description belonged to the office of the legates.

Games of chance were, however, tolerated in the month of December at the Saturnalia, which was a period of general relaxation; and among the Greeks, as well as the Romans, old men were allowed to amuse themselves in this manner. The following line of Publius Syrus shows that...
ALIMENTA'RII, or AL'LIOMO TRÔFH (άλιμον, or ἀλίμων, τρόφης), (from α, negative, and ἀλίμων, "hunger"), a refreshment used by Epimenides, Pythagoras, and other philosophers. Plato states, in his Dialogue on Laws, that the ἀλίμων of Epimenides was made of marine waters, which were boiled and seasoned, and from which the chief ingredient in the φρυγίνα ἐξωτερικά, and was thought to promote long life. Hesychius interprets σφόδρος by ἀλίμων. Pliny says that some that alimon was called aphodites by Hesiod, who thinks an error; but that the ἀλίμων was supplied to some of the poorer in the form of white, lucent, and honey, the leaves of which resembled those of the olive, but were softer, and were used for food; and by others to a pith by which the sea, "whence," says Pliny, "its name," confounding ἀλίμων, from α and ἀλίμων, with τρόφης, "food," or "nourishment," it signifies a medicinal preparation of light equal weights of several herbs, ground and made into a paste with honey. A similar preparation for quenching thirst (ἀβδόν τρόφος) was used by Pythagoras.

ALIMENTA'RII FUERI ET PUELLE. In the Roman republic, the poorer citizens were assisted by public distributions of corn, oil, and money, which were called congiaria. These distributions were not made at stated periods, nor to any but grown-up inhabitants of Rome. The Emperor Nero was the first who extended them to children, and Trajan was the first who bequeathed them to the very young, both to orphans and to the children of poor parents. These children were called pueri et puellœ alimentarii, and also (from the emperor) pueri pueriliae Ulpianæ ; and the officers who administered the institution were called quaestores pecuniae alimentariae, quaestores alimentarium, procuratores alimentarium, or praefecti alimentarium.

The fragments of an interesting record of an institution of this kind by Trajan have been found at Velleia, near Piacentia, from which we learn the sums which were thus distributed. The money was raised by striking a loan at four per cent in interest, at five per cent, from the towns, on the security of lands and houses. A similar institution was founded by the younger Pliny at Comum. Trajan's benevolent plans were carried on upon a larger scale by Hadrian and the Antonines. Under Commode and Pertinax the distribution ceased; but, in the reign of Caracalla, we again meet with alimentarii pueri and puellæ, who were called Mammei, in honour of the emperor's mother. We learn, from a decree of Hadrian's, that boys enjoyed the benefits of this institution up to their eighteenth, and girls up to their...
ALOE.

The (Theophrast., the 5, be 171. (Meth.
(Pindar, (41. to 16.)—
their it have v.

S.)

Cicero, bread podov. Pliny tmall in trainers, *Iit; hell, of persons

boy four; obj

Theophrastus, among the Greeks, was

the first to close the pores of the body, in order to prevent much perspiration, and thereby enabling them to stand the heat longer. In this object, the oil was not simply spread over the surface of the body, but also well rubbed into the skin. The oil was mixed with fine African sand, several jars full of which were found in the baths of Titus, and one of these is now in the British Museum. This preparatory anointing was called ἡ ἄλοιπου ἱδρυσία. After the callaneous anointing after the contest, in order to restore the tone of the strained muscles: this anointing was called ἡ ἀνδρόπεπτια. He then bathed, and had the cust, sweat, and oil scraped off by means of an instrument similar to the strigil of the Romans, and called ὀξεβιγγ, and afterward ὄφτρα. The alptra took advantage of the knowledge they necessarily acquired of the state of the muscles of the athlete, and their general strength or weakness of body, to advise them as to their exercises and mode of life. They were thus a kind of medical trainers, ἀπολαύτερα. Sometimes they even super-

vised their exercises, as in the case of Mile-

sias.

Among the Romans, the alptra were slaves, who scrubbed and anointed their masters in the baths. They, too, like the Greek ἀλλατία, appear to have attended to their masters' constitution and mode of life. They were also called uncaters. They used in their operations a kind of scraper called straight, towels (λατέα), a cruise of oil (μεταξός), which was usu-

ally of ἠτία, a bottle (v.S. ἀμπυλα), and a small vessel called ἄμμος. (Vid. BATHS.)
The apartment in the Greek palastra where the anointing was performed was called ἀλλατιστήριον; that in the Roman baths was called ἀναμανεριακις.

*ALIS'MA, an aquatic herb, supposed to be the same with the Water Plantain. Pliny speaks of it as an antitode against certain venomous creatures, and also against the bite of a rabid dog. For this he is not so much to be blamed, since even some modern practitioners have recommended it as antii-

venomous. (Sauatru.)

Pliny speaks the A. Parnassifolium; this species, however, has never been found in Greece. Stithobor is more correct in designating the A. plantago. *ALLIUM (οιποδωβ), Garlic. There seems to be no reason to doubt that the ὁιποδωβ of Theophras-

mus and Dioscorides is the Allium sativum, manured Garlic, although Stockhouse prefers the A. scor-

agrarum. R. Stephens suggests that the wild Gar-

lic should be called σκοραγραυ, and not σκοροδωνοβ. Pliny informs us that garlic was much used among the Italian rustics as a medicine. Galen also speaks of it as such.

Among the Athenians it was considered an article of food, and seems to have been sold at the same price with bread and wine. Fighting-cocks were also fed upon it, to make them more pugnacious. Great prophylactic virtues were formerly ascribed to this plant, and, among other active properties, that, in particular, of neutralizing the venom of serpents.1

adras, Ant. Pr., 8.—Id., M. Aen., 20.—Id., Part. 9.—Spart.

ius, vi., 38.—Plin. N. H., iv. 15.—Aesop, f. 435.)

*ALOE, a plant, the dried juice of which yields a gum that is employed in varnish and Staining Stucco. 2. (Pithard, de Tenda Sanid.)

i. 17.—Celsus, i., 42)—5. (Icto, Ep, Fam., i., 9. 3.—Seneck, Ep., 6.—Juvenal, Sat.

Mitth. in Aristoph., Acharn., 150 (174).—11. (Aristoph.,

Eup., 435.) (Lam. Mai., as cited by Feo.)

So diversified, indeed, were its charms, verisimilitude, that no need exist to surmise that it adorned on the one hand, along with the other species of allium, by the people of Egypt, and banishment on the other from the tables of the delicate at Rome. Horace assigns it as fit food only for reapers; it was, however, a great favourite also with the Roman soldiers and sail-

ors. The inhabitants of the Northern parts of Europe, in the need of exciting the digestive powers of the stomach, hold garlic in much higher estimation, on this account, than those of more northern regions. Theophrastus makes the Allium cyprium the largest in size of the several species of this plant. 3

*ALOE V. (The) "That," says Gaius, "appears to be added to the word alluvio, which a river adds to our land (ager) so gradually that we cannot esti-

mate how much is added in each moment of time; or, as it is commonly expressed, it is which is added so gradually as to escape observation. But if a river (at once) takes away a part of your land, and brings it to mine, this part still remains our property." There is the same definition by Gaius in his Res Civitates, with this addition: "If the part thus suddenly taken away should adhere for a considerable time to my land, and the trees on such part should drive their roots into my land, from that time such part appears to belong to my land." The dictio of alluvio was by the Roman jurists to be the juss genitum, in the Roman sense of that term.

According to a constitution of the Emperor Antoninus Pius, there was no juss alluvionis in the case of agri limitati. *Circumvallio differs from alluvio in this, that the whole of the land in ques-

tion is surrounded by water, and subject to li-

action. Cicero enumerates the iura alluvionis and circumvallionum as matters included under the head of causa centumvariae.

The doctrine of alluvio, as stated by Bracton in the chapter De aquiriendo Rurum Dominia, is taken from the Digest, and is in several passages a copy of the words of Gaius, as cited in the Digest.

*ALNUS (a/k/a obo), the Alder. The wood of this tree, which is lighter than that of many others, was first employed, according to the poets, for the purposes of navigation. It was also much used among the Romans for water-pipes, and is still much worked among the best materials, next to metal, for these, and for under-ground purposes generally. The alder is an inhabitant of swamps and meadows in all Europe, the north of Africa and Asia, and North America. Virgil is not consistent with himself as regards the name of this tree. In his sixth Eclogue, Virgil makes the sisters of Phaon to have been changed into alders; but in the Aeneid he gives the poplar, as Ovid does. The species of alder most common in Greece is the Alnus oblongata, Wild.

*ALOE, the Aloe, or Aloe-tree. Neither Hippocrates nor Theophrastus notices this plant, but Dioscorides, and others who described it, speaks of two kinds of it. He says it is mostly brought from India, but that the plant grows in Arabia and the maritime parts of Asia. The story related by some writers, that Aristotle recommended the aloe to Alexander as one of the most valuable products of Socotra, appears to be worthy of belief, and yet it probably was the Socotrine, or the same plant, which, in several descriptions, bears most familiar. Feo thinks that the African aloe was unknown to the Greeks and Romans, but that

AMARUNTHIA.

but, being c.)—

The harvest was not from the Arabic alloe. Pliny mentions a mineral substance called aloe, which is the same with the bitumen of Judæa, and which was employed in Egypt in embalming bodies. 4

ALOA (αλωα or αλοε), an Attic festival, but celebrated principally at Eleusis, in honour of Demeter and the Grækai, or protectors of the fruits of the earth. It took place every year after the harvest was over, and only fruits were offered on this occasion, partly as a grateful acknowledgment for the benefits the husbandman had received, and partly that the next harvest might be plentiful. We learn from Dönhoff 8 that it was unlawful to offer any bloody sacrifice on this day, and that the priests alone had the privilege to offer the fruits. The festival was also called ὀλίνθος, or οὐγκομομοπατη.

ALOTYOT ΓΡΑΘ (ἀλοτριον γραθ), an action which might be brought before the logistæ (λογισται), at Athens, against all ambassadors who neglected to pass their accounts when their term of office expired. 9

ALOPECIA, a species of fish, called by Pliny the sea-fish (Vulpes marina), and the same, probably, with the Faus-chark, or modern naturalists. The name comes from the Greek ἀλοπεχα, "a fox." 10

ALOPECUS (ἀλοπεκους), a plant, which sprouted in the way of the Siculis, Syracusia, and Stockhouse the Plienum cristatum, Pl. v., or Hairy Cat's-tail grass. Its spike is described by Theophrastus as being "soft, downy, thick, and like the tails of foxes." 11 This agrees well with the spike of the Alpecucus, L., or Flooktail grass. 12 The same name comes from ἀλοπεχα, "a fox," and ὁπετρα, "a tail." 13

ALOPEX. (Vid. Vulpes.)

AL'INE (ἀλινη), an herb, which Sprengel, in his History of Botany, recognises as the Stellaria nemorum, or Wood Stitchwort; but, in his notes to Dioscorides, he expresses himself doubtfully concerning its genus. Schneider is undecided whether the ἀλινη of Theophrastus be the same as that of Dioscorides. 14

ALTARE. (Vid. Ara.)

ALTÆR'CUM, the Arabian (!) name, according to Pliny, of the Hyoscyamus. 15

ALUT, a plant. (Vid. Symphylton.)

ALUM. (Vid. Stryperia.)

ALYPON (ἀλυπων), an herb, supposed to be the same with that which produced Turbit. Sprengel and Sibthorp mark it as the Globularia abjuxta. 16

ALYSSON (ἀλυσων), a plant. The Glysson of Galen and Paulus Ægineta is the Mnemonobium abyssum, as well as the Moderno. That of Dioscorides is a very different plant, and cannot be very satisfactorily determined. Sprengel hesitates whether to refer it to, with Dodonæus, to the Parasitæ abyssa, or, with Columba, to the Veronica arvensis, or montana, L., our Speedwell. 17

AMARA, (vid. Calceus.)

AMUTAI (ἀμυται), persons whose business it was to keep order in the public games. They received their orders from an ἀλτάριχς, who was himself under the direction of the ἀγονοθέτης, or hollomadex. They are only found at Olympia; in other places, the same office was discharged by the μεσοχρός. 18

ALPHESTES (ἀλφηστες), a species of fish, the same with the Cynosurus of Pliny. It is the Labros cynosurus, L., in French Camade. According to Rowlet, it is about a foot long, and its flesh is easy of digestion. In the Dict. of Nat. Hist., the Alphest is described as being a small fish, having a purple back and belly, with yellow sides. 19

AMANUENSIS, or AD MANUM SERVUS, a slave or freedman, whose office it was to write letters and other things under his master's direction. The amanuensis must not be confounded with another sort of slaves, also called ad manum servos, who were always kept ready to be employed in any business. 20

AMARACUS (ἀμαρακος), a plant. Dioscorides and the scholiast on Nicander state that the Amaracus is the same as the Sampneas (σαμπνηας); and yet Galen and Paulus Ægineta treat of them separately. It seems more probable that it is the common Marrorum, but the late commentators are much at variance about it. Thus Sprengel, in the first edition of his R. H., marks it as the Organum marrornides, but in the second, according to Schneider, he is disposed to refer to the ἀλαύραχας of Thaéophrastus to the Hyacinthis Comosa. Stockhouse prefers the Organum Argentiacum, and Dierbach the Tussulcum Marron, or Mastich. Upon reference to the Commentary of Matthiolus on the μαρακος of Dioscorides, it will be seen that this last opinion had been formerly adopted, and it would appear to be a very plausible one. 21

AMARANTHUS (ἀμαρανθος), the Amaranth, or Never-fading, as its name indicates, from αμαρωσαι, and μαρωσαι, "to neither." According to Pliny, the amaranth appears in the month of August, and lasts until autumn. That of Alexandria was the most common. With the same writer, however, it states, that the flowers of the amaranth bloom anew on being plunged into water, is not very exact. As the flowers are of a very dry kind, they have not much humidity to lose, and therefore may be preserved almost for a long time. The description which Pliny gives fits the 30th day of the month and the 1st of the fourth month. That of Theophrastus, points at once to the Coluria cristata, a plant originally from Asia, but cultivated in Italy a long time before Pliny's day. B flavour believes that this plant is to be found in Theophrastus under the name of κυών, which Theodore Gozzi translates by flame. The άμαρανθος of Dioscorides is another plant, probably the Gynachium Stachys of Linnaeus. The ancient, far less advanced than the moderns in the art of manufacturing stuffs, were unable, as Pliny informs us, to imitate the softness of the amaranth. The moderns, however, have succeeded in imitating and have even surpassed, in the fabrication of their velvet, the beautiful glossy surface of this flower. The common name of the plant, therefore, passe-velours, given to it when the art of manufacturing stuffs was yet in its infancy, suits no longer, and the Italian appellation, fiore di velato ('veil flower') is much more practicable. 22

ARUSTHIA or ARAM/SIA (Ἀμαρουσία or ἀμαρουσία), a festival of Artemis Amartynthia, or Amariysa, celebrated, as it seems, originally at Alma-
AMBITUS.

rythus, in Euboia, with extra ordinary splendour; but it was also solemnized in several places in Attic, with the assemuments of the people, which was a festival, as Pausanias says, in honour of the same goddes, in no way less brilliant than that in Euboia. The festival in Euboia was distinguished for its splendid processions; and Strabo himself seems to have seen, in the temple of Artemis Amarynthia, a column on which was recorded the splendour with which the festival was performed at that time. The festival. The inscription stated that the procession was formed of three thousand heavy-armed men, six hundred horsemen, and sixty chariots.

AMBIVALENIA. (Vid. Avelae Fratres.)

AMBER. (Vid. Electrum.)

AMBIVOSUS-TRIVOSUS. (Vid. Lutrum.)

AMBITUS, which literally signifies "a going about," cannot, perhaps, be more nearly expressed than by our word canvassing. After the plebe had formed a distinct class at Rome, and when the whole body of the citizens had become very greatly increased, we frequently read, in the Roman writers, of the great efforts which it was necessary for candidates to make in order to secure the votes of the citizens. At Rome, as in every community into which the element of popular election enters, solicitation of votes, and open or secret influence and bribery, were among the means by which a candidate sought and secured the votes of the electors.

Whatever may be the authority of the piece entitled "Q. Ciceronis de Pettione Consulatis ad M. Tullium Fratrem," it seems to present a pretty fair picture of those arts and means by which a candidate might lawfully endeavour to secure the votes of the electors, and also some intimation of those means which were not lawful, and which it was the object of various enactments to repress. As the terms which relate to the canvassing for public places often occur in the Roman writers, it may be convenient to mention the principal among them here.

A candidate was called petitor, and his opponent, with reference to him, competitor. A candidate (candidatus) was so called from his appearing in the public places, such as the fora and Campus Martius, before his fellow-citizens, in a whitened toga. On such occasions, the candidate was attended by his friends (cursus), and by a number of his fellow-citizens (sedatores), who could in no other manner show their good-will or give their assistance. The word assiduus expressed both the continual presence of the candidate at Rome, and his continual solicitations. The candidate, in going his rounds of the fora, was attended by his competitor (candidator), who gave him the names of such persons as he might meet; the candidate was thus enabled to address them by their name, an indirect compliment which could not fail to be generally gratifying to the electors. The candidate accompanied his address with a shake of the hand (pronaio). The term honorable was once applied to the person assisting the candidate in canvassing, as shows, feasts, &c. Candidates sometimes left Rome, and visited the colonies and municipia, in which the citizens had the suffrage; thus Cicero proposed to visit the Cisalpine towns when he was a candidate for the consulship.

That ambitus was the object of several penal enactments, taken as a general term, comprehended the two species, ambitus and longitiones (bribery). Libellatoribus and benignitores are opposed by Cicero, as things allowable, to ambitus and longitio, as things illegal. Money was paid for votes; and in order to ensure secrecy and secure the elector, presentees were used, who were acquainted with the bargain, sequentes to hold the money till it was to be paid, and destines to distribute it. The offence of ambitus was a matter which belonged to theromba publica, and the enactments against it were numerous. One of the earliest, though not the earliest of all, the Lex Eumilia Babia (B.C. 180), was specially directed against longitiones. The Lex Cornelia Fulvia (B.C. 169) punished the offence with exile. The Lex Aemilia (B.C. 171) imposed the penalty of losing his office, from the senate and all public offices. The Lex Tullia (B.C. 63), passed in the consulship of Cicero, in addition to the penalty of the Aemilian law, inflicted ten years' exile on the offender; and, among other things, forbade a person to exhibit gladiatorial shows (gladiatores dare) within the city, unless he was required to do so, on a fixed day, by a testator's will. Two years afterward, the Lex Aemilia was passed, by which, among other things, it was provided that, if a candidate promised (promunere) money to a tribe, and did not pay it, he should be unpunishable; if he did pay the money, he should farther pay to each tribe (annually?) 3000 sestertes as long as he lived. This enactment occasioned the witticism of Cicero, who said that Clodius observed this law by anticipation, for he promised, but did not pay. The Lex Licia (B.C. 58) was specially directed against the offence of sindalium, or the wholesale bribery to which the people of Rome was subjected. Another act, passed (B.C. 52) when Pompey was sole consul, had for its object the establishment of a speedier course of proceeding on trials for ambitus. All these enactments failed in completely accomplishing their object. That which no law could suppress, so long as the old popular forms retained any of their pristine vigour, was accomplished by the imperal usurpation. Julius Caesar, when dictator, nominated half the candidates for public offices, except the candidates for the consulship, and notified his pleasure to the tribes by a civil circular; the populus chose the other half. The Lex Julia de Ambitus was passed in the time of Augustus; but the office of ambitus, in its proper sense, soon disappeared, in consequence of all elections being transferred from the comitia to the senate, which Tacitus, in speaking of Tiberius, briefly expresses thus: "The comitia were transferred from the camps to the patrician houses." While the choice of candidates was thus partly in the hands of the senate, bribery and corruption still influenced the elections, though the name of ambitus was, strictly speaking, no longer applicable. But in a short time, the appointment to public offices was entirely in the power of the emperors; and the magistrates of the state should not depend on the pleasure of the populus; but if the magistracy should offend against this law in canvassing for a sacerdotal or magistrates, he is punished, according to a senator consul, with infamy, and subjected to a penalty of 100 aurei." The trials for ambitus were numerous in the time of the Antonines. The oration of Cicero in defence of L. Murenus, who was charged with ambitus, that in defence of Cn. Planeus, who was charged with that offence specially called sindalium, are both extant.

\(^4\) AMETHYSTUS (αμθηστος or -ες), the Amethyst, a precious stone of a purple or violet colour in different degrees of deepness. In modern mineralogy, the name has been applied to two precious stones of essentially different natures: 1. the Oriental amethyst, which is a rare variety of adamantine spar or corundum; and 2. the Occidental or common amethyst. The ancients, on the other hand, reckoned five species, differing in degree of colour. Their Indian amethyst, to which Pliny assigns the first rank among purple or violet-coloured gems, appears to have been our Oriental species, which is nothing more than a violet-coloured sapphire. Those amethysts, again, which Pliny describes as easily engraven (sculpturis facile), may have been the violet-coloured floor spar, now called false amethyst; and the variety of quartz which is now commonly styled amethyst, is well described by the Roman writer as that fifth kind, which approaches crystal, the purple vanishing and fading into white. Some mineralogists think that the amethyst of the ancients was what we call garnet; but there seems little in its description resembling the garnet, except that one kind of it approached the hyacinth in colour, as Pliny and Epiphanius observe; that is, had a very strong shade of red; and so, sometimes, has our amethyst. We see our amethyst, indeed, plainly indicated in one of the reasons assigned by Pliny for its name, that it does not reach the colour of wine (αρ., priv., μελος, "conce."); but first fades into violet. He afterward suggests another, which is the more common derivation, saying that the Magi falsely asserted that these gems were preservative against intoxication (αρ., priv., μελος, "conce."); theophrastus twice mentions the amethyst (αμθηστος), but not in such a way as to determine it; classing it in one place with crystal, as diaphanous, and afterward observing that it is wine-coloured.
AMMI.

AMPHICYTONS.

*AM1/A, a fish of the tunny species, the same with the *Scomber aumia, in Italian, Leccia. Schweig- hauses 1 says its French name is botalet. Rondollet mentions that he had seen individuals which measured three and a half feet in length. Its head was the most esteemed by the *ton vivants of Greece and Rome. The etymologist remarks that it is gregarious, and hence its name, from  *amia, "to go to" or "to go", the name of a tribe to go to, as the *Tripode of *Eleia, and the *Thaikos of Aristotle, *Eppian, and Athenaeus, and the *Gioscous of Ovid and others. *

*AMIANTHUS ( *amirrōr), a variety of Asbes, called in French *Adum de Plume. It consists principally, according to Cheveaux, of silex, magnesia, and *micar, "denied", because, being indestructible in any ordinary fire, it was restored to its original purity and whiteness simply by casting it into the flames. Where amianthis occurs, it does so in many countries, with fibres sufficiently long and flexible for that purpose, it is often now, as anciently it was, spun and woven into cloth; and in modern times has been successfully manufactured into paper, gloves, purses, ribands, girdles, and many other things. The natives of Greenland even use it for the wicks of lamps, as the ancients also did. *

AMIC-TUS, dim. AMIC-UUM.

The verb amicitia is commonly opposed to *indure, the former being applied to the putting on of the outer garment, the pallium, *lanam, or toga ( *μακρόν, *φάρος); the latter, to the putting on of the inner garment, the tunic ( *χιτών). *Graco pallio amicitia. *Vice amicitia, *non togis. 1 In consequence of this distinction, the verbal nouns amicitias and *induvisus, even the verb itself in any further denomination of the dress being added, indicate respectively the outer and the inner clothing. The *Aes says, in Apuleius, 2 Deam, *Srico *contrad amiculo, *mihi *gerendam ipsumment, meaning, "They place on me the goddess, covered with a small silken scarf." The same author says that the priests of the Egyptians used linen induvisetem *et tunicam; i. e., both for their inner and outer clothing. In Greek, amicitia is expressed by *μικαίνονθαι, *μικέντις θνατ, *καταβάλλεσθαι, *περιβάλλεσθαι: and *induvisus by *νίθον. Hence came *μυκκένθω, *ἐνθόλαμα and *πτόλαμον, *περιθάλαμα and *πέταλα, an outer garment, a sheet, a shawl; and *ἴθων, an inner garment, a tunic, a shirt. When Socrates was about to die, his friend *Apolodoros brought him both the inner and the outer garment, each being of great excellence and value, in order that he might put them on before drinking the hemlock: *παρέχετον ἀντιστά τον χίτωνα, καὶ θυμίων περιβάλλεσθαι, τό ἐπί μικρῶν ὁμοιότητα. *AMMI (Adum), Greek measure of length, equal to forty *πῆχυς (cubits), or sixty *ρόδες (feet); that is, twenty yards 9½ inches English. It was used in measuring land. 1

*AMMI, a plant, the same, according to Sprengel, with the *Adum Copinum. Matholius and Dodones, who give drawings of it, seem to refer it to the same plant, namely, Bishop's-weed. It must not be confused, however, with the plant called Bishop's weed in Scotland, which is *Aegopodium podagraria. 1

*AMMODYTE ( *αμμοδέντος), a species of serpent, which *Aetius describes as being a cubit in length, and of a sand colour, with black spots. *Mattiolius, in his comments on *Dioscorides, de terminis libri 14, says that they have been a species of viper. It was most probably, then, only a variety of the *lyx, or *Coluber ammodontis. This is the serpent known by the name of the Horned viper of Illyricum; in venom is active. In the Latin translation of Avicenna it is called *Amnidae and *Calliara, which are corrected names of *Ammodote and *Amnidae of Aristotle. 3

*AMMONIACUM ( *αμμονιακός), Gum Ammonia. Even at the present day it is not well ascertained what species of *Fen from it which produces this gum. *Dioscorides gives it the name of a variant of the *fæm, *The *αμμονιακός of the moderns, which is *Hydrochlorus Ammonia. 4

*AMPELITIS ( *μελιτής γά), a Bituminous Earth, found near Seleucia in Syria. It was black, and resembled small pine charcoal; it was used to polish and to spread a little oil poured upon it. Its name was derived from its being used to anoint the *μυκτρα, and preserve it from the attack of worms. 5

*AMPELO PRA'SUSM ( *μυτέρτασσα), the Allium Ampeloprasum, or Dog-leek, called in French *Portè de corme. 6

*AMPELOS. (Vid. Vith.)

AMPHION. (Vid. *MON, page 55.)

AMPHIARA'UM ( *μικράδα), games celebrated in honour of the ancient hero Amphiarus, in the neighbourhood of *Oropus, where he had a temple with a celebrated oracle. 7

AMPHICYTONS Institutions called Amphicytonic appear to have existed in Greece from time immemorial. Of their nature and object history gives us only a general idea; but we may safely believe them to have been associations of originally neighbouring tribes, formed for the regulation of mutual intercourse and the protection of a common interest. This explains the many confederacies of the different members met, both to transact business, and celebrate religious rites and games. This identity of religion, coupled with near neighbourhood, and that, too, in ages of remote antiquity, implies, in all probability, a certain degree of political and national unity, which might of itself suffice to bind the tribes together and confederacies among tribes so situated, regarding each other as members of the same great family. They would thus preserve among themselves, and transmit to their children, a spirit of nationality and brotherhood; nor could any better means be devised than the bond of a common religious worship, to counteract the hostile interests which, sooner or later, spring up in all large societies. The causes and motives from which we might expect such institutions to arise existed in every neighbourhood; and, accordingly, we find many Amphicytonies of various degrees of importance, though our information respecting them is very deficient.

Thus we learn from Strabo that there was one of some celebrity, whose place of meeting was a sanctuary of Poseidon, 8 at *Calataura, an ancient settlement of the Ionians in the Saronic Gulf. The

original members were Epaminondas, Hermocrates, Nauplius, Prasias in Locarno, Eagnia, Athens, and the Boeotian Orkomenoi,1 whose remoteness from each other makes it difficult to conceive what could have been the method for forming the confederation, more especially as religious causes seem precluded, by the fact that Trazen, though so near to Calauria, and though Poseidon was its tutelary god, was not a member. In later times, Argos and Sparta took the place of Nauplia and Prasias, and relations with the latter were not so intimate as before the meetings of the association. There also seems to have been another in Argolis,2 distinct from that of Calauria, and that of congress being the 'Halaeon, or temple of Hira. Delos,3 too, was the centre of an Amphictyony — the religious metropolis, or ισόγραιον of the neighboring Cyclades, where deputies and embassies (Δημόφυλι) met to celebrate religious solemnities in honour of the Dorian Apollo, and apparently without any reference to political objects.

Nor was the system confined to the mother-country; for the federal unions of the Doriens, Ionians, and Andrians, living on the west coast of Asia Minor, seem to have been Amphictyonic in spirit, although modified by exigences of situation. Their main essence consisted in keeping periodical festivals in honour of the acknowledged gods of their respective natives. Thus the Dorians3 held a sacred territory, the sanctuary of Delphi, in which tribes met with the hieromnemones, Triopium, uniting with the worship of their national god Apollo that of the more ancient and Pelasgic Demeter. The Ionians met for similar purposes, in honour of the Heliconian Poseidon at Mysela; their place of assembly being called the Panionion, and their festival Panionia. (Possession was the god of the Ionians, as Apollo of the Dorians.) The twelve towns of the Aiolians assembled at Gryneum, in honour of Apollo. That these confederacies were not merely for offensive and defensive purposes, may be inferred from their existence after the subjugation of these colonies by Croesus; and we know that Halicarnassus was excluded from the union, merely because one of its citizens had not made the usual offering to Apollo of the prize he had won in the Triopic contests. A confederation somewhat similar, but more political than the former, existed in Lydia: it was called the "Lyceian system," and was composed of twenty-three cities.

But, besides these and others, there was one Amphictyony of greater celebrity than the rest, and much more lasting in its duration. This was, by way of being a sort of Continental or European Amphictyony, and by tracing its sphere of action, its acknowledged duties, and its discharge of them, we shall obtain more precise notions of such bodies in general. This, however, differed from the other associations in having two places of meeting, the sanctuaries of two divinities, which were the temple of Apollo at Delphi, and the Panhellenic sanctuary of the Heraeum, called the Thespian copies,3 where the deputies met in autumn, and that of Apollo at Delphi, where they assembled in spring. The connexion of this Amphictyony with the latter not only contributed to its dignity, but also to its permanence. With respect to its early history, Strabo4 says, that even in those days it was impossible to learn its origin. We know, however, that it was originally composed of twelve tribes (not cities or states, it must be observed), each of which tribes contained various independent cities or states.

We learn from Εσχίσσες,5 a most competent authority (R.C. 298), that eleven of these tribes were as follow: the Thessalians, Boeotians (not Thelians only), Dorians, Ionians, Peribabians, Magnesians, Locrians, ΕΤεεαν or Θεσπιστικοί, Phthians or Aegeans of Phthia, Malertians, and Phocaeans; other lists leave us in doubt whether the remaining tribes were the Dolopes or Thessalians. Again, the Dolopes could hardly be called a distinct tribe, their nobles appearing to have been Dolopes, it seems probable that the Dolopes were originally members, and afterward supplanted by the Delphians.6 The proponent of the Thessalians tribes proves the antiquity of their confederance. One of the Thessalians, standing on an equality with such tribes as the Malertians, shows that it must have existed before the Dorian conquest, which originated several states more powerful, and, therefore, more likely to have sent their respective deputies, than the tribes mentioned.

We also learn from Εσχίσσες that these tribes had two votes in congress, and that deputies from such towns as (Dorians and?) Cythinum had equal power with the Lacedaemonians, and that Eretia and Priene, Ionian colonies, were on a par with Athens (ινόμισμα τω Αθηναιοι). It seems, therefore, to follow, either that each Amphictyonic tribe had a cycle, according to which its component states returned deputies, or that the vote of the tribe was determined by a majority of votes of the different states of that tribe. The latter supposition might explain the fact of their being a larger and smaller assembly — a βασιλική and εἰκληρια — at some periods of the year; the inconvenience of the one circumstance that there was an annual election of deputies at Athens, unless this city usurped functions not properly its own.

The council itself was composed of two classes of representatives, one called pylagores, the other hieromnemones. Of the former, three were annually elected at Athens to act with one hieromnemon appointed by lot.7 That his office was highly honourable we may infer from the oath of the Hellasists,8 in which he is mentioned with the nine archons. On one occasion we find that the president of the council was a hieromnemon, and that he was chosen general of the Amphictyonic forces, to act against the Amphictyonians.9 Hence it has been conjectured, that the hieromnemones, also called ιπογραφαρικοί, were superior in rank to the pylagores. Εσχίσσες also contrasts the two in such a way as to warn: the one to be formed for a temporary purpose, the other permanent of the two. Thus he says,9 "When Dionysus was hieromnemon, ye chose me and two others pylagores." He then contrasts the "hieromnemon of the Athenians with the pylagores for the time being." Again, we find inscriptions9 containing the names of the pylagores, as if they formed an executive; and that the council concluded their proceedings on one occasion10 by resolving that there should be an extraordinary meeting previously to the next regular assembly, to which the hieromnemones should come with a decree to suit the emergency, just as if they had been a standing committee. The pylagores were more direct representatives of the states to which they belonged, but the hieromnemones had supposed powers; only a matter of conjecture; probably they did not.

The εκκλησία, or general assembly, included not only the classes mentioned, but also those who had joined in the sacrifices, and were consulting the god. It was convened on extraordinary occasions by the chairman of the council (Ο θεος τος έκκλησιον επιστολής,).11 Of the duties of this latter body, this will give us a clearer view than the oracles taken and the de-
AMPHICTYONS.

crees made. The oath was as follows: "They would destroy no city of the Amphictyons, nor cut off their streams in war or peace; and if any should do so, they would march against him and destroy his city; and should any pilage the property of the city and plunder the houses of the Amphictyon,

In the second case was, that as the Amphici-

city were kept, it was beclouded, Philip of Macedonia should be requested to help Apollo and the Amphictyons, and was thereby constituted absolute general of the Amphictyons. He accepted the office, and soon reduced the offending city to sub-

The pathway of the Phocians. The council declared war against them, as guilty of a wrong against the god. The war lasted ten years, till, at the suggestion of Solon, the waters of the Pleistus were turned off, then poisoned, and turned again into the city. The besieged drank their fill, and Crissa was soon razed to the ground; and thus, if it were an Amphictyonic city, was a solemn oath doubly violated. Its territory—the rich Cirrhian plain—was consecrated to the god, and curses imprecat upon whomsoever should till or dwell in it. Thus ended the First Sacred War (B.C. 585), in which the Amphictyons were visited by the divine exaltation of the Delphian god, they descend to the regula-

tion of the minutest troubles. History, moreover, teaches, that if the council produced any palpable effects, it was from their interest in Delphi; and though it kept up a standing record of what ought to be done, their members, when collision with the international law of Greece, as sometimes acquiesced in, and at other times was a party to, the most insidious and criminal acts. Of this the case of Crissa is an instance. This town lay on the Gulf of Corinth, near Delphi, and was much frequented by pilgrims from the West. The

Crissa was taken and burned by the Delphi, with the decretal exactions from these strangers. The council declared war against them, as guilty of a wrong against the god. The war lasted ten years, till, at the suggestion of Solon, the waters of the Pleistus were turned off, then poisoned, and turned again into the city. The besieged drank their fill, and Crissa was soon razed to the ground; and thus, if it were an Amphictyonic city, was a solemn oath doubly violated. Its territory—the rich Cirrhian plain—was consecrated to the god, and curses imprecat upon whomsoever should till or dwell in it. Thus ended the First Sacred War (B.C. 585), in which the Amphictyons were visited by the divine exaltation of the Delphian god, they descend to the regula-

AMPHIDROMIA.

AMPHITHEATRUM.

became important enough for the meetings of such a boy as the Amphitryon; nor, if Delphi had been of old the only place of meeting, is it easy to account for what must have been a loss of its ancient dignity.

But, whatever was the case, we have still the fact that there were two places of congress; to account for which the supposition is made here, that there were originally two confederations, afterward united by the growing power of Delphi, as connected with the Dorians, but still retaining the old places of meeting. We must, however, admit that it is a matter of mere conjecture whether this was the case or not, there being strong reasons in support of the opinion that the two confederations, or what afterward combined the worship of the Hellenic Apollo with that of the Pelasgian Demeter, as celebrated by the Amphictyons of Thessaly. Equally doubtful is the question respecting the influence of Acritus, king of Argos, and how far it is true that he first brought the confederacy into order, and determined other points connected with the institution.

AMFYPTEIAON DEIAUS (6£v<i>etv°'dov de-\n\n\ns), a drinking- vessel, often mentioned by Homer. Its form has been the subject of various conjectures; but the name seems to indicate well enough what it really was. It is found both as in composition, and is evidently a diminutive formed from the root signifying a h<om<on>, which we have in the Greek k<o7<ov, and the dialectic form k^v<oa; Lat. cupa; German, kaffe, k<ubel; French, c<asse, c<oppe; and English, cup; it means, therefore, a small goblet or cup. Am<i>v<k>etv°'dov, therefore, according to the analogy of 6f;i<i>etv°'dov, 6v<i>etv°'dov, &c., is that which has a ke<pp>vol at both sides or both ends; and 6v<i>etv°'dov is a drinking-vessel, having a cup at both ends. That this was the form of the vessel is shown by a passage in Aristotle, where he is describing the cells of bees as having two ranges divided by a floor "like the amphiv- 

Pella." 1

AMPHIDROMIA, or APOMIAMB'HION HMAP (6v<i>edvmov, or deev<r>dmov mpos), a family festival of the Athenians, at which the newly-born child was introduced into the family and received its name. No particular day was fixed for this solemnity; but it did not take place very soon after the birth of the child, for it was believed that most children died before the seventh day, and the solemnity was, therefore, generally deferred till after that period, that there might be, at least, some probability of the child remaining alive. But, according to Suidas, the child at this time was brought by the women who had lent their assistance at the birth washed their hands. This purification, however, preceded the real solemnity: The friends and relatives of the parents were invited to the festival of the amphidromia, which was held in the evening; and they generally appeared with presents, among which are mentioned the cuttlefish and the marine polyp. 2 The house was decorated on the outside with olive-branches when the child was a boy, or with garlands of wood when the child was a girl; and a feast was prepared, at which, if we may judge from what is stated by Ephippus in Athenaeus, the guests must have been rather merry. The child was then carried round the fire by the nurse, and thus, as it were, presented to the gods of the house and to the family; and at the same time re-

ceived its name, to which the guests were witnesses.

The carrying of the child round the hearth was the principal part of the solemnity, from which its name was derived. But the scholiast on Aristophanes 3 derives the name from the fact that the guests, while the name was given to the child, walked or danced around it. This festival is sometimes called from the fact that it was to take place on the seventh day, it is called d<ov<ov>as or d<ov<ov>as; if on the tenth day, d<ov<ov>as, &c. 4

APMHIOR'KIA or AMPHOMOS'TIA (6v<i>etv°'dov or 6v<i>etv°'dov) is the oath which was taken, both by the plaintiff and defendant, before the trial of a cause in the Athenian courts, that they would speak the truth. 5

The oaths were composed of two parts, that of the plaintiff and that of the judge. The plaintiff gave the oath that he would not speak the truth, and the judge also included the oath which the judges took, that they would decide according to the laws; or, in case there was no express law on the subject in dispute, that they would decide according to the principles of justice.

AMPHIPPOI. (Vid. Deur. Cort.)

AMPHIPTMON'OI PHIES (6v<i>etv°'dov 6v<i>etv°'dov), also called AMPHIPPOI, ships in which the poop and the prow were so much alike as to be applicable to the same use. A ship of this construction might be considered as having either two prows or two prows,

which was often seen convenient in circumstances where the head of the ship could not be turned about with sufficient celerity. 6

*APMHISSBE'TNA (6v<i>etv°'dov), sometimes called the Double-headed Serpent. Buffon says of it, that it can move along with either the head or the tail foremost, whence it had been thought to have two heads. Avicenna says, that it is of equal thickness from head to tail, and that from this appearance it had been supposed to have two heads. Schneider states, that Linnaeus 7 describes a serpent which agrees very well with the ancient accounts of the Double-headed Serpent; its tail is obuse, and as thick as its body, and it is supposed either to turn aside toward; but, according to Dr. Trail, it is an American species. The amphibesa was probably a variety of the Anguis fragilis, L., or Blind Worm. The American serpent of Pennant, of which mention is made in Linnaeus's correspondence with Dr. David Skene of Aberdeen, is a variety of the Anguis fragilis. Linnaeus denies that the amphibesa is venomous, but many authors, even of modern times, are of a contrary opinion. 8

AMPHITHEA TRUM was a place for the exhibition of combatants and wild beasts, entirely surrounded by the seats of the spectators; whereas, in those for dramatic performances, the seats were arranged in a semicircle facing the stage. It is, therefore, frequently described as a double theatre, consisting of two such semicircles, or halves, joined together, the spaces allotted to their orchestras becoming the inner enclosure or area, termed the arena. The form, however, of the ancient amphitheatres was not a circle, but invariably an ellipse, although the circular form appears best adapted for the convenience of the spectators. The semi amphitheatre appears to have been that of M. Caius, of which a description has been given by Pliny. 9 It consisted of two wooden theatres made to revolve on pivots, in such a manner that they could, by means of windlasses and machinery, be turned round face to face, so as to form one building.

Gladiatorial shows were first exhibited in the forum, and combats of wild beasts in the circus; and it appears that the ancient custom was still preserved till the dictatorship of Julius Caesar, who

built a wooden theatre in the Campus Martius, for
the purpose of exhibiting wild beasts, 1 which was called amphitheatre because it was surrounded by seats without a scene. Most of the seats were covered by a temporary roof, made of wood; such as the one built by Nero at Rome, 2 and that erected by Attilus at Fines during the reign of Tiberius, which gave way while the games were being performed, and killed or
injured 50,000 persons. 3

The first stone amphitheatre was built by Statilius Taurus, at the scene of Augustus. 4 This build-
ing, which stood in the Campus Martius, near the circus called Agonale, was destroyed by fire in the reign of Nero; 5 and it has, therefore, been supposed that only the external walls were of stone, and that the seats and other parts of the interior were of
timber. 6 A second amphitheatre was commenced by Caligula; but except by conjecture all was the Flavian amphitheatre, afterward called the Coliseum, which was begun by Vespasian, and finished by his son Titus, who dedicated it A.D. 80, on which occasion, according to Eutropius, 5000, and according to Dion, 9000, beasts were destroyed.

It is not improbable that this amphitheatre, comparatively entire, was capable of containing about 87,000 spectators, and originally stood nearly in the centre of the city, on the spot previously occupied by the lake or large pond attached to Nero's palace, 7 and at no very great distance from the Baths of Titus. It is first of all let down on the ground; and the transverse, or longer diameter of the external ellipse, is 615 feet, and the conjugate, or shorter one, 510; while those of the interior ellipse, or arena, are 281 and 170 feet respectively. Where it is perfect, the exterior is 100 feet high, and consists of four orders, viz., Doric, Ionic, and Corinthian, in attached three-quarter columns (that is, columns one fourth of whose circumference appears to be buried in the wall behind them), and an upper order of Corinthian pilasters. With the exception of the last, each of these tiers consists of eighty columns, and as many arches between them, forming open galleries throughout the whole circumference of the building; but the fourth has windows instead of large arches, and those are placed only in the alternate inter-columns, conse-
quently, are only forty in number; and this upper portion of the elevation has, both on that account and on account of the smaller area left free for the apertures themselves, an expression of greater solidity than that below. The arches formed open external galleries, with others behind them; besides which, there were several other galleries and passa-
ages, extending beneath the seats for the spectators, and, together with staircases, affording access to the latter. At present, the seats do not rise higher than the level of the third order of the exter-
or, or about half its entire height; therefore, the upper part of the edifice appears to have contributed very little, if at all, to its actual capacity for ac-
commodating spectators. Still, though it has never before been conjectured, it is possible that there were upper tiers of seats and galleries (although no
remains of them now exist), we must suppose that there existed some very sufficient reason for incurring
such enormous expense, and such prodigious waste of material and labour beyond what utility seems to have demanded. This excess of height, so far as it would have been necessary to have been in some measure, with the view that, when the building was covered in with a temporary roofing or awning (velarium), as a defence against the sun or rain, it should seem well proportioned as to

surrounded by a wall about eighteen feet high, measuring from the ground to the top of the parapet; a height considered necessary, in order to render the spectators perfectly secure from the attacks of the wild beasts. There were four principal entrances leading into the arena; the ends of each axis or diameter of it, to which as many passages led directly from the exterior of the building; besides secondary ones, intervening between them, and communicating with the corridors beneath the seats on the podium.

The wall or enclosure of the arena is supposed to have been faced with marble more or less sumptuous; besides which, there appears to have been, in some instances at least, a sort of network affixed to the top of the podium, consisting of railing, or, rather, open trellis-work of metal. From the mention made of this network by ancient writers, nothing can now be gathered respecting it than that, in the time of Nero, such netting, or whatever it might have been, was adorned with gilding and amber; a circumstance that favours the idea of its having been gilt metal-work, with bosses and ornaments of the other material. As a farther defence, dilapidated, called *estuit,* sometimes surrounded the arena.¹

The term *podium* was also applied to the terrace, or gallery itself, immediately above the lower enclosure, and which was no wider than to be capable of containing two, or, at the most, three ranges of movable seats, as being the situation for distinctly viewing the sports in the arena, and also more commodiously accessible than the seats higher up, was the place set apart for senators and other persons of distinction, such as the ambas- sadors of foreign parts; and it was here, also, that the emperor himself used to sit, in an elevated place called *suggestions* or *cubiculum,* and likewise the person who exhibited the games, on a place elevated like a pulpit or tribunal (*editoris tribunal*). The vestal virgins also appear to have had a place allotted to them in the podium.²

Above the podium were the *gradus,* or seats of the other spectators, which were divided into *mamiana,* or stories. The first *mamianum,* consisting of fourteen rows of stone or marble seats, was appropriated to the equestrian order. The seats appropriated to the senators and equites were covered with cushions or *pallium,* which were first used in the time of Caligula.³ Then, after an interval or space, termed *pseudion,* and forming a continued landing-place from the several staircases in it, succeeded the second *mamianum,* where were the seats called *populana,* for the third class of spectators, or the *populii.* Behind this was the second precinctorium, bounded by a rather high wall, above which was the third *mamianum,* where there were only wooden benches for the *pullati,* or common people.⁴ The next and last division, namely, that in the highest part of the building, consisted of a colonnade or gallery, where females were allowed to witness the sports of the amphitheatre,⁵ some parts of which were also occupied by the pullati. At the very summit was the narrow platform for the man who had to attend to the velarium, and to expand or withdraw the awnings, as there might be occasion. Each *mamianum* was not only divided from the other by the *precinctio,* but was intersected at intervals by spaces for passages left between the seats, called *salina* or *salaria,* and the portion between two such passages was called a *cuneus,* because this space gradually widened, like a wedge, from the podium to the top of the building.⁶ The entrances to the seats from the outer porticoes were called *vomitoria,* because, says Macrobius,⁷ *Hominem gleimeralim ingre- dientes in sedilia se fundant.*

The situation of the dens wherein the animals were kept is not very clear. It has been supposed that they were in underground vaults, near to, if not immediately beneath, the arena; yet, admitting such to have been the case, it becomes more difficult than ever to understand how the arena could have been inundated at pleasure with water; nor was any positive information obtained from the excavations made there several years ago in the arena of the Colos- saium. Probably many of the animals were kept in dens and cages within the space immediately beneath the podium (marked d in the cut), in the intervals between the entrances and passages leading into the arena, and so far a very convenient situation for them, as they could have been brought immediately into the place of combat.

There were in the amphitheatres concealed tubes, from which scented liquids were scattered over the audience, which sometimes issued from statues placed in different parts of the building.⁸

Vitruvius affords us no information whatever as to amphitheatres; and, as other ancient writers have mentioned them only incidentally and briefly, many particulars belonging to them are now involved in obscurity.

The annexed woodcut, representing a section, not of an entire amphitheatre, but merely of the exterior wall, and the seats included between that and the arena, will serve to convey an idea of the arrangement of such structures in general. It is that of the Colosseum, and is given upon the authority of Hirt; but it is in some respects conjectural, particularly in the upper part, since no traces of the upper gallery are now remaining. The extreme minuteness of the scale renders it impossible to point out more than the leading form and general disposition of the interior; therefore, as regards the profile of the ex- terior, merely the heights of the cornices of the different orders are shown, with the figures 1, 3, 4 placed against them respectively.

² [Fig. 1, 3, 4. —2. (Lucan, ix., 608.)]
The amphora was also used for keeping oil, wine, and molten gold. A remarkable discovery, made at Salona in 1835, proves that amphora were used as coffins. They were divided in half, in the direction of the length, in order to receive the remains, and the two halves were put together again, and buried in the ground; they were found containing skeletons.

There is in the British Museum (room VI), a vessel resembling an amphora, and containing the fine African sand which was mixed with the oil with which the athlete rubbed their bodies. It was found, with seventy others, in the baths of Titus, in the year 1772. The amphora occurs on the coins of Chios, and on some silver coins of Athens. The Greek amphorēs and the Roman amphora were also names of fixed measures. The amphorē, which was also called μετρήταις and κάδος, was equal to 3 Roman urnae = 8 gallons 7-385 pints, imperial measure. The Roman amphora was two thirds of the amphorē, and was equal to 2 urnae = 8 congi = 6 gallons 7-577 pints; its solid content was exactly a Roman cubic foot. A model amphora was kept in the Capitol, and dedicated to Jupiter. The size of a ship was estimated by amphora; and the produce of a vineyard was reckoned sometimes by the number of amphorae it yielded, and sometimes by the culens of twenty amphorae.

The amphora was also used for keeping oil, wine, and molten gold. A remarkable discovery, made at Salona in 1835, proves that amphora were used as coffins. They were divided in half, in the direction of the length, in order to receive the remains, and the two halves were put together again, and buried in the ground; they were found containing skeletons.

There is in the British Museum (room VI), a vessel resembling an amphora, and containing the fine African sand which was mixed with the oil with which the athlete rubbed their bodies. It was found, with seventy others, in the baths of Titus, in the year 1772. The amphora occurs on the coins of Chios, and on some silver coins of Athens. The Greek amphorēs and the Roman amphora were also names of fixed measures. The amphorē, which was also called μετρήταις and κάδος, was equal to 3 Roman urnae = 8 gallons 7-385 pints, imperial measure. The Roman amphora was two thirds of the amphorē, and was equal to 2 urnae = 8 congi = 6 gallons 7-577 pints; its solid content was exactly a Roman cubic foot. A model amphora was kept in the Capitol, and dedicated to Jupiter. The size of a ship was estimated by amphora; and the produce of a vineyard was reckoned sometimes by the number of amphorae it yielded, and sometimes by the culens of twenty amphorae.

As bottles were round and swollen like a bladder Horace metaphorically describes empty and murrain language by the same name:

"Profligat amputæ et sesquiædalia verba."

An tragicæ deservit et ampullatur in arte?"
AMULETUM.

The following passages may exemplify the use of amulets in ancient times. Pliny¹ says, that any plant gathered from the bank of a brook or river before sunrise, provided that no one sees the person who gathers it, is considered as a remedy for tertian ague when led (solidigutus) to the left arm, the patient having put it on. It is; also, that a person may be immediately cured of the headache by the application of any plant which has grown on the head of a staice, provided it be folded in the shred of a garment, and tied to the part affected with a red string. Q. Serenus Sammonicus, in his poem on the art of healing, describes the following charm, which was long celebrated as of the highest importance for the cure of various diseases: Write abracadabra on a slip of parchment, and repeat the word on other slips, with the omission of the last letter of each preceding slip, until the initial A alone remains. The line so written will assume the form of an equilateral triangle. Tie them together, and suspend them from the neck of the patient by means of linen thread.

According to the scholiast on Juvenal,² athletes used amulets to ensure victory (necvidia phykleriad), and wore them suspended from the neck; and we learn from Pliny's third book of境as that the emblems of this art have been extended beyond the classes of living creatures, since selenite was not only worn by women, but was also tied to trees, for the purpose of making them fruitful.

Consistently with these opinions, an acquaintance of the author has observed that the use of amulets was considered as one of the chief qualifications of nurses. If, for example, an attempt was made to poison a child, it was in danger of destruction from the evil eye, or exposed to any other calamity, it was the duty of the nurse to protect it by the use of such amulets as were suited to the circumstances.³

From things hung or tied to the body, the term amulet was extended to charms of other kinds. Pliny⁴ having observed that the clamamen was cultivated in houses as a protection against poison, adds the remark, Amuletum vacant. The following epitaph by Lucilius contains a joke against an unfortunate physician, one of whose patients, having seen him in a dream, "awoke no more, even though he wore an amulet:"

'Ερεμουγή τον λαυράν λένο Δίαφραγμον ἐν ὑπνώοις
Οὐκ ἔτι ἀγγίξθη, καὶ πείραμα φέρων.

*AMYGDALUS (μαγγυδαλο), the Almond-tree, or *Amygdalus communis. The Almond-tree is a native of Barbary, whence it had not been transferred into Europe down to the time of Cato. It has, however, been so long cultivated all over the shores of Europe, and the naturalized parts of Asia, as to have become, as it were, naturalized in the whole of the Old World from Madrid to Canton. For some remarks on the Amygdalus pericar, or Peach, *Prunus, see *Prunus.

*AMOMON (αμωμον), a plant, and perfume, with regard to which both commentators and botanical writers are very much divided in opinion. Scaliger and Cordus make it the Rose of Jericho (Rosa Hierichonica of Bauhin; Anostasia hierichonica of Linnaeus; Bunsias Syriaca of Gartner); Gesner takes it in his works to be either of the gardens (the Solanum backdrop; Tournefort); Casparius is inclined to the Paeonia Cribuloid; and Plukener and Sprengel, with others, of the Cissus vituperia. The most probable opinion is that advanced by Fée, who makes the plant in question the same with our Amonum racemosum. The Romans obtained their *amomum from Syria, and it formed the ordinary emolument by the country for tribute to the Romans from India.⁵ It is said to have been used by the Eastern nations for embalming; and from this word

¹. (B. H. xxiv., 19.)—2. (iii., 68.)—3. (Ljth., 8.)—4. (Hymn. in Cer., 227.)—5. (Dioscor., i., 176.)—6. (Fée, Flore de Virgile, p. 10.)

². Hesychii, s. v. Αμωμον. An amulet was called a μαγγυδαλο. The Almond-tree is a native of Barbary, whence it had not been transferred into Europe down to the time of Cato. It has, however, been cultivated all over the shores of Europe, and the naturalized parts of Asia, as to have become, as it were, naturalized in the whole of the Old World from Madrid to Canton. For some remarks on the Almond-tree, see Prunus.

³. (B. H. xxiv., 19.)—2. (iii., 68.)—3. (Ljth., 8.)—4. (Hymn. in Cer., 227.)—5. (Dioscor., i., 176.)—6. (Fée, Flore de Virgile, p. 10.)
some have derived, though by no means correctly, the term "ankei'son." The taste of the grains of ankei'son is represented by Charras as tart, fragrant, very aromatic, and remaining a good while in the mouth.1 The name ankei'son is supposed to come from the Arabic khanäma, the ancient Arabians having been the first to make this aromatic known to the Greeks. The root of the Arabic term refers to the warm taste peculiar to spices. The cardamoms, grains of Paradise, and mellagetta pepper of the shops, a class of highly aromatic pungent seeds, are produced by different species of ankei'son, as botanists now employ the term.2

As the Greeks were accustomd to mount upon horseback by means of a slave, who was termed ἄναβολος (from ἀναβαλλέω). This name was also given, according to some writers, to a peg or pin fastened on the spear, which might serve as a resting-place to the foot in mounting the horse.3

ANAKALUPTERIA. (Vid. Marriages.)

ANAKEIA or ANAKEION (ἀνακείσων or ἀνάκεισον), a festival of the Dioscuri, or 'Arakes, as they were called, at Athens. Athenaeus4 mentions a temple of the Dioscuri, called 'Ἀνάκεισον, at Athens; he also informs us5 that the Athenians, probably on this festival, offered sacrifices for these heroes in the Prytaneum a meal consisting of cheese, a barley-cake, ripe figs, olives, and garlic, in remembrance of the ancient mode of living. These heroes, however, received the most distinguished honours in the Dorian and Achæan states, where it may be supposed that every town concerning them was celebrated in their honour, though not under the name of 'Ἀνάκεισων. Pausanias6 mentions a festival held at Amphiass, called that of the ἄνακεισων παιδῶν; but adds that it was disputed whether they were the Dioscuri, the Curetes, or the Cabiri. (See Dioscuria.)

ANAKLAROMA. (Vid. Donaria.)

ANAKLETERIA (ἀνακλητρία) was the name of a solemnity at which a young prince was proclaimed king, and at the same time ascended the throne. The name was chiefly applied to the accession of the Ptolemaic kings of Egypt.7 The prince went to Memphis, and was there adorned by the priests of Horus, and afterwards led into the Temple of Phthis, where he vowed never to make any innovations either in the order of the year or of the festivals. He then carried to some distance the yoke of Apios, in order to be reminded of the sufferings of man. Rejoicings and sacrifices concluded the solemnity.8

ANAKOMIDÉ (ἀνακομίδη). When an individual had died in a foreign country, it was not unusual for his fellow-citizens or relatives to remove his ashes or body to his own country, which was called ἀνακομίδη. Thus the dead body of Theseus was removed from Scyros to Athens, and that of Aristolochus from Naxos to Miletus.

ANACRISIS (ἀνάκρισις), the pleadings preparatory to a trial at Athens, the object of which was to determine, generally, if the action would lie (ἐξετάζομαι δὲ καὶ ἐπί τινα εὐθύνηνν). The magistrates were said ἀνακρίνεται τὴν δίκην, or τὸν ἦντολον; and the parties ἀνακρίνεται. The process consisted in the production of proofs, of which the trial of theseus9 was the most celebrated. Large documents, the production of which, by the opposite party, might be compelled by a δίκη εἰς ἑπεφαγμένον κατίστησον; 3. testimonies of witnesses present (μαρτυριγαρία), or affidavits of absent witnesses (ἐκτυρπαρία); 4. depositions of slaves extorted by the rack; 5. the oath of the partes.10 All these proofs were committed to writing, and placed in a box secured by a seal (ἐγκλειστος) till they were produced at the trial. The name ἀνάκρισις is given to the pleadings, considered expressly as a written document, in isaeus.11 If the evidence proved that the accused was guilty, the magistrate was to decide that there could not remain any doubt, the magistrate could decide the question without sending the cause to be tried before the dicasts: this was called διαμαρτυρία. In this case, the only remedy for the person against whom the decision was given, was to bring an action of perjury against the witnesses (ϕανερωμένα νόμα δίκης), and the pleaders were liable to vexatious delays on the part of the litigants, except in the case of actions concerning merchandise, benefit societies, mines, and dowries, which were necessarily tried within a month from the commencement of the suit, and were therefore called ἑκατον δικαία. The word ἀνακρίσις is sometimes used of a trial in general (μιᾶς ἐξ ἑπεφαγμένων δικαίων). The archons were the proper officers for the δικαίως: they are represented by Minerva, in the Eumenides of Eschylus, where there is a poetical sketch of the process in the law courts.6 (Vid. Antigraphe, Antomosia.) For an account of the ἀνακρίσις, that is, the examination which each archon underwent previously to entering on office, see the account of the Acrospomeni.

ANADIKIA (Vid. Appellatio.)

"""ANAGALLIS (ἀναγάλλις), a plant, of which Dioscorides and Galen describe two species, the male and the female, as distinguished by their flowers, the former having a red flower, and the latter a blue. The former named by the ancients Arvensis Arvensis and Carnosif, the Scarlet and Blue Pinpermels.12

ANAGNOSTES. (Vid. Acnaoma.)

ANAGOTHE DIKH (ἀναγοτικὴ δίκη). If an individual sold a slave who had some secret disease—such, for instance, as epilepsy—without informing the purchaser of the circumstance, it was in the power of the latter to bring an action against the vendor within a certain time, which was fixed by the laws. In order to do this, he had to report (ἀναγένεσθαι) to the proper authorities the nature of the disease, whence the action was called ἀναγοτικῆς δίκης. Plato supplies us with some information on this action; but it is uncertain whether his remarks apply to the action which was brought in the Athenian courts, or an imaginary form of proceeding.7

ANAGOGIA (ἀναγώγια), a festival celebrated at Eryx, in Sicily, in honour of Aphrodite. The inhabitants of the place believed that, during this festival, the goddess went over into Africa, and that all the pigeons of the town and its neighbourhood likewise departed and accompanied her.9 Nine days afterward, during the so-called καταζώγια (return), one pigeon having returned and entered the temple, the rest followed. This was the signal for general rejoicing and feasting. The whole district was said at this time to smell of butter, which the inhabitants believed to be a sign that Aphrodite had returned.9

"""ANAGYRIS (ἀναγύρις), a shrub, which Nicander10 calls the "acrid Ongynys." It is the Anagyris fetida, L., or Petid Bean-trefol. Harding says its French name is Bois puent. According to Laurus, it is a small shrub, having the port of a Cytisus, and rising to the height of five or seven feet.11

The ancient name was well acquainted with many species of Duck; but, from the brevity of the names they have given of them, we have now great difficulty in recognizing these.* The book, therefore, is described by Aristotle, as being like the wild duck, but a little smaller; it may therefore be supposed a mere variety of the Anas Boscii, or Wild Duck. 2. The Querquedula of Varro is referred to Turner the species of duck called Tel in England, namely, Anas crecca, L. 3. The πτερόν, which is ascribed by Aristotle to the smaller species of coot, seems probably a duck, as Gesner suggests. It may therefore be referred to the Anas Penelope, L., or Widgeon. (In modern works on Natural History it is incorrectly written Penelope.) 4. The θυρεός of Aristotle and Eilian, and θυρεός of Philo, although ranked with ducks by Aristotle and Pliny, was probably the Anser Brentii, or Brent Goose. 5. The χαράλωπες of Aristotle and of Eilian is held to be the Anas Bimucrona, or Bernicle Goose, by Elliot. Schneider and Pennant, however, prefer the Anas Tadorna, or Sheldrake. 6. The Sacred Goose of Egypt was a particular species, the Anas Rüppellii, akin to the Bernicle, but distinguished by brighter plumage, and by small spurs on its wings.*

ANATHEMATA. (Vid. DonaHIA.)

ANATOMICUS. (Vid.1. Interest on Money.)

ANATMAXIOT ΤΡΑΣΗ (ανατμαξιοτρασι) was an imprest officer of the trierarch who had kept aloof from action while the rest of the fleet was engaged. From the personal nature of the offence, and the punishment, it is obvious that this action could only have been directed against the actual commander of the ship, whether he was the sole person appointed to the office, or the active partner of the perhaps many συντέκτων, or mere contractor (ο μιτροσώμονος). In a cause of this kind, the strategy would be the natural and official judges. The punishment prescribed by law for this offence was a modified atonim, by which the criminal and his descendants were deprived of their political franchise, but, as we learn from Andocide, were allowed to retain possession of their property.*

ANAXAGOREA (Αναξαγορεία), a day of recreation for all the youths at Lampascus, which took place once every year, in compliance, it was said, with a wish expressed by Anaxagoras, who, after observing that these constituted the remainder of his life. This continued to be observed even in the time of Diogenes Laertius.*

ANAXURIS, a species of Duck; the Rumex Assetarius according to Sprengel.*

ANCHUSA (ἀνχύσα), the herb Alkanet. Four kinds of Alkanet are described by Klossovides and Galen.* With regard to the first, Sprengel hesitates between the Anchusa tinctoria and Lithospermum tincturium; the second is the Echium Italicum, Sibthorp; the third, or Alcibiades, the Echium diffusum; and the fourth, or Lycopers, the Lithospermum fruticosum. This is a plausible account of the variety of Dioscorides, who, according to him, was not uninterested in difficulties. That of Theophrastus seems indisputably to be the Anchusa tinctoria. The Anchusa tenuiflora does not seem to be described by any ancient author.*

ANCYLE, the sacred shield carried by the Salii. It was of Plutarch,* Dionysius of Halicarnassus,* and Festus,* it was made of bronze, and its form was oval, but with the two sides receding inward with an even curvature, and so as to make it broader at the ends than in the middle. It is exhibited in the following woodcut.

The original ancle was found, according to tradition,* in the palace of Numa; and, as no human hand had brought it there, it was concluded that it had been sent from heaven, and was an ὄλπαν διατέτει. At the same time, the haruspices declared that the Roman state would endure so long as this shield remained in Rome. To secure its preservation in the city, Numa ordered eleven other shields, exactly like it, to be made by the armorers Mammurius Venturius and Titus Lucius, and they were appointed under the denomination of Salii, whose office it was to preserve the twelve ancles. They were kept in the temple of that divinity on the Palatine Mount, and were taken from it only once a year, on the calends of March. The Feast of the god was then observed during three days, when the Salii carried their shields about the city, singing songs in praise of Mars, Numa, and Mammurius Venturius, and at the same time performing a dance, which probably, in some degree, resembled our morris-dances, and in which they struck the shields with rods, so as to keep time with their voices and with the movements of their horses. The accompanying figure shows one of these rods, as represented on the tomb of a Pontifices Salii, or chief of the Salii.* Its form, as here exhibited, both illustrates the manner of using it, and shows the reason why different authors call it by different names, as Δυτικούδον, λόχης, βάδος, ἱργα.

Besides these different names of the rod, which was held in the right hand, we observe a similar likeness as to the mode of holding the shield. Virgil, describing the attire of Pius, a mythical king of Latium, says he held the ancle in his left hand (tavagae ancle geraeá). Other authors represent the Salii as bearing the anclea on their necks or on their shoulders.* These accounts may be reconciled on the supposition advanced in the article Ξενος, that the shield was suspended by a leathern band (lorum*) proceeding from the right shoulder, and passing round the neck. That the weight of the ancle was considerable, and that the use of it in the sacred dance required no small exertion, is apparent from Juvenal’s expression, "sudavit cllys

ANCORA.

During the festival, and so long as the Sallii continued to carry the ancilia, no expedition could be undertaken. It was thought ominous to solemnize marriages at that time, or to engage in any undertaking of great importance.

When war was declared, the ancilia were purposely shaken in their sacred depository. But it is alleged that, towards the close of the Cimbic war, they ratted of their own accord.

ANCORA (ἀνκώρα), an anchor.

The anchor used by the ancients was, for the most part, made of iron, and its form, as may be seen from the annexed figure, taken from a coin, resembled that of the modern anchor. The shape of the two extremities illustrates the unco morsu and dente tenaci of Virgil. Indeed, the Greek and Latin names themselves express this essential property of the anchor, being allied to ἄγκωρ, ἄγκων, ἀγκύλα, unco, &c.

The anchor, as here represented and as commonly used, was called bidēs, ἀβλής, ἀφρόλοκος, or ἀμφίσπορος, because it had two teeth or flukes. Sometimes it had only one, and then had the epitex ἐπιστόρημα.

The following expressions were used for the three principal processes in managing the anchor:

Ancoram solvere, ἀγόραν χαλῶν, to loose the anchor.
Ancoram jacere, βάλλων, βίβτων, to cast anchor.
Ancoram tollere, ἀφεῖν, ἀνασκίτω, ἀνασκίπατο, to weigh anchor.

Hence ἀφεῖν by itself meant to set sail, ἀγόραν being understood.

The qualities of a good anchor were not to slip, or lose its hold, and not to break, i.e., to be ἀσφαλῆ τε καὶ βιβαῖα.

The following figure, taken from a marble at Rome, shows the cable (funis) passing through a hole in the prow (ovula).

We may suppose the anchor to be lying on the deck, in the place indicated by the turn of the cable; and if the vessel be approaching the port, the steps taken will be as Virgil describes:

"Oberint pelago proros; tum dente tenaci
Ancora fundatam naves, et litora curvau
Praeventum puppae." 1

And "Ancora de prora jactur, stant litora puppes." 2

The prow being turned towards the deep sea (pe-lo) and the stern towards the land, the latter extremity is fixed upon the shore (stas litore), so that the collected ships, with their aplustria, adorn it, as if they were, with a fringe or border (pretexta).

This prow remains in the deeper water, and therefore the anchor is thrown out to attach it to the ground (fundare).

When a ship was driving before the wind, and in danger of foundering upon shoals, its course would be checked by casting anchor from the stern. This was done when Paul was shipwrecked at Melite. 3 Four anchors were dropped on that occasion. Athen.

The largest and strongest anchor, the "last hope" of the ship, was called iōntes: and, as it was only used in the extremity of danger, the phrase "sacram anchoram solvere" was applied to all persons similarly circumstances.

To indicate the place where the anchor lay, a bundle of cork floated over it, on the surface of the water, 4 being attached, probably, to the ring which, in the preceding figure, is seen fixed to the bottom of the shank; and we may conjecture that the rope tied to that ring was also used in drawing the fluke out of the ground previously to weighing anchor.

In the heroic times of Greece, it appears that anchors were not yet invented: large stones, called στέιον (sleepers), were used in their stead. 5 Even in later times, bags of sand, and baskets filled with stones, were used in cases of necessity. According to Pliny, 6 the anchor was first invented by Empalimus, and afterward improved by Anacharsis. And the anchor was used, (336 B.C.), an herb, the same with our Atriplex hortensis, according to Sprengel, Stackhouse, and Dierbach, who agree in this with the earlier commentators.

All the ancient authorities, from Dioscorides to Macer, give it the character of an excellent pot-herb. It is still cultivated in some gardens as a culinary herb; its English name is Orach. 7

ANDRACHOS, P. lusulare, or Portulae oleacea, L. 8

ANCAPPODIS' ΜΟΥ or ANCAPPID'ΕΣΕΩΣ ΓΡΑΠΗ (ἀναπποδίσμονικον ἀν ἀναπποδίσμοις γραφή) was an action brought before the court of the eleven (οι ἑνάκα) against all persons who carried off slaves from their masters, or reduced free men to a state of slavery. The grammarians mention an oration of Antiphon on this subject, which has not come down to us. 9

ANCAPPOD'ΟΝ ΔΙΚΗ (ἀναπποδίδων δίκη) was the peculiar title of the diakiesis when a property in slaves was the subject of contending claims. The cause belonged to the class of δικαία πρὸς τινα, and was one of the private suits that came under the jurisdiction of the themotheteus. It is recorded to have been a subject of a lost speech of Dinarchus, 10 and is clearly referred to in one still extant of Demosthenes. 11

ANDREIA. (Fid. Syssitia.)

*ANDRODAMAS, one of Pliny's varieties of haematite. (Fid. AIMAΣΙΤΗΣ). It was of a black colour, of remarkable weight and hardness, and attracted silver, copper, and iron. When divested of its fabulous properties, it appears to have been magnetic oxide of iron. 12

ANDROMACHIA (Ἀνδρομαχία), a festival with games, held every year in the Ceramicus at Athens, in honour of the hero Androgeus, son of Minos, who had overcome all his adversaries in the festive

---

ANNUITIES

AimALES (Liv., zoon-but 5.)—the Pliny, (Vid. In This Or. (Bion, styled, differently cluster contain by this appellation legends may nassus. This third in which rose. This appellation occurs in the Materia Medica of Dioscorides, Galen, Oris- bastus, and Paulus Aegineta.4

*ANDROS'ACES (andropousos), a species of St. John's-wort, but not the Hyssopus aureuscomo of modern botanists. Such, at least, is the opinion of Sibthorp, who refers it to the H. caerulis, Lam. Stephens and Matthioli give it the French name of hyssopus.5

*ANDROSACES (andropousos). Sprengel justly pronounces this the "crux exgetarum!" His History of Botany he inclines to the opinion of Gal- nanes, that it is the Madagascar acazeleurom, a zoophye; a most improbable conjecture. But, in his other works, he referring he plants the name Oliva androsaceae, Bracc.</p>

*ANEMONE (anemos), the Anemone or Wind- rose. Dioscorides describes three species: the first, which he calls anemos, or cultivated, is, according to Sprengel, a plant called Anemone nemorosa, or Wood Anemone. The cultivated kind was very variable in the colour of its flowers, these being either blue, violet, purple, or white, whereas the wild kind has merely a flower of purple hue. This may serve to explain the discrepancy in the poetic legends respecting the origin of the anemone. According to one account, it sprung from the tears shed by Venus for the loss of Adonis when slain by the wild boar; according to another, from the blood of Adonis who, during his life as a god, escaped, to the one case, to the white flower of the wind-rose; in the other, to that of purple hue. The anemone has its name from the Greek term anemos, "wind." This is the cause of this name's having been given is dis- ferently stated. Pliny says that the flower was so styled, because it never opens except when the wind blows; Hesychius, because its leaves are quickly scattered by the wind. The best explanation, however, is the following: the blossoms of the anemone contain no distinct calyx, and are succeeded by a cluster of grains, each terminated by a long, slender, feathery, somewhat scarious awn. When grown in open plains, or in high, exposed situations, their feathery grains produce a singular shining appearance when waved by the breeze, and hence, no doubt, the name of the flower has originated, for it means, literally, "Wind-flower," and this is the appellation actually bestowed upon it by the Eng- lish. Sibthorp found the anemone on Mount Pan- nassus.

*ANETHUM (anethos), the herb Anise or Dill. Sprengel makes the anethos of Dioscorides and The- phraustus the Anethum graveolens; but, according to Stockhouse, the anethos of Theophrastus is the A. hortensis, or Garden Dill.1

*ANGOTHERIE (angoverion). (Vid. Incitega.)

*ANGUIILLA (anguillur), the Murana anguilla, L., or Eel. (Vid. Concor and Mercura.) Vol- lum. 1. The elapsus occurs in the following reproduction on the part of eels. Aristotle believed that they sprang from the mud; Pliny, from fragments which they separated from their bodies by rubbing them against the rocks; others of the ancient writers supposed that they came from the carcasses of animals. The truth is, that eels after the manner of serpents; that they form eggs, which, for the most part, disclose in their belly; and that in this case they are viviparous, after the manner of vipers.

*ANGUSIUS (angis), the Snake. (Vid. Aspis, Dra- go.)

*ANGUSTICLAVIA. (Vid. Clavus.)

*ANISUM (anisou) the Pimpinella anison, or Anise. It is described by Theophrastus, Dioscori- des, Galen, and the other writers on the Materia Medica.

ANNUITIES (i. e., annuities libri, year-books) were recorded in the events of each year, which were kept by the chief pontiff (pontifex maximus) at Rome, from the commencement of the state to the time of the chief pontiff Publius Marcus Scavola (consul in 631 A.U.C., 135 B.C.). They were written on a white board (album), which the chief pontiff used in the public places for paragraphe read by the people might have the opportunity of reading them. They were called annales maximi, or annales pontificum maximorum; and the commentarii pontificium mentioned by Livy are in all probability the same. These documents appear to have been very minute, recording chiefly eclipses, prodigies, and the state of the markets; but they were the only historical records which the Romans possessed before the time of Fabius Pictor. The great part of these books when written before the burning of Rome by the Gauls, perished on that occasion; but some fragments seem to have escaped destruction. This circumstance is a chief cause of the uncertainty of the early history of Rome.7

In process of time, individuals undertook to write portions of the Roman history, in imitation of the pontifical annals. The first of these was Quintus Fabius, Cunctore, who during the Carthaginian War, and wrote the history of Rome from its foundation down to his own time.8 Contemporary with him was Lucius Cincius Allmenus, whose annals embraced the same period.9 Dionysius states that both Fabius and Cincius wrote in Greek; but it would seem that Fabius wrote in Latin also.10 Marcus Forcius Cato, consul in 550 A.U.C., and afterward censor, wrote an historical work in seven books, which was called "Origines."11 Anus Postuminus Albinus, consul in 603 A.U.C. wrote annals of the Roman history in Greek;12 Lucius Calpurnius Piso Frugi, consul in 631 A.U.C., and afterward censor, wrote annals.13 Quintus Vauric- us Antias (about 679 A.U.C.) is frequently cited by Livy, and, from his history with him was Caius Iulus Macer.14 The Roman annalists were Lucius Cassius Homina (A.U.C. 608), Quintus Fabius
ANONIS.

Maximus Servilicus (612), Caius Fannius (618), Caius Sempronius Tuditanus (635), Lucius Ceilius Antipater (631), Caius Sempronius Asellio (630), and, about the end of the same century, Publius Rusticus. Lysias, young, 

and Qnemis Claudius Quadragarius. Further information concerning these writers will be found in Clinton's Fasti Hellenici, vol. iii.

The precise difference between the terms annales and historia is still a matter of discussion. Cicero mentions the annales, but there is only one, written by an unknown compiler. The term was used to denote the annals written in imitation of the annales aevi et temporum, and mere written memorials of the times, to men, of places, and of events, without any commentary; and, provided that their meaning was intelligible, thought the only excellence of style was brevity; but that, in history, ornament is studied and style. Descriptions of countries and battles are often introduced, speeches and harangues are reported, and a flowing style is aimed at. Elsewhere he mentions history as one of the highest kinds of oratory, and as one which was as yet neither known to, nor neglected by, his countrymen. Aulus Gellius, which has been the influence between annals and history, is, that the former observe the order of years, narrating under each year the events that happened during that year. Servius* says that history (hstoria) is the events which have happened during the writer's life, so that he has, or might have, seen them; but annals are events which have taken place in former times. The true distinction seems to be that which regards the annalist as adhering to the succession of time, while the historian regards more the succession of events; and, moreover, that the former relates bare facts in a simple, straightforward style, while the latter arranges his materials with the art of an orator, and traces the causes and results of the events which he records. (See a paper by Niebuhr in the Rathsamischen Museum, ii., p. 283, translated by Mr. Thirlwall in the Philosophical Magazine, vol. ii., p. 661.)

ANONIS (from annus, like pomerius from pomo) is used, 1. for the produce of the year in corn, fruit, wine, &c., and hence, 2. for provisions in general, especially for the corn, in the latter years of the Republic, was collected in the storehouses of the state, and sold to the poor at a cheap rate in times of scarcity; and which, under the empire, was distributed gratuitously, or given as pay and rewards. 3. For the price of provisions. 4. For a soldier's allowance of provisions for a certain time. It is used also in the plural for yearly or monthly distributions of pay in corn, &c. Similar distributions in money were called annua. (Curt. X., 40.) In the plural it also signifies provisions given as the wages of labour. Ammon was anointed as a worshipper of the goddess whom the city's prosperity. She was represented on an altar in the Capitol, with the inscription, Annus sanctus. Aulus Vitalio, &c., 4. as a female figure, holding an arrow in her left hand, and the rest of the body clothed, bow on her shoulder, and the cornucopia in her left hand.

ANALIS LEX. (Vid. Aulus, p. 15.)

AN Nil. (Vid. Rom.)

ANUS. (Vid. Year.)

ANTHOI (anthous); a plant. Stephens says its popular name is the 'Red-tarrow.' Modern botanists have accordingly given the name of Anthemis anthos to the Red-tarrow of English herbals.

The popular name is derived from the circumstance of this plant's stopping the plough, or harrow, in its progress, by its stringy roots.

ANTÆ. (παρακολουθῶν). square pillars (quadræ columna, Notius). They were commonly joined to the side walls of a building, being placed on each side of the door, so as to assist in forming the portico. These terms are seldom found except in the plural, because the purpose served by antae required that, in general, two should be erected corresponding to each other, and supporting the extremities of the same roof. Their position, form, and use will be best understood from the following woodcut, in which A A are the antae.

Virg. 34. describes the temple in aunts (væcla pæquitor) to be one of the simplest kind. It had, as he says, in front, a temple attached to the walls which enclosed the cela; and in the middle, between the antæ, two columns supporting the architrave. According to him, the aunts ought to be of the same thickness as the columns. The three spaces (intercolumnia) into which the front of the

According to him, the aunts ought to be of the same thickness as the columns. The three spaces (intercolumnia) into which the front of the
ANTEAMBULONES.

The term anteambulones was divided by the two columns, were sometimes occupied by marble balustrades, or by some kind of rails, with doors or gates. The ruins of temples, corresponding to the description of Vitruvius, are found in Greece and Asia Minor; and we here exhibit as a specimen a restoration of the front of the temple of Artemis Propylea at Eleusis, together with a plan of the pronaos:

ANTEFIXA.

When Neoptolemus is attacked by Orestes in the vestibule of the temple at Delphi, he seizes the arms which were suspended by means of nails or pins from one of the antae (εσχάτος ξύλου), takes his station upon the altar, and addresses the people in his own defence. In two other passages, Euripides uses the term by metonymy, to denote either the pronaos of a temple or the vestibule of a palace; i.e., in each case the portico, or space enclosed between the antae.

From porastas came the adjective parastaticus, and hence we find parastatica employed as the term for a pilaster, which may be considered as the section of a square pillar attached to the wall of a building. The beams of a ceiling were laid upon three kinds of supports, viz., columns, antae, and parastaticae or pilasters.

ANTACEUS (᾽αντακέας), a variety of the Aesculapius Hison, or Isinglass Fish. This would appear to be the fish of whose name a poet in Athenaeus complains that it was inadmissible into heroic verse.

ANTEAMBULONOS were slaves who were accustomed to go before their masters, in order to make way for them through the crowd. They usually called date locum dominó meó and if this were not sufficient to clear the way, they used their hands and elbows for that purpose. Piny relates an amusing tale of an individual who was roughly handled by a Roman knight, because his slave had presumed to touch the latter in order to make way for his master.

ANTECESSORES, called also ANTECURSORES, were horse-soldiers, who were accustomed to precede an army on march in order to ensure a suitable place for the camp, and to make the necessary provisions for the army. They do not appear to have been merely scouts, like the spectularia. This name was also given to the tenches of the Roman law.

ANTECEMNA. (Vid. Cimento.)

ANTEFIXA, terra-cottas, which exhibited various ornamental designs, and were used in architecture to cover the frieze (zophoria) of the entablature. These terra-cottas do not appear to have been used among the Greeks, but were probably Etruscan in their origin, and were thence taken for the decoration of Roman buildings. Festus describes them in the following terms: Antefixa quae ex opere figurato teatis ad gubernatur sub stiltico.

The name antefixa is evidently derived from the circumstance that they were fixed before the buildings which they adorned; and the manner of fixing them, at least in many cases, appears from the remains of them still existing. At Scaurolo, supposed to be the ancient Veii, they were found fastened to the frieze with leaden nails. At Velletri, formerly a city of the Vella, they were discovered (see the following woodcut) with holes for the nails to pass through. They were formed in moulds, and then baked by fire, so that the number of them might be increased to any extent; and copies of the same design were no doubt frequently repeated on the same frieze. Of the great variety and exquisite beauty of this workmanship, the reader may best form an idea by inspecting the collection of them in the British Museum, or by studying the engravings and description of that collection published by Dr. Taylor in Combe.

The two imperfect antefixa here represented were among those found at Velletri, and described by Caroli (Rome, 1785).

The first of them must have formed part of the upper border of the frieze, or, rather, of the cornice. It contains a panther's head, designed to serve as a spout for the rain-water to pass through in descending from the roof. Similar antefixa, but with comic masks instead of animals' heads, adorned the Temple of Isis at Pompeii. The second of the above specimens represents two men who have a dispute, and who come before the sceptre-bearing kings or judges to have their cause decided. The style of this bas-relief indicates its high antiquity, and, at the same time,
proves that the Volsci had attained to considerable taste in their architecture. Their antefixae are remarkable for being painted; the ground of that here represented is blue; the hair of the six men is black or brown; their flesh red; their garments yellow, and red; the chairs are white. The two holes may be observed by which this slab was fixed upon the building.

Cato the Censor complained that the Romans of his time began to despise ornaments of this description, and to prefer the marble friezes of Athens and Corinth. The rising taste which Cato deplored may account for the superior beauty of the antefixae preserved in the British Museum, which were discovered at Rome. A specimen of them is here given. It represents Minerva superintending the

ANTHENICUS.

The former represents Ulysses tied to the mast in order to effect his escape from the Sirens; it shows the cornua at the extremities of the yard, and the two ceraschi proceeding from thence to the top of the mast. Besides these particulars, the other gem represents also the ropes used for turning the antenna so as to face the wind.

ANTENAPAGENTA, doorposts, the jambs of a door.

The inscription quoted in the article Ante contains also a direction to make jambs of silver (anteplagmata aitnegrai). Cato, speaking of the construction of a farmhouse, mentions stone lintels and jambs (jugmenta et antepagmata ex liope). Vitruvius gives minute instructions respecting the form and proportions of the antepagmata in the doors of temples; and these are found, in general, to correspond with the examples preserved among the remains of Grecian architecture. The common term for a doorpost is postis.

ANTESIGNA'NI appear to have been a body of troops, selected for the defence of the standard (signum), before which they were stationed.*

ANTESTAR'I. (Vid. Accro, p. 18.)

*ANTH'EMIS (adveidou), a species of plant. (Vid. Chamaelone.)

*ANTHEMUM (adveidou, -eii, -ai), a species of plants, when some uncertainty prevails. Ad- damis is in favour of its being the genus Matricaria, or Wild Chamomile. Sprengel, however, refers the several species of this plant noticed by Theophrastus to the Anthemis Cotta. Stockhouse also is very unsatisfactory in his views on this subject. *

*ANTHERICUS (adveidou), a plant. Sprengel, in the edition of R. H. F., compares the Anterioricus Graminum with it, but in his second the Asphodelus fabulosus. Thiebaut makes it to be the Ornithogalum Pyrenaeicum, and Stockhouse the Asphodelus fabulosus. Thiebaut makes it to be the Ornithogalum Pyrenaeicum, and Stockhouse the Asphodelus fabulosus.
ANTIDOSIS.

ANTIDOSIS. (Αντίδοσις), a flower-festival, principally celebrated in Sicily in honour of Demeter and Persephone, in commemoration of the latter, who, thrice called Anthophora, since it was derived from Sicily. It consisted in gathering flowers and wining garlands, because Persephone had been carried off by Pluto while engaged in this occupation. 

Strabo relates that at Hippionium the women celebrated a similar festival in honour of Demeter, which was, thrice called Anthophora, since it was derived from Sicily. The women themselves gathered the flowers for the garlands which they wore on the occasion, and it would have been a disgrace to buy the flowers for that purpose. Anthophora were also solemnized in honour of other deities, especially of the honor of June, sung to Aristea, at Argos, where maidens, carrying baskets filled with flowers, went in procession, while a tune called λεπακών was played on the flute. Aphrodite, too, was worshipped at Cronus, under the name Αριθέα, and has therefore been compared with Flora, the Roman deity, as the anthophora have been with Venus.

ANTHESTRIA. (Vid. Dion. Haliea.)

ANTHESTERION. (Vid. Calendar, Greek.)

ANTHIA (ανθια), a species of fish, the same with the Labrus anitha, L., or Serranus anitius of Cuvier. Its French name is Bourrier. The ancients describe several species of this fish, one of which is the καλλαχθς. Cuvier describes this as a most beautiful fish, of a fine ruby red, changing to gold and silver, with yellow hands on the cheek.

ANTHOS, a bird, which, according to Pliny, feeds on flowers, and imitates the neighing of a horse. Below would have it to be the Emberiza atrinella, or Yellow Bunting, called in England the Yellow Hammer, and in France Brunant. This opinion, however, is somewhat doubtful, since Aristotle describes the Anthos as frequenting rivers, whereas the Yellow Hammer delights in trees.

ANTHRAX (ανθραξ), the Carbuncle. (Vid. Carbunculus.)

ANTHRATERION, a species of carbuncle, found, according to Theophrastus, in the island of Cotis. Beeckmann19 thinks that Theophrastus means the well-known black marble of that island, which is also called Anthraterion, and was esteemed of such a quality. it was designated ανθραξων (from ανθρας, "a coal"), just as the ruby took its name from one buming. He supposes, moreover, that of this marble were made the mirrors mentioned by Theophrastus; and that Pliny misinterprets him in stating that they were in the ανθραξων of Orchomenus.

ANTHRENE (ανθρήνη), the Hornet, or Vesper Crabro. L. It's next is called ανθρήνων by Suidas.

ANTHYLLIS (ανθύλλης), a species of plant. Sprengel agrees with Prosper Alpinus, that the first species of Dioscorides is the Cressa Cretica; and with Clusius, that the second is the Aegio lana. Linnaeus gives the name Cressa to the first genus, this opinion in regard to the first species, by giving it the name of Cressa Anthyllis in his Gen. Plant.

ANTHYPOSTOMIA. (Vid. Hypomoria.)

ANTIDOSIS (αντίδοσις), in its literal and general meaning, "an exchange," was, in the language of the Attic courts, particularly applied to proceedings under a law which is said to have originated with Solon.1 By this, a citizen nominated to perform a leiturgia, such as a trierarchy or chororgy, or to rank among the property-tax pavers in a class disproportioned to his means, was empowered to call upon any qualified person not so charged to take the office in his stead, or submit to a complete exchange of property; the charge in question, or could the office of the first party, or the exchange be finally effected. For these proceedings the courts were opened at a stated time every year by the magistrates that had official cognizance of the particular subject, such as the strategy in cases of trierarchy and ranking to the property-taxes, and the choral associations in Greek. And perhaps, by such an officer it was the first step of the challenger to summon his opponent. It may be presumed that he then formally repeated his proposal, and that the other party stated his objections, which, if obviously sufficient in law, might perhaps authorize the magistrate to dismiss the case; if otherwise, the legal resistance, and preparations for bringing the cause before the dike, would naturally begin here. In the latter case, or if the exchange were accepted, the law directed the challenger to repair to the houses and lands of his antagonist, and secure himself, by an agreement, or by the acts of the exchange, to be transferred, from fraudulent encroachments of the real property, by observing what mortgage placards (ξπολυ), if any, were fixed upon it, and against clandestine removal of the other effects, by sealing up the chambers that contained them, and, if he pleased, by putting bailiffs in the premises. His opponent was at the same time informed that he was at liberty to deal in like manner with the estate of the challenger, and received notice to attend the proper tribunal on a fixed day to take the usual oath. The entries here described seem, in contempt of law, to have been taken in an as fast as the challege, and were not to be completed for the new, and it does not appear that primarily there was any legal necessity for a farther ratification by the dike; but, in practice, this must always have been required by the conflict of interests between the parties. The next proceeding was the oath, which was taken by both parties, and purported that they would faithfully discover all their property, except shares held in the silver mines at Laurion; for these were not rated to leiturigia or property taxes, nor, consequently, liable to the exchange. In pursuance of this agreement, the law enjoined the opponent to pay, in addition to the cost of his respective assets (αντοφαρεις) within three days; but, in practice, the time might be extended by the consent of the challenger. After this, if the matter were still uncompromised, it would assume the shape and follow the course of an ordinary lawsuit (Υδ. Δέμος), under the conduct of the magistrate within whose jurisdiction it had originally come. The verdict of the dike, when adverse to the challenged, seems merely to have rendered imperative the first demand of his antagonist, viz., that he should submit to the exchange, or undertake the same upon condition; and as the alternative was open to the former, and the conduct of the exchange, should the latter at any stage of the proceedings, we may infer that the exchange was rarely, if ever, finally accomplished. The irksomeness, however, of the sequestration, during which the litigant was precluded from the use of his own property, and dis- eases attendant upon uncompromised parties for the like against others (for his prospective reimbursement was reckoned a part of the sequestrated estate), would invariably cause a speedy—perhaps,

ANTIGRAPHE.

ANTILIA.

in most cases, a fair—adjustment of the burdens: a
incident to the condition of a wealthy Athenian.

ANTIGRAPHE (ἀντιγραφή) originally signified
be writing put in by the defendant, in all cases,
whether public or private, in answer to the
indictment. But in the early times in which the
action was applied, by an easy transition, to the
substance as well as the form of the reply, both of
which are also indicated by ἀντωνομα, which means
primarily the oath corroborating the statement of
the accused. Harpocrate has remarked that anti-
graphē ought denote, as amnonias does in its
more extended signification, the bill and affidavit of either
party; and this remark seems to be justified by a
passage of Plato. Schömann, however, main-
tains that antigraph was only used in this signifi-
cation in the case of persons who laid claim to an
unassigned inheritance. Here neither the first nor
any other claimant could appear in the character of
a prosecutor: that is, no ἄγγινος ἀντιγραφή could
be strictly said to be directed by one competitor against
another, when all came forward voluntarily to the
tribunal to defend their several titles. This circum-
stance Schömann has suggested as a reason why
the documents of each claimant were denoted by the
word antigraphē.

Perhaps the word "plea," though by no means a
coincident term, may be allowed to be a tolerably
proximate rendering of antigraphē. Of pleas there
may be only two kinds, the dilatory, and those to
the action. The former, in Attic law, comprehends all
such allegations by asserting the incompetency
of the court, the disability of the plaintiff, or privi-
lege of the defendant and the like, would have a
tendency to show that the cause in its present state
could not be brought into court (ὑπὲρ εἰσαγωγῶν
eίνα τὴν δικαίωσιν): the latter, everything that
would be adduced by way of denial, excuse, justification,
and refutation of the evidence as well as the
Greek, kept in mind, that the process called "special plead-
ing" was at Athens supplied by the magistrate hold-
ing the anarchies, at which both parties produced
their allegations, with the evidence to substantiate
them; and what the object of this part of the pro-
ceedings was, under the directions and with the as-
istance of the magistrate, to prepare and enucleate
the question for the dicasts. The following is an
instance of the simplest form of indictment and plea:
"Apollo, son of Pasion of Acharnus, against Stephanus, son of Menechus of Acharnæ, for
perjury. The penalty rated, a talent. Stephanus,
son of Menechus, was accused of having sundered
evidence the matters in the tablet. Stephanus, son
of Menechus of Acharnæ. I witnessed truly when
I gave in evidence the things in the tablet." The
pleadings might be altered during the anarchies;
but, once consigned to the echinus, they, as well as
all the other accompanying documents, were
protected by the official seal from any change by the
litigants. On the day of trial, and in the presence
of the dicasts, the echinus was opened, and the plea
was then read by the clerk of the court, together
with its antagonist bill. Whether it was preserved
afterward as a public record, from which we know to have
been the case with respect to the γραφή in
some causes, we are not informed.

From what has been already stated, it will have
been observed that questions requiring a previous
decision would frequently arise upon the allega-
tions of the plea, and that the plea to the action in
question, even on occasions that would tend
essentially to alter, and, in some cases, to re-
verse the relative positions of the parties. In
the first case, a trial before the dicasts would be granted
by the magistrate whenever he was loath to incur
the responsibility of decision; in the second, a cross-

2. (Deim. in Steph., i., 1115.)—4. (Diog. Laert., ill., c. 5, s. 19.)

action might be instituted, and carried on separately,
the ug phr simultaneously with the original
suit. Cases, also, would sometimes occur, in which
the defendant, from considering the claim to be
an unmeritorious replication, or, perhaps, one best
attacked by appeal, would be tempted to retalia-
tion upon some delinquency of his opponent, utterly
unconnected with the cause in hand, and to this he
would be, in most cases, able to resort. An in-
stance of each kind will be briefly given by citing
the common papyrographē as a case of a cross-
action upon a primary action for the same; and a δικαι-
ωνας, or "judicial examination of the life or mor-
als" of an orator upon an impeachment for miscon-
duct in an embassy (παραπομπησθαι). All causes of
this secondary nature (and there was hardly one
of any kind cognizable by the Attic courts that
might not occasionally rank among some) were
viewed in their relation with the primary action,
comprehended by the enlarged signification of anti-
graphē; or, in other words, this term, inexpressive
of form or substance, is indicative of a repellant
or rehatitive quality, that might be incidental to a
great variety of causes. The distinction, however, that
in this sense is analogous, and not substantial; for we are told, in order to pre
vent frivolous suits on the one hand, and unfair
election upon the other, the loser in a paragraphe, or
cross-action upon a private suit, was condemned
by a special law to pay the ἐπιστήμα (vid. Eras.
i-a), liable upon the valuation of the cause
for the expenses of the former, if he be guilty of
wiving or fraud in the actions of the jury, and certain court fees (παραπομπης, not
original incident to the suit. That there was a simi-
lar provision in public causes we may presume
from analogy, though we have no authority to deter
mine the matter.

ANTIPATHES (ἀντιπάθες) were public
clerks at Athens, of whom there were two kinds.
The first belonged to the βοιλα: his duty was to
give an account to the people of all the moneys paid
to the state. (Ος καθ ἐκκλησίαν προπαναίαν ἀπελο-
γισε τῶς προσόδους τὸ δίμος). In the time of
Atticins, the ἀντιπάθες τῆς βοιλας was χειρο-
τορίσις, but in later times he was chosen by lot.
The second belonged to the βιβλιαἷς, and his duty
was to check the accounts of the public officers,
such as the treasurers of the sacred moneys, of the
war taxes, &c. (Διεύθυνε τοὺς ἀντιπάθες, ὃς τῆς
δικαστάκτου, ὃς τῆς βιβλιαίας?)

ANTIOEIA (Ἀντιόηης), annual festivals and
quinquennial games, which the Roman emperor
Hadrian, being a favourite Antiochus, after he was
drowned in the Nile, or, according to others, had sacrificed himself for his sovereignty,
in a fit of religious fanaticism. The festivals were
celebrated in Bithynia and at Mantinea, in which,
in a week was worshipped as a god.

ANTIPATHES, the sort of Coral called
Ἀντιθάπθος, is the Attic

ANTIPHER'NA. (Vid. Dom.)

ANTIQUAIRII. (Vid. Libraria.)

ANTIRRHNION (ἀντιρρηνίων or ἀντιρρηνίων) a
plant, which Sprengel makes the same with the
Antirrhinum Ornthium. Hardon calls it by its
French name of Misle de tour, or Calf's Smuts, but
Stephens and A. Mather by that of Meconopsis.
It is not very long since it was agreed that its
ordinary name in English is Snapdragon.

ANT'ILIA (ἀντιλια), any machine for raising wa-
ter; a pump.
The annexed figure shows a machine which is still used on the river Eissach, in the Tyrol, the ancient Aenus. As the current puts the wheel in motion, the jaws on its margin are successively immersed and filled with water. When they reach the top, the centrifugal force, conjoined with their oblique position, sends the water sideways into a trough, from which it is conveyed to a distance, and chiefly used for irrigation. Thus, by the incessant action of the current itself, a portion of it is every instant rising to an elevation nearly equal to the diameter of the wheel.

Lucæius mentions a machine constructed on this principle: "Ut fluvius versaret rotae atque haustura videns." The line is quoted by Nonius Marcellus, who observes that the jaws or pots of such wheels (roterum cadit) are properly called "haustura ab haumiendo," as in Greek they are called ἀντλία. In situations where the water was at rest, as in a pond or a well, or where the current was too slow and feeble to put the machine in motion, it was so constructed as to be wrought by animal force, and slaves or criminals were commonly employed for the purpose. Five such machines are described by Vitruvius, in addition to that which has been already explained, and which, as he observes, was turned sine operum calculatu, ipsius fluminis impulso.

These five were: 1. the tympanum; a tread-wheel, wrought hominibus calcantibus: 2. a wheel resembling that in the preceding figure, but having, instead of pots, wooden boxes or buckets (modesti quadrati), so arranged as to form steps for those who trod the wheel; 3. the chain-pump: 4. the cochlea, or Archimedes’s screw; and, 5. the cisticia machine, or forcing-pump. Suætonius mentions the case of a man of equestrian rank condemned to the antlia. The nature of the punishment may be conceived from the words of Artemidorus. He knew a person who dreamed that he was constantly walking, though his body did not move; and another who dreamed that water was flowing from his feet. It was the lot of each to be condemned to the antlia (εἰς ἀντλίαν καταδίωκετο), and thus to fulfil his dream.

On the other hand, the antlia with which Martial watered his garden was probably the pole and bucket universally employed in Italy, Greece, and Egypt. The pole is curved, as shown in the annexed figure; because it is the stem of a fir, or some other tapering tree. The bucket, being attached to the top of the tree, bends by its weight, and the thickness of the other extremity serves as a counter poise. The great antiquity of this method of raising water is proved by representations of it in Egyptian paintings.

ANTYX (ἀντύξ), a part of the ἀνίκματος, or preliminary pleadings in an Athenian lawsuit. The term was used of an oath taken by both parties; by the plaintiff, that his complaint was well-founded, and that he was actuated by no improper motives; and by the defendant, that his defence was true. It was also called ἀνεύδωσις. The oath might contain either the direct affirmative or negative, in which case it was called ἐκδίωκε; or amount to a demurrer or παραγγέλσις. The ἀντύξασθα of the two parties correspond to our oaths or declarations on the one side, and to the replies, replications, or rejoinders on the other. (Vit. Antigraphe.)

ANTYX (ἀντύξ), probably allied etymologically to ANTYX (ἀντύξ), the rim or border of anything, especially of a shield or chariot. The rim of the large round shield of the ancient Greeks was thinner than the part which it enclosed. Thus the ornamental border of the shield of Achilles, fabricated by Vulcan, was only threefold, the shield itself being sevenfold. In another part of the Iliad, Achilles sends his spear against Aeneas, and strikes his shield ἄντυξ απὸ πολτήρον, i.e., "on the outermost border," where (it is added) the bronze was thinnest, and the thinnest part of the ox-hide was stretched over it. In consequence of the great size of this round shield, the extreme border (ἀντύξ πύμαρα) touched the neck of the wearer above, and the lower part of his legs below. In the woodcut, in the article Antepeia, we see the ἄντυξ on one side of Minerva’s shield.

On the other hand, the ἄντυξ of a chariot must have been thicker than the body to which it was attached, and to which it gave both form and strength. For the same reason, it was often made double, as in the chariot of Juno (Δούλω περίδομοι ἄντυξις ελατ’). In early times, it consisted of the twigs or flexible stem of a tree (δροσές), which were polished and shaped for the purpose. Afterward, a splendid rim of metal formed the summit of the chariot, especially when it belonged to a person of wealth and rank.

In front of the chariot, the ἄντυξ was often raised above the body, into the form of a curvature, which served the purpose of a hook to hang the reins upon when the charioteer had occasion to leave his vehicle. Hence Ericlides says of Hippolytus, who had just ascended his chariot, Μάρτυρει τῆς ἕρατι γίγνεται ἄντυξα. On Etruscan and Greek vases, we often see the chariot painted with this appendage to the rim much elevated. The accompanying woodcut shows it in a simpler form, and as it appears in Antepeia, engraved in the work of Calloni, which has been already referred to.

By Syncelnodes, ἄντυξ is sometimes used for a chariot, the part being put for the whole. It is

APAGOE.

plaint was said ἀπάγογε τῆς ἀπάγογος; the magician, when they allowed it, παρεδόθη τῷ ἀπάγογε.

APARINE ἀπαρίνη, a species of plant, the same with the Lappa of the Romans, and now called Clementina or Goose-grass. Sprengel, in the first edition of his R. H. H., holds it to be the Arcitum Lappa, or Burdock; a mistake which lie silently corrects in his edition of Dioscorides. According to Galen, it is the βιλιόσιον and βιλιατέριον of Hippocrates.

APATIS (ἐπάτης), the name of a plant occurring in Theophrastus. Great diversity of opinion prevails, however, with respect to the proper reading; some making it ἀπάτης, and others οὐφάκης. Sprengel refers it to the Leonotodon Taraxacum, or Dandelion; but Stockhouse hesitates between the Taraxacum and the Hieracium of Harkaway.

ἈΠΑΤΕΩΣ ἐκ τῶν δήμων γραφῆς. (Vid. ΔΑΙΚΙΑΣ 

APATURIA (Ἀπατοῦρα) was a political festival which the Athenians had in common with all the Greeks of the Ionian name, with the exception of those of Colophon and Ephesus. It was celebrated in the month of Pyanepis, and lasted for three days. The origin of this festival is mentioned by Xenophon, and following the year 1100 B.C., the Athenians were carrying on a war against the Boeotians, concerning the district of Cisera, or, according to others, respecting the little town of Κήνος. The Boeotian Xanthius or Xanthus challenged Thymoetes, king of Attic, to single combat; and when Melanthus, prefect of the Mendesian exiles of the house of the Neldis, offered himself to fight for Thymoetes, on condition that, if victorious, he should be the successor to Thymoetes. The offer was accepted; and when Xanthius and Melanthus began the engagement, there appeared behind Xanthius a man in the γυρίζειν, the skin of a black goat. Melanthus recognized this as violating the laws of single combat by having a companion, and while Xanthius looked around, Melanthus slew the decoyed Xanthus. From that time the Athenians celebrated two festivals, the Apaturia, and that of Dionysus Melanogis, who was celebrated in the same month. In the former case, the complained ran the risk of forfeiting 100 drachmas if his charge was ill-founded. The cases in which the apagoge was most generally allowed were those of theft, murder, ill-usage of parents, &c. The punishment in these cases was generally fixed by law; and if the accused confessed, or was proved guilty, the magistrate could execute the sentence at once, without appealing to any of the jury-courts; otherwise it was necessary that the case should be referred to a higher tribunal. The magistrates who presided over the apagoge were generally the Eleven (οἱ ἐνδεκάες); sometimes the chief archon, or on the thermaeum. The most important passage with regard to the apagoge is 14: unfortunately corrupt and unintelligible. The com-

the cup-bearers (ποίηστας) were not idle on this occasion, may be seen from Pictius.1

The second day was called Ἀφράκτης (Ἀφράκτης), from the sacrifice offered on this day to Zeus, summoned " Aphractus," and to Athens, and sometimes to Dionysus Melanæus. This was a state sacrifice, in which the priests took a prominent part. The day was chiefly devoted to the gods, and to it, perhaps, can be confounded what Harpocrate2 mentions, from the Athic of Istrus, that the Athenians at the apaturia used to dress splendidly, kind torches on the altar of Hephaistos, and sacrifice and sing in honour of him. In addition to the sacrifice, the monumen
ties, calls the first day of the Apaturia Ἀφράκτης, and the second δορπία, which is, perhaps, nothing more than a slip of his pen.

On the third day, called κομφώτης (κομφώτης), children born in that year, in the families of the phratria, or such as were not yet registered, were taken by their fathers, or, in their absence, by their representatives (κτέρια), before the assembled members of the phratria. For every child, a sheep or goat was sacrificed. The victim was called μελός, and he who sacrificed it μεγαλυγός, μεγαλυγείτης. It is said that the victim was not allowed to be below,3 or, according to Pollux,4 above a certain weight. Whenever any one thought he had reason to oppose the reception of the child into the phratria, he stated the case, and, at the same time, led away the victim from the altar.5 If members of the phratria found the objections to the reception of the child to be sufficient, the victim was removed; when no objections were raised, the father, or he who supplied his place, was obliged to establish by oath that the child was the offspring of free-born parents and citizens of Athens.6 After the victim was sacrificed, the phratriae gave their votes, which they took from the altar of Jupiter Phratrius. When the majority voted against the reception, the cause might be tried before one of the courts of Athens; and if the claims of the child were found unobjectionable, its name, as well as that of the father, was entered in the register of the phratria, and those who had wished to effect the exclusion of the child were punished.7

On this day, also, illegitimate children, on whose heads the lot of the citizens was to be bestowed, as well as children adopted by citizens, and newly-created citizens, were introduced; but the last, it appears, could only be received into a phratria when they had previously been adopted by a citizen; and their children, when born by a mother who was a citizen, had a legitimate claim to be inscribed in the phratria of their grandfather, on their mother's side.8 In later times, however, the difficulties of being admitted into a phratria seem to have been greatly diminished.

Some writers have added a fourth day to this festival, under the name of τετέλεσα;9 but this is no particular day of the festival; for τετέλεσα signifies nothing else but a day subsequent to any festival.10

APELEUTHEROI. (Vid. Liben.)

APER. (Vid. Kapros.)

APERTA NAYIS. (Vid. Aphractus.)

APEX, a cap worn by the flaminies and salii at (come). The use of it was very ancient, being reckoned among the primitive institutions of Numas.

"Hinc ancilia, ab hoc apices, capilasque repertos." The essence, part of the apex, to which alone the name properly belonged, was a pointed piece of olive-wood, the base of which was surrounded with a lock of wool. This was worn on the top of the head, and was held there either by fillets only, or, as was more commonly the case, by the aid of a cap, which fitted the head, and was also fastened by means of two strings or bands (amenta, lorra). These bands had, it appears, a kind of knot or button, called ofodontis or ofodonticum.11

The flaminies were forbidden by law to go into public, or even into the open air, without the apex.12 Sulpius was deprived of the priesthood only because the apex fell from his head while he was sacrificing.13

Dionysus of Halicarnassus describes the cap as being of a conical form.14 On ancient monuments we see it round as well as conical. From its various forms, as shown on bas-reliefs and on coins of the Roman emperors, who, as priests, were entitled to wear it, we have selected six for the annexed woodcut. The middle figure is from a bas-relief, showing one of the salii with the rod in his right-hand. (Vid. Anglice.)

From apex was formed the epithet apicatus, applied to the flamen dialis by Ovid.15

*APHARCE (ἄφαρκα), a kind of pulse or vetch. Puchius and Matthiiphus refer it to the Victa secum; Dalechamp to the Victa angustifolia; Dono- nens and Stockhouse to the Lathyrus ophace. To this last Sprengel refers it in the first edition of his R. H. II., but in his edition of Dioscorides he hesitates as to whether it was the Victa Bithynica, the P. betae, or the V. hybrida.16

*APHARCE (ἄφαρκα), a plant mentioned by Theophrastus,17 which Stockhouse suggests may be the Rhamnus alaternus, or Evergreen Privet.18 Sprengel, however, is in favour of the Philyrea angustifolia. Schneider remarks, that some of the characters given by Theophrastus are wanting in the Philyrea.19

APTE&I TOI NMEPAI (άφεται ἡμέρας) were the days, usually festivals, on which the θησεί did not meet at Athens.20

*APHIA (άφια), a plant mentioned by Theophrastus, but of which nothing can be made satisfactorily, in consequence of the short notice given by him. Stockhouse suspects that it may be a false reading for ἀφία. In another place he suggests that it may be the Caltha palustris, or Marsh Marigold.21

APHRODISIA.

APHASTON. (Vid. Aplistre.)

APHRODISIAINE (άφροδισίαίνε) was the action brought against a banker or money-lender (τραπεζίτης) to recover funds advanced for the purpose of being employed as banking capital. Though such monies were often transferred from one depositor to another, or deposi
tories, to distinguish them from the private capital of the banker (έδα άφροδίς), there is an essential dif
tinction between the actions āφροδίσιας and παρακάτω
θήκης, as the latter implied that the defendant had refused to return a deposit intrusted to him, not upon the condition of his paying a stated interest for its use, as in the former case, but merely that it might be safe in his keeping till the affairs of the plaintiff should enable him to resume its possession in security.

The former action was of the class πρός τίνα, and came under the jurisdiction of the themonthemus. The speech of Demosthenes in be
half of Pharnes was made in a παραγωγή against an action of this kind.

APHRACTUS (ἀπράκτος μοῖρας), called also navis specula, a ship which had no deck, but was merely covered with planks in the front and hinder part, as is represented in the following cut, taken from a coin of Corecyra.

The ships which had decks were called κατά
θέτοντα or strata e strata. At the time of the Trojan war, the Greek ships had no decks, but were only covered in the prow and stern, which covering Homer calls the λιβάνη μοῖρας. Thus Ulysses, when preparing for combat with Scylla, says, Εἰς λιβάνη μοῖρας θηλών ἔφησε. Even in the time of the Persian war, the Athenian ships ap
pear to have been built in the same manner, since Thucydides expressly says that these ships were not yet entirely adopted.

APHRODISIÁ (Ἀφροδισία), festivals celebrated in honour of Aphrodite in a great number of towns in Greece, but particularly in the island of Cyprus. Her most ancient temple was at Paphos, which was built by Athis or Cinyras, in whose family the priestly dignity was hereditary. No bloody sacrifices were allowed to be offered to her, but only pure fire, flowers, and incense; and, therefore, when Tacitus' speaks of victims, we must either suppose, with Ernesti, that they were killed merely that the priests might inspect their intestines, or for the purpose of affording a feast to the persons present at the festival. At all events, however, the altar of the goddess was not allowed to be polluted with the blood of the victims, which were mostly beasts. Mysteries were also celebrated at Paphos in honour of Aphrodite; and those who were initiated offered to the goddess a piece of money, and received in return a measure of salt and a phallos in the natural text
**APLUSTRE.**

"water." The French term *aëre* comes from *aëkès*, in the same language, signifying "a brook."

APLUSTRE (ἅπλοστρον), an ornament of wooden planks, which constituted the highest part of the poop of a ship.

The position of the aplustre is shown in the representations of ancient vessels in the articles *Anchora* and *Antenna*. The forms there exhibited show a correspondence in the general appearance and effect between the aplustre which terminated the stern, and the ἀρκεστάς which advanced towards it, proceeding from the prow. *(Vid. Anchora.)* At the junction of the aplustre with the stern, on which it was based, we commonly observe an ornament resembling a circular shield: this was called ἀσπίδειον or ἀσπίδας. *It is seen on the two aplustra here represented.*

In the history of the Argonautic expedition, a bird is described, which perches on the aplustre of the ship Argo, and delivers oracular counsel.¹ Afterward, the extremities of this appendage to the stern are smashed by the collision of the Syracusian, while the bodies of the vessel narrowly escapes on its passage between those islands.

In the battle at the ships related by Homer,² as they had their poop landward, and nearest to the Trojans, Hector takes a firm hold of one by its aplustre, while he incites his followers to burn fire and burn them. After the battle of Marathon, some similar incidents are mentioned by Herodotus,³ especially the distinguished bravery of Cynægirus, brother of the poet Eschylus, who, having seized the aplustre of a Persian ship, had his hand cut off by a hatchet. In these cases we must suppose the aplustre to have been directed, not towards the centre of the vessel, but in the opposite direction.

The aplustre rose immediately behind the governor, who held the rudder and guided the ship, and it served in some degree to protect him from the wind and rain. The figure introduced in the article Anchora shows that a pole, spear, or standard (σταῖκα, σταῖκῆς) was sometimes erected beside the aplustre, to which a fillet or pennon (γαταία) was attached. This served both to distinguish and adorn the vessel, and also to show the direction of the wind. In the figure of a ship, sculptured on the column of L'Enfant, we see a lantern suspended from the aplustre so as to hang over the deck below the governor. In like manner, when we read in Virgil,⁴ "Puppibus et laetae nautæ improvere coronas," we must suppose the garlands, dedicated to the domest-

**APOCYNON.**

In the celebrated Apotheosis of Homer, now in the British Museum, the female who personates the Odyssey exhibits the same emblem in reference to the voyages of Ulysses.

APÔB'ATE (ἀπὸ βάτης). *(Vid. Desultores.)*

APOKER-ΤΙΧΙΣ (ἀποκερίσις) implies the method by which a father could at Athens dissolve the legal connexion between himself and his son. According to the author of the declaration on the subject (Ἀποκεριστόμενος), which has generally been attributed to Lucian, substantial reasons were required to ensure the ratification of such extraordinary severity. Those suggested in the treatise referred to are, deficiency in filial attention, riotous living, and profanity generally. A subsequent act of pardon might annul this solemn rejection; but if it were not so avoided, the son was denied by his father while alive, and disinherited afterward. It does not, however, appear that his privileges as to his tribe or the state underwent any alteration. The court of the archon must have been that in which cases of this kind were brought forward, and the rejection would be completed and declared by the voice of the herald. It is probable that an adoptive father also might resort to this remedy against the ingratitude of a son.⁵

APOCHEIROT'ONEIN (ἀποχειροτονεῖν). *(Vid. Archairesias.)*

⁵ *AP'OCYNON (ἐπικέννον), a species of plant, which Matthiolus informs us he long despaired of discovering; but that, at last, he was presented with a specimen of a plant which he was satisfied was it. He refers to the Cynæminus eresus, L. Dodoensis confounds it with the Periploca, to which, as Miller remarks, it bears a striking resemblance. Stephens describes it as being frequent in Burgundy, having an ivy leaf, white flower, and fruit like a bean.
APODECTE (αποδεκτής) were public officers at Athens, who were introduced by Kleisthenes in the place of the ancient colaeae (κολακεία). They were ten in number, one for each tribe, and their duty was to collect all the ordinary taxes, and distribute them to the separate branches of the administration which claimants referred to them. They had the power to decide causes connected with the subjects under their management; though, if the matters in dispute were of importance, they were obliged to bring them for decision into the ordinary courts.

The APODECTE (αποδεκτής) is, literally, a "list or register," but, in the language of the Attic courts, the terms ἀπογραφήν and ἀπογραφόθην have three separate applications: 1. ἀπογραφή was used in reference to an accusation in public matters, more particularly when there were several defendants; the denunciation, the bill of indictment, and enumeration of the accused, would in this case be termed ἀπογραφής, and differ but little, if at all, from the ordinary græphā. 2. It implied the making of a solemn protest or assertion before a magistrate, to the intent that it might be preserved by him till it was required to be given in evidence. 3. It was a specification of property, said to belong to the state, but in such a manner as to leave the evidence of possession, which specification was made with a view to the confiscation of such property to the state.

The last case only requires a more extended illustration. There would be two occasions upon which it would occur: first, when a person held public property without purchase, as an intruder; and, secondly, when the substance of an individual was liable to confiscation in consequence of a judicial award, as in the case of a declared state debtor. If no opposition were offered, the ἀπογραφή would attain its object, under the care of the magistrate to whose office it was brought; otherwise a petition arose, which is also designated by the same title.

In a cause of the first kind, which is said in some cases to have also borne the name πόλεν ἔχει τὰ χρήστες ταῦτα τῆς ἐν τῷ νόμῳ, the claimant against the state had merely to prove his title to the property; and with this the case might end, if it was a question of the ἀπογραφή, whereby the substance of another was, or was proposed to be, confiscated, on the ground that he had a loan by way of mortgage or other recognised security upon a portion of it; or that the part in question did not in any way belong to the state debtor, or person so mulcted. This kind of opposition to the ἀπογραφή is illustrated in the speech of Demosthenes against Nicostratus, in which we learn that Apollodorus had instituted a ἀπογραφή against Aristeus, for non-payment of a penalty incurred in a former action. Upon this, Nicostratus attacks the description of the property, and maintains that three slaves were specified, whereas there were only two. The case it is as belonging to Arethusa, for they were, in fact, his own.

In the second case, the defence could, of course, only proceed upon the alleged illegality of the former penalty; and of this we have an instance in the speech of Lysias for the soldier. There Polyarchus had been condemned by the generals to pay a fine for a breach of discipline; and, as he did not pay it within the appointed time, an ἀπογραφή to the amount of the fine was directed against him, which he opposes, on the ground that the fine was illegal. The ἀπογραφή might be instituted by an Athenian citizen; but if there were no private prosecutor, it became the duty of the demarchi to proceed with it officially. Sometimes, however, extra-

ordinary commissioners, as the συλλόγες and κρίται, were appointed for the purpose. The suite instituted against the ἀπογραφή belonged to the jurisdiction of the Eleven, and, for a while, to that of the Syndics. The former course of the case was, if he lost his cause (συλλόγιστοι), in all, he would probably be obliged to pay the costs or court fees (προσακρατοῦ) upon the same contingency:

A private citizen, who prosecuted an individual, by means of ἀπογραφή, forfeited a thousand drachmas if he failed to obtain the votes of one fifth of the diacasts, and reimbursed the defendant his protest upon acquittal. In the former case, too, he would probably incur a modified atima, i.e., a restriction from bringing such actions for the future.

APOLLO (Apollo) was, (ἀπόλλος ὄς ἁγιός), the laws of Athens permitted either the husband or the wife to call for and effect a separation. If it originated with the wife, she was said to leave her husband; if it proceeded from the husband, he was dismissed from it (ἀποσπομένειν). The disposal of the wife seems to have required little, if any, formality; but, as in one instance we find that the husband called in witnesses to attest it, we may infer that their presence upon such an occasion was customary, if not necessary. If, however, it was the wife who first moved in the matter, the other proceedings prescribed by a law of Solon; and the case of a virtuous matron like Hipparette, driven, by the insulting profligacy of her husband Alcibiaides, to appear before the archon sitting in his court, and there relate her wrongs and dictate their enactment, must have formed the model for the statute whereby a woman was permitted to speak for her upon this occasion for, until the separation was completed, her husband was her legal protector, and her husband was now her opponent. Whether the divorce was voluntary or otherwise, the wife resorted to the male relative, with whom she would have remained if she had never come to this state of affairs. The reason of his duty to receive or recover from her late husband all the property that she had brought to him in acknowledged dower upon their marriage. If, upon this, both parties were satisfied, the divorce was complete and final; if otherwise, an action ἀπολέγησις or ἀποστείφεις would be instituted, as the case might be, by the party opposed to the separation. In this the wife would appear by her representative, as above mentioned; but of the forms of the trial and its results we have no information.

APOLLO/IA (Ἀπολλο/ία) is the name of a propitiatory festival solemnized at Sicyon in honour of Apollo and Artemis, of which Pausanias gives the following account: Apollo and Artemis, after the destruction of the Python, had wished to be purified at Sicyon (Ἐγκαθάληκας); but, being driven away by a phantom (whence, in aftertimes, a certain spot in the town was called φόβος), they proceeded to Carmanos in Crete. Upon this, the inhabitants of Sicyon were attacked by a pestilence, and the scent ordered to be extinguished. However, the place where the sacrifice was offered, and the same number of girls were ordered to go to: the river Sythas, and bathe in its waters; then to carry the statues of the two deities into the Temple of Peitho, and thence back to that of Apollo. Similar rites, says Pausanias, still continue to be observed; for, at the festival of Apollo, the boys go to the river Sythas, and carry the two deities into

in Alc.)—4. (th., 7, 7, 7, 7.}
the Temple of Peitho, and thence back to that of Apollo.

Although festivals under the name of Apollo, in honour of Apollo, are mentioned in no other place, yet we are not unable to believe that they existed under the same name in other towns of Greece.

APOMOS'IÀ (apomeiasia) denoted the avowal of the litigant who impugned the allegations upon which the other party grounded his petition for postponement of the trial. (Vid. H'Ypomôsia.) If it was not contested, the trial would come to a decision of the question of delay by the court before which the petition was preferred.1

APÔIÔNE'MEUS ÆÌKH. (Vid. Apôleásieis ÆÌKH.)

APÔPHAN'SIS or APOP'HASIS (apofanias or ap'hasia) was used in several significations in the Attic courts. 1. It signified the proclamation of the decision which the majority of the judges came to at the end of a trial. This proclamation appears to have been made by a herald.2 2. It was used to signify the day on which the trial took place.3 III. It was employed to indicate the accusations of a person’s property, which was obliged to be given when an avóides was demanded. (Vid. Antíñosis.)

APÔPHORA (apophora), which properly means “produce or profit” of any kind, was used at Athens to signify the profit which accrued to masters from their slaves.4 It thus signified the sum which slaves were engaged to obtain the slaveholder on their own account, and the sum which masters received when they let out their slaves on hire, either for the mines or any other kind of labour, and also the money which was paid by the state for the use of the slaves who served in the fleet.5 The term Úpórophora was also applied to the money which was paid by the allied states to Sparta, for the purpose of carrying on the war against the Persians. When Athens acquired the supremacy, these moneys were called Òphorai.

APÔPHORÉTA (apophoréta) were presents, which were given to friends at the end of an entertainment to take home with them. These presents appear to have been usually given on festival days, especially during the Saturnalia.6

APÔPHRAEES H'ßMEPEAI (apofráides hýmeros) were unlucky or unfortunate days, on which no public business, nor any important affairs of any kind, were transacted. They were so called from the fact that these days but one of every month, and the twenty-fifth day of the month Tharchéion, on which the plúnteria were celebrated.7

APÔRRAIßDES (aporrháides), a species of sea-animal noticed by Aristotle, belonging to the genus Murex according to Roodaet and Gesner. Linneas calls it Cockle aporrházis.

APÔRRHE'TA (aporrhéta), literally “things forbidden,” has two peculiar but widely different acceptions in the Attic dialect. In one of these it implies contraband goods, an enumeration of which, at the time of the different periods of Athenian history, is given by Böck.8 In the other it denotes certain contumacious epithets, from the application of which both the living and the dead were protected by special laws.9 Among these, àpórfhónoi, parrakolai, and µptrólooi are certainly to be reckoned; and other words, as býpæthoi, though not forbidden nominative

by the law, seem to have been equity actionable. The penalty for using these words was a fine of 500 dracmae,10 recoverable in an action for abusive language. (Vid. Kátegoria.) It is surmised that this was done at Athens only, and certainly the only instance mentioned in the treatise is the occasion mentioned by Demosthenes.8

APÔSTASSI'ÔTO ÆÌKH (apostassian Æìkh). This is the only private suit which came, as far as we know, under the exclusive jurisdiction of the polemarch.4 It could be brought against none but a freedman (apólestror), and the only prosecutor permitted to appear was his master. To who he had been indebted for his liberty, unless this privilege was transmitted to the sons of such former master. The tenour of the accusation was, that there had been a default in duty to the prosecutor; but what attentions might be claimed from the freedman, we are not informed. It is said, however, that the greatest delict of this kind was the selection of a patron (prostatás) other than the former master. If convicted, the defendant was publicly sold; but if acquitted, the unprosperous connexion ceased forever, and the freedman was at liberty to select any citizen whom he chose. In this connexion, compounders were punished for their actions.11

APÓSTOLEIS (apostoleis), were ten public officers at Athens, whose duty was to see that the ships were properly equipped and provided by those who had delivered them to the government. The intention was to prevent the profiteering of the tricerarchs, who neglected to furnish the ships properly; and they appear to have constituted a board in conjunction with the inspectors of the docks (oi tôn nevouw témpelag) for the prosecution of all matters relating to the equipment of the ships.12

APÔTHÈCA (apothéka) was a place in the upper part of the house, in which the Romans frequently placed the earthen amphore in which their wines were deposited. This place, which was quite different from the evinaearia, was above the fumarium, since it was thought that the passage of the smoke through the room tended greatly to increase the savour of the wine.13

APÔTHEO'SIS (apothèosis), the enrolment of a mortal among the gods. The mythology of Greece contains numerous instances of the deification of a mortal hero. From the republican times of Greece we find few examples of such deification. The inhabitants of Amphipolis, however, offered sacrifices to Brasidas after his death;14 and the people of Egeste built a heron to Philippus, and also offered sacrifices to him on account of his personal beauty.15 In the Greek mythology, which arose in the East on the dismemberment of the empire of Alexander, it does not appear to have been uncommon for the successor or to the throne to have offered divine honours to the former sovereign. Such an apotheosis of Ptolemy, king of Egypt, is described by Theocritus in his 17th Idyll.16

The term apotheosis, among the Romans, properly signified the elevation of a deceased emperor to divine honours. This practice, which was common upon the death of almost all the emperors, appears to have arisen from the opinion, which was generally entertained among the Romans, that the souls of their ancestors were beyond the pleasures and, as it was common for children to worship the relics of their fathers, so it was natural for divine
APOTHEOSIS.

honours to be publicly paid to a deceased emperor, who was regarded as the parent of his country. The ceremony of apotheosis, the Consecratio, was called consecratio; and the emperor who received the honour of an apotheosis was usually said in deum numem referri, or consecrari. Romulus is said to have been admitted to divine honours under the name of Quirinus.1

None of the other Roman kings appears to have received this honour; and also in the republican times we read of no instance of an apotheosis. Julius Caesar was deified after his death, and games were instituted to his honour by Augustus.2 The ceremonies observed on the occasion of an apotheosis have been minutely described by Herodan in the following passage: It is the custom of the Romans to deify those of their emperors who die leaving successors, and this rite they call apotheosis. On this occasion a solemn procession, combined with festival and religious observances, is visible throughout the city. The body of the dead they honour after human fashion, with a splendid funeral; and, making waxen images in all respects resembling him, they expose it to view in the vestibule of the palace, on a lofty ivory couch of great size, spread with cloth of gold. The figure is made paddic, like a sick man. During most of the day senators sit round the bed on the left side, clothed in black, and noble women on the right, clothed in plain white garments, like mourners, wearing no gold or necklaces. These ceremonies continue for seven days; and the physicians severally approach the couch, and, looking on the sick man, say that he grows worse and worse. And when they have made believe that he is dead, the nobility of the equestrian and chosen youths of the senatorial orders take up the couch, and bear it along the Via Sacra, and expose it in the old forum. Platforms, like steps, are built upon each side, on one of which stands a chorus of nobles youths, and on the opposite a chorus of women of high rank, who sing hymns and songs of praise to the deceased, modulated in a solemn and mournful strain. Afterward they bear the couch through the city to the Campus Martius, in the broadest part of which a square pile is constructed entirely of logs of timber of the largest size, in the shape of a chamber, filled with fragrant aromatics and hangings interwoven with gold, and ivory images, and pictures. Upon this a similar but smaller chamber is built, with open doors and windows, and above it a third and fourth, still diminishing to the top, so that one might compare it to the lighthouses which are called Pharos. In the second story they place a bed, and collect all sorts of aromatics and incense, and every sort of fragrant fruit, or herb, or juice; for all cities, and nations, and persons of eminence emulate each other in contributing these last gifts in honour of the emperor. And when a vast heap of aromatics is collected, there is a procession of horsemen and chariots with the emperors, who, in their diurns clothed in robes of office, and wearing masks made to resemble the most distinguished Roman generals and emperors. When all this is done, the others set fire to it on every side, which easily catches hold of the fagots and aromatics; and from the highest and smallest story, as from a pinnacle, an eagle of gold is thrown to the sky as the fire ascends, which is believed by the Romans to carry the soul of the emperor from earth to heaven, and from that time he is worshipped with the other gods.2

In conformity with this account, it is common to see on medals struck in honour of an apotheosis an eagle with fire to it, and an eagle, the bird of Jupiter, taking flight in the air. To these medals alone, trace the names of sixty individuals who received the honours of an apotheosis, from the time of Julius Caesar to that of Constantine the Greek. On most of them the word CONSECRAATIO occurs, and on some Greek coins the word ΑΦΙΕΡΩΣΩΣ. The following woodcut is from these medals alone, trace the names of sixty individuals who received the honours of an apotheosis, from the time of Julius Caesar to that of Constantine the Greek. On most of them the word CONSECRAATIO occurs, and on some Greek coins the word ΑΦΙΕΡΩΣΩΣ. The following woodcut is

APPALLATIO (GREEK), (θησις or αύλωσις). Owing to the constitution of the Athenian tribunals, each of which was generally appropriated to its

particular subjects of cognizance, and, therefore, could not be considered as homogeneous with, or subordinate to, any other, there was little opportunity for bringing appeals, properly so called. It is to be observed that in this general cause was finally and irrevocably decided by the verdict of the dicasts (δικαί αὐτοτελή). There were, however, some exceptions, in which appeals and new trials might be resorted to.

A new trial to annul the previous award might be obtained, if the plaintiff should prove that it was not unjust, as negligence that judgment had gone by default, or that the dicasts had been deceived by false witnesses. (Compare EPHRMS ΔΙΚΗ, KA-

KOTEXINIΩΝ, and ἙΤΕΔΟΜΑΡΤΡΥΡΙΩΝ ΔΙΚΑΙ.) And upon the expulsion of the thirty tyrants, a special law annulled all the judgments that had been given during the usurpation. (1) The peculiar title of the above-mentioned causes was ἀνάκλιν δίκαι, which was also applied to all causes of which the subject-matter was by any means again submitted to the decision of a court.

An appeal from a verdict of the heliarchs was allowed, provided one of the parties was a citizen of a foreign state, between which and Athens an agreement existed as to the method of settling disputes between individuals of the respective countries (δίκαι ἀπὸ συμβάσεως). If such a foreigner lost his cause at Athens, he was permitted to appeal to the proper court in another state, which (ἐκηκτάριον) Bäck, Schömann, and Hudtwalcker suppose to have been the native country of the litigant. Platner, on the other hand, arguing from the intention of the regulation, viz., to protect both parties from the partiality of each other's fellow-citizens, contends that some disinterested state would probably be selected for this purpose. The technical words employed upon this occasion are ἐκακτηριά, ἐκακαλείσθαι, and ἐκηκτάριον, the last used as a substantive, probably by the later writers only, for ἐρήμη. (2) As well as the other cases of appeal, are noticed by Pollux in the following words:

ἐρήμης is when one transfers a cause from the arbitrators (δικαιοριστῶν), or archons, or men of the town (δήμων), to the dicasts, or from the senate to the assembly of the people, or from the assembly to a court (δικαιοσύνης), or from the dicasts to a foreign tribunal; and the cause was then termed ἐρημητικόν. Those suits were also called ἐκηκτηριακόν. The depository staked in appeals, which we now call a court or a tribunal, is called ἄριστομον. The appeals from the diatiete are generally mentioned by Demosthenes; (3) and Hudtwalcker supposes that they were allowable in all cases except when the ὑπὸ ὀφθαλμίς δίκαις was resorted to. (Vid. Dike.)

It is not easy to determine upon what occasions an appeal from the archons could be preferred; for, after the time of Solon, their power of deciding causes had degenerated into the mere presidency of a court (Greek) δικαιοσύνης, and the conduct of the previous examination of causes (κατάδεικτικά). It has been also remarked, (4) that upon the plaintiff's application, he was entitled to a general examination as such to be brought before a court, he would most probably proceed against the archon in the assembly of the people for denial of justice, or would wait till the expiration of his year of office, and attack him when he came to render the account of his conduct in the magistrate (ἐλάφον). An appeal from the archon, therefore, was made to other officers, very often, when they imposed a fine of their own authority, and without the sarcast of a court; and it might also take place when the king archon had by his sole voice made an award of dues and privileges (γέφα) contested by two priesthoods or sacral duties.

The appeal the slavery of the defendant could seek when a person, hitherto deemed one of their members, had been declared by them to be an intruder, and no genuine citizen. If the appeal were made, the demotes appeared by their advocate as plaintiff, and the result was the restitution of the franchise, or the return of the person to his former status. (5) It will have been observed, that in the last three cases, the appeal was made from few, or single, or local judges to the heliarchs, who were considered the representatives of the people or country. With respect to the proceedings, no new documents seem to have been added to the causes of the earlier law; but the anarchy would be confined merely to an examination, as far as was necessary, to those documents which had been already put in by the litigants.

There is some obscurity respecting the two next kinds of appeal that are noticed by Pollux. It is conjectured by Schömann (6) that the appeal from the senate to the people refers to cases which the former were, for various reasons, disinclined to decide, and by Platner, (7) that it occurred when the senate was accused of having exceeded its powers.

Upon the appeal from the assembly to court, there is also confusion between the terminologies of the last-mentioned critics, Schömann maintaining that the words of Pollux are to be applied to a voluntary reference of a case by the assembly to the dicasts, and Platner suggesting the possible case of one that incurred a prejudicium of the assembly against him (προσήλωσις, κατακείμενον) calling upon a court (δικαιοσύνη) to give him the opportunity of vindicating himself from a charge that his antagonist declined to follow up. Platner also supposes the case of a magistrate summarily deposed by the assembly, and demanding to prove his innocence before the higher court.

Appellatio (Roman). This word, and the corresponding verb appellare, are used in the early Roman writers to express the application of an individual to a magistrate, and particularly to a tribunal, in order to protect himself from some wrong inflicted, or threatened, or to be indemnified. The word provocatio, which in the early writers is used to signify an appeal to the populace in a matter affecting life, it would seem that the provocatio was an ancient right of the Roman citizens. The surviving Horatius, who murdered his sister, appealed from his misfortune to the courts of the city, and upon appeal, was avenged without the provocation; but it was restored by a lex consularius provocation, and it was at the same time enacted that in future no magistrate should be made from whom there should be no appeal. On this Livy remarks, that the plebes were now protected by the provocatio and the tribune omnis et excubitorum, a later term applied to the appellatio, properly so called. Appius (8) applied (appellavit) to the tribunes; and when this produced no effect, and he was arrested by a viator, he appealed (provocavit). Cicero (9) appears to allude to the re-establishment of the provocatio, which is mentioned by Livy. (10) The complete phrase to express the provocatio is provocare ad populam; and the phrase which expresses the appellatio is appellare ad, &c. It appears that a person might appellare from one magistrate to another of equal rank; and, of course, from an inferior to a superior magistrate, if the appeal were made from one of the former to another of the latter kind.

When the supreme power became vested in the emperors, the terms provocatio and appellatio lost their original signification. In the Digest, (11) provo

AQVÆ DUCTUS.

caelo and appellate are used indiscriminately; to express what we call an appeal in civil matters; but provocation seems so far to have retained its original meaning as to be the only term used for an appeal in criminal matters. The emperor centred in himself both the power of the populace and the veHS of the tribunes; but the appeal to him was properly in the last resort. Appellatio among the Roman jurists, then, signifies an application for relief from the decision of an inferior to a superior, on the ground of wrong decision, or other sufficient ground. According to Ulpian, appeals were common among the Romans, "on account of the injustice of the inferior court, who had declared (judicavit), though sometimes an appeal alters a proper decision, as it is not a necessary consequence that he who gives the last gives also the best decision." This remark must be taken in connexion with the Roman system of procedure, by which such matters were referred to a judge for his decision, after the pleadings had brought the matter in dispute to an issue. From the emperor himself there was, of course, no appeal; and, by a constitution of Hadrian, there was no appeal from the senate to the emperor. The emperor, in appointing a judge, might exclude all appeal, and make the decision of the judge final. But in some cases, or under some circumstances, he showed who was the appellant, against whom the appeal was, and what was the judgment appealed from.

Appellatio also means to summon a party before a judge, or to call upon him to perform something that he has undertaken to do. The debtor who was summoned (appellatus) by his creditor, and obeyed the summons, was said to respondere.

APPLICATIONIS JUS. (Vid. Bannishment.)

APPULAEIA LEX. (Vid. Majestas.)

APRILIS. (Vid. Calendar, Roman.)

APPROXIMATVQ TECAH (ἀπροστάτων γραφή), an action brought against those meteors, or resident aliens, who had neglected to provide themselves with a patron (προστάτης), or exercised the rights of full citizens, or did not pay the metoeci, a tax of twelve drachmas exacted from resident aliens. Persons convicted under this indictment forfeited the protection of the state, and were sold as slaves.

Aquæ Ductus usually signifies an artificial channel or water-course, by which a supply of water is brought from a considerable distance upon an inclined plane raised on arches, and carried across valleys and uneven country, and occasionally underground, where hills or rocks intervene.

As nearly all the ancient aqueducts now remaining are of Roman construction, it has been generally unnecessary to refer to them here, as they are described with some degree of detail in nearly every known work on the subject. Those which were largely unknown to the Greeks. This, however, is an error, since some are mentioned by Pausanias and others, though too briefly to enable us to judge of their particular construction; whether they consisted chiefly of subterraneous channels bored through hills, or more commonly, as is usually the case, across valleys, since the use of the arch, which is said to have been unknown to the Greeks, was indispensable for such a purpose. Probably those which have been recorded—such as that built by Pisistratus at Athens, that at Megara, and the celebrated one of Polykrates at Samos—were ratheradventures of engineers, and in no way equal with those of the latter, few were constructed in the times of the Roman Republic. We are informed from

1. (Dig. 40, tit. 1.—2.) (Gic., ad Att., i. 8.) (Pho., p. 475, Pers.—Bekker, Anecdot. Orc., p. 201, 434, 445.) (Aristot., H. A., ix. 21.) (Brish Zoology, p. 531.—6, (Herald., i. 80.)

tinus that it was not until about B.C. 313 that any were erected. The inhabitants supplying themselves, as well as by water from the Tiber, or making use of cisterns and springs. The first aqueduct was begun by Appius Claudius the Censor, and was named, after him, the Appia. It is supposed that the water was brought from the distance of between seven and eight miles from the city, almost entirely under ground, since, out of 11,190 passus, its entire extent, the water was above ground only 60 passus before it reached the Porta Capena, and then was only partly carried on arches. Remains of this work no longer remain.

For the Anio Vetus (B.C. 273) a second aqueduct was begun by M. Curions Dentatus, by which the water was brought from the river Anio, 36 miles above Tibur (now Tivoli), making an extent of 43,000 passus, of which only 705 were above ground and upon arches. This was the one afterward known by the name of Anio Vetus. The river Anio is one hundred miles long, and is composed of two large streams, one above the other; the lower course was lined with a thick coating of cement.

In B.C. 179, the censors M. Emilius Lepidus and M. Flaccus Nobilius proposed that another aqueduct should be built; but the scheme was defeated, in consequence of Lcinius Crassus refusing to let it be carried through his lands.

A more abundant supply of water being found indispenhable, particularly as that furnished by the Anio Vetus was of such bad quality as to be unfit for drinking, the senate commissioned Quintus Marcilius Rex, the praetor, who had superintended the repairs of the two aqueducts already built, to undertake a third, which was called, after him, the Aqua Marcia. This was brought from Sublaccaum (Subiaco) along an extent of 61,710 passus; viz, 54,367 under ground, and 7443 above ground, and chiefly on arches; and was of such elevation that water could be supplied from it to the loftiest part of the Campus Martius. Of the arches of this aqueduct a considerable number are still standing. Of these, otherwise, called the Aqua Tepula (B.C. 127), and the Aqua Julia (B.C. 35), which are next in point of date, remaines are still existing; and in the vicinity of the city, these two aqueducts and the Marcia were all united in one line of structure, forming three separate water-courses, one above the other, the lowermost of which formed the channel of the Aqua Marcia, and the uppermost that of the Aqua Julia, and they discharged themselves into one reservoir in common. The Aqua Julia was erected by M. Agrippa during his marriage, who, besides repairing both the Anio Vetus and the Aqua Marcia, added to the number of the Marcia's hundred wells (lacus), one hundred and fifty springs or fountains and one hundred and thirty reservoirs.

Besides repairing and enlarging the Aqua Marcia, and, by turning a new stream into it, increasing its supply to double what it formerly had been, Augustus built the aqueduct called Agrippiana, sometimes called Agrippine after its builder. The water furnished by it was brought from the Lake of Albisius, and was of such bad quality as to be scarcely fit for drinking; on which account it has been supposed that Augustus intended it chiefly for filling his nascaim. This required more water than could be obtained from the Marcia and its adjuncts, its basin being 1800 feet in length and 1200 in breadth. It was in the reign, too, of this emperor that M. Agrippa built the aqueduct called the Aqua Virgo, which
name it is said to have obtained because the spring which supplied it was first pointed out by a girl to some soldiers who were in search of water. Pliny, however, gives a different origin to the name. 1 Its length was 14,165 passus, of which 12,865 were under ground, and some part of it being above ground, it was decorated with columns and statues. This aqueduct still exists, having been re-stored by Nicholas V., although not completely until the pontificate of Pius IV., 1568, and it still bears the name of Aqua Vergina. A few years later, a second aqueduct was built by Augustus, for the purpose of supplying the Aqua Marcia in times of drought.

The two gigantic works of the Emperor Claudius, vix., the Aqua Claudia and Anio Novus, doubled the former supply of water; and although none of the later aqueducts rivaled the Marcia in the vastness and solidity of its constructions, they were of considerably greater extent. The Claudia had been begun by Caligula in the year A.D. 38, but was completed by his successor; and was, although less copious in its supply, not at all inferior to the Marcia in the excellence of its water. The other was, if possible, more magnificent. Many points of interest, remarkable for the quantity which it conveyed to the city, it being in that respect the most copious of them all. Besides which, it was by far the grandest in point of architectural effect, inasmuch as it presented, for about the extent of six miles before it reached the city, a continuous range of exceedingly lofty structure, the arches being in some places 109 feet high. It was much more elevated than any of the other aqueducts, and in one part of its course was carried over the Claudia. Nero afterward made additions to this vast work, by continuing it as far as Mount Custius, where was a temple erected to Claudius.

The Aqua Trajana, which was the work of the emperor whose name it bears, and was completed A.D. 111, was not so much an entirely new and distinct aqueduct as a branch of the Anio Novus brought from Sublaquemum, where it was supplied by a spring of purer water than that of the Anio. It was in the time of this emperor, and of his predecessor Nerva, that the superintendence of all the aqueducts was held by Sextus Julius Frontinus, whose treatise De Aquaeductibus has supplied us with the fullest and most trustworthy account which can be obtained relative to their history and construction.

In addition to the aqueducts which have been already mentioned, there were others of later date: namely, the Antoniana, A.D. 121; the Alexandrina, A.D. 230; and the Jovia, A.D. 300; but these seem to have been of comparatively little note, nor have we any particular account of them.

The magnificence displayed by the Romans in their public works of this class was by no means confined to the capital; for aqueducts more or less stupendous were constructed by them in various parts of Italy, as at Aquileia, Alba Longa, Arezzo, Aquileia, Ephesus, Smyrna, Alexandria, Syracuse, Metz, Nisami (the Font du Gard), Lyons, Evora, Merida, and Segovia. That at Evora, which was built by Quintus Sertorius, is still in good preservation; and at its termination in the city it has a very elegant castellum in two stories, the lower one of which was filled from the top of the aqueduct. The site of Augusta Emerita of the Romans, who established a colony there in the time of Augustus, has among its other antiquities the remains of two aqueducts, one of which, thirty-seven piers are standing, with three tiers of arches; while of the other there are only two arches from the point of the construction. The rest being modern. But that of Segovia, for which some Spanish writers have claimed an antiquity anterior to the sway of the Romans in Spain, is one of the most perfect and magnificent works of the kind anywhere remaining. It is entirely of stone, and of great solidity, the pier being eight feet wide and eleven in depth; and where it traverses a part of the city, the height is upward of a hundred feet, and it has two tiers of arches, the lower ones being twenty-five feet high.

After this historical notice of some of the principal aqueducts both at Rome and in the provinces, we now proceed to give some general account of their construction. Before the mouth or opening into the aqueduct was, where requisite, a large bauble, or collection of stones, which, in order to prevent the water from running in on the sides, was made to slope away from the opening, in order that it might first deposit its impurities; and similar reservoirs were formed at intervals along its course. The spouts, or water-channel, was formed either of stone or brick coated with cement, and was arched over at top, in order to exclude the sun, on which account, these were apertures or vent-holes at certain distances; or where two or more such channels were carried one above the other, the vent-holes of the lower ones were formed in their sides. The water, however, besides flowing through the spouts, passed also through pipes either of lead or burned earth (terre-cotta), a material which was very much used for greater cheapness, but as less prejudicial to the freshness and salubrity of the water. As far as was practicable, aqueducts were carried in a direct line; yet they frequently made considerable turns and windings in their course, either to avoid boring through hills, where that would have been attended with too much expense, or else to avoid, not only very deep valleys, but soft and marshy ground.

In every aqueduct, the castella or reservoirs were very important parts of the construction; and besides the principal ones—that at its mouth and that at its termination—their number was increased by intermediate ones at certain distances along its course, both in order that the water might deposit in them any remaining sediment, and that the whole might be more easily superintended and kept in repair, a defect between any two such points being readily detected. Besides which, these castella were serviceable, inasmuch as they furnished water for the irrigation of fields and gardens, &c. The principal castellum or reservoir was that in which the aqueduct terminated, and whence the water was conveyed by different branches and pipes to various parts of the city, either in open channels or covered ones, not in magnitude alone, but in solidity of construction and grandeur of architecture. The remains of a work of this kind still exist in what are called the Neve Sale, on the Esquiline Hill at Rome; while the Piscina Mirabilis, near Cume, is still more interesting and remarkable, being a stupendous construction about 300 feet in length by 130 in breadth, whose vaulted roof rests upon forty-eight immense pillars, disposed in four rows, so as to form five aisles within the edifice, and sixty arches.

Besides the principal castellum belonging to each aqueduct, there were two or three smaller reservoirs (which was conveyed at once to the baths), there were a number of smaller ones—altogether, it has been computed, 247—in the different regions of the city, as reservoirs for their respective neighbourhoods.

The declivity of an aqueduct (libramentum aqua) was at least the fourth of an inch in every 100 feet; 1 or, in other words, 1 in 500. 2 During the times of the Republic, the censors and aediles had the superintendency of the aqueducts; but under the emperors particular officers were appointed for that purpose, under the title of curatores, or prefects aquarum. These officers were first created by Augustus, and at first invested with considerable authority. They were attended outside the city by two lictors, three public slaves, a secretary, and other attendants.

In the time of Nerva and Trajan, about seven

1. (Plin. H. N. xxi. 31.)—2. (viii. 7.)—3. (Suet. Aug. 35.)
AQUARIUM

Architects and owners were constantly examined, under the orders of the curators aquarium, in attending to the aqueducts. The officers who had charge of these works were, 1. The villani, whose duty it was to attend to the aqueducts in their course to the city. 2. The castellari, who had the superintendence of all the castella both within and without the city. 3. The circutore, so called because they had to go from post to post, to examine into the state of the works, and also to keep watch over the labourers employed upon them. 4. The silicarii, or to attend to the buildings of rain-changers. All these officers appear to have been included under the general term of aquarii.

AQUAE DUCTUS. (Vid. Servitites.)

AQUAE ET IGNIS INTERDICTION (Vid. Punishment.)

AQUAE HAUSTUS. (Vid. Servitites.)

AQUA PLUVIAE ARCADICA ACTIO. That water was called aqua pluvia which fell from the clouds, and the prevention of injury to land from such water was the object of this action. The action aqua pluvia was allowed between the owners of adjoining land, and might be maintained either by the owner of the lower land, or the owner of the higher land, if the latter, by anything done to his land, prevented the water from flowing naturally from the higher to the lower land, or by the owner of the lower land against the owner of the higher land, in case the latter did anything to his land by which the water flowed from it into the lower land in a different way from what it naturally would. In the absence of any special custom or law to the contrary, the lower land was subject to receive the water which flowed naturally from the upper land; and this rule of law was thus expressed: aqua vasa in superius serviet. The hereditary materials carried down to the lower land were considered as an ample compensation for any damage which it might sustain from the water. Many difficult questions occurred in the application to practice of the general rules of law as to aqua pluvia; and, among others, this question: What things done by the owners of the land were to be considered as preventing or altering the natural flow of the waters? The conclusion of Ulpian is, that acts done to the land for the purposes of cultivation were not to be considered as acts interfering with the natural flow of the waters. Water which increased from the fall of rains, and in consequence of a change in its or, and water which, when coming on his land, if such marsh received any increase from rain-water, and so injured the land of a neighbour, the person would be compelled by this action to remove the obstacle which he had created to the free passage of the water.

This action was allowed for the special protection of fields which the water injured a town or a building, the case then belonged to flumina and stillcidic. The action was only allowed to prevent damage, and, therefore, a person could not have this remedy against his neighbour, who did anything to his own land by which he stopped the water which would have otherwise passed over it to the land of another, and made it injurious to it. The title in the Digest contains many curious cases, and the whole is worth perusal.

AQUARII were slaves who carried water for buildings, &c., into the female apartments. The aquarisi were also public officers who attended to the aqueducts. (Vid. Aqua Ductus.)

AQUILA. 1. A Roman military standard. (Vid. Signa Militaria.) 2. The Eagle. The ancient naturalists have described several species. Aristotle divided the Faltonida into 3 quarters (kites), with many subdivisions. M. Vigors is of opinion, that the division 'hieros (Hierax) of Aristotle comprises all the Falconids of Vigors which belong to the stipes or subfamilies of Hawk, Falcon, and Buzzard. Pliny separates the group into Aquila (Eagles) and Accipites, a general term comprising all the rest of the families. The subdivisions of both Aristotle and Pliny do not differ much from those of some of the modern zoologists.—We will now proceed to particulars. 1. The Macrurus, called also pluvius or niphon by Aristotle, would appear to be that species of Falco which bears the English names of Bald Buzzard and Osprey, niphon being derived from the Greek word meaning, that which the late authorities on Ornithology hold to be only a variety of the Golden Eagle, or Aquila Chrysaetos. It is deserving of remark, however, that the learned Gesner seems disposed to refer the Melanopere to the Erne, or Aquila Albicilla of late ornithologists. 2. The tropaeus of Aristotle is undoubtedly the Osprey, or the Aquila Chrysaetos, L., or Pandion Haliaetus, Savigny. 3. The Aquila Albanica of Aristotle would appear to be the Osprey. This bird is the "Ninus" of Virgil and Ovid. Naturalists have recently adopted the opinion that the Osprey is the same as the Sea-eagle. Its scientific name is Pandion Haliaetus, Savigny. 4. The Melanopterus of Aristotle, called also aquarius by him, is referred by Harleoun to the Aquila Articulata. 5. The Aquila Falconides which the late authorities on Ornithology hold to be only a variety of the Golden Eagle, or Aquila Chrysaetos. It is deserving of remark, however, that the learned Gesner seems disposed to refer the Melanopterus to the Erne, or Aquila Albicilla of late ornithologists. 6. The tropaeus of Aristotle is undoubtedly the Osprey, or the Aquila Chrysaetos, L., or Pandion Haliaetus, Savigny; for the ring-tail is now held to be a variety of the Erne. The term tropaeus signifies "of the Tiber." 7. The Astrild of Aristotle is probably Aquila vegetarian by Aristotle is confidently referred by Harleoun to the Golden Eagle, which, as Buffon remarks, is the noblest and largest of the genus. It is the Aquila Chrysaetos, Vigors.

AQUILLIA LEX. (Vid. Darnum.)

ARA (Arae, Arietis), an altar. Ara was a general term denoting any structure elevated above the ground, and used to receive upon its offerings made to the gods. Altar, probably contracted from alta ara, was properly restricted to the larger, higher, and more expensive structures. Hence Menalcas, proposing to erect four altars, &c., to Daphnis and two which were to be high altars, to Apollo, says, "En quattuor Arae: Ecce duas tibi, Daphni; duas, altaris, Phabre." Servius, in his commentary on the passage, observes, that altaras were erected only in honour of the superior divinities, whereas ares were consecrated not only to them, but also to the inferior, to heroes, and to deities. On the other hand, sacrifices were offered to the infernal gods, not upon altars, but in cisterns (scrobos, arietis, sedes, lactea) dug in the ground. Agreeably to this distinction, we find that in some cases an altar was erected upon an ara, or even several altars upon one of inferior elevation.

1. (Cl. at Fam. vii.), 6.—Cod. xii., 43 or 45, 1612.—2. Or. 23, did something to exc. 16, which was 9 from coming on his land, if such marsh received any increase in rain-water, and so injured the land of a neighbour, the person would be compelled by this action to remove the obstacle which he had created to the free passage of the water.

2. AQUARIUS were slaves who carried water for buildings, &c., into the female apartments. The aquarisi were also public officers who attended to the aqueducts.
represents an altar, which was found, with three others, at Antium. It bears the inscription ARA VENTORVM. On it is sculptured the rostrum of a ship, and beneath this is a figure emblematic of the wind. He floats in free space, blows a shell, and wears a chlamys, which is uplifted by the breeze. In the second altar the Æsculapius is distinguished by being hollow. Indeed altars, such as that on the left hand, were rather designed for sacrifices of fruits, or other gifts which were offered without fire, and lands sculptured upon the marble, being.

When the altars were prepared for sacrifice, they were commonly decorated with garlands or festoons. The leaves, flowers, and fruits of which these were composed were of certain kinds, which were considered as consecrated to such uses, and were called verduras.

Theocritus enumerates: 'Ce three following, viz., the oak, the ivy, and the asphodel, as having been used on a particular occasion for this purpose. The altar represented in the next woodcut shows the manner in which the festoon of verdure was suspended. Other ancient sculptures prove that festoons were not suspended, but were laid round the marble, being designed to imitate the recent and real decorations.

Besides the imitation of these ornaments, the art of the sculptor was also exercised in representing on the sides of altars the implements of sacrifice, the animals which were offered, or which were regarded as the emblems of various attributes and emblems of those deities. We see, for example, on altars dedicated to Jupiter, the eagle and the thunderbolt; to Apollo, the stag, the raven, the laurel, the lyre or cithara; to Bacchus, the panther, the thysius, the ivy, Silenus, bacechanis; to Venus, the dove, the myrtle; to Hercules, the poplar, the club, the labours of Hercules; to Sylvinus, the hog, the lamb, the cypress. Strabo says that the principal altar of the Temple of Diana at Ephesus was almost covered with the works of Praxiteles. Some of the altars which still remain are wrought with admirable taste and elegance. We give, as a specimen of the elaborate style, the outline of an Etruscan altar, in contrast with the unadorned altar in our first woodcut.

Besides symbohal and decorative sculptures in bas-relief, ancient altars frequently present inscriptions, mentioning the gods to whom, and the worshippers by whom, they were erected and dedicated. For example, an altar in Montefiascone, dedicated with an eagle which grasps the thunderbolt, and with a club, encircled with a fillet, at each of the four corners, bears the following inscription, included within a wreath of leaves:

OPT. MAX.
ET HERCVLI
IN VICTO
C. TVTICANVS
CALLIAT.
EXTRORO

We select this example, because illustrates the fact that the same altar was often erected in honour

The altar is about half as high as the pedestal of the statue, placed immediately in front of it, and adorned with a wreath of laurel. One of the two stands in an area, or a grove of laurel. Of the two, the Emperor Trajan, appears to be taking an oath, which he expresses by lifting up his right hand and touching the altar with his spear. This sculpture also shows the appearance of the tripod, which were frequently used instead of altars, and which are explained under the article Τίταροι.

We have already had occasion to advert, in several instances, to the practice of building altars in the open air wherever the occasion might require, as on the side of a mountain, on the shore of the sea, or in a sacred grove. But those altars which were intended to be permanent, and which were, consequently, associated with a greater expense of labour and of skill, belonged to temples; and they were erected either before the temple, as shown in the woodcut in the article ΑΡΧΩΝ, and beautifully exemplified in the remains of temples at Pompeii or within the cella of the temple, and principally before the statue of the divinity to which it was dedicated.

When altars in the open air before the temple were common, many of them were of a very simple form, the only ornament being a wreath of laurel or of palm, or an inscription, or a picture of a sacrifice (θυσίαν δεινα), which was a mark of consecration of the spot where an animal sacrifice (θυσίαν, θυρέα, λειτα) was presented: only incense was burned, or cakes and bloodless sacrifices (θυμόμονα, θια) offered on the altars within the building.

Altars were also placed before the doors of private houses. In Theocritus, Terence, a woman is said to ask the verdict of an altar so situated, in order to lay a child upon them before the door of the house. A large altar to Zeus the Protector stood in the open court before the door of Priam's palace in Ilium. Hither, according to the poets, Priam, Hecuba, and their daughers fled before the besieging Trojans; they were dragged with impious violence by Neoptolemus, the son of Achilles, and some of them put to death. All altar places were of refuge. The suppliants were considered as placing themselves under the protection of the deities to whom the altars were consecrated; and violence to the unfortunate, even to slaves and criminals, in such circumstances, was regarded as violence towards the deities themselves.

As in the instance already produced, in which the gods conspired against the Titans, men likewise were accustomed to make solemn treaties and covenants, by taking oaths at altars. Thus Virgil represents the infernal Parnassus entering into a league, before its altar of Jupiter, by immolating a sow, while they hold the pateras for libation in their hands. The story of Hannibal's oath at the altar, when a boy, is well known.

Another practice, often alluded to, was that of touching altars in the act of prayer. Marriages also were solemnized at the altars; and, indeed, for the obvious reason, that religious acts were almost universally accompanied by sacrifice as an essential part of them, all engagements which could be made more binding by sacred considerations were often formed between the parties before an altar.

*ARABICHE, (μεσογνή), is spoken of by Dioscorides as a Galen, and was probably a fine white marble.

*ARACHNE, Αράχνη (οικίς or γη), the Spider, or genus Aranea, L. Several species are mentioned by Aristotle, but so briefly that they cannot be satisfactorily ascertained. Dioscorides describes two species by the names of ηλώς and ηλὼς. The former of these, according to Sprengel, is the Aranea velatissima, and the

We see here Apollo with some of his attributes, viz., the stag, the tripod, the cithara, and plectrum.

tatter the *Aranea domestica*. Sprengel is farther of opinion that no ancient author has noticed the *Aranea Tetrandra*. But vid. Phalanion.†

*ARACHIDNA* (αράχιδνα), a species of Pea, the same, according to Scaucus and Sprengel, with the *Lathyrus ambiglumulus*. Scaucus housekeepers to read αράχιδνα in the text of Theophrastus.‡

*AK'ACUS* (ακακος), a plant, which Sprengel, in the first edition of his R. H. H., marks as the *Lathyrus tuberosus*; but in his second, he confines to the *Phax arvense*. Housekeepers hesitate about acknowledging it as the *Victoria cracca*, or Tufed Vetch.§

*ARANEA*. (Fid. Arachne.)

**ARA'TEIA** (αρατεία), two sacrifices offered every year at Sicyon in honour of Aratus, the great general of the Achaeans, who, after his death, was honoured by his countrymen as a hero, in consequence of the command of an oracle.¶ The full account of the two festive days is preserved in Plutarch's Life of Aratus.¶

The Sicyonians, says he, offer to Aratus two sacrifices every year, the one on the day on which he delivered his native town from tyranny, which is the fifth of the month of Daisius, the same which the Athenians call Anthesterion; and this sacrifice they call *sauris*. The other they celebrate in the month in which they believe that he was born. On the first, the priest of Zeus offered the sacrifices; on the second, that of Aratus bearing a white riband with purple spots in the centre, songs being sung to the guitar by the actors of the stage. The public teacher (γυμνασιαστήρ) led his boys and youths in procession, probably to the heroon of Aratus, followed by the senators adorned with garlands, after whom came those citizens who wished to join the procession. The Sicyonians still observe, he adds, some parts of the solemnity, but the principal honours have been abolished by time and other circumstances.¶

**ARA'TUM** (αρατούμ), a plough.

The Greek word *ara* to appear to have had, from the earliest times, diversities in the fashion of their ploughs. Hesiod advises the farmer to have always two ploughs, so that if one broke, the other might be ready for use; and they were to be of two kinds, the one called *arbróvos*, because in it the plough-tail (γεγομένη, *bara*), was of the same thickness with the share-beam (*skeuia*, *dens*, *dental*), and the pole (*hypus,  ἑκοβετές, *temo*); and the other called *pipérós, *i. e.*, compacted, because in it the three above-mentioned parts, which were, moreover, to be of three different kinds of timber, were adjusted to one another, and fastened together by means of wedges (*pyktóta*).

The method of forming a plough of the former kind was by taking a young tree with two branches proceeding from its trunk in opposite directions, so that while in ploughing the trunk was made to serve for the pole, one of the two branches stood upward and became the tail, and the other penetrated the ground, and was covered with strips of timber; the share-beam, which, besides, had a riband of bronze or iron, fulfilled the purpose of a share. This form is exhibited in the uppermost figure of the annexed woodcut, taken from a metal. The next figure shows the plough still used in Myasis, as described and delineated by a late traveller in that country. Mr. Fellows observes that it is a little smaller than the first plough, inasmuch as it consists of two pieces of timber instead of one, a handle (*kýrtis, *slivis*) being inserted into the larger piece at one side of it. Mr. Fellows observes that each portion of this instrument is still called by its ancient Greek name, and adds that it seems suited only to the light soil prevailing where he observed it; that is

ARATUM.

held by one hand only; that the form of the share (βοῦς) varies; and that the plough is frequently used without any share. "It is drawn by two oxe, yoked from the pole, and guided by a long reed or thin stick (καρτίνος), which has a spud or scraper at the end for cleaning the share." See the lowest figure in the woodcut.

Another recent traveller in Greece gives the following account of the plough which he saw in that country, a description approaching still nearer to the *πίτθων ἄρτινος* of Homer and Hesiod. "It is composed," says he, "of two curved pieces of wood, one longer than the other. The long piece forms the pole, and one end of it being joined to the other part about a foot from the bottom, divides it into a share, which is cased with iron, and a handle. The share is, besides, attached to the pole by a short crossbar of wood. Two oxen, with no other harness than yokes, are joined to the pole, and driven by the ploughman, who holds the handle in his left hand, and the goad in his right." A beautiful view of the plain of Elis, representing this plough in use, is given by Mr. S. Stanhope in his *Olympia.*

The yoke and pole used ancently in ploughing did not differ from those employed for draught in general. Consequently, they do not here require any farther description. (Fid. Jocosa.)

To the bottom of the pole, in the compacted plough, was attached the plough-tail, which, according to Hesiod, might be made of any piece of a tree (especially the *πίπος, i. e.* the iex, or holm-oak), the natural curvature of which fitted it to this use. But in the time and country of Virgil, pains were taken to force a tree into that form which was most exactly adapted to the purpose.

"Continuo in silvis magna vi fexa domatum
In burinum, et curso formam accepit unlaw aravit."

The upper end of the buris being held by the ploughman, the lower part, below its junction with the pole, was used to hold the share-beam, which was either sheathed with metal, or driven bare into the ground, according to circumstances.

To these three continuous and most essential parts, the two following are added in the description of the plough by Virgil:

1. The earth-boards or mould-boards, rising on each side, bending outwardly in such a manner as to throw on either hand the soil which had been previously loosened and raised by the share, and adjusted to the share-beam, which was made double for the purpose of receiving them: "Bina aures, duplicit aplicant dentalia dorsi." According to Palladius, it was desirable to have ploughs both with earth-boards (aurites) and without them (simplicia).

2. The handle, which is seen in Mr. Fellows's woodcut, and likewise in the following representation of an ancient Italian plough. Virgil considers

1. (Hobbse, Journey through Albania, &c. vol. i. p 149.)
2. (Georg. i. 109, 170.) — 4. (i. 43.)
this part as used to turn the plough at the end of the furrow: "Silvaeque, qua curvat a longo locutum hanc." Servius, however, in his note on this line, explains it to mean "the handle by which the plough is directed." It is probable that, as the denella, i.e., the two share-beams, which Virgil supposed, were in the form of the Greek letter Α, which he describes by duplci dorso, the buris was fastened to the left share-beam, and the stiva to the right; so that, instead of the simple plough of the Greeks, described by Servius, Mantua poet, and used, no doubt, in his country (see the following woodcut), was more like the modern Lancashire plough, which is commonly held behind with both hands. Sometimes, however, the stiva (ξηρόν) was used alone and instead of the tail, as in the Mстыan plough above represented. To a plough so constructed, the language of Columella was especially applicable: "Arato sitva pane rectus inmittitur," and the expressions of Ovid, "Silvaeque inrīcis arator," and "Inde premens sitovam designat mamma sulco." In place of "sitva," Ovid also uses the less appropriate term "celpulums." "Fae manae capulums praecisi moderatavus arath." When the plough was thus held either by the stiva alone, or by the buris alone, a piece of wood (manicula) was fixed across the summit, and on this the labourer pressed with both hands. Besides guiding the plough in a straight line, his duty was to force the share to a sufficient depth into the soil. Virgil alludes to this in the lines: "Depresso aratro ..."

The crossbar, which is seen in Mr. Fellows' drawing, and mentioned in Sir J. C. Hobhouse's description, and which passes from the pole to the share for the purpose of giving additional strength, was called σαββυ, in Latin fulcrum.

The coulter (cullæ) was used by the Romans as it is with us. It was inserted into the pole so as to depend vertically before the share, cutting through the roots which came in its way, and thus preparing for the more complete loosening and overturning of the soil by the share.

About the time of Pliny, two small wheels (rotae, subulae) were added to the plough in Rhaeta; and Servius mentions the use of them in the country of Virgil. The annexed woodcut shows the form of a wheel-plough, as represented on a piece of engraved jasper, of Roman workmanship. It also shows distinctly the coulter, the share-beam, the plough-tail, and the handle or stiva. The plough corresponds in all essential particulars with that now used about Mantua and Venice, of which Martin has given an engraving in his edition of Virgil's Georgics.

The Greeks and Romans usually ploughed their three times for each crop. The first ploughing was called procisendae, or noarea (procisēus, velōeus); the second, offringere, or iterare; and the third, iterare, or tertiare. 11 The field which under-went the "procisendo" was called verucuum or verum (verum), and in this process the coulter was employed, because the front surface was entangled with the weeds roots, which required a division before the soil could be turned up by the share. The term "offringere," from off and fringere, was applied to the second ploughing, because the long parallel cols already turned up were broken and cut across, by drawing the plough across its right angles to its former direction. 2 The field which underwent this process was called ager iteratus—ditocola. After the second ploughing, the sower cast his seed. Also the cols were often, though not always, broken still farther by a wooden mallet, or by harrowing (scarin). The Roman ploughman then, for the first time, attached the harrow to his plough. 3 The effect of this adjustment was to divide the level surface of the "ager iteratus" into ridges. These were called porca, and also kera, whence came the verb lēvare, to make ridges, and also delevare, to decline from the straight line. 4 The earth-boards, by throwing the earth from the side of the furrow, which was already flattened, both covered the newly-scattered seed, and formed between the ridges furrows (adiakês, sulic) for carrying off the water. In this state the field was called seges and triplola. The use of this last term by Homer and Æsop proves that the triple ploughing was practised as early as their age. 5 When the Romans ploughed three times only, it was done in the spring, summer, and autumn of the same year. But, in order to obtain a still heavier crop, both the Greeks and the Romans ploughed four times, the prosisendo being performed in the latter part of the preceding year, so that between one crop and another two whole years intervened. 6 A field so managed was called acred or acra. When the ploughman had finished his day's labour, he turned the instrument upside down, and the oxen went home dragging its tail and handle over the surface of the ground—a scene exhibited to us in the following lines:

"Videre fessos comarem interiusso boves
Colo trihentes languido" 7

The Greeks and Romans commonly employed oxen in ploughing; but they also used asses for light work. In this country we use both an ox and an ass, which was expressly forbidden by the law of Moses,18 is made the ground of a ludicrous comparison by Plautus. 19 Ulysses, when he feigned madness in order to avoid going on the Trojan expedition, ploughed with an ox and a horse together. 12

A line has been already quoted from Ovid's Fasti, which mentions the use of the plough by Romulus for marking the site of Rome. 'On this occasion a white bull and a white cow were yoked together: "Alba jugum nīvō cum bove cava lūtī." Beside this ceremony at the foundation of cities or colonies, it was usual to draw the walls when they were conquered by the Romans. 20

ARBITER. (Vid.aped.)

ARBITRATOR ACTIO. (Vid. Actio, p. 17.)

ARBUTUM (μαύλακανον και κούρανον), the fruit of the Wild Strawberry-tree, or Arbutus. It has very much the appearance of our strawberry, except that it has a longer stem, and hangs outside of the pulp, like that fruit. The arbuteo-tree grows plentifully in Italy, and the poets have supposed that the early race of men lived on acorns and the fruit of this tree before the discovery and
ARCHAICAESTAI (άρχαιαται) were the assemblies of the people which were held for the election of the magistrates at Athens who were not chosen by lot. The principal public officers were all chosen by lot (κλαρότω), and the lots were drawn annually in the temple of Theseus by the thesmotheta. Of these magistrates chosen by the general assembly of the people (χειροτονηστών), the most important were the strategi, taxiarchoi, lichiprarchi, and phylarchi. These magistrates were the kings (katoikoi), and the officers connected with the collection of the tribute, all ambassadors, commissioners of works, &c., were appointed in the same manner.

The people always met in the Pryx for the election of these magistrates, even in later times, when they (as became usual) to meet for other purposes in the Temple of Theseus. It is not known at what time of the year they met for this purpose, nor who presided over the assembly, but most probably the archons. The candidates for these offices, especially for that of strategus, had recourse to bribery and corruption to a great extent, although the laws were awarded capital punishment to that offence, which was called by the Athenians διαβολος. The canvassing of the electors and the solicitation of their votes was called ιεραρχείαν. The magistrates who presided over the assembly mentioned the names of the candidates (προδόλελεσθαι), and the people declared their acceptance or rejection of each candidate. The people appeared to have voted by ballot on these occasions.

Those who were elected could decline the office, alleging upon oath some sufficient reason why they were unable to discharge its duties, such as labouring under a disease, &c.; the expression for this was ἀργυρον καθαρθηκαν. If, however, an individual accepted the office to which he was chosen, he could not enter upon the discharge of his duties till he had passed his examination (διακατασχώσεις) before the thesmotheta. If he failed in passing his examination (ἀποδοκιμασθήθαι), he incurred a modified species of αἷμα. All public officers, however, were subject to the ἀρχαιοτεκτονα or confirmation of their appointment by each successive prytany at the commencement of its period of office, when any magistrate might be deprived of his office (ἀρχαιοτεκτονεῖσθαι). In the Attic oaths we are not infrequently read of individuals being the deprived of their offices. (Vid. Archaiaestai.)

ARCHAETER. (άρχαιτερ, compounded of ἀρχαῖος or ἀρχαῖον, a chief, principal, a physician), a medical title under the Roman emperors, the exact signification of which has been the subject of much discussion; for while some persons interpret it "the chief of the physicians" (γαῖας ἀρχαῖας τῶν ἱατρῶν), others explain it to mean "the physician to the prince" (γαῖας ἀρχαῖας ἱατρῶν). Upon the whole, the question may more truly be said, the true form is the "chief of the physicians," and for these reasons: 1. From its etymology it cannot

possibly have any other sense, and of all the words similarly formed (οἰχητάων, οἰχητίλιαω, οἰχη-
τικόνωσι, &c.) there is not one that has any refer-
ence to the sphere applied to physicians who lived at Edessa, Alexandria, &c.,
where no king was at that time reigning. 3. Gal-
en speaks of Andromachus being appointed "to
rule over" the physicians (αὐχεμών, i. e., in fact, to be
"archiater"). 4. Augustine applies the word to
Eusebius, and St. Jerome (metaphorically, of course,
though the title, it would seem, was often inter-
preted in a more restricted sense) to the Emp-
peror, being evidently "the chief physician." 5. It is
apparently synonymous with prodomedicus, sugra medi-
cus, dominus medicorum, and superpustilis medicorum,
all which expressions occur in inscriptions, &c. 6.
We find the names of several persons who were
physicians to the emperor mentioned without the
addition of the title archiater. 7. The archiaters
were divided into A. sancti palatii, who attended
on the emperor, and A. populares, who attended on
the people; so that it is certain that all those who
bore this title were not "physicians to the prince.
"The chief argument in favour of the contrary opin-
ion is found, it would seem, in the fact that of all those
who are known to have held the office of A., the
greater part certainly were physicians to the em-
peror as well; but this is only what might, a priori,
be expected, viz., that those who had attained the
highest rank in their profession would be chosen to
attend on the emperor. The same may very well as in England, the
President of the College of Physicians is ex-officio
physician to the sovereign.

The first person whom we find bearing this title is
Andromachus, physician to Nero, and inventor of the Theriac": (Vid. Theriac.) But it is not
known whether he had at the same time any sort of
authority over the rest of the profession, for
in fact, the history of the title is as obscure as its
meaning, and it is chiefly by means of the laws
respecting the medical profession that we learn the
laws and duties attached to it. In after times (as
was stated above) the order appears to have been
divided, and we find two distinct classes of archi-
atri, viz., those of the palace and those of the people.

The A. sancti palatii were persons of high rank,
who not only exercised their profession, but were
judges on occasion of any disputes that might oc-
cur among the physicians of the place. They
had certain privileges granted to them, e. g., they were
exempt from the attendance of any of their own
children also; were not obliged to lodge soldiers or
others in the provinces; could not be put in prison,
&c.; for, though these privileges seem at first to
have been common to all physicians, yet after-
ward they were confined to the A. of the palace
and to those of Rome. When they obtained their
dismission from attendance on the emperor, either
from old age or any other cause, they retained the
title ex-archiatar or ex-archiathor. The A. populares
were established for the relief of the poor, and each
city was to be provided with five, seven, or ten, ac-
cording to the resources of the people. They were
beside one for the vestal virgins, and one for the blind.
They were paid by the government, and were therefore obliged to attend their poor patients grat-
uitous, but were allowed to receive fees from the rich.

The A. populares were not appointed by the gov-
ernor of the provinces, but were elected by the people
of the city. The office was not considered to be
more lucrative than that of A. palatii, though less
honourable. In later times, we find in Cassio-
dorus the title "comes archiathororum," and in the
archiathir, together with an account of his duties
by which it appears that he was the archiater and
judge of disputes and difficulties, and ranked
among the officers of the Empire as a viricus or dux.

ARCHIMIUS. (Vid. Mimius.)

ARCHITECTURA. (Vid. Amphitheatrum, Aque Ductus, Arcus, Basilica, Bath, Hecate,
Temple, &c.)

ARCHTHEOS. (Vid. Teoria.)

ARCHON. (αὐχέων) The government of Athens
appears to have gone through the cycle of changes,
which history records as the lot of many other
states. It began with monarchy; and, after pass-
ing through a democracy and aristocracy, ended
in democracy. (By dynasty is here meant that Emperor, though not monarchical, was con-
fined to one family.) Of the kings of Athens, con-
considered as the capital of Attica, Theseus may be
said to have been the first; for to him, whether as a
real individual or a representative of a certain period,
is attributed the union of the different and
independent states of Attica under one head. The
acknowledgement of whose patriotism in meeting death for his country, the Athenians are said to have determined that no one
should succeed him with the title of βασιλεύς, or
king. It seems, however, equally probable, that it
was the nobles who availed themselves of this op-
nportunity to serve their own ends by constituting
the another, the possessors of which they called αὐχεμών, or rulers. These for some time continued to be, like the kings of the house of Codrus, appointed for life: still an im-
portant point was gained by the nobles, the office
being made μέτριον, or accountable, which, of
necessity, implies that the nobles, who first held
it over the people, like the barons of the feudal ages,
exercised the power of deposition.

This state of things lasted for twelve reigns of
archons. The next step was to limit the continu-
oance of the office to ten years, still continuing it to
the Medonid, or house of Codrus, so as to estab-
lishment what the Greeks called a democracy, till the
archiship of Eryxias, the last archon of that family
elected as such. At the end of his ten years (B.C.
694), a much greater change took place: the archi-
ship was made annual, and its various duties
were divided among a college of nine, chosen by suffrage
(ευποροικεία) from the Eupatries, or Patricians, and
not as a rule from the Hetairoi, or commoners. This
arrangement continued till the temposcy
established by Solon, who made the qualification
for office depend not on birth, but property, still retain-
ing the election by suffrage, and, according to Plat-
tarch, so far impairing the authority of the archons
and other magistrates as to legalize an appeal from
them to the courts of justice instituted by himself.
The election by lot is believed to have been intro-
duced by Cleisthenes (B.C. 508); for we find this prac-
tice existing shortly after his time; and Aristotle ex-
pressly states that Solon made no alteration in the
ἄρτας, or mode of election, but only in the qualifica-
tion. And now, however, there be no interpretation
in the oath of the Heliacon, and the conclusion is that the election by lot was as old as the
same time of the archon; but the authority of Aristotle and other evi-
dence strongly incline us to some such supposition,
or, rather, leave no doubt of its necessity. The last
change is supposed to have been made by Aristel-
des, who, after the battle of Platea (B.C. 479).

1. (Vid. Le Clerc, and Sprenger, Hist. de la Med.–2. (Vid. Sienese, s. v.)
2. (Vid. Tert. de Adu., c. 13.)—2. (De Civ. Deli., iii., 17.)—

Theol., i. c. 19.)—11. (Dig. 50, tit. 9, c. 11.)—12. (Vid. Melbourn,
Comment in Car. Formul. Archit. Helmut, 1068.)
abolished the property qualification, throwing open the archonship and other magistracies to all the citizens, that is, to the Thetes as well as the other classes, the former of whom were not allowed by Solon’s laws to hold any magistracy at all; in conformity with which, we find that, even in the time of Aristides, the archons were chosen by lot from the wealthiest class of citizens.

Still, after the removal of the old restrictions, some security was left to ensure respectability; for, previously to an archon entering on office, he underwent an examination, called the ἀνακρίσις, as to his being a legitimate and a good citizen, a good suffrage, and in some other respects of a sacred character. Yet, even after passing a satisfactory ἀνακρίσις, each of the archons, in common with other magistrates, was liable to be deposed, on complaint of mis-conduct made before the people, at the first regular assembly in each prytaneion. On such an occasion, the ἄρχονταρχον, as it was called, took place; and we read that, in one case, the whole college of archons was deprived of office (ἀνακρίσιμος ἀρχοντος) for the misbehaviour of one of their body: they were, however, reinstated, in promise of better conduct for the future. (Vid. Archonial.)

With regard to the later ages of Athenian history, we learn from Strabo that even in his day (πέρι τοῦ) the Romans allowed the freedom of Athens; and we may conclude that the Athenians would fondly cling to a name and office associated with some of their most cherished remembrances. The archonship, however, in every respect, was merely honorary, we might expect from the analogy of the consulate at Rome; and, indeed, we learn that it was sometimes filled by strangers, as Hadrian and Plutarch. Such, moreover, was the democratical tendency of the assembly, both for the form and its constitution; and we are told, that even in earlier times, the archons had lost the great political power which they at one time possessed; and that, too, after the division of their functions among nine. They became, in fact, not, as of old, directors of the government, but merely municipal magistrates, exercising functions and having duties, not unlike those of the praefectus urbis.

It has been already stated that the duties of the single archon were shared by a college of nine. The first, or president of this body, was called ἀρχιμακροχρόνιος, by way of pre-eminence; or ἄρχων ἐπάνω, from the year being distinguished by and registered in his name. The second was styled ἀρχιμακροχρόνιος, or κύριος ἀρχοντικός, to become distinguished by oath and declared to be the commander-in-chief; the remaining six, ἐπεξερευναντες, or legislators. As regards the duties of the archons, it is sometimes difficult to distinguish what belonged to them individually and what collectively. It seems, however, that a considerable portion of the judicial functions of the ancient kings devolved upon the ἄρχων ἐπάνω, who was also constituted a sort of special interlocutor of the court who was unable to defend themselves. Thus he was to superintend orphans, heiresses, families losing their representatives, (οἰκος οἱ ἐπαταμοῦιοι), widows left pregnant, and to see that they were not wronged in any way. Should any one do so, he was empowered to inflict a fine of a certain amount, or, in extreme cases, to bring the parties to trial. Heiresses, indeed, seem to have been under his peculiar care; for we read that he could compel the next of kin, either to marry a poor heiress himself, even though she were of a lower class, or to portion her in marriage to another. Again, we find, that, in cases of inheritance, if orphans or heiresses adjudged to others, he summoned the party in possession, before the archon eponym, who brought the case into court, and made arrangements for trying the suit. We must, however, bear in mind that this authority was only exercised in cases where the parties were citizens, the polemarch having corresponding duties when he was a citizen. He was an alien. It must also be understood, that, except in very few cases, the archons did not decide themselves, but merely brought the causes into court, and cast lots for the dicasts who were to try the issue. Another duty of the archons was to register and superintend all the orphans and alien orphans, who had wronged heiresses, children who had maltreated their parents, guardians who had neglected or defrauded their wards. Informations of another kind, the ἑπεξερεύνηται, and ὁμονομακορύφοι, were also laid before the eponymous, though Demosthenes assigned the former to the themonarch. The last office of the archons which we shall mention was of a sacred character; we allude to his superintendence of the greater Dionysia and the Thargelion, the latter celebrated in honour of Apollo and Artemis.

The functions of the ἄρχων ἐπάνω were almost all connected with religion: his distinguishing title denoting that he was considered the representative of the old kings in their capacity of high-priest, as the Regis Sacrum was at Rome. Thus he presided at the Lenaea, or older Dionysia; superintended the mysteries and the games called λαυραδηφορίαι, and had to offer up sacrifices and prayers in the Eleusinian wooden temple of Demeter, and to overlook the minutes of the judges of the Dionysiac games. He tried for perjury, and condemned for impiety, and controversies about the priesthood, were laid before him; and, in cases of murder, he brought the trial into the court of the avεις, and voted with its members. His wife, also, who was called Βασίλεισσα, had to offer certain sac red oblations. For his office he required, to the credit of an citizen of pure blood, without stain or blemish. His court was held in what was called η τοῦ βασιλεύτος στόλος.

The polemarch was originally, as his name denotes, the commander-in-chief; and we find him discharging military duties as late as the battle of Plataea, in which Macartor was killed. Moreover, he there took, like the kings of old, the command of the right wing of the army. This, however, seems to be the last occasion on record of this magistrate, appointed by lot, being invested with such important functions; and in after ages we find that his duties ceased to be military, having been in a great measure transferred to the commanders-in-chief and superintendence of the resident aliens, so that he resembled in many respects the praetor peregrinus at Rome. In fact, we learn from Aristotle, in his

ARCTOS.

"Constitution of Athens," that the polemarch stood in the same relation to foreigners as the archon to citizens.1 Tun, all actions affecting aliens, the isoles and proem, were brought before him provided he was: on duty, for instance, when the dikan apotatōs against a foreigner for living in Athens without a patron; so was also the dikē apotatōs against a slave who failed in his duty to the master who had freed him. Moreover, it was the polemarch's duty to offer the yearly sacrifice to Artemis, in commemoration of the vow made by Callimachus at Marathon, and to give an equal sum for entertainment of the dympna on the day when the archon rode against a foreigner for living in Athens without a patron; so was also the dikē  

people deposed, if an action or indictment were the consequence of it. Moreover, they allotted the discons or jurymen, and probably pre-identified at the annual election of the strategi and other military officers.

In concluding this enumeration of the duties of the archons, we may remark that it is necessary to be cautious in our interpretation of the words ἀρχον and ἀρχηγός: the fact is, that in the Attic orators they have a double meaning, sometimes referring to the archons peculiarly, and as a sort of special magistrate, to any other magistrate, or to a court of justice. Thus, in Isaeus,2 we might, on a cursory perusal, infer, that when a testator left his property away from his heir-at-law, by what was technically called a δόσις,2 the archon took the original will into custody, and was required to be present at the making of any addition or codicil to it. A more accurate observation proves that by δόσις ἀρχηγού is meant one of the ἀρχηγοί, or archons, who formed a magistracy (ἀρχηγός) as well as the nine archons.

A few words will suffice for the privileges and honours of the archons.3 The greatest of the farmer was the exemption from the trierarchies; a boon not allowed even to the successors of Harmodius and Aristogiton, or any of the successors of the archon who were a chaplet or crown of myrtle; and if any one struck or abused one of the thermosthe or the archon, when wearing this badge of office, he became ὁμή, or infamous in the fullest extent, thereby losing his civic rights. The archons, at the close of their year of service, were admitted among the members of the choral group (Ἑρμιάτες). The principal authority on the subject of the archon and their duties is Julius Pollux, in a work called Οἰκονομικών: he was a professor of rhetoric at Athens in the time of the Emperor Commodus, A.D. 190, to whom he inscribed his work, and is considered to have been the first to give an account of the office from a lost treatise of Aristotle on the "Constitution of Athens." It is, however, necessary to consult the Attic orators, as will be seen from the reference which are given in the course of this article. Among the modern writers, Bekk and Schamann are occasionally useful, though they give no regular account of the archon.  

ARCHEONES (ἀρχηγοί). The taxes at Athens were let out to contractors, and were frequently farmed by a company under the direction of an ἀρχηγός, or chief farmer, who was the person responsible to the state.4

ARKTON (ἀρχός, ARKTON, ARKION). There is great confusion of names and uncertainty in respect to these plants. Alston remarks that Dioscorides' description of the ἀρχός agrees better with the character of the Arctium Lappa, or Burdock, than his description of the ἀρχαίος. Spruce, accordingly, holds the former to be the true Arctium, and suggests that the latter may be the Verbascum farragutum.5

ARKTONS (ἀρχοντες). 1. The common Beau, or Ursus Arctos, L. The Greeks and Romans could scarcely be acquainted with the U. maritimus. The ἀρχοντες of Aristotle is the ordinary Brown Bear, and the habits of the animal are well described by him.6 The bear," observes this writer, "is an omnivorous animal, and, by the sure and compact nature of his body, climbs trees, and eats the fruits, and also legumes. It also devours honey, having first, broken up the hives; crabs, too, and ants it eats, and also preys upon flesh." Aristotle then describes how the animal attacks the stag, the boar, and even the bull.7
ARCUS.

II. A crustaceous fish, described by Aristotle. Most probably the Cancer Arcus, or Broad Lobster of Peiranç. 

ARCUS (also Formica and Squama), an arch suspended over the head of an aperture, or carried from one side of a wall to another, and serving as the roof or ceiling to the space below. An arch is formed of a series of wedge-like stones or of bricks, supporting each other, and all bound firmly together by the pressure of the centre one upon them, which latter is therefore distinguished by the name of keystone.

It would seem that the arch, as thus defined, and as used by the Romans, was not known to the Greeks in the early periods of their history, otherwise a language so copious as theirs, and of such ready application, would not have wanted a name properly Greek by which to distinguish it. The use of both arches and vaults appears, however, to have existed in Greece previously to the Roman conquest, though not to have been in general practice. But the constructive principle by which an arch is made to hold together, and to afford a solid resistance against the pressure of the superincumbence, was known to them even previously to the Trojan war, and its use is exemplified in two of the earliest buildings now remaining: the chamber built at Orchomenus by Minyas, king of Bocotia, described by Pausanias, and the treasury of Atreus at Mycenae. Both these works are constructed under ground, and each of them consists of a circular chamber formed by regular courses of stones laid horizontally over each other, each course projecting towards the interior, and beyond the one below it, till they meet in an apex over the centre, which was capped by a large stone, and thus resembled the inside of a dome. Each of the horizontal courses of stones formed a perfect circle, or two semicircular arches joined together, as the subjoined plan of one of these courses will render evident.

It will be observed that the innermost end of each stone is bevelled off into the shape of a wedge, the apex of which, if continued, would meet in the centre of the circle, as is done in forming an arch; while the outer ends against the earth are left rough, and their interstices filled up with small irregular-shaped stones, the immense size of the principal stones rendering it unnecessary to continue the sectional cutting throughout their whole length. Indeed, if these chambers had been constructed upon any other principle, it is clear that the pressure of the earth all round them would have caused them to collapse. The method of construction here described was communicated to the writer of the present article by the late Sir William Gell. Thus it seems that the Greeks did understand the constructive principle upon which arches are formed.

Even in the earliest times; although it did not occur to them to divide the circle by a diameter, and set the half of it upright to bear a superincumbent weight. But they made use of a contrivance, even before the Trojan war, by which they were enabled to gain all the advantages of our archway in making corridors, or hollow galleries, and which, in appearance, resembled the pointed arch, such as is now termed Gothic. This was effected by cutting away the superincumbent stones in the manner already described, at an angle of about 45° with the horizon. The mode of construction and appearance of the arches are represented in the annexed drawing of the walls of Tiryns, copied from Sir William Gell's Argolis. The gate of Signia (Σηγία) in Latium exhibits a similar example.

Of the different forms and curves of arches now in use, the only one adopted by the Romans was the semicircle; and the use of this constitutes one leading distinction between Greek and Roman architecture, for by its application the Romans were enabled to execute works of far bolder construction than those of the Greeks: to erect circuses and aqueducts, and the most durable and massive structures of brick. 

(On the antiquity of the Arch among the Egyptians, Mr. Wilkinson has the following remarks: "There is reason to believe that some of the chambers in the pavilion of Remeses III., at Medinet Habou, were arched with stone, since the devices on the upper part of their walls show that the fallen roofs had this form. At Sagâra, a stone arch still exists of the time of the second Psammiteus, and, consequently, erected 600 years before our era; nor can any one, who sees the style of its construction, for one moment doubt that the Egyptians had been long accustomed to the erection of stone vaults. It is highly probable that the small quantity of wood in Egypt, and the consequent expense of this kind of roofing, led to the invention of the arch. It was evidently used in their tombs as early as the commencement of the eighteenth dynasty, or about the year 1540 B.C.; and, judging from some of the drawings at Beni Hassan, it seems to have been known in the time of the first Ostræsen, whom I suppose to have been contemporary with Joseph."—Manners and Customs of the Anc. Egyptians, vol. ii. p. 116. 117. 1st series.)

ARCUS TRIUMPHALIS (a triumphal arch), an entire structure, forming a passage-way, and erected in honour of an individual, or in commemoration of a conquest. Triumphal arches were built across the principal streets of the city, and, according to the space of their respective localities, consisted of a single archway, or a central one for carriages, and two smaller ones on each side for vehicles.
of passengers, which sometimes have side communications with the centre. Those actually made use of on the occasion of a triumphal entry and procession were merely temporary and hastily erected, and, having served their purpose, were taken down again, and sometimes replaced by others of more durable materials.

Scipio is the first upon record who erected anything of the kind. He built an arch in the Forum Boarium, about B.C. 196, and another in the Circus Maximus, each of which was surmounted by gilt statues.\(^1\) Six years afterward, Scipio Africanus built another on the Clivus Capitolinus, on which he placed seven gilt statues and two figures of horses\(^4\) and a statue of Carthage, and in 36 B.C. Lucullus built a fourth in the Via Sacra, which is called by Cicero\(^3\) the Fornix Fabianus. None of these remain, the Arch of Augustus at Rimini being one of the earliest among those still standing.

There are twenty-one arches recorded by different writers as having been erected in the city of Rome, of which now remain: 1. Arcus Drusti, which was erected to the honour of Claudius Drusus on the Appian Way.\(^4\) 2. Arcus Titi, at the foot of the Palatine, which was erected to the honour of Titus, after his conquest of Judea, but does not appear to have been finished till after his death; since in the inscription upon it he is called Divus, and he is also represented as being carried up to heaven upon an eagle. The bas-reliefs of this arch represent the spoils from the Temple of Jerusalem carried in triumphal procession. This arch has only a single opening, with two columns of the Roman or Composite order on each side of it. 3. Arcus Septimii Severi, which was erected by the senate (A.D. 307) at the end of the Via Sacra, in honour of that emperor and his two sons, Caracalla and Geta, on account of his conquest of the Parthians and Arabians.

4. Arcus Gallieni, erected to the honour of Gallienus by a private individual, M. Aurelius Victor. 5. Arcus Constantini, which is larger and more profusely ornamented than the Arch of Titus. It has three arches in each front, with columns similarly disposed, and statues on the entablatures over them, which, with the other sculptured ornaments, originally decorated the Arch of Trajan.

ARCUS (Ἄρξ, Ἱξ追溯), the bow used for shooting arrows. The bow is one of the most ancient of all weapons, and has been, from time immemorial, in genera \(3 \times \sqrt{7/6}\) : the globe, both among civilized and \(3 \times \sqrt{7/6}\) nations. Hence the Greeks and Romans ascribed to it a mythical origin, some saying that it was the invention of Apollo, who taught the arts of war to the Cretians,\(^4\) the discovery either to Scythia the son of Jupiter, or to Perses the son of Perses.\(^6\) These several fables indicate nothing more than the very superior skill and celebrity of the Cretans, the Scythians, and the Persians in archery. The use of the bow is, however, characteristic of Asia rather than of Europe. In the Roman armies it was scarcely ever employed except by auxiliaries; and these auxiliaries, called sagittarii, were chiefly Cretans and Arabians.\(^7\)

Likewise in the Greek armies, archers acted only a subordinate though important part. Their position was in the rear; and, by taking advantage of the protection afforded by the heavy-armed soldiers, who occupied the front ranks, their skill was rendered very effective in the destruction of the enemy. Thus Homer\(^8\) gives a long list of names in the Trojan army of men slain by the arrows of Teucer, the son of Telamon, who accomplished this object by shootting himself under the ample shield of his brother Ajax.

Among the Scythians and Asiatics, archery was universally practised, and became the principal method of attack. In the description given by Herodotus\(^9\) of the accoutrements of the numerous and vast nations which composed the army of Xerxes, we observe that not only Armenians, Medes, Parthians, Scythians, and Persians, but nearly all the other troops without exception, used the bow, although there were differences characteristic of the several countries in respect to its size, its form, and the materials of which it was made. Thus the Indians and some other haid bows, as well as arrows, made of a cane \(2(\text{καλάμως})\), which was perhaps the bamboo. Herodotus also alludes to the peculiar form of the Scythian bow. Various authorities conspire to show that it corresponded with the upper of the two figures here exhibited, which is taken from one of Εἴν

W. Hamilton's fictile vases. It shows the Scythian or Parthian bow unstrung, and agrees with the form of that now used by the Tartars, the modern representatives of the ancient Scythians. In conformity with this delineation, an unlettered archer, who had seen the name of Theseus (ΘΗΣΕΥΣ), says that the third letter was like a Scythian bow.\(^2\) On the other hand, the Grecian bow, the usual form of which is shown in the lower of the preceding figures, has a double curvature, consisting of two circular portions united by the handle. The fabrication and use of bows of this kind are described by Homer in the following manner: Pandaros, the Lycean archer, having obtained the long horns of a species of wild goat, had them smoothed and polished by a bowman (καρπαυστὸς τίκτων), fitted to one another at the base, and fastened together by means of a ring of gold (καρπαυστὸς τίκτων). Preparing to shoot, he lowers his body (ποτὶ γαῦς ἄγοντες. Compare the next woodcut). His companions cover him with their shields. Having fitted the arrow, he draws the string towards his breast (μενοὶ καρπαυστος ἄγοντες). The bow (δίκτης, as opposed to νερόν) twangs, the string resounds, and the arrow flies to reach its mark. We see this action exhibited in the following outline of a statue belonging to the group of the Εἴν γαρικ, and perhaps early as R.C. 1.

---

old as the age of Homer himself. The bow, placed in the hands of this statue, was probably of bronze, and has been lost.

It is evident that a bow, made and handled in the manner here described, could not be longer than three or four feet, and must have been far less powerful than the Scythian bow. On account of the material, it is often called by the classical authors a /horn (κέρας, κυρνα)\.

This difference of size and form caused a difference also in the mode of drawing the bow. The Greek with a group of archers drew his right hand with the string towards his breast, as represented in the Egyptian statue, in Homer's account of Pandarus, and in Virgil's description of Camilla; the Scythian, on the contrary, advancing boldly towards the enemy, and often on horseback, obliged by the length of his bow, which he held vertically, to avoid stooping and to elevate his left hand, drew the other up to his right ear, as is practised by our archers in the present day. The Oriental arrow was long and heavy in proportion to the bow, and was sent, as Procopius observes, with such force that the Greeks and Persians could resist it.

The bow was sometimes adorned with gold (wherein areus aneros). The golden ring, or handle, has been already mentioned. Apollo is called by Homer “the god of the silver bow” (ἀργυροτόξος).

The bowstring was twisted, and was made either of sinews or of horsehair (τετεσφαγμένοι), or of the hide, or perhaps the intestines, of the horse (νευρος εσωματος).

When not used, the bow was put into a case (τοξοθήκη, γωνιόθηκη, Gorytus), which was made of leather (καστελλαίαν), and sometimes ornamented (φασινειαν). The bowcase is often repeated and very conspicuous in the sculptured borders of Persæpolis. Thus encased, the bow was either hung upon a perch or carried on the shoulders.

Among the Greek and Roman divinities, the use of the bow is attributed to Apollo, Diana, Cupid, and Hercules; and they are often represented armed with it in ancient works of art.

ARIAEON (Αριάιον or Αριάων), also called δαστράκων from the materials of which it was made, was a vessel of water, which stood before the door of a house in which there was a dead body, in order that those who had been with the corpse might purify themselves by sprinkling the water on their persons.\(^8\)

ARDEA (Αρδεά), the Heron. Aristophanes\(^9\) describes three species: 1. The ἱερὸς πελεκα, the Ardea cinerea cristata, L., or common Heron. 2. The Λεκάδος, the Ardea alba, or Great Egret. 3. The Ardea cinerea, the Ardea stellaria, or European Bittern. This last is remarkable for flying very high, and hence its name (ardea stellaria), as if it flew up to the very stars. Its attitude also, when at rest, is very singular, the beak being raised up to the heavens.\(^9\) Virgil's description of the soaring flight of this bird is admirably true to nature:

\[\text{Notasque paludis Descripsit, aequo altum supra volavit ardea rubens.} \]

There is a small species of heron which Gessner supposed may have been the Father of Opian. Some late authors, however, would rather refer the θλισσος to the Coot, or Pelica astra. L.\(^9\)

AREA (Αρέα ή Άραμ), the threshing-floor, was a raised place in the field, open on all sides to the wind. Great pains were taken to make this piece of land smooth and hard; it was sometimes paved with flint stones, but more usually covered with clay and smoothed with a great roller. It was also customary to cover it with layers of oil, which prevented insects injuring it, or grass growing upon it. Thus, some of the grain were beaten out by the hoofs of cattle treading upon it, or by flails (fusiles).

AREIOPAGUS (Αρείος πάγος, or hill of Ares), at Athens, was a rocky eminence, lying to the west of, and not far from, the Acropolis. To account for the name, various stories were told. Thus, some said that it was so called from the Amazons, the daughters of Ares, having encamped there when they attacked Athens; others again, as Aeschylus, from the sacrifices there offered to that god; while the more received opinion connected the name with the legend of Ares having been received as a god there by Poseidon, for the murder of his son Helethrius.\(^8\) To none, however, of these legends did the place owe its fame, but rather to the council (H έπι Αρείου πάγου βολή) which held its sittings there, and was sometimes called Τεώρα βολή, to disdain the name of Ares, and Αριστεράς, by which it was sometimes called in the Ceramicus within the city. That it was a body of very remote antiquity, acting as a criminal tribunal, was evidently evidenced by the Athenians themselves. In proof of this, we may refer to the expression assertions of the orators, and the legend of the toga being the only by which the existence of the body, but also that it had already obtained considerable reputation for equity in its decisions; a reputation which it must have taken some time to establish.

There is sufficient proof, then, that the Areiopagus existed before the time of Solon, though he is admitted to have so far modified its constitution and sphere of duty that he might almost be called its founder. That what original constitution was must in some degree be left to conjecture, though there is good reason to suppose that it was aristocratic, the members being taken, like the Ephors, from the noble patrician families (ἀριστογένες). We may remark that, after the time of Solon the Ephete, fifty-one in number, sat collectively; four different courts, and were charged with the hearing of such cases of accidental or justifiable homicide as admitted of or required expiation. Some of the civil and religious rights he had lost: a resumption impossible in cases of wilful murder, the capital punishment for which could only be escaped by banishment for life, so that no expiation was required of a giver.\(^8\) Now the Ephete formerly administered justice in these courts, and on other reasons it has been conjectured that they and the Areiopagus then formed one court, which decided in all cases of murder, whether wilful or accidental. In support of this view, it has been urged that the separation of functions was rendered necessary by that change of Solon which made the Areiopagus no longer an aristocratic body, while the Ephete remained so, and, as such, were competent to administer the rites of expiation, forming, as they did, a part of the sacred law of Athens, and therefore left in the hands of the old patricians, even after the loss of their political privileges. On this point we may remark, that the connection insisted on (Colum., i., 6.—2. (Verg. Geor., i., 178).—3. (Colum. De Re Rust., 91, 125).—4. (Colum. ii., 21) —5. (Domingo, Acta, p. 649, etc.)—6. (Colum. iv., iv., 5, 1—Thirlwall, Hist. Greece, vol. p. 945).—7. (Müller, Eumen., 68.— Pollux, Quot., viii., 122.)
It is probable that public opinion supported them in none of this kind, without the aid of which they must have been powerless for any such objects. In connexion with this point, we may add that, when heinous crimes had notoriously been committed, but the guilty parties were not known, or no accuser appeared, the Areopagis inquired into the subject, and reported (areopates, to report or deliberation) a case called ἄροπας. This was a duty which they sometimes undertook on their own responsibility, and in the exercise of an old-established right, and sometimes on the order of the demus. Nay, to such an extent did this carry its power, that on one occasion they apprehended an individual (Ἀπτίφονος) who had been accused by the general information of his guilt, and again brought him to a trial, which ended in his condemnation and death. Again we find them revoking an appointment whereby ἀρχιντιασις was made the advocate of Athens before the Amphictyonic council, and substituting Hypereides in his room. In these two cases, also, they were most probably supported by public opinion, or by a strong party in the state.

They also had duties connected with religion, one of which was to superintend the sacred olive growing about Athens, and try those who were charged with destroying them. We read, too, that in the discharge of their duty as religious censors, in some instances, they might have had the subject of the wife of the king archon, was, as required by law, an Athenian; and finding she was not, imposed a fine upon her husband. We learn from the same passage that it was their office generally to punish the impious and irreligious. Again we are told, though rather in a rhetorical way, that they relieved the wife of a needy family, who was the chief of the demus, of the burden that the little boy of her son, under the support of the rich, controlled the studies and education of the young, and interfered with and punished public characters as such.

Independent, then, of its jurisdiction as a criminal court in cases of wilful murder, which Solon continued to the Areopagus, its influence must have been sufficiently great to have isolated the capable to the aggudiment to the democracy at the expense of the other parties in the state. In fact, Plutarch expressly states that Solon had this object in view in its reconstruction; and, accordingly, we find that Pericles, who never had been archon or Areopagite, and who was certain to be less amenable to the despotism for many reasons, resolved to diminish its power and circumscribe its sphere of action. His coadjutor in this work was Ephialtes, a statesman of inflexible integrity, and also a military commander. They experienced much opposition in their attempts, not only in the assembly, but also through the courts of justice, and the process of the Eumeneides, the object of which was to impress upon the Athenians the dignity, the sacredness, and constitutional worth of the institution which Pericles and Ephialtes wished to reform. He reminds the Athenians that it was a tribal tribunal of the authority of its patron goddess Athena, and put into their mouth a populous large array against innovations, and admonishing them to leave the Areopagis in possession of its old and well-grounded rights, that under its watchful guardianship they might sleep in security. Still the opposition failed: a decree was carried, by which, as Aristophanes says, "the Areopagis was deprived of some of its authority, and many of its hereditary rights abolished." Circe, who in one place speaks of the council as governing Athens, observes in another, that from that time all authority was vested in the ecclesia.
AREIOPAGUS.

and the state robbed of its ornament and honour. Plutarch tells us that the people deprived the Areiopagus of nearly all its judicial authority (τῆς κρίσις πλὴν ἄλλων ἀναπήδης), and making themselves supreme judges, put the Areiopagus then no longer as it had formerly been a superior tribunal. But we infer from another passage that the council lost considerable authority in matters of state; for we learn that Athens then entered upon a career of conquest and aggrandizement to which she had previously been a stranger; that, like a rampant horse, she would no longer have anything to fear from her enemies, and would lead the up to the neighbouring islands. These accounts in themselves, and as compared with others, are sufficiently vague and inconsistent to perplex and embarrass; accordingly, there has been much discussion as to the precise nature of the alterations which Pericles effected; some, among whom we may mention Miller, are of opinion that he deprived the Areiopagus of their old jurisdiction in cases of wilful murder; and one of his chief arguments is, that it was evidently the design of Ἐσχήλιος to support them in this prerogative, which therefore must have been lost. For, if we come to this, we would refer our readers to Mr. Thirlwall's remarks, merely stating, in addition, that Demosthenes expressly affirms, that neither tyrant nor democracy had ever dared to take away from them this jurisdiction. In addition to which, it may be added, that the extension of the franchise to the innovation do not seem to us to indicate that the Areiopagus lost its authority as a criminal tribunal, but that it was debarred of its power as superintending the morals and conduct of the citizens, both in civil and religious matters, and as exercising some control over their legislation. Now an authority of the former kind seems far removed from any political influence, and the popular belief as to its origin would have made it a dangerous object of attack, to say nothing of the general satisfaction the verdicts had always given. We may observe, too, that one of the chief features of a democracy is to make all the officers of the state responsible; and that it is not improbable that one of the changes introduced by Ephialtes was to make the Areiopagus, like other functionaries, accountable to the demos for their administration, as, indeed, we know they afterward were. This simple regulation would evidently have made them subservient, as they seem to have been, to public opinion; whereas no such subserviency is recorded in criminal matters, their tribunal, on the contrary, being always spoken of as most just and holy; so much so, that Demosthenes says that not even the condemned whispered an insinuation against the righteousness of their verdicts. Indeed, the proceedings before the Areiopagus, in cases of murder, were, by their solemnity and fairness, well calculated to ensure just decisions. The process was as follows: The king archon, desiring to bring a charge against the accused, went to the council, the judges, who were assembled in the open air, probably to guard against any contamination from the criminal. The accused, who was said to be Ἀρείον πάγων ἐπικατέφυτες, first came forward to make a solemn oath (βασιλεύει) that his accusation was true, standing over the slaughtered victims, and in presence of the whole council and all the citizens. Then he and his whole family were not so. The accused then denied the charge with the same solemnity and form of oath. Each party then stated his case with all possible plainness, keeping strictly to the subject, and not being allowed to appeal in any way to the feelings or passions of the judges. After the first speech, a criminal accused of murder might remove from Athens, and thus avoid the capital punishment; but, if he could not remove, he was then adjudged guilty and his case was handed over to the jury. They were composed of two hundred men, and they were to come from a list of four hundred citizens who were selected by lot; and for this reason it was said that the Areiopagus was a list taken at random against those who had thus left their country.

The reputation of the Areiopagus as a criminal court was of long continuance, as we may learn from an anecdot of Aulus Gellius, who tells us that C. Cestius, procuor of the Roman province of Asia, referred a case which perplexed himself and his council to the Areiopagus (ut ad jueces graviores exercerat se), they ingeniously settled the matter by ordering the parties to appear that day 100 years (centesimo anno adeo). They existed in name, indeed, till a very late period. Thus Plutarch says that Demetrius Phalereus, who was exiled, under the Emperors Gratian and Theodosius (A.D. 380), "Ρωμαίος Φιλόσος is called proconsul of Greece, and an Areiopagite." Of the respectability and moral worth of the council, and the respect that was paid to it, we have the testimony of the orators where, indeed, it would be difficult to find it mentioned except in terms of praise. Thus Lysias speaks of it as most righteous and venerable, and so great was the respect paid to its members, that it was considered rude in the demus laughing at one's presence, while it was considered almost as a duty to make an address to the assembly on a subject they had been deputed to investigate. This respect might, of course, facilitate the resumption of some of their lost power, more especially as they were sometimes intrusted with inquiries on behalf of the state, on the occasion to which we have just alluded, when they were made a sort of commissioners to inquire into the state of the buildings about the Pnyx, and decide upon the adoption or rejection of some proposed alterations. Isocrates, indeed, even in his time, when the previous inquiry of ὑποστάσεως had failed, makes the Areiopagus, in the presence of the judges, pass sentence with grave and solemn influence; but, shortly after the age of Demetrius Phalereus, a change had taken place; they had lost much of their respectability, and were but ill fitted to enforce a conduct in others which they did not observe themselves.

The case of St. Paul is generally quoted as an instance of their authority in religious matters; but the words of the sacred historian do not necessarily imply that he was brought before the council. It may, however, be remarked, that they certainly took cognisance of the introduction of new and uncleanness in it. The Areiopagus, of course, would be resorted to; and there was a tradition that Plato was debarred from mentioning the name of Moses as a teacher of the unity of the Godhead, by his fear of the Areiopagus.

With respect to the number of the Areiopagus, its original number is at least no more of no great moment; there are various accounts; but it is plain that there could have been no fixed number when the archons became members of this body at the expiration of

ARGEMONE.

ARGENTARI, bankers or money-changers at Rome. The public bankers, or mensa'ri, are to be distinguished from the argentarii. The highest class of mensari, the mensari quiuequeviri or triumviri, were a sort of extraordinary magistrates, the office being generally filled by persons of high rank; their business was to regulate the debts of the citizens, and to provide an honest medium of exchange for other mensari, who stood lower than these, and whose office approximated to that of the argentarii; and still lower stood the nummularii, though these were also public functionaries. The argentarii, on the contrary, were private bankers, who did all kinds of dealing, commission, and agency business for their clients. They also delivered money to depositors in public buildings, and were agents for exercising argentarii, domicilius, resellers; negotiatoris stipis argentariae.

Their private character is clear, from what Ulpian says:

"Tuberaria (i.e., argentariae) publica sunt, quorum usu ad privatos pertinent." Almost all money transactions were carried on through their intervention, and they kept the account-books of their customers. Hence all terms respecting the relation between debtor and creditor were borrowed from banking business: thus, rationem accepti scribere ("to put down on the debtor's side in the banker's book") means "to borrow money;" rescribere, "to pay it back again;" nomen (an item in the account) "is the amount that remains in the treasury," as when Cicero says, "Ego meus rebus gestis hoc sum assecurus ut bonum nomen existimer." On these books of account, which have given rise to the modern Italian system of book-keeping by double entry, see Pliny, Hist. Nat., ii., 7.

The functions of the argentarii, besides their original occupation of money-changing (permutatio argenti), were as follows: 1. Attending public sales, as agents for purchasers, in which case they were called interpretes. 2. Assaying and proving money (probatio monorum). 3. Receiving deposits, or keeping a bank in the modern sense of the word. If the deposites was not to bear interest, it was called depositum, or vacus pecunia; if it was to bear interest, it was called creditum. The argentarii were said not only recepere, but also constituere, so that an action constitute pecunia would lie against them.

The shops of the bankers were in the choicest rooms of the city; the name argentarius is often synonymous with that of a shopkeeper. The argentarius was not necessarily a freeman.

ARGENTUM. According to Herodotus,1 the Lydians were the first people who put a stamp upon silver; but, according to the testimony of most ancient writers, silver money was first coined at Eginia, by order of Pheidon, about B.C. 809.2 The silver coins of Greece may be divided into three kinds, which differ in appearance according to the money which they were to represent. The most ancient are those of Eginia, which are entirely devoid of image, and of rude workmanship. These pieces, which are of Eginia usually bear on the upper side the figure of a turtle or a tortoise, and on the under an indented mark, as if the coin at the time of striking the metal had been placed upon a die, and the punch received a mark from the weight of the blow. The argentum appear to belong in the age of Pericles and Xenophon, and

[Image 0x0 to 379x656]
ARGIUM.

ARGHIUM GRAPHIE.

Silver was not coined at Rome till B.C. 269, five years before the first Punic war; but the Roman coinage of silver never appears to have been so fine from baser metal as the best Athenian coinage. Under the Empire, vast quantities of silver were much debased that it contained \( \frac{1}{2} \) silver and \( \frac{1}{2} \) alloy. In the time of the Republic, the impression on silver coins was usually, on the obverse, the head of Rome with a helmet, the Dioscuri, or the head of Jupiter and on the reverse, carriages drawn by two or four horses, and, in the days of Augustus, respectively bigats and quadrigati, &c., nummi. (Vid. Bigats.) The principal silver coins among the Greeks and Romans were respectively the drachma and denarius. (Vid. Drachmi, Denarius.)

The Athenians obtained their silver from the silver mines at Laurion (Apostrophe region), and, as such, as the chief source of the wealth of Athens. We learn from Xenophon that these mines had been worked in remote antiquity; and Xenophon speaks of them as if he considered them inexhaustible. In the time of Demosthenes, however, the profit arising from them was considerably less. Between the second century of the Christian era they were no longer worked. The ore from which the silver was obtained was called silic erth (\( \lambda \gamma \omega \gamma \rho \iota \sigma \rho \varsigma \) \( \gamma \rho \iota \sigma \nu \iota \varsigma \)), or simply \( \lambda \gamma \omega \gamma \rho \iota \varsigma \nu \iota \varsigma \). The same term (terra) was also applied to the ore by the Romans, who obtained most of their silver from Spain.

The Athenians and silver differed considerably at different periods in Greek and Roman history. Herodotus mentions it \( ^{4} \) as 1 to 13; Plato \( ^{3} \) as 1 to 12; Menander \( ^{4} \) as 1 to 10; and Livy \( ^{5} \) as 1 to 10, about B.C. 189. According to Suetonius, \(^{6}\) Julius Caesar, on one occasion, exchanged 80,000 of these money for a yoke of oxen. But the most usual proportion under the early Roman emperors was about 1 to 12; and from Constantine to Justinian about 1 to 14, or 1 to 15.

ARGENTUM VIVUM, Quicksilver or Mercury. It is first spoken of by Aristotle and Theophrastus under the name of fluid silver (\( \lambda \gamma \omega \gamma \rho \iota \varsigma \sigma \tau \) vi- \( \tau \rho \varsigma \varsigma \varsigma \)), and the mode of obtaining it is thus described by the latter: "This is procured when a portion of cinnabar is rubbed with vinegar in a brass mortar and with a brass pestle." All the modern processes, on the other hand, that are adopted for separating them from gold are founded upon the volatility of the metal, its conversion into vapour in distilling vessels or retorts, and its condensation by cold. The nature of this mineral, however, does not seem to have been much understood even four centuries later; for Pliny distinguishes between "the general Mercury," or quicksilver procured by processes which he describes from minim, or native cinnabar. This quicksilver he supposes to be a spurious imitation of quicksilver, and fraudulent substitute for it in various uses to which it was applied. Dioscorides, however, who had the testimony of those who had written about the same time with Pliny, means, according to Hill, by \( \psi \rho \alpha \chi \rho \rho \iota \gamma \sigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigm
Ariadneia.

Ariadneia, the site for the first conviction, and a loss of civic rights (arousa) if the same person was convicted three times of idleness. According to Julius Pollux, it did not impose a severe punishment than arousa, and Solon did not punish it at all till the third offence.  

*ARGILLA, Potters' Clay, included frequently by the Latin writers under the general name of Creta. Thus Palladius says, "Creta, quam argillum dicimus" and Columella, "Creta, quidam standardis frugibus, quamque nonnulla argillin exuvae." These writers speak repeatedly of "creta figuralis" and "creta qui sunt anchor".Cerus, too, speaks of "creta figuralis," and Vitruvius of "cres ex creta factum, non coelum." By the term Creta, therefore, it was generally meant some whitish clay, such as potters' clay, or even, white grape, and are remarkable for their permanence.  

APTVYPIOT AIKH (arpvptov diwv) was a civil suit of the class pro tos tena, and within the jurisdiction of the thesmothetae, to compel the defendant to pay moneys in his possession, or for which he was liable, to the plaintiff. This action is casually alluded to in the speeches of Demosthenes, and is treated of at large in the speech against Callippos.  

*ARGYRITIS (arpvptivc), a name given to the ore from which silver was obtained. (Vid. Argentum.)  

ARGUROKOE'ION (arpvrdocovmv), the place where money was coined, the mint. That at Athens appears to have been in or adjoining to the chapel (arps) of a hero named Sthepanoreus. In it were kept the standard weights for the coins.  

ARGYRIS'PIDES (arpvrdocvds), a division of the Macedonian army, who were so called because they carried shields covered with silver plates. They were held in high honour by Alexander the Great, after whose death they went over to Antigonus. Livy mentions them as the royal cohort in the army of Antigonus. The Emperor Alexander Severus had in his army a body of men who were called argyroaspides.  

*ARIES (Apollo's), a species of plant. Bauhin held it to be a kind of pear-tree, and Miller makes it to be that kind which gets the English name of White Beam-tree, namely, the Pyrus Arias of Hooker. But Schneider, upon the authority of Sibthorp, holds it to be a variety of the Quercus Fisci.  

ARIADNEIA (Arianthos), festivals solemnized in the island of Naxos in honour of Ariadne, who, according to one tradition, had died here a natural death, and was honoured with sacrifices, accompanied by rejoicings and merriment. Another festival of the same name was celebrated in honour of Ariadne in Cyprus, which was said to have been instituted in commemoration of her death in the month of Gorpheus. The Amathusians called the grove in which the grave of Ariadne was shown, that of Aphrodite-Ariadne. This is the account given by Plutarch from Peon, an Athenian writer.  

ARTES (Artes), the battering-rams, was used to shake, perforate, and batter down the walls of besieged cities. It consisted of a large beam, meant of the trunk of a tree, especially of a fir or an ash. To one end was fastened a mass of bronze or iron (koperla, koperla, proton), which resembled in its form the head of a ram; and it is evident that this shape of the extremity of the engine, as well as its name, was given to it on account of its mode of action to that of a ram butting with its forehead. The upper figure in the annexed woodcut is taken from the bas-reliefs on the column of Trajan at Rome. It shows the array in its simplest state, and as it was borne and impelled by human hands, without other assistance. Even when the art of war was much advanced the ram must have been frequently used in this manner, both whenever time was wanting for more complicated arrangements, and wherever the inequality of the ground rendered such arrangements impracticable. This sculpture shows the ram directed against the angle of a wall, which must have been more vulnerable than the perpendicular parts ("arguruum turrim insus, (pavlit aries violentus)."

In an improved form, the ram was surrounded with iron bands, to which rings were attached, for the purpose of suspending it by ropes or chains from a beam fixed transversely over it. See the lower figure in the woodcut. By this contrivance the soldiers were relieved from the necessity of supporting the weight of the ram, and they could with ease give it a rapid and forcible motion backward and forward, so as to put the opposite wall into a state of vibration, and thus to shatter it into fragments. The use of this machine was farther aided by placing the frame in which it was suspended upon wheels, and also by constructing over it a wooden roof, so as to form a "testudo" (xelofta krepoforos), which protected the besieging party from the defensive assaults of the besieged. Josephus informs us that there was not a tower so strong, no wall so thick as to resist the force of this machine, if its blow were continued long enough.  

The beam of the aries was of great length, c. e., 60, 100, or even 150 feet. The design of the limb was both to act across an intervening ditch, and to enable those who worked the machine to receive in a position of comparative security. A hundred men, or even a greater number, were sometimes employed to strike with the beam. The besieged had recourse to various contrivances in order to defend their walls and towers from the attacks of the aries. 1. They attempted, by throwing burning materials upon it, to set fire to it; and, to prevent this from being effected, it was covered with sackcloth (dpfis, cisticum) or with hides

ARISTOCLEIA, in Greek, means "flowering plant" or "emergent leaf." It is a genus of flowering plants in the family Aristolochiaceae, which are native to the Americas. The flowers of these plants are often large and showy, with distinctive shapes and colors. The fruit is a capsule containing many seeds. ARMA, on the other hand, is a Latin word that means "arm," referring to the weapons and armor used by soldiers. It is interesting to note the connection between nature and warfare, as both require a certain degree of strength and preparedness. However, the description of the properties of the plants in the genus ARISTOCLEIA seems to be related to the use of the skin of a lion, which was mentioned in the text as being used for its strength and durability in warfare. This suggests that the ancient Greeks may have valued the natural world for its resources and attributes, which they could apply to various aspects of their lives, including military conflicts and personal adornment.
passed over the right shoulder; fourthly, the large round shield (ὄσις, ὀσις, κύπες, scutum), supported in the same manner; fifthly, his helmet (ἀφάλος, αφάλος, κάσσας galata); sixthly and lastly, he took his spear (βεγγας, ἄγγας, ἄγας) or, in many cases, two spears (δύο ἄγας). Virgil represents the outfit of a warrior as consisting of the same six portions, when he describes the armour made by Vulcan for Αἴας and brought to him by his brother. The form and use of these portions are described in separate articles under their Latin names. The annexed woodcut exhibits them all in the form of a Greek warrior attired for battle, as shown in Hope's Costumes of the Ancients (i., 70).

Those who were defended in the manner which has now been represented, are called by Homer ἀριστερινά, from their great shield (ἰσις); also ἄγγας, μαχαίρα, because they fought hand to hand with their adversaries; but much more commonly πράγμαχοι, because they occupied the front of the army: and it is to be observed that these terms, especially the last, were honourable titles, the expense of a complete suit of armour (παπολίπι) being of itself sufficient to prove the wealth and rank of the wearer, while his place on the field was no less indicative of strength and bravery. In later times, the heavy-armed soldiers were called ὀσιλατοι, because the term ὀσελ more especially denoted the defensive armour, the shield and thorax. By wearing these they were distinguished from the light-armed, whom Herodotus, for the reason just mentioned, calls άπολειμμα, and who are also denominating χαλλός and γαλεά, γαλεάς τι μυστική. Instead of being defended by the shield and thorax, their bodies had a much slighter covering, sometimes consisting of skins, as in the above-mentioned instance of the Arrabians, and sometimes of leather or cloth; and, instead of the sword and lance, they commonly fought with darts, stones, bows and arrows, or slings. Though greatly inferior in rank and prowess to the heavy-armed sol- diers, it is probable that they often surpassed them in numbers; and by their agility, by their rapid movements from place to place, and by embracing every opportunity of assailing the enemy, coming towards the front under the protection of the heavy-

armed, and again retreating for safety in the rear, they rendered important service to their employers. We are justified in using the term "employers," because the light-armed were commonly attached in a subordinate capacity to individuals of the heavy-armed soldiery. In this manner the Helots were compelled to serve in the Spartan army. At the battle of Platea, each Spartan had an appointment of no less than seven Helots to carry his arms, protect him in danger, to assist him in conquering his opponent, and also to perform every menial ser-
v.1 On the same occasion, as we are informed by Herodotus, the other divisions of the Greek army had only one light-armed to one heavy-armed soldier. In after times, also, the Athenian hoplite had usually one attendant, and received as wages for both himself and his servant two drachmas per day.3

Besides the heavy and light armed soldiers, the ὀσιλατοι and χαλλος, who, in general, bore towards one another one the intimate relation now explained, another description of men, the πεντασταλινες, were extremely often of the Greek army, though we do not hear of them in early times. Instead of the large round shield, they carried a smaller one called the πενταξα, and in other respects their armuour, though heavier and more effective than that of the χαλλος, was much lighter than that of the hoplites. The weapon on which they principally depended was the spear.

The cities of Euboea agreed to go to battle only as hoplites, discarding the use of light armour, de- pending on the sword and lance, and handling the latter as a pike.4 The Euboeans were probably induced to form this agreement in consequence of the richness of their island in the ores of copper and iron. On the other hand, those nations which had neither mines, nor any considerable wealth of other kinds, could scarcely send any but light-armed sol-
diers, who commonly served as mercenaries.

The Romans legion consisted, as the Greek in- fantry for the most part did, of heavy and light armed troops (gravis et levis armature). But they were not formed upon the same system of attaching individuals to one another, in the relation of the master or employer and his servant. At all events, this system did not prevail among the Romans to any extent; and when Virgil, in the Aeneid, mentions the armour-bearer or squire (armiger), we must understand him to allude to the Grecian or Oriental practice, of which attendance and suite to kings and generals only.

When a legion was drawn up in order of battle, the heavy-armed were posted in front in three di-
visions, viz., the principes, the hastati, and the triarii, and behind them were placed the light-armed in two divisions, called the velites and the accessi or exules, the weight and strength of the arms decreasing gradually in these five divisions, until the rear con- the weight and strength of the arms decreasing gradually in these five divisions, until the rear con- sisted only of archers, slingers, and other troops, who might leave their place whenever occasion re- quired, and make swift excursions for the purpose of attacking and annoying the enemy. Especially in coming to engagement, the light-armed troops advanced to the front, stove to put the enemy to flight, and, if successful, pursued them. If, on the other hand, they were worsted, they retreated again in a body behind the heavy troops, on whom, as the main stay of the army, depended the decision of the conflict. If the heavy-armed were victorious, again, the same was the matter, only the breaking the ranks of the enemy, and the pursuit was left to them and to the cavalry, while the prin-
cipes, hastati, and triarii maintained their original position.

ARMILLA.

The annexed figure is taken from the arch of Septimius Severus at Rome. On comparing it with that of the Greek hoplite in the last woodcut, we perceive that, while the national character is displayed by a wide difference in the attitude and expression, the several parts of the armour correspond, excepting only that the Roman soldier wears a dagger (πακέτον, πακέτον) on his right side instead of a sword on his left, and, instead of greaves upon his legs, has femorals and caligae. All the essential parts of the Roman heavy armour (lorica, ensis, clipeus, galea, haste) are mentioned together in an epitome of Martial, and all except the spear in a well-known passage of St. Paul, whose enumeration exactly coincides with the figures on the arch of Severus, and who makes mention, not of greaves, but of shoes or sandals for the feet.

ARMILLA.

The soft or flexible parts of the heavy armour were made of cloth or leather. The metal principally used in their formation was that of copper and tin, which we call bronze, or, more properly, bell-metal. (Vid. Es.) Hence the names for this metal (χαλκός, ας) are often used to mean armour, and the light reflected from the arms of a warrior is called αὐλή χάλκεια by Homer, and ἱερὰ αἰμα by Virgil.* Instead of copper, iron afterward came to be very extensively used in the manufacture of arms, although articles made of it are much more rarely discovered, because iron is, by exposure to air and moisture, exceedingly liable to corrosion and decay. Gold and silver, and tin mixed with copper, were also used, more especially to enrich and adorn the armament. When the Cyclopes, under the direction of Vulcan, made the suit for Achilles, as already mentioned, they employ these various metals:

"Pluit as vivis, aureisque metallis:
Vulmineque chalybis vasta formae liceant."

It cannot be supposed that the Roman soldiers could have acquired their high renown as conquerors without being regularly instructed in the use of arms. Vegecius, accordingly, in his first book, devotes several chapters to an account of the exercises devised for this purpose. The recruits were provided with shields, spears, and other weapons of usual size and weight, and in other respects expressly adapted for the discipline of the drill. The masters at arms were called armüdoctores and campdoctores (οπλοδιδαταί, ὀπλοδιδακταὶ). The armory or arsenal, in which arms of all kinds were kept, was called armamentarium (ὀπλοθήκη, ὀπλοφόρωμα). The military arsenal at the Piraeus, built by the architect Philo, was the glory of the Athenians.†

In rude states of society, when the spirit of violence rendered life and property insecure, both Oriental and barbarian nations around, whom they called barbarians, constantly carried arms for their defence.‡ In the time of Thucydides the Athenians had discontinued this practice, because the necessity for being always armed existed no longer; but they all bore spears and shields in the public processions.

ARMA RIVUM, originally a place for keeping arms, afterward a cupboard, in which were kept, not only arms, but also clothes, books, money, ornaments, images, pictures, and other articles of value. The armarium was generally placed in the atrium of the house. The divisions of a library were called armoria.‡ We find armarius discussed as mentioned as a kind of sepulchre in an inscription in Gruter.†

ARMAMENTARIO. (Vid. Arma, p. 95.)

1. ARMENIACA MALA (μῆλον ᾿Αρμένικα), a fruit, which Dioscorides makes the same with the pruccioce with all Rubeans, and other weapons of un

2. ARMENIUM (Ἀρμενίου), a blue pigment called after the country whence it came. The kind which by Dioscorides is esteemed the best, appears to have been an earth; for he requires it to be smooth, triable, and free from stone. Adams makes it to have been an impure carbonat of copper, like the Lapis Lazuli. Hill, however, maintains that it was a yellow earth or ochre of copper. The Armenium must not be confounded with the Lapis Armenius (Λίθος ᾿Αρμενίου), or Armenian stone, first noticed by Paulus Egmont, and which is called Λίθος Αρμένως by Myrepsus. Jameson says the Armenian stone of the ancients was a limestone impregnated with earthy azure copper, and in which copper and iron pyrites were sometimes disseminated.

3. ARMILLA (ἄρμιλλα, ὄρμυλλα, ὄρμυλλον, χρύλλον, φόντης), a bracelet or armlet.

4. ARMILLAE of antiquity, the Medes and Persians appear to have displayed the greatest taste for ornaments of this class. They wore not only armillae on their wrists, and on the arm a little below the shoulder, but also earrings, collars or necklaces, and splendid turbans. These portions of their dress often consisted of strings of variously formed pearls, or were enriched with jewels. They were intended to indicate the rank, power, and wealth of the wearer, and this use of them has continued through successive generations down to the present day. 10

5. In Europe, golden armillae were worn by the Gauls both on their arms and on their wrists. The Sabines also wore ponderous golden armillae on the left arm, about the keep, was the glory of the foundation of Rome. 11

---

2. (Vitruv., V., 14.)
These spiral wires were sometimes engraved so as to exhibit the form of a serpent, and bracelets of this description were called *scape*. As in regard to the frONTAL (*vid. Amphyx*), so also in respect of armilla, the Greeks conceived the attire of a goddess to resemble that of a lady of superior state and beauty. Hence they attributed these decorations to Aphrodite, and traces of a metallic armlet are seen upon the celebrated marble statue of that divinity preserved at Florence. In the British Museum is an inscription, found among the ruins of the Parthenon at Athens, which makes distinct mention of the *armilla* upon both the arms of a golden Victory preserved in that temple.

Among the Romans we most commonly read of armilla as conferred upon soldiers for deeds of extraordinary merit. (See the next woodcut.) An instance of this occurs in Livy, where, after a victory, one of the consuls bestowed golden crowns and bracelets upon two officers, four centurions, and a manipulus of hastati, and gives silver horns and bracelets to others, who were either foreigners, or younger and of inferior rank. Pliny says that crowns and bracelets of gold were given to citizens, and not to foreigners. These military honours are enumerated in the inscriptions upon various ancient monuments raised to the memory of Roman officers and soldiers, stating that the emperor had presented them *torquemis, armillos, phaleras, &c.*, and often recording the exact number of these several decorations. The following form of words used in conferring them is preserved by Valerius Maximus:

*Armilla donata.*

The Roman females wore bracelets partly for use and partly for ornament. The use of them was to hold amulets. (*Vid. Amuletum.*) Pliny gives a variety of directions respecting the remedies to be effected by inserting particular things in bracelets (armillas, brachiales), and wearing them constantly upon the arm. On the same principle, the Emperor Nero, in compliance with the wishes of his mother, sometimes wore on his right arm the exuviae of a serpent, enclosed in a golden armilla.

As ornaments, armilla were worn at Rome chiefly by women of considerable rank. The metallic band was, for this purpose, frequently enriched with precious stones and other beautiful objects. The presents of amber, *succina granatia*, mentioned by Juvenal, as sent to a lady on her birthday, were probably bracelets set with amber. In the following woodcut, the first figure represents a gold bracelet discovered at Rome, on the Palatin Mount. The rosette in the middle is composed of distinct and very delicate leaves. The two staves (*crescents*) on each side have been repeated where the holes for securing them are still visible. The second figure represents a gold bracelet found in Britain, and preserved in the British Museum. It appears to be

---

made of two gold wires twisted together, and the mode of fastening it upon the arm by a clasp, is worthy of observation. It has evidently been a lady's ornament. Besides objects finely wrought in gold, and the more beautiful patterns and latticed necklaces and bracelets were also formed to display other exquisitely works of art. Bottiger says 1 "it can scarcely be doubted that the most splendid gems, with figures cut in relief, were designed to be worn in bracelets by the empresses, and other women of high rank in Rome." The same author observes, that the large bracelets, made with three or four combs, were intended as rewards for the soldiers, 9 and that it would be ridiculous to suppose such massive ornaments to have been designed for women. A specimen of these ponderous and highly valuable armillae is represented in the third of the preceding figures. The original, of pure gold, is more than twice the length of the figure, and was found in Cheshire 3.

If bracelets were worn by a Caligula, 4 it was regarded as a sign of extravagance and effeminacy, being quite opposed to Roman ideas and customs.

In general, the epheser armillata denoted a servile or hireling's weapon.

The terms armilla and ψέλλον are used for ornaments of the same kind as those already explained, which were worn upon the ankles, very commonly by Africans and Asians, rarely by Europeans. 4 A dog-collar is also called armilla (armillatos canes), and a collar for the neck, armilus or armillatus.

ARMILUS TRIUM, a Roman festival for the purification of arms. It was celebrated every year on the 14th before the calends of November (Oct. 19), when the citizens assembled in arms, and offered sacrifical sacrifices in the place called Armilustrum, or Vicus Armilistrini, in the 13th region of the city. 5

ARMORACIA (Bdovas), Horseradish. (Vis.

HIPHANIR.)

ARMY (GREEK). In the petty states of Greece, down to a period long subsequent to their establishment, a traveller, when beyond the walls of a town, was in constant danger of being surprised by an enemy, and often the labours of husbandry were carried on by men with arms in their hands. 10 This insecurity of liberty and life must have tended powerfully to have infused a martial spirit among the Greeks; and, though they may have borrowed the first art of war from the East, it was among them that the organization of a military force, and the tactics of the field, were brought nearly to as high a degree of perfection as was consistent with the nature of the arms in use before the invention of gunpowder.

1. Homer, Iliad, x., 800; Thucydes and the war of Troy are the earliest instances in the Greek history of military actions performed on a considerable scale; and on the latter occasion (probably about B.C. 1184), an army of 100,000 men is supposed to have been assembled. It would seem that the troops of the different states engaged in this war were at first independent of each other, for, in the second book of the Iliad, Nestor is represented as advising Agamemnon to divide the army into several bodies, according to the nations or tribes of which it was composed, and to place each division under its own prince. It is scarcely conceivable, however, that such a distribution did not also subsist when nations combined together for one object; and, as the ships of the several states appear to have been drawn up separately, probably the mixture of the troops was only an accidental circumstance, arising from the inactivity in which the army had for some time previously remained. It may be imagined, therefore, that the advice of Nestor was only intended as a regular notice for re-forming the army preparatory to inspection, and previously to a return to the field; and as it may, the practice was afterward general, as well in the East as in the Greek states of Europe.

In the fourth book of the Iliad, the arrangement of the army previously to an engagement is distinctly described. A line of war-chariots, in which the chief fought, formed the front; the heavy-armed foot were in the rear; and the middle space was occupied by archers or light-armed men, on whom less reliance could be placed. The warriors were protected by cuirasses, greaves, and helmets, all of bronze; they carried strong bucklers, and their offensive arms were javelins or pikes, and swords. The battle began by darts being thrown from the chariots as the latter advanced to break the ranks of the enemy: the chariots probably then fell into the intervals between the divisions of the troops who fought on foot; for the latter are said to have moved up in close order and engaged, shield to shield, javelin to javelin. The light-armed troops, now in the rear of all, or behind the chariots, discharged their arrows and stones over the heads of the combatants in front. The precept of Nestor, that the warriors should keep their ranks in action, according to the manner of their ancestors, was, in general, observed, for as the rigor of discipline had long before been observed in the march of armies, or in the collisions of hostile troops.

On contemplating the account given by Homer, it must appear evident that the practice of war in his age differed from that which was followed by the Asiatics, Egyptians, and Greeks of a much later period, chiefly in the absence of cavalry: a circumstance which seems to prove that the art of horsemanship, though not wholly unknown, since Diomed rides on one of the horses which had been taken from the car of Rhesus, 5 must have been then very imperfect. The dense array in which the Greeks are represented as formed, in the fourth and thirteenth books of the Iliad, corresponds to that of the body of troops subsequently denominated a phalanx; and these are the first occasions on which great bodies of men are said to have been so drawn up. But, at the same time, it is evident that the ancients did not, in every matter, in which the Greeks seem in some passages to consider the compact arrangement of troops as a matter of great importance; yet the issue of the battle is almost always decided by the personal prowess of individual chieftains, who are able to put to flight whole troops of ordinary soldiers.

From a passage in the last book of the Iliad, 8 it appears that during the heroic ages, as they are called, every family in a state was obliged to furnish one man, or more, who were chosen by lot, when a chieftain intended to set out on a military expedition. While absent from home, the troops subsisted by supplies from other nations, those who were raised in that of the enemy. In the manner last mentioned, and by the plunder obtained in piratical excursions to the neighbouring coasts, the Greek army supported itself during the ten years of the Trojan war. When in war on land, the states of Greece had acquired some stability, the great lawgivers of Sparta and Athens, while forming constitutions for their several people, are said to have made regulations for the military service. To the free citizens only was it thought proper to grant the honour of bearing arms, and the wear of complete armour; and we learn from Herodotus that slaves were made to act as light-armed troops. In the action at Platea against Mardonius, the right wing of the Greek army was composed of 10,000 Light

ARMY.

Xenodochiopolis, of whom half were Spartans, and each of these was accompanied by seven Helots; the remaining 5000, who were furnished by the other towns of Laconia, were each accompanied by one Helot.\(^1\) The employment of slaves in the ancient armies was, however, always considered as a dangerous measure; and it was apprehended, with reason, that they might turn against their masters, or desert in case of need. The organization of the Lacedaemonian army was more perfect than that of any other in Greece. It was based upon a graduated system of subordination, which gave to almost every individual a degree of authority, rendering the whole military force a perfect machine, and giving command to the cavalry signal given by the king ran in an instant through the whole army.\(^2\) The foundation of this system is attributed to Lycurgus, who is said to have formed the Lacedaemonian forces into six divisions (μῆδα). Each μῆδα was commanded by a στρατηγὸς, under whom were four λέχοι, eight πεντηκοσίοι, sixteen ἑξακόσιοι, \(^3\) consequently, the two τριώματα formed a πεντηκοσίον, two of those a λέχος, and four λέχοι made a μῆδα. The regular complement of the enomotia appears to have been twenty-four men besides its captain. The lochos, then, consisted ordinarily of 100, and the mora of 400 men. The front row of the enomotia appears to have consisted of three men, and the depth of the line of eight men. The number of men in each enomotia was, however, not uniformly increased. Thus, a. the battle of Mantinea, another file was added; so that the front row consisted of four men, and each enomotia consequently contained thirty-two men.\(^4\) At the battle of Leuctra, on the contrary, the usual number of files was retained, but the depth of its ranks was increased from eight to twelve men, so that each enomotia contained thirty-six men.\(^5\) In the time of Xenophon, the mora appears to have consisted usually of 600 men.\(^6\) The numbers seem, however, to have fluctuated considerably, according to the greater or less increase in the number of the enomotia. Ephorus makes the mora to consist of 500 men, and Polibius of 900.

At the battle of Mantinea there were seven lochii, and the strength of the lochos was doubled by being made to consist of four persons instead of one enomotia.\(^7\) Upon this account Dr. Arnold remarks: \(^8\) "A question here arises why Thucydides makes no mention of the mora, which, according to Xenophon, was the largest division of the Lacedaemonian army, and consisted of four lochii; the whole Spartan army consisting of sixty lochii, was thus divided into three Richter's, or three thousand lochii. 512 men, are thus much larger than the regular mora, which contained only 400, and approach more nearly to the enlarged mora of 600 men, such as it usually was in active service in the time of Agesilaus. Was it that, among the many innovations introduced into Sparta after the triumphant close of the Peloponnesian war, the term lochii was henceforward used in the sense in which the other Greeks commonly used it, that is, as a mere military division, consisting properly of about 100 men; and that, to avoid confusion, the greater divisions, formerly called lochii, and whose number, as being connected with old traditions and political divisions, was not variable, were for the future called by the less equivocal name of mora?\(^9\)"

To each mora of heavy-armed infantry there belonged a body of cavalry bearing the same name, consisting of at least 1000 men, and commanded by a ‘ισημαχός. The cavalry is said, by Plutarch, to have been divided in the time of Lycurgus into oulami (οὐλαμα) of fifty men each,\(^10\) but this portion of the Lacedaemonian army was unimportant, and served only to cover the wings of the infantry. The three hundred knights forming the king's guard were not to be confounded with the cavalry. They were the choicest of the Spartan youths, and fought either on horseback or on foot, as occasion required.

Solon divided the Athenian people into four classes, of which the first two comprehended those persons whose estates were respectively estimated at the value of 500 and 300 of the Attic measures called medimni. These were not obliged to serve in the infantry or on board ship, except in some command; but they were bound to keep a horse for the public, and to serve in the cavalry at their own expense. The third class, whose estates were equivalent to 200 such measures, were oblige to keep a heavy-armed horse and bring their own armor, and both of them were allowed to provide themselves with complete armor, served either among the light-armed troops or in the navy. The ministers of religion, and persons who danced in the festival of Dionysus, were exempt from serving in the army; the same privilege was also accorded to those who farmed the revenues of the state. There is no doubt that, among the Athenians, the divisions of the army differed from those which, as above stated, had been appointed by the Spartan legislator; but the nature of the divisions is unknown, and it cannot only be supposed that the decision was not hint at in the Cyropæia. In that work, Xenophon, who, being an Athenian, may be supposed to have in view the military institutions of his own country, speaking of the advantages attending the subdivisions of large bodies of men, with respect to the power of re-forming those bodies when they happen to be broken, says: \(^11\) "The division of the army was, in historic times, into ten sections of 100 men, and the λόγος of twenty-four men (exclusive of their officer); and in another passage he mentions the δεκάς, or section of ten, and the πυτσιάς, or section of five men. The τέτεις seems to have been the principal element in the division of troops in the Athenian army, and to have corresponded to the Peloponnesian ἐνομοτίαι. The army was commanded by ten strategi (Vid. Strabo,) and ten taxarchs, and the cavalry by two hipparchs and ten phylarchs. These officers were chosen annually, and they appear to have appointed the subordinate officers of each τέτεις or λόγος."

The mountainous character of Attica and the Peloponnesus were opposed to the formation of numerous cavalry. Hence, when the Persian invasion of Greece, the number of horse-soldiers belonging to the Athenians was but ninety-six, each of the forty-eight nauparites (ναυπαρίται), into which the state was divided, furnishing two persons; but soon afterward the body was augmented to 1900 nauparites, or heavy-armed horsemen, and there was, besides, an equal number of ἄσπες, archers, who fought on horseback. The horses belonging to the former class were covered with bronze or other metal, and they were ornamented with bells and embroidered clothing. Before being allowed to serve, both men and horses were subject to an examination before the hipparch, to ascertain if they were strong and courageous persons who should enter without the requisite qualifications.
cations. It was also the duty of the hipparchos to train the cavalry in time of peace.1 Every free citizen of the Greek states was, according to Xenophon and Plutarch, enrolled for military service from the age of 18 or 20, to 50 or 60, as the case might be. In the democracies, the citizens were to be in constant readiness for service; in the oligarchies, the citizens were to be in constant readiness for service, whenever the oligarchs thought fit. Xenophon (Thu. 72.)—discipline, action and (Xen., and: dier use the arm of Xenophon's gymnasium, or school. The times appointed for performing the exercises, as well in the gymnasium as in the camp, were early in the morning, and in the evening before going to rest. The first employment of the young soldiers was to guard the city; and in this duty they were associated with such veterans as, on account of their age, had been discharged from playing the part of soldiers at 30 years of age. The Athenian recruit could be sent on foreign expeditions; but, among the Spartans, this was seldom done till the soldier was 30 years old. No man beyond the legal age could be compelled to serve out of his country, except in times of public danger. 2 The impecunious, the soldiers, were placed in the rear of the army during an action, and charged with the care of the baggage.3 While the Athenians were engaged in an expedition against Aegina, the Peloponnesians sent a detachment of troops towards Megara, in expectation of surprising the place; but the young and the aged men who remained to guard Athens marched, under Myronides, against the enemy, and prevented the success of the enterprise. An attention to military duties, when the troops were encamped, was strictly enforced in all the Greek armies; but a considerable difference prevailed in those of the two principal states with respect to the recreations of the soldiers. The men of Athens were allowed to witness theatrical performances, and to have in the camp companies of singers and dancers. In the Lacedaemonian army, on the contrary, all these were forbidden; the constant practice of temperance, and the observance of a rigid discipline, being prescribed to the Spartan youth, in order that they might excel in war (which among them was considered as the proper occupation of freemen); and main exercises alone were permitted. When they were encamped, the young men were encouraged to use perfumes, and to wear costly armour, though the adornment of their persons at home would have subjected them to the reproach of effeminacy. On going into action, they crowned themselves with garlands, and marched with a regulated pace, a copy of that of Castor.4 The military service was not always voluntarily embraced by the Greek people, since it was found necessary to decree punishments against such as evaded the conscriptions. These consisted in a deprivation of the privileges of citizenship, or in being branded in the hand. Deserters from the army were punished with death; and at home, when a man deserted himself from the ranks, he was made to sit three days in a public place in women's apparel. It was held to be highly disgraceful in a soldier if, after an action, he was without his buckler; probably because it is supposed that he, who ought to have maintained his post till the last moment, had made a precipitate retreat; a coward would throw away his buckler in order that he might run faster.5

In the infancy of the Greek republics, while the theatre of war was almost at the gates of the cities, the citizens carried their own sword, being, in that case, considered as members of the army.6 Both at Athens and Sparta the inriei, or horsemen, consisted of persons possessing considerable estates and vigour of body; each man furnished and maintained his own horse, and he was, besides, bound to provide at least one foot-soldier as an attendant. In the infancy of the Athenian constitution, the number of citizens who composed the tribe of the original institution had greatly declined; not only was the citizen allowed to commute his personal services for those of a horseman hired in his stead, but the purchase and maintenance of the horses, which were imposed as a tax on the wealthy, were ill executed; the men, also, when well armed, and provided with a horse, and least desirous of distinguishing themselves, were admitted into the ranks of the cavalry.

The distress occasioned by the long continuance of the Peloponnesian war having put it out of the power of the poorer citizens of Athens to serve the country at their own expense, Pericles introduced a system of civic service, in which the privations of the three classes of citizens was commuted for thirty days, and what was more reasonable, that the figures of the three classes should pay, daily, one drachma (of Aegina) for each horseman, and three oboli for a foot-soldier, whether heavy-armed, light-armed, or archer.7 At Athens, by the laws of Solon, if a man lost a limb in war, one obolus was allowed him daily for the rest of his life; if he died at the public expense, the parents and children of such an individual were also provided for by the state.8

With the acquisition of wealth, the love of fame prevailed over that of glory; and the principal states of Greece, in order to supply the places of such citizens as claimed the privilege of exemption from military service, were obliged to take in pay bodies of troops which were raised among their poorer neighbours. The Arcadians, like the modern, Swiss, were most generally retained as auxiliaries in the armies of the other Greek states. In earlier times, to engage as a mercenary in the service of the king was considered more honourable; and the natives of the Carians, who are said to have been the first to do so, became on that account a term of reproach. The strength of a Grecian army consisted chiefly in its foot-soldiers; and of these there were at first but two classes: the sarkai, who wore heavy arms and a stouter shield, than the light-armed, and carried swords and long spears; and the zeloi, who were light-armed, having frequently only helmets and small bucklers, with neither cuirasses nor greaves, and who were employed chiefly as skirmishers in discharging arrows, darts, or stones. An intermediate class of troops, however, was employed by Iphicrates; after the Peloponnesian war, they were armed nearly in the same manner as the sarkai, but their cuirasses were of linen instead of bronze or iron; their spears were short, and they carried small round bucklers (sarkai). These troops, uniting in some measure the stability of the phalanx with the lightness and rapidity of the line, found to be highly efficient; and from the time of their adoption, they were extensively employed in the Greek armies. A band of club-men is mentioned by Xenophon among the Theban troops at the battle of Leuctra.

Scarlet or crimson appears to have been the general colour of the Greek uniform, at least in the

days of Xenophon; for he observed that the army of Agesilaus appeared all bronze and scarlet (σιδερωτάτων, ἱππατα καὶ φόντα φαίνεται).

The oldest existing works which treat expressly of the constitution and tactics of the Grecian armies are the treatises of Xenophon and Arrian, which were written in the time of Hadrian, when the art of war had changed its character, and when many details relating to the ancient military organizations were forgotten. Yet the systems of these tacticians, speaking generally, appear to belong to the age of Philip or Alexander; and, consequently, they may be considered as having succeeded those which have been indicated above.

Xenophon makes the lowest subdivision of the army to consist of the ιξός, δορικός, or ἕβορικός, which he says were then supposed to have been respectively files of 16, 12, or 8 men; and he recommends the latter. The numbers in the superior divisions proceeded in a geometrical progression by doubles, and the principal bodies were formed and denominated as follow: Four ὄρχος constituted a τεταρτάς (the τετράτας, if the army consisted of 16 men). The latter doubled, was called a σεντετάς or ἕβεττας (=256 men), to which division it appears that five supernumeraries were attached; these were the crier, the ensign, the trumpeter, a servant, and an officer, called ἑποφγωνός, who brought up the rear. Four of the last-mentioned divisions formed a στρατός, and 16 of these 64 were united into a τίλας, and quadrupled, formed the body which was denominated a φάλαξ. This corps would therefore appear to have consisted of 4096 men; but, in fact, divisions of very different strengths were at different times designated by that name. Xenophon, in the Cyropedia, applies the term phalanx to the army of Cyrus, and in the Books of Crassus, and in the Anabasis to the bodies of Grecian troops in the battle of Cunaxa, as well as upon many other occasions. It is evident, therefore, that before the time of Philip of Macedon, phalanx was a general expression for any large body of troops in the Grecian armies. That prince, however, united under this name 6000 of his most efficient heavy-armed men, whom he called his companions; he subjected them to judicious regulations, and improved their arms and discipline; and from that time the name of his country was constantly applied to bodies of troops which were similarly organized.

The numerical strength of the phalanx was probably the greatest in the days of Philip and Alexander; and, if the tactics of Xenophon may be considered applicable to the age of those monarchs, it would appear that the corps, when complete, consisted of about 10,000 heavy-armed men. It was divided into four parts, each consisting of 4000 men, who were drawn up in files generally 16 men deep. The whole front, properly speaking, consisted of two grand divisions; but each of these was divided into two sections, and the two middle sections of the whole constituted the centre, or ἡμιφάλαι. The others were designated κεφαλή, or ἔφεξ, and in these the best troops seem to have been placed. The evolutions were performed upon the enemy, or single file, whether it were required to extend or to deepen the line; and there was an interval between every two sections for the convenience of maneuvering.

The smallest division of the phalanx, or light troops, according to the treatise of Xenophon, was the λόγος, which in this class consisted of eight men only; and four of these are said to have formed a στρατός. The sections afterward increased by doubling the numbers in the preceding divisions up to the τεταρτάς, which consisted of 8192 men; and this was the whole number of the ψηφιοὶ who were attached to a phalanx of heavy-armed troops.

The Greek cavalry, according to Xenophon, was divided into bodies, of which the smallest was called ὅνος: it is said to have consisted of 64 men, though the term was used in earlier times; for a party of horse of any number. A troop called κατιγαρία contained two or three horses, and the καταχράσια (from Terentum in Italy) was double the former. Each of the succeeding divisions was double that which proceeded it; and one, consisting of 2048 men, was called τελωνία; finally, the τυχαγάρα was equal to two τένων, and contained 4096 men. The troops of the division or class, called by Xenophon Tarentines, are supposed to have been similar to those which also bore the names of ψαλάχια and ὑπαπαται, and which corresponded to the present dragoons, since they engaged either on horseback or on foot, being attended by persons who took care of the horses when the riders fought dismounted. Their armour was heavier than that of the common horsemen, but lighter than that of the ἐριγαμία; and their first essential point of difference is ascribed to Alexander. It does not appear that war-chariots were used in Greece after the heroic ages; indeed, the mountainous nature of the country must have been unfavourable for their evolutions. In the East, however, the armies frequently coming to action in vast plains, not only did the host of horsemen exceed the host of footmen, but they continued to be employed till the conquest of Syria and Egypt by the Romans. Numerous chariots formed the front of the Persian line when Alexander overthrew the empire of Darius. Divisions of chariots were placed at intervals before the army of Molon, when he attacked Antiochus. Justin relates that there were 600 in the army which Mithradates (Emperor) drew up against that of Ariarathes. In the engagements with Darius and Porus, the troops of Alexander were opposed to elephants; and subsequently to the reign of that prince, these animals were generally employed in the Greek armies in Asia. They were arranged in line in front of the troops, and carried on their backs wooden turrets, in which were placed from 10 to 30 men, for the purpose of annoying the enemy with darts and arrows. They were also trained to act against each other: rushing together, they intertwined their trunks, and the strongest one overpowered the other, flung him with his tusks; the men, in the meantime, fighting with their spears. Thus, at the battle of Raphia, between Antiochus and Polymy, one wing of the Egyptian army was defeated in consequence of the African elephants being inferior in strength to those of India. Elephants were also employed in the wars of the Greeks, Romans, and Carthaginians with each other.

The four chief officers of a phalanx were disposed in the following manner: The first with respect to merit was placed at the extremity of the right wing; the second, at the extremity of the left; the third was placed on the right of the left wing, and the fourth on the left of the right wing; and a like order was observed in placing the officers of the several subdivisions of the phalanx. The reason given by Xenophon for this fanciful arrangement is, that thus the whole front of the line will be equally well commanded; since, as he observes, in every (artificial) phalanx, the term ἐριγαμία is equal to that of the mean terms: whatever may be the value of this reason, it must have been a difficult task to determine the relative merit of the officers with the precision necessary for assigning them their proper places in the series. Experienced soldiers were also placed in the rear of the

1. (Xen., Anab., 4, 2; 10 -- 2. (Polyb. v. 5.) 3 (xenoph. 1).--4. (Polyb. 5.)
phalanx; and Xenophon, in the Cyropædia, compares a body of troops thus officered to a house having a good foundation and roof.

Each soldier in the phalanx was allowed, when in open order, a space equal to four cubits (5½ or 6 feet) each way; when a space was to be made, the space was reduced to two cubits each way, and this order was called πακώνως. On some occasions only one cubit was allowed, and then the order was called ἐναισσατικοῦ, because the bucklers touched each other.

When receiving or giving an attack, when each man occupied about three feet in depth, and the Macedonian spear, or ψαρίσσα, which was 18 or 20 feet long, was held in a horizontal position, the point of that which was in the hands of a front-rank man might project about 14 feet from the line; the extent of that which was in the hands of a sex or rear-rank man might project about 11 feet, and so on. Therefore, of the sixteen ranks, which was the ordinary depth of the phalanx, those in rear of the fifth could not evidently contribute by their pikes to the annoyance of the enemy: they consequently kept their pikes in an inclined position, rear-rank men, that of the third rank in their front; and thus they were enabled to arrest the enemy's missiles, which, after flying over the front ranks, might otherwise fall on those in the rear. The ranks beyond the fifth pressing with all their force against the men who were in their front, while they prevented them from falling back, increased the effect of the charge, or the resistance opposed to that of the enemy, and from a disposition similar to that which is here supposed in the Spartan troops at the battle of Plataea, the Persian infantry, ill armed, and unskilled in close action, are said to have perished in vast numbers in the vain attempt to penetrate the dense masses of the Greeks.

In action, it was one duty of the officers to prevent the whole body of the men from inclining towards the right hand; to this there was always a great tendency, theキャン on the right being the chief resort of action, some particular word or sentence, συνδυάσε, was given out by the commanders to the soldiers, who were enabled, on demanding it, to distinguish each other from the enemy.

The Greek tactics appear to have been simple, and the evolutions of the troops such as could be easily executed: the general figure of the phalanx was an oblong rectangle, and this could, when required, be thrown into the form of a solid or hollow square, a rhombus or lozenge, a triangle, or a portion of a circle. On a march it was capable of contracting its front, according to the breadth of the road on which it was placed, or, when necessary, it could be extended. If the phalanx was drawn up so that its front exceeded its depth, it had the name of παλαιώνθεν; on the other hand, when it advanced in column, or on a front narrower than its depth, it was called περαγός. Usually, the opposing armies were drawn up in two parallel lines; but there was also an oblique order of battle in the Phocian manner, and the other being kept retired; and this disposition was used when it was desired to indicate the enemy to break his line. It is supposed to have been frequently adopted by the Thebans; and, at the battle of Delium, the Boeotians thus defeated the army of the Graecians, as Alexander, following, it is said, the practice of Ephesians.

army.

Army.
did not attack at once the whole army of the enemy, but threw himself with condensed forces against the centre only of the Persian line.

Occasionally, the phalanx was formed in two divisions, each facing outward, for the purpose of engaging at a distance: the footmen were thus at the front and rear, or on both flanks; these orders were called respectively ἀμφίτοοος and ἀναστικοῦ. When the phalanx was in danger of being surrounded, it could be formed in four divisions, which faced in opposite directions. At the battle of Arbela, the two divisions of Alexander's army formed a phalanx with two fronts, and here the attack was directed against the right wing only of the Persians.

The manoeuvres necessary for changing the front of the phalanx were generally performed by counter-marching the files, because it was of importance that the officers or file leaders should be in the line. When a phalanx was to be formed into two parallel lines, the leaders commonly placed themselves on the exterior front of each line, with the ψαρίσσα, or rear-rank men, who were almost always veteran soldiers, in the interior; the contrary disposition, however, sometimes adopted.

The phalanx, in order to make the form of a lozenge, or wedge, when it was intended to pierce the line of an enemy. At the battle of Leuctra, the Lacedæmonians, attempting to extend their line to the right in order to outflank the Thebans, Ephesians, or, rather, Peloponnesians, attacked them while they were about to form a phalanx—and in this instance, the Boeotian troops were drawn up in the form of a hollow wedge, which was made by two divisions of a double phalanx being joined together at one end.

It is a matter of importance to note that, from the disposition of the troops in the Greek armies, the success of an action depended in general on a single effort, since there was no second line of troops to support the first in the event of any disaster. The dense order of the phalanx was only proper for a combat on a perfectly level plain; and even then the victory depended rather on the prowess of the soldier than on the skill of the commander, who was commonly distinguished from the men only by fighting at their head. But, when the field of battle was commanded by heights, and intersected by streams or defiles, and the army was compelled to engage, the footmen, by its simple orders of action, a certain line of action, a certain line of action, was even the least possible to be made in the front, the soldiers were more frequently employed in the rear, or in the intervals between the divisions.

An engagement sometimes consisted merely in the charges which the opposing cavalry made on each other, as in the battle between the Lacedæmonians and Olynthians.

The simple battering-ram for demolishing the walls of fortresses is supposed to have been an invention of the earliest times: we learn from Thucydides' that it was employed by the Peloponnesians at the siege of Plataea; and, according to Vitruvius, the ram, covered with a roof of hides or wood for the protection of the men, was invented by Cetras of Chalcis, who lived before the age of Philip and Alexander. (Vid. Aug.) But we have little knowledge of what may be called the field-artillery of the Greeks at any period of their history. Didorus Siculus mentions the καταπηδής, or machine for throwing arrows, invented or improved at Syracuse in the time of Dionysius; but whether it was used in the attack of the Greeks against troops in the field, does not appear; and it is not till about a century after the death of Alexander that we have any distinct intimation of such

The armies of the Roman Republic were composed of legions, which were the primary military units. According to Polybius, there were ten legions in the case of the army that was sent against the Gauls in the Second Punic War. Each legion was composed of four maniples, or units of 600 men each. The legions were organized in a phalanx-like formation, with the maniples placed in three lines, the front line being the closest to the enemy. The front line consisted of the third and second maniples, while the rear line was composed of the first and fourth maniples. TheManiples were commanded by tribunes, who were responsible for the discharge of their men and the organization of the battle formation.

Polybius states that the legions were led by consuls and praetors, who were elected by the Senate. The consuls were the chief magistrates of the Republic, and were responsible for the指挥 of the army. The praetors were assistants to the consuls, and were responsible for the administration of justice and the collection of taxes.

The legions were organized into three lines, with the first and second lines being composed of the third and fourth maniples, respectively. The third and second lines were composed of the first and fourth maniples, respectively. Each maniple was composed of 600 men, and was commanded by a tribune. The tribunes were responsible for the discharge of their men and the organization of the battle formation.

The number of legions in the service of Rome went on increasing with the extent of its territory; and, after the Punic wars, when the state had acquired wealth by its conquests in the East, the military force became very considerable. Notwithstanding the loss sustained at the battle of Cannus, we find that, immediately afterward, the Romans raised in the city four legions of infantry, with 1000 horsemen, besides arming 8000 slaves; the cities of Latium sent an equal force; and, supposing 10,000 men to have escaped from Cannae, the whole number of the soldiers of the legions of the year before the battle, the Republic had on foot 18 legions; and in the fourth year, 23 legions. 1 In the interview of Octavius with Antony and Lepidus, it was agreed that the former should prosecute the war against Brutus and Cassius, each at the head of 20 legions, and that the other should be left with these forces to guard the city. 2 Philippi, Antony and Cassius had, in all, 19 legions, which are said to have been complete in number, and increased by supernumerary troops; and, therefore, their force must have amounted to at least 100,000 infantry. On the other hand, Brutus and Cassius had also an army of 19 legions to oppose them, with 20,000 cavalry from the eastern provinces. According to Appian, Octavius, after the death of Lepidus, found himself master of all the western provinces, and at the head of 45 legions, together with 25,000 horse and 37,000 light-armed troops; and there were, moreover, the legions serving under Antony. 3 Under Tiberius there were 25 legions even in time of peace, besides the troops in Italy. 4 Besides being designated by numbers, the legions bore particular names. In a letter from Galba to Cicero, 5 mention is made of the Marti legion as being one of the veteran bodies engaged in an action between Antony and Pansa in the north of Italy. 6 And while Caesar was carrying on the war in Gaul, he gave the freedom of the city to a number of the natives of that country, whom he disciplined in the Roman manner, and imbodied in a legion which he designated ala; because the men wore on their helmets a crest of feathers, like those on the heads of certain birds. 7 The legions were also distinguished by the name of the place where they were stationed or whither they had been sent, as Italica, Britannica, Parthica, or by that of the emperor who raised them.

Tacitus, in the Annals and elsewhere, makes mention of bodies of troops called vexillarii; and, as no precise account is given of them, the place where they held in the Roman armies can only be known by conjecture. It appears, however, most probable that they formed part of the cohortes of the Agricola of Tacitus, 8 that the vexillarii were those veterans who, after the time of Augustus, were released from their military oath, but were retained, till their complete discharge, under a flag (vexillum) by themselves, free from all military duties, to render their assistance in the more severe battles, gaged to the emperor, and to keep in exact execution provisions that had been repeatedly renewed. 9 There were a certain number of vexillarii attached to each legion; and, from a passage in Tacitus, 10 it would appear that they amounted to 500. They were sometimes detached from the legion, and sometimes those belonging to several legions seem to have been united in one body (fratres vexillariorum milites). 11 The subignation military of Tacitus may be looked upon as the same with the vexillarii. 12 In Livy the triarii are said to be sub signis, 13 where we perceive a close analogy between the old triarius and the vexillarii or subignarii of the age of Tacitus, although we must not suppose that the vexillarii were the same as the triarii.

After the selection of the men who were to compose the legion, the military oath was administered: on this occasion, one person was appointed to pronounce the words of the oath, and the rest of the soldiers were to say that they were ready to serve under the same commander. 14 Under the emperors, fidelity to the sovereign was required of the legions, and in the establishment of Christianity, the engagement was made in the name of the Trinity and the majesty of the emperor. 15 Livy says 16 that this military oath was first legally exacted in the time of the second Punic war, B.C. 216, and that, previously to that time, each decuria of cavalry and centuria of foot had only been accustomed to swear, voluntarily among themselves, that they would act like good soldiers.

The whole infantry of the legion was drawn up in three lines, each consisting of a separate class of troops. In the first were the hastati, so called from the hasta, or long spear which each man carried, but which was afterward disused; these were the youngest of the soldiers. The second line was formed of the principes, or grown men of mature age, and from their name it would appear that they were placed in the front line. 17 In the third line were the triarii, so called from their position; and these were veteran soldiers, each of whom carried two pilum, or strong javelins, whence they were sometimes called pilaeae, and the hastati and principes, who stood before them, antepilae.

When vacancies occurred on service, the men who had long been in the ranks of the first, or inferior of these three classes, were advanced to those of the second; and again, after a time, they were received among the triarii, or veteran troops. According to Appian, 18 in a battle in which the hastati was 1300; that of the principes was the same; but the triarius amounted to 600 only: if the strength of the legion exceeded 4000 men, that of the several bodies was increased proportionally, the number of the last class alone remaining the same.

The usual depth of each of the three bodies, or lines of troops in a legion, was ten men; an interval of an elliptical figure of horse was left between every two of these divisions in the first and second lines, and rather greater intervals between those in the third line. Every infantry soldier of the legion was allowed, besides the ground on which he stood, a space equal to three feet, both in length of front and in the depth of the files, because we perceive a close analogy between the old triarius and the hastati. He might have room for shifting the position of his buckler according to the action of his opponent, for throwing his javelin, or for using his sword with advantage. 19 The divisions of the second line were in general placed opposite the intervals of the first, and, in like manner, the divisions of the third were opposite the intervals in the second. At the battle

---

n Zama, however, the divisions of troops in the several lines were exactly opposite each other; but this was a deviation from the usual disposition, in order that the elephants of the Carthaginians might pass quite through to the rear. In an action, if the hastati were overpowered, they retired slowly tow-ard the principes; and, falling into the interval before mentioned, the two classes in succession continued the combat. In the mean time, the triarii, keeping one knee on the ground, covered themselves with the bucklers from the darts of the enemy; and, in the event of the first and second lines falling back, they united with them in making a powerful effort to obtain the victory.

The light-armed troops, bearing the name of velites and ferociarii or voravarii, did not form a part of the legion, but fought in scattered parties, wherever they were required. They carried a strong circular buckler three feet in diameter; the staff of their javelin was two cubits long, and about the thickness of a finger; and the iron was formed with a fine point, in order that it might be bent on the f. It discharged, and, consequently, rendered useless to the enemy.

The cavalry of the legion was divided into ten turmae, each containing 30 men, and each turma into three decuriae, or bodies of 10 men. Each horseman was allowed a space equal to five feet in length in the direction of the line. Each turma had three decuriones, or commanders of ten; but he who was first elected commanded the turma, and was prob-ably called turmarius.

In the time of the Republic, the six tribunes who were placed over a legion commanded by turns. (Vid. Tribuni Militum.) To every 100 men were appointed two centurions, the first of whom was properly so called; and the other, called signifer, uragal, or subcenturio, acted as a lieutenant, being chosen for the purpose of doing the duty in the event of the death or absence of the former. The signifer appears to have been originally chosen by the tribune, but afterward by the centurion. (Vid. Centurio.) The centurio also chose the standard-bearer, or ensign of his century (signifer or vexillarius). Each century was also divided into bodies of ten, each of which was commanded by a decurio or decanus. The first century of the triarius was called the primipila, the centurion of which had commanded the whole legion under the tribunes. The light-armed troops were also formed into bands or centuries, each of which was commanded by a centurio.

To Marius or Cesar is ascribed the practice of drawing up the Roman army in lines by cohorts, which gradually led to the abandonment of the ancient division of the legion into manipuli (Vid. Manipuli), and of the distinctions of hastati, principes, and triarii. Each legion was then divided into ten cohorts, each cohort into three maniples, and each maniple into two centuries, so that there were thirty maniples and sixty centuries in a legion. (Cohors or chora, the Greek χώρα, originally signified an enclosure to shelter the poultry, and was afterward used to designate the number of men which could stand within such an enclosure.) From a passage in Livy, *it appears that very anciently the allies or auxiliaries of Rome were arranged by co- horts: a disposition which is again referred to in the 23d and 28th books of his history, and in other places, whence it may be concluded that among those troops ait was ordinarily adopted. But, in the Commentaries of Cesar, the divisions of all the legions, whether Roman or allied, are alike designa- ted cohorts, and the term is also applied to the body of men (prætoria cohors) which was particularly ap- pointed to attend on the person of the manditor-prætor, which had objected to march against Ariovistus, that if the other troops should refuse to follow him, he would advance with the tenth legion alone, and would make that legion his prætorian cohort.

It has been supposed that Marius, who in order to recruit the forces of the Republic, was compelled to admit men of all classes indiscriminately into the ranks, did not intend to divide the three lines of troops in which the Roman armies had been previously drawn up for action; but, if such were the fact, the regulation could not have long remained in force, since Cesar usually, as in the battle with the Helvetians, formed his army in three lines: and at Pharsalia he appears to have had a reserve, which constituted a fourth, or additional line. It may be added that the name of only at last served these three classes of legionary troops continued to be applied till near the end of the Republic; for, in the first book of the Civil War, Cesar, mentioning the loss of Q. Fulginus in an action against Afranius, designates him the first centurion of the hastati in the 14th legion.

The allied troops were raised and officered nearly in the same manner as those of the Roman legion, but probably there was not among them a division of the heavy-army infantry into three classes. They were commanded by prefects (see page 102), who received their orders from the Roman consuls or tribunes. The troops sent by foreign states were the service of Rome were designated auxiliaries; and they usually, but not invariably, received their pay and clothing from the Republic.

According to Livy, the Roman soldiers at first received no pay (stipendium) from the state. It was first granted to the foot A. U. C. 347, in the war with the Volsci, and, three years afterward, to the horse, during the siege of Veii. Niebuhr, however, brings forward sufficient reasons for believing that the troops received pay at a much earlier period, and that the servarii (vid. Basi) had always been obliged to have pay also for the single women and minors who did to the knights; and he supposes that the change alluded to by Livy con- sisted in this, that every soldier now became entitled to pay, whereas previously the number of pensions had been limited by that of the persons liable to be charged with them. Polibius states the daily pay of a legionary soldier to have been two obols, which were equal to 93 asses, and in thirty days would amount to 100 asses. A knight's yearly pay amounted to 2000 asses; and, since the Romab year originally consisted of only ten months, his monthly pay amounted to 200 asses, which was double the pay of a foot-soldier. Polibius informs us that a knight's pay was three times as much as that of a foot-soldier; but this was not introduced until A. U. C. 354, and, if true, as Niebuhr has remarked, as a compensation for the service performed with their own horses, which were originally sup- plied by the state. (Compare Æs Hordarium. A centurion received double the pay of a legio- nary.) The pay of the soldiers was doubled by Julius Cesar. In the time of Augustus, the pay of a legio- nary was 10 asses a day, which was increased still more by Domitian (addidit quinaria stipendium)

This peculiar was the general, and, Sict, Dom., and, armed there supplies. whether make that discipline, of and Ibrm pilus, drawn Cannae,clusively Bcrib'". them. there were equally but only the Roman army given under the article ADMESS.

No one order of battle appears to have been ex-clusively adhered to by the Romans during the time of the Republic, though, in general, their armies were drawn up in three extended lines of heavy-armed troops (triplex acies); the cavalry being on order to draw the line to straighten them, formed there a sort of phalanx, whose edge succeeded so well that the enemy's line was broken; but, pressing forward too far, the wings of the latter closed upon the disordered troops, and nearly surrounded them. In the engagement with Labienus, the army of Caesar, being attacked both in front and rear, was divided into two lines, which were engaged opposite directions; and, in the action with the Par-thians, Crassus drew up the Roman army in one square body, having twelve cohorts on each of the four sides, with a division of cavalry between every two cohorts in each face.

The word of command was at first given aloud at the head of the army; but Eumlius Paulus changed this custom, and caused the tribune of the nearest legion to give it in a low voice to his primi-pilus, who transmitted it to the next centurion, and so on. It appears also that, anciently, the men on guard were at their posts during the whole day, and that, in consequence, they sometimes fell asleep leaving on their shields. Eumlius Paulus, in order to give the soldiers more time of their sleeping, appointed that they should be relieved every six hours, and that they should go on guard without their shields. (Vid. Castra.)

The legion, during the continuance of the ancient discipline, was found to be more than equal to the phalanx of the Greeks for general service, and Po-llybius has sufficiently accounted for the fact. This writer observes that, while the phalanx retained its form and power of action, no force was able to make any impression upon it, or support the violence of its attack; but he adds that the phalanx required that the field of battle should be a nearly level plain; even then the enemy might avoid it; and, by manoeuvring on its flanks and rear, might cut off its line of retreat to the number, and the charge of the eagle and the standard of the emperor. Its strength was 1105 foot-soldiers, and 132 cuirassiers on horseback, and its post was on the right of the first line. The remaining legions contained 555 infantry and 66 cavalry, and the five cohorts of the second line contained each the same number of infantry and cavalry. Thus the whole legion was composed of 6100 foot-soldiers and 726 horse-men, not including either the triarii or the light troops.

After the establishment of the imperial authority, the sovereign appointed some person of consular dignity to command each legion in the provinces; and this officer, as the emperor's lieutenant, had

1. (Liv. xlv. 41.)—2. (Polyb. xii. ex 3.)—3. (Liv. Bks. lvf.)—4. (vi. 16.)—5. (Veget., ii. 6, 15.)—6. (viii. 8.)
the title of prefectus, or legatus legionis.1 The first appointment of this kind appears to have taken place in the reign of Augustus, and Tacitus mentions the existence of the office in the reign of Tiberius. The authority of the legatus was superior to that of the tribunes, who before were responsible only to the consul. In speaking of the officers of a legion, Vegetius2 mentions two tribunes (probably meaning two classes of tribunes), of which the first, called tribunus major, received his commission from the censor; the other, called tribunus minor, rose to that rank by merit or length of service. Subordinate to the tribunes were, in each cohort, the several centurions, who bore the general name of ordinarii.3 To these hundred men there were probably, at one time, only the centurio, whose post was in front of the division, and the optio, who remained in the rear, but it appears that Augustus and Vespasian increased the number of officers of this class; for Vegetius observes that those whom these two emperors added to the ordinarii were called Augus-
tales and Flaviales.4 The decurions or decani were, as formerly, the leaders of files. According to Dio Cassius, seven cohorts of troops were instituted by Augustus for the defence of the city, and those bore the name of sigiles. It appears, however, that in the time of Tiberius they ceased to be considered as soldiers; for that writer takes no notice of them when, in enumerating the guards of Rome, he mentions three uran and nine praeptorini cohors.5 In a fragment of Arrian (the author of the work on the tactics of the Greeks) we have a brief notice of the constitution of a Roman army during the reign of Hadrian, and the description will probably serve for any age between that time and the dissolution of the Empire. It was so regulated that, when drawn up in order of battle, the legions should be in one line in the centre, and no division is made of any division of the troops into hastati, princples, and triarii. The first four ranks were armed with the pilum, and the others with slender pikes or javelins. The men in the front rank were to present their pila at the level of the enemy's horses' breasts, and those in the second, third, and fourth ranks were to stand ready to throw theirs. A ninth rank was appointed for the purpose of driving away the catapultari for projecting darts and arrows, and balistae for throwing stones, over the heads of the men in front. The cavalry were directed to be in the rear of the legions, probably in the event of being obliged to quit their stations on the wings. On the enemy making a charge, the second and third ranks were to close up to the first, and all these were to present their pila; the men in the fourth rank were to throw their weapons directly forward, and those in the rear were to discharge theirs over the heads of the others. The march of the army was made in one column. First came the Roman artillery, in two ranks; these were followed by archers on horseback and by the allied cavalry; then came the Armenian archers on foot, and half of the allied infan-
ty. A third rank consisted of the cavalry of Achaia. The elites of the Roman cavalry marched at the head of the central division; after them came the ordinarv cavalry, then the cataphractae and the light troops attached to the legions, followed by the legions themselves, in cohorts four men deep. At the head of the legion marched the praefect, his legate, the tribunes, and the centurions of the first cohort. The rear division consisted of the other half of the allied infantry and the baggage; and the whole was closed by the cavalry of the Gete.

After the settlement of the Empire, Augustus united with the troops which, under the name of the praetorian cohort, had attended him as his guard two legions of infantry which had been raised in Italy, and placed the whole in garrison in the chief towns of that country, but never allowed more than three cohorts to be in one city.1 Tiberius afterward assembled to this body of Praetorians in one at Rome,2 but outside the walls of the city; and there, during 300 years, they were at times the guards and the masters of the sovereign. In the time of Tiberius there were nine praeptorini co-
horts,3 but their number was increased to sixteen under Vitellius, four of whom guarded the city.4 When Severus had got possession of the Empire, he was subsequently to this body of Praetorians by these praetorians the Emperor the latter, and banished them from Rome; but such an institution was to be convenient to be neglected by the despotic monarch of a vast empire, and he immediately drew from the legions of the frontiers the men most remarkable for their strength and courage.5 With these he assembled an army of 25,000 men, to whom he gave pay and privileges superior to those of the other troops; and their commander, the praetorian pre-
fect, was made both the head of all the military force and the chief minister of the Empire. By the arrangements of Diocletian, a praetorian prefect was appointed, with both a military and a civil jur-
isdiction, in each of the four great provinces, Italy, Gaul, Illyria, and the East, into which the Empire was then divided; but a large body of guards, under the name of the praetorian guard of Rome, was continued to form the garrison of the city. Engaged in the cause of Maxentius, these troops, almost alone, withstood for a time the shock of Constantine's Gallic army, and most of them are said to have covered with their dead bodies the ground which they occupied when in line; but, after the death of the former, the forti
camp of the praetorians was destroyed and the garrison of Rome was disbanded.

The command of all the armies of the Empire was then committed by Constantine to two officers, who had the title of magistri militum; one of these was placed over the cavalry, and the other over the infantry, yet both commanded indifferently the troops of both classes in any one army.6 On the death of Constantine the Empire their number was doubled, and in the reign of Constantius it was increased to eight. According to Vegetius,7 the magister militi
tum was a man of distinguished birth; but this writer observes that the troops were actually com-
manded by the praefectus legionis, who held an in-
termediate rank between the magister militum and the tribunes, who were placed over the cohorts.

The hope of preventing those acts of insubordi-
nation which had occurred among the lega
tional troops, appears to have induced Constantine, or his immediate successors, to diminish the strength of these bodies; and, from a computation founded on the number of the troops which garrisoned Amide when it was besieged by Sapor, it appears that a Roman legion could not then have consisted of more than 1,500 men. Of these comparatively small bodies there were about 122 in the whole Empire; they were, however, not only without the discipline which characterized the Roman line of battle in former times, but the progress of luxury had so far enervated the class of free citizens that a sufficient number could not be found to fill the ranks of the army. Slaves were admitted into every corps except the superior class of cavalry; and the boldest of the Franks and Goths were al-

1. Of Augustus. 2. Of Marcellus. 3. Of Constantine.
ARQUEATUS

ned, for the sake of their services, to attain the highest military posts. In this age appear the first indications of the feudal tenures; for the lands bestowed on the veterans, as the reward of valour, were granted on condition that the sons of those who would, like their fathers, serve the state in the wars. 1

The reputation of the Roman arms was upheld for a time in the West by the troops under Aetius, and in the East by the martial virtues of Belisarius; and the last notice we have of an engagement sustained in the spirit of the ancient battles, is that given in an agreement which was arrived at between the two parties in the war, 2 when, describing an action on the Exophrates between the troops of that nation and those of Justinian, he says the latter presented a front which opposed to the assaults of the enemy's cavalry an impenetrable line of pikes, while the bucklers of the men protected them from the flights of arrows with which they would have otherwise overthrown and destroyed. Aetius, a Roman army began to assimilate to that of an Asiatic people; its strength consisting in its cavalry, which was armed with cuirass, helmet, and greaves, and which had acquired dexterity in the use of the javelin and bow; while the infantry, formed of men taken from the lowest rank in society, ill-armed and disciplined, served only as a support to the horsemen, or attackers on the horsemen, and in action only engaged with an infantry like themselves.

"ARNABO (άρναβο), a medicinal substance noticed by Asinus 3 and Paulus Egineta. 4 It would appear that it is not noticed by the other medical authors, whether Greek, Roman, or Arabis, unless we except the only work of Pliny, major and et condensata. Adams states, with reason to doubt that these are the two species noticed by Dioscorides. Since, although Sprengel hesitatingly refers them to the P. Asiatica and maritima; and Sibthorp marks the άρναβον μυκράν as being the P. lagoopus. Stackhouse reasons the ά. of Theophrastus as being the ά. of Dioscorides. ARON (άρτον) a plant about which great uncertainty prevails. Woodville holds it to be the Arum maculatum, L., or the Wake-robot; but Alston says "the Wake-robot is not the άρον, but the άρι- 

ARHEPHORIA (άρχηφορία), a festival which, according to the various ways in which the name is written (for we find πρωρία and ιρηφορία), is attributed to different deities. The first form is derived from ιφρη, and thus would indicate a festival at which mysterious things were carried out. The other name would point to Erse or Herse, who was believed to be a daughter of Cecrops, and whose worship was intimately connected with that of Athena. But since no written account of the latter, which have sufficient ground for believing that the festival was solemnized, in some good humour, in honour of Athena. 8 It was held at Athens, in the month of

2. (Archeatus, cupro, regus morbus) derives its name from the yellow tint diffused over the body, imitating in a manner the colours of the rainbow. 1 It is sometimes spelled arevus, but less correctly, as (according to Nonius) areus signifies any arrow, but aerus only the Iris, or rainbow, as Lucretius, "he of no color in nigritis existit nubilus argi."

"ARRA, ARRABO, or ARRA, ARRHHABO, is defined by Gaus 4 to be the "proof of a contract of buying and selling;" but it also has a more general signification. That thing was called arfa which the contracting parties gave to one another, whether a silver coin or money itself, in order to be witness of the evidence of the contract being made; it was no essential part of the contract of buying and selling, but only evidence of agreement as to price. 5 If the arfa was given as evidence of a contract absolutely made, it was called arfa pacto perfecto data; if it was given as evidence of a contract to be made at a future time, it was called arfa pacto imperfecto data.

In the latter case, the party who refused to complete the contract lost the arfa which he had given; and when he had received an arfa, but given none, he was obliged to restore double the amount of the arfa. Yet the bare restitution of the arfa was sufficient, if both parties consented to put an end to the contract, or if performance of the contract was impossible on either side. In the former case, the contract was not completely performed, the arfa was restored, and the party who was in fault lost the arfa which he had given. But when the contract was completely performed, in all cases where the arfa was money, it was restored, or taken as part of the price, unless special customs determined otherwise, it was called arfa imperatae data.

The recovery of the arfa was in all cases by a personal action.

The arfa in some respects resembles the deposit of money which a purchaser of land in England generally pays, according to the conditions of sale, on opening the contract.

The term arfa, in its general sense of an evidence of agreement, was also used on other occasions, as in the case of betrothment ( sponsellies, 9. (Vul. Marriage). Some time the word arfa is used as synonymous with pignus, but this is not the legal meaning of the term. 10. (Arrhephoria)
Skitophorion. Four girls, of between seven and eleven years, were selected every year from the mistresses and mistresses families, two of whom were to intend the weaving of the sacred robe—the Athenians, which was begun on the last day of Pyanepos; the other two had to carry the mysterious and sacred vessels of the goddess. These latter remained a whole year on the Acropolis, either in the Parthenon or some adjoining building; and, when the festival commenced, the priestess of the goddess placed vessels upon their heads, the contents of which, 118, 117, 24—Afterward, with these they descended to a natural grove within the district of Aphrodis, in the gardens. Here they deposited the sacred vessels, and carried back something else, which was covered, and likewise unknown to them. After this the girls were dismissed, and others were chosen to supply their place in the Acropolis. The girls wore white robes adorned with gold, which were left for the goddess; and in all circumstances of kind cakes were baked for them. To cover the expenses of the festival, a peculiar lighting was established, called ἀπόφησις. All other details concerning this festival are unknown.

ARROGATIO. (Vid. Aburito.)

ARSENICON (ἀρσενίκον) does not mean which is a common name, but the σεμιχτος
phare of arsenic, or orpiment. Celsus clearly indicates what it was when he says "Arsipagium, quod ἀρσενίκον a Gravis nominatur." In a word, it is yellow orpiment, and this latter name itself is merely a corruption from arsipagium, or "paint of gold." "It was called," observes Dr. Moore, "Arsipagium, perhaps, not merely from its golden colour and the use to which it was applied, but because the ancients thought it really contained that metal. Pliny mentions, among other modes of obtaining gold, that of making it from orpiment; and says that Caligula ordered a great quantity of that substance to be reduced, and obtained excellent gold, but in such small proportion as to lose by an experiment which was not afterward repeated. Although no great reliance can be placed on this account, we are not of necessity, to regard it as a fable; for the mass experimented on may have contained, as it is said this mineral sometimes does, a small portion of gold." The arsenic of the ancients, then, was considerably different from our oxide of arsenic, which is a factitious substance procured from coal by sublimation. The Arabian authors mention a substance derived from the earth by the same process; subliming arsenic; and Avicenna makes mention of white arsenic, by which he no doubt meant sublimed arsenic, or the Arsenicum album of modern chemists. According to the analysis of Klaproth, yellow orpiment consists of 62 parts of arsenic and 38 of sulphur. The Greek name ἀρσενίκον (masculine) is said by some to have been given to it because the substance was employed by the Ancients in some of their religious ceremonies; others that it was got from the earth by sublimation; others, that it was obtained from sapropelic earth. Whatever name is given to it, there is no doubt that it was employed as an additional ingredient, and a means of giving character to the artaba, which, on account of its bluish tinge, was called "artaba." The name was also applied to the trachea by Hippocrates and his contemporaries, by whom the vessels now called arteries were distinguished from the veins by the addition of the word ὁδός. By later writers it is used to signify sometimes the trachea, and in this sense the epithet ἄφριξα, aspera, is occasionally added; sometimes the tricuspid artery, in which sense the epithet λατευς, is sometimes added, to distinguish it from the trachea; and sometimes, in the plural number, the bronchi.
ARVALES FRATRES.

Notwithstanding the opinion of many of the ancients, that the arteries contained only air, it is certain that the more intelligent among them knew perfectly well, 1. That they contain blood, and even that this is of a different nature from that which is in the veins. 2. Galen, from whom the last idea is obtained, calls the pulmonary artery ἄερος ἄνθρωπου, because it conveys venous blood, although it has the form and structure of an artery.

3. That the section of an artery is much more dangerous and more difficult to heal than that of a vein.

4. That there is a pulsation in the arteries which does not exist in the veins, and of which the variations are of great value, both as assisting to form a correct diagnosis, and also as an indication of treatment.

ARTOP'TA. (Vid. Pistor.)

ARU'RA ( Ipsum, a Greek measure of surface, which, according to Suidas, was the fourth part of the στάθμος as a measure of length, contained 100 Greek feet; its square, therefore, =10,000, and therefore the arrara =6500 Greek square feet.

Herodotus mentions a measure of the same name, but apparently of a different size. He says that it is a hundred Egyptian cubits in every direction. Now the Egyptian cubit contained nearly 17 inches; and so, the square of the same size is 2711/2 inches, i.e., 142.1 feet, gives the number of square feet in the arrara, viz., 21,904.

ARUS'PEX. (Vid. Haruspek.)

ARVALES FRATRES. The fraters arvalis formed a college or company of twelve in number, and were so called, according to Varro, from offering the victims with the feet upon the altar. (secra publica factam poptertca, ut fruges ferant aere.) That they were of extreme antiquity is proved by the legend which refers their institution to Romulus, of whom it is said, that when his nurse Acca Laurentia lost one of her twelve sons, he allowed himself to be adopted by her in his place, and called himself Frater Arvalis. The legend of the maternal grandfather of the frater Arvalis."

We also find a college called the Societas Ttiei, and as the latter were confessedly of Sabine origin, and instituted for the purpose of keeping up the Sabine religious rites, there is some reason for the supposed of Nieuwberg, 17 that these colleges corresponded one to the other; the Fratres Arvalis being connected with the Latin, and the Societas Ttiei with the Latin, the Roman colleges contented with just as there were two colleges of the Luperci, namely, the Pabii and the Quinetiti, the former of whom seem to have belonged to the Sabines.

The office of the fraters arvalis was for life, and was not taken away even from an exile or captive. They wore, as a badge of office, a chaplet of ears of corn (epices cornes) fastened on their heads with a white band. 12 The number given by inscriptions varies, but it is never more than nine; though, according to the legend and general belief, it amounted to twelve.

One of their annual duties was to celebrate a three days' festival in honour of Dea Dia, supposed to be Ceres, sometimes held on the xvi., xiv., and xiii., sometimes on the vii., vi., and iv. Eski Jov., sometimes on the 17th, the 27th, 29th, and 30th of May. Of this the master of the college, appointed annually, gave public notice (indicebat) from the Temple of Concord on the Capitol. On the first and last of these days, the college met at the house of their president, to make offerings to the Dea Dia; on the second they assembled in the grove of the same goddess, about five miles south of Rome, and there offered sacrifices for the fertility of the earth. An account of the different ceremonies of this festival is preserved in an inscription, which was written in the first year of the Emperor Elagabalus (A.D. 218), who was elected a member of the college under the name of M. Aurelius Antonius Pius Felix. 13 The same inscription contains the following song or hymn, which appears to have been sung at this festival several hundred years before.

"E nos. Lare, invote,
Nave lucem, Marym, sine iunctore in pleon
Satur furare, Mars, lumen, salis, sta herber
Semnus alternei adop secret conertos.
E nos, Marmor, uvato:
Triumpe, triumpe, triumpe, triumpe, triumpe,"

Klausen, in his work on this subject, 14 gives the following translation of the above:

"Age nos, Lare, juwate.
Novo luce, Mars, sine incertore in pleure:
Satur furere, Mars, pate pulsa lumen, sta verbere
Semnus alternei adop secret conertos.
Age nos, Maret, juwate:
Triumpe, &c,"

But, besides this festival of the Dea Dia, the fraters arvalis were required, on various occasions under the emperors, to make vows and offer up thank-givings, an enumeration of which is given in Faciolati. 15 Strabo, indeed, 16 informs us that, in the reign of Tiberius, these priests (lupovnwnwes) performed sacrifices called the ambarvalia at various places in the province of the city or original territory of Rome; 17 and among others, at Festi, a place between five and six miles from the city, in the direction of Alba. There is no boldness in supposing that this was a custom handed down from time immemorial, and, moreover, that it was a duty of this priesthood to invoke a blessing on the whole territory of Rome. It is proved by inscriptions that this college existed till the reign of the Emperor Gordion, or A.D. 325, and it is probable that it was not abolished till A.D. 400, together with the other colleges of the pagan priesthoods.

The private ambarvalia were certainly of a different nature from those mentioned by Strabo, and were called from the town at which that was done on the occasion, being led three times round the cornfields before the sickle was put to the corn. This victim was accompanied by a crowd of merry-makers (chori e socii), the reapers and farm-servants dancing and singing, as they marched along, the praises of Ceres, and praying for her favour and presence, while they offered her the libations of milk, honey, and wine. 18 This ceremony was also called a iustratio, 19 or purification; and for a beautiful description of the holyday, and the prayers and vows made on the occasion, the reader is referred to Tibullus, lib. ii., eleg. i. It is, perhaps, worth while to remark that Polybius uses language almost applicable to the Roman ambarvalia in speaking of the Mantinians, who, he says repeatedly, made a purification, and carried victims round the city, and all the country: his words are, Οἱ Μαντίνιοι καθαροὺς ἐπισώσσοντο, καὶ σφίγγα περιφέροντο τῆς πόλεως κύκλῳ καὶ τῆς χώρας πάσης.

There is, however, a still greater resemblance to

Indeed, the history of Roman coinage is a fascinating story of changes and developments. The weight of a pound was originally 12 ounces, and the weight of a Roman denarius was 1/36 of a pound. The Roman denarius was divided into smaller units such as the sextans, semis, quinarius, triens, quadrans, and as. The value of these coins varied over time, and their weight was subject to fluctuations.

The Roman denarius was the standard unit of currency for the first Punic war (B.C. 264-241), and in order to meet the expenses of the state, the weight of a pound was diminished, and asses were struck of the same weight as the sextans (that is, two ounces, or one-sixth of the ancient weight); and that thus the Republic paid off its debts, gaining five parts in six: that afterward, in the second Punic war, in the dictatorship of Q. Fabius Maximus (about B.C. 217), asses of one ounce were made, and the denarius was decreed to be equal to sixteen asses, the Republic thus gaining one half; but that, in military pay, the denarius was always given for ten asses: and that, soon after, by the Papirian law (about B.C. 191), asses of half an ounce were made. Festus, also, mentions the reduction of the ass to two ounces at the time of the first Punic war. There seem to have been other reductions besides those mentioned by Pliny, for there exist asses, and parts of asses, which show that this coin was made of 11, 10, 9, 8, 3, 1, 1/4 ounces; and there are copper coins of the Terentian family.

Pliny informs us that, in the time of the first Punic war (B.C. 264-241), in order to meet the expenses of the state, the weight of a pound was diminished, and asses were struck of the same weight as the sextans (that is, two ounces, or one-sixth of the ancient weight); and that thus the Republic paid off its debts, gaining five parts in six: that afterward, in the second Punic war, in the dictatorship of Q. Fabius Maximus (about B.C. 217), asses of one ounce were made, and the denarius was decreed to be equal to sixteen asses, the Republic thus gaining one half; but that, in military pay, the denarius was always given for ten asses: and that, soon after, by the Papirian law (about B.C. 191), asses of half an ounce were made. Festus, also, mentions the reduction of the ass to two ounces at the time of the first Punic war. There seem to have been other reductions besides those mentioned by Pliny, for there exist asses, and parts of asses, which show that this coin was made of 11, 10, 9, 8, 3, 1, 1/4 ounces; and there are copper coins of the Terentian family.

which show that it was depressed to 1/4 and 1/2 of its original weight. Several modern writers have contended, chiefly from the fact of asses being found of so many different weights, that Pliny's account of the reductions of the coin is incorrect, and that these reductions took place gradually, in the lapse of successive centuries. But Boeck has shown that there is no trace in early times of a distinction between the as grave and lighter money; that the Twelve Tables know of no such distinction; that, even after the introduction of lighter money, fines and rewards were reckoned in as grave; and that the style of the true Roman coins which still remain by no means proves that the heavier pieces are much older than those of two ounces, but we have the contrary. His conclusion is, that all the reductions of the weight of the as, from a pound down to two ounces, took place during the first Punic war. Indeed, if the reduction had been very gradual, it is impossible that the Republic could have made by it that gain which Pliny states to have been the motive for the step.

The value of the as, of course, varied with its weight. Some writers, indeed, suppose that a rise took place in the value of copper, which compensated for the reduction in the weight of the as; so that, in fact, the as libralis of Servius Tullius was not of much greater value than the lighter money of later times. But this supposition is directly contradicted by Pliny's account of the reduction in the weight of the as, and it would appear that the value of copper had rather fallen than risen at the time when the reduction took place.

Before the reduction to two ounces, ten asses were equal to the denarius = about 81 pence English. (Vid. Dexiarus.) Therefore the as = 3 4 farthings. By the reduction the denarius was made equal to 16 asses; therefore the as = 24 farthings.

The as was divided into parts, which were named according to the number of ounces they contained. They were the denus, sextans, dodrans, bes, septunx, semis, quinarius, triens, quadrans, or teruncius, sextans, septunx, or sesquuncia, and uncia, consisting respectively of 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, and 1 ounces. Of these divisions the following were represented by coins; namely, the semis, quinarius, triens, quadrans, sextans, and uncia. There is a solitary instance of the existence of the dodrans, in a coin of the Cassian family, bearing an S and three balls. We have no precise information as to the time when these divisions were first introduced, but it was probably nearly as early as the first coinage of copper money.

The semis, semissis, or semi-as, half the as, or six ounces, is always marked with an S to represent its value, and very commonly with heads of Jupiter; Juno, and Pallas, accompanied by strigils.

The quinarius, or piece of five ounces, is very rare. There is no specimen of it in the British Museum. It is distinguished by five small balls to represent its value.

The triens, the third part of the as, or piece of four ounces, is marked with four balls. In the annexed specimen from the British Museum, the ball...
ASCALABOTES.

The ascus, one ounce piece, or twelfth of the as, is marked by a single ball. There appear on this coin heads of Pallas, of Roma, and of Diana, ships, frogs, and ears of barley.

The sextans, the sixth part of the as, or piece of two ounces, bears two balls. In the annexed speciemen from the British Museum, there is a caduceus and strigil on one side, and a cockle-shell on the other. Its weight is 777 grains.

The vasia, one ounce piece, or twelfth of the as, is marked by a single ball. In the annexed specimen from the British Museum, there is a caduceus and strigil on one side, and a cockle-shell on the other. Its weight is 717 grains.

The word as was used also for any whole which was to be divided into equal parts; and those parts were called uncias. Thus these words were applied not only to weight and money, but to measures of length, surface, and capacity, to inheritances, interests, houses, farms, and many other things. Hence the modern use of the terms: hares ex dextrane, the heir to the ninth part, etc.

Pliny even uses the phrases semisiem Africa, and dodecans et semicunctos horae.

The as was also called, in ancient times, assarius (sc. nummus), and in Greek τὸ δησαυρίου. According to Polybius, the assarius was equal to half the obolus.

The coins of Chios we find δησαυρίου, δησαυρίου βύσμα, δησαυρίου δβά, δησαυρίου τόλα.

*ASARIUM* (ἀσαρίον), a plant. There can be no doubt, observes Adams, that it is the Aserium Euro- paenum, or common Assarabaca. Dodonaeus mentions that it had got the trivial name of Buccac in France, and hence supposed Assarabaca was a compound of the two terms. He denies, however, that it is the same as Assaraca of the ancients. But Strabo advocates this opinion, and mentions in confirmation of it, upon the authority of the Flora Vernemenis, that the Assarabaca is called bacchera and bac- cera by the inhabitants of the district around Veron-za.

According to Sibthorp, it still grows in what was once the Laconian territory, and in the country around Constancia. The word as

ASBESTOS or AMANTIUMUS (ἀσβιτρως, ἀμανι- τως). This mineral, which is generally white, and has sometimes a greenish hue, and which consists of soft flexible fibres, was obtained by the ancients from India, from the vicinity of Carpusus in Cyprus and from Carystus in Euboea. In consequence of being found in the two latter localities, it was some times called "the flax of Carpusus" (Αἰγινος Καρπο- σίου), and also "the Carystian stone" (Κήλος Καρπο- σίου). It was well adapted for making the wicks of lamps, because it is indestructible by fire; and hence the Greeks, who used it for this purpose, gave it the name "φωτιστήρ" (φωτιστήρ), which means not distinguish- able. Passanis2 mentions that the golden lamp which burned day and night in the temple of Athena Polias, at Athens, had a wick of this substance.

It was also spun and woven into cloth. Thus manufactured, it was used for napkins (εὑραμενη- γες, εὑραμενακτος), which were never washed, but cleaned in a much more effective manner, whenever they required it, by being thrown into the fire.

Another use to which asbestos cloth was applied, was to preserve the remains of dead bodies burned in the funeral pyle. The corpse, having been wrapped in a cloth of this substance, was consumed with the exception of the bones, which were thus kept together, and the charred remains were buried with the ashes of the wood. But the expense of this kind of cloth was so great, that it could only be used at the obsequies of persons of the most exalted rank. The testimony of Pliny, who alone has transmitted to us the knowledge of this species of posthumous luxury, has been corroborated by the discovery of a piece of this same material, manufactured by the ancient Romans, in an Egyptian sepulchre. The most remarkable specimen of this kind was found at Rome, A.D. 1705, in a marble sarcophagus. The skull and bones of the deceased were wrapped up in it. Its dimensions were about five feet by six and a half. Since its discovery, it has been carefully preserved in the Vatican Library; and Sir J. E. Smith, who saw it there, made the following note, which we copy:—

"This specimen of cloth, which was once used in the manufacture of a kainos, or cloth made of flax, has been found in a sepulchre of the ancient Romans. It is of the purest white, and consists of two threads: it is coarsely spun, but as soft and pliant as silk. Our guide set fire to one corner of it, and the very same part burned repeatedly with great rapidity and brightness without being at all injured."

Although asbestos is still found naturally assi- cated with rocks of serpentine in Cornwall, and in many other parts of the world, it is chiefly used in the manufacture of this material, which we call asbestos, for certain philosophical purposes, and, if made into cloth, it is only in very small quantities, and as a matter of curiosity.—II. The Greek medical writers use the term ἄσβεστος in a very different sense from the preceding. With them it indicates Calx vera, or Quilkime (τιρώνας being understood). By Dioscorides it is exclusively applied to the horn or bones of sea-shells. "I am not aware," observes Adams, "that any Greek author uses the term ἄσβεστος in the sense in which it is employed by the Latin writers and by modern naturalists."

*ASCALABOTES* (ἀσκαλάβοτης), a species of Lizard. Its Greek name are ἄσκαλαβον, ἄσκαλα- βος, ἄσκαλαβη, and κόλλαβη, all of which appellations are given in the following passages. We have no doubt that the Spotted Lizard, the Stellio of the Latin writers, and the Lacerta gecko of Linnaeus. The Stellio lived in walls, and was accustomed to run along these and on the roofs of houses. It was considered the en- emy of man, venomous and cunning. Hence the term stellatimatus, denoting all kinds of fraud in bar- gain, and the English word "stelmatist" or "Fraud in the contract." The Stellio is the Tarentolo, or Gecko turbulentus of the south of Europe. It must not be confounded with the Lacerta stella, L.,

or the Stelio of the Levant. This misapprehension of the term was first made by Belon. The *Lacerta stellio* is of an olive colour, shaded with black, and is very common throughout the Levant, and particularly in Egypt. The *Lacerta* on the other hand, is a spotted lizard, and some of the species, the Platydactylus for instance, are painted with the most lively colours. The melancholy and heavy air of the Gecko, superadded to a certain resemblance which it bears to the salamander and the toad, have rendered it an object of hatred, and caused it to be considered as venomous, but of this there is no real proof.

ASCARIS (ascaris), the small intestinal worm formed in children and in adults afflicted with certain diseases. It is the *Ascaris normcularis,* L. 2

ASCIA, dim. ASCIOLEA (ascarppn, escarppn), in adze.

Murato 4 has published numerous representations of the adze, as it is exhibited on ancient monuments. We select the three following, two of which show the instrument itself, with a slight variety of form, while the third represents a ship-builder holding it in his right hand, and using it to shape the rib of a vessel. The blade of the adze was frequently curved, as we see it in all these figures, in order that it might be employed to hollow out pieces of wood, so as to construct vessels either for holding water or for floating upon it. Calypso, in the Odyssey, 1 furnishes Ulysses both with an *axe* (πέτρων) and with a *well-polished adze,* as the most necessary instruments for cutting down trees and constructing a ship.

In other cases the curvature of the blade was much less considerable, the adze being used merely to cut off all inequalities, so as to make a rough piece of timber smooth (asciar, dolare), and, as far as possible, to polish it (polire). Cicero 5 quotes from the Twelve Tables the following law, designed to restrain the expenses of funerals: *Rogum ascia ne exilio.*

In using the adze, the shipwright or carpenter was always in danger of inflicting severe blows upon his own feet if he made a false stroke. Hence arose the proverb applied to those who were their own ene-

νemy. 

ASCIOLEA.

to ιασκορπόν κέρατον, and denoted a rock in its natural state.

Both the substantive *ascia,* and the verb *asciare,* derived from it, retain the same signification in modern Italian which they had in Latin, as above explained.

Vitruvius and Palladius 4 give directions for using the ascia in chopping lime and mixing it so as to make mortar or plaster. For this purpose we must suppose it to have had a blunt, unpolished blade, and a long handle. In fact, it would then resemble the modern hoe, as used either by ploughmen and plowmen, as the use just specified, or by gardeners or agriculturists for breaking the surface of the ground and eradicating weeds. Accordingly, Palladius,' in his enumeration of the implements necessary for tillimg the ground, mentions hoes with rakes fixed at the back, *ascias in averse parte referentes rastris.*

Together with the three representations of the ascia, we have introduced into the preceding woodcut the figure of another instrument, taken from a coin of the Valerian family. 4 This instrument was called *Aesculus.* It was chiefly used by masons, whence, in the ancient glossaries, *Aesculeius* is translated λατιός, a stone-cutter. The acisculus, or pick, as shown in the above figure, was a little curved, and it terminated in a point in one direction and was flattened out like a hammer in the other. Here it was inserted so that it might be used with the same kind of action as the adze. Also, as the substantive *ascia* gave origin to the verb *exasciare,* meaning to hew a smooth piece of wood out of a rough piece by means of the adze, *so asciaulus gave origin to exasciare,* meaning to hew anything out of stone by the use of the pick. Various monumental inscriptions, published by Muratori, 7 warn persons against opening or destroying tombs by this process.

A'SKION (ascon), a species or variety of *Truffla,* mentioned by Theophrastus. 4

ASCLEPIAS (a'sklepia), a plant, which Alston, Woodville, Billerbeck, and Sprengel agree in identifying with the *Asclepias vinealeus, L.,* or official Swallow-wort. Stackhouse, however, prefers the *Thapsia Aesclepiun.* It was used in cases of dropsy, 7 and took its name from Aesclepiades, who first recommended its use.

ASCLEPIESA (a'sklepia) is the name of fes-

vivals which were probably celebrated in all places where temples of *Asclepius* (Asculapius) existed. The most celebrated, however, was that of Epidaurus, which took place every five years, and was solemnized with contests of racists and musicians, and with solemn processions and games. *A'sklepia* are also mentioned at Athens, 7 which were, probably, like those of Epidaurus, solemnized with musical contests. They took place on the eighth day of the month of Elaphbolion.

ASCYRON (as'kron), a plant. Dioscorides puts it beyond a doubt that the *as'kron* is a species of *Helleborus,* or St. John's-wort; but which species it is cannot be satisfactorily determined. Sprengel, in the first edition of his R. H. H., preter the *Hypericum Androsanum,* or Tutan; but in his edition of Dioscorides he hesitates between the *H. perforatum* and the *H. montanum.* Dodonaeus is for the former, and Matthiolus for the latter. Adams thinks that the description of Dioscorides is more applicable to the *Androsanum* than to the *perforatum.*

The name "asiarchum (ασιαρχόμενος)" was given to this plant, because the black exudation with the nai, exudes a blood-red colour (κόκκινος αίμα, "human blood"). A species of balsamic oil was extracted from this plant. According to Sibthorp, the Ascyron is called at the present day Βάλλαυνοι by the monks of Mount Athos; λειψανοφόροι in Zante, where it grows in the hedges; and σσθάνοι in Labrador.

ASCRO/LIA (ασκόλλια) (the leaping upon the leather bag) was one of the many kinds of amusements in which the Athenians indulged during the Anthestheria and other festivals in honour of Dionysus. The Athenians sacrificed a he-goat to the god, made a bag out of the skin, smeared it with oil, and then tried to dance upon it. The various accidents attending this contest, forcibly gave impetus to the spectators. He who succeeded was victor, and received the skin as a reward. The scholar, however, erroneously calls the ascollia a festival; for, in reality, it only formed a part of one.

ΑΣΙΑΡΧΕΙΑΝ ΓΡΑΦΗ (ασιαρχικό γράμμα) was one of the many forms prescribed by the law for the avoidance of the imprecation of impiety. From the various tenour or the accusations still extant, it may be gathered that this crime was as ill-defined at Athens, and, therefore, as liable to be made the pretext for persecution, as it has been in all other countries in which the civil power has attempted to reach offences so much beyond the natural limits of its jurisdiction. The occasions on which the Athenian accuser professed to come forward, may be classed as, first, breaches of the ceremonial law of public worship; and, secondly, indications of that, which in analogous cases of modern times would be called heterodoxy or heresy. The former comprehended emasculation upon consecrated grounds, the sacrifice of slaves, the consumption of sacrileges and festials, the mutilation of statues of the gods, the introduction of deities not acknowledged by the state, and various other transgressions peculiarly defined by the laws of the Aται sacra, such as a private celebration of the Eleusinian mysteries and their publication, the planting of sacred olive-trees, or placing a suppliant bough (ιευρότιο) on a particular altar at an improper time. The heretical delinquencies may be exemplified by the expulsion of Protagoras4 for writing that "he could not learn whether the gods existed or not," in the persecution of Anaxagoras,5 like that of Galilee in analogous cases, for this ignoring the positive opinions about the same, and the condemnation of which others for not holding the objects of the public worship to be gods.6 The variety of these examples will have shown that it is impossible to enumerate all the cases to which this sweeping accusation might be extended; and, as it is not upon record that religious Athens7 was scandalized at the profane jests of others, it may be inferred that the gods were indifferent to human actions, it is difficult to ascertain the limits at which jests and sarcasm ended, and penal impiety began.

With respect to the trial, any citizen that pleaded διαλογίζομενος—which, however, in this, as in all other public actions, must be understood of those only who did not labor under an incapacitating distrust of the proceedings (περικοπή) seems to have been a competent accuser; but, as the nine archons and the septemagites were the proper guardians of the sacred

ASPILLA

The epistle Philip is called, high-priest (λειτουργός), which appears to show that he must have been chief asarch of the province.

ASPILLA (ασπίλλα) was a wooden pole or yoke, held by a man either on his two shoulders, or more commonly on one shoulder only, and used for carrying burdens.

The paintings in the ancient tombs of Egypt prove the general use of this implement in that country, especially for carrying bricks, water-pails to irrigate the gardens, and baskets with all kinds of provisions for the market. Mr. Burton found at Thebes a wooden yoke of this kind, with one of the leather straps belonging to it. The yoke (which is now in the British Museum) is about 3½ feet long, and the strap about 16 inches.

We also find this instrument displayed in works of Grecian art. A small bronze lamp found at Stabiae (see the annexed woodcut) represents a boy carrying two baskets suspended from a pole which rests upon his right shoulder. The two other representations here introduced, though of a fanciful or ludicrous character, show by that very circumstance how familiar the ancients must have been with the use of this piece of furniture. The first is from a beautiful sarcophagus in the Florentine museum: it represents a grasshopper carrying two baskets, suspended each by three cords from the extremity of the yoke, and skilfully imitates the action of a man who is proceeding on a journey. The other is from a Greek painted vase, and, under the disguise of a satyr, shows the mode in which lambs

and other viands were sometimes carried in preparing for a sacrifice to Bacchus. In the collection of antique gems at Berlin there are no less than four representations of men carrying burdens in this manner.

Aristotle has preserved an epigram of Simonides, which was probably inscribed upon the base of a statue erected at Olympia to the individual whom it celebrates. It begins thus:

Προσέκεν μὲν ἀμβούς ἐγὼν τριχέα χειλέαν,

Ἰθέων ἐκ Αργοῦ εἰς Τεγέαν ἐφορον.

This poor man, who had formerly obtained his living by bearing "a rough yoke" upon his shoulders, to carry fish all the way from Argos to Tegea, at length immortalized himself by a victory at the Olympic games.

ASPALATHUS

Aristophanes calls this implement ἀνφόρας: it introduces upon the stage a slave carrying a heavy load by means of it; and he describes the act of transferring it from one shoulder to another by the phrase μεταφέρειν, or ἀνφόρας λαμβάνειν.

*ASPILLOS, a species of Goddy or Horsefly, accustomed to sting cattle. Virgil makes it the same with the οἶνοστρῶς of the Greeks, and Varro gives it the name of Tabanus. Flins should also be able to transfer it from one shoulder to another by the phrase μεταφέρειν, or ἀνφόρας λαμβάνειν.

As in Latin, so in Greek there are two names, οἴνοστρος and μελάφυ. Boechari and Aldrovandi have provided it very satisfactorily, that by the word poets and writers on Belles Lettres these two terms were used indiscriminately, but that Aristotle and other writers on matters of science apply the former (οἴνοστρος) to a species of gadfly, meaning, very probably, the Cestrus hounis or Breeze, and the latter to a species of horsefly, the Tabanus bovinus. This Adams considers the most satisfactory account of the matter: he deems it right, however, to mention, that Schneider, treating of the μελάφυ of Ælian, professes himself unable to determine whether it was a species of Cestrus, Tabanus, or Hypolobos, and in another place he offers it as a conjecture, that the οἴνοστρος of Aristotle was a species of Culex, or gnat. It seems agreed that the Asilus of Virgil was the Breeze.7 Martyr gives a description of the Asilla, which he tells us to be the same with the Asilus, from an Italian author. He represents it as a shape somewhat resembling a wasp or wild bee. It has two membranous wings, with which it makes a loud whizzing. The belly is terminated by three long rings, one less than the other, from the last of which proceeds a formidable sting. This sting is composed of a tube, through which the egg is emitted, and of two augers, which make way for the stinger into the skin of the animal. These augers are armed with little knives, which prick with their points and sting with their edges, causing intolerable pain to the animal that is wounded by them. But this pain is not all; for at the end of the sting, as at the end of a viper's tooth, and of the sting of wasps, bees, and hornets, issues forth a venomous liquor, which irritates and inflames the parts of the wounded nerves, and causes the wound to become fistulous. This fistula seems to be kept open by the egg, after the manner of an issue. The egg is hatched within the fistula, and the worm continues there till it is ready to turn to a chrysalis, receiving its nourishment from the juice which flows from the wounded fibres. These worms remain for nine or ten months under the skin, and are then, being arrived almost to perfection, they come out of their own accord, and creep into some hole or under some stone, and there enter into the state of a chrysalis, in which condition they lie quiet for some time, and at last come forth in the form of the parent fly.

*ASINGAS. (Vid. Osos.)

ASPALATHUS (ἀσπαλάθος), a species of thorny shrub, which bears thorns by which some call the Rose of Jerusalem, or Lady's Rose. Much uncertainty, however, exists on this point. "The Asaltus," says Charissis, "is the wood of a thorn-tree or bush, in virtues, taste, smell, and figure much resembling Lignum aloeus." Matthis is at great pains to prove that it is not the Santalum rubrum. Sprangel, in his first edition of his 'H. H., holds it to be the same as aspalathoides, but in his edition of Dioscorides he inclines to the Cyrtus laniger.

1. (Ram, 8—Eccles. 828—Schol. in loco.).—2. (Georg. ii. 146).—3. (De Re Rust. ii. 5).—4. (H. N. xii. 25).—5. (Hier. ib. iv. col. 546).—6. (De Insect. lib. iii.).—7. (Adami, Append. v. 9—小吃, N. A. M. 37).—8. (In Virg. Georg. iii. 148).—9. (Royal Pharmacop. 5 v.)
In the works of the Arabian writers on Husbandry, it is said that the Asparagus has a purple flower and an acidic taste, and has no fruit. According to Marie Anticista, the Attics used adserere, or the Arabic "asparagus," but is well-known that a.c. in 1., or common Mole; but it is deserving of remark, that Olivier, in his Travels, has described a species or variety of mole found in Asia Minor, which, Dr. Trail of Edinburgh thinks, answers better to Aristotle's description than the common mole. Aristotle was aware that the Mole is not blind, although it has very small eyes. 1.

*ASPARAGUS* (ισπαράγος or σπαράγος), the Asparagus, a well-known vegetable. Theophrastus remarks that Asparagus has thorns in place of leaves, so that it is easy to perceive he means the Asparagus equihis, L. The wild Asparagus, called απειροχόρνος by the Greeks and carduto by the Romans, was more used in medicine. The Greeks learned to cultivate the Asparagus from the Romans, which they increased by seed, by stumps shooting up for the production of fruit or seed. 2.—The Attics wrote ισπαράγος with the aspirated letter, as the grammarians and also Galen inform us. 3. The common name at present in Greece is σπαρτίγι or σπαρτίγια.

*ASPHALTUS.* (Vid. Spunen.)

In the present day, the assessor, or adseror, is the name of a plant, called by Apuleius *Hastula regia,* and hence its English name, "King's Spear." 4. According to Sprengel, the *σπαρτίδος* of Galen is the *Ornithogalum jactitans,* but by that Theophrastus and Dioscorides the Asphodelus ramusus. L. This is the famous herb which Homer represents as growing in the meadows of Elam. 5. It is not often planted in the neighborhood of sepulchres. The common name of the Ornithogalum is the Star of Bethlehem.—The Asphodelus was used as a poison in the time of Hesiod. 6. According to Sibthorp, the common name for this plant at the present day is *σπαρτίδολο.* In Laconia it is termed *σπαρτίδικελα, in* Attica, *σπαρτίδζασ.*

*ASPIS* (ασπίς), i. the Asp, a species of venomous serpent often mentioned by both Greek and Roman writers; and from the discrepancies which are observable in the accounts given by different authors, it would seem that several different species of poisonous serpents were known to the ancients under this common name. Galen, in fact, and the other medical authorities, describe three varieties of the Asp, namely, the Ptasus, Chersaia, and Celthidonia. 7. Eelam, however, affirms that the Egyptians distinguished sixteen varieties of it. 8. From various circumstances, and particularly from the description of Pliny, it is evident that the most common and celebrated of the Asp species was that to which Pliny alludes, giving a species of *Asp viridis*; the *Houia,* or *Yoa Naeche.* This animal measures from three to five feet in length; it is of a dark green colour, marked obliquely with bands of brown; the scales of the neck, back, and upper surface of the tail are slightly carinated, and the tail is about one fourth part the length of the whole body. The *haye* is closely allied to the *sabia capella,* or spectacled snake of India, the chief apparent difference being its want of the singular yellow mark on the back of the neck, from which the latter species derives its name. In other respects these two serpents are so nearly of the same kind, that they both have the power of swelling out the neck when irritated, and raising themselves upright upon their tails, to dart by a single bound upon their enemies. The poison of the Asp is of the most deadly nature. The habit which this serpent has of erecting itself when approached, made the ancient Egyptians and asses to maintain it guarded the place which it inhabited. They made it the emblem of the divinity whom they supposed to protect the world; and, accordingly, they have represented it on their temples, sculptured on each side of a globe. 9.—Il. (Vid. Cirtus.)

*ASPLENIUM* (ασπελόνιον), a plant, which Sprengel follows Trapez in referring to the Asparagus ceterach, or, as he proposes to call its English ceterach, our Spleenwort or Milkwort. He admits that he could not ascertain the origin of the term ceterach. Miller, however, says "the word ceterach is Arabic." 10. The Asplegium took its name from its supposed utility in disorders of the spleen.

ASSASUS NUMMUS. (Vid. As.)

*ASSETER* or *ADSESSOR* contains the same root as the verb adserere, which, when coupled with the word *manus,* signifies to lay hold of a thing, to draw it towards one. Hence the phrase adserere in libertatem, or liberali manus, applies to him who lays his hand on a person reputed to be a slave, and adserere or adseror signifies the person who thus maintained the freedom of a reputed slave was called adseror; 11. and by the laws of the Twelve Tables, it was enacted in favour of liberty, that such adseror should not be called on to give security in the sacrament actio to more than the amount of the *asses.* The person whose freedom was thus claimed was said to be adseror. The expressions liberalis causa and liberalis manus, which occur in classical authors in connexion with the verb adserere, will easily be understood from what has been said. 12. Sometimes the word adserere alone was used as equivalent to adseror in libertatem.

The expression asserere in servitutem, to claim a person as a slave, is also found in the same manner.

*ASSESSOR,* or *ADSESSOR,* literally one who sits by the side of another. The duties of an assessor, as described by Paulus, related to "cognitones, postulationes, libelli, edicta, decreta, epistola;" from which it appears that they were employed in and about the administration of law. The consuls, praetors, governors of provinces, and the judges, were often associated with the law and the forms of procedure, and it was necessary that they should have the aid of those who had made the law their study. The prefects prætorii and prefects urbii, and other civil and military functionaries, had their assessors. An instance is mentioned by Tacitus of the Emperor Tiberius as treating an assessor with a certain degree of severity, and taking his seat at the corner of the tribunal; but this passage cannot be interpreted to mean, as some persons interpret it, that the emperor sat there in the character of an assessor, properly so called; the remark of Tacitus shows that, though the emperor might have taken his seat under the name of assessor, he could be considered in no other light than as a head of the state.

ASTRAGALUS.

The Emperor Alexander Severus gave the assessores a regular salary. 1 Freedmen might be assessores. In the later writers the assessores are mentioned under the various names of conciliarii, juris studiosi, comites, &c. The studiosi juris, mentioned by Gellius 2 as assistant to the judges (quaesitores in consilio judicis), were the assessores. Sabinus, as it appears from Ulpian, 3 wrote a book on the duties of assessors. The assessors sat on the tribunal with the magistrate. Their advice or aid was given during the proceedings as well as at other times, but they never pronounced a judicial sentence. As the old forms of procedure gradually declined, the assessores, according to the conjecture of Savigny, 4 took the place of the judices.

*ASSIUS LAPIS (Ασσιος λίθος), a kind of stone, deriving its name from Assos, a city in the Trond. Such, at least, is the account of Pliny. 5 Diocorides, 6 however, calls it 'Ασιος λίθος and Celsius? Lapsa Assoi, the Asian Stone; the last-mentioned author appearing to derive its name from Asia generally. All these writers agree in classing it with the stones which, from their consuming the bodies of the dead enclosed within them, were called sarcophagi (σαρκοφάγοι). The Asian stone was characterized by a laminated structure, a saline efflorescence of a sharp taste, and its styptic properties. 8 Galen, in describing this stone, says that it is of a spongy substance, light and friable; that it is covered with an outer and a central portion, and called a flower. The flower of the Asian stone; that the molecules of this flower are very penetrating; that they consume flesh; and that the stone has a similar property, but in a less degree. This efflorescence had, moreover, a saline taste. Galen adds, that it was of a yellow or whitish colour, and that, when mixed with resin of turpentine or with tar, it removed tubercles. Pliny, who gives it its same appellation, adds that, 'no plant in the world is esteemed like the lapis assius, as it bestows its beauty to the eye, and balm to the body.'

*ASTACUS (αστάκος), a sea animal, described by Aristotle, Galen, Oppian, Zelian, and others. It belongs to the class Crustacea, and is called Grammaro by the Italians, Homar by the French, and Craw-fish by the English. It is the Astacus fluviatilis. L. Cuvier has shown that it is the Elephantes of Pliny.

*ASTER (αστήρ). I. A species of bird, most probably the Fringilla rubra, or Smaller Redpoll. — II. The genus Stellae, or Star-fish. It has been variously classed under Zoophyta, Mollusca, and Crustacea, by both ancient and modern naturalists. — III. One of the varieties of the Samian earth was also called by this name. (Vid. SAMIA TERRA.

*ASTERIS CUS (αστήρις), a plant. According to Apuleius, the Asterion, Asteriscus, Aster Atticus, and Ingenualis, are synonymous. Stackhouse and Schneider further identify the asterioiokos of Theophrastus with it. Martin is at great pains to prove that the "Amellus" of Virgil is the Aster Atticus. Botanists accordingly give to the Italian blue-starwort the name of Aster amellus. The flower of the Aster has its leaves radiating like a star, whence its name (aster, "a star"). This plant was employed in swellings of the groin, whence the names of Ingenualis and Bubonium that were sometimes applied to it. Another ancient appellation, Allellus, was derived from that of the river (the Melis, in Cisalpine Gaul) on the banks of which this plant grew very abundantly. The root of the Aster, cooked in old Roman wine, is mentioned by Columella as a good remedy for sickness among bees. The Aster grows in the valleys and on the hills of Italy and Sicily, frequently in a wild state. Sibthorp found it also near Athens. 6 It used to grow abundantly in Attica.

*ASTERIA, a gem, mentioned by Pliny, which came from India and from Carmania. It derived its name from its star-like lustre when exposed to the rays of the sun. Minersologists make it to have been that variety of opal which is called girasole from its reflecting a reddish light when turned towards the sun. Pliny describes it as difficult to engrave; "the difficulty," observes Dr. Moore, "arising probably, not from its hardness, but from the numerous minute fissures which traverse opal in all directions, and to which it is supposed to owe the playful variation of its colours." 7

*ASTRIOUS, a gem mentioned by Pliny, and which occurred in India and on the shores of Pal- lene, but of the best quality in Carmania. The Roman writer describes it as shining "from a point within it like a star, with the brightness of the full moon." Dr. Moore considers Werner's opinion the most probable, that it is the same with the moon-stone of Ceylon.

ASTRAGALUS, an astragal, one of the mouldings in architecture, more especially characteristic of the Ionic order.

The astragal is always found as the lowest member of the Ionic capital, forming the division between it and the fluted shaft of the column. Of this we have a beautiful example in the remains of the Temple of Bacchus at Teos, which, as we are informed by Vitruvius, 8 was built by Hormogenes of Abalaba, one of the most celebrated of the ancient architects, and of which he wrote a full description. One of the capitals of this temple is shown in the annexed woodcut. Above the astragal we see the echinus, and on each side of it the echinos, which is added on account of the ornamentation of the splastre of a ship. (Vid. APPLUSTRE.

The astragal was used with a beautiful effect not only in Ionia, but also in Corinthian buildings; to border or divide the three faces of the architrave; and it was admitted under an echinus to enrich the cornice. The lower figure in the woodcut shows a small portion of the astragal forming the upper edge of an architrave, which Armow in the British Museum, and which was part of the Temple of Erch- theus at Athens. It is drawn of the same size as the marble itself. The term asteragalus, employed by Vitruvius, 9 was no doubt borrowed from Hemo-

ANTIIANAE FABULAE.

emperor were considered to inflict disgrace on their master, as it was reasonably supposed that no slave would take such a step unless he had received very bad usage from his master. If it could be proved that any individual had instigated the slave of another to flee to the statue of an emperor, he was liable to an action corrupti servum. The right of asylum seems to have been generally, but not entirely, confined to slaves.

The term 

nulla was also applied to the security from plunder (avolía καὶ κατὰ γῆν καὶ κατὰ δίκαιο-

ναχ) which was sometimes granted by one state to another, or even to single individuals.

ATLLA 

immunity from public burdens, was enjoyed at Athens by the archons for the term

(1) without any personal qualifications.

persons, on whom it had been conferred as a reward for great services, as in the case of Harmodius and Aristogeiton; and by the inhabitants of certain foreign states. It was of several kinds: it might be a general immunity (ateliea ἡμών), or a more special exemption, as from custom-duties, from the liturgies, or from providing sacrifices (ateliea ἀρτιες). The exemption from military service was also called ateliea.

ATLNANAE FABULAE. The Atellane plays were a species of farce or comedy, so called from Atella, a town of the Osci, in Campania. From this circumstance, and from being written in the Oscan dialect, they were also called Ludii Osci. According to Valerius Romanus, and other authorities, this doctrine is false; for it is not unreasonable to suppose that they were at first, and in their native country, rude improvisatory farces, without dramatic connexion, but full of raillery and wit, suggested by the contemporary events of the neighbourhood. However this may be, the "Atellane fabulae" at Rome had a peculiar and dramatic character, as well as a particular style, and the less elegant imitations of the Romans: the latter, he says, were acted in the Roman language, not the Oscan; they consisted of only one act, whereas the Atellane and other plays had five, with laughable exodua or interludes; lastly, as he thought, they had not the accompaniment of the flute-player, nor of singing, nor gesticulation (mota ov πυθον). One of them seems to have been a history, that, instead of the satyrs and similar characters of the Greek satyr-drama, which they in some respects resembled, they had Oscan characters drawn from real life, speaking their language, and personating some peculiar class of people in a particular locality. Such, indeed, are the Harlequin and Pulcinello of the modern Italian stage, called mascherone or masks, and supposed to be descended from the old Oscan characters of the Atellane. Thus, even now, zanni is one of the Harlequin's names, as sannio in the Latin farces was the name of a buffoon, who had his head shorn, and wore a dress of gay patchwork; and the very figure of Pulcinello is said to have been found in the stucco painting of Pompeii, at the old tabernaria of the Atellane. On this subject Lady Morgan speaks as follows: "The Pulcinello of Italy is not like the Pulchinel of Paris, or the Punch of England; but a particular character of low comedy peculiar to Naples, as Pantalone of Venice, II Dottore of Bologna. Their name of Maschere comes from their wearing masks on the upper part of their faces. They are the remains of the Greek and Latin theatres, and are devoted to the depicting of national, or rather provincial absurdities and peculiarities." Again, at Cologne in Köln, famous for its connexion with the Romans, there still exists a puppet theatre (Puppentheater), where dull farces are performed by dolls, and the dialogue, spoken in the patois or dialect of the country, and full of satirical local allusions, is carried on by persons concealing.

These Atellane plays were not protetenate, i. e., comedies in which magistrates and persons of rank were introduced; not tabernaria, the characters in which were taken from low life: "they rather seem to have been a union of high comedy and its parody." They were also distinguished from the mimés by the absence of low buffoonery and ribaldry, being more serious in tone, such as could be understood and appreciated by educated people. Thus Cicero reproaches one of his correspondents for a coarseness in his joking, more like the ribaldry of the mimés than the humour of the Atellane fabulae, which in former times were the after-piece in dramatic representations (secundum Ædouam Actum, non ut idem soliæ Atellaneum, sed ut nunc faciam,intromissionem). This statement of Cicero agrees with a remark of Valerius Maximus, that these plays were tempered with an Italian severity of taste; and Donatus also says of them, that they were remarkable for their antique elegance, i. e., not of language, but of style and character. This suggests an explanation of the fact that Atellane were not performed by regular actors (histriones), but by some body of nobile birth, who were engaged so that account subjected to any degradation, but retained their rights as citizens, and might serve in the army. This was not the case with other actors, so that the profession was confined to foreigners or freedmen. Niebuhr, however, is of opinion, that all the three kinds of the Roman national drama, and not the Atellane only, might be represented by this body of Romans, without the risk of their franchise.

The Oscan or Opician language, in which these plays were written, was spread over all the south of Italy; and as some inscriptions in it are intelligible to us, we cannot wonder that plays written in Oscan were understood by the more educated Romans. One peculiarity of it was the use of "p for "f:

However, in one part of these plays, called the canticum, the Latin language, and sometimes the Greek, was used. Thus we are told that one of these canticas opened with the words Veni to simus a villa, "The haboon is come from his country house;" and as Gaia was entering Rome at the time, the players caught up the burden of the song, joining in chorus. It might be thought that this is true only of the time of the emperors; but we find that, even before then, the Latin language was used, as in the instances given below, and that, too, in other parts besides the canticum. In connexion with this, it may be remarked, that, like everything else at Rome, the Atellane degenerated under the emperors, so as to become more like the mimés, till they were at last acted by common players.

They were written in verse, chiefly iambic, with many triasyllabic feet. Lucius Sulla, the dictator, is believed to have written plays of this sort from a statement in Athenaeus, that he wrote satirical comedies in his native, i. e., the Campanian dialect. Quintus Novius, who flourished about fifty years after

ATHLE'T^ (dS/lijTai, aBlririipeg) were persons
who contended in the public games of the Greeks
and Romans for the prizes (ud'Aa, whence the name
of iiBy^riTai), which were given to those who con
quered in contests of agility and strength. Thie
name was, in the later period of Grecian history
and among the Romans, properly confined to .those
lain.

persons who entirely devoted themselves to a course
of training which might fit them to excel in such
contests, and who, in fact, made athletic exercises
their profession.
The athletae differed, therefore,
from the agonistae (liyuviaTai), who only pursued

gymnastic exercises for the sake of improving their
health and bodily strength, and who, though they
sometimes contended for the prizes in the public
games, did not devote their whole lives, like the
preparing for these contests. In early
times there does not appear to have been any disbetween the athletae and agonistae since
we find that many individuals, who obtained prizes
at the great national games of the Greeks, were
persons of considerable political importance, who
were never considered to pursue athletic exercises
as a profession.
Thus we read that Phayllus of
Grotona, who had thrice conquered in the Pythian
games, commanded a vessel at the battle of Salamis;" and that Dorieus of Rhodes, who had obtained the prize in all of the four great festivals, was
celebrated in Greece for his opposition to the Athenians.'
But as the individuals who obtained the
prizes in these games received great honours and
rewards, not only from their fellow-citizens, but also
from foreign states, those persons who intended to
contend for the prizes made extraordinary efl^orts to
prepare themselves for the contest
and it was
soon found that, unless they subjected themselves
to a severer course of training than was afforded by
the ordinary exercises of the gymnasia, they would
not have any chance of gaining the victory. Thus
arose a class of individuals, to whom the term athletae was appropriated, and who became, in course
of time, the only persons who contended in the pul>athleta;, to

contended.*
certamen athletarum' was also
exhibited by Scaurus in B.C. 59; and, among the
various games with which Julius Caesar gratified
the people, we read of a contest of athletaj vi'hich
lasted for three days, and which was exhibited in a
temporary stadium in the Campus Martius.' Under the Roman emperors, and especially under
Nero, who was passionately fond of the Grecian
games,' the number of athletae increased greatly in
Italy, Greece,' and Asia Minor; and many inscriptions respecting them have come down to us, which
show that professional athletae were very numerous, and that they enjoyed several privileges. They
formed at Rome a kind of corporation, and possessed a tabularium and a common hall curia athletarum,^ in which they were accustomed to deliberate
on all matters which had a reference to the interests of the body.
find that they were called
Herculanei, and also xystici, because they were acletiE

eustoned to exercise, in winter, in a covered place called xystus; and that they had a president, who was called syzyarchos, and also archon.

Those athletes who conquered in any of the great national festivals of the Greeks were called hieronika (ἱερονικαί) (p. 119) and, received, as has been already remarked, the greatest honours and rewards. Such a conqueror was considered to confer honour upon the state to which he belonged; he entered his native city in triumph, through a breach made in the walls for his reception, to intimate, says Plutarch, that the state which possessed such a citizen had no occasion for walls. 1 He usually passed through the walls in a chariot drawn by four white horses, and went along the principal street of the city to the temple of the guardian deity of the state, where hymns of victory were sung. Those games, which gave the conquerors the right of such an entrance into the city, were called seisaistici (σείσαιστικοί). This term was originally confined to the four great Greek festivals, the Olympic, Isthmian, Nemean, and Pythian; but was afterward applied to other public games, as, for instance, to those instituted in Asia Minor. 2 In the Greek states, the victors in these games not only obtained the greatest glory and respect, but also substantial rewards. They were generally relieved from the payment of taxes, and also enjoyed the first seat (προσθήκη) in all public games and spectacles. The exercise of the gymnastic contests was not only of national, but of international, interest, as all the states, in the most frequent part of the city, as the market-place, the gymnasia, and the neighborhood of the temples. 3 At Athens, according to a law of Solon, the conquerors in the Olympic games were rewarded with a prize of 500 drachmae; and the conquerors in the Pythian, Nemean, and Isthmian games in the same manner, as is intimated by Juvenal, 4 that they had the privilege of fighting near the person of the king. 5 The privileges of the athletes were preserved and increased by Augustus; 6 and the following emperors appear to have always treated them with considerable favour. Those who conquered in the games called seisaistici received, in the time of Trajan, a sum from the state, termed opoma (οπομα, perhaps from opōma, opōma), which became a special reward. The athletic games were celebrated only by those athletes who had obtained in the sacred games (ςωρὶς κάρτερμινις, by which is probably meant the seisaistici iudici not less than three crowns, and had not bribed their antagonists to give them the victory, enjoyed immunity from all taxes. 7

The term athlete, though sometimes applied metaphorically to other combatants, was properly limited to those who took part in the games, and engaged in the following contests: 1. Running (ὁρμός, cursus), which was divided into four different contests, namely, the σταδιορομός, in which the race was the length of the stadium; the διανυκτορομός, in which the stadium was traversed twice; the διοικτιορομός, which consisted of several lengths of the stadium, but the number of which is uncertain; and the ἐπίστατος, in which the race was run in armor. 2. Wrestling (πάλη, lucta). 3. Boxing (νυμμή, pukulatia). 4. The pentadixium (πένταδίκσιον, or, as the Romans called it, quingvertum). 5. The pancratium (πανκράτιον). Of all these an account is given in separate articles. These contests were divided into two kinds: the severe (βαρεά, βαρόστρες) and the light (σεβαστά, σεβώντρες). Under the former were included wrestling, boxing, the running of the CDs of the pentad) and the pancratium, which consisted of wrestling and boxing combined, and was also called pammachon. 8

Great attention was paid to the training of the athlete. They were generally trained in the πολιτικήν, which, in the Grecian states, were distinctly places from the gymnasia, to which they may have been frequently confined. 9 Plutarch informs us, 10 that near the gymnasion at Olympia there were palestra for the athletes; and Plutarch expressly says 11 that the place in which the athlete exercissa is called a palæstra. 2 Their exercises were supervised by the gymnasiarch (γυμνασιάρχης), and their diet was regulated by the alipites (ἄλιπτης). (Vid. Διατρ.) According to Plutarch, the athletes did not eat meat, but principally lived upon fresh cheese, 12 and Diogenes Laërtius 13 informs us that their original diet consisted of dried figs, 14 moist or new cheese, 15 and wheat. 16 The eating of meat by the athletes is said, according to some writers, 17 to have been first introduced by Dromeus of Symplythus, in Arcadia; and, according to others, by the philosopher Pythagoras, or by an alipites of that name. 18 According to Galen, 19 the athlete, who practised the severe exercises, 20 ate pork and a particular kind of bread; and from a remark of Diogenes the Cynic, 21 it would appear that in his time beef and pork formed the ordinary diet of the athlete. Beef is also mentioned by Plato, 22 as the food of the athlete; and a writer quoted by Athenaeus 23 relates, that the Athenians gave to their athletes, not only great food, but strong wine, that he was enabled to overcome all the athletes of his time. At the end of the exercises of each day, the athletes were obliged to take a certain quantity of food, which was usually called ἀνάκορανοφία and ἀνάκορυφωρία, 24 οἵς βασιλεύας; 25 after which, they were accustomed to take a long sleep. The quantity of animal food which some 26 of the celebrated athletes ate is described in the games given in the twenty-third book of the Iliad; 27 the combatants are said to have worn a girdle about their loins; and the same practice, as we learn from Thucydidcs, 28 anciently prevailed at the Olympic games, but was discontinued afterward.

For further information on the athlete, the reader is referred to the articles Isthmian, Nemean, Olympic, Pythian Games; and to Krause's Thūgen, oder wissenschaftliche Darstellung der Gymnastik, Agonistik, und Festspiele der Hellenen (Halle, 1835); and Olympia, oder Darstellung der grossen Olympischen Spiele (Vienna, 1838).

ATHLIDTEAE. (Vid. Aaononoth, Hellenodice.)

ATLIA LEX. (Vid. Tutor.)

ATLIA (ἄτλια), or the Fortnite of a man's civil rights. It was either total or partial. A man was totally deprived of his rights, both for himself and for his descendants, 29 when he was convicted of murder, theft, false witness, partiality as arbiter, violence offered to a magistrate, and so forth. This highest degree of atilía excluded the person affected by it from the forum, and from all public assem-
ATRAMENTUM.

ATRAMENTUM, a term applicable to any black colouring substance, for whatever purpose it may be used, like the μέλαν of the Greeks. There were, however, three principal kinds of atrimentum: one called librarium or scriptorium (in Greč., γραφαίον μέλαν), another called sutorium, the third pictorium. Atrimentum librarium was what we call writing-ink. Atrimentum sutorium was used by shoemakers for dying leather. This atrimentum: sutorium contained some poisonous ingredient, such as oil of vitriol; whence a person is said to die of atrimentum sutorium, that is, of poison, as in Cicero. Atrimentum pictorium or pictorium was used for the inking of pages for some purposes, apparently as a sort of varnish. The scholiast of Aristophanes says that the courts of justice, or δικαιστήρια, in Athens were called each after some letter of the alphabet: one alpha, another beta, a third gamma, and so on, and that against the doors of each δικαιστήριον, the letter which belonged to it was written ἱστός βυζαντινός, in red ink. This red ink, or red写字, was the occasion of a famous case. The inscrip- tions of the pages are often written in red ink. Ink among the Romans is first found mentioned in the passages of Cicero and Plautus above referred to. Pliny informs us how it was made. He says, "It was made of soot in various ways, with burned resin or pitch: and for this purpose," he adds, "they have built furnaces, which do not allow the smoke to escape. The kind most commonly used is made in this way from pine-wood: It is mixed with soot from the furnaces or baths (that is, the hypocausts of the baths: οικία), and this they used ad volumina scribendi. Some also make a kind of ink by boiling and straining the lees of wine," &c. With this account the statements of Vitruvius in the main agree. The black matter eminently used by the cuttlefish (sepia), and hence itself called sepia, was also used for atrimentum. Aristotle, however, in treating of the cuttlefish, does not refer to the use of the matter (ϑόλος) which it emits, as ink. Pliny observes14 that an infusion of worm-wood with ink preserves a manuscript from mice.15

A representation of these figures is given in the preceding woodcut, copied from the tegularium in the baths at Pompeii. They are placed round the sides of the chamber, and support a cornice, upon which the vaulting of the roof rests, thus dividing the whole extent of the walls into a number of small compartments, the uses of which are explained in the description of tegularium in the article Baths.

A representation of a species of atrimentum, called by some the Distaff-Thistle, from its resen-

blance to a distaff (ὁπάρσα), for which its stam-

was often employed. It is not improbable, as Au-

tamsa thinks, that it was applied to several sorts of

thistles, a tribe still very difficult to classify and
distinguish. Euellius and Hermolaus make it out
to be the Ononis sylvestris, but this opinion is

rejected by Matthiolus, and that of Fuchsus, who
held it to be the Carduus Bnecdicius does not seem

less objectionable. Speangel, in the first edition of

his R. H. H., inclines to the Carchinus Canatus,

and in the second to the C. Cricicus; but in his

edition of Dioscorides he proposes the Carchina lan-
alata, L. Stackhouse hesitates about the Atractylis

gummifera. The modern name in u. among the

Greeks is Aristocarya or xypoxitly. Sibthorp found

it in Southern Greece.

VITRUVUS LEX. (Vid. Usurcaei.)

ATLANTES ('ἄτλαντες), also called Tedamones.

These both words are used, in a general sense, to

signify anything which supports a burden, whether

a man, an animal, or an inanimate object; but in

architectural language they were specifically ap-
dplied to designate those μασσευ γιγιγις which are

sometimes fancifully used instead of modifications
to support the cornices, or upper member of a cornice:

"Nositas Tedamones, Graeci vero hos Atlantes vocant,"
says Vitruvius. The fable of Atlas, who bore the
globe upon his shoulders, and of whom Homer says,

"Εγένετε τον κοσμον αόηνς μακροζ, αλα γαθον ται και ουραιαν ύπον ιχθυαν," supplied an historical derivation for the name. They were distinguished from Caryatides, which are al-

ways represented as female figures in an erect po-
tion.

They were also applied as ornaments to the sides

of a vessel, having the appearance of supporting the

oars; as in the ship of Hiero, described by

Atheneus,* in which instance he represents them

as being six cubits in height, and sustaining the
tripods and cornices.

Here, too, the term came to be used in ivory

(σκήριον), to ridicule a person of very diminu-
tive or deformed stature.

1. (De Myst., c. 73, 76, p. 33.)—2. (Vitr., vi., 10.)—3. (Od., l., 52.—4. (v., 45.)—5. (Juv, Sat., vili., 32.)
On the whole, perhaps, it may be said that the inks of the ancients were more durable than our own; that they were thicker and more incoherent, in substance and durability more resembling the ink now used by printers. An inksand was discovered at Herculeanum, called human ink as thick as oil, and still usable for writing.\(^1\)

It would appear, also, that this gummy character of the ink, preventing it from running to the point of the pen, was as much complained of by the ancient Romans as it is by ourselves. Persius\(^2\) represents a foppish writer sitting down to compose; but, as the ideas do not run freely,

\[Tuo queritur, esseasula quod pendet humor; Nicula quaed infusa vanescat sopia lympha.\]

They also added water, as we do sometimes, to thin it. Mr. Lane\(^3\) remarks that the ink of the modern Egyptians is “very thick and gummy.”

From a phrase used by Demosthenes, it would appear if the colouring ingredient was obtained by rubbing from some solid substance, perhaps much as we rub Indian ink. Demosthenes is reproaching Eschines with his low origin, and says that,

“when a youth, he was in a state of great want, assisted his father in his school, rubbed the ink (prepared the ink by rubbing, τοις μελαν τριθοιον), washed down the forms, and swept the schoolroom,” etc. It is probable that there were many ways of colouring ink, especially of different colors. Red ink was often used for writing the titles and beginnings of books,\(^4\) so also was ink made of rubrica, “red ochre”; and because the headings of laws were written with rubrica, the word rubric came to be used for the civil law.\(^5\) So album, a white or whitened table, on which the prators’ edicts were written, was used in a similar way. A person devoting himself to poetry and rhetoric was said to “rub himself to the law.”

(Vul. Ateum.) There was also a very expensive red-coloured ink, with which the emperor used to write his signature, but which any one else was by an edict forbidden to use, excepting the sons or near relatives of the emperor, to whom the privilege was expressly granted. But if the emperor was under, Livy says, a great illness, and writing his will, he used white ink. On the basements of Crassus there were purple letters, φωναις γρυψαμετα.\(^6\) On pillars and monuments, letters of gold and silver, or letters covered with gilt and silver, were sometimes used, as appears from Cicero\(^7\) and Suetonius.\(^8\) In writing, also, this was done at a later period. Suetonius\(^9\) says, that of the poems which Nero recited at Rome, one part was written in gold (or gilt) letters (aurae litterae), and consecrated to Jupiter Capitolinus.\(^10\)

This kind of illuminated writing was more practised afterward in religious compositions, which were considered as worthy to be written in letters of gold (as we say even now), and therefore, were actually written so. Something like what we call sympathetic ink, which is invisible till heat, or some preparation be applied, appears to have been not uncommon. So Ovid\(^11\) advises writing love-letters with fresh milk, which would be unreadable until the letters were sprinkled with coal-dust:

“Tutaoque est, fallitique ocules e lacte recenti Littera: carbonis pulpere tangis: leges.” Ausonius\(^12\) gives the same direction (“Lacte in aide notas; wrescens charta tenetis Semper inadscipias; pro-

tended to contain both black and red ink, mucen in the modern fashion. They were also of various shapes, as, for example, round or hexagonal. They had covers to keep the dust from the ink. The preceding cuts represent inksands found at Pompeii.

ARIUM, called aedii by the Greeks and by Virgil,\(^13\) and also μεσαύλιον, περιστύλων, περίστρων.

Two derivations of this word are given by the ancient writers. Festus and Varro refer it to the same origin: Ab Atria popoli, a quibus ariarium exempla desumpta fuerant \(^14\) but Servius, on the contrary,\(^15\) derives the term ab atrario, fiamnum qui esse solebat in atris; a remark which explains the allusion of Juvenal,\(^16\) Fumosum equium cum dictatoribus magistratos, since it was customary among the Romans to preserve the statues of their ancestors in the atrium, which were blackened by the smoke of the fires kept there for the use of the household.

Atrium is used in a distinctive as well as collective sense, to designate a particular part in the private houses of the Romans (vid. House), and also a class of public buildings, so called from their general resemblance in construction to the atrium of a private house. There is likewise a distinction between atrium and area; the former being an open area surrounded by a colonnade, while the latter had no such ornament attached to it. The atrium, moreover, was sometimes a building by itself, resembling, in some respects, the open basilica (vid. Basilica), but consisting of three sides. Such was the Atrium Publicum in the Capitol, which Livy informs us was struck with lightning B.C. 216.\(^17\) It was at other times attached to some temple or other edifice, and in such case consisted of an open area and surrounding portico in front of the structure, like that before the Church of St. Peter in the Vatican.

Several of these buildings are mentioned by the ancient historians, two of which were dedicated to the same goddess, Libertas; and hence a difficulty is sometimes felt in deciding which of the two is meant when the atrium Libertatis is spoken of. The most celebrated, as well as the most ancient, was situated upon the Avenue Mount. Of this there is no doubt; for it is enumerated by Victor, in his catalogue of the buildings contained in the xii. Regio, which comprises the Mons Aventinus, on which there was an aedes Libertatis built and dedicated by the father of Gracchus,\(^18\) to which the atrium was attached either at the same time or shortly afterward; for Livy also states\(^19\) that the hostages from Tarentum were confined in astra Libertatis, which must refer to the atrium on the Aven-
Astrinus, "Pausanias, quoted and lay foster [Ap., Tac., Rom., humorously order reddish (ix., but [lcmoin, Another strong and a (Av., and, —10. M.) mention out ris mentioned &remus I'aulli ally, considered also this evident in this has torture, in Atria was be Cicero in 1, 22.)— It meant. which quce Cicero 26.— the preservation to spot was this the place, This seems to have been used because Attica was also called Attica/'Athens, for a species of Gnat, but referred by Stackhouse to the genus Atteles, I., a class of insects that attack the leaves and most tender parts of plants.

ATTHIS (artbic), a name given to any composition which treated of the history of Attica. This name seems to have been used because Attica was also called Athens. The first book 'Artic svyypa9, because it treats chiefly of Athen and Athens. The Attides appear to have been not strictly historical; but also geographical, topographical, mythological, and archeological. By preserving the local history, legends, traditions, and antiquities, and thus drawing attention to the ancient standing and renown of the country, and connecting with the present, it was meant to foster a strong national feeling. From what Dionysius says it would appear that other districts had their local histories as well as Attica.11 The nature of the 'Artides we know only from a few fragments and incidental notices. The most ancient writer of these compositions would appear, according to Pausanias,12 to have been Citodemus—Kleidodromos or Kleidodromos (άπος το 'Αθρών ϣ επίχωρα γαρφέων, δ θρώστοντος). His 'Artis was published about B.C. 378.13 Probably Pausanias means that Citodemus was the first native Athenian who wrote an 'Arthis, as Clinton observes, and not the first person; for Helenius, a native of Lesbos, had written one before him. Another writer of this class was Andron ('Ανδρών, a native of Halicarnassus, as appears from Plutarch;14 also Androtion—'Ανδρότιον,15 and Philochorus, who held the office of ierocóptos at Athens, B.C. 306.16 His 'Arthis is quoted by the scholar on Aristophanes17 and Euripides.18 Phanodemos, Demon, and later

Atrium

ATHIS.

ATTHIS.

ATTHIS.

Although the name of its founder is broken off, yet the open peristyles, without any surrounding wall, demonstrate that it was in the nature of a basilica. The passage of Cicero will be satisfactorily explained.

In order to lay open the magnificent Basilica of Paulus to the Forum of Caesar, he proposed to buy and pull down some buildings which obstructed the view, which would extend the small forum of Caes ar suis et lib. atrium, by doing which he intended to erect the forum of Caesar, upon whose good will he prides himself so much in the epistle.

The dotted lines represent a crack in the marble.

were also writers of "Arēdes." Their date is uncertain; but it appears that Demon was nearly contemporary with Philochoros, and that Ister flourished B.C. 240—221, in the reign of Ptolemaus Euergetes, and was, as Suidas asserts, a pupil of Callimachus. The fragments of Philochoros and Androtion have been edited by C. G. Siebelis (Leipsig, 1811); and those of Phanodemus, Demon, Chotode mus, and Ister also (Leipsig, 1812).

Atticurges (tò Ἀττικοῦργης), in the Attic style. Vitruvius, when treating of the different constructions of doorways to sacred edifices, enumerates three, the Doric, Ionic, and Attic (Atticurges). He first gives an account of the Doric, then the Ionic, and, lastly, states that the Attic follows generally the same rules as the Doric; and then, having instanced the points of difference between these two orders, he concludes by saying that he has laid down all the rules necessary for the construction of the Doric, Ionic, and Corinthian orders (Doric, Ionic, Corinthiacque operibus), which would certainly seem to identify the Attic with the Corinthian. Pliny, however, designates as Attic columns (columnas Atticas) those which have four angles and equal sides, i. e., a square pilaster, such as the order of columns in the upper story of the Coliseum, which have Corinthian capitals; but the projection of their sides is not equal to the front. There is much difficulty in using this consideration; for if the people of Attica had an order of their own, distinct from the Doric, which they commonly adopted, as the Tuscan, Ionians, and Corinthians had, it is singular that we should not have any account of its distinctive properties, and that Vitruvius himself should not have described it as exactly as he has the other three. The only way to remove the difficulty is to adopt the explanation of Pliny, and to conclude that the Athenians had no distinct order of their own, with a peculiar character in all its component parts; but that they adopted a column expressly Attic, i. e., a square one, with a Corinthian capital and an Attic base, to the other parts and proportions of the Doric order. Thus Vitruvius may be reconciled with himself; for he says in one place that he adopt ed the doorways, where the square or Attic columns of Pliny would be admirably fitted for the upright jambs, which might be ornamented with a Corinthian capital and an Attic base, the proportions and component parts of which are enumerated by Vitruvius.

The lowest he terms πινθος; the one above that, τος υπερινος; the next three divisions, αυτος ευμ αυτος και τος ηπερινος; and the highest, the τους συντομος. The sale was sometimes conducted by an argentarius, or by a magister auctionis; and the time, place, and conditions of sale were announced either by a public notice (τέκλα, άλαμβος, &c.) or by a crier (πρωκος).

An entry was made in the books of the argentarius of the sale and the money due, and credit was given in the same books to the purchaser when he paid the money (expensae pecunia lata, accipiet relata). Thus the book of the argentarius might be used as evidence for the purchaser, both of his having made a purchase, and having paid for the thing purchased. If the money was not paid according to the conditions of sale, the argentarius could sue for it.

The præco or crier seemed to have acted the part of the agent for the seller; so far as calling out the biddings and amusing the company. Slaves, when sold by auction, were placed on a stone or other elevated thing, and hence the phrase homon de lapide emitus. It was usual to put up a spear, haste, in auctions, a symbol derived, it is said, from the ancient practice of selling under a spear the booty acquired in war. By the auction, the Quiritanian owners, and others in possession, were permitted to make a bid for the purchaser. (Vid. Bonnerus Exprivto, Scaccto.)

Auctor, a word which contains the same element as aegco, and signifies generally one who enlarges, confirms, or gives to a thing its completeness and efficient form. The numerous technical significations of the word are derived from this general notion. As he who gives to a thing that which is necessary for its completeness, may in this sense be viewed as the chief actor or doer, the word auctor is also used in the sense of one who originates or proposes a thing; but this cannot be viewed as its primary meaning. Accordingly, the word auctor, when used in connexion with lex or senator consultum, often means he who originates and proposes, as appears from numerous passages. When a measure was approved by the senate, the name of auctor was confirmed by the votes of the people, the senate were said auctores fieri, and this preliminary approval was called senatus auctoritas.

In the passage of Livy, there is an ambiguity in the use of the word, arising from the statement of the practice in Livy's time, and the circumstances of the peculiar case of the election of a king. The effect of what Livy states is as to the election of Numa: Numa "made a reservation of a veto: "Si dignum creabitis, patres auctores fient." The meaning, however, of the whole passage is clearly this: the patres gave permission to elect, and if the person elected should be approved by them, that was to be considered equivalent to their nomination.

In the imperial time, auctor is often said of the emperor (præ consilii) who recommended anything to the senate, and on which recommendation that body passed a senators consultum.

When the word auctor is applied to him who recommends, but does not originate a legislative
meant, it is equivalent to *uctor.* Sometimes both auctor and suasor are used in the same sentence, and the meaning of each is kept distinct. 4

With reference to dealings between individuals, auctor has the sense of owner, and is defined thus: 4

* Auctorem * _a quo jus in me transit._ In this sense auctor is the seller (vendedor), as opposed to the buyer (emtor): the person who joined the seller in a warranty, or as security, was called auctorum manus, as opposed to the seller, or auctor primus. The phrase *mala auctore emerit, auctore laudari? will thus be intelligible. The testator, with respect to his heir, might be called auctor.

Consistently with the meanings of auctor as already explained, the notion of consenting, approving, and giving validity to a measure affecting a person, *auctoritas* clearly appears in the following passage.

Auctor is also used generally to express any person under whose authority any legal act is done. In this sense, it means a tutor who is appointed to aid or advise a woman on account of the infirmity of her sex. 4 It is also applied to a tutor whose husband, for similar or other reasons, has departed or become unworthy to beahalf of a ward (pupillus).

The term auctores is equivalent to jurisperiti; and the law writers, or leaders of particular schools of law, were called *schola auctores.* It is unnecessary to trace the other significations of this word.

**AUCTORITAS.** The technical meanings of this word correlate with those of auctor.

The auctoritas senatus was not a senatus consultum; it was a measure, incomplete in itself, which received its completion by some other authority. Auctoritas, as applied to property, is equivalent to legal ownership, being a corollary of auctor. It is derived from *aucturus,* a present participle, that there could be no usucapion of a stolen thing, which is thus expressed by Gellius in speaking of the Athenian law: 5 " *Quod subreptum erit ejus rei atena auctoritas esto;" the ownership of the thing stolen was still in the original owner.

Auctoritas sometimes signifies a warranty or collateral securities given in support of some personal promise. Sometimes, of course, it might denote the act of giving such security. The word auctoritas actio means the action of eviction. 6 The instrumenta auctoritatia are the proofs or evidences of title.

The auctoritas of the praetor is sometimes used to signify the judicial sanction of the praetor, or his order, by which a person, a tutor for instance, might be compelled to do some legal act or in other words, "auctor fieri." The tutor, with respect to his wards, both male and female (pupilli, pupillae), was said *negotium gerere, and auctorialiter interponere: the former phrase is applicable where the tutor does the act himself; the latter, where he gives his approbation and confirmation to the act of his ward. Though an infant had not a capacity to do any act, his tutor was considered to have such capacity to receive or assent to anything which was for his benefit, and in such case the auctoritas of the tutor was not necessary.

The authority of decided cases was called *similis judicatorum auctoritas.* The other meanings of auctoritas may be easily derived from the primary meaning of the word, and from the explanations here given.

AUCTORIUM is a place where poets, orators, and critics were heard recite their compositions. There were places used expressly for this purpose, as the Athenaeum. (Vid. Athenaeum.) Sometimes, also, a room was hired and converted to this object, by the erection of seats, and by other arrangements. The form auditorium was also applied to a court, and, when the inference has been drawn that this kind of auditorium was the emperor's audience-chamber.

* AVELLANA NUX, the Filbert, the fruit of the Corylus Avellana, or Hazelnut-tree. It is the kappov Ποικιλον or Ποικιλορρομον of Dioscorides. According to Pliny, the earlier form of the Latin name was *Abellana max,* an appellation coming very probably, and hence the inference has been drawn that this species of nut is said to have abounded, or else from the Campanian city of Abellia. Servius is in favour of the latter. Pliny says the filbert came first from Pontus into Lower Asia and Greece, and hence one of its Greek names, as given above, καπνον Ποικιλον. Macrobius styles it also *max rara* (Plin. N.H. xii. 8, 5). The names were afterwards applied to the Corylus Avellana and Prunus. Theophrastus 8 speaks of two varieties of this kind of nut, the one round, the other oblong; the latter is referred by Sprengel to the Corylus tubulosa, Wild.

* AUGITUS (euraytic), a species of gem deriving its name from its brilliancy (euraytis). Pliny says it was thought by many to be different from the Catulus, and hence the inference has been drawn that it was generally the same with the latter, which was probably turquoise. 

AUGUR meant a diviner by birds, but was sometimes applied in a more extended sense. The word seems to be connected with *augeo, auguro,* in the same manner as *fulgur with fulgeo and fulgurio.* This word is explained by Varron thus: "Augur is a man who, according to an obscure and vague custom, which it may have been at first restricted. 10 The idea of a second derivation from *axis,* confirmed by the analogy of *auspec (avispec), may perhaps have limited the signification of augur. It is not improbable that this last etymology may be the true one; but if so, it is impossible to explain the second element. We have, however, *aviturio* (Varr. de rari, de virt. 160, 27), which is *divinio, gardium grattalae, gardinum,* says Salmacius.

The institution of augurs is lost in the origin of the Roman state. According to that view of the constitution which makes it come entire from the hands of the first king, a college of three was appointed by Romulus, answering to the number of the three great orders of Roman society, which he added two; 12, yet, at the passing of the Ougulan law (B.C. 300), the augurs were but four in number: whether, as Livy supposes, the deficiency was accidental, is uncertain. Niebuhr supposes that there were four augurs at the passing of the Ougulan law, two aipece for the Thranes and Titiles. But it seems incredible that the third tribe should have an augur, who is, however, the inferno Augur, as it does appear how it ever obtained the privilege, as the additional augurs were elected from the plebs. By the law just mentioned, their number became nine, five ofwhom were chosen from the plebs. The dictator Sulla further increased them to fifteen, a multiple of their original number, which probably had a reference to the early tribes. This continued until the time of Augustus, who, during

other extraordinary powers, had the right conferred on him of electing augurs at his pleasure, whether there was a vacancy or not, B.C. 29, so that from this time the number of the college was unlimited.

According to Dionysius, the augurs, like the other priests, were originally elected by the comitia curiata, or assembly of the patricians, in their curia. As no election was complete without the sanction of augury, the college virtually possessed a veto on the election of all its members. They very soon obtained the privilege of self-election (jus cooptatio), which, with one interruption, viz., at the election of the first plebeian augurs, they retained until B.C. 103, the year of the Domitian law. By this law it was enacted that vacancies in the priestly colleges should be filled up by the votes of a majority of the tribes, i.e., seventeen out of thirty-five, chosen by lot. The Domitian law was repealed by Sulla, but again restored B.C. 63, during the consulsiput of Cicero, by the tribune T. Annius Labienus, with the support of Caesar. It was a second time abrogated by Antonia; whether again restored by Hirtius and Pansa, in their general annulment of the acts of Antony, seems uncertain. The emperors, as mentioned above, possessed the right of electing augurs at pleasure.

The augurship is described by Cicero, himself an augur, as the highest dignity in the state, having an authority which could prevent the comitia from voting otherwise, if the augurs had not been duly performed. The words altum die from a single augur might put a stop to all business, and a decree of the college had several times rescinded laws. Such exorbitant powers, as Cicero must have seen, depended for their continuance on the moderation of those who exercised the office.

The augurs were elected for life, and, even if capriciously elected, never lost their sacred character. They were to be free from any taint of disease while performing their sacred functions, which Plutarch thought was designed to show that purity of mind was required in the service of the gods. When a vacancy occurred, the candidate was nominated by tribune of the people, and the augurs were sworn, and the new member took an oath of secrecy before his inauguration. The only distinction among them was one of age, the eldest augur being styled magister collegii. Among other privileges, they enjoyed that of wearing the purple praetexta, or, according to some, the trabea. On ancient coins they are represented wearing a long robe, which reached to the head and reached down to the feet, thrown back over the left shoulder. They held in the right hand a litus or curved wand, hooked at the end like a crook, and sometimes have the capis, or earthen water vessel, by their side. On solemn occasions they appear to have worn a garland on the head. Although many of the augurs were senators, their office gave them no place in the Senate; and the manner of taking the auspices is described under auspicii.

The chief duties of the augurs were to observe and report supernatural signs. They were also the repositories of the ceremonial law, and had to advise on the expiation of prodigies, and other matters of religious observance. The sources of their art were threefold: first, the formulas and traditions of the college were in ancient times met on the nones of every month; secondly, the augures habere, which were extant even in Scipicun's time,13 thirdly, the

commentarii augurum, such as those of Messala and of Appius Claudius Pulcher, which seem to have been distinguished from the former as the treatises or learned men from received sacred writings. Other duties of the augurs were to assist magistrates, to assist the magistrates in taking the auspices. At the passing of the lex curiata, three were required to be present, a number probably designed to represent the three ancient tribes.

One of the difficulties connected with this subject is to distinguish between the religious duties of the augurs and of the higher magistrates. Under the latter were included consuls, augurs, and censors, the augurs, as appears from Varro, being obliged to apply for the auspices to his superior. A single magistrate had the power of proroguing the comitia by the formula sed de facto servare. (Vid. Auspicum.)

The law obliged him to give notice beforehand, so that it can only have been a religious way of exercising a constitutional right. The spectio, as it was termed, was a voluntary duty on the part of the magistrate, and no actual observation was required.

On the other hand, the augurs were employed by virtue of their office: they declared the auspices from immediate observation, without giving any notice:

they had the right of nonnullatio, not of spectio, at least in the comitia; in other words, they were to report "signs where they did, not to invent there where they did not exist."

The name of augurs possessed far greater power in the earlier than in the later period of Roman history. The old legends delighted to tell of the triumphs of religion: its first kings were augurs, and Romulus was believed to have founded the empire by a divin- graduation from heaven. It seems natural that augury should have sprung up amid the simple habits of a rude people, and hence to have struck a deeper root in the Etruscan than in the Sabine. That a learned system should be ingrafted on a more simple one, such as that of the ancient Sabines, seems surely far more probable than the reverse. Yet the prevalence of Etruscan influence, during the second and third centuries of Roman history, must have greatly modified the primitive belief. It might almost appear that the augurs have been borrowed from the Etruscan region was hinted at in the story of Attus Navius, especially when we remember that Tarquiniius, whether of Latin or Etruscan origin, is undoubtedly the representative of an Etruscan period. The Romans themselves, as Müller admits, distinguished between their own rites of augury and Etruscan divination. The separate origin of the Roman religion is implied in the tradition that the name of augur was of Sabine birth, not to mention that many of the names used by the augurs (such as Sangmals avus, from the Sabine god Sancius, Titiae avus, Sabinius cultus) bear traces of a Sabine origin. Such a view is not inconsistent with the incorporation of many parts of the Etruscan system, as the constitution of the college of augurs, or the divisions of the heavens.

Augurie was the name given to the men who were safeguards which the wisdom of an oligarchic party was opposed to the freedom of the plebs.4 Of the three comitia—curiata, centurial, and tributa—the two former were subject to the auspices. As the favourable signs were known to the augurs alone, their scruples were a pretext for the government to put off an inconvenient assembly. Yet in early times the augurs were without the most of the government, but formed by themselves. In this last may be seen the oligarchy, an important portion of the Roman state. The terrors of religion, which the senate and patricians used against the plebs, must often

1. (Ling. Lat. iv. 9.) 2. (Cic. Phil. iv. 48.) 3. (Cic. Div. i. 2.) 4. (Livy. vi. 41.)
have been turned against themselves, especially during the period when the college enjoyed an absolute control over the election of its own members. Under the kings, the story of Attus Nevius seems to testify the independence of the augurs. During many centuries their power was supported by the voice of public opinion. Livy tells us that the first military tribunes abdicated in consequence of a decree of the augurs; and, on another occasion, the members of the college, actuated by the death of Marcellus, to be irrevocably created. It was urged by the patricians, and half believed by the plebeians themselves, that the auspices would be profaned by the admission of the plebs to the rights of intermarriage or the higher magistracies. With the consulship the plebeians must have obtained the higher augurate, but the augurs, without a legal measure, dependant on the augurs, the plebs would not be, in this respect, on a level with the patricians until the passing of the Oulian law. During the civil wars, the augurs were employed by both parties as political tools. Cicero4 laments the neglect and decline of the art in his day. The college of augurs was finally abolished by the Emperor Tiberius.2 We find, in the middle of the Christian era, that, even in the fourteenth century, a Christian bishop found it necessary to issue an edict against it.6

For a view of the Roman augurs, which derives them from Etruria, see Müller's Etrusk. ill., v. 5.

1. AUGUSTALES. (Strat. 4, 5.)—Augustales were properly called Augustali or Augustales, and in Latin, (Sueton., Suet., and other authors, in Scotch, and in Greek inscriptions, Αὐγούστος, Σεβαστά, Άγοντωνιά, Εὐπροσόντων is) were games celebrated in honour of Augustus at Rome and in other parts of the Roman Empire. After the battle of Actium, a quinquennial festival (πανηγύριος πεντετρεῖος) was instituted, and the birthday (γενέθλια) of Augustus, as well as that on which the victory was announced at Rome or other provinces, were regarded as the days for the celebration of these games. In the provinces, also, in addition to temples and altars, quinquennial games were instituted in almost every town.6 On his return from Rome to Greece, in B.C. 19, after being absent from Italy for two years, the day on which he returned was made a festival, and called Augustalia.7 The Roman equites were accustomed to wear the costume of the Augustales on the birthday of Augustus in every alternate year,8 and the priests, before any decree had been passed for the purpose, were also in the habit of exhibiting games every year in honour of Augustus. According to Dion Cassius, it was not until B.C. 11 that the Augustalia were established by a decree of the senate; by which Augustalia he appears, from the connexion of the passage, to mean the festival celebrated on the birthday of Augustus. This account seems, however, to be at variance with the statement of Tacitus, who speaks of the augustales as first commenced in the reign of Tiberius (ludus Augustalis tum primum capito turbantius discordiae), to reconcile which passage with the one quoted from Dion Cassius, Lipsius supposed the phrase, declamavit, as used by Tacitus, to have been caused by a play on words, declamavit (the declamatio) in the games was made at the beginning of the reign of Tiberius,11 and thus speaks of them as first established at that time. They were exhibited annually in the circus, at first by the tribunes of the plebes, at the commencement of the reign of Tiberius, but afterward by the praetors, perpetually.12

These games continued in the time of Dion Cassius, that is, about A.D. 230.13

The Augustales or Augustalia at Neapolis (Naples) were celebrated with great splendour. They were instituted in the lifetime of Augustus,1 and were celebrated every five years. According to Strabo, who speaks of these games without mentioning their name, they rivalled the most magnificent of the Grecian festivals. They consisted of gymnastic and musical contests, and lasted for several days.4 At these games the Emperor Claudius put forward a Greek comedy, and received the prize.6

Augustalia (Σεβάστοι) were also celebrated at Alexandria, as appears from an inscription in Gruter;5 and in this city there was a magnificent temple to Augustus (Σεβαστόν, Augustale). We find mention of Augustalia in numerous other places, as Perge, Cyparissus, Heliopolis, and Cyrene.

2. AUGUSTALES were an order of priests in the municipia, who were appointed by Augustus, and selected from the libertini, whose duty it was to attend to the religious rites connected with the worship of the Lares and Penates, which Augustus put in places where two or more ways met (in comparit). The name of this order of priests occurs as early as Tacitus, often along with other benefactions of Augustus. The Augustales were not the only religious corporation which Augustus founded, in most municipia, a kind of corporation, of which the first six in importance had the title of serviri, and the remainder that of comparitae Larum Aug.8 It has been maintained by some modern writers that these augustales were civil magistrates; but there is good reason for viewing them after the manner of a religious corporation. The office, which was called Augustale, was looked upon as honourable, and was much sought after by the more wealthy libertini; and it appears that the decuriones in the municipia were accustomed to sell the dignity, since we find it recorded in an inscription that the office had been conferred gratuitously upon an individual on account of the benefits which he had conferred upon the town (ordo decurionum ob merita ejus honorem Augustalitis gratium decrevit). The number of Augustales in each municipium does not appear to have had any limitation; and it seems that, in course of time, almost all the respectable libertini in every municipium belonged to the order, which title for a time was supposed to be a sort of mark of distinction, like the equestrian order at Rome. We find in the inscriptions of many municipia that the decuriones, seviri or augustales, and plebes, are mentioned together, as if they were the three principal classes into which the community was divided.9

The augustales of whom we have been speaking should be carefully distinguished from the sodales Augustales, who were an order of priests instituted by Tiberius to attend to the worship of Augustus.10 They were chosen by lot from among the principal persons of Rome, and were twenty-one in number, to which were added Tiberius, Drusus, Claudius, and Germanicus.11 They were also called sacerdotes augustales, and Augustali.14

It appears that similar priests were appointed to attend to the worship of other emperors after their decease; and we accordingly find, in inscriptions, mention made of the sodales Flavii, Hadrianus, Eliani, Antonini, &c.14

It appears that the flamines Augustales ought to be distinguished from the sodales Augustales. We find that flamines and sacerdotes were appointed—

127
in the lifetime of Augustus to attend to his worship; but we have the express statements of Suetonius and Dion Cassius that this worship was confined to the provinces, and was not practised in Rome, or in any part of Italy, during the lifetime of Augustus. Women even were appointed priestesses of Augustus, as appears from an inscription in Gruter: this practice probably took its origin from the appointment of Livia, by a decree of the senate, to be priestess to her deceased husband. It seems probable that the sodales Augustales were intrusted with the management of the worship, but that the flamines Augustales were the persons who actually offered the sacrifices and performed the other ceremonies. A member of the sodales Augustales was sometimes a flamen also (Neronis Caesaris, flamine Augustalii, sodali Augustalii); and it is not improbable that the flamines were appointed by the sodales.

Augustus. (Vid. Calendar, Roman.)

Augusteum. (Vid. Sapiarium, Tapes, Velum.)

Aulopolis (aulopolis), a large fish, of which Ælian gives an interesting account. Rundale refers it to the genus Labrus, or Wrasse, but Adams thinks it much more probable that it was a species of Squalus, or Shark.

Aulos (aulos), a wind instrument played with the fingers. It consisted of several parts: χαλώτης or χαλάττα, the mouthpiece, which was taken off when not used, and kept in a case (χαλωτήρ). The bell was a piece of bone, and often put for the mouthpiece itself; Ἁλός, pieces of wood or bone inserted in the ἱστικήματα or openings, and pushed aside, or up and down, so as to narrow or extend the compass of the scale at pleasure; ὕπθαλαμον, similar to Ἁλος, but inserted in the mouthpiece so as to lessen the power of the instrument when required, and often covered by ἁλαρίας, which is said to have been of the same kind (ἀλος). The Ἁργυρόφατος was not a part of the ἀλός, but a strap fastened at the back of the head, with a hole in front fitting to the mouthpiece. (Vid. Phormion.) For an account of the different sorts of ἀλός, see Thuc.; and for the character of flute music, and its adaptation to the different modes, see Music.

Aureus. (Vid. Aurum.)

Auriga. (Vid. Circus.)

Aurifigamentum. (Vid. Arsenicum.)

Aurum (œron), Gold. It is stated under Arsenium, that as late as the commencement of the Peloponnesian war the Athenians had no gold coinage. It would appear from a passage in the Augustalii; that in the time of Sophocles gold was rare at Athens. Indeed, throughout the whole of Greece, though gold was by no means unknown, it appears to have been obtained chiefly through the Greek cities of Asia Minor and the adjacent islands, which possessed it in abundance. The Homeric poems speak constantly of gold being laid up in treasuries, and gold being utilized for the purpose of ornament; but this is sufficiently accounted for by the fact that Homer was an Asiatic Greek. The chief places from which the Greeks procured their gold were India, Arabia, Armenia, Colchis, and Tyrrhenia. It was found mixed with the sands of the Factolus and other rivers.

Greek Gold Money.

The time when gold was issued as coin is very uncertain. Aristophanes speaks in the Frogs (406 B.C.) of τοῦ καινοῦ χρυσοῦ, "the new gold money," which he immediately afterwards calls ποντία χρύση. The scho-
was not coined at Athens in the period between Pericles and Alexander the Great, if we except the solitary issue of debased gold in the year 407. A question similar to that just discussed arises with respect to other Greek states, which we know to have had a silver currency, but of which a few gold coins are found. This is the case with Æginæ, Thebes, Argos, Carystus in Euboea, Acarnania, and Ætolia. But of these coins, all except two bear evident marks, in their weight or workmanship, of belonging to a period not earlier than Alexander the Great. There is great reason, therefore, to believe that no gold coinage existed in Greece previous to the time of that monarch. But from a very early period the Asiatic nations, and the Greek cities of Asia Minor and the adjacent islands, as well as Sicily and Cyrene, possessed a gold coinage, which was more or less current in Greece. Herodotus 1 says that the Lydians were the first who coined gold, and the state of Creæs appears to have been the earliest gold coin known to them. In the 5th and 6th centuries A.D. the Phœnician, Staters of Cyzicus and Phœcea had a considerable currency in Greece. There was a gold coinage in Samos as early as the time of Polycrates. 2 The islands of Siphnus and Thasos, which possessed gold mines, appear to have had a gold coinage at an early period. In most of the coins of the Greek cities of Asia Minor, the metal is very scarce, and the Macedonian gold coinage came into circulation in Greece in the time of Philip, and continued in use till the subsidence of the Roman Empire. (Vid. Darius, Stater.)

Romæa Gold Money.—The standard gold coin of Rome was the aureus nummus, or denarius aureus, which, according to Pliny, 3 was first coined 62 years after thehappy coinage. 4 The standard or silver coinage (aequitas, which is, in the year 207 B.C. The lowest denomination was the scrupulum, which was made equal to 50 sestertii. The weight of the scrupulum, as determined by Mr. Hussey, 4 was 18.06 grs. In the British Museum there are gold coins of one, two, three, and four scrupula, the weights of which are 17 grs. 51, 38, and 25 grs. respectively. These bear a head of Mars on one side, and on the other an eagle standing on a thunderbolt, and beneath the inscription "Roma." The first has the mark XX (20 sestertii); the second, XXX (30 sestertii); the third, XX (50 sestertii). Of the last we subjoin an engraving:

Pliny adds, that afterward aurei were coined of 40 to the pound, which weight was diminished, till, under Nero (the reading of this word is doubtful), they reached 45 to the pound. This change is supposed, from an examination of extant specimens, to have been made in the time of Julius Caesar. The estimated full weight of the aurei of 40 to the pound is 130.1 grains; of those of 45 to the pound, 1166 grains. No specimens exist which come up to the 130.1 grains; the heaviest known is one of Pompey, which weighs 128.2 grains. The average of the gold coins of Julius Caesar is fixed by Létorme at 126-66 grains, those of Nero, 115.39 grains. Though the weight of the aureus was diminished, its proportion to the weight of the denarius remained about the same, namely, as 2:1 (or rather, perhaps, as 2:1:1). Therefore, since the standard weight of the denarius, under the

early emperors, was 60 grains, that of the aureus should be 120. The average weight of the aurei of Augustus, in the British Museum, is 121.20 grains; and as the weight was afterward diminished, we may take the average at 120 grains. The aureus proved to have been no intentional alloy in the Roman gold coins, but they generally contained a small portion of native silver. The average alloy is $\frac{1}{3}$. The aureus of the Roman emperors, therefore, contained $\frac{1}{3}$ of a grain of alloy, and, therefore, 119.6 grains of pure gold. Now a sovereign contains 115.12 grains of pure gold. Therefore the ratio of the value of the aureus in terms of the sovereign is 1.016.6, or 1.02 coins. A denarius being $\frac{1}{2}$ of a halfpenny. This is its value according to the present worth of gold; but its current value in Rome was different from this, on account of the difference in the weight of the metal. The aureus passed for 25 denarii; therefore, the denarius being $\frac{1}{2}$d., it was worth 17s. 8d. The ratio of the value of gold to that of silver is given in the article Augustus.

The following cut represents an aureus of Augustus in the British Museum, which weighs 121 grains:

Alexander Severus coined pieces of one half and one third of the aureus, called semissis and tremisses, 1 after which time the aureus was called solidus. Constantine the Great coined ætius of 72 to the pound, at which standard the coin remained to the end of the Empire. 2

AURUM CORONARIUM. When a general in a Roman province had obtained a victory, it was the custom for the cities in his own provinces, and for those from the neighbouring states, to send golden crowns to him, which were carried before him in his triumph at Rome. 3 This practice appears to have been borrowed from the Greeks; for Chares relates, in his history of Alexander, 4 that after the conquest of Persia, crowns were sent to Alexander which amounted to the weight of 10,500 talents. The number of crowns which were sent to a Roman general was sometimes very great. Cn. Manlius had 200 crowns carried before him in the triumph which he obtained on account of his conquest of the Gauls in Asia. 5 In the time of Cicero, it appears to have been usual for the cities of the provinces, instead of sending crowns on occasion of a victory, to pay money, which was called aurum coronarium. 6 This offering, which was at first voluntary, came to be regarded as a regular tribute, and seems to have been sometimes exacted by the governors of the provinces even when no victory had been gained. By a law of Julius Cæsar, 7 it was provided that the aurum coronarium should be given, unless a triumph was decreed; but under the emperors it was exacted on many other occasions, as, for instance, on the adoption of Antoninus Pius. 8 It continued to be collected, apparently as a part of the revenue, in the time of Valentinian and Theodosius. 9

129
AUSPICICUM.

Servius says that aurum coronarium was a sum of money exacted from conquered nations, in consideration of the lives of the citizens being spared; but this statement does not appear to be correct.

AURUM LUSTRALE was a tax imposed by Constantine, according to Zosimus, upon all merchants and traders, which was payable at every lustrum, or every four years, and not at every five, as might have been expected from the original length of the lustrum. This tax was also called aurii et argentii colliatio or præstatio, and, thus, in Greek, ἡ αὐροτέλεια ἢ τῶ χρυσάργιον. It appears from an inscription in Gruter that there was a distinct officer appointed to collect this tax (aurii lacrator coeptor).

AUSPICICUM originally meant a sign from birds. The word is derived from avis, and the root spec. As the Roman religion was gradually extended by additions from Greece and Ethiopia, the meaning of the word was widened, so as to include any supernatural sign. The chief difference between auspiciis and augurium seems to have been, that the latter term is never applied to the specio of the magistrate. (Vid. Augur.)

Whoever has thought on this part of the Roman religion cannot but feel astonished at its exceeding simplicity. The rudest observations on the instinct of birds, such as the country people make in all ages, and the rudest belief. The system outlined the age for which it was adapted, and in which it arose. Its duration may be attributed to its convenience as a political instrument: at length, as learning and civilization increased, it ceased to be regarded in any other light.

Yet, simple as the system appears, of its innumerable details only a faint outline can be given. Birds were divided into those which gave omen and augur; the former gave omens by singing, the latter by their flight and the motion of their wings. Every motion of every bird had a different meaning, according to the different circumstances or times of the year when it was observed. Many signs were supposed to be so obvious, that any, not blinded by fate, might understand them; and much was understood of any new sign, the meaning of which could only be detected by the discrimination of augurs.

Another division of birds was into dextra and sinistra, about the meaning of which some difficulty has arisen, from a confusion of Greek and Roman notions in the writings of the classics. The Greeks and Romans ascribed to the praedium quod orientem, the sun, by which any sign came from the east; but as the Greek priest turned his face to the north, the east was on his right hand; the Roman augur, with his face to the south, had the east on his left. The confusion was rather increased by the euphemisms common to both nations; and the rule itself was not universal, at least with the Romans: the day when it appeared on the sun, and the side on the right, being thought to give good omens.

The auspices were taken before a marriage, before entering on an expedition, before the passing of laws or election of magistrates, or any other important occasion, whether public or private. Candidates for public offices used to sleep without the walls on the night before the election, that they might take the auspices before daylight. In early times such was the importance attached to them, that a soldier was released from the military oath if the auspices had not been duly performed.

The commander-in-chief of an army received the auspices, together with the imperium, and a war was therefore said to be carried on with the auspices, as the general of the army; and, thus, if the legates gained a victory in the absence of his commander, the latter, and not his deputy, was honoured by a triumph.

The ordinary manner of taking the auspices was as follows: The augur went out before the dawn of day, and, sitting in an open place, with his head veiled, marked out with a white line, litus, the divisions of the heavens, even if he were declared, in a solemn form of words, the limits assigned, making shrubs or trees, called tenqua, his boundary on earth correspondent to that in the sky. The temple augurale, which appears to have included both, was divided into four parts: those to the east and west were termed sinistra and dextra; to the north and south, anticas and postica. (Vid. Aurance.)

If a breath of air disturbed the calmness of the heavens (as silentiurn non casus), the auspices could not be taken, and, according to Plutarch, it was for this reason the augurs carried lanterns open to the wind. After sacrificing, the augur offered a prayer for the desired signs to appear, repeating, after an inferior minister, a set form: unless the first appearances were confirmed by subsequent ones, they were insufficient. If, in the augur's following stream, the Augur could not be satisfied, he again repeated a prayer, and purified himself in its waters; otherwise the auspices were held to be null.

Another method of taking the auspices, usual on military expeditions, was from the feeding of birds confined in a cage, and committed to the care of the pullarius. An ancient decree of the college of augurs allowed the auspices to be taken from any bird. When all around seemed favourable (silentiurn facto, h. e. quod omni viso caret), either at dawn or in the evening, the pullarius opened the cage, and threw to the chickens pulse, or a kind of soft cake. If they refused to come out, or to eat, or uttered a cry (occirenter), or beat their wings, or flew away, the signs were considered unfavorable, and the engagement was declared off. On the contrary, if they ate greedily, so that something fell and struck the earth (tripudium solstitium, tripudium quasi terrapannum, solstitium, from sol, the latter part of the word probably from the root of simul), it was held a favourable sign. Two other kinds of tripudia are mentioned by Festus, the tripudium ossarium, from the cry of birds, and sonarium, from the sound of the pulse on the ground.

The place where the auspices were taken, called auxuraculum, augurerale, or auguratorium, was open to the heavens: one of the most ancient of these was on the Palantine Hill, the regular station for the observations of augurs. Sometimes the auspices were taken in the Capitol, or in the pomerium. In the camp, a place was set apart to the right of the general's tent, or at his head. Some of the auspices were taken without the walls, the augur pitched a tent after a solemn form: if he repassed without taking the auspices, it was necessary that the tent should be taken down and dedicated anew.

The lex Aelia and Fufia provided that no assemblies of the people should be held, nisi prurs de aurescere esset. It appears to have confirmed the augur's decisions in matters of war, or of imposing a veto. (Vid. Augur.)

Auspicia were said to be elivia, prohibitory, imper.

BACCAR.

 Babylonicum, a Babylonian shawl. The splendid productions of the Babylonian looms, which appear, even as early as the days of Joshua, have excited universal admiration, were, like the shawls of modern Persia, adorned both with gold and with variously coloured figures. HencePublius Syrus' comments on a main to be figured Babylonicum, enriched with gold (plamato aureo Babylonico). Lucretius and Martial celebrate the magnificence of these textures, and Pliny mentions the enormous prices of some which were intended to serve as furniture for triclinia (triclinia Babylonica). Nevertheless, Plutarch informs us, in his life of the elder Catilo, that one of these precious shawls (enim hogmra tov tôn pillan Babyloniouou) was bequeathed to him, he immediately gave it away. (Vid. Palium, Peristroma, Straulium.)

BACCA. (Vid. Inabris, Monile.)

• BACCAR or BACCARI (Bâxâgâ, Bâxâr), a plant. "Even in ancient times," remarks Adams, "it was a matter of dispute what this was. Galen says that a root of Baccar had been employed by the ancients of Matti- tus, in like manner, and Baunih, point to the Comp. squarrosa, L.: which I think the most probable conjecture that has been formed respecting it, though it does not satisfie Sprengel. Dierbach, however, contends for its being the Gnaphalus sangui-neminum, or Bloody Cudweed. Sprengel taakes the 'Baccar' of Virgil to have been the Valeriana officinalis, a species of the Baccarin. A root of this plant, if irregular or ungent, was made out of the root of the Baccar, called bâxâgâvón mívôn.

BACCHANALIA. (Vid. Dionysia.)

BACCHARUS, diyin. BACILLUS, BACILLUM (bâk-

tron, skâp'tron), a staff, a walking-stick.

The aid afforded by the âktrôns to the steps of
the aged is recognised in the celebrated enigma of
the Sphinx, which was solved by Cédipus. 1 In his
old age, Cédipus himself is represented asking his
daughter for the same support: Bâktra próspore, ó
popëian. 2 When, in Ovid’s Metamorphoses, certain
of the gods (viz., Minerva 3 and Vertumnus 4 )
assume the garb of old women, they take the baculus
to lean upon. On the other hand, an old man in
Juvenal, 4 describing himself as still hale and vigo-
rous, says that he walked without a stick (nullo
dextero). 5

If the loss of sight was added to infirmity, the
staff was requisite for direction as well as for sup-
port. To the blind seer Tiresias one was given,
which served him instead of eyes (méga âktrôn, 
skâp'treó). Homer represents him as carrying it
even in Eôrus. 6

A dutiful and affectionate daughter is figuratively
called the staff of her aged parents. Thus Hécuba

describes Polyxena (Bâktra 7), and the same beau-
tiful metaphor is applied to Antigone and Ismene,
the daughters of Cédipus (skâp’tro). 8

The staff and wallet were frequently borne by
philosophers, and were more especially characteris-
tic of the Cynics. (Vid. Pera.)

The shepherds also used a straight staff as well
as a crook. The annexed woodcut, taken from a
gem in the Florentine cabinet, shows the attire of
a Roman shepherd in the character of Faustulus,
who is contemplating the she-wolf with Romulus
and Remus. It illustrates what Ovid 9 says of himself
in his ode:

3; yel celtin baculo pascerre nivus mo! 10

Among the gods, Ésculapius, 12 Tanus, 13 and occa-

sionally Sonnus, 14 were represented as old men

leaning on a staff.

It appears that the kings of Sparta carried a tran-
chon (bâktria) as the ensign of their authority. 13
On the occasion of one of them lifting it up in
a threatening attitude, Thucydides returned the
celebrated answer, “Strike, but hear.” In reference
to this custom, the tranchon (baculus) was carried
in the hand by actors on the Roman stage. 14
The dicasts at Athens received, at the time of their
appointment, a bâktria and sýmâbol as a mark of
their authority. 15

Crooked sticks were carried by men of fashion at
Athens (bâktria tòv sômalov ënekeleusov 16). As
baculus was a general term, its application in
various specific senses is farther explained under
Lettus, Pedum, Sceptrum, Virga.

BAKTERIA (bâktria). (Vid. Bacilus.)

BÆBIA AEMLIA LEX. (Vid. Ambitus.)

*BALENA (pâlâvna), the Whale. After
the conquest of Britain by the Romans, it is not im-
probable that they may have acquired some knowl-
edge of the Bâleâna mysticus, 15 i.e., Great Green
whale, or Bâleâna of Britain to which Juvenal 11 alludes.
The ancients were also acquainted with the Bâleâna
Physalus, the Gibbar or fin-fish. (Vid. Physalus.)

There can be no doubt, however, that the pâlâvna
of Aristotle and Ælian, as well as of Xenocrates and Galen,
was the Phýsēter micros, L., the Cachalot or spermastci whale.

*BALANUS (bâlànus). 1. A crustaceous fish
described by Aristotles and Xenocrates, and which,
according to Coray, is the Lepas Bâlânus, L., called
in English the Barnacle.

II. (bâlànus moúropûs), the Nut-Ben, from which
a perfume was obtained by the ancients. 16

Dioecides says, “It is the fruit of a tree resembling
the Myrica, like what is called the Punic bean, the
inner part of which, when pressed, like bitter almonds,
emits a liquid that is used for preparing many cur-
rents.” Moses Charras says of it, “The Nut-Ben,
called by the Greeks Bâlânus Myrepísca, by the
Romans Óiâno Unguentaria, affords its oil by pressing
in the same manner as other fruits.” The tree
which furnishes the Nut-Ben has got the name of
Heptândera moringa, Vahl., in English, the Smooth
Bouc-de-tre. It is worthy of remark, that the Nut-Ben,
called by the ancients Bâlânus, is the same term by the Greeks
and Romans, a term which is important to note,
that the reader should not confound with the Myrobalans
of the Arabsians and of the moderns. These are all
stone-fruits got from the East. The only Greek
authors who make mention of the latter are Actu-
arios, Zosimus Panopolita, and Myrepis. 18

BALATRO, a professional jester, buffoon, or para-
site. 19 In Horace, 7 Balatro is used as a proper
name—Servilius Balatro. 29 An old seal in, in
commenting on this word, derives the common
word from the proper names; buffoons being called
calatrones, because Servilius Balatro was a buffon:
but this is opposed to the national inference from the
former passage, and was said to get rid of a diffi-
culty. Festus derives the word from bletae, and
supposes buffoons to have been called calatrones,
because they were dirty fellows, and were covet, in
spots of mud (bleatea), with which they got
spattered in walking; but this is opposed to sound
eymology and common sense. Another writer has
derived it from barathrum, and supposes buffoons
to have been called calatrones, because they, so to
speak, carried their jesting to market, even into the
very dwellings of the shambles (barathrum maccellum).

According to some the etymologists, Luceretius
has barathro in a similar sense to balatro. Perhaps
balatro may be connected with bala-re (to beat like a
sheep, and hence) to speak silli. It is probably
connected with biatero, a busy-body. 20

Baleatrones were paid for their jests, and the tables
of the wealthy were generally open to them for the sake
of the amusement they afforded the company.

BALLEUS (bâlônus), a fish of the Carp species.
Artedi supposes it a species of Cyprinus, called in
French Borderedie, and in German Bîck. 21

BALLISTA, BOLLIS TA. (Vid. Termentum.)

*BALLOTTE (bâlô'te), a plant. Pliny 22 calls it
“portum mirtum,” confusing, apparently, pâlôs
with pâlôs. In another place he describes it as

1. (Apôllonîor., iii., 5.—Schol. in Erat. Phain., 50.)—2. (Er-

at. Phain., 1742.—Compara 1590.—3. (vi., 27.)—4. (civ.,
(180; Schol. Col., 844, 1105.)—11. (De Pau, 1.)—12.
(Ovid., Met., x., 655.)—13. (Past., i., 177.)—14. (Bac-Relief in
Villa Albani.)—15. (Theod., viii., 55.—Dover in loc.)—16.
(Suet., Ner., 24.)—17. (Demost., De Cor., p. 505.—Tayler in
loc.)—18. (Theo. Præf., Chr., 5.)

132
In the Homeric times the Greeks also used a belt to support the shield, which, as well as the sword, was worn by them on the left side; and this second belt lay over the other, and was larger and broader than it (τελαμώνιον ὁπίσθεν, πλάτος τελαμώνιον, μίας εἰς ἑν τολμήματος). Vid. Eöös, p. 26. The two belts upon the breast of Ajax, the son of Telamon, who carried a remarkably heavy shield, are mentioned in the Iliad. But, although he was saved by this double belt, according to Homer, the shield by Hector's spear, yet the language of Homer clearly implies that the practice alluded to was on the field of battle productive of great heat and annoyance; and this circumstance probably led to the diocese of the oppressive shield-belt, and to the invention of the Carian οἶκος by which it was superseded. (Vid. 139, 140.) The belt must also have occasioned some inconvenience in putting on the armour. The circumstance to which some of the Alexandria critics objected, that Homer makes his heroes assume the shield before the helmet, may be explained from the impossibility of throwing the shield-belt over the lofty crest of the helmet, supposing the helmet to have been put on first; whereas the third shield-belt, which, if large and ponderous, might have been more difficult in putting on his helmet. The very early diuse of the shield-belt accounts for the fact, that, except in the case of the Δησις, which was retained on account of its mythological importance, this part of the ancient armour is never exhibited in paintings or sculptures. Even the author of the Shield of Hercules supposes it to be omitted.

A third use of the balteus was to suspend the quiver, and sometimes, together with it, the bow. Hence Nemesianus, describing the dress of Diana, when she attires herself for the chase, says,

"Corticeque sinus gemmatus balteus ariet."

And a similar expression (balteus et revocet volubus in pectori sinus) is used by Livi'vs Andronicus,

because the belt, besides fulfilling the purpose for which it was intended, of supporting the quiver, also confined the garments, and prevented them from being flung over the shield by the wind. The belt passed over the right shoulder and under the left arm, in the same manner with the others.

According to Theocritus, Amphionyx used a sword-belt made of cloth, linen being probably intended (νεκλόλαιο τελαμώνιον). More commonly the belt, whether employed to support the sword, the shield, or the quiver, was made of leather and differed in the case of the ήπιος κυνήγους (τελαμώνιον). It was ornamented (φασάει) Insignis balteus auro). That which Agamemnon wore with his shield was plated with silver, and on it was also displayed a serpent (δράκων) wrought in blue steel. The three heads of the serpent (κεφαλαί τρεις ἀμφοτερεῖς) were turned back, so as to form hooks for fastening the two ends of the belt together. And this fact lends the clue to the myth that Hercules armed with his bow and arrows (vid. Aesch.) he wears on his breast a golden belt for suspending his quiver (δόρφη χρυσῆς τελαμώνιον), on which are embossed both the animals of the chase and exhibitions of the slaughter of men. In a passage already quoted, Diana's belt is described as enriched with jewels. In like manner, Eneas gives as a prize in the games at his father's tomb a quiver full of arrows, with the belt belonging to it, which was covered with gold, and had a buckle, or rath-

BALTEUS.

A sword-belt enriched with gold, on which a celebrated sculptor had produced a representation of the Danaids murdering their husbands on the bridal night, gives occasion to the concluding incident of the Æneid.

That taste for richly-decorated sword-belts, the prevalence of which, in the Augustan age, may be inferred from the mention of them in the Æneid, did not decline under the succeeding emperors. It is, indeed, mentioned as an instance of the self-de
denial and moderation of Hadrian, that he had no gold on his belt.

But Pliny seems to have partaken in the common practice, in his time, of covering this part of the soldier's dress with laminae of the precious metals; and of the great intrinsic value and elaborate orna
tment of those which were worn by persons attached
to the court, we may form some judgment from the circumstance that the baltearius, or master of the belts, was a distinct officer in the imperial household.

Spon, who has published an inscription from the family tomb of one of these officers, remarks, that their business must have been to provide, prepare, and preserve all the belts in the ar
manentarium.

This office will appear still more considerable from the fact that belts (balteoli) were occasionally given as military rewards, together with swords and armaments.

In a general sense, "balteus" was applied not only to the simple belt, or the more splendid balteus which passed over the shoulder, but also to the girdle (cingulum) which encompassed the waist (Coza mumicatu uraque). Hence the girdle of Orion, called ζώγ by Aratus, is rather incorrectly denominated balteus in the translations of that author by Strabo and Avienus. The oblique ar
rangement of the balteus, in the proper sense of that term, is alluded to by Quintilian in his advice re
specting the mode of wearing the toga: oblique du
citum, velut balteum.

Vitruvius applies the term "balteus" to the bands surrounding the volute on each side of an Ionic capital. Other writers apply it to the large steps, presenting the appearance of an array of parallel walls, by which an amphitheatre was divided into stories for the accommodation of different classes of spectators.

Vitruvius calls these divisions prciausaliones. (Via Amphitheatrum.) In the amphitheatre at Verona the baltei are found by measurement to be 22 feet high, the steps which they enclose being one foot two inches a step.

BANISHMENT.

The word "banishment" among the Greek states seldom, if ever, appears as a punishment appointed by law for particular offences. We might, indeed, expect this; for the division of Greece into a number of independent states would neither admit of the establishment of penal colonies, as among us, nor of the various kinds of exile which we read of under the Roman emperors. The general term ψῆφι (flight) was, for the most part, applied in the case of those who, in order to avoid some punishment or danger, removed from their own country to another. Proof of this is found in the records of the heroic ages, and chiefly where homicide had been committed, whether with or without malice aforethought. Thus Patroclus appears as a fugitive for life, in consequence of manslaughter (πανομκτησία) committed by him when a boy, and in anger. In the same manner, Theoclymenus is represented as a fugitive and wanderer over the world, in fine for the murder of Heitor, by the four of vengeance from the numerous kin
men of the man whom he had slain. The duty of taking vengeance was in cases of this kind consid-
ered sacred, though the penalty of exile was sometimes remitted, and the homicide allowed to remain in his country on payment of a τούθρος, the price of blood, or wehrugel of the Germans, which was paid to the relatives of the murdered man, in the place of the blood of the slain. We even read of princes in the heroic age, being compelled to leave their country after the commission of homicide on any of their subjects, and even though there were no relatives to aecocur the slain man, still deference to public opinion im
posed on the homicide a temporary absence, until he had obtained expiation at the hands of another who seems to have been called the ευμετρήτης, or puri
fier. For an illustration of this, the reader is re
ferred to the story of Aegisthus and Creusas.

In the later times of Athenian history, ψῆφι, or banishment, partook of the same nature, and was practised nearly in the same cases as in the heroic ages, with this difference, that the laws more strict
ly defined its limits, its legal consequences, and d
termination. The word was retained in Greece, and brought before the Areiopagus, and for manslaughter before the court of the Ephetae. The accused might, in either case, withdraw himself (ψυνείπ) before sentence was passed; but when a criminal evaded the punishment to which an act of murder would have exposed him had he remained in his own land, he was then banished forever (ψευνείπ de
gnwnod) and never supposed to return home. And when other exiles were restored or received a general amnesty, since, on such occasions, a special expec
tion was made against criminals banished by the Areiopagus (οἱ τῇ Ἐρείᾳ πάγων φαντόγρατοι). A con
victed murderer, if found within the limits of the state, might be seized and put to death, and who
ever harboured or entertained (υπελδέητου) any one who had fled from his country (τὸν ψευνείπνυντον) to avoid a capital punishment, was liable to the same penalties as the fugitive himself.

1. (De Arch., iii., 3.)
BANISHMENT

Demosthenes suggests that the word "φυγή" was properly applied to the exile of those who committed murder with malice aforethought, whereas the term "μεθία-ασθεία" was used when the act was not intentional. The property, also, was confiscated in the former case, but not in the latter.

When a verdict of manslaughter was returned, it was usual for the convicted party to leave (επιβάλεται) his country by a certain day, and to remain in exile till he induced one of the relatives of the slain man to take compassion on him (τω δι' αλλοτροπού τῶν ἐν γενεάς τοῖς περιπάτοις). During his absence, his possessions were κτίσμα, that is, not confiscated; but if he remained at home, or returned before the requirements of the law were satisfied, he was driven out of the country by force. It sometimes happened that a fugitive for manslaughter was charged with murder; in that case he pleaded on board ship, before a court which sat at Phrearotin, in the Peisaius.

We are not informed what were the consequencess if the relatives of the slain man refused to make a requisition: but that exiles from banishment, it is reasonable to conclude that the exile was allowed to return after a fixed time. In cases of manslaughter, but not of murder, this seems to have been usual in other parts of Greece as well as Athens. Plato, who is believed to have copied many of his laws from the constitution of Athens, fixes the term of banishment for murder at one year, and the word "παρτιστάρως," explained to mean a year's exile for the commission of homicide (τοις φιόνοι δράσεσ), seems to imply that the custom was pretty general. We have, indeed, the authority of Xenophon to prove that at Sparta banishment was the consequence of involuntary homicide, though to a lesser extent.

Moreover, not only was it an actual murder punished with banishment and confiscation, but also a "τραγιμα ηνινολογα", or wounding with intent to kill, though death might not ensue. The same punishment was inflicted on persons who ventured to use the sacred olive at Athens, and by the laws of Soinn every one was liable to it who remained unrepentant during the period of exile.

Under ψυγη, or banishment, as a general term, is comprehended ostracism: the difference between the two is correctly stated by Suidas, and the scholiast on Aristophanes, if we are to understand by the former "ψυγηναία, or banishment for life. "Ψυγη" (say they) differs from ostracism, inasmuch as those who were banished lost their liberty by confiscation, whereas the ostracized did not; the former, also, have no fixed place of abode, no time of return assigned, but the latter have." This ostracism is supposed by some to have been instituted by Cleisthenes after the expulsion of the Peisistratides; its nature and object are thus explained by Aristotle. "But we have no information as to what time those who appeared to be pre-eminent above their fellow-citizens, by reason of their wealth, the number of their friends, or any other means of influence," it is well known, and implied in the quotation just given, that ostracism was not a punishment for any crime, but rather a precautionary remonstration of those who possessed sufficient power in the state to excite either envy or fear. Thus Plutarch says it was a good-natured way of allaying envy (φθόνοι παραμαθείᾳ φιλόνομοι) by the humiliation of superior dignity and power. The manner of effecting it was as follows: A space in the ἄγορα was enclosed by barriers, with ten entrances for the ten tribes. By these the tribemen entered, each with his ὁστρακος, or piece of tile, on which was written the name of the individual whom he wished to be ostracized. In the presence of the senate, i.e., the presidents of that body, superintended the proceedings, and the party who had the greatest number of votes against him, supposing that this number amounted to 6000, was obliged to withdraw (μετασχάλα) from the city within ten days; if the number of votes did not amount to 6000, nothing was done. Ostracism differs from other forms in stating that, if the candidate were once thus expelled, it was not necessary that the votes given against any individual should amount to 6000, but only that the sum total should not be less than that number. All, however, agree, that the party thus expelled (ὁ ὁστρακοφης) was not deprived of his property. The ostracism was also called "κορεία, κορεία" or earthenware scourge, from the material of the ὁστρακον of which the names were written.

Some of the most distinguished men at Athens were removed by ostracism, but recalled when the city found their services indispensable. Among these were Themistocles, Aristides, Cimon, and Alcibiades; of the first of whom Thucydides states that his usefulness to Athens was confined to Athens, though he was not confined to that city, but visited other parts of Peloponnese. The last person against whom it was used at Athens was Hyperbolus, a demagogue of low birth and character; but the Athenians thought their own dignity compromised, and ostracism degraded by such an application of it, and accordingly discontinued the practice.

Ostracism prevailed in other democratical states as well as Athens; namely, Argos, Miletus, and Megara: it was by some, indeed, considered to be a necessary, or, at any rate, a useful precaution for ensuring equality among the citizens of a state. But the Athenians, who were more convinced of the wisdom of their remarks, "Men did not look to the interests of the community, but used ostracisms for party purposes" (στατισχικώς).

From the ostracism of Athens was copied the petalism (πεταλομέρος) of the Syracusans, so called from the πέταλα, or leaves of the vine, on which his name was written the name of the person whom they wished to remove from the city. The removal, however, was only for five years; a sufficient time, as they thought, to humble the pride and hopes of the exile. But petalism did not last long; for the fear of this "humbling" deterred the best qualified among the citizens from taking any part in public affairs, and the degeneracy and bad government which followed soon led to a repeal of the law, B.C. 452.

In connexion with petalism, it may be remarked, that if any one were falsely registered in a demus or ward at Athens, his expulsion was called "ευροφια, from the votes being given by leaves.

The reader of Greek history will remember that, besides those exiled by law, or ostracized, there was frequently a great number of political exiles in Greece; men who, having distinguished themselves as the leaders of one party, were expelled, or obliged...
is applied by Cicero¹ to the case of Titus Manlius, who had been compelled by his father to live in solitude in the country.

Deportatio in insulam, or deportatio simply, was introduced under the emperors in place of the aqua et ignis interdict⁵; the governor of a province (praeses) had not the power of pronouncing the sentence of deportatio; but this power was given to the prefectus urbi by a rescript of the Emperor Severus⁶. The consequence of deportatio was loss of property and citizenship, but not of freedom. Though the deportatus ceased to be a Roman citizen, he had the capacity to buy and sell, and do other acts which might be done according to the jus gentium. Deportatio differed from relegatio, as already shown, and also in being always for an indefinite time. The relegatus went into banishment; the deportatus was conducted to his place of banishment, sometimes in chains.

As the exsilium in the special sense, and the deportatio took away a person's citizenship, it follows that, if he was a father, his children ceased to be in his power; and if he was a son, he ceased to be in his father's power; for the relationship expressed by the terms patria potestas could not exist when either party had ceased to be a Roman citizen. Relegatio of a father or of a son, of course, had not this effect. But the interdict and the deportatio did not dissolve marriage.² When a parent or child, was condemned to the mines or to fight with wild beasts, the relation of the patria potestas was dissolved. This, though not reckoned a species of exsilium, resembled deportatio in its consequences.

It remains to examine the meaning of the term exsilium in the republican period, and to ascend, so far as we can, to its origin. Cicero³ affirms that the deportatio of Gaius, when he was first accused of treason, was in truth a violation of freedom by a lex. In the oration Pro Domō⁵ he makes the same assertion, but in a qualified way; he says that no special lex, that is, no privilege, could be passed against the caput of a Roman citizen unless he was first condemned in a judicium. It was, according to Cicero, a fundamental principle of Roman law,⁴⁵ that no Roman citizen could lose his freedom and his citizenship without his own permission.⁶ Cicero adds, that Roman citizens who went out as Latin colonists could not become Latin unless they went voluntarily and registered their names: those who were condemned of capital crimes did not lose their citizenship till they were admitted as citizens of another state; and this was effected, not by depriving them of their civitates (adempit civitate), but by the interdict or tecti, aqua et ignis. The same thing is stated in the oration Pro Cæcina⁴ with the addition, that a Roman citizen, when he was received into another state, lost his citizenship at Rome, because by the Roman law a man could not become a citizen of two states. This reason, however, would be equally good for showing that a Roman citizen could not become a citizen of another community. In the oration Pro Balba⁶ the proposition is put rather in this form: that a Roman who became a citizen of another state thereby ceased to be a Roman citizen. It must not be forgotten, that in the oration Pro Cæcina, it is one of Cicero's objects to prove that his client had the rights of a Roman citizen; and in the oration Pro Domō, to prove that he himself had not been an exsilus, though he was interdicted (from fire and water) within 400 miles of Rome.¹⁶

as Cicero had been interdicted from fire and water, and he evaded the penalty, to use his own words, by going beyond the limits, he could only escape the consequences, namely, exilium, either by relying on the fact of his not being received as a citizen into another state, or by alleging the illegality of the proceedings against him. But the latter is the ground on which he seems to maintain his case in the Pro Domō: he alleges that he was made the subject of an illegal sentence, and has been freely condemned in a judicium.

In the earlier republican period, a Roman citizen might have a right to go into exile to another state, or a citizen of another state might have a right to go into exile at Rome, by virtue of certain isopolitical relations existing between such state and Rome. (Vid. Memor. civ. 2.) This right was a personal one, with reference to the state to which the person came; with respect to his own state, which he left, he was exsul, and his condition was exilium: with respect to the state which he entered, he was dignus; and at Rome he might attach himself (applicare se) to a quasi-patronus, a relationship which gave rise to questions involving the person of the citizen. But Cicero, by pursuing his suit, and by its termination in qua, to denote a person who was one of a class, like the word libertinus. The prefix in appears to be the correlative of ex in exsul, and the remaining part quid is probably related to col, in incula and colonus.

The sentence of aquæ et ignis, to which Cicero adds, seems to point to the deprivations resulting from the deprivation of the chief necessary of life, and its effect was to incapacitate a person from exercising the rights of a citizen within the limits which the sentence comprised. Supposing it to be true, that no Roman citizen could, in direct terms, be deprived of his civitas, it requires but little knowledge of the history of Roman jurisprudence to perceive that a way would readily be found of doing that which indirectly could not be done directly: and such, in fact, was the aquæ et ignis interdicto. The meaning of the sentence of aquæ et ignis interdicto is clear when we consider the symbolic meaning of the aquæ et ignis. The bride, on the day of her marriage, was received by her husband with aquæ et ignis, the water and the fire, and these, with taking her under his protection and sustentation. Varro5 gives a different explanation of the symbolic meaning of aquæ et ignis in the marriage ceremony: Aquæ et ignis (according to the expression of Festus) sunt duo elementa quo humanam vitam maxime continent. The sentence of interdict was either pronounced in a judicium, or it was the subject of a lex. The punishment was inflicted for various crimes, as his publica, peculias, veneficium, &c. The Lex Julia de vi publica et privata applied, among other cases, to any person qui recuperet, celatra, tenuerit, the interdicted person,4 and there was a clause to this effect in the lex of Clodius, by which Cicero was also convicted. The essence of the interdict, which in the time of the Antonines was accompanied with the loss of citizenship, could hardly have had any other effect in the time of Cicero. It may be true that exilium, that is, the change of solum or ground, was not in direct terms included in the sentence of aquæ et ignis interdicto: the person might stay if he liked, and submit to the penalty of being an outcast, and being incapacitated from doing any legal act. Indeed, it is not easy to conceive that banishment can exist in any state, except such state has distant possessions of its own to which the offender can be sent. Thus banishment, as a penalty, did not exist in the old English law. When isopolitical relations existed between Rome and another state, exilium might be the privilege of an offender. Cicero might then truly say that exilium was not a punishment, but a mode of evading punishment; and this is quite consistent with the interdict being a punishment, and having for its object the exilium.

According to Niebuhr, the interdict was intended to prevent public proceedings against Cicero without having been returning to Rome and resuming his citizenship; and the interdict was taken off when an exsilium was recalled: an opinion in direct contradiction to all the testimony of antiquity. Farther, Niebuhr asserts that they who settled in an unprivileged place (one that was not in an isopolitical connexion with Rome) needed a decree of the people, declaring that their settlement should operate as a legal exilium. And this assertion is supported by a single passage in Livy,6 from which it appears that it was declared by a plebisicium, that C. Fabius, by going into exile (exsilium) to Tarquinii, which was a municipium,6 was legally in exile.

Niebuhr asserts that Cicero had not lost his franchise, and the interdict was a mere punishment, and not a sentence, which is analogous to the processus, and it also shows that the consequence of such an interdict was the loss of caput. And the ground on which he mainly attempted to support his case was, that the lex by which he was interdicted was in fact no lex; but a proceeding altogether irregular. Farther, the interdict did pass against Cicero, but was not taken off as appears that there were persons called cepiones, through the reader too much against adopting implicitly anything that is stated in the orations Pro Cæcino, Pro Balbo, and Pro Domo: and, indeed, anywhere else, when Cicero has a case to support.

BAPHIUM (baphi, bapho), an establishment for dyeing cloth, a dyehouse. An apparatus for weaving cloth, and adapting it to the various purposes that a part of every Greek and Roman household, it was a matter of necessity that the Roman government should have its own institutions for similar uses; and the immense quantity of cloth required, both for the army and for all the officers of the court, made it indispensable that these institutions should be conducted on a large scale, giving rise to manufactures for the dyestuffs not only for the army, but for the whole empire, according to the previous habits of the people employed and the facilities for carrying on their operations. Tarentum, having been celebrated during many centuries for the fineness and beauty of its woollen manufactures, was selected as one of the most suitable places for an imperial baphium.6 Traces of this establishment are still apparent in a vast accumulation near Taranto, called "Monte Testaceo," and consisting of the shells of the Murex, the animal which afforded the purple dye.

A passage in Ælius Lampridius4 shows that these great dyehouses must have existed as early as the second century.

BARBA.

The phrase πάγωμος σοφός, which is applied to letting the beard grow, implies a positive culture. Generally speaking, a thick beard, πάγωμα βαθός or δαίμον, was considered as a mark of manliness. The Greek philosophers were distinguished by their long beards as a sort of badge, and hence the term which Porphyry applies to Socrates, magistros barbatus, was a sort of hereditary mark; as Agamemnon, Ajax, Menelaus, Ulysses. According to Chrysippus, cited by Athenaeus, the Greeks wore the beard till the time of Alexander the Great, and he adds that the first man who was shaven was called after κόρανας, "shaven" (from κόρανας). Plutarch says that the reason for the shaving was that they might not be betrayed by the beard, and that the custom of shaving the beard continued among the Greeks till the time of Justinian, and during that period even the statues of the philosophers were without the beard. The philosophers, however, generally continued the old badge of their profession, and their ostentation in so doing gave rise to the saying that a long beard does not make a philosopher (παρουσίαμα φιλόσοφος). But wisdom stopped with his beard was called ἐκ πάγωμος σοφός. So Aulus Gellius says, "Video barbam et pallium, philosophum nundum video." Horace speaks of "teeding the philosophic beard." The Romans, in early times, wore the beard as usual, we learn from the insculpt offered by the Gaul to Marcus Papirius, and from Ciceron, and, according to Varro and Pliny, the beards of the Romans were shaved till B.C. 300, when P. Ticianus Mena brought over a barber from Sicily; and Pliny adds, that the first Roman who was shaved (rausus) every day was Scipio Africanus. His custom, however, was soon followed, and shaving became a regular thing. The lower orders, then as now, were not always able to do the same, and hence the greater part of the barbarians of the British Isles, there were many who shaved the beard only partially, and trimmed it so as to give it an ornamental form; to them the terms bene barbae and barbatae are applied. When in mourning, all the higher as well as the lower orders let their beards grow.

In the general way in Rome at this time, a long beard (barba promissa) was considered a mark of slovenliness and equalor. The censors Lucius Vettius and P. Licinius compelled Marcus Livius, who had been convicted on a charge of restoration to the city, to shave his beard, and to lay aside his dirty appearance (corti et equalorem degeneris), and then, but not till then, to come into the senate, &c. The first time of shaving was regarded as the beginning of manhood, and the day on which this took place was celebrated as a festival. There was no particular time fixed for this to be done. Usually, however, it was done when the young Roman assumed the toga virilis; and Augustus did it in his 24th year, Caligula in his 20th. The hair cut off on such occasions was consecrated to some god. Thus Nero put his up in a gold box, set with pearls, and dedicated it to Jupiter Capitolinus. So Statius mentions a person who sent his hair as an offering to Asclepius Pergamenus, and requested Statius to write some devotional verses on the occasion. He sent the hair with a box set with precious stones (cum gemmala pyxide) and a mirror.

With the Emperor Hadrian the beard began to revive. Plutarch says that the emperor wore it to hide some scars on his face. The practice afterwards became common, and till the time of Constantine the Great the emperors appear in busts and coins with beards. The Romans let their beards grow in time of mourning; so Augustus, in the time when he had shaved off he made a season of festivity. The Greeks, on the other hand, on such occasions, shaved the beard close. Strabo says that the beards of the inhabitants of the Caspierides were like those of goats. Tacitus says that the Catti let their hair and beard grow, and would not have them cut till they had slain an enemy.

BARBERS. The Greek name for a barber was κουφετής, and the Latin tonsor. The term employed in modern European languages is derived from the low Latin barbatarius, which is found in Petronius. The barber of the ancients was a far more important personage than his modern representative. Men had not often the necessary implements for the various operations of the toilet: combs, razors, perfumes, and tools for clipping, cutting, shaving, &c. Accordingly, the whole process had to be performed at the barber's, and hence the great concourse of people who daily gossiped at the tonstrina, or barber shop. Besides the duties of a barber and hairdresser, strictly so called, the ancient tonsor discharged other offices. He was also a barber, and a hairdresser, and even a physician. He was, in fact, much what the English barber was when he extracted teeth, as well as cut and dressed hair. People who kept the necessary instruments for all the different operations, generally had also slaves expressly for the purpose of performing them. The business of the barber was threefold. First, there was the cutting of hair: hence the barber's question, πός εἰς κεφάλα; For this purpose, he used various knives of different sizes and shapes. He had a sharp razor, a broad razor, and a broad knife. Hence Lucian, in enumerating the apparatus of a barber's shop, mentions πλέθος μαχαιρών (μάχαιρα, μαχαῖρας κατέχονται) are used also, in Latin text; but scissors, ψαλίς, διπλή ψαλίς (in Latin forfex, axia), were used too. Mǎχαιρα was the usual word. (Böttiger, however, says that two knives were merely used, forming a kind of scissors. The
terms it, found in Ethiopia, of the colour and hardness of iron, whence its name, from an Oriental term basalt, signifying "iron." To what Eastern language this word belongs is not known; we may compare with it, however, the Hebrew basal. Pliny speaks of fine works of art in Egyptian basalt, and of these some have found their way to Rome, as the lions at the base of the ascent to the Capitol, and the Sphinx of the Villa Borghese.1 Winckelmann distinguishes two kinds of this stone: the black, which is the more common sort, is the material of the figures just mentioned; the other variety has a greenish hue and must be carefully noted to confirm the inventions of the ancients upon this modern basalt. The former was merely a species of syenite, commonly called basaltoid syenite, black Egyptian basalt, and "basaltique antique." The basalt of the moderns is a hard, dark-coloured rock, of igneous origin.2

BASANISTAI. (Vid. Basan.)

BASANUS. BASANUS is LAPIS (lapis libycus), called also Basanov and Lapis Lydius, the Touchstone. Its Greek and English names both refer to its office of trying metals by the touch. The appellation of "Lydian Stone" was derived from the circumstance of Lydia having been one of its principal localities. It was also obtained in Egypt, and, besides the use just mentioned, was wrought into various curi-

BASANOS (Basawo), the general term among the Athenians for the application of torture. By a decree of Scamandrius, it was ordained that no free Athenian could be put to the torture; and this appears to have been the general practice, notwithstanding the assertion of Cicero to the contrary ([de institutis Atheniensium, Rhetoriam—apud quos liberis civibus conditi sunt]). The only two apparent exceptions to this practice are mentioned by Antiphon9 and Lysias. But, in the case mentioned by Antiphon, Bœch4 has shown that the torture was not applied at Athens, but in a foreign country; and in Lysias, as it is a Platean boy that is spoken of, we have no occasion to conclude that he was an Athenian citizen, since we learn from Demosthenes1 that there were several hundred thousand Athenian citizens. It must, however, be observed, that the decree of Scamandrius does not appear to have interdicted the use of torture as a means of exuc

judges that they had put Antiphon to death by the rack (στρατάςκοντος).  

The evidence of slaves was, however, always taken with torture, and their testimony was not otherwise received. From this circumstance their testimony appears to have been considered of more value than that of freemen. Thus Isaeus says,  

"When slaves and freemen are at hand, you do not make law of the testimony of freemen; but, putting slaves to the torture, they themselves fall into the trap of their own device. Before the truth of what has been done."  

Numerous passages of a similar nature might easily be produced from the orators. Any person might offer his own slave to be examined by torture, or demand that of his adversary, and the offer or demand was equally called προφήκτης εἰς βασανον. If the opponent refused to give up his slave to be thus examined, such a refusal was looked upon as a strong presumption against him. The προφήκτης appears to have been generally made in writing, and to have been delivered to the opponent in the presence of witnesses in the most frequent part of the Agora, and as there were several modes of torture, the particular one to be employed was usually specified. Sometimes, when a person offered his slave for torture, he was not the opponent of the liberty of adopting any mode of torture which the latter pleased. The parties interested either superintended the torture themselves, or chose certain persons for this purpose, hence called βασιλευτα, who took the evidence of the slaves. In some cases, however, we find a public slave attached to the court, who administered the torture, but this appears only to have taken place when the slave was administered in the court, in presence of the judges. This public mode of administering the torture was, however, certainly contrary to the usual practice. The general practice was to read at the trial the deposition of the slaves, which were called βασιλευτα, and to confirm them by the testimony of those who were present at the administration of the torture. 

BASCANIA. (Vid. Scascina.)

BASCANIA, a British basket. This term, which remains with very little variation in the Welsh "basgawd" and the English "basket," was conveyed to Rome together with the articles denoted by it. We find it used by Juvenal14 and by Martial15 in conjunctions which imply that these articles were held in much esteem by the luxurious Roman nobility. The magistrates and their courts excelled so as to obtain for their productions a similar distinction. In what consisted the curiosity and the value of these baskets, we are not informed; but they seem to be classed among vessels capable of holding water.

BASILEIA (Βασιλεία) was the name of a festival celebrated at Lebadeia, in Boeotia, in honour of the Trophonius, who had the surname of Basileias. This festival was also called Trophonia—Τροφώνα; and it was first observed under the latter name as a general festival of the Boeotians after the battle of Leuctra. 

BASILICUS (Βασιλικύ), ANAX (Αναξ), titles originally given to any persons in a public service, and applied in the first instance indiscriminately, without any accurate distinction. In the government of Phæacia, which was a mixed constitution, consisting of one supreme magistrate, twelve poers or councillors, and the assembly of the people, each of the twelve who shared, as well as the one who nominally possessed the supreme power, is designated by the word basileis, which title became afterwards applied to the Roman Emperor; but ἀναξ continued long to have a much wider signification. In the Empire of the Taurinius, the title ἀναξ is applied to Apollo, to Tiresias, to Creon and Oedipus, and to the Chorus. Isocrate1 uses basileis in the sense of king, and ἀναξ as exactly synonymous with prince, calling the king's sons ἄναξες, and his daughters ἄναξας. The title of basileus was applied to magistrates in some republics, who possessed no regal power, but who generally attended to whatever was connected with the religion of the state and public worship. Thus the second archon at Athens had the title of basileus (vid. Archon), and we find magistrates with the same title in the republican states of Delphi, Siphnos, Chalcedon, Cyrene, &c.

After the introduction of the republican form of government into the Greek communities, another term (τρόπος, τυράννος) came into use, in contradistinction to the other two, and was used to designate any citizen who had acquired and retained for life the supreme authority in a state which had previously enjoyed the republican form of government. The term tyrant, therefore, among the Greeks, had a different signification from its usual acceptance in modern language; and when used reproachfully, it is only in a political, and not a moral sense; for, many of the Greek tyrants conferred great benefits upon their country.

BASILICA (sc. edes, aula, porticus—basileas, also regia16), a building which served as a court of law and an exchange, or place of meeting for merchants and men of business. The term is derived, according to Philander, from basileis, a king, in reference to early times, when the chief magistrate administered the laws he made; but it is more immediately adopted from the Greeks of Athens, whose second archon was styled ἄναξ βασιλεις, and the tribunal where he adjudicated σταὶ βασιλεις, the substantive aula or porticus in Latin being omitted for convenience, and the distinctive epithet basileas, τυράννος, and regia being substituted. Among the Latin writers, who speak of the Roman basilica, they sometimes sayo basileia, and sometimes merely σταὶ.

The first edifice of this description was not erected until B.C. 182,17 for it is expressly stated by the historian that there were no basilicas at the time of the fire, which destroyed so many buildings in the Forum, and that the new basilica was constructed by Titus Sempronius, B.C. 171,18 and that it was said to have been between the vicus Tuscus and the Velabrum. 2 Basilica Opima, which was added to the Comitium. 3 Basilica Pauli Emili, or Basilica

ca Aemilia, called also Regina Pauli by Statius. Cicero mentions two basilicas of this name, of which one was built, and the other only restored, by Paulus Aemilius. Both these edifices were in the Forum, and one was celebrated for its open peristyle of Phrygian columns, which Plutarch (Cae.) states was erected by L. Aemilius Paulus during his consulship, at an expense of 1500 talents, sent to him by Caesar from Gaul, as a bribe to gain him over from the aristocratical party. A representation of this is given below. 4. Basilica Pompei, called also regia, near the theatre of Pompey. 5. Basilica Constantini, erected by the Emperor Constantine, supposed to be the ruin now remaining in the Via Sacra, near the Temple of Rome and Venus, and commonly called the Temple of Peace. Of all these magnificent edifices, nothing now remains beyond the ground plan, and the bases and some portion of the columns and superstructure of the last two. The basilica at Pompeii is in better preservation than the exterior walls, ranges of columns, and tribunal of the judges being still tolerably perfect on the ground floor. The Forum, or, where there was more than one, the one which was in the most frequented and central part of the city, was always selected for the site of a basilica; and hence it is that the classic writers not unfrequently use the term basilica, and basilicae synonymously, as in the passage of Claudian—De sedulique singit Regius curulis for a fascibus Ulpia lictor, where the Forum is not meant, but the basilica which was in it, and which was surrounded by the lictors who stood in the Forum.

Vitruvius directs that the most sheltered part of the Forum should be selected for the site of a basilica, in order that the public might suffer as little as possible from exposure to bad weather, while going to, or returning from, their place of business; he might also have added, for their greater convenience whilst engaged within, since many of these edifices, and all of the more ancient ones, were entirely open to the external air, being surrounded and protected solely by the open peristyle of columns, the annexed representation of the Basilica Aemilia, from a medal of Lepidus, with the inscription, clearly shows:

When, however, the Romans became wealthy and refined, and, consequently, more effeminate, a wall was substituted for the external peristyle, and the columns were confined to the interior; or, if used externally, it was only in decorating the propeca, or vestibule of entrance. This was the only change which took place in the form of these buildings from the time of their first institution until they were converted into Christian churches. The ground plan of all of them is rectangular, and their width not more than half, nor less than one third of the length; but if the area on which the edifice was to be raised was not proportionally long, small chambers (chalcides) were set off from one of the ends, which served as oratories for the judges or merchants. This area was divided into three naves, consisting of a centre (media porticus) and two side aisles, separated from the centre one by each a single row of columns: a mode of construction particularly adapted to buildings intended for the reception of a large concourse of people. At one end of the centre aisle was the tribunal of the judge, in form either rectangular or circular, and sometimes cut off from the length of the grand nave (as is seen in the annexed plan of the basilica at Pompeii, which also affords an example of the chambers of the judges or chalcides above mentioned), or otherwise thrown out from the posterior wall of the building, like the tribune of some of the most ancient churches in Rome, and then called the hemicycle: an instance of which is afforded in the Basilica Trajani, of which the plan is given below. It will be observed that this was a most sumptuous edifice, possessing a double tribune, and double row of columns on each side of the centre aisle, dividing the whole into five naves.

The internal tribune was probably the original construction, when the basilica was simply used as a court of justice; but when those spacious halls were erected for the convenience of traders as well as loungers, then the semicircular and external tribune was adopted, in order that the noise and confusion in the basilica might not interrupt the proceedings of the magistrates. In the centre of this tribune was placed the curule chair of the praetor, and seats for judges, who sometimes amount

1. (Vitruv., l. c.—2. (Vitruv., l. c.)—3. (Vitruv., l. c.)
BASILICA.

on the number of 180, and the advocates; and round the sides of the hemicycle, called the wings (cornua), were seats for persons of distinction, as well as the parties engaged in the proceedings. It was in the wing of the tribunal that Tiberian sat to overawe the judgment at the trial of Granius Maccellus. The two side aisles, as has been said, were separated from the central one by a parapet wall or balustrade (parastata), which supported the flooring of an upper portico, similar to the gallery of a modern church. The upper gallery was in like manner decorated with columns, of lower dimensions than those below; and these served to support the roof, and were connected with one another by a parapet wall or balustrade (parastata), which served as a defence against the danger of falling over, and screened the crowd of loiterers above (subbasilicam) from the people of business in the area below. This gallery reached entirely round the inside of the building, and was frequented by women as well as men, the women on one side, and the men on the other, who went to hear and see. The gallery led to the upper portico which lay on the outside, as is seen in the plan of the Basilica of Pompeii. It is similarly situated in the Basilica of Constantine. The whole area of these magnificent structures was covered with three separate ceilings, of the kind called testudinatum, like a tortoise-shell; in technical language now denominated coenobium, an expression used to distinguish a ceiling which has the general appearance of a vault, the central part of which is, however, flat, while the margins incline by a cylindrical shell from each of the four sides of the central square to the side walls; in which form the ancient imagined a resemblance to the shell of a tortoise.

From the description which has been given, it will be evident how much these edifices were adapted, in their general form and construction, to the uses of a Christian church; to which purpose some of them were, in fact, converted, as may be inferred from a passage in Ausonius, addressed to the Emperor Gratianus: Basilica olim negotiis plena, nunc votis pro tua salute suscepit. Hence the later writers of the Empire apply the term basilica to all churches, whether Christian or heathen; and such were the earliest edifices dedicated to Christian worship, which, with their original designation, continue to this day, being still called at Rome basiliches.

A Christian basilica consisted of four principal parts: 1. Πρόναος, the vestibule of entrance. 2. Ναός, nave, and sometimes gremium, the nave or centre aisle, which was divided from the two side ones by a row of columns on each of its sides. Here the people assembled for the purposes of worship. 3. Ἀψίδων (from ἀπάθαινον, to ascend), χώρα (the choir), and συγγεύσια, a part of the lower extremity of the nave raised above the general level of the floor by a flight of steps. 4. Ἰεράπετρον, λεπόν βύσμα, sanctuary, which answered to the tribunal of the ancient basilica. In the centre of this sanctuary was placed the high altar, covered with a tabernacle, or canopy, such as still remains in the Basilica of St. John of Lateran at Rome, at which the priest officiated with his face turned towards the people. Around this altar, and in the wings of the sanctuary, were seats for the assistant clergy, with an elevated chair for the bishop at the bottom of the circle in each of the sides. 

BASTERNIA, a kind of litter (lectica) in which women were carried in the time of the Roman emperors.

BASILICA (Basilikai Διατάξεις). About A.D. 876, the Greek emperor Basilus, the Macedonian, commenced this work, which was completed by his son Leo, the philosopher. Before the reign of Basilius, there had been several Greek translations of the Pentateuch, the Psalms, and the Institutes; but there was none of the Old Testament, or of the New, authorized Greek version of them. The numerous Constitutions of Justinian's successors, and the contradictory interpretations of the jurists, were a farther reason for publishing a revised Greek text under the imperial authority. This great work was called Basilia, or Basilicae Διατάξεις; it was revised by the order of Constantine Porphyrogynus. The Basilica comprised the Institutes, Pentateuch, Code, the Novellae, and the Imperial Constitutions subsequent to the time of Justinian, in a Greek translation, in sixty books, which are subdivided into titles. The publication of the authorized body of law in the Greek language led to the gradual disuse of the original compilation of Justinian in the East.

The arrangement of the matter in the Basilica is as follows: All the matter relating to a given subject is selected from the Corpus Juris; the extracts from the Pentateuch are placed first under each title, then the constitutions of the Code, and next in order the provisions contained in the Institutes and the Novellae, which confirm or complete the provisions of the Pentateuch. The Basilica does not contain all that the Roman jurists have written on the subject; it contains the chief fragments of the opinions of ancient jurists, and of imperial Constitutions, which are not in the Corpus Juris.

The Basilica was published, with a Latin version, by Fabrot, Paris, 1647, seven vols. fol. Fabrot published only thirty-six books complete, and six others incomplete: the other books were made up from an extract from the Basilica and the codices. Four of the deficient books were afterward found in MS., and published by Gerhard Meerman, with a translation by M. Otto Reitz, in the fifth volume of his Thesaurus Juris Civilis et Canonici; and they were also published separately in London in 1785, folio, as a supplement to Fabrot's edition. A new critical edition, by the brothers Heimbach, was commenced in 1853, and is now in progress.

The Basilica is divided into books, each book subdivided into paragraphs; and each of these paragraphs is sub-divided into sections. The paragraphs under which the several decisions are placed are numbered, which is useful in reading ancient authors.

There; (Salmis., (i.v., bath, 143 (ad Varro,* (CSc, and (Olymp., 18x53 (Varro, 18x41 yond age, cent
private could Aulus nesius'.) baths ca, stead

in the written in the earlier and better authors they are used with a nice discrimination. Balneum or balneum, which is derived from the Greek βαλνεῠν, signifies, in its primary sense, a bath or bathing-vessel, such as most persons of any consequence among the Romans possessed in their own houses; in which sense it is used by Cicero in balnearia, and from that it came to signify the chamber which contained the bath (labrum sī in balineo non est), which is also the proper translation of the word balnearium. The diminutive balneolum is adopted by Seneca4 to designate the bath-room of Scipio, in the villa at Lertum; and is expressly used to characterize the sumptuous apparatus of the Roman nobility, as, compared with the luxury of his own times. But when the baths of private individuals became more sumptuous, and comprised many rooms instead of the one small chamber described by Seneca, the plural balnea or balines was adopted, which still, in correct language, had reference only to the baths of private people. Thus Cicero terms the baths at the villa of his brother Quintus'* balnearum. Balnea and balines, which, according to Varro,* have no singular number, were the public baths. (Balnea is, however, used in the singular, to designate a private bath, in an inscription quoted by Renessius.) Thus Cicero4 speaks of balneas Senias, balneas publicas, and in vestibulo balnearum,1 and Author. The accuracy of diction is neglected by many of the subsequent writers, and particularly by the poets, among whom balnea is not uncommonly used in the plural number to signify the public baths, since the word balnea could not be introduced in an hexameter verse. Pliny also, in the same sentence, makes use of the neuter form, balneas, for 'bathing-vessels for private bath.'13 Thesma (from θέρμη, warmth) mean, properly, warm springs or baths of warm water, but came afterward to be applied to the structures in which the baths were placed, and which were both hot and cold. There was, however, a material distinction between the balnea and theemas, inasmuch as the latter was the term used under the Republik, and referred to the public establishments of that age, which contained no appliances for luxury beyond the mere convenience of hot and cold baths, whereas the latter name was given to those magnificent edifices which grew up under the Empire, and which comprised within their range of buildings all the appendances belonging to the Greek gymnasium, and as a regular establishment appropriated for bathing; which distinction is noticed by Juvenc.

14 "Dom petit aut thermas, aut Phabi balnea."

Subsequent writers, however, use these terms without distinction. Thus the baths erected by Claudianus Etruscus, the freedman of the Emperor Claudian, are styled by Status5 balines, and by Martial6 Brutus thermalis. In an epitram, also, by Mai,7 balnearium hotum, the verbs are applied to the whole building, but to two different chambers in the same edifice.

Bathing was a practice familiar to the Greeks of both sexes from the earliest times, both in fresh water and salt, and in the natural warm springs as well as vessels artificially heated. Thus Nausicus, daughter of Akinous, king of Phaeacia, goes out with her maid, dons her clothes, and, after the task is done, she bathes herself in the river. Ulysses, who is conducted to the same spot, strips and takes a bath, while she and her servants stand aside.8 Europa also bathes in the river Anararus, and Helen and her companions in the Euratas.9 Warm springs were also resorted to for the purpose of bathing. The Πρακτελεια λουτρα shown by Vul- can or Minerva to Hercules are celebrated by the poets. Findar speaks of the hot bath of the nymphs —θερμα Νηωνοι λουτρα,8 and Homo9 celebrates one of the streams of the Scamander for its warm temperature. The artificial warm bath was taken in a vessel called ἀναδύως by Hom.,10 because it diminished the uncleanness of the skin, and ἐξαλάτη by Heliodorus, because it was used in the washing of the bath administered to Ulysses in the palace of Circe, that this vessel did not contain water itself, but was only used for the bather to sit in while the warm water was poured over him, which was heated in a large caldron or tripod, under which the fire was placed, and, when sufficiently warmed, was taken out of the vessels, and administered to the head and shoulders of the person who sat in the ἀναδύως.11 Where cleanliness merely was the object sought, cold bathing was adopted, which was considered as most bracing to the nerves;12 but, after violent bodily fatigue or exertion, warm water was made use of, in order to refresh the body and relax the over-tension of the muscles.13 Thus the ἀναδύως is proposed by Euphorion to Pericles, and Athenaeus makes the palace of Menelaus,14 and is resorted to by Ulysses and Diomed, when they return with the captured horses of Rhesus,15

'Εσ' ἀπαντιδε στη θεά τιμίας λούσανον.

From which passage we also learn that the vessel was of polished marble, like the basins (labra) which have been discovered in the Roman baths. Aromachnea, in the 22d book of the Iliad, prepares a hot bath for Hector against his return from battle;16 and Nestor, in the 14th, orders Hecamecne to make ready the warm bath (θερμα λουτρα;) and Pope tells us that the Phoenicians are represented as being addicted to the vanities of dress, warm baths, and sexual indulgence.17

Επιαρα τ' εςλατη, λουτρα τε θερμα, καί ειναι.

It was also customary for the Greeks to take two baths in succession, first cold and afterward warm; thus, in the passage of the Iliad just referred to, Ulysses and Diomed both bathe in the sea, and afterward refresh themselves with a warm bath (ἀναδύως) upon returning to their tents. The custom of plunging into cold water after the warm bath mentioned by Athenaeus, and which we wrote in the 2nd century, does not refer to the Greeks of this early age, but to those who lived after the subjugation of their country by the Romans, from whom the habit was most probably borrowed.

After bathing, both sexes anointed themselves.
BATHS.

the women as well as men, in order that the skin might not be left harsh and rough, especially after warm water. Oil (ἐλαίον) is the only ointment mentioned by Homer as used for this purpose, and Pilny 2 says that the Greeks had no better ointment at the time of the Trojan war than oil perfumed with herbs. In all the passages quoted above, the bathers anointed themselves with clear pure oil (κρίνειν ἔλαιον); but in the 23d book of the Iliad, 3 Venus anoints the body of Hector with oil scented with roses (κρίνον ἔλαιον); and, in the 14th book of the same poem, Juno anoints herself with oil "ambo- 

sia, sweet, and odoriferous" (ἀμβόσιον, ἱδαίον, ἑθο-

μοῖον); and elsewhere the oil is termed ἔλαιον, sweet-smelling, upon which epithet the commenta-

tories are acquainted with the use of more precious ointments, but calls them oil with an epithet to distinguish them from common oil. The ancient heroes, however, never used precious unguents (μύρα).

Among the Greeks as well as Romans, bathing was always a preliminary to the hour of meals. In-

deed, the process of eating seems to have followed as a matter of course upon that of bathing: even Nausicaa and her companions, in the passage referred to above, immediately after they had bathed and anointed themselves, sat down to eat by the river's side while waiting for the clothes to dry.

The Lacedemonians, who considered warm wa-

ter as enervating and effeminate, used two kinds of baths, namely, the cold daily bath in the Eurotas, which was possessed by each of them independently, in a chamber heated with warm air by means of a stove; and from them the chamber used by the Romans for a similar purpose was termed Lacon-

icum. 10

Thus it seems clear that the Greeks were familiar with the use of the bath, both as a source of health and pleasure, long before it came into gener-

a practice among the Romans, although they had "public establishments expressly devoted to the purpose of the same magnificence as the Romans had; in which sense the words of Artemidorus 11 may be understood, when he says, "They were unacquainted with the use of baths" (βαλνας οὐκ ἱδαίον); for it appears that the Athenians, at least, had public baths (λαυρώνες) attached to the gym-

nasia, which were used by the common people than by the great and wealthy, who had private baths in their own houses. 12

The Romans, as well as Greeks, resorted to the rivers, in the earlier periods of their history, from motives of health or cleanliness, and not of luxury; for, as the use of linen was little known in those ages, 13 health as well as comfort rendered frequent ablutions necessary. This we learn from Seneca 14 that the ancient Romans washed their legs and arms daily, and bathed their whole body once a week.

It is not recorded at what precise period the use of the warm bath was first introduced among the Romans; but we learn from Seneca 14 that Scipio had a warm bath in his villa at Liternum, which, however, was of the simplest kind, consisting of a simple chamber, just sufficient for the necessary purposes, and without any pretension to luxury. It was "small and dark," he says, "after the manner of the ancients." This was a bath of warm water; but the practice of heating an apartment with warm air by flues placed immediately under it, as to produce a vapour bath, is stated by Valerius Maximus 2 and by Pliny 3 to have been invented by Sergius Orata, who lived in the age of Crassus, before the Marsei war. The expression used by Valerius Maximus is balnea penalis, and by Pliny balnea penitentialia, which is differently explained by different commentators: but a single glance at the inscriptions inserted below will be sufficient in the following of whether the chambers was suspended over the hollow cells of the hypocaust, called by Vitruvius suspensura cal-
darium, 2 so as to leave no doubt as to the precise meaning of the invention, which is more fully ex-

emplified in the following passage of Ausonius:"Quod (memoram) qua paulo substructa crepitantium

balnea, ferrenti cum Mulicius haustus opero, Volvili anhelatas tectoria per cava flaves,

Inclusum glomerans asti expirante vaporem." 4

Thus by the time of Cicero, the use of baths, both public and private, of warm water and hot air, had obtained very generally, and with a considerable degree of luxury, if not of splendour, as may be collected from a letter to his brother, 5 in which he informs him that he had given directions for the setting up of the vapour bath (αὐραίον) in the opposite angle of the undressing-room (αποδύτεριον), on account of the flue being placed in an injudicious situation; and we learn from the same author that there were baths at Rome in his time—balnea Senesis 4—which were open to the public upon payment of a small fee.

In the earlier ages of Roman history, a much greater delicacy was observed with respect to pro-
miscuous bathing, even among the men, than was usual among the Greeks: for, according to Vale-
ius Maximus, 6 it was deemed indecent for a father to bathe in company with his own son after he had attained the age of puberty, or a son in-law with his father-in-law: the same respectful reserve being shewn to blood and affinity as was paid to the temples of the gods, towards whom it was considered as an act of religion even to appear naked in any of the places consecrated to their worship. 9 But virtue passed away as wealth increased; and, when the thermes came into use, not only did the men bathe together in numbers, but even men and women stripped and bathed promiscuously in the same bath. It is true, however, that the public establishments often contained separate baths for both sexes; and it can be shown that such baths had been also the case at the baths of Pompelii. Aulus Gel-

lius 11 relates a story of a consul's wife who took a whim to bathe at Teneum (Teano), a small provin-
cial town of Campania, in the men's baths (balnea virilis); probably because, in a small town, the female department, like that at Pompelii, was more confined and less convenient than that assigned to the men. The prince was ordered to go to the quaster, M. Marius, to turn the men out. But whether the men and women were allowed to use each other's chambers indiscriminately, or that some of the public establishments had only one common set of baths for both, the custom prevailed under the Empire of men and women bathing indis- criminatingly together. 12 This custom was forbidden by the Emperor Flavius Vespasianus 13 and by Emperor Tiberius. 14

But Alexander Severus prohibited any bath common to both sexes (balnea mixta), from being opened in Rome. 14

---

144

When the public baths (balneae) were first instituted, they were duly for the lower orders, who alone in the public baths; the people of wealth, as well as those who formed the equestrian and senatorial orders, using private baths in their own houses. But this monopoly was not long enjoyed; for, as early as the time of Julius Caesar, we find no less a personage than the mother of Augustus making use of the public establishments, which were probably, at that time, separate from the age of Cicero. The baths were opened before a day (ante auroram), and were shut before sunset (ante vesperum); and Juvenal includes in his catalogue of female immoralities, that of taking the bath at night (balnea nocte subit), which may, however, refer to private baths.

The price of a bath was a quindecim, the smallest gold piece, which was paid to the keeper of the bath (balneator); and hence it is termed by Cicero, in the oration just cited, quadrantria permutatio, and by Seneca, res quadrantraria. Children below a certain age were admitted free.

"Neque pueri creditur, nisi quidiam arce laevatur." Strangers also, and foreigners, were admitted to some of the baths, if not to all without payment, as we learn from an inscription found at Rome, and quoted by Pitschius.

\[1\]

\[\text{OCTAV. L. P. CAM.}^{1} \text{ RUFO. THIB. MILL.} \]

\[\text{QUI LAVATIONEM GRATUAM MUNICIPIUM, INCOLIS HOSPITIBUS ET ADVENTORIIS.}^{1}\]

The baths were closed when any misfortune happened to the Republic, and Suetonius says that the Emperor Caligula, who made it a capital offence to indulge in the luxury of bathing upon any religious holyday. They were originally placed under the superintendence of the aediles, whose business it was to keep them also in repair, and to see that they were kept clean and of a proper temperature.

In the provinces, the same duty seems to have devolved upon the questors, as may be inferred from the passage already quoted from Aulus Gellius.

The time usually assigned by the Romans for taking the bath was the eighth hour, or shortly after.

"Octavam potissim servare; lavabimus ina.
Seis, quam siin Stephani balnea juncta miri.

Before that time none but invalids were allowed to bathe in public. Vitruvius reckons the best hours for bathing to be from midnight until about sunrise. Pliny took his bath at the ninth hour in summer, and at the eighth in winter; and Martia speaks of taking a bath, when fatigued and weary, at the tenth hour, and even later.

When all was prepared, notice was given by the sound of a bell—as the narum. One of these bells, with the inscription \text{FIRMI BALNEATORIS}, was found in the thermal Dionysians, in the year 1548, and came into the possession of the learned Fulvius Ursinus.

While the bath was used for health merely or cleanliness, the one was considered sufficient at a time, and that only when requisite. But the luxuries of the Empire knew no such bounds, and the daily bath was sometimes repeated as many as seven and eight times in succession—the number which the Emperor Commodus indulged himself with. Gordian bathed seven times a day in summer, and twice in winter; the Emperor Gallienus six or seven times in summer, and twice or thrice in winter. Commodus also took his meals in the bath; a custom which was not confined to a dissolute emperor alone, for Martial attacks a certain \text{Aemilius} for the same practice, which passage, however, is differently interpreted by some commentators.

It was the usual and constant habit of the Romans to take the bath after exercise, and previously to their principal meal (comen); but the debauchees of the Empire bathed also after eating, as well as before, in order to promote digestion, so as to acquire a new appetite for fresh delicacies. Nero is related to have indulged in this practice, which is also alluded to by Martial.

Upon quitting the bath, it was usual for the Romans, as well as Greeks, to be anointed with oil; to which custom both Pompey and Brutus are represented by Plutarch as adhering. But a particular habit of body, or tendency to certain complaints, sometimes required this order to be reversed; for which reason, when those who suffered from certain disorders, was accustomed to anoint himself before bathing, and a similar practice was adopted by Alexander Severus. The most usual practice, however, seems to have been to take some gentle exercise (exercitio) in the first instance, and then, after bathing, to be anointed either in the sun, or in the temple or thermal chamber, and finally to take their food.

The Romans did not content themselves with a single bath of hot or cold water, but they went through a course of baths in succession, in which the agency of air as well as water was applied. It is difficult to ascertain the precise order in which the course was usually taken, if, indeed, there was any general or at least a habitual order of the variety of baths, the composition of which varies, and the various parts of the body, were successively anointed with different waters, introduced to the bath at first without water, and poured over the head, or by pouring cold water over the head, or by plunging at once into the piscina, or into a river, as the Russians still do, and as the Romans sometimes did, as we learn from Ausonius.

"Vidi ego defessos multo sudare lavacri Fasciolae lacos, et frigora piscinarum, Ut vivia frumentorum aqua; max anime refertos Pluvium gelidum, flumen populissiae naus.

\[\text{Musa, the physician of Augustus, is said to have}^{1}\]

introduced this practice, which became quite the fashion, in consequence of the benefit which the emperor derived from it, though Dion accuses him of having artfully caused the death of Marcellus by an improper application of the same treatment. In other cases it was considered conducive to health to pour warm water over the head before the vapour bath, and cold water immediately after it, and other times a success of warm, tepid, and cold water was resorted to.

The two physicians, Galen and Celsus, differ in some respects as to the order in which the baths should be taken; the former recommending first the hot air of the Laconicum (ἀείθριον, θερμού) next the bath of warm water (θυμάμαρα καὶ χυτάριον), afterward the cold, and, finally, to be well rubbed, while the latter recommends the patients first to sweat for a short time in the tepid chamber (tēpiadairiōn) without undressing; then to proceed into the thermal chamber (calidarium), and, after having gone through a regular course of perspiration there, not to descend into the warm bath (soloium), but to pour a quantity of warm water over the head, then tepid, and finally cold; afterward to be scraped with the strigil (perstricati), and finally rubbed dry and anointed. Such, in all probability, was the usual habit of the Romans when the bath was resorted to as a daily source of pleasure, and not for any particular medical treatment; the more so, as it resembles, in many respects, the system of bathing still in practice among the Orientals, who, as Sir W. Gell remarks, "succeeded by conquest to the luxuries of the enervated Greeks and Romans." 18

In the passage quoted above from Galen, it is plain that the word λοτσρν is used for a warm bath, in which sense it also occurs in the same author. Vitruvius, on the contrary, says, that the Greeks used the same word to signify a cold bath (frigida lavatio, quae Graeci lotsovo vocant). The contradiction between the two authors is here pointed out, for the purpose of showing the impossibility, as well as improvidence, of attempting to fix precise meaning to each of the different terms made use of by the ancient writers in reference to their bathing establishments.

Having thus detailed from classical authorities the general habits of the Romans in connexion with their system of bathing, it now remains to examine and explain the internal arrangements of the structures which contained their baths, which will serve as a practical commentary upon all that has been said. Indeed, there are more ample and better materials for acquiring a thorough insight into Roman manners in this one particular, than for any other of the usages connected with their domestic habits. Lucian, in the treatise which is inscribed Ἱππίας, has given a minute and interesting description of a set of baths erected by an architect of that name, which it is to be regretted is much too long for insertion in this place, but which is well worthy perusal; and an excavation made at Pompeii between the years 1824, 25, laid open a complete set of public baths (balneum), with many of the chambers, even to the ceilings, in good preservation, and constructed in all their important parts upon rules very similar to those laid down by Vitruvius.

In order to render the subjoined remarks more easily intelligible, the preceding woodcut is inserted, which is taken from a fresco painting upon the walls of the thermae of Titus at Rome.

The woodcut on the following page represents the ground-plan of the baths of Pompeii, which are nearly surrounded on three sides by houses and shops, thus forming what the Romans termed an insula.

The whole building, which comprises a double set of baths, has six different entrances from the street, one of which, A, gives admission to the smaller set only, which were appropriated to the women, and five others to the male department; of which two, B and C, communicate directly with the furnaces, and the other three, D, E, F, with the bathing apartments, of which F, the nearest to the Forum, was the principal one; the other two, D and E, being on opposite sides of the building, served for the convenience of those who lived on the north and east sides of the city. To have a variety of entrances (αὐτοίς συλλαμβάνεται) is one of the qualities enumerated by Lucian necessary to a well-constructed set of baths. Passing through the principal entrance F, which is removed from the street by a narrow footway surrounding the insula (the outer curb of which is marked upon the plan by the thin line drawn round it), and after descending three steps, the bather finds upon his left hand a small chamber 11, which contained a convenience (latrina2), and proceeds into a covered portico (2), which ran round three sides of an open court (atrium (3), and these together formed the vestibule of the baths—vestibulum balnearum, in which the servants belonging to the establishment, as well as some of the slaves and attendants of the great and wealthy whose services were not required in the interior, waited. There are seats for their accommodation placed underneath the portico (a, b) This compartment answers exactly to the first, which is described by Lucian. 4

1. (Plin., H. N., xxv., 28.)—2. (Latrina was also used, previously by the time of Varro, for the bathing-room, quae latrinae.—Vatko De Lign, lat., ix., 65, ed. Müller.— contain Luci, ap. Non c. 3 n. 124.)—3. (Cic., Pro. Colum., 28.—1. (c. 3.)
BATHS

the keeper of the baths (balneator), who exacted the quadrans paid by each visitor, was also stationed; and, accordingly, it was found for the box for the porico might have been appropriated to him; or, if not, it might have been an aedes or exedra, for the convenience of the better classes while awaiting the return of their acquaintances from the interior, in which case it will correspond with the chambers mentioned by Lucian,1 adjoining to the servants' waiting-place (by ὀπτωμας δε των χων μεταφρασαν ουκ ενεπηκοινωνον). In this court likewise, as being the most public place, advertisements for the theatre, or other announcements of general interest, were posted up, one of which, announcing a gladiatorial show, still remains. (5) Is the corridor which conducts from the entrance E into the same vestibule. (6) A small cell of similar use as the corresponding one in the opposite corridor (1). (7) A passage of communication which leads into the chamber (8), the frigidarium, which also served as an apodyterium or spoliateum, a room for undressing; and which is also accessible from the street by the door D, through the corridor (9), in which a small niche is observable, which probably served for the station of another balneator, who collected the money from those entering from the north street. Here, then, is the centre in which all the persons must have met before entering into the interior of the baths; and its locality, as well as other characteristic features in its fittings up, leave no room to doubt that it served as an undressing-room to the balnea Pompeiana. It does not appear that any general rule of construction was followed by the architects of antiquity with regard to the locality and temperature best adapted for an apodyterium. The word is not mentioned by Vitruvius, nor expressly by Lucian; but he says enough for us to infer that it belonged to the frigidarium in the baths of Hippias.8 After quitting the last apartment, there is a sufficient number of chambers for the bathers to undress, in the centre of which is an aedes, containing three baths of cold water.9 Pliny 

1. (Cic., Pro Coel., 35.).—2. (Carus., xxxii., 1.)—3. (Il., xxxvii.).—4. (Vitruv., v., 16.)

147
BATHS.

en in Sir W. Gell's *Pompeii*. There are no less than six doors to this chamber; one led to the entrance E, another to the entrance D, a third to the small room (11), a fourth to the furnaces, a fifth to the tepid apartment, and the sixth opened upon the cold bath (10), named indifferently by the ancient authors, natatio, natatorium, piscina, baptismarium, puteus, λυστρον. The word *baptisterium* is not a bath sufficiently large to immerse the whole body, but a vessel or *labora*, containing cold water for pouring over the head. The bath, which is coated with white marble, is 15 feet 10 inches in diameter, and about three feet deep, and has two marble steps to facilitate the descent into it, and a seat surrounding it at the depth of 10 inches from the bottom, for the purpose of enabling the bathers to sit down and wash themselves. The ample size of this basin explains to us what Cicero meant when he wrote, "*Laticium piscinam voluisset, ubi jactata brachia non offenduerent.*" It is probable that many persons contented themselves with the cold bath only, instead of going through the severe course of perspiration in the hot apartments; and as the *frigidarium*, alone could have had no effect in baths like these, where it merely served as an *apodyterium*, the *natatio* must be referred to when it is said that at one period cold baths were in such request that scarcely any others were used. There is a platform or ambulatory (*schola*) round the bath, also of marble, and four niches of the same material disposed at regular intervals round the walls, with pedestals, for statues probably, placed in them; according to Sir W. Gell, with seats, which he interprets *schola*, for the accommodation of persons waiting an opportunity to bathe; but a passage of Vitruvius, hereafter quoted, seems to contradict this use of the term: and seats were placed in the *frigidarium* adjoining, for the express purpose of accommodating those who were obliged to wait for their turn. The ceiling is vaulted, and the chamber lighted by a window in the centre. The annexed woodcut represents a *frigidarium*, with its cold bath at one extremity, supposed to have formed a part of the Formian villa of Cicero, to whose age the style of construction, and the use of the simple Doric order, undoubtedly belong. The bath itself, into which the water still continues to flow from a neighbouring spring, is placed under the alcove, and the two doors on each side opened into small chambers, which probably served as *apodyteria*. It is still to be seen in the gardens of the Villa Caposelli, at Mola di Gaeta, the site of the ancient Formiae.

1. (Plin., Ep., v. 6.)—2. (Compare also Plin., Ep. xvii, 3.)

2. (Gell's *Pompeii*, l. c.)—4. (Vitr., v. 10.)—5. (l. c.).

In the cold bath of Pompeii the water ran into the basin through a spout of bronze, and was carried off again through a conduit on the opposite side. It was also furnished with a waste-pipe under the margin to prevent it from running over. No. 11 is a small chamber on the side opposite to the *frigidarium*, which might have served for shaving (καταρασμα), or for keeping unguefants or stigiles; and from the centre of the side of the *frigidarium*, the bather, who intended to go through the process of warm bathing and sudation, entered into (12) the tepidarium.

This chamber did not contain water either at Pompeii or at the baths of Hippias, but was merely heated with warm air of an agreeable temperature, in order to prepare the body for the great heat of the vapour and warm baths; and, upon returning, to obviate the danger of a too sudden transition to the open air. In this respect it resembles exactly the tepid chamber described by Lucian, which he says was of a moderate and not oppressive heat, adjoining to which he places a room for anointing (*ολιγος δελφισμα προσωπων παρακριμενος*).

In the baths at Pompeii this chamber served likewise as an *apodyterium* for those who took the warm bath; for which purpose the fittings up are evidently adapted, the walls being divided into a number of separate compartments or recesses for receiving the garments when taken off, by a series of figures of the kind called *Atlantes* or *Telamones*, which project from the walls, and support a rich cornice above them. One of these divisions, with the *Telamones*, is represented in the article *Atlantes*. Two bronze benches were also found in the room, which was heated as well by its contiguous to the hypocaust of the adjoining chamber, as by a brazier of bronze (*foculus*), in which the charcoal ashes were still remaining when the excavation was made. A representation of it is given in the annexed woodcut. Its whole length was seven feet, and its breadth two feet six inches.

In addition to this service, there can be little doubt that this apartment was also used as a depository for unguefants and a room for anointing (*ultramarum, uncatrum, elaothamum*), the proper place for which is represented by Lucian as adjoining to the tepidarium, and by Pliny as adjoining to the hypocaust; and for which purpose some of the niches between the *Telamones* seem to be peculiarly adapted. In the larger establishments, a separate chamber was allotted to these purposes, as may be seen by referring to the annexed plan from the *Tritoma* of Titus; but, as there is no other spot within the circuit of the Pompeian baths which could be applied in the same manner, we may safely conclude that the inhabitants of this city were anointed in the tepidarium, which service was performed by slaves called *unctores* and *alitato*. (Vid. *Aliptes,*). For this purpose the common people used oil simply of some quality, and scented; but the more wealthy classes indulged in the greatest extravagance with regard to their perfumes and unguefants. These they either procured from the *elaothamum* of the baths, or brought with them in small glass bottles (*amphullae olearum*), hundreds of which have been discovered in different excavations made in various parts of
ITALY. (Vid. Ampulla.) The fifth book of Atticneus contains an ample treatise upon the numerous kinds of ointments used by the Romans; which subject is also fully treated by Pliny.1

Caligula is mentioned by Suetonius2 as having invented a new luxury in the use of the bath, by perfuming the water, whether hot or cold, by an infusion of precious odours. The length of the foot,3 by annotating the walls with valuable unguents; a practice, he adds, which was adopted by one of the slaves of Nero, that the luxury should not be confined to royalty (ne principale videatur hoc bonum).

From this apartment, a door, which closed by its own weight, to prevent the admission of cold air, open by allowing to pass the light of the adjacent room, led to the Laconicum or Laconiana, which is the form of a room with four windows, and a floor of the same kind as that of the cella.37

The object in leaving so much space between the warm bath and the Laconicum was to give room for the gymnastic exercises of the persons within the chamber, who were accustomed to promote a full flow of perspiration by rapid movements of the arms and legs; or by lifting weights; which practice is alluded to by Juvenal.7

"Magnus gaudet sudare tumulus,
Quum laxata gravi eccidenter brachia massa."4

In larger establishments, the conveniences contained in this apartment occupied two separate cells, one of which was appropriated to the warm bath, which apartment was then termed calidarium, cella calidaria, or balneum, and the other which comprised the Laconicum and sudatory—Laconicum sudatorius,4 which part alone was then designated under the name of concamerata sudatio. This distribution is represented in the painting on the walls of the Thermes of Titus; in which there is also another peculiarity to be observed, viz., the passage of communication (intercapedo) between the two chambers, the flooring of which is suspended over the hypocaust. Lucian informs us of the use for which this compartment was intended, where he mentions as one of the characteristic conveniences in the baths of Hippas, that the bathers need not retire thence while the water was warm, by which they had entered, but might return from the thermam chamber by a shorter circuit through a room of gentle temperature (δυσθέσιον ἐξὸν ἤκτρησαν), which communicated immediately with the frigidarium.

The cold water-bath, which is termed calda latatio by Vitruvius,4 balineum by Cicero,1 piscina or calda piscina by Pliny1 and Suetonius,1 as well as labrum2 and solium by Cicero,4 appears to have been a capacious marble vessel, sometimes standing upon the floor, like that in the picture from the Thermes of Titus; and sometimes either partly elevated above the floor, as it was at Pompeii, or entirely sunk into it, as directed by Vitruvius. The term labrum is also generally used of a bath containing warm water, and piscina of one which contains cold; but the real distinction seems to be that the latter was larger than the former, as in the words of Cicero already quoted, "latiore piscinam solutis..." Pliny4 uses the term piscina for a pona or tank in the open air (which was probably the accurate and genuine sense of the word); which, from being exposed to the heat of the sun, possessed a higher temperature than the cold bath, which last he distinguishes in the same sentence by the word puteus, a well, which probably refers to that represented in the drawing from the baths at Mola.4

Maeenias is said, by Dion,2 to have been the first person who made use of a piscina of warm water, called by Dion καλυμμαθής.4—The words of Vitruvius,4 in speaking of the warm-water bath, are as follows: "The bath (labrum) should be placed under the window, in such a position that the persons who stand around may not cast their shadows upon it. The platform which surrounds the bath (schola labrorum) must be sufficiently spacious to allow the surrounding observers, who are waiting for their turn, to stand there without crowding each other. The width of the passage or channel (alveus), which lies between the parapet (pluteus) and the wall, should not be less than six feet, so that the space occupied by the seat and its step below (pulsum et gradus inferior) may take off just two feet from the whole width." The subjoined plans, given by Marini, will explain his meaning.

A. labrum; B. bath; C. solium; D. alveus, passage between the pluteus and wall; F. pulsum, or seat; and E. the lower step (gradus inferior), which together take up two feet.

The warm bath at Pompeii is a square basin of marble, and is ascended from the outside by two steps raised from the floor, which answered to the parapet or pluteus of Vitruvius. Around ran a narrow platform (schola); but which, in consequence of the limited extent of the building, would not admit of a seat (pulsum) all round it. On the interior, another step, dividing equally the whole length of the cistern, allowed the bathers to sit down and wash themselves. The annexed section will render this easily intelligible.

1. (Epp., vi., 6.)—2. ("Si natura laribus aut tepidis, velis, in area piscina est, in pumeo puteus, ex quo possint manus adstringi ad reminiscentia terornia")—3. (lib. iv.)—4. (τους τι πολλαπλασιης θεραματος ὑπό της πόλεως κατακρίνει.)—5. (v., 10.)—6. (v. in Pleon., 27.)

149
to express a vessel for containing liquids. But the explanation given above is much more satisfactory, and is also supported by a number of passages in which it is used. It is adopted by Fulv. Ursinus, who represents the solium, in a drawing copied from Mercureius, as a portable bench or seat, placed sometimes within and sometimes by the side of the bath. Augustus is represented as making use of a wooden solium (quod ipse Hispanico verbo durelum vocavit); in which passage it is evident that a seat was meant, upon which he sat to have warm water poured over him. In the women's baths of the opulent and luxurious capital, the solium were sometimes made of silver.

We now turn to the opposite extremity of the chamber which contains the Laconicum or vapour bath, so called because it was the custom of the Laconians to strip and anoint themselves without using warm water after the perspiration produced by their athletic exercises; to which origin of the term Martial also alludes:

"Ritus si placet tibi Laconum, Contentus potes arido vapore
Cruda Virgine Martiaue mergi."

By the terms Virgine and Martia the poet refers to the Aqua Virgo and the Aqua Martia, two streams brought to Rome by the aqueducts. (Vid. Aqua.-

rectus.) It is termed assa by Cicero, from ἀσά, to dry; because it produced perspiration by means of a dry, hot atmosphere; which Celsius consequently terms sudationes assas, "dry sweating," which, he afterward adds, was produced by dry warmth (calore sicco). It was called by the Greeks πυράστριον, from the fire of the hypocaust, which was extended under it; and hence by Alexander Aphrodis., ἑρμον θόδω, "a dry vaulted chamber."

Vitruvius says that its width should be equal to its height, reckoning from the flooring (suspensura) to the bottom of the thole (imam curvatum hemi-

spharii), over which centre of which an orifice is left, from which a bronze shield (cilpeus) was suspended. This regulated the temperature of the apartment, being raised or lowered by means of chains to which it was attached. The form of the well was required to be circular, in order that the warm air from the hypocaust might encircle it with greater facility. In accordance with these rules is the Laconicum at Pompeii, a section of which is given below, the cli-

pens only being added in order to make the drawing more clear.

A, The suspended pavement, suspensura; B, the junction of the hemisphaeric with the side walls, imia curvatura hemispharii; C, the shield, cilpeus; E and F, the chains by which it is raised and lowered; D, a labrum, or flat marble vase, like those called tazze by the Italians, into which a supply of water was introduced by a single pipe running through the stem. Its use is not exactly ascertained in this place, nor whether the water it contained was hot or cold.

It would not be proper to dismiss this account of the Laconicum without alluding to an opinion adopted by some writers, among whom are Galiano and

Cameron, that the Laconicum was merely a small cupola, with a metal shield over it, rising above the flooring (suspensura) of the chamber, in the manner represented by the drawing from the Thermes of Titus, which drawing has, doubtless, given rise to the opinion. But it will be observed that the design in question is little more than a section, and that the artist may have resorted to the expedient in order to show the apparatus belonging to one end of the chamber, as is frequently done in similar plans, where any part which required to be represented upon a larger scale is inserted in full development within the general section; for in none of the numerous baths which have been discovered in Italy or elsewhere, even where the pavements were in a perfect state, has any such contrivance been observed. Besides which, it is manifest that the cilpeus could not be raised or lowered in the design alluded to, seeing that the chains for that purpose could not be reached in the situation represented, or, if attained, could not be handled, as they must be re-

hot from the heat of the hypocaust, into which they were inserted. In addition to which, the remains discovered tally exactly with the directions of Vitruvius, which this does not.

After having gone through the regular course of perspiration, the Romans made use of instruments called strigiles (or strigiles) to scrape off the perspiration, much in the same way as we are accustomed to scrape the sweat off a horse with a piece of iron hoop after he has run a heat, or comes in from violent exercise. These instruments, some specimens of which are represented in the following woodcut, and many of which have been discov-

BATHS.

The poorer classes were obliged to scrape themselves, but the more wealthy took their slaves to the baths for the purpose; a fact which is elucidated by a curious story related by Spartan. The emperor, while bathing one day, observing an old soldier, whom he had formerly known among the legions, rubbing his back, as the cattle do, against the marble walls of the chamber, asked him why he converted the wall into a strigil; and learning that he was too poor to keep a slave, he gave him one, and money for his maintenance.

On the following day, upon his return to the bath, he found the old man lying on the floor, of old men rubbing themselves in the same manner against the wall, in the hope of experiencing the same good fortune from the prince’s liberality; but, instead of taking the hint, he had them all called up, and told them to scrub one another.

The strigil was by no means a blunt instrument; consequently, its edge was softened by the application of oil, which was dropped upon it from a small vessel called guttus (called also ampulla, lámpykos, μαπωθία, ἐλαζομέρας). Vid. AMPULLA. This had a narrow neck, so as to discharge its contents drop by drop, from whence the name is taken. A representation of a guttus is given in the preceding woodcut. The guttus was related to have suffered from an over-vigorous use of this instrument. Invalids and persons of a delicate habit made use of sponges, which Pliny says answered for towels as well as strigs. They were finally dried with tovils (lintes), and anointed.

The common people were supplied with these necessaries in the baths, but the men of wealth carried their own with them, as we infer from Persius.

‘I, puer, et strigiles Crispini ad baenea defer.’

Lucan adds also soap and towels to the list.

After the operation of scraping and rubbing dry, they retired into, or remained in, the tepidarium until they thought it prudent to encounter the open air. But it does not appear to have been customary to bathe in the water, when there was any, which was not the case at Pompeii, nor in the baths of Hippasus, either of the tepidarium or frigidarium; the tepidarium of the present day, and the wall beneath the two chambers being of consequence to break the sudden change from the extreme of hot to cold.

Returning now back into the frigidarium (8), which, according to the directions of Vitruvius, has a passage (14) communicating with the mouth of the furnace (c), which is also seen in the next woodcut under the boilers, called praefurnium, propigniegum, *αποφυγεγον* (from ἀπό, before, and νύξνας, a furnace), and passing down that passage, we reach the chamber (15) into which the praefurnium projects, and which has also an entrance from the street at B. It was appropriated to the use of those who had charge of the fires (fornacitores). There are two staircases in it; one of which leads to the roof of the bath, and the other to the copper which contained the water. Of these there were three: one of which contained the hot water — callidarium (sc. vas or aenueum) ; the second the tepid- tepidarium; and the last the cold — frigidarium. The warm water was introduced into the warm bath by means of a conduit pipe, marked on the plan, and conducted through the whole. Underneath the calidarium was placed the furnace (furnus), which served to heat the water, and give outlet streams of warm air into the hollow cells of the hypocaustum (from υπόκαστρον, under, atK. kaios, to burn). It passed from the furnace under the first and last of the calidors by two flues, which are marked upon the plan. These copper were constructed in the same manner as is represented in the engraving from the Thorvaldsen of Titus; the one containing hot water being fixed immediately over the furnace, and as the water was drawn out from thence, it was supplied from the next, the tepidarium, which was already considerably heated, from its contiguity to the furnace and the hypocaust below it, so that it supplied the deficiency of the former without materially diminishing its temperature; and the vacuum in this last was again filled up from the farthest removed, which contained the cold water received directly from the square reservoir seen behind them; a principle which has at length been introduced into the modern bathing establishments, where its efficacy, both in saving time and expense, is fully acknowledged.

The boilers themselves no longer remain, but the impressions which they have left in the mortar in which they were imbedded are clearly visible, and enable us to ascertain their respective positions and dimensions, the first of which, the calidarium is represented in the annexed cut.

We now proceed to the adjoining set of baths which were assigned to the women. The entrance is by the door A, which conducts into a small vestibule (19), and thence into the apodyterium (19), which, like the one in the men’s baths, has a seat (pulvinus et gradus) on either side built up against the wall. This opens upon a cold bath (20), answering to the natatio of the other set, but of much smaller dimension, and probably similar to the one denominated by Pliny puteus. There are four steps on the inside to descend into it. Opposite to the door of entrance into the apodyterium is another doorway which leads to the tepidarium (21), which also communicates with the thermal chamber (22), on one side of which is a warm bath in a square recess, and at the farther extremity the Laconium with its tab蚯. The floor of this chamber is suspended, and its walls perforated for flues, like the corresponding one in the men’s baths.

The comparative smallness and inferiority of the fittings-up in this suite of baths has induced some Italian antiquaries to throw a doubt upon the fact of their being assigned to the women; and among these the Court, as long as they were in the possession of the Emperor, they were an old set of baths, to which the larger ones were subsequently added when they became too small for the increasing wealth and population of the city. But the story, already quoted, of the

1. (I. c.—2. (Plan of Pompeii.)
Baths.

in the wife who turned the men out of their baths at Teanum for her convenience, seems sufficiently to negative such a supposition, and to prove that the inhabitants of ancient Italy, if not more selfish, were certainly less galling than their successors. In addition to this, Vitruvius expressly enlists the baths of the men and women, though separate, should be contiguous to each other, in order that they might be supplied from the same boilers and hypocaust; directions which are here fulfilled to the letter, as a glance at the plan will demonstrate.

It does not enter within the scope of this article to investigate the source from whence the various systems of baths, in which the water was supplied to the baths of Pompeii. But it may be remarked that the suggestion of Mazeris, who wrote just after the excavation was commenced, and which has been copied from him by the editor of the volumes on Pompeii published by the Society for the Diffusion of Useful Knowledge, was not confirmed by the excavation; and those who are interested in the matter may consult the fourth appendix to the Plan de Pompei, by the Abbate Iorio.

Notwithstanding the ample account which has been given of the plans and usages respecting baths in general, something yet remains to be said about that particular class denominated Thermes; of which establishments the baths, in fact, constituted the surface of the ground. These thermae were, it is true, a Roman adaptation of the Greek gymnasium, or palestra (vid. Palæstra), as described by Vitruvius; both of which contained a system of baths in conjunction with conveniences for athletic games and youthful sports, exedrae in which the rhetoricians declaimed, poets recited, and philosophers lectured, as well as porticoes and vestasicles for the literary and poetical meetings. They were ornamented with the finest objects of art, both in painting and sculpture, covered with precious marbles, and adorned with fountains and shaded walks and plantations, like the groves of the Academy. It may be said that they began and ended with the Empire, for it was not until the time of Augustus that these magnificent structures were commenced. Many, in fact, were already in existence when Augustus ascended the throne, and were, perhaps, without any other object in view than that of making his countrymen, by bequeathing to them the thermæ and gardens which he had erected in the Campus Mariscus. The Pantheon, now existing at Rome, served originally as a vestibule to these baths; and, as it was considered too magnificent for the purpose, it is supposed that Agrippa added the portico and consecrated it as a temple, for which use it still serves. It appears from a passage in Sidonius Apollinaris, that the whole of these buildings, together with the adjacent Thermæ Neronomiae, remained entire in the year A.D. 466. Little is now left but a few fragments of ruins, and the Pantheon. The example set by Agrippa was followed by Nero, and afterward by Titus; the ruins of the latter are, however, very extensive, partly under ground and partly above the Esquiline Hill. Thermæ were also erected by Trajan, Caracalla, and Diocletian, of the last two of which ample remains still exist; and even as late as Constantine, besides several which were constructed by private individuals, P. Victor enumerates sixteen, and Panvinius has added four more. Previous to these establishments for the use of the population, it was customary for those who sought the favour of the people to give them a day's bathing free of expense. Thus, according to Dion Cassius, Faustus, the son of Sulla, furnished warm baths and oil gratis to the people for one day; and Augustus, on one occasion, furnished warm baths and bars of the precious metals for the same period free of expense, and at another time for a whole year to the women as well as men. From thence it is fair to infer that the quadrant paid for admission into the baths was not exacted at the thermæ, which, as being the works of the emperors, would naturally be opened with imperial generosity to all, and without any charge, otherwise the whole city would have thronged to the establishment benefited. At the same time, and in spite of this opinion, it may be remarked that, the old establishments, which were probably erected by private enterprise, were termed meritória. Most, if not all, of the other regulations previously detailed as relating to the economy of the baths, apply equally to the thermæ: but it is to these establishments especially that the dissolute conduct of the emperors, and other indulgences of the people in general, detailed in the compositions of the satirists and later writers, must be considered to refer.

Although considerable remains of the Roman thermæ are still visible, yet, from the very ruinous state in which they are found, we are far from being able to arrive at the same accurate knowledge of their component parts, and the usages to which they have been applied. They are, however, of great interest as compared to the baths; or, indeed, to discover a satisfactory mode of reconciling their constructive details with the description which Vitruvius has left of the baths appertaining to a Greek palestra, or the description given by Lucian of the baths of Hippias. All, indeed, is doubt and guess-work; each of the learned men who have pretended to give an account of their remains, has differed in almost all the essential particulars from one another. And yet the great similarity in the ground-plan of the three which still remain cannot fail to strike even a superficial observer; so great, indeed, that it is impossible not to perceive at once that they were all constructed upon a similar plan. Not, however, to dismiss the subject without enabling our readers to form something like a general idea of these enormous edifices, which, from their extent and magnificence, have been likened to provinces (in modum provinciarum exstructa), a ground-plan of the Thermæ of Caracalla is annexed, which are the best preserved among those remaining, and which were, perhaps, more splendid than all the rest. Those apartments, of which the use is ascertained with the appearance of certainty, are marked and explained. The dark parts represent the remains still visible, the open lines are restorations.

A, Portico fronting the street made by Caracalla when he constructed his thermæ. B, Separate heating-rooms, either for the use of the common people, or, perhaps, for any persons who did not wish to bathe in public. C, Apodyterium attached to them. D, Drawers for the members of the public, which were seats for the philosophers to hold their conversations. G, Hypæthra, passages open to the air: Hypæthra ambulatoria quae Graeci ἐξωποδίαν, nostri xystos appellant. H, H, Stadia in the palestra—quadra rive oblonga. I, I, Possibly schools or academies where public lectures were delivered. J, J, and K, K, Rooms appropriated to the use of the women of the baths. L, L, some of the chambers are armouries for ascending to the principal reservoir. M, Space occupied by walks and shrubberies—ambulatoria inter platanos. The area or stadium in which the youth performed their exer-

BATHS.

BATHS.

exercise, with seats for the spectators, called the *theatridium*. N, N, Reservoirs, with upper stories, sectional elevations of which are given in the two subsequent woodcuts. O, Aqueduct which supplied the baths. P, The cistern or piscina. This external range of buildings occupies one mile in circuit.

We now come to the arrangement of the interior, for which it is very difficult to assign satisfactory destinations. Q represents the principal entrances, of which there were eight. R, the *nataeio, piscina*, or cold-water bath, to which the direct entrance from the portico is by a vestibule on either side marked S, and which is surrounded by a set of chambers which served most probably as rooms for undressing (*apodyteria*), anointing (*unctuaria*), and stations for the *capsae*. Those nearest to the peristyle were, perhaps, the *conisteria*, where the powder was kept which the wrestlers used in order to obtain a firmer grasp upon their adversaries:

"Itae caris hausto spargarit me pulvere potis,
Inque vicem fulus tacta flavescit arenae."1

The inferior quality of the ornaments which these apartments have had, and the staircases in two of them, afford evidence that they were occupied by menials. T is considered to be the *tegeliarium*, with four warm baths (τ, υ, υ, υ) taken out of its four angles, and two *labra* on its two flanks. There are steps for descending into the baths, in one of which traces of the conduit are still manifest. Thus it would appear that the centre part of this apartment served as *tegeliarium*, having a balneum or *calda locutio in fou* (*i* its corners. The centre part, like that also of the preceding apartment, is supported by eight immense columns.

The apartments beyond this, which are too much dilapidated to be restored with any degree of certainty, contained, of course, the *laconicum* and *sudatories*, for which the round chamber W, and its appurtenances, seem to be adapted, and which are also contiguous to the reservoirs, Z, Z.

C, c probably comprised the *ephebias*, or places where the youth were taught their exercises, with the appurtenances belonging to them, such as the *sphairistarium* and *corpusceum*. The first of these takes its name from the game at ball, so much in favour with the Romans, at which Martial's friend was playing when the bell sounded to announce that the water was ready.2 The latter is derived from *kólpucos*, a sack, which was filled with bran and olive husks for the young, and sand for the more robust, and then suspended at a certain height, and swung backward and forward by the players.3

The chambers also on the other side, which are not marked, probably served for the exercises of the *palaestra* in bad weather.4

These baths contained an upper story, of which nothing remains beyond what is just sufficient to indicate the fact. They have been mentioned and eulogized by several of the Latin authors.5

in the thumus, or that the women were excluded altogether from these establishments, and only admitted to the baths.

It remains to explain the manner in which the immense body of water required for the supply of a set of baths in the thumus was heated, which has been performed very satisfactorily by Piranesi and Camerone, as may be seen by a reference to the two subjoined sections of the castellum aquaductus and piscina belonging to the Therman of Caracalla.

A, arches of the aqueduct which conveyed the water into the piscina B, from whence it flowed into the upper range of cells through the aperture at C, and thence again descended into the lower ones by the aperture at D, which were placed immediately over the hypocaust E, the preparium of which is seen in the transverse section at F, in the lower cut. There were thirty-two of these cells arranged in two rows over the hypocaust, sixteen on each side, and all communicating with each other; and over these a similar number similarly arranged, which communicated with those below by the aperture at D. The parting walls between these cells were likewise perforated with flues, which served to disseminate the heat all round the whole body of water. When the water was sufficiently warm, it was turned on to the baths through pipes conducted likewise through flues in order to prevent the loss of temperature during the passage, and the vacuum was supplied by tepid water from the range above, which was replenished from the piscina; exactly upon the principle represented in the drawing from the Thermen of Titus, ingenuously applied upon a much larger scale.

**BATILLUS (βατιλίος), a shovel. Pliny mentions the use of iron shovels, when heated, in testing silver and verdigris.** Horace ridicules the vain pomposity of a municipal officer in the small town of Fundi, who had a shovel of red-hot charcoal carried before him in public for the purpose of burning it on frankincense and other odours (pruna batillis).

Varro points out the use of the shovel in the poultry-yard (sum latitio circumire, ac stercus tollere). The same instrument was employed, together with the spade, for making roads and for various agricultural operations (γαλάξ). "Hama" are also mentioned as utensils for extinguishing fires. These may have been wooden shovels, used for throwing water, as we now see them employed in some countries which abound in pools and canals.

**BATIS (βάτιος), a species of fish. It is the Rana batia, L., called in French Coiart, in English the Rana batia.**

**BATOS (βάτος), a plant or shrub, the species of which, as described by Theophrastus, is thus arranged by Stackhouse: The first, or ὁδόνως, is the Rubus fruticosus, or Common Bramble. The second, or χαλαβάτος, is the R. chamamenus, or Cloud-berry (called in Scotland the Aarrow). The third, or κονιόβατος, is the K. idean.** Sprengel agrees with almost all the authorities, that the βάτος, properly speaking, of Dioscorides and Galen, is the Rubus fruticosus; and the ἰδαία, the Rubus idean. It may be proper to remark, that by the poets, βάτος is often applied to any thorny shrub. Thus, in the following epigram, it is applied to the stem of the rose:

"Τοί βάδοι ἕκαστα μοι χρόνον, ὧν με κατεβάζει ἄτοχοι εὔροις οὐ βότων ἀλλά βάτων."**

**BATRACHITUM (βατράχιον), a plant of which Apuleius says, "Nascitur sive in Sardinia."** Hence Schulze, who is otherwise undecided respecting it, holds it to be identical with the "Sordoa herbata" of Virgil and others, namely, a species of the Rana culus, or Crow-foot. Sprengel refers the first species of Dioscorides to the Ranunculus Aotites, the second to the R. lanuginosus; the third to the R. muricatua; and the fourth to the R. aquatilis, upon the authority of Sibthorp.**

**BATRACHUS (βατραχός). I. The Frog, called in Latin Rana. The name was applied to several species of the genus Rana. "The common frogs of Greece," observes Dodwell, "have a note totally different from that of the frogs of the northern climates, and there cannot be a more perfect imitation of it than the Brekkekekes koos koos of Aristophanes." The Rana arbores, according to the same traveller, is of a most beautiful light-green color, and forms nearly resemble the common frog, but is of a smaller size; it has also longer claws, and a glutinous matter at its feet, with which it attaches itself with great facility to any substance that comes to its way. It lives chiefly on trees, and jumps with surprising agility from branch to branch. Its colour is so nearly identified with that of the leaves, that it is very difficult to see one from the other. Its eyes are of a most beautiful vivacity, and it is so extremely cold that, when held in the hand, it produces a chilly sensation like a piece of ice. Its song is surprisingly loud and shrill, and in hot days almost as incessant and tiresome as that of the betix. These animals are more common in Lucania than in other parts of Greece.**

II. A species of fish, called in English the Toad-fish, Frog-fish, and Sea-devil. It is the Lophius piscatorius, L.; in French, Bandrike; in Italian, Martino piscator. Aristotle calls it the βατράχος ἀλας, Ελληνικ the β. ἀλας. By Ovid it is termed Rana; by Pliny, Rana, and also Rana piscator; and by Cicer, Rana marina. Schneider, in his commentary on Aristotle, states that the βατράχιος of Opian would appear to be the Lophius barbarus, and that of Ελληνικ the L. piscatorius.

**BAXA or BAXEA, a sandal made of vegetable leaves, twigs, or fibres. According to Iasidore, this kind of sandal was worn on the stage by comediennes, while the cothurnus was appropriate to tragical actors. When, therefore, one of the characters in

---

1. (Plin., II. viii., xxiii., 44: xxxvii., 26.)—2. (Sat. i., v., 26.)
2. (De Re Rust., ii., 6.)—3. (Xen., Cyrop., vi., 2.—Brack, Anal., ii., p., 58.—Geoponica, ii., 28.)—4. (Juv., xiv., 205.)
5. (Orig., xix., 33.)
It appears that these vegetable sandals were sometimes ornamented, so as to become expensive and fashionable; for Tertullian says, "Socius et baza quotidie deaneantur."* The making of them, in all their variety, was the business of a class of men called baseari; and these, with the solareti, who made other kinds of sandals, constituted a corporation or college at Rome.8

* _BDELLiUM_ (βδέλλιον), commonly called a gum, but in reality a gum-resin, the origin of which is a subject of doubt. It would appear that there are two, if not more, kinds of bdellium, the source of one of which seems to be ascertained; the others are matters of controversy. The _BDellium_ of the ancients came from India, Arabia, Babylonia, and Bactria; the last is the best. It still comes, though not exclusively, from Asia. Adamont states that he saw in Africa the substance exude from a thorny species of Amyris, called by the natives Nisoutout. From its resemblance to myrrh, the analogy is in favour of its being obtained from an Amyris or _Balsamodendron_. The opinion of its being obtained from a palm-tree instead of the _Bdellium domestica_ (Gaertn.) or the _Borassus flabeliformis_ is very improbable. The Sicilian bdellium is produced by the _Drucus Hispanicus_ (Decand.), which grows on the islands and shores of the Mediterranean. The Egyptian bdellium is conjectured to be produced by the _Borassus flabeliformis_ already alluded to. Dioscorides and Galen describe two kinds of bdellium, the second of which is _Benzaxa_, according to Hardouin and Sprengel.

II. A substance mentioned in the second chapter of Genesis, and which has given rise to a great diversity of opinion. The Hebrew name is _bedolah_, which the Septuagint renders by _δεβόας_, "carbon- ele;" the Syriac version, "beryll" (reading _ber-__alia_); the Arabic version recommend _Bdellium_ and _Symmachus_, "Bdellium;" while some are in favour of "crystal," an opinion which Reland, among others, maintains.4 There is nothing, however, of so much value in _bdellium_ as to warrant the mention of this in the account of a particular region; it is more than probable, on the contrary, that pearls are meant, as expressed by the Arabic version. Several instances are on record of the purchase of pearls by many of the Jewish rabbins, and, among others, by Benjamin of Tudela. Bochart also advocates it with great learning; and it derives great support from another passage in the Sacred Writings, where Manna is compared with _Bdellium_. As the Manna is said to have been white and round, these two substances may be conjectured to be identical, or at least resemble each other.5

BEBAIOSEON DIKE (βεβαιωσός δίκη), an action to compel the vendor to make a good title, was had recourse to when the right or possession of the purchaser was impugned or disturbed by a third person. A claimant under these circumstances, unless the goods were warranted by the vendor, might easily bring himself (_αυτοφαγείο_), was referred to the vendor as the proper defendant in the cause (εἰς πρα- τήρα ανώτερον). If the vendor were then unwilling to appear, the action in question was the legal remedy against him, and might be resorted to by the purchaser even when the earnest only had been paid.6 From the passages in the oration of Demosthenes against Antiphanes, it appears that, in order to assert his own title, it is concluded by Heralds* that the liability to be so called upon was inherent in the character of a vendor, and, therefore, not the subject of specific warranty or covenants for title. The same critic also concludes, from the glosses of Hebrunch and Suidas, that this action might in like manner be brought against, or a claimant might avoid, a defendant if the claimant had established his right, and been, by the decision of the diacs, in legal possession of the property, whether movable or otherwise, as appears from the case in the speech against Panutencus, the ejected purchaser was entitled to sue for reinstatement.
BERYLUS.

BENEFICIUM.

BENEFICIUM, BERYLLUS. 

called beneficiarii: this practice was common, as we see from inscriptions in Gruter;1 in some of which the beneficiarius is represented by the two letters B. F. In this sense we must understand the passage of Caesar2 when he speaks of the magnum beneficia et the magnae clientelae of Pompey in Citerior Spain. Beneficiarius is also used by Caesar4 to express the person who had received a beneficium. It does not, however, appear from these passages what the beneficium actually was. It must be conceived of as a kind of honour, or special exemption from service.4

Beneficiarius is opposed by Festus5 to munificus, in the sense of one who is released from military service, as opposed to one who is bound to do military service.

It appears that grants of land and other things made by the Roman emperors were called beneficia, and were recorded in a book called Liber Beneficiarum.6 The secretary or clerk who kept this book was called a commentarius beneficiarii, as appears from an inscription in Gruter.7

BEN/BERI (besepos), according to Rondelot, the Oechea margaritifera, or Mother of Pearl, meaning, as Adams supposes, the Aicula margaritifera of later naturalists.8 Eustathius makes it an Indian name. It appears to be connected in some way with the common names of the Eastern region, or seascape-termed Barbaria.9

BERNIKOKOA (boπικοικα), a synonym of the Malum Armeniacum, or Apricot.

BERYLLUS (bpdplov), the Beryl, a precious stone, forming a sub-species of emerald. The Romans would appear to have been in the habit of studding their cups with beryls, and hence Juvenal says, "omnes margaritum radiis phoeniceus." The affinity between the beryl and the emerald was not unknown to the ancients, and hence Pliny remarks, "Beryls appear to many of the same, at least, a like nature with emeralds."10 According to this writer, they came from India, and were rarely found in other countries. At the present day, however, the finest beryls are obtained from Dauria, on the borders of China. They occur also, in the Urals, where the nature of the emerald, more or less modified; the pointing, however, is not always complete.11 Pliny seems to regard this crystalline form of the stone as the result of the degenerate condition of the parent pearl. Moreover, that some suppose the Beryl to be naturally of that shape, the same writer enumerates eight different kinds: "The best were those of a pure sea-green, our aqua marina, or, as the French term it, Beryl aigue-marine. The next in estate were called Chrysoberyls, and are somewhat vaguely described as "paulino pelidiores, sed in aurem calcem exeunte fulgere." This stone was also called the green emerald, such as occurs in Auvergne, or in the Haddes; indeed, the name of this kind was called Chrysoprase, and would seem to have been, in fact, as Pliny says some consider it, a mineral proprii geminis, different from the Beryl. It resembled in colour the juice of the leak, but with somewhat of a golden tinge, and hence its name. Although we are uncertain as to the mineral here described, yet it is not improbable that it was the same now called Chrysopraese, and to which Le

BETONICA.

BIBASIS.

man was the first in modern times who gave the ancient name. The fourth variety of Beryl was of a colour approaching the hyacinth; the fifth were termed aërideī; the sixth were of a wax, the seventh of an olive colour. The last variety spoken of by Piny resembled crystal, but contained hairy threads and impurities. These were probably in the crystals of quartz as are often found, rendered partly opaque by chlorite, or penetrated by capillary crystals of epidote, actinolite, or other minerals. Piny observes that the Indians stained rock-crystal in such a way as to counterfeit other gems, and especially the Bery. The bestiarii (ὄφημάκος) were persons who fought with wild beasts in the games of the circus. They were either persons who fought for the sake of pay (αὐτοκομματόν), and who were allowed arms, or they were criminals, who were usually permitted to have no means of defence against the wild beasts. The bestiarii, who fought with the beasts for the sake of pay, and of whom there were great numbers in Athens, are described by the Athenian historian that it was the same with and under the Empire, are always spoken of as distinct from the gladiators, who fought with one another.

It appears that there were schools in Rome, in which persons were trained to fight with wild beasts (σχολά beiaiarum or beiaiariorum).

BETA (ϛεῖδος, -ον, -ιον, -ις, οίς, και -κενδος), the Botony, was a Pindus, a species of plant, commonly called the "Botony." It is almost incredible," observes Adams, "how much of confusion and mistake has arisen about these terms. With regard to the Botony of Paul of Egin, the most probable opinion is that he meant the Boronia officinalis, common male Speedwell, or the V. serysulifolia, or smooth Speedwell. In Miller's Gardener's Dictionary, the former of these, and in the Northern Flora of Dr. Murray, the latter, gets the additional name of 'Paul's Botony.' The Boronia, which was merely a synonyme of the Scrophularia, was allowed either the Boronia officinalis, or, as Speedell rather thinks, the B. alcpectoradus. We now come to the Boronia of Dioscorides. This he describes as resembling wild Dock (κατίκα άφτερο), but having a larger and rougher leaf. He ascribes to it also, a styptic power, which rendered it well adapted for afections of the mouth and fauces. Paul of Egin, in like manner, compares its juice to the Dock. It supplies it for the cure of mortifications of the mouth, by which he no doubt means Scoury. This is the plant upon the uses of which a small work was written by Antonius Musa, physician to Augustus. This Libellus was published at Zurich, A.D. 1537, with notes by Humelineburgius. It is a tract, however, which is not of much scientific point of view; and, indeed, there is much that remains to doubt the genuineness of the work which we possess. Munting, in a very learned work, 'De Vera Antiqurum Herba Britannica,' gives an interesting exposition of the opinions entertained by modern authorities on Botany respecting this herb. He shows that it has been referred to the Cochlearia, Anagallia, Consolida, Veronica, Prussella, &c. The most probable opinion, however, he thinks, is that it was some species of Dock or Rumex. Sprengel, too, inclines to the same opinion, that it was either the Rumex hydrolepis or Oxalis. In confirmation of this view of the matter, it may be proper to mention that the Britannica is noticed under the name of the black Dock by Aetius. Another form of the ancient name is Vettomna, derived, according to Piny, from the circumstance of the Vettones in Spain having discovered this herb. Its uses are most probably those of a medicine, so that a proverb has arisen among the Italians respecting it: "aver pie virtu che la bottonica," "to possess more virtue than the bottonica."

BHYXION (βύξιον), a plant, which Woodville, Sprengel, Dierich, and nearly all the commentators agree is the Tussilago farfara, or Colt's-foot. Galen says it derived its name from its being bequeathed by a Telphus (τελφυς) to the Collegium, the difficulty of breathing (βύξις, γεγος, being the Greek term for a cough). A patent medicine, prepared from the Colt's-foot, is, according to Adams, much cried up in England at the present day as a cure for coughs.

BIASIN AIKH (βιασιν δίκη). This action might be brought between a rape of free persons, or the illegal and forcible seizure of property of any kind, were the subject of accusation; and we learn from Demosthenes that it came under the jurisdiction of the Curty. According to Plutarch, the law prescribed that ravishers should pay a fine of 100 drachmae; but other accounts merely state generally that the convict was mulcted in a sum equal to twice that of a slave, and which is supposed to be the word ολοκλείς; and the plaintiff in such case received one half of the fine, and the state, as a party merely injured, the other. To reconcile these accounts, Meier? supposes the rape to have been estimated by law at 100 drachmae, and that the plaintiff fixed the damages in reference to other injuries suffered by the plaintiff, and the perpetration of the main offence. With respect to aggressions upon property, the action Biavon is to be distinguished from ξειδος, in that the former implies the employment of actual violence, the latter merely such detention of property as amounted to violence in the contemplation of law, as, for instance, the refusal to deliver damages; and the like, to the successful litigant after an award in his favour by a court of justice.

BIBASIS (βιβασις) was a kind of gymnastic dance, much practised among the Spartans, by both men and women. The dance consisted in springing rapidly from the ground, and striking the feet behind; a feat of which a Spartan woman in Aris- totle's time was celebrated. In the epistles of the female was counted, and the most skilful received prizes. We are told by a verse which has been preserved by Pollux, that a Lacanian girl had danced the bibasis a thousand times, which was more than had ever been done before. The bibasis appears to have been nearly the same as the ῥαβδασις, which Pollux explains by σπανή ἀλυσίν, "to dance on a stick, on the meaning of which see Hesychius."
BIBLIOTHECA.

BIBLIOPOLiA, a bookseller,1 βιβλιοπωλης,2 also called librairus,3 in Greek also βιβλιων κατάλογος,4 or βιβλιοκατάλογος. The shop was called αρχαθεία (arkathēia), or taberna librariorum,6 or merely libraría.6 The Romans had their Paternoster Row; for the bibliopoli or librarīi lived mostly in one street, called Argiletum, to which Martial alludes7 when addressing his book on the prospect of the criticism it would meet with:

"Argiletanae mania habitare tabernas,
Quom tibi, parvis liber, serinu nostra vacant."

Another favourite quarter of the booksellers was the Vicus Sandalarius.9 There seems also to have been a sort of bookstalls by the temples of Vertumnus and Janus, as we gather from Horace's address to his book of Epistles:10

"Vertumnum Janumque, liber, spectare videris."

Again, Horace11 prides himself on his books not being to be seen at the common shops and stalls, to be thumbed over by every passer-by:

"Nulla taberna meae habeat, neque pila libellis;
Quae manu tuae solvatur, Hermodemenique Vigilis."

Booksellers were not found at Rome only, though they were, of course, rare in smaller cities. Pliny11 says he had not supposed that there were any booksellers at Lugdunum, but finds that there were, and that they even had works on sale. Martial, in an amusing epigram,12 tells a person called Quintus, who had asked him by a broad hint to give him a copy of his works, that he could get one at Tryphon's, the bookseller:

"Exigit ut donem nostras tibi, Quinte, libellos,
Non habeas, sed habet bibliopola Tryphon."

The booksellers not only sold books; they transcribed and sold copies and original specimens of the manuscripts and codices for the purpose; but they did not consider themselves answerable always for the correctness of the copy.13 Sometimes the author revised it to oblige a friend who might have bought it.14

On the shop-door or the pillar, as the case might be, there was a title of the list of books on sale; for MS. is made to this by Martial15 and by Horace.16

The remuneration of authors must have been very small, if we are to judge from the allusions of Martial, who says, for example, that a nice copy of his first book of Epigrams might be had for five denarii.17 Pliny the elder, however, when in Spain, was offered as much as four hundred thousand sesterces for his Commentarii Electionium.18

Bards and comedians, too, received their money in this way into other shops besides book-shops, as waste paper; and schoolboys had frequently to go, for example, to the fishmonger's to see if he had the book they wanted.19 Mice, moths, beetles, and so forth, found plenty of food in musty unused books.20

BIBLIOTHECA (βιβλιοθήκη, or ἀποθήκη βιβλίων), primarily, the place where a collection of books was kept; and, by extension, the books themselves.21 Little as the states of antiquity dealt with the instruction of the people, public collections of books appear to have been very ancient. That of Pisis-tratus was intended for public use;22 it was subsequently removed to Persia by Xerxes. About the same time, Polygastes, tyrant of Samos, is said to have founded a library. In the best days of Athens, even private persons had large collections of books; and it was not important of which we know anything belonged to Euclid, Euripides, and Aristotle.23 Strabo says that Aristotle was the first who, to his knowledge, made a collection of books, and taught the Egyptian kings the arrangement of a library. The most important and splendid public library of antiquity was that founded by the Ptolemies at Alexandria, begun under Ptolemy I, and increased and completed in an orderly and systematic manner by Ptolemy Philadelphus, who also appointed a fixed librarian, and otherwise provided for the usefulness of the institution. The library of the Ptolemies contained, according to Aulus Gellius,3 700,000 volumes; according to Josephus, 500,000; and according to Seneca, 400,000. The different reckoning of different authors may be due to some measure, perhaps, recouraged by supposing that they give the number of books only in a part of the library; for it consisted of two parts, one in the quarter of the city called Brucheion, the other in the quarter called Sarapeion. Ptolemy Philadelphus bought Aristotle's collection to add to the library, and Ptolemy Euergetes continued to add to the stock. A great part of this splendid library was burned down by the Pisans, and the Ptolemies at Alexandria, by Julius Caesar; some writers say that the whole was burned; but the discrepancy in the numbers stated above seems to confirm the opinion that the fire did not extend so far. At any rate, the library was soon restored, and continued in a flourishing condition till it was destroyed by the Arabs A.D. 640.24 Connected with the greater division of the library, in the quarter of Alexander the Great, there was a sort of college, to which the name of Mousieon (or Museum) was given. Here many favoured literati pursued their studies, transcribed books, and so forth; lectures also were delivered. (Vid. Auctore A.) The Ptolemies were not long without a rival in zeal. Emennes, king of Pergamus, became a patron of literature and the sciences, and established a library, which, in spite of the prohibition against exporting papyri issued by Ptolemy, who was jealous of his success, became very extensive, and perhaps not in importance to the library of Alexandria. It remained; and probably continued to increase, till Antoninus made it a present to Cleopatra.25

The first public library in Rome was 'that founded by Asinus Pollio, and was in the atrium Lictorum. (Sulp. Post.) The theatre of Marcellus. There also were libraries on the Capitol,26 in the Temple of Peace,27 in the palace of Tiberius,28 besides the Ulpiian library, which was the most famous, founded by Trajan,29 called Ulpiian from his own name, Ulpius. This library was attached by Dioecletian as an ornament to his theatre.30

Private collections of books were made at Rome seen after the second Punic war. The zeal of Cicero, mentioned above, in increasing the number of his libraries is well known.17 It became, in fact, the fashion

BIPALIUM. BIDENAL.

BIPALIUM. BIDENAL.

BIPENNIS. (Vid. Securit.)

BIREMIS was used in two significations. 1. It signified a ship with two banks of oars, as an explanation of the construction of which is given in the article NA. 2. Such ships were called διπόλα by the Greeks, which term is also used by Cicero (Ipsa Domitius doma plane habet decora) and Hirtius (Capitix ex prato penteram unam, tricenus duas, dicratas octa). 2. It signified a boat rowed by two oars, and this sense it must be used by Horace when he says:

"Tunc me, biremis pravisio scapha,
Tutum per Aegros tumulus
Aurum ferat, geminisque Pollux." 14

HIRRHUS (βίρρος, βίρρος), a cape or hood, which was worn out of doors over the shoulders, and was sometimes elevated so as to cover the head. On the former account it is classed by an ancient grammarian with the lacera, and on the latter with the cowl, or cucullus. 8 It had a long nap (amphibalis, i.e., amphidas, silicrata), which was commonly of sheep's wool, more rarely of beaver's wool (birtius castoreus). In consequence of its thickness, it was also rather stiff (lyrarium rigitens). According to the materials of which it was made, it might be either dear, or so cheap as to be purchased by the common people.

These garments, as well as lacerae, were worn at Caesar, and occasionally by their name (βιρρα, i.e., πυρός) was derived from the red color of the wool for which that district was celebrated. They were also made in different parts of Gaul, especially among the Atrebates. Soon after they came into general use, so that the bicornus is mentioned in the edict of Diocletian, published A.D. 303, for the purpose of fixing a maximum price of all the different sorts of wool most commonly used throughout the Roman empire.

*BISON (βίσων), the name of a sub-genus of the genus bos ('ox'), containing two living species, one of them the European, now become very scarce, and verging towards extinction; the other the American, and, notwithstanding the advances of man, still multitudinous. A good deal of conflicting opinion has been expressed concerning the species that have been assigned. Peninn, in his 'British Zoology,' after stating his belief that the ancient wild cattle of Britain were the Bisontes jubati of Pliny, thus continues: 'The Ursus of the Hercynian forest, described by Caesar, was of this kind, the same which is called by the modern Germans Aurochs, i.e., Bos rufescens.' This opinion is not correct. Though there are parts of Caesar's description applicable to the European Bison, there is one striking characteristic which forbids us to conclude that Caesar's Ursus was identical with it. A glance at the European Bison will convince us that it could never have afforded the horns whose amplitude Caesar celebrates. In the Archæologia (vol. iii., p. 15) it is stated, that the Bisons of Atrebates were supposed to have belonged to the bison or buffalo. That it might be possible to a buffalo is not impossible; but that it did not belong to a bison is sufficiently clear, from the following description: 'It is two feet four inches long on the convex bend, and twenty three inches on the concave. The inside at the large end is three inches diameter, being perforated so as to leave the thickness of only half an inch for about three inches deep; but farther on it is thicker, being not so much or so naaly perforated.' Such a horn might indeed have crowned the head of Caesar's Ursus, a species which Cuvier believes to be extinct. Caesar's Ursus, then, was not, as it would appear, the European Bison. There can be little doubt that the Bisont jubatus of Pliny, 9 which he seems to distinguish from the Ursus, was the European Bison, or Aurochs; and, though, in the fifteenth chapter of the eighth book, he mentions the tradition of the British Bisons, he calls them Bovasus after he has dismissed his Bisontes jubatus, and with every appearance of a conclusion on his part that the Bonasus and Bison were not identical, his own description, when compared with that of Aristotle, will leave little doubt, that the Bison jubatus and Bonasus of Pliny and others, the Bos arvensis or Bosanu of Aristotle (for the word is written both ways), and the Bovis et Oppian, were no other than the European Bisons, the Aurochs (Aurochs) of the Prussians, the Zubr of the Poles, the Taurus Paonius, &c., of Jonston and others, l'Aurochs and le Bonasus of Buffon, Bos Ursus of Bodder, and Bos Bonasus of Linnaeus. Cuvier considers it as certain, that the European Bison, the largest, or, at least, the most massive of all existing quadrupeds after the rhinoceros, an animal still inhabited in parts of the Low Countries, and, though not numerous, still easy to be killed, and perhaps in those of Moldavia, Wallachia, and the neighbourhood of the Caucasus, is a distinct species, which man has never subdued. Following out this subject with his usual industry and ability, that great naturalist goes on to state, that if Europe possessed a Ursus, a Thur of the Poles, different from the Bison or the Aurochs of the Germans, it is only in its remains that the species can be traced; such remains are found, in the skulls of a species of ox, different from the Aurochs, in the superficial heads of certain districts. This, Cuvier thinks, must be the Ursus of the ancients, the original of our domestic Ox; the stock, perhaps, whence our wild cattle descended; while the Aurochs of the present day is nothing more than the Bison or Bonasus of the ancients, a species which has never been brought under the yoke. — The elevated ridge of the spine on the shoulders, long legs, a woolly fur, and the residence in mountain forests, cause the Bison to approach nearer the Damaline and Catobeline genera than the Buffalos. 13 For some remarks on the knowledge possessed by the ancients of the latter consult article BULLAIS.

BISSEXTEUS. (Vid. Calendar, Roman.)

BISSEXTILIS ANNUUS. (Vid. Calendar, Roman.)

*BITUMEN, a Latin word used by Tacitus, Pliny, and other Roman writers, to indicate a species of mineral pitch or oil. The term appears to have some analogy with the Greek πίτα, πίτα, "pitch," its earlier form having probably been "pi men." The corresponding Greek word is ἁπείρον (in modern Latin asphaltum) from Ἀρμενία, the kind of asphaltum &c. Thus the bricks of which the walls of Babylon were constructed were cemented by a bitumen, which was found abundantly in that vicinity on springs, or floating on the river 1s, which fell into the Euphrates. Asphaltum or Maltha, either pure or mixed with a liquid extracted from the cedar was employed by the Egyptians in embalming dead

BCEO'TARCH

BLATTA.

BCLNUS (βλέννος), called by Pliny *Blennius* the Blenny or Butter-fish (Blennius scutariar, L.); it is about seven inches long, and has a slimy mucous smeared over the skin, to which it owes its name, from the Greek βλέννος, "mucus," "slime." Athanasius says it resembles the Gudgeon. Several of the Blenny kind are viviparous.

BLETON, or BLITON (βλητος, βλητον, βλητον), the herb Blute or Blutes, a kind of heet. Stockhouse and Dierbach agree with the older commentators, that it is the Amarathus Bitum; and Sprengel inclines to this opinion in his notes to Dioscorides, although in his History of Medicine he had set it down as the Bitum capitatum. The insipidity of the Bitum gave rise to an adage directed against the feeble intellect, or the tame and spiritless in disposition.

BOA. (Vid. Draco)

BOEDROMIA (Βοεδρομία, and τοι), a festival celebrated at Athens on the seventh day of the month of Boedromion, in honour of Apollo Boedromius. The name Boedromius, by which Apollo was called in Boeotia and many other parts of Greece, seems to indicate that by this festival he was honoured as a martial god, who, either by his actual presence or by his oracles, afforded assistance in the dangers of war. The origin of the festival is, however, traced by different authors to different events in Greek story. Plutarch says that Theseus, in his war against the Amazons, did not give battle till after he had offered a sacrifice to Phobos; and that, in commemoration of the successful battle which took place in the month of Boedromion, the Athenians, down to his own time, continued to celebrate the festival of the Boedromia. According to Suidas, the Eymol, Magn., and Euriptides, the festival derived its name and origin from the cure of Theseus. As further the cure of Theseus, the Athenians were attacked by Eumolpus, Kuthus or (according to Philochorus in Harpocrates, s. v.) his son Ion came to their assistance, and procured them the victory. Respecting the particulars of this festival, nothing is known except that sacrifices were offered to Artemis.

BOEOTIA. (Vid. Bocotia,Greek.)

BOETHE'TICAN. (Vid. Boetica.)

BOEOTARCH (Βοετάρχης or Βοεταρχής). The Boeotians in ancient times occupied Arne in Thessaly. Sixty years after the taking of Troy they were expelled by the Thessalians, and settled in the country then called Cadmeia, but afterward Boeotia. The division of the Boeotia into three states, or districts, was consequence of the conquest of the country, it was divided into several states, containing a principal city, with its ξυνεκτικος εξευεμοσ (inhabitants of the same μοιχ or district) living around it. Of these greater states, with dependent territories, there seem to have been in former times fourteen, a number which frequently occurs in Boeotian legends. The names are differently given by different writers. But it has been determined by certain, that they formed a conspiracy called the Boeotian league, with Thebes at its head, the dependencies of which city formed about a third part of the whole of Boeotia. These dependant towns or districts were not immediately connected with the national confederacy, but with the neighbouring chief city, as Cynocephalea was with Thebes. In fact they were obliged to furnish troops and money, to make up the contingent furnished by the state to which they belonged, to the general confederacy. Of the independent states, Thyucidides says

161
BCEOTARCH.

BOEOTOL.

Mentions seven by name; and gives us reasons for concluding that, in the time of the Peloponnesian War, Boeotarchs were the chief. Platea had withdrawn from them, and placed itself under the protection of Athens as early as B.C. 519; and in B.C. 374, Thebais, another member of the league, was destroyed by the Thebans.

Each of the principal towns of Boeotia seems to have had its δήμος and βουλή. The βουλή was probably an archaic institution, and possessed some privileges over the ordinary forms of the old kings, but possessed little, if any, executive authority. The polarchains, who, in treaties and agreements, are mentioned next to the archon, had some executive authority, but did not command forces; e.g., they could imprison, and they directed the levies of troops. But, besides the archon of each separate state, there was an archon of the confederacy—ἄρχων τοῦ κοινοῦ Βοιοτῶν, most probably always a Theban. His name was affixed to all alliances and compacts which concerned the whole confederacy, and he was president of what Thucydides calls the four councils, who directed the affairs of the league (ἅπας τὸ κοίνος ἑγών). On important questions they seem to have been united; for the same day and the same hour are mentioned, and informs us that the determinations of the Boeotarchs required the ratification of this body before they were valid. We will now explain which these Boeotarchs were. They were properly the military heads of the confederacy, chosen by the different states; but we also find them discharging the functions of an executive in various matters. In fact, they are represented by Thucydides as forming an alliance with foreign states; as receiving ambassadors on their return home; as negotiating with envoys from other countries; and acting as the representatives of the whole league, though the βουλή refused to sanction the measures they had resolved on in the particular case to which we are now alluding. Another instance in which the Boeotarchs appear as executive is their interference with Argosians, on his embarking from Aulis for Asia (B.C. 396), when they prevented him offering sacrifice as he wished. Still the principal duty of the Boeotarchs was of a military nature: thus they led into the field the troops of their respective states; and when at home, they took whatever measures were requisite to carry on the military operations of the league or of their own state; for example, we read of one of the Theban Boeotarchs ordering the Thebans to come in arms to the ecclesia for the purpose of being ready to attack Platea. Each state of the confederacy elected one Boeotarch, the Boeotarchs two; although on one occasion, i.e., after the return of the exiles with Pelopidas (B.C. 379), we read of there being three at Thebes. The total number from the whole confederacy varied with the number of the independent states. Mention is made of the Boeotarchs by Thucydides, in connexion with the battle of Delium (B.C. 424). There is, however, a difference of opinion with respect to his meaning: some understand him to speak of eleven, some of twelve, and others of thirteen Boeotarchs. Dr. Arnot believes there were thirteen. In the last number, and we think the context is in favour of the idea that there were then thirteen Boeotarchs, so that the number of free states was twelve. At the time of the battle of Locri (B.C. 371), we find seven Boeotarchs mentioned.1 On another occasion, when Greece was invaded by the Gauls (B.C. 379), we are ourselves that there were twelve, but, before the time (B.C. 171) to which his statement refers, Platea had been reunited to the league. Still the number mentioned in any case is no test of the actual number, inasmuch as we are not sure that all the Boeotarchs were sent out by their respective states on every expedition or to every battle.

The Boeotarchs, when engaged in military service, formed a council of war, the decisions of which were determined on by a majority of votes, the president being one of the two Theban Boeotarchs who commanded alternately.2 Their period of service was a year, beginning about the winter solstice; and whoever continued in office longer than his time, was punishable with death both at Thebes and in other cities.3 Epaminondas and Pelopidas did so on their invasion of Laconia (B.C. 369), but their eminent services saved them; in fact, the judges did not even come to a vote respecting the former (οὐδὲ ἄρχων περὶ αὐτοῦ θεσαυρίαν εὔφρον). At the expiration of the year, a Boeotarch was eligible to office a second time, and Pelopidas was repeatedly chosen.4 From the case of Epaminondas and Pelopidas, who were sent out by the Boeotarchs (δικασταὶ) for transgression of the law which limited the time of office, we may conclude that each Boeotarch was responsible to his own state alone, and not to the general body of the four counsels.

Mention is made of an election of Boeotarchs by Livy.5 He farther informs us that the league (concordia) was broken by the Romans B.C. 171.6 Still it must have been partially revived, as we are told of a second breaking up by the Romans after the destruction of Corinth, B.C. 146.7

*BOCA or BOCE (βόκα, Aristot. : βόζ, Oppian: βοής, Atheneus), a small fish not exceeding a palm in length; but, according to Willughby, its flesh is wholesome and pleasant. Oppian makes mention of two species. Rendel remarks that the second was a species of Moxa, meaning, as Adams supposes, the Sparus Menes.

*BOITOS (βοῖτος), a species of fish, mentioned by Aristotle.8 It is supposed to be the Cotus Gelo, the Bull-head, or Miller's thumb. According to Arctob, an old MS. in the Vatican reads κοῖνος.9

*BOEL (βοηλ), a general name for bulbous roots, as the Cichorieum; so also the βόηλος τοῦ θάλασσας. Adams remarks as follows in his Commentary on the Psalter of Aegina: "It is not well ascertained what the excretory bulb of the ancients were. Hardouin conjectures that they were a delicious kind of onions. Matthioli and Nonnus are wholly undecided. Sprangel inclines, with Dalechamp and Sibthorp, in thinking that they were a species of Muscaria, or Cichorieum; the account of them given by Serapion, who calls them χειλεῖα, appears better with the conjecture of Hardouin. Enestahius also says that the Bulbus was a wild onion."10 The βοηλὸς ἀντίκοις is referred by Matthioli to the Muscaria moschatum; by Donatus to the Narcissus jonquilla; by Lonicer to the Scilla bifolia; by Sibthorp to the Ornithogalum moschatum; and by Celsrarius to the Narcissus poeticus. Sprengel rather inclines to the opinion of Donatus. Debernard holds the βοηλὸς of Hippocrates to be the Hyacinth.
...
BONA CADUCA

By the help of fictitious grants, gave to persons the beneficial interest to whom he could not give the ownership. When the grantor gave the goods of the death to the legatee, the creditor said in possession reserum, or bona debitoris miti. (Vid. Bonorum Emto, Bonorum Possessio.)

As to things nec mancipi, the ownership might be transferred by bare tradition or delivery, and such ownership was Quiritian, inasmuch as the Roman law required no special form to be observed in the transfer of the ownership of res nec mancipi. Such transfer was made according to the jus genkum (in the Roman law). 4

On this subject the reader may consult a long essay by Zimmern, Uber das Wesen des sogenannten bonitarien Eigenthums.

BONA CADU'CA. Caducum literally signifies that which falls: thus glans caduca, according to Gaius, 5 is the mast which falls from a tree. Caducum, in its general sense, might be anything with or an owner, or what the person entitled to neglect to take; but the strict legal sense of caducum and bona caduca is that stated by Ulpian, 6 which is as follows:

If a thing is left by testament to a person who has then a capacity to take it by the jus civile, but from some cause does not take it, that thing is called caducum: for instance, if a legacy was left to a minor, or a per son, d. and the unmarried person did not, within a hundred days, obey the law by marrying, or if, within the same time, the Latinus did not obtain the jus Quiritium, the legacy was caducum. Or if a heres ex parte, or a legatee, died after the death of the testator, and before the opening of the will, the thing was called caducum.

The law above alluded to is the Lex Julia et Papi Poppea, which is sometimes simply called Julia, or Papi Poppea. This law, which was passed in the time of Augustus (B.C. 9), had the double object of encouraging marriages and enfranchising the treasury.—ararium, 7 and contained, with reference to these two objects, a great number of provisions. Martial 8 alludes to a person who married in order to comply with the law.

That which was caducum, came, in the first place, to those among the heredes who had children, and among those of the legatees who had children. The law gave the jus accrescendi, that is, the right to the caducum as far as the three degree of consanguinity, both ascending and descending; to those who were made heredes by the will. Under the provisions of the law, the caducum, in case there was no prior claimant, belonged to the ararium; or, as the case might be, the person was entitled to the hereditas caducaria, or the person was entitled to the heredum possessori, or if a person was entitled, but did not assert his right, the bona became public property (populo deferentur), according to the Lex Julia caducaria; but by a constitution of the Emperor Antoninus Caracalla, it was appropriated to the fiscus: the jus accrescendi above mentioned was, however, still retained. The lawyers, however (sp. probidentium), by various devices, such as substitutions, often enacted in making the law of no effect.

He who took the portion of a heres, which he came caduca, took it by universal succession: in the case of a legacy, the caducum was a singuliacaducum, and the testator took it with the bequests of freedom, of legacies, and fidei commissia with which it was burdened: if the legata and fidei commissia became caduca, all charges with which they were burdened became caduca also. In the time of Constantine, both the castells and the orus, or childless person (who was under a limited incapacity), obtained the full legal succession. But in the case of the Soldi or the Doni Caducum, and caducum. 1

On this last-mentioned title (De Caducia tollen- dia) it is stated both that the name and the thing (omen et materia caducum) had their origin in the civil wars, that many-provisions of the law were evaded, and many had become absolute. 2 As to the Doe caduca, see D.S.

BONA FIDES. This term frequently occurs in the Latin writers, and particularly in the Roman jurists. It can only be defined with reference to things opposed to it, namely, mala fides, and dolus malus, both of which terms, and especially the latter, are frequently used in a technical sense. (Vid. DOLUS MALUS.)

Generally speaking, bona fides implies the absence of all a fraud or unfair dealing or acting. In this sense, bona fides, that is, the absence of all fraud, whether the fraud consists in simulation or dissimulation, is a necessary ingredient in all contracts.

Bona fide possidere applies to him who has acquired the possession of a thing under a good title, as he supposes. He who possessed a thing bona fide, had a capacity of acquiring the ownership by successio, and had the protection of the actio Publicians. The person who received a thing either mancipi or nec mancipi, not from the owner, but from a person whom he believed to be the owner, could acquire the ownership by succession. 4 A thing which was furtivum or vis possessor, or the 3rd mancipi of a female who was in the tutela of her agnati, unless it was delivered by her under the auctoritas of her tutor, was not subject to succession, and therefore, in the case of the acquisition of such bona fides was immaterial. 5 A person who bought from a pa- pilium without the auctoritas of his tutor, or with the auctoritas of a person whom he knew not to be the tutor, did not purchase bona fide; that is, he was guilty of a legal fraud. A sole tutor could not purchase a thing bona fide from his pupilis; and if he purchased it from another, to whom a bona fide sale had been made, the transaction was null.

A bona fide possessor was also protected as to property acquired for him by another person. 7

In various actions arising out of mutual dealings, such as buying and selling, lending and hiring, partnership, and others, bona fides is equivalent to asqnum and justum; and such actions were sometimes called bona fide actions. The formula of the claim is "bona fide atque usque ad actum auctoris," or "bona fide actum auctoris." It has empowered him in such cases to inquire and determine ex bona fide, that is, according to the real merits of the case. 8

BONA RAPTA. The actio vi bonorum rapatur was granted by the prator against those who had by force carried off a man's property. The offense was, in fact, a species of furtum. If the person in- jured brought his action within one year after the

time when he was first able to bring his action, he might recover for one. If, in the latter year, he only recovered the value of the goods. If a slave was the offender, he would recover the proceeds of the process of the cession bonorum more simply, by making it a procedure extra jus, and giving farther privileges to the insolvent. Like several other Julian laws, it appears to have consolidated and extended the provisions of previous enactments.

BONORUM COLLATIO. By the strict rules of the civil law, an emancipated son had no right to the inheritance of his father, whether he died testate or intestate. But, in course of time, the practice of an heir for making a will at the time of his death, and the equal succession with those who remained in the power of the father at the time of his death; and this grant might be either contra tabulas or ad intestato. But this favor was granted to emancipated children only on condition that they should bring into one common stock with their father's property, and for the purpose of an equal division among all the fathers children, whatever property they had at the time of the father's death, and which would have been acquired for the father in case they had still remained in his power. This was called bonorum collatio. It resembles the old English hutch-pot, upon the principle of which is framed the provision in the statute 22 and 23 Charles II., c. 10, s 6, as to the proceeds of personal estrates.

BONORUM EMERGO ET EMATOR. The ex presion bonorum emerto applies to a sale of the property either of a living or of a dead person. It was in effect, as to a living debtor, an execution. In the case of a living person, his goods were liable to be sold if he concealed himself for the purpose of defrauding his creditors, and was not defended in his absence. Where the bonorum cessa to give up his property to his creditors. The debtor might declare his willingness to give up his property by letter or by a verbal message. The debtor thus avoided the infamia consequent on the bonorum emito, which was involuntary, and he was free from all personal execution. He was also allowed to retain a certain portion of his property. An old gloss describes the bonorum cesso thus: 'Cedere bonis est ab universitate rerum suam recedere.'

The property thus given up was sold, and the proceeds distributed among the creditors. The purchaser, of course, did not obtain the Quiritarian ownership of the property by the act of purchase. If the bonorum cessa to give up his property to his creditors, he was also liable to the payment of his old debts, with some limitations, if they were not already fully satisfied.

The benefit of the lex Julia was extended by the imperial constitutions to the provinces. The history of the bonorum cesso does not seem quite clear. The lex Julia, however, was not the oldest enactment which relieved the person of the debtor from being taken in execution. The lex Petelia Papiria (B.C. 327) exempted the person of the debtor (nisi qui nonem merisset), and only made his property (bona) liable for his debts. It does not appear from the passage in Livy whether this was a bonorum cesso in the sense of the bonorum cesso of the lex Julia, or only a bonorum cessa, with the privilege of freedom from arrest. The Tablet of Heraclia speaks of those qui in jure bonam cognomini jurabant; a phrase which appears to be equivalent to the bonorum cesso, and was a declaration on oath in jure, that is, before the praetor, by the debtor that his property was sufficient to pay his debts. But this was still accompanied with intent to deprive Livy, no such declaration of solvency was required from the debtor by the Petelia lex. The Julian law rendered 1.

1. (Gaius, ii., 909.—Dig. 7, tit. 3. 20a. (Marzari, Lehrbuch des Röm. Rechts, p. 336.—Manzocchi, p 423.)
Inheritance may or thing which belonged to another at the time of his death." The strict laws of the Twelve Tables as to inheritance were gradually relaxed by the praetor's edict, and a new kind of succession was introduced, by which a person might have a bonorum possessio which he could have no hereditas or legal inheritance.

The bonorum possessio was given by the edict both contra tabulas, secundum tabulas, and intestatil. An emancipated son had no legal claim on the inheritance of his father; but if he was omitted in his father's will, or not expressly ex heredated, the praetor's edict relieved him. He might have a bonorum possessio, on condition that he would bring into hotchpot (bonorum collatio) with his brethren who continued in the parent's power, whatever property he had at the time of the parent's death. The bonorum possessio was given both to children of the blood (naturaes) and to adopted children, provided the former were not adopted into any other family, and the latter were in the adoptive parent's power at the time of his death. If a freedman made a will without leaving his patron as much as one half of his property, the patron obtained the bonorum possessio of one half, unless the freedman appointed a son of his own blood as his successor.

The bonorum possessio secundum tabulas was that possession which the praetor gave, conformably to the law, if the will were wanting, and it was admitted in the claim as heredes, when there was no person entitled to make a claim against the will, or none who chose to make such a claim. It was also given secundum tabulas in cases where all the requisite legal formalities had not been observed, provided there were seven proper witnesses to the will.

In the case of a married woman (intestatil), there were seven degrees of persons who might claim the bonorum possessio, each in his order, upon there being no claim of a prior degree. The first three classes were children, legitiem heredes and proximae cognati. Emancipated children could claim as well as those who were not emancipated, and adoptive as well as children of the blood; but not children who had been adopted into another family. If a freedman died intestate, legitime, or adoptively, (heredum manu) or an adoptive son, the patron was entitled to the bonorum possessio of one half of his property.

The bonorum possessio was given either cum re or sine re. It was given cum re when the person to whom it was given thereby obtained the property or inheritance. It was given sine re when another person could assert his claim to the inheritance, under the jus civile: as, if a man died intestate, leaving a sine re, the grant of the bonorum possessio would have no effect; for the heirs could maintain his legal right to the inheritance. Or, if a person who was named heres in a valid will was satisfied with his title according to the jus civile, and did not choose to ask for the bonorum possessio (which he could have if he possessed it), those who would have been heredes in case of intestacy might claim the bonorum possessio, which, however, would be unavailing against the legal title of the testamentary heres, a., since, sine re.

Parents and children might claim the bonorum possessio within a year from the time of their being able to make the claim; others were required to make their claim within a hundred days. On the failure of such party to make his claim within the proper time, the right to claim the bonorum possessio devolved on those next in order, through the seven degrees of succession.

He who received the bonorum possessio was not merely heres, but was placed heredes loci; for the praetor could not make a heres. The property of which the possessio was thus given was only in bonis, until, by usucaption, the possessio was converted into Quitterian ownership (dominium). All the claims and obligations of the deceased person were transferred with the bonorum possessio to the possessor or praetorian heres: and he was protected in his possessio by the interdictum quorum bonorum. The benefit of this interdict was limited to cases of bonorum possessio, and this was the reason why a person who could claim the inheritance in case of intestacy by the civil law, sometimes chose to ask for the bonorum possessio also. The praetorian heres could only sue and be sued in respect of the property by a legal fiction. He was not able to sustain a directa actio; but, in order to give him this capacity, he was, by a fiction of law, supposed to be what he was not, heres; and he was said facto se herede agere, or intendere. The actions which he could sustain or defend were actio suasoria.

A good general view of the bonorum possessio is given by Marezoll, "Lehrbuch der Institutionen des Röm. Rechts, § 174."

*BONASSUS (Bonaesso), a quadruped, the same with the Bisen. (Vid. Bison.)

*BOSCAS (Bosco), the Wild Duck. (Vid. Bosca.)

*BOSTRICHITES (Bosatrichites), a stone resembling a look of female hair. It is supposed to have been made of flax.

*BOS (boar), a generic term, applied to several varieties of the ox and cow, namely, of the Bos taurus. L. "The immense advantages derived from the domestication of ox in the beginning of human civilization," observes Lieut. Col. Smith, "may be gathered from the conspicuous part its and attributes perform in the early history of mankind."

We find the Bull among the signs of the Zoology; it typifies the father, the cow and calf being the species of mythology; it was personally worshipped among the Egyptians, and is still venerated in India. The Cow is repeatedly a mystical type of the earth in the mystical systems of ancient Greece, or a form of Bhavani with the Hindu. The Vedas consider it the primordial animal, the first created by the three kinds of gods who were directed by the Supreme Lord to furnish the earth with animal beings. The Ox first enabling man to till the ground, was a direct cause of private territorial property, and of its consequences, wealth, commerce, leisure, and learning; he was no less the means of abstracting mankind from the necessity of shedding blood, and thus he became the emblem of justice, the vehicle of Siva. This merited considerations we see dexterously used by ancient legislators, to soften the brutality of human manners, either by forbidding the flesh as food in those countries where his acknowledged utility was counteracted by ob stacles in the increase, or by commanding the frequent use of sacrifices by a proper slaughter, and where fire and salt should be employed to check a horrid species of massacre and practice of devour ing the flesh of one's enemies.

Toor, Tier, Deer, Stier, Steer, in the northern dialects of Europe, in their early and in their latest acceptances, are direct names of well-known ruminants; but in proportion as we pursue the root towards its origin in Central Asia, we find that the parent language of the Gothic and Schavonian, as well as those of the Hellenic and other tongues, unite in fixing it upon a larger bovine animal, perfectly applicable to have given birth in Caesar's Commentaries by the name of Urus, implying, as some think, primavoy, ancient, sylvan, fierce, mysterious; still retained in the Teutonic ur and its numerous ab
large fish, the *Raia oxyrhyncha*, L., called in English the Sharp-nosed Ray. The French name is *Alevin*.

The *leptocephalus* of Aristotle is a variety of it.

**BOONAI** (*Bos ovina*) were persons in Athens who purchased oxen for the public sacrifices and feasts. They are spoken of by Demosthenes in conjunction with the *teosouli* and those who presided over the mysteries, and are ranked by Libanius with the *tithomeis* and *boulii*; in these offices, as well as others, they were spoken of as honourable by Harpocrates, but Poli-

*BOARESMOI or BOARESMOS* (*Boreas or Boreasmus*), a festival celebrated by the Athenians in honour of *Boreas*, which, as Herodotus seems to think, originated in the *tomacula* or sacrifice of a bull, and was held on the day when the Athenians, being commanded by an oracle to invoke their *γαμόφωνος ἐπισκοπός*, prayed to *Boreas*. The fleet of *Xerxes* was soon after destroyed by a north wind, near Cape Sepias, and the grateful Athenians erected to his honour a temple on the banks of the *Ilistus*. But, considering that *Boreas* was intimately connected with the early history of Asia, we are not surprised to hear that he had married Erechtheus, and that he was familiar to them under the name of *brother-in-

The character of domestic oxen is absolutely the same as the fossil, and the wild breeds differ only in the flexures of the hams and in external appearance, occasioned by the variations of climate, food, and treatment. The humped races of Africa may be regarded as introduced with the *Bullae*. After the Hegira for the period of the *Dinahou* into that country, domestic cattle did not only fewer, but far from deserving the commendations bestowed upon them by the ancients.**

The character of domestic oxen is absolutely the same as the fossil, and the wild breeds differ only in the flexures of the hams and in external appearance, occasioned by the variations of climate, food, and treatment. The humped races of Africa may be regarded as introduced into that country, domestic cattle did not only fewer, but far from deserving the commendations bestowed upon them by the ancients."**

**BOTANOMANTEIA.** (*Vid. Divinitatine*)

**BOTEULUS** (*alluas; *δοφυς*), a sausage, was a very ancient and favourite food, and the word *tomaculum* was also a species of sausage, but not the same as the *botulis*, for Petronius speaks of *tomaculum cum hotulis*. The sausages of the ancients, like our own, were usually made of pork, and were cooked on a gridiron or frying-pan, and eaten warm (*færent et tomaculum supra eraticulum argenteum fer-

Sausages were also made with the blood of animals, like our black-puddings, and Tartar*ian* in forms as that, among the trials to which the healths exposed Christians, one was to offer them such sausages (*botuli erusere distinctos*), well knowing that the act by which they thus tempted their transgressions was forbidden by the Christian laws.

**BOUA.** (*Vid. Agele*)

**BOS MARINUS** (*Bos salvaticus*), a species of...
BOYALH (θῶν κεραυνών). In the heroic ages, represented to us by Homer, the boylai is simply an aristocratical council of the elders among the nobles, sitting under their king as president, who, however, did not possess authority higher than the other members, except what position gave him. The nobles, thus assembled, decided on public business and judicial matters, frequently in connection with, but apparently not subject to, nor of necessity controlled by, an ágyora, or meeting of the Freeman of the state. This form of government, though it existed for some time in the Ionian, Æolian, and Achæan states, was wholly abolished. Among the Dorian, however, especially with the Spartans, this was not the case; for it is well known that they retained the kingly power of the Heracleides, in conjunction with the yevrovia (vid. Gekousia), or assembly of elders, of which the kings were members. At Athens, on the contrary, the boylai was a representative, and in most respects a popular body (depatridio), the origin, nature, and duties of which we proceed to describe.

Its first institution is generally attributed to Solon. There are, however, strong reasons for supposing that, as in the case of the areopagus, he merely modified the constitution of a body which he found already existing. In the first place, it is improbable, and, in fact, almost inconsistent with the existence of a whole body of magistrates, except a small, single, absolute monarchy, to suppose that there was no such council. Besides this Herodotus tells us that in the time of Cylon (B.C. 620), Athens was under the direction of the presidents of the Naucraries (vavkorapias), the number of which was forty-eight, twelve out of each of the four tribes. Moreover, we read of the case of the Alonemus being referred to an aristocratical council. It only amounted to 300 persons, and was led by the leader of the aristocratic party at Athens, endeavoured to suppress the council, or boylai, which Cleisthenes had raised to 600 in number, and to vest the government in the hands of 300 of his own party. This, as Mr. Thirlwall remarks, can hardly have been a chance coincidence; and he also suggests that there may have been two councils, and that the council of 300 was like the Spartan, and the other a general assembly of the eunapists; thus corresponding, one to the senators, the other to the comitia curiata, or assembly of the burghers at Rome. But, be this as it may, it is admitted that Solon made the number of his boylai 400, taking the members from the first three classes, 100 from each of the four tribes. On the tribes being remodelled by Cleisthenes (B.C. 510), and raised to ten in number, the council also was increased to 500, fifty being taken from each of the ten tribes. It is doubtful whether the boylai, or councillors, were at first appointed by lot, as they were afterward; but as it is stated to have been Solon’s wish to make the boylai a restraint upon the people, and as he, moreover, said to have chosen (μελέτεται)100 members from each of the tribes, it seems reasonable to suppose that they were elected, more especially when there is no evidence to the contrary. It is, at any rate, certain that an election, where the cunapists might have used influence, would have been more favourable to Solon’s views than an appointment by lot. But, whatever was the practice originally, it is well known that the appointment was in after times made by lot, as is indicated by the title of the government, except boylai, suggested by the use of beans in drawing the lots.2

Boule.

This senate of 500 was divided into ten sections of fifty each, the members of which were called proedres (πρωτόταις), and were all of the same tribe; they acted as presidents both of the council and the assemblies during 35 or 36 days, as the case might be, so as to complete the lunar year of 354 days (12 X 29'). Each tribe exercised these functions in turn, and the period of office was called a pyrrhine (πυρρηκτεία). The turn of each tribe was determined by lot, and the four supernumerary days were given to the tribes which came last in order. Moreover, to obviate the difficulty of having too many in office at once, every fifty was subdivided into five bodies of ten each; its pyrrhine also being portioned out into five periods of seven days each; so that only ten senators presided for five days, and the remaining forty-three spoke. Again, out of these proedres an επιστάτης was chosen for every day in the week, to preside as a chairman in the senate and the assembly of the people; during his day of office he kept the public records and seal.

The pyrrhines had the right of convening the council and the assembly (εὐκλησία). The duty of the proedri and their president was to propose subjects for discussion, and to take the votes both of the councillors and the people; for neglect of their duty they were liable to a fine. Moreover, whenever a meeting, either of the council or the assembly, was convened, the chairman of the prooeidi selected by lot nine others, one from each of the ten presiding tribes; these also were called proedri, and possessed a chairman of their own, likewise appointed by lot among themselves. On their functions, and the probable object of their appointment, some remarks are made in the latter part of this article.

We now proceed to speak of the duties of the senate as a body. It is observed under ἀρχοντας that the chief object of Solon in forming the senate and the areopagus was to control the democratical powers of the state; for this reason Solon ordained that the senate should discuss and vote upon all matters before they were submitted to the assembly, so that nothing could be laid before the people on which the senate had not come to a previous decision. This decision or bill was called προβολείμα, and if the assembly had been obliged either to acquiesce in any such proposition, or to gain the consent of the senate to their modification, either of it, the assembly would have had equal powers in the state, and nearly related to each other, as our two houses of Parliament. But, besides the option of adopting or rejecting a προβολέμα, or ψηφίσμα as it was sometimes called, the people possessed and exercised the power of coming to a decision completely different from the will of the senate, as expressed in the προβολείμα. Thus, in matters relating to peace and war and national statecrafts, it was the duty of the senators to watch over the interests of the state.

and they could initiate whatever measures, and come to whatever resolutions they might think necessary; but on a discussion before the people it was competent for any individual to move a different or even contrary proposition. To take an example: In the Euboian war (B.C. 350), in which the Thebans were opposed to the Athenians, the senate voted that all the cavalry in the city should be sent out to assist the forces then besieged at Ta-

kle, perceiving this to be a different effect was proposed to the people, but they decided that the cavalry were not wanted, and the expedition was not underta-

ken. Other instances of this kind occur in Xeno-

phon. In addition to the hills which it was the duty of the senate to propose of their own accord, there were others of a different character, viz., such as any private individual might wish to have submitted to the people. To accomplish this, it was first necessary for the party to obtain, by petition, the privilege of access to the senate (πρόσδοθειανικόν έται), and leave to propose his motion; and if the measure met with their approbation, he could then submit it to the assembly. Proposals of this kind, which had the sanction of the senate, were also sometimes opposed by one of the people, the conferring of some particular honour or privilege upon an individual. Thus the proposal of Ctesi-

phon for crowning Democtenes is so styled, as also that of Aristocrates for conferring extraordin-

ary privileges on Charidemes, an Athenian com-

mander in Thrace. Any measure of this sort, which was opposed by the senate, was then sub-

mitted to the people, and by them simply adopted or rejected; and it is in these and similar cases that the statement of the grammarians is true, that no law or measure could be presented for ratifica-

tion by the people without the previous approbation of the senate, by which it assumed the form of a decree passing by the body. In the assembly the bill of the senate was first read, perhaps by the orator, after the introductory ceremonies were over; and then the proedri put the question to the people, whether they approved of it, or wished to give the subject further deliberation. The people declared their will by a show of hands (προχαρισμον). Sometimes, however, the bill was also opposed by a private individual—either the original ap-

licant for leave to bring forward the measure, or a senator distinguished for oratorical power. Ex-

amples of this are given by Schömann. If the pro-

δολεμα of the senate were rejected by the people, it was, of course, null void. If it happened that it was neither confirmed nor rejected, it was (επτεκνει) that is, only remained in force during the year the senate was in office. If it was confirmed it became a φεριμα, or decree of the people, bind-

ing upon all classes. The form for drawing up such decrees varied in different ages. Before the archon-

ship of Eucleides (B.C. 403), they were generally headed by the formula, 'Εδοκε τη βολη και τω δημω, Λαμων ς αποστησεν, Κλησεν δε επιρρο-

ματεν, Βοσκεν εισεπιτευτεν, τατ δεμερασις τοιογενε-

ων.' From the archonship of Eucleides till about B.C. 325, the decrees commence with the name of the archon; then come the day of the month, the tribe in office, and lastly, the name of the proposer. The motive for passing the decree is next stated, and then follows the decree itself, prefixed with the formula δεδομενα τη βολη και τω δημω. The reader is referred to Demosthenes, De Corone, for examples. After B.C. 325, another form was used, which continued unaltered till the latest times. We will here briefly state the difference between the νομιμου and προειρεσια. It is as follows: The former was a constitutional law; the latter, decrees of the peo-

ple on particular occasions. Mention has just been made of the γραμματου, whose name was affixed to the προειρεσια, as in the example given above: it may be as well to explain that this functionary was a clerk chosen by lot by the senate in every Prytany, for the purpose of keeping the records, and resolutions passed during that period; he was called the clerk according to the Prytany (δ κατα προειρεσιας), and the name of the clerk of the first Prytany was sometimes used to designate the year. With respect to the power of the senate, it must be clearly understood that, except in cases of small importance, they had only the right of originating measures. This, however, was the right which they wished to conserve for themselves; and whenever, however, the senators were convened by the prytanes every day, except on festivals or σημερινος μη-

ρας, it is obvious that they would be fit recipient of any intelligence affecting the interests of the state, and it is admitted that they had the right of proposing any measure to meet the emergency; for example, we find Demosthenes in the omnibus account of the conduct of Echeneis and himself, when sent out as ambassadors to Philip, in conse-

quence of which they propose a bill to the people. Again, when Philip seized on Elis [De C. 338], the senate was immediately called together by the prytanes to determine what was best to be done. But, besides passing the initiatory power of which we have spoken, the senate was sometimes delegated by the people to determine absolutely about par-

ticular matters, without reference to the assembly. Thus we are told that the people gave the senate power to decide about sending ambassadors to Philip, and Andocides informs us that the senate was invested with absolute authority to investigate the conduct of the generals, and to censure or reward them previously to the sailing of the Sicilian expedition. Sometimes, also, the senate was empowered to act in conjunction with the nomothetes (συνομο-

θητερας), as on the revision of the laws after the ex-

pulsion of the Thirty by Thrasybulus and his party, B.C. 403. Moreover, it was the province of the senate to receive ελεγχαδες, or informations of ex-

traordinary crimes committed against the state, and for which there was no special law provided. The senate in such cases either decided themselves, or referred the case to one of the courts of the helia, especially if they thought it required a higher pen-

alty than it was competent for them to impose, viz., 500 drachmae. It was also their duty to decide on the qualification of magistrates, and the character of members of their own body. (Vid. D. H. H. M.) But, besides the duties we have enumerated, the senate discharged important functions in cases of finance. All legislative authority, indeed, in such matters rested with the people, the amount of ex-

penditure and the sources of revenue being deter-

mined by the decrees which they passed; but the administration was intrusted to the senate, as the
executive power of the state, and responsible (οἰσχύνων) to the people. Thus Xenophon\(^1\) tells us that the senate was occupied with providing money, with receiving the tribute, and with the management of naval affairs and the temples; and Lysias\(^2\) indicates the following remark: 'When the senate has sufficient money for the administration of affairs, it does nothing wrong; but when it is in want of funds, it receives informations, and confiscates the property of the citizens.' The letting of the duties (τελώνεια) was also under its superintendence, and those who were in possession of any sacred or public moneys (εἰρέα καὶ δόσια) were bound to pay them into the senate-house; and in default of payment, the state, as a matter of course, retained the moneys, in conformity with the laws for the furnishing of the duties (οἱ τελώνικοι νόμος).

The accounts of the moneys that had been received, and of those still remaining due, were delivered to the senate by the aριστοκρατικοί, or public treasurers. (Vid. Αριστοκρατικό.)

'"The senate arranged, also, the application of the public money, even in trifling matters, such as the salary of the poets, the superintendence of the calamities already maintained by the state, and the examination of the infring (ἀδιάβαινος) supported by the state, are particularly mentioned among its duties; the public debts were also paid under its direction. From this enumeration we are justified in inferring that all questions of finance were confided to its supreme regulation.\(^3\) Another very important duty of the senators was to take care, in the carrying on of public affairs, that none of them was built every year, for which purpose they were supplied with money by the state; in default of doing so, they were not allowed to claim the honour of wearing a crown or chaplet (στέφανος) at the expiration of their year of office.\(^4\)

It has been already stated that there were two classes of proedri in the senate, one of which, amounting to ten in number, belonged to the presiding tribe; the other consisted of nine, chosen by lot by the chairman of the presiding proedri from the nine non-presiding tribes, one from each, as often as either the senate or the people were convened. It must be remembered that they were not elected as the other proedri, for seven days, but only for the sessions as the session of the senate, or meeting of the people, lasted. Now it has been a question what were the respective duties of these two classes: but we have no hesitation in stating our conviction that it was the proedri of the presiding tribe who proposed to the people in assembly the subjects for discussion; recited, or caused to be recited, the previous bill (προσδήλαμα) of the senate; officiated as presidents in conjunction with their proedri, or chairman, and discharged, in fact, all the functions implied by the words χρηστοίσιν πόρον τὸν δήμον. For ample arguments in support of this opinion, the reader is referred to Schömann.\(^5\) It does indeed appear, from decrees punished by inscriptions and other authorities, that in later times the proedri of the nine tribes exercised various functions which the orations of Demosthenes and his contemporaries justify us in assigning to the proedri of the presiding tribe. It must, however, be remarked, that all such decrees were passed after B.C. 308, when there were twelve tribes; and that we cannot, from the practice of those days, arrive at any conclusions relative to the customs of former ages.

If it is asked what, then, were the duties of these proedri in earlier times, the answer must be in a great measure conjectural; but the opinions of Schömann on this point seems very plausible. He ob-

---

2. serves that the prytanes had extensive and important duties intrusted to them; that they were all of one tribe, and therefore closely connected; that they officiated for thirty-five days as presidents of the representatives of the other tribes; and that they had ample opportunities of combing for the benefit of their own tribe at the expense of the community. To prevent this, and watch their conduct whenever any business was brought before the senate and assembly, may have been the reason for ap pointing, by lot, nine other quasi-presidents, representatives of the non-presiding tribes, who would protest and interfere, or approve and sanction, as they might think fit. Supposing this to have been the case, it is easy to see how they might at least have been united with the proper proedri in the performance of duties originally appropriated to the latter.

In connexion with the proedri, we will explain what is meant by the phrase προτεροδοτεύοντας φίλους. Our information on this subject is derived from the speech of Ἐσχινης against Timarchus, who informs us that, in consequence of the uncertain conduct of Timarchus on one occasion before the assembly, a new law was passed, in virtue of which a tribe was chosen by lot to keep order, and sit as presidents under the βήμα, or platform on which the orators stood. No remark is made on the subject to warrant us in supposing that senators only were elected to this office; it seems more probable that a credibl power was chosen from the tribe on which the lot had fallen, and occasionally to sit along with the prytanes and the proedri, and that they assisted in keeping order. We may here remark, that if any of the spekters (ὑπόπερος) misconducted themselves either in the senate in the assembly, or were guilty of any act of violence to the ἐπιστάμενος, after the breaking up of tumult, the proedri had the power to draw up a summary fine, or bring the matter before the senate and assembly; the next meeting, if they thought the case required it.

The meetings of the senate were, as we learn from various passages of the Attic orators, open to strangers; thus Demosthenes\(^6\) says that the senate-house was, on a particular occasion, full of strangers (στραγγαλοι); in Ἐσχινης we read of a motion "that strangers do not withdraw (μεταστραγγάμενοι τοις ἑστατοις)." Nay, private individuals were sometimes, by a special decree, authorized to come forward and give advice to the senate.\(^7\) The senate-house was called τὸ βουλεύ-

3. τήρημα, and contained two chapels, one of ᾽Ενετος βουλακίων, another of ὁθώρα ταυρινία, in which it was customary for the senators to offer up certain prayers before proceeding to business.\(^8\) The prytanes also had a building to hold their meetings in, where they were entertained at the public expense during their prytany. This was the προτεροδοτίαν, and was used for a variety of purposes. (Vid. ΠΡΟΤΕΡΟΔΟΤΙΑΝ.) Thucydides,\(^9\) indeed, tells us that, before the time of Thucydides, every city of Attica had its βουλευτήριον and προτεροδοτίαν; a statement which gives additional support to the opinion that Solon did not originate the senate at Athens.

The number of tribes at Athens was not always ten; an alteration took place in B.C. 306, when Demetrius Poliorcetes had liberated the city from the usurpation of Cassander. Two were then added, and called Demetrius and Antigonus, in honor of Demetrius and his father.\(^1\) It is evident that

---

2. (De Buc. Theb., 1, 243, 3).
that the consequent addition of 100 members to the senate, must have varied the order and length of the pyrtanes. The tribes just mentioned were afterward called Ptolemais and Atalai; and in the time of Hadrian, who beautified and improved Athens, a tristcheenth was added, called from him Hadrianis. An edict of this emperor has been preserved, which proves that even in his time the Athenians kept up the show of their former magnificence.

BOULÈTÆUS GREGÁN (Boulètésous gráphi), an impeachment for conspiracy. Bouleutéus, being in this case the abbreviated form of epístóleus, is the name of two widely different actions at Attic law. The first was the accusation of conspiracy against life, and might be instituted by the person thereby attacked, if competent to bring an action; otherwise, by his or her legal patron. In case of the plot having succeeded, the deceased might be represented in the prosecution by near kinsmen (ói kynés anépísitos), or, if they were incompetent, by the kínetes, as above mentioned. The criminality of the accused was independent of the result of the conspiracy, and the penalty, upon conviction, derived from the conspiracy. 

The presidency of the court, upon a trial of this kind, as in most tókoi faináke, belonged to the king archon, and the court itself was composed of the ephetae, sitting at the Palladion, according to Issæus and Aristotele, as cited by Hapscis, who, however, also mentions that the Athenians were succeeded by Dimarchus to have been the proper tribunal.

The other action, bouleútésus, was available upon a person finding himself wrongfully inscribed as a state debtor in the registers or rolls, which were kept by the different financial officers. Meier, however, suggests that a magistrate that had so offended would probably be proceeded against at the order of kathêkouríterous, or after an accusation to which the public conduct of magistrates was examined, so that, generally, the defendant in this action would be a private citizen, that had directed such an assertion at his own peril. From the passage in Demosthenes, it seems doubtful whether the disfranchisement (dramia) of the plaintiff as a state debtor was a penalty comparable to the actual murderers. The presidency of the court, upon a trial of this kind, as in most tókoi faináke, belonged to the king archon, and the court itself was composed of the ephetae, sitting at the Palladion, according to Issæus and Aristotele, as cited by Hapscis, who, however, also mentions that the Athenians were succeeded by Dimarchus to have been the proper tribunal.

There is no very obvious distinction laid down between this action and θεσμογραφία; but it has been conjectured by Suidas, from a passage in Lycurgus, that the latter was adopted when the defendant was a debtor to the state, but found his debt wrongly set down, and that bronceínas was the remedy of a discharged debtor again registered for the debt already paid. If the defendant lost his cause, his name was substituted for that of the plaintiff. The cause was one of the prápsis lýan that came under the jurisdiction of the thesmothéca.

BOULEUTERON. (Vid. BOULÉ.)

The process of BRACÉ or BRACCE (λαύριδες), trousers, pantaloons.

These, as well as various other articles of armour and of dress (vid. ACOINAS, ARBUS, ARILLMA), were common to all the nations which encircled the Greek and Roman population, extending from the Indian to the Atlantic Ocean. Hence Aristogoras, king of Miletus, in his interview with Cleomenes, described the attire of a large portion of them in these terms: "They carry bows and a short spear, and go to battle in trousers and with hats upon their heads." Hence, also, the phrase Bracca militis στριφτος, signifying that those who wore trousers were in general armed with the bow. In particular, we are informed of the use of trousers or pantaloons among the following nations:

The Gallic term "brakes," which Diodorus Siculus has preserved in the last-cited passage, also remains in the Scottish "breacks" and the English "breaks." Corresponding terms are used in all the northern languages. 14. The Cononius and Persian trousers of the present day differ in no material respect from those which were anciently worn in the same countries.

In conformity with the preceding list of testimonies, the monuments of every kind which contain representations of the nations included in it, exhibit them in trousers, thus clearly distinguishing them from Greeks and Romans. An example is seen in the annexed group of Sarmatians, taken from the column of Trajan.

The proper bracca of the eastern and western nations were loose (κεραλαστήσσαντες), and they are therefore very aptly, though ludicrously, described in Empirides as "variegated bags" (τοὺς δυλίκους τοὺς ποτίκοις). To the Greeks they must have appeared highly ridiculous, although Ovid mentions the adoption of them by the descendants of some of the Greek colonists on the Euxine.

Trousers were principally worn by, but Agathisan states that in Europe they were also made of linen and of leather; probably the Asiatics made them of cotton and of silk. Sometimes they were striped (vīgala), ornamented with a woof of various colors.

BREVIARIUM.

BRACHIALE. (Vid. Armilla.)

BRASIDEA (Brasida), a festival celebrated at Sparta in honour of their great general Brasidas, who, after his death, received the honours of a hero. It was held every year with orations and tقصests, in which none but Spartans were allowed to partake.

Brasidae were also celebrated at Amphipolis, which, though a colony of Athens, transferred the honour of κιστος from Hagnon to Brasidas, and paid him heroic honours by an annual festival with sacrifices and contests.

*BRASSICA (καπιθών), the Cabbage. Some varieties of this plant have been cultivated from the very earliest times of which we have any record. But the migrations and changes of the best sorts have not been traced; neither is it at all probable that the varieties which the ancients enjoyed have descended to us unaltered. Three kinds of cabbage were known to the Romans in the time of Caesar: the first had a large stalk, and leaves also of considerable size; the second had crisp leaves; the third, which was the largest, had small, soft leaves, and a bitterish taste. According to Columella, the brassica or cabbage was a favourite edible with the Romans, and in sufficient plenty to be even an article of food for slaves. It was sown and cut all the year round; the best time, however, for planting it was after the autumnal equinox.

When it had been once cut after this, it put forth young and tender shoots during the ensuing spring. Appius Claudius the Consul of Rome in the time of Tiberius employed these, and inspired the young prince Drusus with the same dislike towards them, for which, according to Pliny, he was reproved by his father Tiberius. This same writer mentions various kinds, of which the most esteemed was that of Ariea, with numerous and very thick leaves. Cato's second kind, the Olus Apium (more correctly APLICON), is the brassica vulgaris crispa of modern botany. The Olus Aricium is the Brassica oleracea gongylodes, L.; the Brassica Halmymida is thought to have been the Crambe maritima; some, however, are in favour of the Convolvulus soldanella. 'It is uncertain,' observes Bevemann, 'whether we still possess that kind of cabbage which the ancients, to prevent intoxication, ate raw like salad.'

Of red cabbage, according to a late author, the ancient Germans, and, in fact, all the northern nations of Europe, cultivated the cabbage from very remote times. The Saxons name for February is sprout-kale, and that is the season when the sprouts from the old stalks begin to be fit for use. The Saxons must of course, therefore, have been familiar with the culture of cabbage as it is now known. We have no evidence of cabbage cultivation amongst the English until after their settlement in Britain. We nowhere find among the Greeks and Romans any traces of that excellent preparation of cabbage called by the Germans suor-kraut, though the ancients were acquainted with the art of preparing turnips in the same manner.

Whether suor-kraut be a German invention appears somewhat doubtful, if the statement of Helon be correct, who informs us that the Turks in his time were accustomed to pickle cabbage for winter food.

*BRAVITUS (Bravies), the Savine, or Juniperus & bina. According to Pliny, there were two kinds, the one resembling the tamarisk, the other the cypress; and hence some called the latter the Cretan cypress. The two species described by Dioscrides are hence supposed by Sprengel to be Tamarica and Cypresia.

BRAVARIA (Bravaronia), a festival celebrated in Libya of Artemis Brauronia, in the Attic town of Brauron, where, according to Aesopus, two oracles and Iphigenia, on their return from Tauria, were supposed by the Athenians to have landed, and left the statue of the Taurian goddess. It was held every fifth year, under the superintendence of ten epitoi; and the chief solemnity consisted in the circumstance that the Attic girls between the ages of five and ten years, dressed in crocus-colored garments, went in solemn procession to the sanctuary, where they were consecrated to the goddess.

During this act the epitoi sacrificed a goat, and the girls performed a propitiatory rite in which they imitated bears. This rite may have simply arisen from the circumstance that the bear was sacred to Artemis, especially in Arcadia; but a tradition preserved in Suidas relates its origin as follows: In the Attic town of Phenchis a bear was kept, which was so tame that it was allowed to go about quite freely, and received its food from and among men. One day a girl ventured to play with it, and, on treating the animal rather harshly, it turned round and tore her to pieces. Her brothers, enraged at this, went out and killed the bear. The Athenians now were visited by a plague; and when they consulted the oracle, the answer given was that the statue of the goddess had been evil which had befallen them if they would compel some of their citizens to make their daughters propitiate Artemis by a rite called ἀργυρείνειν. For the crime committed against the animal sacred to the goddess, the command was more than obeyed; for the Athenians decreed that from thenceforth all women, before they could marry, should have once taken part in this festival, and have been consecrated to the goddess. Hence the girls themselves were called ἀργυροί, the consecration ἀργυρείνειν, the act of consecrating ἀργυρείται, and to celebrate the festival ἀργυρεῖα. But as the girls, when they celebrated this festival, were nearly ten years old, the verb βαρανίας was sometimes used instead of ἀργυρείειν. According to Hesychius, whose statement, however, is not supported by any other ancient authority, the lidon was reducted on this occasion by pharaohs.

There was also a quinquennial festival called Brauronia, which was celebrated by men and Bdoouine women, at Brauron, in honour of Dionysus. Whether its celebration took place at the same time as that of Artemis Brauronia (as has been supposed by Dr. Meyer, who has, howeyer, omitted it in the English translation), or at a different time, remains uncertain, although the very different characters of the two festivals incline us rather to believe that they were not celebrated at the same time.

BREVIARIUM or BREVIARIUM AL ARI- CANUM. Alaric the Second, king of the Vagritos, who reigned from A.D. 494 to A.D. 507, in the

BRIDGE.

The Xen., for but the Greece and 1. (Hcsych., The (Herod., people 22.) drawbridge, this right opposed composed for the use of his Roman subjects. The code, when made, was confirmed by the bishops and nobility; and a copy, signed by Anianus, the referendarii of Alaric, was sent to each city, with an order to use no other law or legal form in his court (ut in foro tuo nulla alia lex neque juris formula proferri vel recti pravsmatur). The signature of Anianus was for the purpose of giving authenticity to the official copies of the code; a circumstance which has been so far misunderstood that he has sometimes been considered as the compiler of the code. This code has been called Lex Romana, and, at a later period, frequently Lex Theodosii, from the title of the first and most important part of its contents. The name Brevarium, or Brevarium Alarianum, does not appear before the sixteenth century.

The following are the contents of the Brevarium, with their order in the code: 1. Codex Theodosianus, xvi. books. 2. Novellae of Theodosius II., Val- entian III., Marcian, Majorian, Severus. 3. The Institutions of Gaius. 4. Pauli Receptam Sementiae, v. books. 5. Codex Gregorianus, 13 titles. 6. Codex Hermogenianus, 2 titles. 7. Papinianus, lib. i. Respensorum. The code was thus composed of two kinds of ma- terial, imperial constitutions, which, both in the code itself, and the commentorium or notice prefixed to it, are called Leges; and the writings of Ro- man jurists, which are called Jus. Both the Codex Gregorianus and Hermogenianus, being compila- tions made without any legal authority, are included under the head of Jus. The selections are extracts, with occasional additions, from four different sources, except in the case of the Institutions of Gaius; as a general rule, the text, so far as it was adopted, was not altered. The Institutions of Gaius, however, are abridged or epitomized, and such alterations as were considered necessary for the time are intro- duced into the text: this part of the work required no interpretation, and, accordingly, it has few notes. The code contains a small part of the history of Roman law, as it contains several sources of the Roman law which otherwise are unknown, espe- cially Paulus and the first five books of the Theo- dosian Code. Since the discovery of the Institu- tions of Gaius, that part of this code is of less value. The author of the Epitome of Gaius in the Bre- varium paid little attention to retaining the words of the original, and a comparison of the Epitome and the MS. of Gaius is therefore of little advan- tage in this point of view. The Epitome is, how- ever, still useful in showing what subjects were dis- cussed in Gaius, and thus filling up (so far as the material contents are concerned) some of the lacu- nas of the Verona MS. The edition of this code was undertaken by Siehard, in his Codex Theodosianism, Basileia, 1538, small folio. The whole is contained in the edition of the Theodosian Code by Cujacius, Lugd., 1666, folio. The Theodosian Code and the Novellae alone are contained in the editions of Marvile and Ritter; the remainder is contained in Schulting. Jurisdictiona Vitae Ante-Justinianae, Lugd. Bud., 1717. The whole, together with the fragments of Ulpin and other things, is contained in the Jus Ci- vile Antejustinianum, Berlin, 1815.

BRIDGE (γέφυρα, ponte). The most ancient bridge upon record, of which the construction has been described, is the one erected by Nitooris over the Euphrates at Babylon. It was in the nature of a drawbridge, and consisted merely of stone piers without arches, but connected with one an- other by a framework of plankng, which was re- moved at night to prevent the inhabitants from pass- ing over from the different sides of the river to com- mit mutual depredations. The stones were fast- ened together by iron cramps, which united, and the piers were built while the bed of the river was free from water, its course having been divert- ed into a large lake, which was again restored to the usual channel when the work had been com- pleted. See the description given by Dido- rus Sicinus, who ascribes the work to Semiramis.

Temporary bridges constructed upon boats, called ctenoem, 6046 were frequently made use of in the country. The word ctenoem, 6047 is the genitive singular of cteno, 6048 which becomes cteno in all its forms except the dative plural, where ctenes arises. The word signifies a net, the Romans being familiar with the word from their knowledge of the fish- ermen's nets. Some of the names of the bridge were First bridge which was con- structed at this spot was washed away by a storm almost immediately after it was completed, and of this no details are given. The subsequent one was executed under the directions of a different set of men, and the style of building them was par- taken of the nature of suspension bridges, the platform which formed the passage-way being se- cured upon enormous cables formed by ropes of flax (αἰενόκαλυμ) and papyrus (σιδηλώμ) twisted together, and then stretched tight by means of wind- lasses (hōyō) on each side. The bridge of which mention cannot be strictly denominated Greek, although the architects by whom the last two were constructed were natives of the Greek islands. But the frequent mention of the word in Homer proves that they were not un- common in Greece, or, at least, in the western part of Asia Minor, during his time. The Greek term for a permanent bridge is γέφυρα (γέφυρα, γέφυρα), and the eponymous Boeotian bridge is the Gephyraeia (Γεφυραία), a people whom Herodotus states have been Phoenicians, though they pretended to have come from Eretria; and the etymologists accord- ingly tell us that the first bridge in Greece was built by this people across the Cephissus; but such an explanation is opposed to sound etymology and common usage. At the rivers of Greece were small, and the use of the arch known to them only to a limited extent (vid. Acacus), it is probable that their bridges were built entirely of wood, or, at best, were nothing more than a wooden platform supported upon stone piers at each extremity, like that of Ni- tooris described above. Pliny mentions a bridge over the Acheron 1000 feet in length, and also says that in the region of the river Cephissus, the first people who dwelt there, erected an arch over a ravine by a bridge; but it is probable that both these works were executed after the Roman conquest.

In Greece also, as well as in Italy, the term bridge was used to signify a roadway raised upon piers or arches to connect the opposite sides of a ravine, even where no water flowed through it.

The Romans were the first people who applied the arch to the construction of bridges, by which they were enabled to erect structures of great beauty and solidity, as well as utility; for by

BRIDGE.

this means the openings between the piers for the convenience of navigation, which in the bridges of Babylon and Greece must have been very narrow, could be extended to any necessary span.

The width of the passage-way in a Roman bridge was commonly narrow, as compared with modern structures of the same kind, and corresponded with the road (via) leading to and from it. It was divided into three parts. The centre one, for horses and carriages, was designated agger or the raised footpaths on each side (decursae), which were enclosed by parapet walls similar in use and appearance to the pilaeae in the basilica. (Vid. BASILICA, p. 142.)

Eight bridges across the Tiber are enumerated by P. Victor as belonging to the city of Rome. Of these, the most celebrated, as well as the most ancient, was the Pons Sublicius, so called, because it was built of wood; similae, in the language of the Formian, meaning wooden beams. It was built by Ancus Marcius, when he united the Janiculum to the city, and became renowned from the well-known feat of Horatius Cocles in the war with Porsonna. In consequence of the delay and difficulty then experienced in breaking it down, it was reconstructed without nails, in such a manner that each beam could be removed and replaced at pleasure. It was so rebuilt by the pontifices, from which fact, according to Varro, they derived their name; and it was afterward considered so sacred, that no repairs could be made in it without previous sacrifice conducted by the pontifex in person.

In the age of Augustus it was still a wooden bridge, as is manifest from the epithet used by Ovid. 4

"Tunc quoque priscorum Virgo simulacra vivorum
Milites roboreae scripsa ponte soles;" 4

in which state it appears to have remained at the time of Otho, when it was carried away by an inundation of the Tiber. In later ages it was also called Pons Emilius, probably from the name of the person by whom it was rebuilt; but who this Emilius was is uncertain. It may have been Emilius Lepidus the triumvir, or probably the Emilius Lepidus who was censor with Mutilus Plancus, under Augustus, ten years after the Pons Sublicius fell down, as related by Dion Cassius. 13 We learn from P. Victor, in his description of the Regio xi., that these two bridges were one and the same: "Emil-

A representation of this bridge is given in the following woodcut, taken from a medal still extant. It affords a specimen of the style employed at the period when the fine arts are considered to have been at their greatest perfection at Rome.

VIII. Pons Miltius, on the Via Flaminia, now confirmed by the fact that he afterward put to death the architect, Artemidorus, under whose directions it was constructed.

The Romans also denominated by the name of pontes the causeways which in modern language are termed "viaducts." Of these, the Pons ad Nonam, now called Ponte Nono, near the ninth mile from Rome, on the Via Flaminia, is a fine specimen.

Among the bridges of temporary use, which were

Ponte Mollo, was built by Emilius Seaurus the censor, and is mentioned by Cicero about 45 years after its formation. Its vicinity was a favourite place of resort for pleasure and debauchery in the licentious reign of Nero. Upon this bridge the ambassadors of the Alliobroges were arrested by Cicero’s retainers during the conspiracy of Catiline. Catilus and Pompy encamped here against Lepidus when he attempted to annul the acts of Sulla. And, finally, it was at this spot that the battle between Maxentius and Constantine, which decided the fate of the Roman Empire, took place (A.D. 312). The Roman bridges without the city were far too many to be enumerated here. They formed one of the chief embellishments in all the public roads; and their frequent and stupendous remains, still existing in Italy, Portugal, and Spain, attest, even to the present day, the scale of grandeur with which their works of national utility were always carried on. Subjoined is a representation of the bridge at Ariminum (Rimini), which remains entire, and was commenced by Augustus and terminated by Tiberius, as we learn from the inscription, which is still extant. It is introduced in order to give the reader an idea of the style of art during the age of Vitruvius, that peculiar period of transition between the austere simplicity of the Republic and the profuse magnificence of the Empire.

The bridge: thrown across the Bay of Baiae by Caligula, the useless undertaking of a prodigal prince, does not require any farther notice; but the bridge which Trajan built across the Danube, which is one of the greatest efforts of human ingenuity, must not pass unmentioned. A full account of its construction is given by Dion Cassius,1 and it is also mentioned by Pliny.2 The form of it is given in the following woodcut, from a representation of it on the column of Trajan at Rome, which has given rise to much controversy, as it does not agree in many respects with the description of Dion Cassius. The inscription, supposed to have belonged to this bridge, is quoted by Leucanius3 and by Gruter.4

Sub jucum ecce rapit et Danuvius.

purposes of sculpture. It was destroyed by Hadrían, under the pretense that it would facilitate the incursions of the barbarians into the Roman territories, but in reality, it is said, from jealousy and despair of being able himself to accomplish any equally great undertaking, which is supposed to be 1. (Spart., Hadri., c. 19.—Dion, Ixix., 707, E.)—2 (Aux. Vict., De Viris Illustribus, c. 27, § 6)—3 (in Cat., iii., 2).—4. (Taeut., Ann., xii., 47).—5. (Cic. in Cat., iii., 2).—6. (Florus, ii., 23).—7. (Dion, i., 659, E.—Suet., Calig., 19).—8. (Lex., 776, B.).—9. (Eut., vii., 4.—Compare Prosperus, De Edificiis, 10. in 1041 §§ 11.—12. (Duen., I c.)
When the Comitia were held, the voters, in order to reach the Rolloumla called Dupium and ovale, passed over a wooden platform, elevated above the ground, which was called Pons Saffragiorum, in order that they might be able to give their votes without confusion or collision. Pons is also used to signify the platform (εροτοιδ, αριστοδία) used for embarking in, or disembarking from, a ship.

"Inter caeca sensos de pappibus alius Pontibus exponit."

The method of using these ponics is represented in the annexed woodcut, taken from a very curious intaglio, representing the history of the Trojan war, discovered at Bonnale towards the latter end of the 17th century, which is given by Fabreiti, Syntaxma de Column. Trajanii, p. 315.

*BRONOS* (βρόνος or βρόνον), a plant, which Derrich makes to be the Avena sativa, "Oats." Stackhouse, however, is in favour of the Secale Cereale, and Sprengel of the Avena futa, "or wild Oats."

BRONZE (γαλακτικ, as), a compound of copper and tin. Other metals are sometimes combined with the above; but the most ancient bronzes, properly so called, are found to consist of those two ingredients. In the article on ἔξος, some farther particulars are supplied respecting the different compositions of bronze and brass. The distinctive terms should always be observed in speaking of these substances, as the indiscriminate use of them has led to great error and confusion in describing works of art.

There can be no question as to the remote antiquity of metallurgy; though at what precise period the various metals were known, in what order they were discovered, and by what processes extracted—either simply, or by reducing their ores when they were found, or when they were not found, or by no satisfactory means of judging. In the twenty-eighth chapter of the book of Job we read, "Surely there is a vein for the silver, and a place for gold where they find it. Iron is taken out of the earth, and brass (copper) is molten out of the stone." This passage, taken as a whole, and supported as it is by various intimations throughout the Pentateuch, shows that at this early period greater advances had been made in mining and the metallurgical arts than is usually supposed. There is the same dearth of exact information on the practice of the metal-founders and workers of the archaic ages, even after the different substances were known, and objects of imitative art had been executed in them.

The most ancient Greek bronzes extant are composed simply of copper and tin; and it is remarkable that the very ancient proportions of the metals agree in all the specimens that have been analyzed. Some bronze nails from the ruins of the Treasury of Atreus at Mycenae; some ancient coins of Corinth; a very ancient Greek helmet, on which is a houstrophedon inscription, now in the British Museum; portions of the breastplates of a piece of armour called the Bronzes of Siris, also preserved in our national collection; and an antique swor found in France, produced in 100 parts, 87-43 and 88 copper 12-53 and 12 tin 99-96 100

At a later period than that to which some of the above works may be referred, the composition of bronze seems to have been a subject to which the greatest attention was paid; and the addition of a variety of metals seems to have been made to the original (if it is a natural combination) of copper and tin. The few writers on art whose evidence has reached our times, make particular mention of certain of these bronzes, which, notwithstanding the changes they underwent by the introduction of novel elements, were still ranked under the words γαλακτικ and ασ. That which appears to have held the first place in the estimation of the ancients was the παρυονῖν bronzium, which some pretended was an alloy made accidentally, in the first instance, by the melting and running together of various metals (especially gold and bronze), at the burning of Corinth by Lucius Mummius, about 168 B.C. This account is obviously incorrect, as some of the artists whose productions are mentioned as composed of this highly valued metal lived long before the event alluded to. Piny particularizes three branches of the Corinthian, which the first, he says, was white (κενθιανό), the greatest proportion of silver that was employed in its composition giving it a light colour. In the second sort or quality gold was introduced, in sufficient quantity to impart to the mixture a strong yellow or gold tint. The third was composed of equal proportions of the different metals. The next bronze of note among the ancient Greek sculptures is distinguished by the title of hepatizon, which it seems it acquired from its colour, which bore some resemblance

1. (De Bell. Gall., iv, 17.)—8. (iii. 7).—3. (viii, 4, 5).—4. (viii, 5. 4).—5. (i. c.)—6. (Florus, iii, 5).—7. (Virg., Æn., x, 391.)
The accounts that have been brought down to us are to be credited, to have existed in very early times. This is not the place to discuss the genuineness of the passage in Homer in which mention r made of the shield of Achilles. It is only necessary here to state, that in one of its compartments, oxen, sheep, and various other objects were represented, and that they were distinguished by variety of colour.

Pliny* says that the artist Aristonidas made a statue of Ahasvus, in which he proposed to himself the difficult and almost impossible task of producing a mixed plating, by using a mixture of iron with the bronze in which the work was executed (Es ferrumagus miscuit, ut rubigine eis per nilores oris relucere exprimatur vercundia rubor). Plutarch tells us that a statuary called Silanos or Silanion made statue of Jocasta dying, and so composed his metals that a salid appearance or complexion was produced. This, it is inferred, was effected by the introduction of silver. Callistratus speaks of a statue of Cupid by Praxiteles, and another of occasion (Kairos), represented under the form of a youth; also one of Bacchus by Praxiteles; all of which were remarkable for the colour of the bronze imitating the appearance of nature. A bronze relieve of the head of the Minotaur was also referred to for its truth of effect, produced by the blending of colours, and which rendered it worthy to be compared with the finest pictures.

With the very limited data we possess, it is impossible to offer much conjecture upon these state means, or to say how much or how little they are correct. They must be relied upon merely as probably inventions of the fancy; some of them may be founded on facts greatly overcharged, the effects described being produced by overlaying the metal with colour, or, in some cases, perhaps, by what is now called plating. A slight acquaintance with the nature of metal, and the processes of founding, will be sufficient to convince any one of the improbability (at least by melting the materials together, and producing variety of tints) what it is pretended was done in some of the instances referred to.

The earliest mode of working in metal among the Greeks seems to have been with the hammer; by beating out lumps of the metal into the form produced, as in the case of the temples of Minerva, tended to designate the combination of the two metals alluded to. Reference to the passage in Pliny will make this clear to the reader. He says distinctly it was not found in his time, the mines which produced it being exhausted.

Although, strictly speaking, it does not belong to our subject, a mixture, which was employed and much esteemed by the ancients, may be mentioned in this place. It was called electrum, and was composed of gold and silver in certain proportions. It was, in all probability, only used for extraordinary purposes. Thus Helen is said to have dedicated, in the Temple of Minerva at Lindus, a cup made of electrum, of the exact size and form of one of her Phaethonts, or Pythagoras, were in the zenith of their glory. This taste was carried into metal-works, and seems, if

---

** Pliny. H. N., xxxii., 22. 2.
The subject is a small head of Osiris and the wood is still remaining within the metal. It is probable that the terms *holophryon* and *sphyrra* were intended to designate the two modes of hammer-work; the first on a solid mass, and the other hammering out plates.

It is extremely difficult to determine at what date the casting of metal was introduced. That it was known at a very early period there can be no doubt, although it may not have been exercised by statuaries in European Greece till a comparatively late date. The art of founding may be divided into three classes or stages. The first is the simple melting of metals; the second, casting the fused metals into prepared forms or moulds; and the third, casting into a mould, with a core or internal nucleus, by which the metal may be preserved of a determined thickness. The first stage must have been known at a period of which we have no record beyond that intimation especially alluded to in Job, which establishes the fact that some of the processes of metallurgy were well known when that book was composed. The earliest works of art described as of hammer-work were probably executed in lumps of metal that had already undergone this simple preparation. The casting of metal into moulds must also have been practised very early. There is very little known about the preparation of the mould, or exposure the forms or moulds were made, but in all probability clay (dried, and then perhaps baked) was employed for the purpose. The circumstance of a spot where clay abounded having been chosen for the foundling of the bronze works for the Temple of Solomon supports this supposition. Of course, all the earliest works produced in this manner of the best known have not been solid. The third process, that of casting into a mould with a core, was an important step in the statuary's art. Unfortunately, there is no record of the time, nor of the mode in which this was effected by the ancients, unless we consider the statements of Pausanias of sufficient authority for the date of the various discoveries among the Greeks. His account would make one of the bronze heads not have been solid. Before the time of Theodorus of Samos, who probably lived between eight and seven hundred years before our era, Herodotus, Plisty, and Pausanias make honourable mention of Rhaeus and Theodorus. Pausanias says that they first invented casting in bronze (δυναμως χαλλας και άγρωτες εκχωναισην), Pliny, who seems to have written down whatever he heard, says, "In Samo primos omnium \(\text{πλατις}^\) invenisse Rhaecum et Theodorum," but he proves the incorrectness of this statement by recording an instance of the proficiency of Theodorus in his art, when he says "He cast a bronze statue of himself, holding in one hand a file (a illusion, probably, to his profession), and in the other a quadriga of such small dimensions that a fly might cover it with its wings." An example of practical skill that at once places him in a much more advanced rank in his art than the inventor of its first and most simple process could have attained.

The ancients used something answering the purpose of a solder for fastening the different pieces of metal together; but it is difficult to determine whether the term *κάλλας* means a solder or only a metal that might be mixed with a different material to give it something different from nails or cramps, and gives us the name of its inventor, Glauclus of Chios. He is speaking of a vase of iron, which he says was the work of Glauclus (του Χίου, σιδήρου κάλλας ἀνέρη τευχώτος). The art of raising the 1. (Plut., iv., 12, § 3) — 6. pl. 51; iii., 41, 60, 3. (H. N., xevii, 43, &c.) — 4 (viii., 14, § 5) — 5 (1, c.) 178.
examples of bronze works that have reached us exhibit signs of having been gilt, and the writers of antiquity refer occasionally to the practice. It does not seem to have been employed till taste had much deteriorated; probably when the value and richness of the material were more highly estimated than the excellence of the workmanship. Nero commanded a statue of Alexander, the work of Ly- sippus, to be gilt; but Pliny tells us it was found to injure the beauty and effect of the work, and the gold was removed. The great works of destruction, at one time, of ancient works of art is supposed to have occurred at the taking of Constantiople, in the beginning of the thirteenth century. The collection of statues was made with great care, and their number had accumulated to a amount which seems quite surprising when it is considered how long a time had elapsed since art had been encouraged or protected. At the period alluded to are told that some of the finest works of the ancient masters were purposely destroyed; either in mere wantonness, or with the view of turning the material into money, or for sale to the metal founders for the value of the bronze. Among the few works saved from this devastation are the celebrated bronze horses which were originally the property of St. Mark's Church at Venice. They have been ascribed, but without sufficient authority, to Lysippus.

Before taking leave of the subject of metal-working, it may be right to add a few words upon *toreutis* or *toreutica* art (τορευτική). From the difference of opinion that exists among antiquaries and scholars, it is easier to say what it is not than what it is. Some believe it to be equivalent to the *calatura* of the Latins, which seems to mean chasing. Others suppose it means the art of turning, from τόρος: and others think it applies to works in relievo, from τό- ρος, clear, distinct. Some believe it is the art of uniting two or more metals; and others, that it is the casting in the former or other materials. Millicent, who is one of the best authorities on such subjects, says, "The art of working the precious metals either separately, or uniting them with other substances, was called *toreutica*. It was known at a very early epoch, as may be inferred from the shield of Achilles, the ark of Cypselus, and other productions of the kind." There is an ancient casting of a bird above the name of a writer, in the British Museum. It is not cast, but consists of very thin laminated plates of silver, beaten or punched out, and chased. The relief is bold, and the accessories are of sheet gold, overlaid.

*BRUCUS* or *BRUCHUS* (βρύγος, *brýgos*), a very formidable species of locust, described by *Theophrastos* as the most terrible of their kind. The term, however, does not appear to have been very well defined by the Greek writers. The *Bruchus* in the Linnean system is an insect that commits great ravages on the different grains of the majority of leguminous plants, and of some kernel fruits, and particularly on beans, lentils, vetches, and peas. The *brýgos* of the ancients appears to have been the same with the *Cossus* of Pliny and Festus.

*BRYON* (βρύος), a term used in a variety of senses: 1. As applied to the germ of a flower by *Theophrastos* as the most terrible of their kind. The term, however, does not appear to have been very well defined by the Greek writers. The *Bruchus* in the Linnean system is an insect that commits great ravages on the different grains of the majority of leguminous plants, and of some kernel fruits, and particularly on beans, lentils, vetches, and peas. The *brýgos* of the ancients appears to have been the same with the *Cossus* of Pliny and Festus.

*BRYONIA* (βρυώνια), a species of wild vine, *Bryony*. The name *bryonia* was applied to two kinds of vine, the ἄρισχος λευκή, or white vine (the *Bryonia alba* of Pliny), and the ἄρισχος μελανά, or black vine (*Bryonia nigra*). The term, however, is more probably referred to the *Bryonia alba* of Pliny, which seems the same with the *Tamus Communis*, L.

*BU'BALIS* or *BUBALUS* (βοβάλας or -οί), first names applied by Aristophanes and his successors to a species of Antelope, most probably the Stag-like Antelope. "How these writers," observes Lienzian-colonel Smith, "came to designate such an animal by an appellation which is symphoric with that of the *Buffalo* in all the dialects of Northern and Central Asia, cannot be explained but by the supposition that Aristotle gave that name in consequence of some imperfect information which he may have obtained on this subject through the Macedonian invaders of Eastern Persia. It is worthy of remark, however, that in the case of those animals of the *Bubalus* genus, which are the more exclusively characterized with the antelope, the more equivocal characteristic approximates them to the Bovine nearly as much as to the Caprine nature. Hence the naturalists of the present day have found it necessary to interpose a new genus, the characters of which should embrace the evanescent distinctions of Antelope, Capra, and Ovis, together with the incipient characters of the *Bubalus* genus. This is the *Genus Damalis*. The native names of the animals thus generally separated, import that they are considered distinct from the Antelope in their own countries; and although no great stress should usually be laid upon local names, yet it would be treating the knowledge and experience of the residents in that country with gross indifferency, if, upon inquiry, it should be found that, from the earliest antiquity to the present time, every people who have intimate knowledge of the animals under consideration should agree in bestowing one general designation upon them, and yet that such designation should be rejected by systematic writers, for only being applied to the case with the groups of animals before us, which, whether they be Indian or African, have in their local names either something that shows their separation from Antelope, or, what is more common, a generic indication, which proves them to be regarded as more nearly allied to Bos than to Capra. Where the Persian, Arabo-Indoe, and Eastern and Western Arabic are agreed, it appears that all the species we are about to enumerate will be found designated by the generic word Ghaou, 'ox' or 'cow,' Bakr, 'oxen,' Qows, in the Arabic, or Bakrah in the Persian. The appellation given by Aristotle may, after these remarks, be easily traced to its source.

II. The *Buffalo*. "The name *Bubalis* is asserted to have been transferred from the Antelope Bubalis of authors (Genus Damalis) to the animals of the Buffalo group, during the sixth century of the Roman Empire. It is true, but Buffon maintains, that Aristotle, Pliny, and Oppian did not know the Buffalo by the name of *Bubalis*, but it cannot be denied, that in the age of Martial, this name was vaguely applied even to the Ursus, and, consequent-

The musical instrument *buccina* nearly resembles in shape the shell *buccinum*, and, like it, might as most be described from the above lines (in the language of conchologists) as spiral and gibbous. The two drawings in the annexed woodcut agree with this account. In the first, taken from a frieze, the *buccina* is curved for the convenience of the performer, with a very wide mouth, to diffuse and increase the sound. In the next, a copy of an ancient sculpture taken from Bianchini's work, still retains the original form of the shell.

Hyginus, the *buccina* was invented by Tyrrhenus, a son of Hercules, which, if the tradition were of any value, would refer this, as well as many other musical instruments in use among the Romans, to an Etruscan origin. Propertius testifies to its being a very ancient instrument. Athenaeus mentions a kind of shell called *skine* (according to Casaubon, the shell of the murex), probably from its sonorous qualities.

The inscriptions quoted by Bartholin seem to prove that the *buccina* was distinct from the *cornu*; but it is often confounded with it. The *buccina* seems to have been chiefly distinguished by the twisted form of the shell, from which it was originally made. In later times it was carved from horn, and perhaps from wood or metal, so as to imitate the shell.

The *buccina* was chiefly used to proclaim the watches of the day and of the night, hence called *buccina prima, seconda, &c.* It was also blown at funerals, and at festive entertainments both before and after sitting down to table and after. Macrobium tells us that tritons holding *buccinae* were fixed on the roof of the temple of Saturn.

According to Festus, *buccina* is derived from the Greek *buklavos*, a word not found in the lexicon, or, as others say, from the Hebrew *buk*, a trumpet. Varro considers it as formed by Onomatopoeia from *hoo*, in allusion to its sound. It is more probably derived from *bucina*, the name of a shellfish.

The sound of the *buccina* was called *bucinum*, and the musician who played it *bucinatar* (in Greek *beucinatar*).

**BUCERAS** (bouropax), the herb Fenugreek, *Trigonella fenum Gramum*. The name is derived from *bois*, "an ox," and *stropes*, "a horn," the seed resembling the horn of an ox. Other appellations for this same plant, as given by Dioscorides and Pliny are *teiza*, carpos, *acropes*, *ceratitis*, *lotus*, and *fluna*.

The Roman writer gives a long account of its several uses in the healing art, especially in female complaints.

**BUFO**, the Toad. (Vid. PHYLUM.)

---

1. (Smith in Griffith's Cuvier, vol. iv., p. 378, seqq.)—2. (Mel., 335.)

---

17. That the vulgar were already familiarized with it as early as the time of the Flavian line. Now the Bubali of Aristotle must have been a rare animal, which certainly bore no such Greek name in its native regions, and therefore the word itself originated and became common in some other way. The learned among the ancients were as liable to misapply appellations of strange animals as the moderns, and the Arachosian oxen of Aristotle may have been known to the Greek soldiers of Alexander by another name, namely, by the name which it appears the Buffalo bore among the northern nations of Central Asia from the earliest periods; a name which, although it has the sound of a Greek compound, is nevertheless of genuine Turanian origin. It is composed of the syllable *Bu*, 'ox,' joined to a distinctive epithet. Taking the Tartaric to be the root, we find that nearly all the dialects of ancient Turan, Cheen, and the posterior Scelavonic, designate both the Buffalo and the Bull by the words *Bukan, Bukah, Buzum, Buka, Buku, Buga, Bujan*. *Buwoi* is the modern Russian, *Bwavoi* the Polish, *Buwavel* Bohemian, and *Bvial* Hungarian. In most of the countries where the above dialects are spoken, the Buffalo is nearly as common as the domestic ox, and, moreover, some of these dialects were spoken by the very nation who introduced the animal into Western Asia, Africa, and Europe. From a careful consideration of the whole subject, the presumption will be found to be fairly established, that the nations who invaded the Roman and Byzantine empires brought with them the very animal whose name had reached Europe, perhaps by means of the Greek followers of the Selucid dynasty, and that the word *Bubalis* is the true name of the Buffalo, as clearly as Usus and Bison are derived from the Teutonic *Aurochs* (*Uroks*) and *Wiesend*. Aristotle and others evidently knew the Buffalo (*bois ignoris in Aithérois, Bois Indicus, or Arachosian Ox*). It is described as differing from the Ox as the Wild Boar does from the Hog; to be black, poterful, with the nose turned up, and the horns bent outward. In that period, the species was not found farther west than Northeastern Persia. Paul Warnefried, surnamed Diconesus, fixes the appearance of Buffaloes in Italy in the reign of Aigulf, or the close of the sixth century, that is, in the year 596. But we may reasonably look for their appearance in the east of Europe to an earlier date. The warlike force of Attila's forces drawn out of Eastern and Central Asia, were supported by droves of cattle bearing grain (buck-weed), as is still done with buffaloes in common trade, and by the nomad equestrian nations, who lead or follow these animals in their native regions, there is no reason for us to conclude that the Arachosian Buffalo was not in their herds; or if it could be proved that the power of the Huns did not extend into the northern provinces of Persia or Chorassania, the Avars and Bulgarians may be regarded as the conductors of that species to the valley of the Danube, Thrace, and Illyricum. This was probably during the reign of Marcian, or about 453, and the subsequent introduction of the animals into Italy might result from causes not connected with the migrations of the barbarians.

---

**BUFO, the Horned Owl. (Vid. GLAUX.)**

**BUCCINCA (bdxavos), a kind of horn-trumpet, apparently made out of a shell. It is thus happily described by Ovid:

> Cosa buccinca summim illis
> Tortitis, in latum qua turbine crescit ab imo:
> Buccina, qua in medio concepit ut aere pondo,
> Littor a voca replet sub utroque jacentia Phathon.**

**BUFO.**
BULLA.

*BUGLOSSA* and BUGLOSSOS (**bov'lywulos** or **bov'lywulos**), the herb Bugloss or Ox-tongue, deriving its name from the likeness its leaf bears to the tongue of the ox (**bov**, "an ox," and **lywlos**, "the tongue"). Owing to the natural resemblance which runs through the genera of *Anchusa*, *Borrage*, and *Lycopus*, there is some difficulty in deciding exactly to what genus and species the *bov'lywulos* of the ancients should be referred. Still, Thor and Sprengel prefer the *Anchusa Italic* or Italian Alkanet.1—2

**BULLA**, a circular plate or boss of metal, so called from its resemblance in form to a bubble floating upon water. Bright studs of this description were used to adorn the sword-belt (*aurea bullis circula*; *bullis aper belli*). Amongst them was in the Roman fashion, the part of which was fastened together by brass-headed, or *cynu* by gold-headed nails. The magnificent *truze* doors of the Pantheon at Rome are enriched with highly-ornamented bosses, some of which are here shown.

The golden bosses on the doors of the Temple of Minerva at Syracuse were remarkable both for their number and their weight.

We most frequently read, however, of bullas as ornaments worn by children suspended from the neck, and especially by the sons of the noble and wealthy. Such a one is called *haires bullus* by Juvenal.4 His bulla was made of thin plates of gold. Its design is shown in the annexed woodcut, which represents a fine bulla preserved in the British Museum, and is of the size of the original.

The bulla was worn by children of both sexes for ornament, "as a token of paternal affection and a sign of high birth," and, as it was given to infants, it sometimes served, like other ornaments or playing things (cymen), to recognise a lost child. Probably also, it contained amulets.

Instead of the bulla of gold, boys of inferior rank, including the children of freemen, wore only a piece of leather (**torum**; *nodus tantonet et signum de paupere lori; libertinis scortae*).

BUSTUM.

On arriving at adolescence, the bulla was laid aside, together with the praetexta, and it was often consecrated, on this occasion, to the Lares, or to some divinity.1

Valerius Maximus9 mentions a *status bullata*, and examples of boys represented with the bulla are not infrequent in statues, on tombs, and in other works of art.5

*BUMAMA*, a kind of large grass, so called because formed and swelling out like an adder or teat (from *bov*, an intensive particle, and *mamma*, "a dung" or "breast"). The Greek form of the name is *Bumastus, bov'catoor, from *bov, and *muwor, *a breach" or *dung*. Varro6 and Macrobius7 employ *Bumamma*; Virgil8 and Pliny,9 *Bumastus.

*BU'MIAS* (**bov'nia**), a species of plant, the wild Narew. "The term Bumias," remarks Adams, "occurs first in Nicander, and that it is synonymous with the Gongylis is declared by Galen and Paulus Egineta; and, farther, that it was the *Brassica Napolobrassica*, L., or wild Narew, is admitted by all the late authorities on classical botany, with the exception of Dierbach, who most unaccountably contends that it is the *Brassica Oleracea, or Sea-cabbage."9

*BU'NION* (**bov'nia**), a plant of the family of the Umbellifera. The preponderance of authority is in favour of its being the *Bunium bulbocastanum*, or Earth-nut, a plant having a bulbous root, round and good to eat. *Bunium* is frequent in the medical works of Alexander Trallianus. The *Bun'ium* was taken for the *Barbara vulgaris* by Dodonaeus and Bauhin; but Sprengel contends that these authorities were in error, and holds it to be the *Pimpinella tenus*, Sieb.9

*BUPRESTIS* (**bov'niaros**), an insect treated of by all the ancients on *Entomology*. It is often fatal to cattle when eaten among pasturage, giving a burning sensation, whence it derives its name (*bov*, "an ox" or "cow," and *pi'rho, *to inflame"). Belon mentions that he found in Greece a species of *Cantharis*, which corresponded with the ancient description of the Buprestis. "In fact," says Adams, "there is every reason to identify it with the *Molinae interrupta*, found in the medical works of Alexander Trallianus. The Buprestis of the ancients must not be confounded with the Buprestis of Linnaeus.10

BURIS. (Vid. ARATRUM, p. 79.)

BUSTUARI. (Vid. BUSTUM.)

BUSTUM. It was customary among the Romans to burn the bodies of the dead before burying them. When the spot appointed for that purpose adjacent the place of sepulture,11 it was termed bustum,12 and hence that word is said by Cicero13 to be synonymous with *vyuop*: when it was separate from it, it was called *uwirnina*.

There was a Bustum at Rome, in the centre of the Campus Martius, connected with the mausoleum of Augustus, where the remains of that emperor and many of his family were buried and buried. It is described by Strabo,14 who says that it was of white stone surrounded by an iron railing, and planted on the inside with poplars.15 In the year 1777, several blocks of *travertine* stone (**kh65 loooxel**) were discovered in the space before the Church of San Carlo al Corso, upon which were inscribed the names of several members of the family of Au-

181
gustus, with the words hic Crenatus est, which identifies that locality with the bustum of Augustus. The busts are now preserved at the Vatican.

From this word three others derive their signification:

I. **BUSTARI,** gladiators, who were hired to fight round the burning pyre of the deceased, in consequence of the belief that the Manes were gratified by blood.

II. **BUSTARIE, women of abandoned character, including the term ac monumenta prostantes.**

III. **BUSTARI,** persons suffering the extreme of poverty; so called because they satisfied their cravings by snatching from the flames of the funeral pyre the bread and other castaways which the superstition of the living dedicated to the dead. 

**Bustum** is also used for the hollow space on the top of an altar in which the fire was kindled.

**BUTYRUM**, **(boeotropus)**. **Butter.** 

"This substance," observes Beckmann, "though commonly used at present in the greater part of Europe, was known very imperfectly to the ancients; to some, indeed, it was not known at all. The translators of the Hebrew writings seem to have thought that they found it mentioned in Scripture," but those best acquainted with Biblical criticism unanimously agree that the word chamse signifies milk or cream, or may mean both; and that, as we have said, it does not mean butter. The word plainly alludes to something liquid, as it appears that chamse was used for washing the feet, that it was drunk, and that it had the power of intoxicating; and we know that mare's milk, when sour, will produce the like effect. We can imagine streams of milk, but not streams of butter. This error has been occasioned by the unwary interpreters, who translate the Hebrew word by the term butyron (boeotropus)." These translators, who lived two hundred years after Hippocrates, might, as Michaelis remarks, have been acquainted with butter, or have heard of it; but it is highly probable that they meant cream, and not our usual butter.

The oldest mention of butter, though dubious and obscure, is in the account given by the Scythians by Herodotus. According to the historian, they poured the milk of mares into wooden vessels, caused it to be violently stirred or shaken by their blind slaves, and thus separated the part that arose to the surface, which they considered more valuable and more delicious than that which was collected. These vessels hence evidently speaks of the richest part of the milk being separated from the rest by shaking; and that what he alludes to here was actually butter, would plainly appear from comparing with what he says the much clearer account of his contemporary Hippocrates. The Scythians, remarks this latter writer, 'pour the milk of their mares into wooden vessels, and shake it with a stick; this causes it to foam, and the fat part, which is light, rising to the surface becomes what is called butter (δ βοιτρων καλοβα).'

Mention of butter occurs several times, in fact, in the writings of Hippocrates, and he prescribes it externally as a medicine; he gives it, however, another name, *pikerion* (πικεριον), which seems to have been in use among the Greeks earlier than the former, and to have been afterward neglected. That word

signified butter, and was no longer employed in the time of Galen, appears from his translating it, in his explanations of obscure passages, by the term bustum, by the word butyron (boeotropus). It was even before that period, explained in the same manner by Erothin, in his Dictionary of the words used by that Greek physician; and he remarks from an ancient writer, that the Phrygians called butter τη πεσο (pikerion), and that the Greeks seem to have borrowed the word from that people. The poet Anaxandrides, who lived soon after Hippocrates, describing the wedding of Iphicrates, who married the daughter of Cotys, king of Thrace, and the Thracian entertainment given on that occasion, says that the Thracians ate butter, which the Greeks at that time considered a wonderful kind of food. It is very remarkable, that the word butter does not occur in Aristotle, and that he even scarcely alludes to that substance, though we find in his works some very proper information respecting milk and cheese, which seems to imply careful observation. At first he gives only two compounds, the watery and caseous; but he remarks afterward, for the first time, in a passage where one little expects it, that in milk there is also a fat substance, which, under certain circumstances, is like oil. In Strabo there are three passages that refer to this subject, but in none of these can it be obtained. This author says that the Lusi- tanians used butter instead of oil; he mentions the same circumstance respecting the Ethiopians; and he relates in another place, that elephants, when wounded, drank this substance in order to make the darts fall from their bodies. The use of butter by the Ethiopians or Abyssinians is confirmed by Ludolfus. Elian also states that the Indians anointed the wounds of their elephants with butter. Aristotle, however, makes the wounded elephants drink oil, and not butter; but the difficulty may easily be obviated by supposing the butter spoken of by Strabo to have been in a liquid state.—We are told by Plutarch that a Spartan lady paid a visit to Beroe, the wife of Deiotarus, and that the one smelled so much of sweet ointment, and the other of butter, that neither of them could endure the other. Was it customary, therefore, at that period, for people to perfume themselves with butter?*

"The remarks of Dioscorides and Galen on the present subject are of much more importance. The former says that good butter was prepared from the fattest milk, such as that of sheep or goats, by adding to it the milk of the cows; To this butter he ascribes the same effects, when used externally, as those produced by our butter at present. He adds also, and he is the first writer that makes the observation, that fresh butter might be melted, and poured over pulse and vegetables instead of oil, and that it might be employed in many of the room of other fat substances." Galen, who wrote in a more modern period, the healing virtues of butter expressly remarks that cow's milk produces the fattest butter; that butter made from sheep's or goat's milk's is less rich; and that asso milk yields the poorest. He expresses his astonishment, therefore, that Dioscorides should say that butter was made from the milk of sheep and goats. He assures us that he had seen milk from a cow's milk, and he believed it to have thence acquired its name.**

BUXUS.

delicious box (Caput exerectum buxus); 14

BUXUS (ερυθρα), the Box-tree, or Buxus sempervirens, L. The Box loves cold and mountainous situations; the places most famed for its growth are mentioned in the beginning of the previous article. 12

it cuts better than any other wood; and, when an edge is made of the ends of the fibres, it stands better than lead or tin, nay, almost as well as brass. Like holly, the Box is very retentive of its sap, and warps when not properly dried; though, when sufficiently dried, it is very truly stated (by some) that its wood is as close (δαλαυρος τελεωτικος), which Rosellini and many modern writers maintain to be cotton. The only decisive test, however, as to the material of mummy-cloth, is the microscope; and from the numerous examinations which have been made, it is quite certain that the mummy-cloth was made of flax, and not of cotton, and, therefore, whenever the ancient writers apply the term byssus to the mummy-cloth, we must understand it to mean linen. 8

The word byssus appears to come from the Hebrew buzit (בזית), and the Greeks probably got it through the Phenicians. 2 Pausanias 3 says that the district of Elis was well adapted for growing byssus, and remarks that the byssus of Elis is not inferior to that of the Hebrews in fineness, but is not so yellow (ευθυδε). The women in Patras gained their living by making and selling the wool and woolens, and weaving cloth, from the byssus grown in Elis. 4

Among later writers, the word byssus may, perhaps, be used to indicate either cotton or linen cloth. Böttiger 5 supposes that the byssus was a kind of muslin, which was employed in making the decorated Coptic garments. It is mentioned in the Gospel of St. Luke 6 as part of the dress of a rich man: Ειδοθήκετον μαριονειαν και Ρηςον. 7 It was sometimes dyed of a purple or crimson colour (δεσποντω τοπομον). 9 Piny 10 speaks of it as a species of flax (linum), and says that it served medullum maxime deliclus. Follux, 11 also, says that it was a kind of linen grown in India; but he appears to include cotton under this term.

BUXUS.

CABEIRIA.

's 'cheese,' 'engaled milk,' was a favourite with the Greek and Roman writers, but is altogether erroneous. The term is of foreign origin, and the reader may see some curious speculations on this subject in the numerous books and treatises on intoxication. It is connected with the name of the mythology of Bouphakes, and with the general civilization introduced into the West by the sacerdotal colonies from India. 1

From what has thus far been said, it would appear that butter must have been very little known to, or used by, the Greeks and Romans, till the time of the great invasions and wars of the Middle Ages. It appears, also, that when they had learned the art of making it, they employed it only as an ointment in their baths, and particularly in medicine. Pliny recommends it, mixed with honey, to be rubbed over children's gums, in order to ease the pain of teething, and also for ulcers in the mouth. 2 The Romans, in general, seem to have used butter for anointing the bodies of their children, to render them pliable; 3 and we are told that the ancient Burgundians smeared their hair with it. 4 If we except the passage of Dioscorides already referred to, we find no proof whatever that it was used by the Greeks or Romans in cookery, or the preparation of food. No notice is taken of it by Apicius; nor do we find it mentioned in any other ancient cook-books. Hence, for what we know of the wooden part of the finer tools, for everything that requires strength, beauty, and polish in timber, there is nothing equal to it. This will explain why so many different articles among the ancients were made of this wood. (Vid. Buxum.) There is one purpose for which box, and box-wood, is properly adapted, and that is the process of xylography, or engraving on wood. 5

BYTHELUS (βυθελος), the plant from which the Egyptians formed paper, the Cyperus Papyrus. (Vid. Papyrus.)

BYSSUS (βυσσος). It has been a subject of some dispute whether the byssus of the ancients was cotton or linen. Herodotus 6 says that the mummy-cloth was made up in this way, (δαλαυρος τελεωτικος), which Rosellini and many modern writers maintain to be cotton. The only decisive test, however, as to the material of mummy-cloth, is the microscope; and from the numerous examinations which have been made, it is quite certain that the mummy-cloth was made of flax, and not of cotton, and, therefore, whenever the ancient writers apply the term byssus to the mummy-cloth, we must understand it to mean linen. 8

The word byssus appears to come from the Hebrew buzit (בזית), and the Greeks probably got it through the Phenicians. 2 Pausanias 3 says that the district of Elis was well adapted for growing byssus, and remarks that the byssus of Elis is not inferior to that of the Hebrews in fineness, but is not so yellow (ευθυδε). The women in Patras gained their living by making and selling the wool and woolens, and weaving cloth, from the byssus grown in Elis. 4

Among later writers, the word byssus may, perhaps, be used to indicate either cotton or linen cloth. Böttiger 5 supposes that the byssus was a kind of muslin, which was employed in making the decorated Coptic garments. It is mentioned in the Gospel of St. Luke 6 as part of the dress of a rich man: Ειδοθήκετον μαριονειαν και Ρηςον. 7 It was sometimes dyed of a purple or crimson colour (δεσποντω τοπομον). 9 Piny 10 speaks of it as a species of flax (linum), and says that it served medullum maxime deliclus. Follux, 11 also, says that it was a kind of linen grown in India; but he appears to include cotton under this term.

CABEIRIA (Καβειρία), mysteries, festivals and orgies solemnized in all places in which the Pelasgian Cabiri, the most mysterious and perplexing deities of Greek mythology, were worshipped, but especially in Samothrace, Imbros, Lemnos, Thesebe, Anthedon, Pergamus, and Berytos. 12

The is known respecting the rites observed in these mysteries, as no one was allowed to divulge them. Diogoras is said to have provoked the highest indignation of the Athenians by his having made these and other mysteries public. 5. The most celebrated were those of the island of Samothrace, which, if we may judge from those of Lemnos, were solemnized every year, and lasted for nine days. The admission was not confined to men, for we find instances of women and boys being initiated. 6. Persons on their admission seem to have undergone a sort of examination respecting the life they had led hitherto, and were then purified of all their crimes, even if they had committed murder. 7. The priest who undertook the purification of murderers bore the name of koic. The persons who were initiated received a purple riband, which was worn around their bodies as an amulet to preserve them against all dangers and storms of the sea. 8. Respecting the Lemnian Cabiria, we know that their annual celebration took place at night, 9. and lasted for nine days, during which all the fires of the island which were thought to be impure were extinguished, sacrifices were offered to the dead, and a sacred vessel was sent out to fetch new fire from Delos. During these sacrifices the Cabiri were thought to be absent with the sacred vessel; after the return of which the pure fire was distributed, and a new life began, probably with banquets. 10. The Etruscan Cabiria was said to have obscured and thrown into oblivion those of Lemnos, from which Pythagoras is said to have derived a part of his wisdom. Concerning the celebration of the Cabiria in other places, nothing is known, and they seem to have fallen into decay at a very early period.

1. MACALIA (macalia), a plant mentioned by Dioscorides, in Book I., p. 1, and also by Sprengel to be the Mercurialis tomentosa. Sibthorp and Fee, however, are undecided, though the latter inclines somewhat to the Cabiria petasites sive albi-frons. 2. KAIKOPRIS DKK (κακοπριος δήκ) was an action for abusive language in the Attic courts, called, in one passage of Demosthenes, κακοπριας και τοποφθαλμίας. These actions are referred to in the dialogue of Plato, 3. KAIKOIS AKTOIS DKK (καικοτηνιων δ κκ) corresponds in some degree with an action for suborning of perjury. It might be instituted against a party to a previous suit, whose witnesses had already been convicted of falsehood in an action Tuckeriaphia. 4. It has also been surmised that this proceeding was available against the same party when persons had subscribed themselves falsely as summoners in the declaration or indictment in a previous suit; and if Plato's authority with respect to the terms of Attic law can be considered conclusive, other cases of conspiracy and contrivance may have borne this title. With respect to the court into which these causes were brought, and the advantages obtained by the successful party, we have no information.

1. KAKOSIS (κακωσις), in the language of the Attic law, does not signify every kind of ill-treatment, but 2. The ill-treatment of parents by their children (κακωσις γονών). 2. Of women by their husbands (κακωσις γυναικών). 3. Of heireesses (κακωσις τῶν ἵππηραν κακοπριας). 4. All the actions against guardians or any other persons (κακωσις τῶν ὥρων καὶ χειροτονικῶν γυναικῶν). 5. A κακωσις γονών was committed by those who struck their parents, or applied abusive epithets to them, or refused them the means of support when they were able to afford it, or did not bury them after their death, and pay them proper honours. 6. A κακωσις τῶν ὥρων, which was committed by their parents, had treated them badly. If, however, they were illegitimate, or had not received a proper education from their parents, they could not be prosecuted for κακωσις. 7. A κακωσις γυναικών was committed by husbands who ill-treated their wives in any manner, or had intercourse with other women, 8. or denied them the maintenance, or brought against a heireess her parents had treated them badly. If, however, they were illegitimate, or had not received a proper education from their parents, they could not be prosecuted for κακωσις. 9. A κακωσις τῶν ὥρων καὶ χειροτονικῶν γυναικῶν was committed by the nearest relatives of poor heireesses, who neither married themselves, nor gave them a dowry in order to marry them to persons of their own rank in life; or, if they married them themselves, did not perform the marriage duties.
The caduceus was committed by those who injured in any way either orphans or widows, both of whom were considered to be in an especial manner under the protection of the state. The speech of Iseus on the Inheritance of Hagnias, is a defence against an ἡπτημία κακώσεως of this kind. It was adjudged to belong to the jurisdiction of the chief archon (ἀρχέων ἐπίσημων). If a person wronged in any way orphans, heiresses, or widows, the archon could inflict a fine upon them himself; or, if he considered the person deserving of greater punishment, could bring him before the helia. Any private individual could also accuse parties guilty of κακώσεως by means of laying an information (κακώσματα) before the helia. This, however, though sometimes the accuser proceeded by means of a regular indictment (γραφέος), with an ἀνόκρυος before the archon. Those who accused persons guilty of κακώσεως incurred no danger, as was usually the case, if the defendant was acquitted, and they did not obtain the fifth part of the votes of the dicasts.

The punishment does not appear to have been fixed for the different cases of κακώσεως, but it was generally severe. Those found guilty of κακώσεως γίνοντεs lost their civil rights (ἀτύχεσα), but were allowed to retain their property (ὅπως ἀτύχεσα τὰ ἀτύχεσα ἐγένετο); but if the κακώσεως was a great one, then the parties who had not voted would also be punished.

*CACTUS (κάκος), a species of plant. Sprengel inclines to the opinion that it was the kind of artichoke called Cardoon, namely, the Cima cardunculus. Stackhouse suggests that it was the Cactus opuntia, or Indian Fig. The locality of the κάκος of Theophrastus does not suit well with either Cactus or Cardoon, and Sprengel's Cactus renunciat. Sprengel's opinion is, perhaps, after all, the more correct one, and is advocated by Fée. Pliny describes the Cactus as growing only in Sicily.

CADÁVER. (Vid. Fossa.)

CADISKOI or CADOIL also ADDISKOI (καδιακός, καδωκός, καδακός), were small vessels or urns, in which the counters or pebbles of the dicasts were put, when they gave their votes on a trial. There were, in fact, usually two καδιακά: one, that in which the voting pebble was put; this was made of copper, the other, that in which the other pebble, which had not been used, was put; the καδιακά from both of these was put into the table, which was called the κάρνω καδιακός, while the other was called κώρος καδιακός. After all had voted, the presiding officer emptied the counters or pebbles from the metal urn, the κώρος καδιακός, and counted them on a table, and judgment was then given accordingly. The pebbles were distinguished from one another by powder marks. For one or another had been used; and the dicasts kept the counter which they did not use. This vessel was called ἀμφεφέος. Sometimes, also, the dicasts had only one counter each, and there were two καδιακά, one for acquiring, the other for condemning.

When there were several contesting parties, there were several καδιακά, according to the number of the parties; as in Demosthenes. In the dicasts then had either one pebble, which they put into the καδιακός of the party in whose favour they meant to vote; or they had as many pebbles as there were καδιακά (but only one favourable one among them), which they put in according to their opinion. The pebble was dropped into the urn through a long tube, which was called κανος. The noise which the pebble made in striking against the bottom of the καδιακός was represented by the syllable μίξης. *CADMEIA or CADMIA (Κάδμεια or -μια), a species of earth, as the ancients termed it, more correctly, however, Calamine, or an ore of zinc. Geoffroy says, 'The dealers in metals call by the name of metal zinc, a material which is thrown out in making copper into brass.' Dr. Kidd calls it a native oxide of zinc. According to Dr. Hill, the Cadomia factitia of the ancients was a recrystallization of copper, produced in the furnaces where that metal was separated from its ore. According to Sprengel, the kind called barpoír,ts, or clustered Cadmium, is strong. This earth, which is full of a diathermic proportion of copper. The καντίτς, or Smoky Cadmium, according to Dr. Hill, was a fine powder collected at the mouths of the furnaces. The καντίτς, or Cazn-like Cadmia, was the coarsest and heaviest of all. *‘With Cadmia (or an ore of zinc),' observes Dr. Moore, ‘the ancients were not acquainted, though they are commonly supposed not to have known the metal, excepting that it was mixed with copper in the form of brass. But a passage in Strabo authorizes the belief that they also knew this metal in its separate state. The geographer says, that near Andeira, a town of Trasos, is found a stone, which, being burned, becomes iron, and distils false silver (ἀποστιεύει ψεύδοργος) when calcined. The ancient inscriptions show that they knew this metal, which, receiving the addition of copper, forms the alloy that some call brass (δρέκοναλον). He adds respecting this false silver, which was probably our zinc, that it occurs also near Trasos. Stephanus states the same thing in somewhat clearer words, and refers to both Theopompos and Strabo as authorities. This earth, which is full of a diathermic proportion of copper, was called its name, Cadmia, from Cadmus, son of Aegon, who first introduced at Thebes the making of brass, is spoken of by Aristotle, who informs us that the Mosynaeans had anciently prepared a brass of a pale colour and superior lustre, mixing it not with tin, but with a certain earth found among them. This earth, which Theopompos also describes, is also brass. Pliny repeatedly speaks of Cadmia, but it is evident that he does not always mean one and the same thing. Cadmia seems to have signified with him not only our Calamine, but a copper ore which contained zinc; and the same name was extended to what the Germans call ofenbronch, furnace-calamine, which, in melting ores containing both, will separate itself in zinc, or in making brass, falls to the bottom of the furnace, and contains more or less of calcined zinc. CADUCEUS (καπτέιον, καπρόκον, καπρήνιον) was the staff or mace carried by heralds and am bassadors in time of war. This name is also given to the staff with which Hermes or Mercury is usually represented, as is shown in the following figure, and taken from an ancient vase, which is given in Millin's Peintures de Vases antiques.

with the στρωματας, which were afterward formed into snakes. Later mythologists ventured tales about these snakes. Hyginus tells us that Mercury once found two snakes fighting, and divided them with his wand; from which circumstance they were used as an emblem of peace. 6

From caduceus was formed the word caduceator, which signified a person sent to treat of peace. 7 Thus Anius Gellius 8 tells us that Q. Fabius sent to the Carthaginians a spear and a caduceus as the emblems of war or peace (hasiam et caduceum, signa duo belli aut pacis). The persons of the caduceators were considered sacred. 9

It would appear, however, that the Roman ambassadors did not usually carry the caduceus, since Macrobius informs us that the Roman ambassadors carried veravinum (seginma) that no one might injure them, in the same manner as the Greek ambassadors carried the cerycia (σεχρυσα). 10

CADUSUM (Vid. Bona Caduca.)
CADUS (καδος, καδος), a large earthen vessel, which was used for several purposes among the ancients. Wine was frequently kept in it; and we learn from an author quoted by Pollux, that the amphora was also called cadus. 11 The vessel used in drawing water from wells was called cadus, 12 or χυδης. 13 The name of cadus was sometimes given to the vessel or urn in which the counters or pebbles of the dice was put when they gave their vote on a trial, but the diminutive καδονας was more commonly used in this signification. (Vid. Canthos.)

"CADUCUM VINUM, a name given to a wine which was at one time the best growth of the Fa- lernian vineyards. " Formerly," says Pliny, 14 "the Caecean wine, which came from the poplar marshes of Anycole, was most esteemed of all the Campanian wines; but it has now lost its repute, partly from the negligence of the growers, and partly from the limited extent of the vineyard, which has been nearly destroyed by the navigable canal that was begun by Nero from Avernus to Ostia." The Caecean is described by Galen 15 as a generous, durable wine, but apt to affect the head, and ripening only after a long term of years. In another place 16 he remarks that the Bithynian white wine, when very old, passed with the Romans for Caecean but that, in this state, it was generally bitter and unfit for drinking. From this analogy we may conclude that, when new, it belonged to the class of rough, sweet wines. It appears to have been one of Horace's favorite wines, which he mentioned in general, as having been reserved for important festivals. After the breaking up of the principal vineyards which supplied it, this wine would necessarily become very scarce and valuable. 17

CABATUR / (Vid. Bronze, p. 179.)
*CEPA or CEPE (καπονος), the Onion, or Al- lium Cepa, L. The Greeks had numerous kinds, or, rather, varieties of this vegetable, which are mentioned by Pliny. The Romans, on the other hand, had two principal kinds, the Pallacana and the Condimentarium, the latter of which was subdivided into many species. The Pallacana (cep) had hardly any head, and consisted principally of a long stem: it admitted of being often cut. The Condimentarium (cepe), so called because it could be potted and kept for use, was likewise termed Cepa. 18 From its exuberant head—"Though the history of the onion can be but imperfectly traced in Europe, there is no doubt as to its great antiquity in Africa, since there is evidence to show that this bulb was known and much esteemed in Egypt 2000 years before Christ. Juvenal, 19 indeed, says that the Egyptians were forbidden to eat the onion, this vegetable having been defiled by them. The probability of this, seems to have extended to the priests, who, according to Plutarch, 20 'abstained from most kinds of pulse;' and the abhorrence felt for onions, according to the same author, was confined to the members of the sacerdotal order. That onions were cultivated in Egypt, is proved, 21 continues Wilkinson, "from the authority of many writers, as well as from the sculpture; that quantity was denominated in ancient times, and has been equally so in modern times; and the Israelites, when they left the country, regretted the 'onions,' as well as the cucumbers, the melons, the leeks, the garlic, and the meats they 'did eat' in Egypt. Among the offerings presented to the gods, both in the tombs and temples, onions are introduced, and a priest is frequently seen holding them in his hand, or covering an altar with a bundle of the green shoots. Nor is it known that they were introduced at private as well as public festivals, and brought to table with gourds, cucumbers, and other vegetables; and if there is any truth in the notion of their being forbidden, we may conclude that this was entirely confined to the priestly order. The onions of Egypt were mild and of an excellent flavour, a character enjoyed by them at the present day; and they were quite crude as well as cooked, by persons both of the higher and lower classes. It is difficult, however, to say if they introduced them to table like the cabbage, as a hors d'oeuvre to stimulate the appetite which Socrates recommends in the Banquet of Xenophon. On this occasion, some curious reasons for their use are brought forward by different members of the party. Callias affirms that they inspire courage in the hour of battle; and Charmides suggests their utility in deceiving a jealous wife, who, finding her husband return with his breath smelling of onions, would be induced to believe he had not solated any one while from home." 22

CEPHALUS (Vid. Phaethon.)
*The inhabitants of Care obtained from the Romans, in early times, the Ro-
man franchise, but without the suffragium.¹ Some ancient writers thought that the Cretans originally had the full franchise, and were afterward deprived of the suffragium.² The names of the citizens of Ciero were kept at Rome in lists called tabula Cæri- tum, in which the names of all other citizens who had not the suffragium appear to have been entered in later times. All citizens who were degraded by the censors to the rank of serarians were classed among the Cretans; and hence we find the expressions of araurus faceræ³ and in tabulae Cærium re- ferri³ used as synonymous. (Vid. Exarab.)

"CALAMINTHE (καλαμίνθη), a shrub, which Spengel, in the first edition of his work, is disposed to refer the Melissa Cretica; but in his second, the Thymus nepeta, or Catmint. In his edition of Dioscorides he calls the first species the Melissa Cretica; the second, the Thymus nepeta, Scop.; and the third, the Melissa altissima."⁴

CALAMISTRUM, an instrument made of iron, and hollow like a reed (calamus), used for curling the hair. For this purpose it was heated, the person who performed the office of heating it in woodashes (cinus) being called cinoio or cineria.⁵ This use of heated iron was adopted very early among the Romans,⁶ and became as common among them as it has been in modern times.⁷ In the age of Cicero, who frequently alludes to it, the Roman youths, as well as the matrons, often appeared with their hair curled in this manner (calamistrati). We see the result in many antique statues and busts.

CALAMUS (καλάμος⁸), a sort of reed which the ancients used as a pen for writing.⁹ The best sorts were got from Egypt and Cnide.¹⁰ So Martial,¹¹ "Dat chartis habiles calamos Memphita tellus." When the reed became blunt, it was sharpened with a knife, sculpturn librarium;¹² and to a reed so sharpened the epithet temperatus, used by Cicero, probably refers.¹³ "calamo et atrotemo temperato res agere." One of the inkstands given under the artifice ATRAMENTUM has a calamus upon it. The calamus was split like our pens, and hence Ausonius¹⁴ calls it fissipes, or cloven-footed.

"ΚΑΛΑΜΟΣ ἀφρωτικὸς. Sprengel feels little hesitation in deciding that this is the Acorus Cala- mus, or Sweet Flag. Schneider states that Stockhouse, in the second edition of his work, is disposed to refer the κάλαμος ἐνασος of Theophrastus to the same. The term ἐνασος also occurs in Theophras- tus. (Vid. Saccharum.)"¹⁵

"ΚΑΛΑΜΟΣ φρωτικὸς." All agree that this is the Arundo phragmites, L., or common Reed. Sprengel refers the κάλαμος χαράξας of Theophrastus to the same.¹⁶

"ΚΑΛΑΜΟΣ αἰθητικὸς, the same as the δώροφ, and, consequently, the Arundo donax."¹⁷ (Vid. Donax.)

"ΚΑΛΑΜΟΣ ἀνοσίως." The early commentators on Dioscorides have settled the identity of this with the φυτὸς of Theophrastus; and Sprengel refers it very properly, as Adams thinks, to the Arundo are- naria, or sea-side Reed.¹⁸

"ΚΑΛΑΜΟΣ ῬΩμαίος, most probably the Bamboo Cane, or Bamboo Arundinacea. Mention of the Bamboo Cane is made by Herodotus, and also by

The persons who made these nets were called κεκραφελλόπουλα, and also σκοκυφνατα, according to Pollux, who explains the word by πελεκύττας της γυναικείας κεκραφέλλου. These nets appear to have been sometimes made of gold threads, and at other times of silk, or the Elean byssus, and probably of other materials which are not mentioned by ancient writers.

The head-dress of close materials must be distinguished from the κεκράφελλος or reticulum. The former was called mira or calantica, which words are said to be synonymous,¹⁹ though in a passage in the Digest²⁰ they are mentioned together as if they were distinct. Such head-dresses frequently occur in paintings on vases. Their forms are very various, as the two following woodcuts, taken from Millin, Peintures de Vases Antiques,²¹ will show.

The first is an exact copy of the painting on the vase, and represents a man and a woman reclining on a couch, with a small figure standing by the woman's side, the meaning of which is not quite clear.

The next woodcut only contains a part of the
CALATHUS.

original painting, which consists of many other female figures, engaged in the celebration of certain mysteries.

The mitra was originally the name of an eastern head-dress, and is sometimes spoken of as characteristic of the Phrygians. 1 Pliny 2 says that Polycrates was the first who painted Greek women "mitris sericioloribus."

It appears from a passage in Martin 3 (fortior in-tortus verbalia vestis capillos) that a bladder was sometimes used as a kind of covering for the hair.

CALATHUS, dim. CALATHIS/CUS (καλάθος, καλαθίσσω), also called ΤΑΛΑΡΟΣ, usually signified the basket in which women placed their work, and especially the materials for spinning. Thus Pollux 4 speaks of both τάλαρος and κάλαθος as τῆς γυναικείαςντόσιος σκεπας; and in another passage he names them in connexion with spinning, and says that τάλαρος and καλαθίσσω were the same. These baskets were made of osiers or reeds; whence we read in Pollux 5 πλέκει τάλαρος καὶ καλαθίσσω, and in Calathus, 6

"Ante pedes autem candidens molia lana
Villera virgatius custodiant calathis."

They appear, however, to have been made in earlier times of more valuable materials, since we read in Homer 7 of a silver τάλαρος. They frequently occur in paintings on vases, and often indicate, as Büttger 8 has remarked, that the scene represented takes place in the gynaeconitis, or women's apartments. In the following woodcut, taken from a painting on a vase, 9 a slave, belonging to the class called quasillaria, is presenting her mistress with the calathus, in which the wool was kept for embroidery, &c.

Baskets of this kind were also used for other purposes, 10 such as for carrying fruits, flowers, &c.

188

CALCEUS.

The name of calathus was also given to cups for holding wine. 1

CALCEUS was properly a Greek word, though used by the Latin writers. The Latin word corresponding to it was qualites, 2 or quasillaria. 3 From quasillaria came quasillarius, the name of the slave who spun, and who was considered as meanest of the female slaves (Convocat annes quasillarium, familiare sor-dissimam partem). 4

CALCAR, a spur, that is, a goad attached to the heel (calx) in riding on horseback, and used to urge on the horse to greater swiftness. 5

The early adoption of this contrivance by the Romans appears from the mention of it in Plautus 6 and Lucretius. 7 It is afterward often alluded to by Cicero, 8 Ovid, 9 Virgil, 10 and subsequent Roman authors. On the other hand, we do not find that the Greeks used spurs, and this may account for the fact that they are seldom, if ever, seen on antique statues.

The spurs of a cock are called calaelara: 11 CALCEUS (dim. CALCEOLUS), CALCEA-MEN, CALCEAMENTUM (σπάθινα, πτέλινα), a shoe or boot, anything adapted to cover and preserve the feet in walking.

The use of shoes was by no means universal among the Greeks and Romans. The Homeric heroes are represented without shoes when armed for battle. (Vid. ARM, BALTEUS.) According to the institutions of Lycurgus, the young Spartans were brought up without wearing shoes (ἀνυντορχία), in order that they might have the full use of their feet in running, leaping, and climbing. Socrates, Phocion, and Cato frequently went barefoot (ἀνυντορχία), pedes nudi, 12 The Roman slaves had no shoes (pavo talo), their naked feet being marked with chalk or gumpsin. The covering of the feet was removed before reclining at meals. (Vid. CENA.) To go barefoot also indicated haste, grief, distraction of mind, or any violent emotion, as when the chorus of Oceanides hasten to the fettered Prometheus (ἰκτίλος); when Venus goes in quest of Adonis (διδακλός); and when the vestals flee from Rome with the apparatus of sacred utensils. 13 For similar reasons, sorceresses go with naked feet when intent upon the exercise of magical arts (nuda pedem, 20 pedibus nūtis), although sometimes one foot only was unsheathed (unum exuto pedem vincit), and is so painted on fictile vases. That it was a very rare thing at Rome to see a respectable female out of doors without shoes, is clear from the astonish-

1. (Virg., Eo., v. 21.)—2. (Hor., Carm., iii. xii. 4.)—3. (Petron., v. 132.)—4. (Clas. &c.)—5. (Ibid.)—6. (Virg., vii. 172.)—7. (Hor., iv. 124.)—8. (Virg., iv. 44.)—9. (Mullin, Pointers de Vases Antiques, vol. i. pl. 4.)

189

CALCEUS.

The foot was sometimes bare in attendance on funerals. Thus the remains of Augustus were collected from the pyra by noblemen of the first rank with naked feet. A picture found at Herculanenum exhibits persons with naked feet engaged in the worship of Isis; and this practice was observed at Rome in honour of Cybele. In case of drought, a procession and ceremonies, called Nymphalia, were performed with a view to propitiate the gods by the same token of grief and humiliation.

The idea of the defilement arising from contact with anything that had died, led to the entire disuse of skin or leather by the priests of Egypt. Their shoes were made of vegetable materials (calceus ex papyre). (Vid. Bac.)

Those of the Greeks and Romans who wore shoes, including generally all persons except youths, slaves, and ascetics, consulted their convenience, and indulged their fancy, by inventing the greatest possible variety in the forms, colours, and materials of their shoes. Hence we find a multitude of names, the exact meaning of which it is impossible to ascertain, but which were often derived either from the persons who were supposed to have brought certain kinds of shoes into fashion, or from the places where they were procured. We read, for example, of "shoes of Alcibiades;" of "Sicyonian," and "Persian," which were ladies' shoes; of "Laconian," which were men's shoes; and of "Cretan," "Milesian," and "Athenian" shoes.

The distinctions depending upon form may be generally divided into those in which the mere sole of a shoe was attached to the sole of the foot by tics or bands, or by a covering for the toes or the instep (sid. SOLA, CREPDA, SOCCUS); and those which ascended higher and higher, according as they covered the ankle, the calf, or the whole of the leg. To calceamenta of the latter kind, i. e., to shoes and boots as distinguished from sandals and slippers, the term "calceus" was applied in its proper and restricted sense.

Besides the difference in the intervals to which the calceus extended from the sole upward to the knee, other varieties arose from its adaptation to particular professions or modes of life. Thus the calceus was principally worn by soldiers; the VERO by labourers and rustics; and the CATHENUS by tragedians, hunters, and horsemen.

Understanding "calceus" in its more confined application, it included all those more complete coverings for the feet which were used in walking out of doors or in travelling. As most commonly worn, these probably did not much differ from our shoes, and are exemplified in a painting at Herculanenum, which represents a female wearing bracelets, a wreath of ivy, and a panther's skin, while she is in the attitude of dancing and playing on the cymbals. Her shoes are yellow, illustrating that they were worn of various colours, especially by females. (Vid. preceding woodcut.) The shoe-ties (corrigia) are likewise yellow. These shoes appear light and thin, corresponding to the dress and attitude of the wearer. On the other hand, a marble foot in the British Museum exhibits the form of a man's shoe. Both the sole and the upper leather are thick and strong. The toes are uncovered, and a thong passes between the great and the second toe, as in a sandal.

For an example of calcei reaching to the middle of the leg, see the figure of Orcstes in Aeneid (p. 47). In the Panathenaic frieze of the Parthenon, boots much like his, but reaching still higher, are worn by many of the Athenian horsemen. They are fastened tightly below the knee, and fit closely in every part, showing how completely the sculptor avoided the reproach of making the foot "float" in the shoe (nature, t aoiv bva ia\ei\os). In many statues the flaps are produced by turning down the head and claws of the quadruped out of whose hide the boot was made. We often see it laced in front. (Vid. Coturnicus.)

Upon no part of their dress did the ancients bestow greater attention than upon this. Theophrastus considers it as a proof of rusticity to wear shoes larger than the foot. If, on the one hand, Ovid advises the lover, "Nec vagus in late po\e pelle matre," we find Quintilian, on the other hand, laying down similar maxims for the statesman and the orator. Over剋istically produced the inconvenience of pinching shoes, especially when they were pointed at the toes and turned upward (unciati). Besides the various and splendid colours of the leather, the patterns still existing on marble statues show that it was cut in a very elaborate manner. When Lucullus triumphed after his victories in Asia, he displayed fine shoes from Syria, painted with spots in imitation of jewels. Real gems and gold were added by some of the emperors, especially Heliogabalus, who wore beautiful cameos on his boots and shoes, but with the natural effect of exciting ridicule rather than admiration.

The form and colour of the calceus were also

among the insignia of rank and office. Those who were elevated to the senate wore high shoes like bukshis, fastened in front with four black thongs (nigiris pilitas), and adorned with a small crescent. 4 Hence Cicero, speaking of the assumption of the senatorial dignity by Asinius, says mutatis caleos. Another man, in similar circumstances, was told that his nobility was in his heels. 4 Among the Attic months, the 10th, 11th, and 12th, called the months of sowing, from their resemblance to the scales of the red mullet, were particularly admired; as well as others called alute, because the leather was softened by the use of alum.

CALCULATOR (Λογιστής) signifies a keeper of accounts in general, but was also used in the signification of a teacher of arithmetic; whence Martull! classes him with the notarius, or writing-master. The name was derived from calculi, which were commonly used in teaching arithmetic, and also in reckoning in general. (Vid. Abacus, No. VI.) Among the Greeks the logiștēs and γραμματιστής appear to have been usually the same person.

In Roman families importance there was a calculator or account-keeper, who is, however, more frequently called by the name of dispensator or procurator, and the kind of steward. 5

CALCULI were little stones or pebbles, used for various purposes; such, for example, as the Athenians used in voting (mil. Cadiros), or such as Demosthenes put in his mouth when declaiming, in order to muffle his pronunciation. 14 Calculi were used in playing a sort of draughts. (Vid. Lathruitur.) Subsequently, instead of pebbles, ivory, or ivory, or gold, or other men as we call them, were used, but still called calculi. The calculi were bi—
colores. 11 Calculi were also used in reckoning, and hence the phrases calkulerum ponere, 12 calkulerum subdu—
tere. 13 (Vid. Abacus, No VI.)

CALDA. (Vid. Calda.)

CALDARIUM. (Vid. Baths, p. 149.)

CALENDAR (GREEK). The Greek year was divided into twelve lunar months, depending on the actual changes of the moon. The first day of the month (υομισία) was not the day of the conjunction, but the day on the evening of which the new moon first appeared; consequently full moon was the middle of the month, and is called δισμής, or "the divider of the month." 15 The lunar month consists of 29 days and about 13 hours; accordingly the moon passed through 30 cycles in one year, and rather more of them at thirty days. The latter were called full months (πλήρες), the former hollow months (κολατοι). As the twelve lunar months fell short of the solar year, they were obliged every other year to interpose an intercalary month (μήνιον ἐξολοκλήματος) of 30 or 29 days. The ordinary year consisted of 354 days, and the intercalated year, therefore, of 384 or 385. This intercalated year (τάηηατικας) was seven days and a half too long; and, to correct the error, the intercalary month was from time to time omitted. The Attic year began with the summer solstice: the following is the sequence of the Attic months, and the number of days in each:

Hecatombion (30), Metageitnor (29), Boe
dromion (30), Phaneporon (29), Mæsoncerion (30), Poseidonion (30), Elaphobolion (30), Munychion (29), Thargelion (29), Scirophorion (29).

The intercalary month was a second Poseidon inserted in the middle of the year. Every Athenian month was divided into three decades. The days of the first decade were designated as λαταμίνον or ἀρχομένον μήνα, and were counted on regularly from 1 to 10; thus δευτέρα ἀρχομένον or λαταμίνον is "the second day of the month." The days of the second decade were designated as τρίται, or ἐκάστος, and were counted from the 11th to the 20th day, which was called έκατος.

There were two ways of counting the days of the last decade: they were either reckoned onward from the 20th (thus πρώτην ἐκάτος was the 21st), or backward from the last day, with the addition φθιάνοντος, πανομένου, ἐκάστος, or ἀπάντος; thus the 21st day of a hollow month was ἐφτάνον φθιάνον—of a full month, ἐπαναφθιάνον. The last day of the month was called ηήμην και νέα, "the old and new," because, as the lunar month really consisted of more than 29 and less than 30 days, the last day might be considered as belonging equally to the old and new month.

The first calendars of the Greeks were founded on rude observations of the rising and setting of certain fixed stars; as Orion, the Pleiades, Arcturus, &c. The earliest scientific calendar, which superseded the earlier artificial system, is thought to have been invented by Meton. He observed that 325 lunar months correspond very nearly to 19 solar years. Accordingly, he introduced a circle of 19 years, or 6940 days, distributed into months, so that they corresponded to the changes of the moon throughout the whole period. This cycle was called the year of Meton (Μέτωνος ἡμιαος), and the calendar based upon it was published at Athens in B.C. 4. The calendar commenced with the month Scirophorion (16th July, B.C. 432). This cycle of 19 years was an ex—
tension of the octaeteris of Cleodorus, which contained 8 years, or 99 months, or 2925 days. Three of the months in the octaeteris were intercalary, occurring in the third, fifth, and eighth years of the cycle. If Meton had reckoned every month full, his cycle would have contained 7650 days, or 7650 —6940—110 days too much; consequently, it was necessary to take 110 hollow months in each cycle. Dividing 7650 by 110 we get the quotient 64, which denotes the interval between every two successive days to be rejected (παραβολαῖοι). Meton's canon begins with two full months, and then we have hollow and full months alternately; but, after the seven epochs of 12 years, we have two full months come together, because there must be 17 full months in every 32. The Metonic cycle was corrected in Ol. 110, by Callippus of Cyzicus. Meton had made the solar year 365 days; Callipppus accordingly assumed a 4 x 19 =76 years' cycle omitting one day, or 2775 days. The epoch of this cycle is 28th June, B.C. 330, Ol. 112, 3. A farther correction of the Metonic cycle was introduced by Timaeus of Taurumon, about Ol. 130. As this clumsy method of reckoning was still found in books, it will be right to give the rules for converting Olympiacos into the year B.C., and vice versa.

CALENDAR.

1. To find the year B.C., given the 4th year of Ol. p. take the formula \(781-(4 \times 365)\). If the event happened in the second half of the Attic year, this must be further reduced by 1; for the Attic year, as mentioned above, commenced with the summer solstice. Thus Socrates was put to death in Thrasylum of Ol. 95, 1. Therefore in B.C. \((781-(4 \times 365))-1=399\). Therefore, to take the Olympic, given the year a B.C., take the formula \(781-n\). The quotient is the Ol., and the remainder the current year of it; if there is no remainder, the current year is the 4th of the Olympiad. If the event happened in the second half of the given year, it must be increased by 1. Thus, to take the event just mentioned, Socrates was put to death in Ol. 95, 1.

2. Demonsthenes was born in the summer of 392, therefore \(781-392=399\). On the Greek calendar in general, the reader may consult Ideler's *Handbuch der Mathematischen und Technischen Chronologie*, Th. i., p. 229-317.

CALENDAR. (Vid. Calendar, Romans.)

The Roman year.—The name of Romulus is commonly attached to the year which is said to have prevailed in the earliest times of Rome; but tradition is not consistent with regard to the form of it. The historians Licinius Macer and Festensta- liu maintained that the oldest year consisted of twelve months, and that it was already in those days an annus serions, that is, a year which coincided directly with the course of the years. Consen- nius, however, in whose work this statement occurs, goes on to say that more credit is due to Graccu- nius, Fulvius (Nobilior), Varro, and others, according to whom the Romans, in the earliest times, like the people of Alba from whom they sprung, allotted to the year but ten months. This opinion is sup- ported by Ovid in several passages of his *Fasti*, by Gallius, Macrobius, Solinus, and Servius. Lastly, an old Latin year of ten months is implied in the fact, that at Laurentum a sacrifice was or- dered to Juno Calendarius on the first of every month except February and January. These ten months were called Martius, Aprilis, Maius, June, Quintilis, Sextilis, September, October, November, and December. That March was the first month in the year is implied in the last six names; and even Plu- tarch, who ascribes twelve months to the Romulian year, places Januarius and Februarius at the end. The fact is also confirmed by the ceremony of re- kindling the sacred fire in the Temple of Vesta on the first day of March, by the practice of placing fresh laurel in public buildings on that day, and by many other customs recorded by Macrobius. With regard to the length of the months, Consen- nius, Macrobius, and Solinus agree in ascribing thirty- one days to four of them, called *pleni mensae*; thirty to the rest, called *cavi mensae*. The four longer months were Martius, Maius, Quintilis, and October. These, as Macrobius says, are distinguished in the latest form of the Roman cal- endar by having their nones two days later than any of the other months. The symmetry of this ar- rangement will appear by placing the numbers in succession: 31; 30; 31; 30; 31; 30; 31; 30; 30. Ovid, indeed, appears to speak of the months as coinciding with the lunar period.

---

1. (On Dio Natalisi, c. 39.—Compare also the beginning of c. 145.—2, (ii, 37, 43; iii, 93, 132, 151)—3, (Noot. Att., iii, 16, 4).—4, (Saturni, 1, 12, 5, (Polyb, l, 6, (in Virgil, Georg, 1, 19).—5, (Mu., 15, 8, (Numa, c. 15)—9, (i, 12.)

2. *Annum est decidium cum luna reverterat annum,* but the language of a poet must not be pressed too closely. On the other hand, Plutarch, in the pas- sage already referred to, while he assigns to the old year twelve months and 365 days, gives the months as varying without system between the limits of twenty and thirty-five days. Such an irregularity is not incredible, as we find that even when Censorinus wrote (A.D. 238), the Alban calendar gave 36 days to March, 22 to May, 18 to Sextilis, and 16 to September; while at Tusculum Quinctilis had 34 days, and Augustus 36. Nevertheless, the same month, October, had no less than 39.1 The Romulian year, if we follow the majority of authors, contained but 304 days; a period differing so widely from the real length of the sun's course, that the months would rapidly revolve through all the seasons of the year. This inconvenience was remedied, says Macrobius, by the addition of the proper number of days at the end of the year; but these days, he goes on to say, did not re- ceive any name as a month. Servius speaks of the intercalated period as consisting of two months, which at first had no name, but were eventually called after Janus and Februns. That some system of intercalation was employed in the Romulian year was as early as the time of Censorinus and Macer. This appears to be all that is handed down with regard to the earliest years of the Romans.

As a year of ten months, i.e., 304 days, at once falls greatly short of the solar year, and contains no exact number of lunations, some have gone so far as to dispute the truth of the tradition in whole or part, and to attempt to reconcile it with the megarian account for the adoption of so anomalous a year. Puteanus, calling to mind that the old Roman or Etruscan week contained eight days, every eighth day being specially devoted to religious and other public purposes, under the name of *nona* or *nonils*, was the first to point out that the number 304 is a precise multiple of eight. To this observa- tion, in itself of little moment, Nicomachus added some weight, by farther noticing that the 38 non- dies in a year of 304 days tally exactly with the number of *dies fasti* afterward retained in the Julian calendar. Another writer, Pontederia, observ- ed that 304 bore to 365 days nearly the ratio of 5 to 6; of the six Romulian years containing 1524, five of them had 304 days. Sulpicius Severus,2 who is a warm advocate of the ten-month year, has made much use of this consideration. He thus explains the origin of the well-known quinquennal period called the lustrum, which Censorinus express- ly calls an annus magnus, that is, in the modern language of chronology, a cycle. Moreover, the year of ten months, says the same writer, was the term for mourning, for paying portions left by will, for credit on the sale of yearly profits; most probably for all loans; and it was the measure for the most ancient rate of interest. (Vid. Interest or Money.) Lastly, he finds in the existence of this short year the solution of certain historical difficulties. A peace or, rather, truce with Veii was concluded in the year 407 before Rome obtained 40 years. In 316, Fidenae revolted and joined Veii, which implies that Veii was already at war with Rome; yet the Veientines are not accused of hav- ing broken their oaths.3 Again, a twenty years' truce, made in 359, is said by Livy to have expired in 947.4 These facts are explained by supposing the years in question to have been those of ten months; for 40 of these are equal to 33 3/1 ordinary

CALENDAR.

June is referred by the latter writer to the fact that the months originally began with the moon, and that June and Luna are the same goddess; and the poet likewise points at the same connexion in his explanation of June's epithet Luscia. Moreover, at Laurentum, Juno was worshipped as Juno Kalendars. Even so late as 448 B.C., strictly lunar months were still in use; for Dionysius* says that Appius, in that year, received the consular authority on the idea of May, being the day of full moon; for at that time, he adds, the Romans regulated their months by the moon. In fact, so completely was the day of the month which they called their Natale conscriba of priestly importance, that some derived the word dano roth etrusc, quod so die plenam speciem luna demonstrat.† Quietly to insert the word of plenam, when the Greek word signifies merely speciem, is in accordance with those loose notions which prevailed in all ancient attempts at etymology. But, though the derivation is of course groundless, it is of historical value, as showing how far connected with the term idea.

For the same reason, probably, the ides of March were selected for the sacrifice to the goddess Anna Perenna, in whose name we have nothing more than the feminine form of the word annus, which, whether written with one n or two, whether in its simple form annus or diminutive annus, still always means a year. The feminine form was easily adopted to denote the period of the sun's course, so the feminine, in like manner, might well be employed to signify, first, the moon's revolution, and then the moon herself. The tendency among the Romans to have the same word repeatedly, first, as a male, and then as a female deity, has been noticed by Niebuhr; and there occurs a complete parallel in Isis and Diana, after the days, for the god of dies, or light, the sun; Diana, afterward, Diana, for the goddess of light, the moon, to say anything of the words Jupiter and Juno. That the month of March should have been selected arose from its being the first of the year, and a sacrifice to the moon might well take place on the day when her power is fully displayed under the moon. The epithet Perenna itself means no more than ever-circling. Nay, Macrobius himself connects the two words with annus, when he states the object of the sacrifice to be, ut annare perennareque commodae licet.

Another argument in favour of the lunar origin of the Roman month is the deductable from the practice of counting the days backward from the kalends, nones, and ides; for the phrases will then amount to saying, "It wants so many days to the new moon, to the first quarter, to full moon." It would be difficult, on any other hypothesis, to account for the adoption of a mode of calculation, which, to our notions, at least, is so inconvenient; and, indeed, it is of late years, that the Roman month has been restored from Greece, under which term the Athenians probably are meant; and by these we know that a strictly lunar year was employed down to a late period.‡ But perhaps the most decisive proof of all lies in the simple statement of Livy, that Numa so regulated his lunar year of twelve months by the insertion of intercalary months, that at the end of every nineteen year it again coincided with the same point in the sun's course from which it started. His words are, "Quem (annum) intercalibus mensibus interponendis vix dispensavit ut vicesimo anno ad metum tandem solis under orsi sunt, pleni annorum mun.

‡ But perhaps the most decisive proof of all lies in the simple statement of Livy, that Numa so regulated his lunar year of twelve months by the insertion of intercalary months, that at the end of every nineteen year it again coincided with the same point in the sun's course from which it started. His words are, "Quem (annum) intercalibus mensibus interponendis vix dispensavit ut vicesimo anno ad metum tandem solis under orsi sunt, pleni annorum mun. spatis, dies congruentes. We quote the text.

because editors, n support of a theory, have taken the liberty of altering it by the insertion of the word quarto, forgetting, too, that the words quarta et vicevima anna signify, not every twenty-fourth year, which their theory requires, but every twenty-third, according to that peculiar error of the Romans which led them to count both the extremes in defining the interval from one point to another, and which still survives in the medical phrases tertian and quartan ague, as well as in the French expressions huit jours for a week, and quinze jours for a fortnight. Accordingly, it is not doing violence to words, but giving the strict and necessary meaning to them, to reduce the words of Livy, which passage in Livy, we express vicevima anno by every nineteenth year.

Now 19 years, it is well known, constitute a most convenient cycle for the conjunction of a lunar and solar year. A mean lunation, or synodic month, according to modern astronomy, is 29d., 12h., 44° 3′, and a mean tropical year 365d., 6h., 48° 48′. Hence we believe that 235 lunations amount to 6999d. 16h., 31′ 45″, while 19 tropical years give 6999d. 14h., 27′ 12″, so that the difference is only 2h., 4′ 33″. Although it was only in the second century B.C. that Hipparchus gave to astronomical observations a nice which they could proceed to deal with (a valuation of the synodic month was 19 d.) at an attempt, therefore, to reconcile the length of the month of Rome, the Greek towns in the south of Italy must already have possessed astronomers, from whom the inhabitants of Latium could have borrowed such a rough practical knowledge of both the mean and the sun's period was as sufficient to show that at the end of 19 solar years the moon's age would be nearly what it was on the first day of the month; and it is reasonable to think that the name of Numa which is often connected by tradition with the learning of Magna Graecia. At any rate, a cycle of 19 years was introduced by Meton, at Athens, in the year 432 B.C.; and the knowledge of it among the learned may probably have preceded, by a long period, its introduction into popular use, the more so as religious festivals are generally connected with the various divisions of time, and superstition, therefore, would be most certainly opposed to innovations of this nature. How the Romans may have intercalated in their 19 lunar years the seven additional months which are requisite to make up the whole number of 355 (=12×19+4) lunations, is a subject on which we have seen, however, that From a union of these various considerations, it must be deemed highly probable that the Romans at one period possessed a division of time dependent upon the moon's course.

Year of the Decemviri (so called by Ideler).—The motives which induced the Romans to abandon the lunar year are nowhere recorded, nor, indeed, the most important, the date of the law of the Twelve Tribes, is brought down from Greece, under which term the Athenians probably are meant; and by these we know that a strictly lunar year was employed down to a late period. But perhaps the most decisive proof of all lies in the simple statement of Livy, that Numa so regulated his lunar year of twelve months by the insertion of intercalary months, that at the end of every nineteen year it again coincided with the same point in the sun's course from which it started. His words are, "Quem (annum) intercalibus mensibus interponendis vix dispensavit ut vicesimo anno ad metum tandem solis under orsi sunt, pleni annorum mun. spatis, dies congruentes. We quote the text. 2. (Philol., Altnac., iv., 2.)—9. (Macrobi., c. 13.)
Latin from the text of Macrobius, because their import is doubtful. If we are right in interpreting them thus, "the date upon which is expressed by a month called intercalary," all that is meant may be one of the intercalary lunations, which must have existed even in the old lunar year. At the period of the decennial legislation there was probably instituted that form of the year of 554 days, which was corrected by the short intercalary month called Macrodonitis or Macrodonis; but so corrected as to deprive the year and month of all connexion with the moon's course. The length of the several ordinary months was probably that which Censorinus has erroneously allotted to the months of Numa's lunar year, viz.: Martius 31 days. Aprilis 30 " 22 March 31 " Maius 31 " June 29 " Quintilis 31 " Sextilis 29 " Such, at any rate, was the number of days in each month immediately prior to the Julian correction; for both Censorinus and Macrobius say that Caesar added two days to Januarius, Sextilis, and December, and in place of them inserted two to September, and November. Hence Niebuhr appears to have made an error when he asserts 3 that July acquired two more days at the reformation of the calendar, and founds thereon a charge of carelessness against Livy. That November had but 29 days prior to the correction—in other words, that the XVII. Kal. Dec. immediately followed the Idus Nov., appears likewise, from a comparison of Cicero's letters to Tiro, for he reaches Corcyra a. d. V. Id. Nov., and on the XV. Kal. Dec. complains, "Septemnum jam diem enabumur." The seven days in question would be IV. Id. III. Id., Prid. Id., Id. Nov., XVII. Kal. Dec., XVI. Kal. Dec., XV. Kal. Dec. That the place of the nones and ides was in each month the same before the Julian correction as afterward, is asserted by Macrobius. The main difficulty is with regard to the mode of intercalation. Plutarch, we have already observed, speaks of an intercalation, by him referred to Numa, of 22 days in alternate years in the month of February. Censorinus, with more precision, says that the number of days in each intercalation was either 22 or 23, and Macrobius agrees with him in substance. When the intercalary month was inserted, the accounts are these: Varro says the twelfth month was February; and when intercalations take place, the last five days of this month are removed. Censorinus agrees herewith, when he places the intercalation generally (potissimum) in the month of February, between the Terminalia and the Regifugium, that is, immediately after the day called by the Romans a. d. VI. Kal. Mar., or by us the 23d of February. This, again, is confirmed by Macrobius. The setting aside of the last five days agrees with the practice which Herodotus ascribes to the Egyptians, of considering the five days over the 360 as scarcely belonging to the year, and not placing them in any month. So completely were these five days considered after the Festival of the Nones, that it would be something extraneous, that the soldier appears to have received them only for 360 days. For in the time of Augustus the soldier received dcnii asses per day, i. e., ½ of a denarius; but Domitian added quadrum stipendium aureos at the same terms. Thus, as 25 denarii made an aureus, the annual pay prior to Domitian was 360 x 10 = 3600 aurei, or 16 x 225 aurei = 9 aurei; and thus the addition of three aurei was precisely a fourth more. Lastly, the festival Terminalia, as its name implies, marked the end of the year; and this, by-the-way, again proves that March was originally the first month.

The intercalary month was called Mepaidwos. We give it in Greek characters, because it happened so strangely that not only an author has mentioned the name, the term memnis interkalaris or interkalarius supplying its place. Thus, in the year of intercalation, the day after the idea of February was called, not, as usual, a. d. XVI. Kalendas Martius, but a. d. XI. Kalendas interkalares. So, also, there were the Nona intercalares and Iulii intercalares, and after this last came either a. d. XV. or XVI. Kal. Mart, according as that month had 22 or 23 days; or, rather, if we add the five remaining days struck off from February, 27 or 28 days. In either case the Reginfugium retained its ordinary designation a. d. VI. Kal. Mart. 2 When Cicero writes to Atticus, "Accept tuas litteras a. d. V. Terminalia" (i. e., Feb. 19), he uses this strange mode of defining a date, because, being then in Cilicia, he was not aware whether any intercalation had been inserted that year. Indeed, he says, in another part of the same letter, "En sic observa quasi interkalatum non sit."

Besides the intercalary month, mention is occasionally made of an intercalary day. The object of this was solely to prevent the first day of the year, and perhaps also the nones, from coinciding with the nundinae, of which mention has been already made. Hence, in Livy, 4 "Intercalatum ex aenea postridie Terminalia intercalares fuerunt." This would not have been said had the day of intercalation been invariably the same; and, again, Livy, "Hoc anno intercalatum est. Tertio die post Terminalia Calendae intercalares fuerint," i. e., two days after the Terminalia, so that the dies intercalares was on this occasion inserted, as well as the month so called. Nay, even after the reformation of the calendar, the same superstitious practice remained. Thus, in the year 40 B.C., a day was inserted for this purpose, and afterward an omission of a day took place, that the calendar might not be disturbed. 4

The system of intercalating in alternate years 25 or 26 days, that is, of ninety days in eight years, was approved, we are told by Macrobius, from the Greeks; and the assertion is probable enough, first, because from the Greeks the Romans generally derived all scientific assistance; and, secondly, because the decennial legislation was avowedly deduced from that quarter. Moreover, at the very period in question, a cycle of eight years appears to have been in use at Athens, for the Metonic period of 19 years is often adopted before 492 B.C. The Romans, however, seem to have been guilty of some clumsiness in applying the science they derived from Greece. The addition of ninety days in a cycle of eight years to a lunar year of 354 days would, in substance, have amounted to the addition of 111 (= 90 + 8) days to each year, so that the Romans would virtually have possessed the Julian calendar. As it was, they added the intercalation to a year of 355 days, and consequently, every year exceeded its proper length by a day, if we neglect the inaccuracies of the Julian calendar. Accordingly, we find that the civil and solar years were greatly at variance in the year 564 A.U.C. On the 11th of Quintilis in that year, a remarkable
At the festivals of the Romans were for the most part dependant upon the calendar, the regulation of the latter was intrusted to the college of pontifices, who in early times were chosen exclusively from the body of patricians. It was, therefore, in the power of the college to add to their own means of oppressing the plebeians, by keeping to themselves the calendar, all would of course be dependent upon their favor. The passage which has induced the editors of Livy to insert the word *quarto* in the text already quoted, as

"... the three months which from the first possessed that number are still distinguished by the constellation of Lyra..."

appears to have been incorrectly quoted. It appears, however, from the last passage, that Atticus doubted the truth of the story. In either case, the other privilege of regulating the year by the insertion of an intercalary month gave them the power, which they were not backward to employ. Everything connected with the matter of intercalation was left, says Censorinus,4 to the unrestrained pleasure of the pontifices; and the majority of these, on personal grounds, added or took from the year by capricious intercalations, so as to lengthen or shorten the calendar. These months were long occupied, and seriously to benefit or injure the farmer of the public revenue. Similar to this was the language employed by Macrobius,4 Ammianus,5 Solinus,6 Plutarch,7 and their assertions are confirmed by the letters of Cicero, written during his proconsulate in Cilicia, the constant burden of which is that the pontiffs will not submit to his year of government by intercalation. In consequence of this license, says Suetonius,8 neither the festivals of the harvest coincided with the summer, nor those of the vintage with the autumn. But we cannot desire a better proof of the confusion than a comparison of three short passages, the first of which is taken from Macrobius, the second from Cicero, the third from Suetonius: 

"... from the new Januarsia navis solis, famque hieme adpropinquabat, multijam menses transirent et hiems jam praepativerat..."

Year of Julius Caesar.—In the year 46 B.C., Caesar, now master of the Roman world, crowned his other great services to his country by employing his authority, as pontifex maximus, in the correction of this serious evil. For this purpose he availed himself of the services of Sosigenes the peripatetic, and a scribe named M. Flavius, though he himself too, we are told, was well acquainted with astronomy, and, indeed, was the author of a work of some merit upon the subject, which was still extant in the time of Pliny. The chief authorities upon the subject of the Julian reformation are Phurtag,1 Dio Cassius,2 Appian,3 Ovid,4 Suetonius,5 Pliny,6 Censorinus,7 Macrobius,8 Ammianus Marcellinus,9 Silius,10 et alii.11 Of these, Censorinus is the most precise:

"... The calendar was for the first time reformed so far, that C. Caesar, the pontifex maximus, in his third consulate, with Lepidus for his colleague, inserted between November and December two intercalary months of 67 days, the month of February having already received an intercalation of 23 days, and thus made the whole year to consist of 445 days. At the same time, he provided against the repetition of similar errors by casting aside the intercalary month, and adapting the year to the sun's course. Accordingly, to the 355 days of the previously existing year, he added ten days, which he so distributed between the seven months having 29 days, that January, Sextillius, and December received each two each, the others but one; and these additional months, being called because they occur in the backward months, no doubt with the wish not to remove the various festivals from those positions in the several months which they had so long occupied. Hence, in the present calendar, although there are seven months of 31 days, yet the four months which from the first possessed that number are still distinguished by the constellation of Lyra, were inserted, having them on the fifth of the month. Lastly, in consideration of the quarter of a day, which he considered as completing the true year, he established the rule, that at the end of every four years a single day should be intercalated where the month had been hitherto inserted, that is, immediately after the Terminalia; which day is now called the Bisextilis..."

This year of 445 days is commonly called by theologists the year of confusion; but by Macrobius, more fitly, the last year of confusion. The kalends of January, of the year 708 A.U.C., fell on the 13th of October, 47 B.C. of the Julian calendar; the kalends of March, 708 A.U.C., on the 1st of January, 45 B.C. of the same. The second of the two intercalary months inserted in this year after November, mention is made in Cicero's letters.11

It was probably the original intention of Caesar to commence the year with the shortest day. The winter solstice at Rome, in the year 46 B.C., occurred on the 24th of December of the Julian calendar. His motive for delaying the commencement for seven days longer, instead of taking the following day, was probably the desire to gratify the superstition of the Romans, by causing the first year of the reformed calendar to fall on the day of the new moon, which is held to be the shortest day. The new moon occurred at Rome on the 1st of January, 45 B.C., at 6h. 16' P.M. In this way alone can be explained the phrase used by Macrobius: "*Amnum civilim Caesar, habitus ad lunam dimensionibus constitutum, edicto palam proposito publicis.*" This edict is also mentioned by Plutarch where he gives the anecdote of Cicero, who, on being told by some one that the constellation Lyra would rise the next morning, "Yes, no doubt, in obedience to the edict."

The mode of denoting the days of the month will

1 (Livy, xxvii. 4. 2—xxviii. 37. 3. (Macrobi. c. 18. 4.) [ib. 46.—Cic. Pro Mur. c. 11.—Plin. H. N. xxvii. 1. Val. Mar. 5.—A. Spil. vi. 9.—Macrobi. 1. 15.—Pomponius. De Origine Jan. in Digesta. I. 11. 2.—Cicero ad Att. vi. 1.—c. 35.)—f. (xxvii. 7. 12.—c. 59.—9. (Jul. 50.—) (Jul. 40.)—11. (c. 51.—12. (c. 53.)
2 (De Bell. Civ. c. 60.—a. xii. 26.—3. (De Bell. Civ. c. 61.—a. exx. 1.—f. (Hist. iii. 155.—f. (Jul. 40.)—6. (Hist. iv. 76.—7. (c. 50.)—8. (Sat. i. 14.—g. (xxvii. 10.—h. 45.—i. (Ad Fam. vi. 14.—j. 195
cause no difficulty, if it be recollected that the kalends always denote the first of the month, that the nones occur on the seventh of the four months March, May, Quintilis or July, and October, and on the fifth of the other months; that the ides always fall eight days later than the nones; and, lastly, that the intermediate days are in all cases reckoned backward, upon the Roman principle already explained of counting both extremes.

For the month of January the notation will be as follows:

The letters a. d. are often, through error, written together, and so confounded with the prepositional ad, which would have a different meaning, for ad kalendas would signify by, i. e., on or before the kalends. The letters are in fact an abridgment of ante diem, and the full phrase for “on the second of January” would be ante diem quantum nonas Januarii. The word ante in this expression seems really to belong in sense to nonas, and to be the cause why nonas is an accusative. Hence occur such phrases as in ante diem quantum Kal. Decemb. distulit, “he put it off to the fourth day before the kalends of December,” Is dies erat ante diem V. Kal. Apr., and ante quem diem iturus sit, for quo die. The same confusion exists in the phrase post paucis diebus, which means “a few days after,” and is equivalent to post quatuor diebus. Whether the phrase Kalenda Januarii was ever used by the best writers is doubtful. The words are commonly abbreviated; and those passages where Aprilis, Decemberis, &c., occur, are of no avail, as they are probably inaccuracies. The ante may be omitted, in which case the phrase will be die quarto nononum.

In the leap year (to use a modern phrase), the last days of February were called:

Feb. 23. a. d. VII. Kal. Mart.
Feb. 25. a. d. VI. Kal. Mart. priorem.
Feb. 27. a. d. IV. Kal. Mart.
Feb. 28. a. d. III. Kal. Mart.

In which the words prior and posterior are used in reference to the retrograde direction of the reckoning. Such, at least, is the opinion of Ideler, who refers to Celsus in theDigests.4

From the fact that the intercalated year has two days called ante diem sextum, the name of bissextile has been applied to it. The term annus bissextialis, however, does not occur in any writer prior to Beda, but, in the place of it, the phrase annum bissecutum.

It was the intention of Caesar that the bissextile should be inserted peracto quadraniis circuitu, as Censorinus says, or quinto quinto inceptor anno, to use the words of Macrobius. The phrase, however, which Caesar used seems to have been quarto quarto anno, which was interpreted by the priests to mean every third year. The consequence was, that in the year 8 B.C., the Emperor Augustus, finding that three more intercalations had been made than was the intention of the law, gave directions that for the next twelve years there should be no bissextile.

The services which Caesar and Augustus had conferred upon their country by the reformation of the year seems to have been the immediate cause of the compliment paid to them by the insertion of their names in the Kalendas. Julius was substituted for Quintilis, the month in which Caesar was born, in the second Julian year, that is, the year of the dictator’s death; for the first Julian year was the first year of the corrected Julian calendar, that is, 45 B.C. The name Augustus, in place of Sextilis, was introduced by the emperor himself, at the time when he rectified the error in the mode of intercalating; anno Augustano xx. The first year of the Augustan era was 27 B.C., viz., that in which he first took the name of Augustus, se v. c. M. Vipsania Agrippa Gruter's.

It has been in September, but gave the preference to the preceding month, for reasons stated in the senatus consultum, preserved by Macrobius.4 Whereas the Emperor Augustus Caesar, in the month of Sextilis, was first admitted to the consulate, and the state entered 1590, in the first month the legions from the Janiculum placed themselves under his auspices, and in the same month Egypt was brought under the authority of the Roman people, and in the same month an end was put to the civil war; and whereas, for these reasons, the said month is, and has been, most fortunate to this empire, it is hereby decreed by the senate that the said month shall be called Augustus. A plebiscitum to the same effect was passed on the motion of Sextus Parvus, tribune of the plebs.

The month of September in like manner received the name of Germanicus from the general so called, and the appellation appears to have existed even in the time of Macrobius. Domitian, too, conferred his name upon October, but the old word was restored upon the death of the tyrant.

The Fasti of Caesar have not come down to us in their entire form. Such fragments as exist may be seen in Gruter’s Inscriptiones, or more completely in Poggini’s, Fastorum Anni Romani...religiae. See also some papers by Ideler in the Berlin Transactions for 1822 and 1833.

The Gregorian Year.—The Julian calendar supposed to have been in use from 45 B.C. to A.D. 1582. But this, as we have already seen, exceeds the real amount by 11’ 12”, the accumulation of which, year after year, caused, at last, considerable inconvenience. Accordingly, in the year 1582, Pope Gregory the XIIIth., assisted by Aloysius, Lilius, Christoph Clavius, Petrus Ciacconius, and others, again reformed the calendar. The ten days by which the year had been unfairly retarded were struck out by regulation that the ten days after the Kalends of October in that year should be called the fifteenth; and it was ordered that, whereas hitherto an intercalary day had been inserted every four years, for the future three such intercalations in the course of four hundred years should be omitted, viz., in those years which are divisible without remainder by 100, but not by 400. Thus, according to the Julian calendar, in years 1700, 1800, 1900, etc., the Kalends of January should be on the 1st, 2d, 3d; but by the regulation of Gregory, the years 1700, 1800, and 1900, were to receive no intercalation, while the years 1600 and 2000 were to be bissextile as before. The bull which effected this change was issued Feb. 24, 1582. The fullest account of this correction is to be found in the work of Clavius, entitled Roman

1. (Cic.) Phil., iii., 8.—2. (Cass.) Bell. Gall., i., 6.—3. (Cass.) Bell. Civ., i., 11—4. (Sth., Hist. 16, s. 98.)
CALENDAR.

Calendaria a Gregorio XIII. P. M. restituti Explication. As the Calendarian calendar has only 97 leap-years in a period of 400 years, the mean Gregorian year is \( \frac{365 \times 365 + 97 \times 366}{400} \), which is, 365.2425 days, or 24" more than the mean tropical year. This difference, in sixty years, would amount to 24", and in 60 times 60, or 3600 years, to 24 hours, a day. Hence the French astronomer, Delambre, has proposed that the years 3600, 7200, 10,800, and all multiples of 3600, should not be leap-years. The Gregorian calendar was introduced into the greater part of Italy, as well as in Spain and Portugal, on the day named in the bull. Into France, two months after, by an edict of Henry III., the 9th of December was followed by the 20th. The Catholic parts of Switzerland, Germany, and the Low Countries adopted the correction in 1550, Poland in 1556, Hungary in 1557. The Protestant parts of Europe resisted what they called a papis- tical invention for more than a century. At last, in 1700, Protestant Germany, as well as Denmark and Holland, allowed reason to prevail over prejudice, and the Protestant cantons of Switzerland copied their example the following year.

In England, the Gregorian calendar was first adopted in 1752, and in Sweden in 1753. In Russia, and those countries which belong to the Greek Church, the Julian year, or old style as it is called, still prevails.

In this article free use has been made of Ideler's work Lehrbuch der Chronologie. For other in- formation connected with the Roman measurement of time, see Clepsydra, Dies, Hora, Horologia, Lostrum, Nundinae, Sacrarium, Sidere.

The following Calendar, which gives the rising and setting of the stars, the Roman festivals, &c., is taken from an article on the Roman Calendar in Pauly's Recht-Encyclopedia der Alterthumswissenschaft. It has been principally compiled from Ovid's Fasti, Columella, and Pliny's Natural History. The letter O signifies Ovid, C. Columella, P. Pliny; but when C. is placed immediately after the date, it signifies a day on which the Comitia were held.

CALIGA.

middle of the vessel there is a small cylindrical
burse, in which the wood or charcoal was kept for
heating the water; and at the bottom of this burse
there are four small holes for the ashes to fall
through. On the right-hand side of the vessel there
is a kind of cup, communicating with the part sur-
rounding the burse, by which the vessel might be
filled without taking off the lid; and on the left-hand
side there is, in about the middle, a tube with a cock
for drawing off the liquid. Beneath the conical
cover, and on a level with the rim of the vessel,
there is a movable flat cover, with a hole in the
middle, which closes the whole urn except the
mouth of the small burse.

Though there can be no doubt that this vessel
was used for the purpose which has been men-
tioned, it is difficult to determine its Latin name; but
it was probably called authemia. (Vid. Authemph.)
Pollex mentions several names which were applied
to the vessels used for heating water, of which the
πυθολέβη, which also occurs in Lucian, appears to
answer best to the vessel which has been described
above.

*CALIDRIS (καλίδρης), the name of a bird men-
tioned by Aristotle. Belon conjectures that it was
a bird called Cheedar by the French. The term
Calidris is now applied to the Red-sshank.

CALIGA, a strong and heavy sandal worn by the
Roman soldiers.

Although the use of this species of calceamentum
extended to the centurions, it was not worn by the
superior officers. Hence the common soldiers, in-
cluding centurions, were distinguished by the name

I. (Plint., Curs., ii., iii.,—Trin., iv., iii.,—Rudn., vi.,
65.—2. (Darr., tr. 6.)—3 (vol. ii., p. 62.)—4 (x., 62.)—5
(Lexiph., v.)—6. (Widiger, Sabina, i., p. 86.—Rockers, Gallus,
vol. i., p. 175)
CALOUPUS, CALOPODITUM. (Vid. Forma.)

CALUMNIA. "Calumniiarii is defined by Marcian as "persona qui crimina intenderet," a definition which, as there given, was only intended to comprehend criminal matters. The definition of Paulus 1, applies to matters both criminal and civil: "Calumnianus est qui sciens praesumusque per fraudem negatum aliqui eum comparat." Cicero 2 speaks of "calumnia," and of the "nimes calida et malitious juris interpretation," as things related. Gains says, "Calumnia in adesta causae abesse est; sed criminale verum unius ad singulas victimas a quo usque ad socia to the soldiers: since, however, they probably furnished them with provisions and necessaries, to the soldiers, it seems not unlikely that their application may have some allusion to this circumstance. 3

CALOUPUS, CALOPODITUM. (Vid. Forma.)

CALUMNIA. "Calumniiarii is defined by Marcian as "persona qui crimina intenderet," a definition which, as there given, was only intended to comprehend criminal matters. The definition of Paulus 1, applies to matters both criminal and civil: "Calumnianus est qui sciens praesumusque per fraudem negatum aliqui eum comparat." Cicero 2 speaks of "calumnia," and of the "nimes calida et malitious juris interpretation," as things related. Gains says, "Calumnia in adesta causae abesse est; sed criminale verum unius ad singulas victimas a quo usque ad sociationem." When an accused failed in his proof, and the reus was acquitted, it might be an inquiry into the conduct and motives of the accuser. If the person who made this judicial inquiry (qui cognovit) found that the accuser had merely acted from error of judgment or ignorance, theacus (pro quo praebuit) if he convicted him of evil intention, he declared his sentence in the words calumnianus est, which sentence was followed by the legal punishment.

According to Marcian, as above quoted, the punishment for calumnium was fixed by the lex Remnia, or, as it is sometimes, perhaps incorrectly, named the lex Remnia. But when this lex was passed, nor what were its penalties. It appears from Cicero 3 that the false accuser might be branded on the forehead with the letter K, the initial of Kalumnia; and it has been conjectured, though it is a mere conjecture, that this punishment was inflicted by the lex Remnia.

The punishment for calumnium was also exsul, relegation in insula, or loss of rank (ordinem asexisio); but probably only in criminal cases, or in matters relating to status. 4

In the case of actions, the calumnia of the accuser, was checked by the calumniae judicium, the judicium contrarium, the jusjurandum calumniae, and the restitutio, which are particularly described by Gaius. 5 The defendant might in all cases avail himself of the calumniae judicium, by which the plaintiff, if he were found to be guilty of calumnia, was mulcted to the defendant in the value of the object-matter of the suit. But the actor was not mulcted in this action, unless it was shown that he brought his suit without foundation, knowingly and designedly. In the contrarium judicium, of which the defendant could only avail himself in certain cases, the rectitude of the plaintiff's purpose did not save him from the penalty. Instead of being mulcted, the defendant in the value of the object-matter of the suit, or the defendant might put the plaintiff to the oath of calumnia, which was to the effect, "Se non calumnia causa agere." In some cases the defendant also was required by the praetor to swear that he did not dispute the plaintiff's claim. calumnia causa. Generally speaking, if the plaintiff put the defendant to his oath of calumnia, and the defendant might put the plaintiff to his oath of calumnia. In some actions, the oath of calumnia on the part of the plaintiff was a necessary preliminary to the action. In all judicia publica, it seems that the oath of calumnia was required from the accuser.

If the restitutio poena was required from the actor, the defendant could not have the benefit of the calumniae judicium, or of the oath of calumnia; and the judicium contrarium was not applicable to such cases.

Persons who for money either did or neglected to do certain things, calumniae causa, were liable to certain actions.

OCA (.pointer, lance) or CAMEREA is used in two different senses:

I. It signifies a particular kind of arched ceiling in use among the Romans, and, most probably, common also to the Greeks, to whose language the word belongs. It was formed by semicircular bands or beams of wood, arranged at small lateral distances, over the walls, and by means of them the whole, and the whole covered in by a roof, resembling in construction the hipped awnings in use among us, or like the segment of a cart-wheel, from which the expression rotatio camarae is derived. Subsequently to the age of Augustus, it became the fashion to line the camarae with plates of glass; and they are called camarae vetustae. II. Small boxes used in early times by the people who inhabited the shores of the Palus Matucus, capable of containing from twenty-five to thirty men, were termed καιδας by the Greeks. They were made to work fore and aft, like the fast-sailing pros of the Indian seas, and continued in use until the age of Tacitus, by whom they are still named kamarae veteres, by whom their construction and uses are described.

*CAMEL JPsardais (καμελοπαρδαίς), the Camelopard or Giraffe, the Giraffa Camelopardalis, L. "The name Giraffa," observes Lt. Col. Smith, "is derived from the Arabic zuwarphala, which is itself corruputed from Amharir zirakula; and the Romans, who have seen this animal in several times exhibited from the period when Julius Caesar first described one to the people, described it under the name of Camelopardalis, on account of its similarity to the Camel in form, and to the Panther or

CAMELUS. CAMPUS MARTIUS.

اردinis in spots. This beautiful animal is noticed by Oppian,1 Diodorus Siculus,2 Horace,3 Strabo,4 and Pliny;5 but the first satisfactory description is found in the *Ethiopica* of Heliodorus.6 Schneider follows Pallas in referring the *nāpadwas* of Aristotle7 to this same animal. Modern naturalists have known the Giraffe only since Mr. Patterson, of Gordon, and M. le Vaillont found it in South Africa; but as the Romans were acquainted with the animal, it must have existed to the north of the equinoctial line. It would appear, moreover, that a variety or second species is found in Central Africa; for Park, in describing his escape from captivity among the Moors, noticed an animal of a gray color, which he refers to the word *Camelus,* or the same animal as the wild Camel of the mountains, the existence of which has been attested by several negroes brought from the interior, and in the Prenestine Mosaics, where two spotted Camelopardales are seen together; a larger animal is likewise represented, with short horns, but without spots, and the name TABOUC written over. In a drawing of the same mosaic, the word *Camelus* is seen, and apparently, this animal has been PA-

ΦΟUC. It is remarkable, that while the spotted figures are without a name, the animal in question, occupying that part of the picture which designates the Cataracts of the Nile, should be called by the Ethiopian appellation of the Camelopard, which, according to Pliny, was Nābas, resembling the Hotentot Naip; or, by the second reading, be like the Arabian, or, as one says—like the Giraffe from Europe for three centuries and a half naturally induced a belief that the descriptions of this animal were fabulous, or nearly so, and that a creature of such extraordinary height and apparent disproportions was not to be found among the actual works of nature. This skepticism was first shaken by Le Vaillant, the traveller, and is now completely removed.8

*CAMELUS* (καμηλος), the Camel. As Buffon remarks, Aristotle has correctly described the two species of Camel, which he calls the Bactrian and the Arabian, the former being the *Camelus Bactri-

anuS,* L., or the Camel with two hunches, one on the shoulders, and the other on the croup; and the latter the *Camelus Græcus,* or the Camels, with only one hunch, and of which the Dromedary, properly so called, is a breed. The Dromedary of the Greeks is the Mahairy, and is the most celebrated for speed. "The name by which these animals are generally known in Europe is evidently derived from an Eastern root, namely, *Djemel* of the Arabs, *Gomai* or *Gimal* of the Hebrews, and points out the quarter where they have been domesticated from a period anterior to all historical documents. Although the Greek and Roman writers take universally as little notice of the Camel as an inhabitant of North Western Africa or Egypt, as they speak repeatedly of him in Syria, Arabia, and the rest of Western Asia, we may easily infer, from a consideration of the peculiar structure of this animal, that the primitive habitat of the genus was on the sandy deserts of the Sahara, as well as the plains of Arabia, Persia, the Indies, and Southern Tartary. The silence of profane writers, however, is compensated by the Sacred Writings. In Genesis, the King of Egypt is mentioned as having bestowed Camels upon Abram; consequently, their presence in the valley of the Nile is established before the era of the earliest Greek or Roman writers. And yet it is a singular fact, that the Camel is not rep-

resented in the hieroglyphics, either in domestic scenes or in subjects relating to religion. In all obvious cases, the intelligence of man may be considered as acting in unison with the intentions of Nature; now, as this sagacity to appreciate his own interest is a most important part of the warlike spirit, the Camel over India, China, and Middle Russia, it is certainly rather surprising that the Romans, in their frequent wars in Northern Africa, should not have found them of sufficient importance to be mentioned, till Procopius first notices camel-riding Moors in arms against Solomon, the lieutenant of Belisarius: from that period, and most particularly during the progress of the sword of the Koran in Morocco, the Camel is the most striking, and considered the most useful animal in the country. It is probable that this animal increased in proportion as agriculture diminished; at least the two facts are coeval. With the Koran, also, the Camel first crossed the Bosphorus, and spread with the Turks over their present dominions in Europe.9

*CAMMARUS* (καμμαρος or -ος), a variety of the Caro, or Scimitar, as it is called. It is the common Lobster, the *Carus marinus* of Pliny, and the *Cancer Carenus* of Linnaeus. Aristotle, in the second chapter of the fourth book of his "History of Animals," gives a most faithful and elaborate account of this species, which is still an inhabitant of the Mediterranean.9

CAMELUS. (Val. Haus.)

CAMPUS MARDUS (καμπους αρδινος) was a kind of guide absent, which the Roman youths were wont their loins when they exercised naked in the Campus Martius.9 The campstret was sometimes worn in warm weather in place of the tunic under the toga (campstret sub toga cinctus).10

CAMPIDOCTORES were persons who taught soldiers their exercises.2

In the times of the Republic, this duty was discharged by a centurion, a veteran soldier of merit and distinction (Excenen-

turnibus nostris non veteranorum aliquis, cui decus

muralis aut civica, sed Graecus magister assisit).11

CAMPUS MARTIUS. The term *campus* belongs to the language of Sicily, in which it signified a hippodrome or race-course (ευκρινως, ἐπιθηκος 2καταλόγισα).12 But among the Romans it was used to signify an open plain, covered with herbage, and set out with various species of exercise. Eight of these plains are enumerated by P. Vici as appertaining to the city of Rome; among which the most celebrated was the Campus Martius, so called because it was consecrated to the god Mars.1 Some difference exists between Livy and Dionysius Halicarnassus respecting the period at which this consecration took place. The former states that, upon the expulsion of the Tarquins, the people took possession of their property (et Tarquinius), situate between the city and the Tiber, and assigned it to the god of war, by whose name it was sub-

sequently distinguished; whereas the latter says that the ager Tarquinius had been usurped from that divinity, in whom it belonged of old, and appropriated by the Tarquins, so that it was only re-

stored to its original service upon their expulsion, which gains confirmation from the exact date, quoted by Festus,12 "Secunda spolia in Martis aera in campo Soliturnivilia ultra volueret cadit."13

From the greater extent and importance of this plain beyond all the others, it was often spoken of as the plain, και τη ξενοφυ, without any epithet to dis-

CAMPUS SCCELERATUS

C. NATHRON

unuish it, as in the passage of Festus just cited;¹ and, therefore, whenever the word is so used, it is the Campus Martius which is to be understood as always referred to.

The general designation Campus Martius comprised two plains, which, though generally spoken of collectively, are sometimes distinguished.² The former of these was called the Campus Martius and Tarquinianum, to which Juvenal³ refers, in De Superbi Totum regia agrum; the other was given to the Roman people by the vestal virgin Caia Taratia or Sufletia,⁴ and is sometimes called Campus Tiberinus,⁵ and sometimes Campus Minor.⁶

It is difficult to determine the precise limits of the Campus Martius, but in general terms it may be described as that area in the Via Latina and Via Flaminia on the north, the Via Recta on the south; as bounded by the Tiber on the west, and the Pantheon and gardens of Agrippa towards the east; and the Campus Minor, or Tiberinus, occupied the lower portion of the circuit towards the Via Recta, from the Pons Ælius to the Pons Neronianus.⁷

That the Campus Martius was originally without the city is apparent, first, from the passages of Livy and Dionysius above referred to; secondly, from the custom of holding the Comitia Centuriata there, which could not be held within the Pomerium;⁸ hence the word campus is put for the comitia, which also explains the expression of Cicero, fora domus,⁹ and of Lucan,¹⁰ sanae campus, which means "a corrupt voter," thrirdly, because the generals who demanded a triumph, not being allowed to enter the city, remained with their armies in the Campus Martius; and, finally, because it was not lawful to bury within the city, whereas the monuments of the illustrious dead were among the most sacred to the Romans, with which it was consecrated (Vid. Bustinus.) But it was included in the city by Aurelian when he enlarged the walls.¹¹

The principal edifices which adorned this famous plain are described by Strabo,¹² and are amply treated of by Nardini.¹³ It was covered with perpetual verdure,¹⁴ and was a favourite resort for air, exercise, and games. But when the labours of the day were over,¹⁵ its ample area was occupied by the young, who there initiated themselves in all warlike and athletic exercises, and in the games usual to the palestra; for which purpose the contiguous Tiber rendered it peculiarly appropriate in early times, before public baths were established.¹⁶ Hence campus Martius was called "a field" for any exercise, mental or bodily.¹⁷ Wooden horses were also kept in the Campus Martius, under porticoes in winter, and in the open plain during summer, in order to give expediency in mounting and dismounting; a necessary practice when stirrups were not in use.¹⁸ Horse-races (epuria) also took place here, unless when the campus was overflowed, upon which occasions the games were removed to the Campus Martialis on the Caelian.

CAMPUS SCCELERATUS was a spot within the walls, and close to the Porta Collina, where those of the vestal virgins who had transgressed their vows were entombed alive, from which circum-

stance it takes its name.¹⁹ As it was infutut to bury within the city, or to slay a vestal, whose person, even when polluted by the crime alluded to, was held sacred, this expedient was resorted to in order to elude the superstition against taking away a consecrated life, or giving burial within the city.²⁰ CANABOS or CINABROS (καναβός oκ κιναβας) was the name of the ditch round which the clay or plaster was laid in forming models. Figures of a similar kind, formed to display the muscles and veins, were studied by painters in order to acquire some knowledge of anatomy.²¹

CANALIS, which means properly a pipe or gutter for conveying water, is also used in three specific modifications:

1. To designate a particular part of the Forum Romanum.

"In foro infimo honi domus atque dites ambulant; in medio proper canalem, ibi ostentatores meri."

The immediate spot so designated is not precisely known; but we can make an approximation which cannot be far from the truth. Before the Cloaca were made, there was a marbys spot in the Forum called the Locus Curtius;²² and as the Cloaca Maxima was constructed for the purpose of draining off the waters which flowed down from the Palatine hill into the Forum, it must have had a mouth in it, which was called the prætorium.²³ The"kennel," therefore, which conducted the waters to this embouchure, was termed Canalis in Foro; and because the idle and indigent among the lower classes were in the habit of frequenting this spot, they were named Canaliculii.²⁴ The canals appear to have had gratings (cancelli) before it, to which Cicero²⁵ refers when he says, that after the tribune P. Sextus had arrived at the Colosseum, he tore out ex omnibus specularibus uisque a Capitolle, tantus ex fori cancellis planus excussit;²⁶ by which he means all classes, both high and low: the upper, who sat between the Columna Menia and the Capitol; and the lower, who were stationed near the cancelli of the canals. In the modern city of Rome, the foul waters emptied themselves into the sewers through an archway nearly six feet high, the mouth of which is closed by an iron grating called cancello, so that the passer-by is annoyed by the effluvia exhalmg from them; which, we learn from a passage in Tertullian,²⁷ was also the case in the ancient city.

II. CANALIS is used by Vitruvius²⁸ to signify the channels of the aqueducts. The words meant the capital, above the cymatium or echinus, which may be understood by referring to the representation of an Ionic capital given in the article ASTRAGALUS.

III. In reference to aqueducts, CANALIS is used by Frontinus²⁹ for a conduit of water running parallel to the main course (specus), though detached from it. Accurately speaking, it therefore means a pipe or conduit of water from some source to the aqueduct, which brought a stream of water from the same source, but for some specific use, and not for general distribution; though the word is sometimes used for a watercourse of any kind.

CANA THRON (καναθρόν), a carriage, the upper part of which was made of basket-work, or, more properly, a basket itself, which was fixed in the carriage.³⁰ Homer calls this kind of basket πέταλος.³¹

¹. (Properiti., 15, 34.—Orat. Past., 27.—Livy, vi., 43.)
The candelabrum was originally used as a candlestick, but was afterward used to support lamps (λυχνῳδές), in which signification it most commonly occurs. The candelabra of this kind were usually made to stand upon the ground, and were of a considerable height. The most common kind were made of wood, but those which have been found in Herculaneum and Pompeii are mostly of bronze. Sometimes they were made of the more precious metals, and even of jewels, as was the one, which Antiochus intended to dedicate to Jupiter Capitolinus. In the temples of the gods and palaces there were frequently large candelabra made of marble, and fastened to the ground.

There is a great resemblance in the general plan and appearance of most of the candelabra which have been found. They usually consist of three parts: 1. the foot (στήνας); 2. the shaft or stem (στύλος); 3. the plinth or tray (ἄσθρον), large enough for a lamp to stand on, or with a socket to receive a wax candle. The foot usually consists of three lions' or griffins' feet, ornamented with leaves; and the shaft, which is either plain or fluted, generally ends in a kind of capital, on which the tray rests for supporting the lamp. Sometimes we find a figure between the capital and the tray, as is seen in the candelabrum on the right hand. In this annexed woodcut, which is taken from the Museo Borbonico, and represents a candelabrum found in Pompeii, The...
CANDYS (κάνδυς), a gown worn by the Modes and Persians over their trousers and other garments. It had wide sleeves, and was made of woolen cloth, which was either purple or of some other splendid colour. In the Persepolitan sculptures, nearly all the principal personages are clothed in it. The three here shown are taken from Sir T. K. Porter's Travels.2

We observe that the persons represented in these sculptures commonly put their hands through the sleeves (διακρότες τῶν χειρῶν διὰ τῶν κανδύων); but sometimes keep them out of the sleeves (ἐκ τῶν χειρῶν); a distinction noticed by Xenophon.4 The Persian candys, which Strabo6 describes as a "flowered tunic with sleeves," corresponded to the woolen tunic worn by the Babylonians over their linen shirt (ἐρυθέων κεφαλῶν ἐπενδυόμενος; ἐπενδυόμενος λειβός). A gown of the same kind is still worn by the Armenians, Turks, and other Orientals, and by both sexes.

CANE'PHOROS (κανεφόρος). When a sacrifice was to be offered, the round cake (τροχία θάλας; πλάνθος; δίψη, μοία σάλας), the chaplet of flowers, the knife used to slay the victim, and sometimes the frankincense, were deposited in a flat circular basket (κάνεων, canisium), and this was frequently carried by a virgin on her head to the altar. The practice was observed more especially at Athens. When a private man sacrificed, either his daughter or some unmarried female of his family officiated as his canesphoros; but in the Panathenaea, the Dionysia, and other public festivals, two virgins of the first Athenian families were appointed for the purpose. Their function is described by Ovid in the following lines:

"Ilià forte die casta de more puellae
Vertice supposito festas in Palladis arcus
Pura coronis portabant sacra consilia."

That the office was accounted highly honourable appears from the fact that the resentment of Harmodius, which instigated him to kill Hipparchus, arose from the insult offered by the latter to the forbids

She slightly raises her tunic with the other. This attitude was much admired by ancient artists. Pliny mentions a marble canesphoros, and Cicero7 describes a candelabrum in bronze, which were the exquisite work of Polydectes. (Vid. Caryatidas.)

*CANCAMUM (κάνκαμος), a substance mentioned by Dioscorides,9 and which Paul of Aegina10 describes as the gum of an Arabian tree, resembling myrrh, and used in perfumes. Avicenna calls it a gum of a horrid taste. Alston remarks that "some have taken this word to be a corruption of the Greek word, but it seems to have been unknown to the ancient Greeks." Upon the whole, Sprengel inclines to the supposition that it may have been a species of the Amysis Katac.;11

CANIC'ULA. (Vid. CANALS.)

CANI'COLA.5 (Vid. SIROS.)

CANS (κάνις) the Dog.4 "The parent-stock of this faithful friend of man must always remain uncertain. Some zoologists are of opinion that the breed is derived from the wolf; others, that it is a familiarized jackal: all agree that no trace of it is to be found in a primitive state of nature. That there were dogs, or, rather, animals of the canine family, is evident from the remains; and that there are wild dogs we also know. India, for example, affords many of them, living in a state of complete independence, and without any indication of a wish to approach the dwellings of man. These dogs, however, though they have been accurately noticed by competent observers, do not draw much light upon the question. The most probable opinion is that advanced by Bell, in his History of British Quadrupeds.12 This author thus sums up: 'Upon the whole, the argument in favour of the view which I have taken, that the wolf is probably the original of all the canine races, may be stated as follows: the structure of the animal is identical, or so nearly so as to render any other species impossible; the domestication of the wolf is a proof of its favour. The Dog must have been derived from an animal susceptible of the highest degree of domestication, and capable of great affection for mankind, which has been abundantly proved of the wolf. Dogs having returned to a wild state, and continued in that condition through many generations, exhibit a similarity approaching more or less to that of the wolf, in proportion as the influence of domestication ceases to act. The two animals, moreover, will breed together, and produce fertile young; and the period of gestation is the same. The period at which the domestication of the Dog first took place is wholly lost in the mist of antiquity. The earliest mention of it in the

---

Scriptures occurs during the sojourn of the Israelites in Egypt: 'But against Israel shall not a dog move his tongue.' It is again mentioned in the Mosaic law in a manner which would seem to show that dogs were the common scavengers of the Israeliish camp, as they still are in many cities of the East: 'Neither shall ye eat any flesh that is torn of beasts in the field; ye shall cast it to the dogs.' A similar office seems to be repeatedly alluded to in the course of the Jewish history. The Dog was considered by the Jews as eminently an unclean animal, and was the figure selected for the most contemptuous insults. It is impossible not to be struck with the similarity which exists in the feelings of many Oriental nations at the present day, among whom the very phraseology of the Scriptures is, with little modification, applied to a similar purpose. The Dog was held in great estimation in many parts of Egypt, particularly at the city of Cynopolis, where it was treated with divine honours. According to Plutarch, however, the animal lost this high rank by reason of its eating the flesh of Apis, after Canybeses had slain the latter and thrown it out on, which occasion no other animal would taste or even come near it. But considerable doubt has been thrown on this story, and the remarks, with the group of the god Mithras, where the dog is represented feeding on the blood of the slaughtered ox, that there is reason to believe the story derived its origin from the Persian idol. The Egyptians, as appears from the monuments, had several breeds of dogs: some solely used for the chase; others admitted into the parlour, or selected as the companions of their walks; and some, as at the present day, chosen on account of their peculiar ugliness. The most common kinds were a sort of fox-dog and a hound; they had also a short-legged dog, not unlike our terrier, which was a great favourite in the house. The fox-dog appears to have been the parent-stock of the modern red wild dog of Egypt, which is so common at Cairo and other towns of the lower country. The Albatian Dog has been noticed by historians, naturalists, and poets, ever since Europe first began to be raised into consequence and importance. A supernatural origin and infallible powers have been attributed to it. Diana is said to have presented Procris with a dog which was always sure of its prey, and to this animal the canine genealogists of antiquity attributed the origin of the celebrated race of the southeast of Europe, particularly of Messius and Sparta. The very fine breed of dogs now found very plentifully in this corner of Europe, particularly in Albania, accords with the descriptions existing of its progenitors, indigenous in the same countries, and do not seem to have degenerated. The Mastiff (Canis Angelicus, L.) is another fine and powerful species. This breed was assiduously fostered by the Romans while they had possession of Britain, and many of them were exported to Rome, to combat wild animals in the amphitheatres. The canis Melitcera were a small species, or a kind of lap-dog. The modern Maltese dog is a small species of the Spaniel, and so, perhaps, was its ancient.

II. CANTHRUS was also the name of a man, which Elian calls κυνάρος θαλάσσιος. It is the Sparus canthusus, L. Its flesh is like that of the Gilt-head in taste and other qualities.

III. CANTHRUS, the Beetle. (Vid. SCARRABUS.)

CANTICUM. In the Roman theatre, between the first and second acts, flute music appears to have been introduced, which was accompanied by a kind of recitative, performed by a single actor, or, if there were two, the second was not allowed to speak with the first. Thus Diomedes says, 'In cantica una cantans debet esse persona, aut si duo forint, ita debent certi, ut ex oculos una audiatur, vel loquatur, sed secum, si opus fuerit, verba faciat.' In

294
the caudium, as violent gesticulation was required. It appears to have been the custom, from the time of Livia's Andronicus, for the actor to confine himself to the gesticulation, while another person sang the recitative. The caudium always formed a part of a Roman comedy. Diomedes observes that a Roman comedy consists of two parts, dialogue and caudium (Latinus comediae duobus tantum membri constant, diviserio et cantico). Wolf* ended the caudium with various come- dy situations and an ode, and the Antellane fable. There can be no doubt that they did in the latter; they were usually composed in the Latin, and sometimes in the Greek language, whereas the other parts of the Antellane plays were written in Oscan. (Vid. Antellane Fabule.)

CAPELEFON. (Vid. CARPON.)

CAPET (CAPET, and, contri-

nientum membrum, or, and, the Antellane fable. There can be no doubt that they did in the latter; they were usually composed in the Latin, and sometimes in the Greek language, whereas the other parts of the Antellane plays were written in Oscan. (Vid. Antellane Fabule.)

CAPER (τρίγυγος), the he-Goat. Capra is the same for the female, to which αλς corresponds in Greek. The generic appellation in the Linnaean system is Capra hircus. The ancients were likewise acquainted with the wild Goat, or Cepora ibex; it is supposed to be the Ako or Akko of Deuteronom-
y, and the ἄρισκες of the Septuagint and of Diodorus. The wild Goat was regarded as the emblem of the generative principle, and was held sacred in some parts of the land. The Ιβex, or wild goat of the Desert, however, was not sacred. It occurs sometimes in astronomical subjects, and is frequently represented among the animals slaughtered for the table and the altar; both in the Thebaid and in Lower Egypt. It was kept in the Egyptian temple of the crystal. Col. Smith, "that, as far as geological observations have extended over fossil organic remains, among the multitude of extinct and existing genera, and species of mammiferous animals, which the exercised eye of comparative anatomists has detected, no portions of Caprine or Ovine races have yet been satisfactorily authenticated; yet, in a wild state, the first are found in three quarters of the globe, and perhaps in the fourth; and the second most certainly exists in every great portion of the earth, New-Hol-

land, perhaps, excepted. It would almost seem as if this class of animals were added by Providence to the stock of other creatures for the express purpose of making the instruments which should lead man to industry and peace; at least such an effect may, in a great measure, be ascribed to them; and, if not the first companion, the Goat may nevertheless be regarded as the earliest passive means by which mankind entered upon an improving state of existence. The skins of these animals were prob-

ably among the first materials employed for clothing. Afterward the long hair of the goat was mixed

up with the short and soft fur of other animals, and, united with the gum of trees or animal glue, manufactured into that coarse but solid felt known in Northern Asia from the earliest ages, and noticed by historians and poets. It was probably of this material that the black war-tunics of the Cimbri were made, in their conflicts with Marius; and we know when the winter dress of the auxiliary aux-

iliaries, and even of the Roman legions in Britain, at least to the period of Constantine. But, long before this era, the gradual advance of art was felt, even in the depth of Northern Europe; the distaff had reached the Scandinavian nations; and the thread, at first platted into ribbons, afterward enlarged, and wrought like matting into a kind of thrum, was at

last, of all, into broad pieces of cloth. In the riband plat (i.e., plaid) we see the origin of the check dresses common to most nations of northern latitudes during their incipient state of civilization; for these were made by plat-
ing the ribbons into broader and warmer pieces. The stripes, almost universal in the South, were the same plats sewed together. That goat's hair was the chief ingredient among the Scandavians, is proved by their divinities being dressed in Geia Kurtuls. The domestic goat in the north and west of the Old World preceded sheep for many ages, and predominated while the country was chiefly covered with forests; nor is there evidence of wool-bearing animals crossing the Rhine or the Upper Danube till towards the subversion of the Roman Empire."

*CAPHURA (καφυρά), the Camphor-tree. SY-

meon Callus is the first Greek who makes mention of the Camphor-tree, or Lauraus Camphora, L. He describes it as a very large tree, growing in India, the wood of which is light and ferulaceous. Cam-

phor was first introduced into medical practice by the Arabians. CAPILLUS. (Vid. COMA.)

CAPISTRUM (καπιστρον), a halter, a tie for horses, asses, or other stock animals, placed round the head or neck, and made of osiers or other fibrous materials. It was used in holding the head of a quadruped which required any healing operation, in retaining animals at the yoke, or in fastening them to the yoke, as shown in the woodcut ARAUTUM (p. 79). In representations of Bacchanaclian processions, the tigers or feras are attached to the capi-

stra made of vine-branches. Thus we read of the vite capitstara tigris of Ariadne, and they are seen on the bas-relief of a sarcophagus in the Vati-

can representing her nuptial procession. See the

annexed woodcut.

In ploughing fields which were planted with vines or other trees, the halter had a small basket at-

tached to it, enclosing the mouth, so as to prevent the ox from cropping the tender shoots (fuscellis ca-

pistatis!). Also, when goatherds wished to obtain milk for making cheese, they fastened a muzzle or capistroma, or yoke, with iron points, about the mouth of the kid, to prevent it from sucking.

Bands of similar materials were used to tie vines to the poles (pali) or transverse rails (yuga) of a trellis.

The term φοιλίεσι was also applied to a contrivance used by pipers (αδιστήλιοι) and trumpeters to compress their mouths and cheeks, and thus to add to their voice (Vid. Caput). This was said to be the invention of Marsyas.

CAPITA/LIS. (Vid. CAPUT.)

CAPITE CENSI. (Vid. CAPUT.)

1. (Griffith's Cuvier, vol. iv., p. 294, seqq.)—2. (Colmerella, vi., 19, 20.—3. (Varro, De Rustis, iii., 6) 4. (Cicero, Epist., 1o,

CAPITOLIUM.

CAPITOLIUM. (Vid. CAPUT.)

This word is used in different significations by the Latin writers, the principal of which are the following:

I. Capitolium, a small temple (saeculum), supposed to have been built by Numa, and dedicated to Jupiter, Juno, and Minerva, situated in the Regio ix. on the Esquiline, near to the spot which was afterward the Circus of Flora. It was a small and humble structure, suited to the simplicity of the age in which it was erected, and was not termed capitolium until after the foundation of the one mentioned below, from which it was then distinguished as the Capitolium vulus. ² ³ ⁴ ⁵ ⁶

II. Capitolium, the Temple of Jupiter Optimus Maximus, in the Regio viii. on the Mons Tarpeian, so called from a human head being discovered in digging the foundations. ⁷ ⁸

The Capitolium contained three temples within the same peristyle, or three cells parallel to each other, the partition walls of which were common, and all under the same roof. ⁹

In the centre was the seat of Jupiter Optimus Maximus, called cella Jovis, and hence he is described by Ovid as "media qui sedet aed. Deus. That of Minerva was the third cella, and perhaps the allusion of Horace, to Proximos illi tamen occupavit Pacificae veneris, and that of Juno upon the left, but compare Livy. ³ ⁷ "Jupiter Optimus Maximus, Juno Regina, et Minerva," and Ovid, ⁸ which passages are considered by some writers to give Juno the precedence over Minerva. The representation of the Capitolium in the next woodcut is taken from a medal.

The exact position occupied by this temple has been the subject of much dispute. Some writers consider it to have been upon the north, and some upon the south point of the Mons Capitolini; some, that it stood upon a different summit from the arx, or fortress, with the intermontium between them; others, that it was within the arx, which is again referred by some to that side of the mount which overhangs the Tiber, and by others to the opposite acclivity. The reader will find the subject fully discussed in the following works: Marliani, Urb. Rom. Topogr., i., 1, 5.—Donati, De Urb. Rom.—Lucio Mauro, Antiqu. Roma.—Andreas Fulvio, Id.—Johannes Boneis, &c.—Nardini, Roma Antica, v., 14.—Bunsen and Plattner, Beschreibung Rom.—Nebihr, Hist. Rom., v., i., p. 502, trans.

III. Capitolium is sometimes put for the whole mount, including both summits, as well as the intermontium, which was originally called Mons Saturnius, ¹ and afterward Mons Tarpeian, ² from the virgin Tarpeia, who was killed and buried there by the Sabines ; and, finally, Mons Capitolinus, for the reason already stated; and, when this last term became usual, the name of Tarpeia was confined to the immediate spot which was the scene of her destruction, viz., the rock from which criminals were cast down. This distinction, pointed out by Varro, is material; because the epithet Tarpeian, so often applied by the poets to Jupiter, has been brought forward as a proof that the temple stood upon the rock, whereas it only proves that it stood upon the Tarpeian or Capitoline Mount. At other times capitolium is used to designate one only of the summits, and that one apparently distinct from the arx, ³ which obscurity is farther increased, because, on the other hand, arx is sometimes put for the whole mount, ⁴ and at others for one of the summits only. ⁵

The approach to the Forum from the Capitoline Mount is as follows: from the Forum to the Mons Capitolinus. The first was by a flight of 100 steps (centum gradus), which led directly to the side of the Tarpeian Rock. The other two were the circus Capitolinus and circus Asyli, ⁶ one of which entered on the north, and the other on the south side of the intermontium, the former by the side of the Cerecenis Tulliani, the latter from the foot of the Via Sacra, in the direction of theodium, which stood on one side of the Palazzo de' Consulato; but which of these was the circus Capitolinus and which the circus Asyli, will depend upon the disputed situation of the arx and Temple of Jupiter Optimus Maximus.

The epithets aurata ⁷ and fulgens ⁸ are illustrative of the materials with which the Temple of Jupiter O.M. was adorned: its bronze gates, ⁹ and gilt ceilings and tiles. ¹⁰ The gilding of the latter alone costs 12,000 talents. ¹¹

IV. Capitolium is also used to distinguish the chief temples in other cities besides Rome. ¹²

CAPNIOS.

*CAPNIOS or CAPNOS (κάτωσις or κατόπτης), a plant which all the authorities agree in referring to the Fumaria officinalis, or common Fumitory. It is the one exception, which in the following Glossa, is called a fumaria, Linn. It is the Fum. terae of Seribonius Largus. ¹³ The juice of this plant was used, according to Pliny, in the cure of ophthalmitis. ¹⁴ It derives its name from its juice, when spread over the eyes, af

CAPPARIS, a plant which Sprengel, Stackhouse, and Schneider agree in referring to the Capparis Spinosa, L., or Thorny Caper-bush. Sibthorpe, however, in favour of a variety of the C. Spinosa, to which he gives the name of Capparis natali. Disscords mentions several kinds from different countries, all differing in their qualities. The best came from Caria, the next in the order of merit from Phrygia. •

2. •CAPRA, the she-Goat, the aeg of the Greeks. (Vid. Cap'er.)

3. •CAPREA, a wild she-Goat, or, rather, a species of wild goat generally. Pliny* speaks of it as being possessed of a very keen sight, which, maybe, perhaps, identify it with the Dorcas, or Gazelle. Cuvier, however, renders it necessary to refer the same to the Cervus Capricus, L., or Roe-buck. (Vid. Dorsac.*).

4. •CAPRICICATIO, the process of capricration, or a ripening of figs on the domestic tree by means of insects found on the wild fig. The process is described briefly by Eustathius, and more at large by Pliny. The former, speaking of the wild fig trees, states that the insects which inhabit the fruit of these, being driven in by the heat of the sun, cause the fruit to fall from their branches and leaves.

5. •CAPSULA, the same flower, * CAPSULA, as the Ficus Carica, L. (Vid. Sysc, and Caprificatio.)

6. •CAPRIMULUS, (Vid. Algo'te'slas.)

7. •CAPROS (kaptrep), I. the wild Boar, called by the Romans Aper. (Vid. Sus.) The flesh of this animal was highly esteemed by that people, and it was customary to serve up whole ones at table. Hence the boar was termed caprurus, or, as we would say, the head dish, hence, also, the language of Juvenal in speaking of the wild boar, animal prop'ter convivis natus, an animal born for the sake of banquets.'

8. •CAPSA (napr, nap6), the wild fig-tree, the Ficus Carica, L. (Vid. Sysc, and Caprificatio.)

9. •CAPSULUS. (Vid. Caste.)

There does not appear to have been any difference between the capsula and the scirnium, except that the latter word was usually applied to those boxes which held a considerable number of rolls (scirnium da magna). Boxes used for preserving other things besides books were also called capsula, while in the scirnium nothing appears to have been kept but books, letters, and other writings.

The slaves who had the charge of these book-cases were called capsarri, and also custodes scirinorum; and the slaves who carried, in a capsula behind their young masters, the books, &c., of the sons of respectable Romans, when they went to school, were also called capsarri (Quem sequitur custos angustae sorariae capsae). We accordingly find them mentioned together with the pedagogi (con stat quadam cum pedagogis et capsarvis una prandio necato). When the capsula contained books of importance, it was sealed or kept under lock and key; whence Horace* says to his work, "Odiati clases, et grata sigilla pudico."•

10. •CAPSA'RII, the name of three different classes of slaves:

1. Of those who took care of the clothes of persons while bathing in the public baths. (Vid. Baths, p. 147.) In later times they were subject to the jurisdiction of the praefectus vigilium. 2. Of those who had the care of the capsula, in which books and letters were kept. (Vid. Capsa.) 3. Of those who carried the books, &c., of boys to school. (Vid. Capsa.)

CAPSULA. (Vid. Caste.)

CAPULUS (kapul, lava), the hilt of a sword. This was commonly made of wood or horn, but sometimes of ivory or of silver, which was either embossed or adorned with gems (capsula radicatiis enaes). Philistats describes the hilt of a Persian axines, which was made of gold set with beryls, so as to resemble a branch with its buds. These valuable swords descended from father to son. When Theseus for the first time appears at Athens before his father Egeus, he is known by the carving upon the ivory hilt of his sword, and if

211
The term caputius is likewise applied to the handle of a plough by Ovid, as quoted in 

CAPUT, the head. The term "head" is often used by the Roman writers as equivalent to "person" or "human being." Through an easy transition, it was used to signify "life:" thus, capite damnari, plecei, &c., are equivalent to capital punishment.

Caput is also used to express a man's status, or civil condition; and the persons who were registered in the tables of the census are spoken of as capita, sometimes with the addition of the word civium, and sometimes not. Thus to be registered in the census was the same thing as caput habere: and a slave and a filius familiae, in this sense of the word, were said to have no caput. The sixth class of Servius Tullius comprised the proletarii and the capite censi, of whom the latter, having little or no property, were rarely rated as so many heads of citizens.

He who lost or changed his status was said to be capite minuto, deminutius, or capitis minor. The phrase se capite deminuere was also applicable in case of a voluntary change of status.

Capitis minuto is defined by Gaius to be status permutato. A Roman citizen possessed libertas, civitas, and familia; the loss of all three, or of libertas and civitas (for civitas included familia), constituted the maxima capita deminutio. This capitis deminutio was sustained by those who refused to be registered at the census, or neglected the registration, and were thence called incensi. The incensus was liable to be sold, and so to lose his liberty; but this being a matter which concerned citizenship and freedom, such penalty could not be inflicted directly, and the object was only effected by the fiction of the citizen having himself abjured his freedom. (Vid. Banishment, p. 136.) Those who refused to perform military service might also be sold.10 A Roman citizen who was taken prisoner by the enemy lost his civil rights, together with his liberty, but he might recover them on returning to his country. (Vid. Posteliminium.) Persons convicted of ignominious punishments, as to the mines, sustained the maxima capita deminutio. A free woman who cohabited with a slave, after notice given to her by the owner of the slave, became an amella, by a senatus consultum passed in the time of Claudius, to be loved of cives only, as when a man was iterated from fire and water, was the media capita deminutio. (Vid. Banishment.)

The change of familia by adoption, and by the in manum conventio, was the minima capita deminutio. A father who was adrogated suffered the minima capita deminutio, for he and his children were transferred into the power of the adoptive father. A son who was emancipated by his father also sustained the minima capita deminutio; the cause of which could not be the circumstance of his being freed from the patria potestas, for that made the son a liberum caput; but the cause was, or was considered to be, the form of sale by which the emancipation was effected.

A judicium capitale, or pena capitalis, was one which affected a citizen's caput.

CAPUT. (Vid. Interest or Money.)

CAPUT EXTORUM. The Roman soothsayers (haruspices) pretended to a knowledge of coming events from the inspection of the entrails of victims slain for that purpose. The part to which they especially directed their attention was the liver, the convex upper portion of which seems to have been called the caput extorum. Any disease or deficiency in this organ was considered an unfavourable omen; whereas, if healthy and perfect, it was believed to indicate good fortune. The haruspices divided it into two parts, one called familiaris, the other hostilia: from the former they foretold the fate of friends, from the latter that of enemies.

Thus we read that the head of the liver was mutilated by the knife of the operator on the "familiar" part (caput jecinoris a familiaris parte caseum), which was always a bad sign. But the word "caput" here seems of doubtful application; for it may designate either the convex upper part of the liver, or one of the prominences of the various lobes which form its lower and irregularly convege part.

It is, more obvious and natural to understand by it the upper part, which is formed of two prominences, called the great and small, or right and left. When the liver was found, it was a bad sign (nihil triarius accidere potuit: if well defined, or double, it was a lucky omen.

*CARA, a plant. (Vid. Careum.)

*CARABUS (Carpococchi), a crustaceous animal, of which there is frequent mention in the classics. It is the Locusta of Pliny, in French langouste. There is some difficulty, remarks Adams, in determining to what species of Cancer it applies. Schneider thinks it is more certainly not the Cancer harmsii; and he is not quite satisfied that it was the C. elephas.

CARACALLA was an outer garment used in Gaul, and not unlike the Roman lacerum. (Vid. Lacer.) It was first introduced at Rome by the Emperor Aurelius Antoninus Bassianus, who commanded all the people that came to court to wear it; in order to distinguish the name of Caracalla.

This garment, as worn by Gal. Bassianus, appears to have reached lower than the knee, but Caracalla lengthened it so as to reach the ankle. It after ward became common among the Romans; and garrs of this kind were called caracalla Antonianum.

CARCHAR.

CARCHARIAS.

to distinguish them from the Gallic caracalla.¹ It usually had a hood to it, and came to be worn by the clergy. Jerome² speaks of "pallium mirae pulchritudinis in modum caesarum sed cecipe cujuslibet coelum."³

CARBATINA. (Vid. Perg.)•CARBUNCULUS (άνθραξ), the Carbuncle, a precious stone, deriving its name, both in Greek and Latin, from its resemblance to a small ignited coal. The ancient called by these two names all the red transparent gems, which have since been classed among the Garnet species, &c., all of which they regarded merely as species of the Carbuncle. Theophrastus and Strabo enumerate the Carchaginian and Garamantian carbunculi among those most in repute. "Those carbuncles," observes Dr. Moore, "which Pliny calls Alabandic, because they are cut and polished at Alabaum, were precious garnets, still called by some mineralogists Alabandic or Alabamades. What he afterward says of Alabandic carbuncles, which were darker coloured and rougher than others, may be explained by supposing that near Alabaum both precious and common garnets were obtained."⁴ The term Carbunculus was also applied to a species of black marble, on account of its likeness to the Carbuncle. And out of which mirrors were sometimes made.⁵

CARCI'R. Carcer (κεκρ., Ger., χορήγα, Greek) is connected with ἐρός and εὐγένεια, the natural being interlaced with the aspire. Thus also Varro,⁶ "Caæter at corcecento quo prohibentur exire." Carcer (Greek). Imprisonment was seldom used among the Greeks as a legal punishment. The innocent, they preferred banishment to the expense of keeping prisoners in confinement. We do, indeed, find some cases in which it was sanctioned by law; but these are not altogether instances of its being used as a punishment. Thus the farmers of the duties, and their bondsmen, were liable to imprisonment if the duties were not paid by a specified time; but the object of this was to prevent the escape of defaulters, and to ensure regularity of payment.⁷ Again, persons who had been mulcted in penalties might be confined till they had paid them.⁸ The άγων also, if they exercised the rights of citizenship, were subject to the same consequences. They were liable to the penalty of a δεσφός for theft; but this was a προσπίμα or a petitum penalty, the infliction of which was at the option of the court which tried the case; and the δεσφός itself was not an imprisonment, but a public exposure in the ποιδία, or stocks, for five days and nights—the τέων ἐξ ἔξω δελθοντῶν. We may observe, that in most cases of theft the Athenians proceeded by "civil action," and that, if the accused were against the defendant (εἰ τίς διὰν ἄνεικνυ λιπά τοι), he had to pay, by way of reparation, twice the value of the stolen property: this was required by law. The προσπίμα was at the discretion of the court. Still the idea of imprisonment per se, as a punishment, was not strange to the Athenians. Thus we find that the law allows to the states to have three prisons: one of these was to be a προσπίμα, or petitum prison; and another a place of punishment—a sort of penal settlement away from the city.

The prisons in different countries were called by different names: thus there was the Αναγκαστόν in Benoeia; the Κέδρος, at Sparta; the Κέραμος at Cyprus; the Κόρος at Corinth; and among the Ionians, the γορόφυρα, as at Samos.¹ The prison at Athens was in former times called δεσμοτηρίον, and afterward, by a sort of euphemism, δέσφιμα. It was chiefly a place of imprisonment, or prison: and, in ancient times, it was under the charge of two double officers called the αρκατούς or the κόκκινος. One gate in the prison, through which the condemned were led to execution, was called τοῦ Χαρακτέρου.² The Attic expression for imprisonment was δεσφιμός. Thus, in the oath of the βουλευταί, or senators, occurs the phrase οὗτος δεσφημοίων αὐθηνών. Hence Sallust speaks of the δεσφήμια and δεσφημία, "liberty of the Romans, signifying that a party was under strict surveillance and guard, though not confined within a prison.

CARCAR (Roman). A carcer or prison was first built at Rome by Ancus Marcus, overhauling the Forum.² This was enlarged by Servius Tullius, who added to it a souterrain or dungeon, called from him the Tullianum. Sallust¹ describes this as being twelve feet under ground, walled on each side, and arched over with stonework. For a long time this was the only prison at Rome, being, in fact, the "Tower," or state prison of the city, which was sometimes doubly guarded in times of alarm, and was the chief object of attack in many conspiracies.³ Varro describes it as being built in the "Lautumian," from some quarries in the neighbourhood; or, as others think, in allusion to the "Lautumian" of Syracuse, a prison cut out of the solid rock. In later times the whole building was called the "Marmentine." Close to it were the Scala Gene- nomiae, or steps, down which the bodies of those we have the phrase δικαστήριον: "In robore et tenebris expurgratur." ⁴ "Robur et saxum (sc. Tar- peium) ministrat."⁵ So also we read of the "catena et Italum robur."⁶

CARCERES. (Vul. Circus.)•CARCHARITAS (καρχαρίτας), a species of fish, called in English the White Shark, and in French Requin. The scientific name is Squalus carcharias, L., or, in modern usage, Carcharias. The Carcharias is as the same with the Lamia of Aristotle,¹¹ Galen, and Pliny;² the λίμυον of Oppian; the κνίον of Thalassius (<Ep., xliii., 17—18. (H. A. v., 5)>. It has also been called by some

231
The same term was used to designate the tops of a ship, that is, the structure surrounding the mast immediately above the yard (vid. Ant. N.). In which the mariners ascended in order to manage the sail, to obtain a distant view, or to discharge missiles (applied carchesium, carche-sia mali). This was probably called "carchesium" on account of its resemblance in form to the cup of that name. The oar or other oar may have been fastened to its lateral projections, which corresponded to the handles of the cup (summita mali, per quam funes tractaret & foramina, quae summo mali funes recipiant). Pindar calls the yard of a ship "the yoke of its carchesium," an expression well suited to the relative position of the parts.

The carchesium of the three-masted ship built for Hiero II. by Archimedes were of bronze. Three men were placed in the largest, two in the next, and one man in the smallest. Breastworks (strophia) were fixed to these structures, so as to supply the place of defensive armour; and palisades (prooxy- mata, trochlea) for hoisting up the vessels. This part of an ancient vessel was sometimes made to produce a gay and imposing effect when seen from a distance (lacuda qua splendent summis carchesiae mali). The carchesium was sometimes made to turn, upon its axis (cercastil), so that by means of its apparatus of pulleys it served the purposes of a crane.

*CARCINUM (carkivus), according to Pennant, a species of scolifish, the same with the Cancer bernardus, Lim. I., or Hermit-crab. It is more correct, however, to say that the Greeks applied the same name Carcinium generically to the crustacean which lodge themselves in the empty shells of the mollusca, and which the Latins designated by the synonymous appellation of Cancell. Albrovandus, Geisser, Rondelet, Swammerdam, and other modern naturalists, preserve this last denomination; but Plinius has bestowed that of Pagurus upon this genus, a name by which the ancients designated a sort of crab, or one of the bouchyrous crustacea. Aristotle mentions the fact, now so well established, that the shell serving as an habitation to the Cancer or Pagurus was not of its own formation; that it had possessed itself of it after the death of the molluscan animal which had formed it; and that its body was not adherent to it. The common Paguran was made of a cussatecum in the writings of Pliny, Dioscorides, Nicander, and others. It is the Granio or Garanz of the Italians. It was believed that the ashes of this species were useful, from their desiccative qualities, to those who had been bitten by a mad dog, either by employing those ashes alone, or mixed with incense and gum. According to Otho, the fresh-water crabs, as well as the tortoises and crocodiles, foresaw the inundations of the Nile, and, about a month previously to that event, resorted to the most elevated situations in the neighbourhood. The kind of crustacea termed by modern naturalists Ocypridae is probably the same of which Pliny makes mention, and which the Greeks, by reason of the celerity of its movements, designated as the Hippus (Gpressão), or Horseman.

With regard to the Cancer Pagurus, or small Crab, vid. Pinnowych.

*CARDAMOMUM, according to Pliny, a species of aromatic shrub, producing a seed or grain of the same name. The grain, or caryod, is used in unguments. The Roman writers mention four kinds of this seed: the first, which was the best, was of a very bright green, and hard to break up; the second was of a whitish-red colour; the third, smaller, and of a darker hue; the fourth and worst, of different colours, having little odour, and very friable. The Cardamumum had a fragrance resembling that of Costus, or Spikenard. The Cardamumum of the shops at the present day appears to be the same with that of the ancients, and is the fruit or seed of the Amomum Cardamumum. It comes, not from Arabia, as Pliny says the ancient kinds did, but from India; and, indeed, it was in this way the Greeks and Romans actually obtained theirs, by the Red Sea, and the overland trade through Arabia. Only three kinds are known at the present day, the large, medium, and small seed. M. Bory de St. Vincent observes that cardamum means "a medicine in husks," or "husk-anomum" (amomum virgulae, the Egyptian term karth meaning, as he says, "a husk." Other etymologists, however, make the term in question come from kapha, "a heart" and wosvov, and consider it to mean "strengthening, exhilarating, or cardiac anomum."
CARDUUMS

CARDO

*CARD'AMUM (κάρδάμων), a species of plant. Schneider remarks that Sprengel holds it to be the *Lepidium sativum*, or cultivated Pepper-wort; Stackhouse, however, is for the *Sisymbrium nasturtium*, or Water-cress; while Corey thinks it is either the *Lepidium perfoliatum*, or *Oriental*, Turnefort.

There can be little doubt," observes Adams, 4 that it was a sort of Cress, but the species cannot be determined with any degree of certainty. 5

CARDO (κάρδιος, στροφείος, στροφίς, γόγγυμος), a hinge, a pivot.

The first figure in the annexed woodcut is designed to show the general form of a door, as we find it with a pivot at the top and bottom (a, b) in ancient remains of stone, marble, wood, and bronze.

The second figure represents a bronze hinge in the Eg. W. Mus. (2083), on which the pivot (b) is exactly cylindrical. Under these is drawn the threshold of a temple, or other large edifice, with the plan of the folding-doors. The pivots move in holes fitted to receive them (b, b), each of which is in an angle behind the antepagmentum (marmore aratus strienis in timine cardo). This representation illustrates the following account of the breaking down of doors: "Jamina cedulis funditus cardinibus promiscuit." 6 When Hector forces the gate of the Grecian camp, he does it by breaking both the hinges (φυσίφορος θαμαρος), i.e., as explained by the scholiast, the pivots (στροφήγας) as explained by the top and bottom. (Vid. Catacysa.)

According to the ancient lexicons, "cardo" denoted not only the pivot, but sometimes the socket (foramen) in which it turned. On this assumption we may vindicate the accuracy of such expressions as Posites a cardine volit, and Emoti procumbent cardina postes; 7 θαμαρως ξεμφρανες. 8 In these instances, "postis" appears to have meant the upright pillar (a, b) in the frame of the door. The whole of this "post," including the pivots, appears to be called στροφείος and "cardo" by Theophrastus and Pliny, who say that it was best made of elm, because elm does not warp, and because the whole door will preserve its proper form, if this part remains unaltered. 7

To prevent the grating or creaking noise (atrior, strephitus) made by opening a door, lovers and others who had an object in silence (cardine tacito) poured water into the hole in which the pivot moved. 9

The Greeks and Romans also used hinges exactly like those now in common use. Four Roman hinges of bronze, preserved in the British Museum, are shown in the following woodcut.

The proper Greek name for this kind of hinge was γόγγυμος; whence Aristotle 10 applies it to the

The Greeks and Romans also used hinges exactly like those now in common use. Four Roman hinges of bronze, preserved in the British Museum, are shown in the following woodcut.

CARMENTALIA.

edible thistle, and, according to Sithorp, is the same with the Scolytus Hispanicus: Schneider, however, is of opinion that it is the Cardunculus, or Cardon Artichoke.1 (Vid. Acanthill.)

*CAREUM (kápos), the plant called Curreony, the Careum carui, L. It took its name from the country of Caria, where the best grow, and the name is, in fact, an adjective, there being an vegetable carunus; for the Careum is, in truth, the Careum cycneostre. Billerbeck thinks2 that the Chara or Care which the soldiers of Caesar eat with milk, and which they also made up into bread during the scarcity of provisions which prevailed in the camp of the latter at Dyrhachium, was no other than the root of the Careum. Cuvier,3 however, with more appearance of reason, declares for a species of wild cabbage (une espece de chou sauvage), of which Jacquin has given a description under the title of Crume Tartaria. The Chara of modern botanists is quite different from this, being a small aquatic herb.

*CAREX, a species of Rush. The Carex is mentioned by Virgil4 with the epithet acuta, and Martyn5 remarks of it as follows: "This plant has so little said of it, that it is hard to ascertain what species we are to understand by the name. It is called 'sharp' by Virgil, as if it meant the end of the stalk, is no more than what Ovid has said of the Carex carica, which is a fruit. We find also in another passage of Virgil,6 itu post carecta latebas,7 from which we can gather nothing more than that these plants grew close enough together for a person to conceal himself behind them. Catullus mentions the Carex together with Fern, and tells what season is best to destroy them. Since, therefore, it is difficult to determine what the Carex is from ancient authorities, we must depend upon the account of Anguilla, who assures us that, about Padua and Vincenza, they call a sort of rush Carex, which seems to be the old word Carex modernized. Caspar Buhain says it is that sort of rush which he has called Juncus acutus panicula sparsa. It is, therefore, our common hard rush, which grows in pastures and by waysides in a moist soil. It is more solid, hard, and prickly at the point than our common soft rush, which seems to be what the ancients called Juncus.19"

*CARIS (karpis), a sea-animal of the class Cusastea. According to Adams, it is the Squilla of Cicero and Pliny,8 a term that has been retained in the Linnaean nomenclature. It is the Cancer squilla, L. The larger kind of Squilla, he adds, is called We. The Latin name is from the word Carex, and the smaller, Prawn. The caris knyp of Aristotle is a variety of the Cancer squilla, called in French Crevette. In the systems of Latreille and Fleming, the term Carides is applied to a subdivision of the Crustacea. In these systems, the Prawn gets the scientific name of Palinus serratus, the common Shrimp of Crustaceae vulgaris.10

CARMENTALIA. (Vid. NAVIS.)

CARMENTALIA. Carmenta, also called Carmentas, is famed to have been the mother of Evander, who came from Pallantium in Arcadia and settled in Latium; he was said to have brought with him a knowledge of the arts, and the Latin alphabetical characters as distinguished from the Etruscan.12 In honour of this Carmenta, who was supposed to marry a human,13 were celebrated the Carmentalia,14 earl in the time of Annus Julii, to which we may believe the authority of Pausanias.15 These were nine Statia, i. e., annually held on the 11th of January. The old calendar2 assigns to them the four following days besides; of this, however, there is no confirmation in Ovid.3 A temple was erected to the same goddess at the foot of the Capitoline Hill, near the Porta Carmentalis, afterward called Sculcuta.4 The name Carmenta is said to have been given to her from her prophetic character, carmen or carmentis being synonymous with vates. The word is, of course, connected with carmen, and prophetic prophecies were generally delivered in verse. Her Greek title was Thémis.5 Plutarch6 tells us that some supposed Carmenta to be one of the Fates who presided over the birth of men: we know, moreover, that other divinities were called by the same name; as, for instance, the Carmenta Postvera and Carmenta Prorsa were invoked in cases of childbirth, for further information with respect to whom, see Ann. Gell., vi., 6; Ovid, Fast., i., 634.

CARNEIA (Karpovia), a great national festival, celebrated by the Spartans in honour of Apollo Carneios, which, according to Sosibius,7 was instituted Olymp. 25, although Apollo, under the name of Carneios, was worshipped in various places of Peloponnesus, particularly at Amyclae, at a very early period. But it was not, however, until Wachsmuth,8 referring to the passage of Athenaeus above quoted, thinks that the Carneia had long before been celebrated; and that when, in Olymp. 26, Therapond gained the victory, musical contests were only added to the other solemnities of the festival. But the words of Athenæus, who is the only authority to which Wachsmuth refers, do not allow of such an interpretation; for no distinction is there made between earlier and later solemnities of the festival, and Athenaeus simply says the institution of the Carneia took place Olymp. 26 ('ψυγνό νή ψαλίδας τῶν Καρνείων κατὰ τὴν ἕκτην καὶ εἰκοστὴν Ὀλυμπιάδαν, ὡς Σωβάδων φυλών, ἐν τῷ περὶ χρόνων). The festival began on the seventh day of the month of Carneios=Metageitnion of the Athenians, and lasted for nine days,9 it was, as far as we know, a warlike festival, similar to the Attic Boedromia. During the time of its celebration, nine tents were pitched near the city, in each of which nine men lived in the manner of a military camp, obeying in everything the commands of a herald. Müller also supposes that a boat was carried round, and upon it a statue of the Carneian Apollo of the Attic type. (Ἀρόμας ἐπιγραφᾶς, both adorned with illustrations, symbols, or legends, connected in allusion to the passage of the Dorians from Naupactus to Peloponnesus.11 The priest conducting the sacrifices at the Carneia was called Α'γρήθη, whose festival was sometimes designated by the name Α'γγίρωνοτ ή Α'γγίρονος;12 and from each of the Spartan tribes five men (Κρονετάτα) were chosen as his ministers, whose office lasted four years, during which time they were not to serve in the army.13 Some of them bore the name of Σχραλόνταρος.14 Therapond was the first who gained the prize in the musical contests of the Carneia, and the musicians of his school were long distinguished competitors for the prize at this festival,15 and the last of this school who engaged in the contest was Pericleas.16 We read in Herodotus and Thucydides

Carpentum, a cart; also a rectangular two-wheeled carriage, enclosed, and with an arched or sloping cover overhead.

The cart was used to convey the Roman matrons in the public festal processions; and, as this was a high distinction, the privilege of riding in a cart on such occasions was allowed to particular females by special grant of the senate. This was done on behalf of Agrippina (q.v. carpentum) in 217 C.E. (Plut., "Caesar," 22, 4), who availed herself of the privilege so far as even to enter the Capitol in her carriage. A medal was struck (see woodcut) to commemorate this decree of the senate in her favour. When Claudius celebrated his triumph at Rome, he was followed by his empress Messalina in her carpentum. This carriage contained seats for two, and sometimes for three persons, besides the coachman. It was commonly drawn by a pair of mules (carpentum mulare), but more rarely by oxen or horses, and sometimes by four horses like a quadriga. For grand occasions it was very richly adorned. Agrippina's carriage, as above represented, shows painting or carving on the panels, and the head is supported by Caryatides at the four corners.

The convenience and statefulness of the carpentum were also assumed by magistrates, and by men of luxurious habits, or those who had a passion for driving. When Caligula instituted games and other solemnities in honour of his deceased mother Agrippina, her carpentum went in the procession. This practice, so similar to ours of sending carriages to a funeral, is evidently alluded to in the alto-relievo here represented, which is preserved in the British Museum. It has been taken from a sarcophagus, and exhibits a close carpentum drawn by four horses. Mercury, the conductor of ghosts to Hades, appears on the front, and Castor and Pollux, with their horses, on the side panel.

The coins of Ephesus show a carpentum, proving that it was used to add to the splendour of the processions in honour of Diana. It probably carried a statue of the goddess, or some of the symbols of her attributes and worship.

Carpentum, or covered carts, were much used by our ancestors the Britons, and by the Gauls, the Cimbri, the Allobrogues, and other northern nations. These, together with the carts in the carto-carrus form, including baggage-wagons, appear to have been comprehended under the term carri or carrus, which is the Celtic name with a Latin termination. The Gauls and Helvetii took a great multitude of them on their military expeditions; and, when they were encamped, arranged them in close order, so as to form extensive lines of circumvallation.

The ancient writers use "carpentum" to denote either a common cart or a cart-load, e. g., xxiv. stercoris carpentum.

Carpesium (karpısion), an aromatic some times used in place of Cassia. Galen describes it as resembling Valerian. Some of the earlier commentators, and, as it would appear, the Arabic physicians, confused it with carpesium. This confusion is rebutted by Matthioli and C. Bauhin. Dr. Hill says of it, "If the Arabsians were acquainted with our Cubes at all, it appears that, not knowing what the Carpesium and Ruscus were, they ignorantly attributed the virtues ascribed by the Greeks to their medicines to the Cubes."

Carpinus, a species of Maple, called also the Hornbeam, or Yoke-elm. It is a tree that loves the mountains, and is described by Pliny as having its wood of a red colour and easy to cleave, and covered with a livid and rugged bark. It was called Zygia (zygia) by the Greeks, because often used to make yokes (zygia) for oxen. The scientific name is Carpinus betulae. 1

Karpfou, a species of Melk (karpfou), a civil action under the jurisdiction of the thesmothete, might be instituted against a farmer for default in payment of rent. 1 It was also adopted to enforce a judicial award when the unsuccessful litigant refused to surrender the land to his opponent, and might be used to determine the right to land, 2 as the judgment would determine whether the plaintiff could claim rent of the defendant. 1

CARRAGO, a kind of fortification, consisting of a great number of wagons placed round an army, and so employed by barbarous nations, as, for instance, the Scythians. 1 Gauls (vid. CARPENTUM), and Goths. 2

Carrago also signifies sometimes the baggage of an army. 3

CARRUCA was a carriage, the name of which only occurs under the emperors. It appears to have been a species of rheda (vid. RHEDA), whence Marcial, in one epigram, 4 uses the words as synonymous. It had four wheels, and was used in travelling. Nero is said never to have travelled with less than 1000 curraces. 5 These curraces were sometimes used in Rome by persons of distinction, like the carpenta (vid. CARPENTUM), in which case they appear to have been covered with plates of bronze, silver, and even gold, which were sometimes ornamented with embroidered work. Alexander Severus allowed senators at Rome to use curraces and rheda plated with silver; 6 one Martial 7 speaks of an aura curracea which cost the value of a farm. We have no representations of curraces in ancient works of art which can be safely said to be curraces, but we have several delineations of curraces ornamented with plates of metal. 8 Curraces were also used for carrying women, and were then, as well perhaps, as in other cases, drawn by mules, 9 whence Lupani 10 speaks of mula curracia.

CARRUS. (Vid. CARPENTUM.)

CARYA or CARYA-TIS (Καρυά or Καραύατις), a festival held at Carye, in Laconia, in honour of Artemis Caryatis. It was celebrated every year by Laconian maidens (Καραύατιδες) with national dances of a very lively kind, 11 and with solemn hymns.

CARYATIS (καριατίς), pl. CARYATIDES. From the notices and testimonies of ancient authors, we may gather the following account: That Carye was a city (civitas) in Arcadia, near the Laconian border; that its inhabitants joined the Persians after the battle of Thermopylae; 12 that on the defeat of the Persians the allied Greeks destroyed the town, slew the men, and led the women into captivity; and that as male figures representing Persians were afterward employed with an historical reference instead of columns in architecture (vid. ARALANTES, PERSE), so Praxiteles and other Athenian artists employed female figures for the same purpose, intending them to express the garb, and to commemorate the disgrace of the Caryatides, or women of Carye. 13 This account is illustrated by a bas-relief with a Greek inscription, recording the conquest of the Caryeatis, which is preserved at Naples, and copied in the following woodcut.

In allusion to the uplifted arm of these marble statues, a celebrated parasite, when he was visiting in a ruinous house, observed, "Here we must dine with our left hand placed under the roof, like Caryatides." (Vid. CARPENTUM.) The Caryatides existed by the orders of Athens, and placed in the Pantheon at Rome, above the sixteen columns which surrounded the interior, may have resembled those which are represented in a similar position in one of the paintings on the walls of the baths of Titus. 14 It is proper to observe that Lessing, and various writers after him, treat the preceding account as fabulous.

After the subjugation of the Caryates, their territory became part of Laconia. The fortress (τερ-ποι) had been consecrated to Artemis, 2 which image was in the open air, and at whose annual festival (Καριάτις κορής) the Laconian virgins continued, as before, to perform a dance of a peculiar kind, the execution of which was called κοραυατίς. Bloomfield thinks that the Caryatides in architecture were so called from these figures resembling the statue of Αργεύς Καραύατις, or the Laconian virgin who celebrated their annual dance in her temple. 3

CAR-ΟΥΝ (κάρον), the Walnut. "By itself," observes Adams, 4 "the κάρον is undoubtedly to be generally taken for the Juglans regia, or common Walnut. I am farther disposed to agree with Stockhouse in holding the κάρον Εβδοκίας, Περσικα, and Βασίλικα as mere varieties of the same. The κάρον Ποίοντον or λεπτο-κάρον, of Dioscorides and Galen, is as certainly the Nuc. Aciлина, or Füllert, being the fruit of the Caryatae, or Haret nut." (Vid. AVELLANE NUCES.)

CARYOPHYLL’ON (κάροφύλλον), Clovers, ő the flower-buds of the Caryophyllus aromatics (Σεγρεια Caryophylliata of the London Dispensary); They are first noticed by Paul of Ελεγία. 5 Symeon Seth 6 likewise gives a short account of cloves. That is no mention of the clove in the works of Dioscorides, Galen, Orphisias, or Achilles, but it is regularly noticed in the Materia Medica of all the Arabians.

CASSIA or ΚΑΣΣΙΑ (κασσία, κασσίας), Cassia. Moses Charras says of it, "The tree called Cassia is almost like that which bears the Cinnamon. These two bucks, though borne by different trees, are boiled and dried after the same manner, and their taste and scent are almost alike." 7 "I can see no difficulty," observes Adams, "about recognising it as the Λαυριος Κασσία." Stockhouse, however, prefers the Laurus gracilis, but upon what authority he does not explain. The Κασσία εύροφα and γελοκατάκα are thus explained by Alston: "The Cassia lignea of the ancients was the larger branch of the cinnamon-tree cut off with their bark, and sent together to the druggists; their Cassia futilis, or Syringa vulgaris, was the smaller leafy branch, as we now have it stripped from the tree, and rolled up into a kind of Fistula, or pipe." The Greeks then were unacquainted with our Cassia futilis, which was first introduced into medical practice by the Arabians. 8

CASSITEROΣ. (Vid. PLUMB.)

CÁSTANA (καστάνεα, καστάνια, or κώστι), the Chestnut-tree, or Fagus Castanea, L. Its fruit was called by the Latin writers Castanes max, and

CASTELLUM AQUÆ

also simply Castanea. Among the Greeks, on the other hand, chestnuts had various names. They are called ἄεις βάλλανοι by Theophrastus;¹ Σκαλίωνι βάλλανοι by Dioscorides and Galen; λίπεις κά-
pαυα by Nicander;² and κάρπα simply by Xenophon,³ who mentions that the nation of the Mosynoei lived entirely on them.⁴ The Chestnut-tree is generally considered to be a native of Asia, in many parts of which it is to be found in situations where it is most likely to have been planted. Tradition says that it was brought from Asia Minor, and soon spread over all the warmer parts of Europe. In the southern parts of the latter continent, chestnuts grow so abundantly as to form a very large portion of the food of the common people, who, besides eating them both raw and roasted, form them into puddings, and cakes, and even bread. The name Castanea is derived from Vossius from that of the town of Castanea in Thessaly, where this tree grew very abundantly. This etymology, however, is more than doubtful.

CASSIA LEX. (Vid. Tabellaria.)

CASSIS. (Vid. GALE, RETE.)

CASTELLUM AQUÆ, a reservoir, or building constructed for the purpose of containing an aqueduct, when it reached the city walls,⁵ for the purpose of forming a head of water, so that its measure might be taken, and thence distributed through the city in the allotted quantities. The more ancient name in use, when the aqueducts were first constructed, was dividellum.⁶

The castella were of three kinds, public, private, and domestic.

1. CASTELLA PUBLICA. Those which received the waters from a public duct to be distributed through the city for public purposes: 1. Castra, the pretorian camps. 2. The fountains and pools in the city (iacus). 3. Manera, under which head are comprised the places where the public shows and amusements were given, such as the circus, amphitheatres, saunachiae, &c. 4. Opera publica, under which were comprised the baths, and the service of certain trades—the fullers, dyers, and tanners—which, though conducted by private individuals, were looked upon as public works, being necessary to the comfort and wants of the whole community. 5. Acquaeducti. The aqueducts were given, such as the circus, the fountains, the public baths, and the like, to individuals, or to the public, for the purpose of facilitating the distribution of the water, or of placing a supply of it near public places. When a private person obtained a license to build a public duct, it was called modulature acceptoria, the letus erogatorius. To distribute the water was termed erogare; the distribution, erogatio; the size of the tube, fastula, or modulorum capacities, or lumen. The smaller pipes, which led from the main to the houses of private persons, were called punctae; those inserted by fraud into the duct itself, or into the main after it had left the castellum, fastula illicita. The erogatio was regulated by a tube called •.x, of the diameter required, attached to the extremity of each pipe where it entered the castellum; it was probably of lead in the time of Vitruvius, though it was not mentioned by him; but was made of bronze (anexa) when Frontinus wrote, in order to check the robery of the aquarii, who were able to increase or diminish the flow of water from the reservoir by compressing or extending the tube. Pipes which did not require any calix were termed soluta.

The subjoined plans and elevations represent a ruin still remaining at Rome, commonly called the "Trophies of Marins," which is generally consid-
ered to have been the castellum of an aqueduct. It is now much dilapidated, but was sufficiently entire about the middle of the sixteenth century, as may be seen by the drawing published by Guinacci,¹ from which this restoration is made. The trophies,

then remaining in their places, from which the monument derives its modern appellation, are now placed on the Capitol. The ground-plans are given

1. (Front. § 94.)—2. (Front. § 111.)—3. (Front. § 107.)—4. (Front. § 78.)—5. (Antichità di Roma, vol. p. 100.)

219
CASTRA.

from an excavation made some years since by the students of the French Academy; they explain part of the internal construction, and show the arrangement adopted for disposing of the superfluous water. 1. The second hypothesis, that this structure was made to contribute to the embellishment and comforts of the city. The general stream of water is first divided by the round projecting buttress into two courses, which subdivide themselves into five minor streams, and finally fall into a reservoir in the manner directed by Vitruvius, 2 “immissarium ad recipiendum aquam castello conjunctum.” Thus the structure affords also an example of that class of fountains designated by the Romans emissaria.

*CASTOR (κάστορ), the Beaver, or Castor Führer. It is also called κύων πατάγως. The κάστορος φρύς, or καστρίων, is Castor, but this substance is not the testicles of the animal, as was generally supposed by the ancients, but a peculiar gland, placed in the groin of the beaver of both sexes. The ancients had a story prevalent among them, that the Beaver, when closely pursued, bit off its testicles, and, leaving these to the hunters, managed in this way to escape. 3

*CASTORIUM. (Vid. CASTOR.)

CASTRA. The system of encampment among the Romans, during the later ages of the Republic, was one of singular regularity and order; but any attempt to describe it accurately at this stage by us, who have reached this excellence, would be an unprofitable task, in which we shall not engage. We may, however, observe, that in the earlier wars of Rome with the neighbouring petty states, the want of a regular camp would seldom be felt, and that the later form of encampment, which was based upon the constitution of the legion, would not have been applicable to the Roman army under the kings and in the first ages of the Republic, when it was arranged as a phalanx. We read, indeed, of statio castra, or stationary camps, in the wars with the Αἰγι and Βόλτη, and of winter-quarters being constructed for the first time at the siege of Veii (B.C. 404-395), and it is not improbable that the great Samnite war (B.C. 343-290) led to some regular system of encampment. This was followed by the campaigns against Pyrrhus (B.C. 280-277), whose superior tactics and arrangement of his forces were not likely to be lost upon the Romans. The epoch of the first Punic war (B.C. 264-241), in which Rome had to contend against various mercenary forces, was succeeded by the struggle against the Cisalpine Ga. 4, and in both these contests the Romans found ample opportunities for improving themselves in the art of war. After the fall of Carthage, and Punic war followed (B.C. 218-211), in which Hannibal was their adversary and 1 teacher. After its conclusion, their military operations were no longer confined to Italy, but directed against various distant enemies, the Macedonian and Syrian kings (B.C. 200-192). These, of course, squire a longer absence from home, and often exposed them to enemies of superior forces, so that it became necessary to protect themselves, both in the field and in the camp, by superintendence in discipline and skill. Shortly after these times flourished Polybius, the historian of Megalopolis (a friend and companion of Scipio Africanus the younger), who expresses his admiration of the Roman system of encampment, and tells his readers that it is well worthy of their attention and study. 5 His description of the Roman camp of his day is remarkably clear, and we proceed to give it with the accompanying plan.

1. (Compare Plin., H. N., xxxvi., 24, 3—2. (viii., 7.—3. (Arunt., ii., viii. 5. (i., vii. 3—2. (vi., xvi. 3—, ni. 3—, 2. (vii.) 6. (H. St., 24, ed. Gron.))

A. praetorium. B. tents of the tribunes. C. tents of the prefect or sociorium. D. street 100 feet wide E, F, G. and their streets were 50 feet wide. L. select foot and horse volunteers. M. extra-ordinary horse of the allies. N. extra-ordinary foot of the allies. O. reserved for occasional auxiliaries. Q. the street called Quintana, 50 feet wide. V., V., Via Principalis, 100 feet wide.

N.B. The position assigned to the prefect or sociorium is doubtful.

The arrangements for a proper situation for the camp (castro militari) devolved upon one of the tribunes and a number of centurions who were specially appointed for that purpose, and sent in advance whenever the army was about to encamp; they were called metatores, from their office. After fixing on a proper locality, they then chose and distinguished with a white flag a place for the praetorium (A) or general's tent—the prepossession of the old name of the consul. 1 This was fixed, if possible, on an elevation, so as to secure an extensive prospect, and afford every convenience for giving orders. About it was measured out a square, each side of which was 100 feet distant from the white flag, and therefore 200 feet in length, so that the whole area amounted to four plethra, or 40,000 square feet. (Vid. Arura.) The two legions of the consular army were arranged on the right side of the praetorium; the former a sort of market-place, the latter appropriated to the quastor and the camp stores under his superintendence.

On the sides of, and facing the forum and quartorium, were stationed select bodies of horse (k), taken from the extraordinaries (επιστευοι των αν-

lεκτων), with mounted volunteers, who served out of respect to the consul, and were stationed near him, not only in the camp, but also on the line of march and elsewhere, so that they were always ready to do any service for him as well as the quaestor.

Behind, and parallel to these, but facing the sides of the camp, were posted similar bodies of foot-soldiers (L). Again, parallel with the line of the tribunes' tents, and stretching behind the praetorium, the line of the forum and the quastorium ran across the via (D), 100 feet broad, from one side of the camp to the other. Along the upper side of this street was ranged the main body of the "extraordinary" horse (M), parallel to and facing the line of the tribunes' tents: they were separated into two equal parts by a street fifty feet broad (E), perpendicular to that front, and leading from the praetorium to the higher or back gate of the camp, the Porta Decumanu.

At the back of this body of horse was a similar body of infantry (N), selected from the allies, and facing the opposite way, i. e., towards the ram-
part of the camp. The vacant spaces (O) on each side of the troops were reserved for "foreigners" (deditilia) and occasional auxiliaries.

The upper part of the camp, which we have just described, formed about a third of the whole, the remaining two thirds being appropriated to the main body of the forces, both legionary and allied, whose arrangement we now proceed to explain. The lower part of the camp was divided from the upper by a street, called the Via Principalis (V. P.), 100 feet broad, running parallel to and in front of the tribunes' tents: this was cut at right angles by another road (F), 50 feet broad, parallel to the length of the camp, and dividing the lower part into two equal spaces. On each side of this street (F) were ranged the horse of the two legions, the ten turmae of each being on different sides, and facing each other; the turma consisted of 30 men, and occupied a square whose side was 100 feet long. At the back of these turmae, and facing the contrary way, namely, towards the sides of the camp, stood the triarii; each maniple corresponding to a turma, and occupying a rectangle 100 feet in length by 50 in width. These dimensions would, of course, vary according to the component parts of the legion. Opposite to the two lines of triarii, but separated from them by a wide street (G), also 50 feet wide, stood the principes; they were double the triarii in number, and had a square, whose side was 100 feet, appropriated to each maniple. Behind these again, and in close contact with them, stood the ten maniples of the hastati, with their backs turned the opposite way, having the same space for each maniple as the principes. As the whole legion was divided into thirty maniples of foot, ten of each class, the whole arrangement was therefore perfectly symmetrical, the fifty-feet roads of which we have spoken commencing from the Via Principalis, and terminating in the open space by the ramparts. The whole legionary army thus formed a square, on each side of which were encamped the allies at a distance of 50 feet from the hastati, and presenting a front parallel to theirs. The allied infantry was equal in number to that of the legions, the cavalry twice as great: a portion of each (a third part) of the latter and about a fifth of the former was posted as "extraordinaries" in the upper part of the camp; so that, to make the line of the allies coterminous with that of the legion, it was necessary to give the former a greater depth of encampment. The cavalry of the allies faced the hastati, and the infantry at their back fronted the ramparts. The several front lines of the legioaries and allies were bisected by a road parallel to the Via Principalis, and called the Quintana (Q), from its dividing the ten maniples into two sets of five each; it was 50 feet in breadth.

Between the ramparts and the tents was left a vacant space of 200 feet on every side, which was useful for many purposes: thus it served for the reception of any booty that was taken, and facilitated the entrance and exit of the army. Besides this, it was a security against firebrands or missiles that might be thrown into the camp, as it placed the tents and the soldiers out of their reach.

From the description we have given, the reader will perceive that the camp was a square in form, divided into two parts by the Via Principalis, the
We may now observe, that every morning at daybreak the centurions and horsemen presented themselves to the tribunes. The latter then went to the consul and received his orders, which were conveyed through the former to the soldiers. The watchword for the night, marked on a four-cornered piece of wood, and therefore called tessera, was given out in the following way: A soldier in every tenth maniple, posted farthest from the tribune's tent, went up to the guard of duty, and presented himself at sunset before the tribune, from whom he received the tessera; he returned with it to his own tent, and, in the presence of witnesses, gave it to the centurion of number nine; it was passed on to him by the centurion of number eight, and so on, till it came back to the tribune. Besides the guards (executio) of the tribunes, &c., which we have already mentioned, there were also several night-watches (vigiliae); thus there were generally three about theuestorium, and two for each of the legi
ti; each division (tégimentum) also set a watch for itself. The velites were stationed by the walls of the rampart, and supplied the posts or pikets at the gates (stations a'te partes agilandi).

We will now describe the arrangements for the inspection of the night-watches, first observing that the soldiers were divided into twelve night-watch companies, or those whose duty it was to see that the army was kept in order, and to guard against surprise. Each of these companies was divided into three watch-companies, or 

unites, of the tribunes, remaining nothing of the officers Romans, tribunes that the Porta was the praetorium, was assigned was the Porta Principalis Dextra and the Porta Principalis Sinistra. The whole camp was surrounded by a twelve foot high wall, and a rampart (vallum) made of the earth that was thrown up (agger), with stakes (vallum) fixed at the top of it. The labour of this work was so divided that the allies completed the two sides of the camp along which they were stationed, and the two Roman legions the rest; the centurions and tribunes performed the work of the Romans, the prefects of the allies seem to have done for them.

We will now speak of the discipline of the camp. After choosing the ground (loca capere), the proper officers marked, by flags and other signals, the principal points and quarters; so that, as Polibius observes, the soldiers, on arriving at the place, proceeded to their respective stations like troops entering a well-known city, and passing through the streets to their several quarters. The tribunes then met, and administered to all, Freeman as well as slaves, an oath to the effect "that they would steal nothing from the camp, and bring whatever they might find to the tribunes." After this, two maniple were chosen from the princes and hastati of each legion, to keep clean and in good order the Via Principalis, a piece of ground of the same width and length; the arrangements were as follows: The soldiers of the watch-companies, supplied by the different maniples who were to furnish the guards during the first watch of the night, received from the tribune a number of small tablets (vexillia) with certain marks upon them, and then went to their respective posts. The duty of visiting these posts and making the nightly rounds of inspection, devolved upon the horsemen. Four of these, who were selected for this duty every day, according to a regular cycle, received from the tribune written instructions as to the time when they were to visit each post, and the number of posts to be visited; they were called circutores (περιτοιός), and, in the time of Vegetius, circutores. After receiving their orders, they went and posted themselves by the first maniple of the triarii, the centurion of which was required to see that the hours of the watch were properly given by the sound of the trumpet: then, when the time came, the circutor of the first watch proceeded on his rounds to all the posts; if he found the guards awake and on duty, he took their tablets; if he found them asleep, or any one absent from his post, he called upon the friends who accompanied him to witness the fact, and so passed on to the next post. The same was done by the circutores of the other watches. The next morning, all the inspectors appeared before the tribunes, and presented the tablets they had received; any guard whose tablet was not produced, was required to account for it. If the fault lay with the circutor, he was liable to a stoning, which was generally fatal. A regular system of rewards and punishments was also established in the time of Vegetius describing which, Polibius gives the following comparison between the methods of encampment among the Romans and Greeks.

The latter, he says, endeavoured to avail themselves of the natural advantages afforded by any ground they could seize upon, thus avoiding the trouble of intrenchment, and securing, as they thought, greater safety than any artificial defence would have given them. The consequence of this was, that they had no regular form of camp, and the different divisions of an army had no fixed place to occupy.

In describing the Roman camp and its internal arrangements, we have confined ourselves to the information given by Polibius, which, of course, is as accurate as the earliest of the classical writers, that he may be considered as the founder of a school of military science which has been followed by all his successors.
CAPIRATER.

CATAPLOS.

plies only to his age, and to armies constituted like those he witnessed. When the practice of drawing up the army according to cohorts, ascribed to Marius or Caesar (vid. Army, p. 104), had superseded the ancient division into maniples, and the distinction of triarii, &c., the internal arrangements of the camp must have been changed accordingly. So also, was the outward form for we learn from Vegetius, who lived in the reign of the Emperor Valentinian (A.D. 385), that camps were made square, round, or triangular, to suit the nature of the ground, and that the most approved form was the oblong, with the length one third greater than the breadth. He also distinguishes between camps made only for the night or for a march, and those which were made for a more stationary or built strongly for a stationary encampment. Another author also 8 alludes to places in the camp which Polybius does not mention, e.g., the valetudinarium, or infirmary; the veterinarium, or farriery; the fabrica, or forge; the tabulurn, or record-office. Besides this, we read of a great variety of troops under the emperors who did not exist under the Republic, and, of course, had their respective states as assigned them in the camp.

In closing this article, we will mention some points, a previous notice of which would have interrupted the order of description.

We learn from Tacitus 8 that a part of the praetorian guard was always stationed near the emperor, the auguries being there taken by the general.

The questorium, in former times, seems to have been near the back gate, or Porta Decumana, hence called questorium. 8 The same author 4 tells us that the tribunes formerly inspected (circuitum) the night-watches. In the principia, or its immediate neighbourhood, was erected the tribunal of the general, or of the emperors when they dwelt there. The tribunes administered justice there. The principal standards, the altars of the gods, and the images of the emperors, were also placed there.

From the stationary camps, or castra stativa, arose many towns in Europe, 8 in England, especially those whose names end in cester or chest. Some of these are to be traced in the present day as are Ardoch and Strathearn, in Scotland. Their form is generally oblong.

The castella of the Romans in England were places of very great strength, built for fixed stations. Burgh Castle in Suffolk, the ancient Caronunciun, and Richborough Castle, the Rutupiae of the Romans, were both erected in the first century, and they seem to have been built nearly on the model of the castra. For information on the Roman stations in this country, the reader is referred to General Roy's Military Antiquities in Great Britain.

CATAPGRAPHA. (vid. Pictura.)

CATALOGIA. (vid. Anologia.)

CATALOGON (vid. Apona.)

CATALTUXX. (vid. Galata.)

CATALOGOS, the catalogue of those persons in Athens who were liable to regular military service. At Athens, those persons alone who possessed a certain amount of property were allowed to serve in the regular infantry, while the lower class, the thetes, had not this privilege. (vid. Census.) Thus the word thetes, and the created class called the istheutai, and the latter of ëte tou kataleuon. Those who were exempted by their military service are called by Demosthenes òi òpò tou kataleuon. It appears to have been the duty of the generals

(τράτηγας) to make out the list of persona liable to service (vid. Αστράτειας Γραφῆς), in which duty they were probably assisted by the demarchi, and sometimes by the βουλευταὶ. 1

ΚΑΤΑΛΣΕΩΣ ΤΟΥ ΔΗΜΟΥ ΓΡΑΦΗ (Κατά-
λάθως του δήμου γραφή) was an action brought against those persons who had altered, or attempted to alter, the democratical form of government at Athens. A person was also liable to this action who held any public office in the state after the democracy had been subverted. 2 This action is closely connected with the προδοσία γραφή (ἐπὶ προδοσία τῆς πόλεωςε ἐπὶ καταλάθως τοῦ δήμου), with which it appears in some cases to have been almost identical. The form of proceeding was the same in both cases, namely, by εἰσαγγελία. In the case of καταλάθως τοῦ δήμου, the punishment was death; the property of the offender was confiscated to the state, and a tenth part dedicated to Athena. 3

CATALUSIS. (vid. Cactuva.)

*CATANANKE (κατανάγκη). There are few plants in the Ματέρα Μεδίκα of the ancients, 4 observed which have served with advantage as an argument to support a particular theory. There is, however, no want of opinion. It will be sufficient to mention that Sprengel, upon the whole, inclines to the opinion that the first species is the Ortholopus compressus, and the other the Astragalus magniflorus, Hort. 5

CATAPHRACTA. (vid. Litorea.)

CATAPHRACA (καταφρακτα.) This word was used in two different significations:

1. It was the name of the heavy-armed cavalry, the horses of which were also covered with defensive armour, 6 whence they are called by Polylus πεπορφορημένοι. The armour of the horses consisted either of scale armour, or of plates of metal, which had different names, according to their form, and whether they were fastened together, or were distinct. Polylus speaks of the προμετεύσων, παραστίων, παραστρεπτών, παραμετευσών, παραμετρεπτών, παρακατωσών. Among many of the Eastern nations, who placed their chief dependence upon their cavalry, we find horses protected in this manner; but among the Romans we do not read of any troops of this description, and we may remark that the form of the light cavalry, the discipline of the legions was destroyed, and the chief dependence began to be placed on the cavalry. When Postumus leaves Rome for the Eastern wars, Gallus prays,

"Ne ve tua Moda latecute caede sagittae, Ferrus armato nec ete eataphracta equo." 7

This species of troops was common among the Persians from the earliest times, from whom it was adopted by their Macedonian conquerors. 8 In the army of Cyrus, Xenophon says 9 that the horses were protected by coverings for the forehead and chest (προκαταπράξιν καὶ προσκαταπράξιν); and the same must have been the case with those which he fought with his younger brother. 10 Troops of this description were called elibanarii by the Persians (καταφρακτα eqwtes, gus elibanarios diétant Perusai). 11 We first read of cataphracti in the Roman army in the time of Constantine. 12

II. The term CATAPHRACCI was applied to ships which had decks, in opposition to apariata. (vid. Aparia.)

CATAPRATER (καταπρατηρία, βολίς), the lead used in sounding, or fathoming the depth of water in navigation.

The mode of employing this instrument appears to have undergone no change for more than two thousand years, and is described with exactness in the account of St. Paul's voyage and shipwreck at Miletus. A cylindrical piece of lead was attached to a long line, so as to admit of being thrown into the water in advance of the vessel, and to sink rapidly to the bottom, the line being knotted at both extremities to measure the depth. By smearing the bottom of the lead with tallow (μεστον), specimens of the ground were brought up, showing whether it was clay, gravel, or hard rock.

CATAULITICA. (Vid. TORMENTUM.)

CATAULACTA (καταυλάκτης), a portcullis, so called, because it fell with great force and a loud noise.

According to Vettius, it was an additional defence, suspended by iron rings and ropes before the gates of a city, in such a manner that, when the enemy had come up to the gates, the portcullis might be let down so as to shut them in, and to enable the besiegers to assail them from above. In accompanying plan of the principal entrance to Pompeii, there are two sideways for foot-passengers, and a road between them, fourteen feet wide, for carriages. The gates were placed at A, A, turning on pivots (σθαρολε), as is proved by the holes in the pavement, which still remain. This end of the road is nearest to the town; in the opposite direction, the road led into the country. The portcullis was at B, B, and was made to slide in grooves cut in the walls. The sideways, secured with smaller gates, were roofed in, whereas the portion of the main road between the gates (A, A) and the portcullis (B, B) was open to the sky. When, therefore, an attack was made, the assailants were either excluded by the portcullis, or, if they forced their way into the barbican, and attempted to break down the gates, the citizens, surrounding and attacking them from above, had the greatest possible facilities for impeding and destroying them. Vettius speaks of the "cataulacta" as an ancient contrivance; and it appears to have been employed by the Jews at Jerusalem as early as the time of David.

CATENA.

A sluice constructed in a watercourse, and made to rise and fall like a portcullis, was called by its name (cataulacta aqua cursum temperare). Rutilla* mentions the use of such sluices in salt-works. (Vid. Saline.)

The term "cataulacta" was also applied to those natural channels which were obstructed by rocky barriers, producing a rapid and violent descent of the water, as in the celebrated "cataulactas" of the Nile.

*CATARACTES (καταράκτης), the name given to a bird mentioned by Aristotle. Schneider (who reads καταράκτης) pronounces it, upon the authority of Edmann, to be the Pelicanus hasanus, L. or the Gannet. In Scotland it is known by the name of the Solan Goose.

KATAKFOYNEI (κατακοφυνέων) τταφή (κατακοφυνες γραφα), an action brought against spies at Athens ("Αν μία ώρα πεποι ζε φρενάρη μεμονωμένη Σπείρας τυγχάνων τότων ὡς κατακοφυνέων") If a spy was discovered, he was put to the rack in order to obtain information from him, and afterward put to death. It appears that foreigners only were liable to this action, since citizens who were guilty of this crime were liable to the προβολία γραφή.

CATENYAN (κατενυγαφ). (Vid. Enye.)

CATEGORIA (κατεγορία). (Vid. Gra.)

CATICA, a missile used in war by the Germans, Gauls, and some of the Italian nations, supposed to resemble the Aulis. It probably had its name from cutting; and, if so, the Welsh terms catai, a weapon, caitia, to cut or mangle, and catus, to fight, are nearly allied to it.

CATELLA. (Vid. Catena.)

CATENA, dim. CATELLA (ἄλυος, dim. ἄλυσιος, αἵλυσιον), a chain.

Thusdies informs us that the Plateans made use of "long iron chains" to suspend the beams which they let fall upon the battering-rams of their assailants. (Vid. Aries.) Under the Romans, prisoners were chained in the following manner: the soldier who was appointed to guard a particular captive had the chain fastened to the wrist of his left hand, the right remaining at liberty. The prisoner on the contrary, had the chain fastened to the wrist of his right hand. Hence dextrae insertare catena means to submit to captivity: ieviorem in sinistra catenam. The prisoner and the soldier who had the care of him (custos) were said to be tied to one another (alligati, latro et colligatius). Sometimes, for greater security, the prisoner was chained to two soldiers, one on each side of him (ἄλυοι δυομενοι). If he was found guiltless, they broke or cut the chain thrown by his chains (ἄλυοι τὴν ἄλυσιν). Instead of the common materials, iron or bronze, Antony, having got into his power Artavasdes, king of the Armenians, paid him the pretended compliment of having him bound with chains of gold.

Chains which were of superior value, either on account of the material or the workmanship, are commonly called catella (ἄλυεια), the diminutive expressions (ἄλυοι, αἵλυοι, αἵλυεια, etc.) being used of their fineness and delicacy as well as their minuteness. The specimens of ancient chains which we have in bronze lamps, in scales (vid. Libra), and in ornaments for the person, especially necklaces (vid. Monile), show a great variety of elegant and ingenious patterns. Besides a plain dir-

---

GATOBLEPAΣ

These valuable chains were sometimes given as rewards to the soldiers; but they were commonly worn by ladies, either on the neck (περι τον τραγη-λον ὀλλισιον), or round the waist, and were used to suspend pearls, or jewels set in gold, keys, locks, and other trinkets.

CATERVA RHI. (Vid. GLADIATORES.)

CATHEDRA, a seat; but the term was more particularly applied to the soft seats used by women, whereas sella signified a seat common to both sexes (inter feminas cathedras). The cathedrae were, no doubt, of various forms and sizes; but they usually appear to have had backs to them, as is the case in the one represented in the annexed woodcut, which is taken from Sir William Hamilton's work on Greek vases. On the cathedra is seated a bride, who is being fanned by a female slave with a fan made of peacock's feathers.

Women were also accustomed to be carried abroad in these cathedrae instead of in lecteum, which practice was sometimes adopted by effeminate persons of the other sex (sexit cerise feratur cathedra). The word cathedra was also applied to the chair or pulpit from which lectures were read.

CATO'BLEPAΣ (κατοβλέπας or το κατοβλέ-παν) is an animal dwelling in Æthiopia, near the sources of the Nile. Pliny describes it as of moderate size in every respect except the head, which is so heavy that the creature bears it with difficulty. Hence it holds the head always towards the ground; and from the circumstance of its thus always looking downward, it gets the name of Catoblepas (κατα, "downward," and βλεπα, "to look"). It is well for the human race, it seems, that the animal has this downcast look, since otherwise it would annihilate them all; for no one, says Philo, can catch its eye without expiring on the spot. The eyes of the Catoblepas are a bull, but with a more fierce and terrible aspect. Its eyes, according to him, are red with blood, but are smaller than those of an ox, and surmounted by large and elevated eyebrows. Its mane rises on the summit of the head, descends on the forehead, and covers the face, giving an additional terror to its aspect. It feeds, the same authority informs us, on deadly herbs, which render its breath so poisonous that all animals which inhale it, even men themselves, instantly perish. Modern naturalists have formed the genus Catoblepas, in one of the species of which they place the Gnau, an animal that may possibly have given rise to some of these marvelous tales. Indeed, no other creature but the Gnau could well give rise to so many singular ideas. There is none that has an air so extraordinary, and, at the same time, so mournful, by reason, principally, of its long white eyebrows, and the hair, or, rather, mane on its snout, a characteristic not found in any other species of Antelope. *CATOCH'TIS (κατοχθ' τις), a species of gem or stone found in Corsica, and adhering to the hand like gum. It is thought to have been either amber, or some variety of bitumen.

CAT'RINOS (κατρινος) is a genuine Greek word, with an exact and distinct signification, although it is found in no Greek ancient or modern. It only in two authors, viz., Mr. Charles Fellows, as quoted in Aristox., p. 79, who gives the figure of the agriculture implement which it denoted, with the name written over the implement, from a very ancient MS. of Hesiod's Works and Days. It is doubtful whether the κατρινος had a Latin name; for Pliny describes it by a periphrasis: 'PERGUM vomerem subinde stimulam cuspidae protractam.' But his remark proves that it was used in Italy as well as in Greece, and coincides with the accompanying representation, from a very ancient bronze of an Etruscan ploughman driving his yoke of oxen with the κατρινος in his hand.

It cannot be doubted that, if the traveller were to visit the remote valleys of Greece and Asia Minor and take time to study the language and habits of the people, he would find many other curious and instructive remains of classical antiquity, which are preserved in no other way.

CAUCALIN.

Women were also accustomed to be carried abroad in these cathedrae instead of in lecteum, which practice was sometimes adopted by effeminate persons of the other sex (sexit cerise feratur cathedra). The word cathedra was also applied to the chair or pulpit from which lectures were read.

CATO'BLEPAΣ (κατοβλέπας or το κατοβλέ-παν) is an animal dwelling in Æthiopia, near the sources of the Nile. CAUSIA

1. It signified an inn, where travellers obtained food and lodging; in which sense it answered to the Greek words πανδοκείον and κατάλυον.

2. It signified a shop where wine and ready-dressed meat were sold, and thus corresponded to the Greek κατάλυον.

The person who kept a caupon was called caupo.

It has been maintained by many writers that the Greeks and Romans had no inns for the accommodation of persons of any respectability, and that their caupones and πανδοκεία were mere houses of shelter for the lowest classes. That such, however, was not the case, the ancient writers, especially classical authors, will sufficiently show; though it is, at the same time, very evident that their houses of public entertainment did not correspond, either in size or convenience, to similar places in modern times.

Among the Romans, the want of such houses of public entertainment would be less felt than among the Greeks; because, during the latter days of the Republic and under the emperors, most Romans of respectability had friends or connexions in the principal cities of Europe and Asia, who could accommodate them in their own houses. They were, however, frequently obliged to have recourse to the public inns.

An inn was not only called caupon, but also taberna and taberna diversoria, or simply diversorium or diversorium.

It has already been remarked that caupones also supplied inns, where wine and ready-dressed provisions were sold, thus corresponding to the Greek κατάλυον. In Greek κάτφιλεν signifies, in general, a retail trader, who sold goods in small quantities, whence he is sometimes called παλιγκατεψίς, and his business παλιγκατεπτέλεων.

The word κάτφιλος, however, is more particularly applied to a person who sold ready-dressed provisions, and especially wine, by small quantities, as plainly appears from a passage in Plato.

When a retail dealer in other commodities is spoken of, the name of his trade is usually prefixed; thus we read of προδοκατάφιλος, ὑπελεγκατάφιλος, ὑπεστίων κάτφιλος, βιβλιοκάτφιλος, &c. In these caupones only persons of the very lowest class were accustomed to eat and drink (ἐν καύπονι δὲ γαφτὶ ἡπίων ὀδὸν ὀδὸν ἐν ὑκράτει ἕνακτι τοῦτο).

There were, no doubt, inns to accommodate strangers, but these were probably only frequented by the lower classes, since all person in respectable society could easily find accommodation in the houses of their friends. There were, however, in all parts of the city, numerous houses where wine and ready-dressed provisions were sold. The houses where persons were allowed to eat and drink were usually called popinae, and not caupones. The passage in Martial calls these places sellariolas popinae. This circumstance is illustrated by a painting found at Pompeii in a wine-shop, representing a drinking-scene.

There are four persons sitting on stools round a tripod table. The dress of two of the figures is remarkable for the hoods, which resemble those of the capocollo the Italian sailors and traders of the present day. They use cupa made of bone instead of glasses, and, from their whole appearance, evidently belong to the lower orders. Above them are different sorts of eatables hung upon a row of pegs.

The thermopodia, which are spoken of in the article CALDA, appear to have been the same as the popinae. Many of these popinae seem to have been little better than the luperaria or brothels; whence Horace calls them immundas popinae. The wine-shop at Pompeii, where the painting described above was found, seems to have been a house of this description; for behind the shop there is an inner chamber painted with very species of indecency.

The gansea, which are sometimes mentioned in connexion with the popinae, were brothels, whence they are often classed with the love. Under the emperors many attempts were made to regulate the popinae, but apparently with little success. Tiburtius forbade all cooked provisions to be sold in these shops; and Claudius commanded them to be shut up altogether. They appear, however, to have been opened again, if they were ever closed; for Nero commanded that nothing should be sold in them but different kinds of cooked pulse or vegetables, and an edict to the same effect was also published by Vespasian.

All persons who kept inns, or houses of public entertainment of any kind, were held in low estimation, both among the Greeks and Romans. They appeared to have been generally the usual haunts to which they possessed; for they were accustomed to cheat their customers by false weights and measures, and by all the means in their power, whether Horace calls them perfidiae and maliagiae.
Cautio.

CAUTION.

knocks. Its form is seen in the annexed figures, which are taken from a sicile vase, and from a

medal of Alexander I. of Macedon. The Romans adopted it from the Macedonians, and more especially the Emperor Caracalla, who used to imitate Alexander the Great in his costume.

CAU'TIO, CAU'RE. These words are of frequent occurrence in the Roman classical writers and jurists, and have a great variety of significations, according to the matter to which they refer. Their general significations are that of security given by one person to another, or security which one person obtains by the advice or assistance of another. The general term (cautio) is distributed into its species according to the particular kind of the security, which may be by satisfaction, by a fidejus- sio, and in various other ways. The general sense of the word cautio is accordingly modified by its adjuncts, as cautio fidejussoria, pigneratica, or hypothesaria, and so on. Cautio is used to express both the security which a magistratus or a judex may require one party to give to another, which applies to cases where there is a matter in dispute of which a court has already cognizance; and also the security which is a matter of contract between parties, in which the word cautio is more particularly used in the latter sense.

If a thing is made a security from one person to another, the cautio becomes a matter of pignus or of hypothecas; if the cautio is the engagement of a surety on behalf of a principal, it is a cautio fidejussoria.

The cautio was most frequently a writing, which expressed the object of the parties to it; accordingly, the word cautio came to signify both the instrument (chirographum or instrumentum) and the object which it was the purpose of the instrument to secure. Cicero uses the expression cautio chirographi me as the phrase cautiare aliquid aliis express the object of one according to the security to another as to some particular thing or act. 1

Ulpian 2 divides the prioris stipulations into three species, judiciales, cantionale, communes; and he defines the cantionales to be those which are equivalent to an action, and are a good ground for a new action, as the stipulationes de legatis, cutelas, ratam rem habere, and damnum infectum. Cautiones then, which were a branch of stipula- tions, were such contracts as would be ground of actions. The following examples will explain the passage of Ulpian.

In many cases a heres could not safely pay legacies, unless the legatee gave security (cautio) to re- find in case the will under which he claimed should turn out to be bad. The Cautio Maciana was the engagement by which the heres bound himself to fulfil the conditions of his testator’s will, or to give up the inheritance. The heres was also, in some cases, bound to give security for the payment of legacies, or the legatee was entitled to the Bonu- rum Possesso. Tutors and curators were required to give security (satisdare) for the due ad- ministration of the property intrusted to them, unless the tutor was appointed by testament, or unless the curator was a curatur legate. 3 A procurato- tor who sued in the name of an absent party might be required to give security that the absent party would be contented by the act of the procurator; 2 this security was a species of stipula- tions, included under the genus cautio. 4 In the case of damnum infectum, the owner of the land or property threatened with the mischief might call for security on the person threatening the mischief. 5

If a vendor sold a thing, it was usual for him to declare that he had a good title to it, and that, if any person recovered it from the purchaser by a better title, he would make it good to the purchaser; and in some cases the cautio was for double the value of the thing. 6 This was, in fact, a warranty.

The word cautio was also applied to the release which a debtor obtained from his creditor on satisfying his demand: in this sense cautio is equiva- lent to a modern receipt; it is the debtor’s security regained for his satisfaction, and so it was often termed secun- titiae. 7 Thus cauerre ab aliquo significis to obtain this kind of security. A person to whom the usual fructus of a thing was given might be required to give security that he would enjoy and use it properly, and not waste it. 8

Cauvere is also applied to express the professional advice which a lawyer gives to his client for his conduct in any legal matter. 9

The word cauerre and its derivatives are also used to express the provisions of a law by which anything is forbidden or ordered, as in the phrase ‘cautio est legi, principibus constitutionibus,’ &c. It is also used to express the words in a will by which the testator declares his wish that certain things should be done after his death. 'The prepar- ation of the instruments of cautio was, of course, the business of a lawyer.

It is unnecessary to particularize farther the species of cautio, as they belong to their several heads in the law.

CEDIS OR CAIADAS (καίκια or καίκια) was a deep cavern or chasm, like the βαδηπτής του Αθήνας, into which the Spartans were accustomed to thrust persons condemned to death. 9

*CEBLE'PYRS (κεβλέπυρος), a species of bird, mentioned by Aristophanes. It is probably, accord- ing to Adams, the Red-pole, or Fringilla Linaria.

CEDIT DIES. (Vid. LEGATUM.)

*CEDRUS (κέδρος and κέδρος), the Cedar, as we commonly translate it. According to the best bot-anical writers, however, the κέδρος of the Greeks and CEDRUS of the Romans was a species of Juni- per. The Cedar of Lebanon seems to have been but little known to the Greek and Roman writers. Theophrastus, according to Martyr, appears to speak of the 60th chapter of the fifth book of his History of Plants, where he says that the cedar grow to a great size in Syria, so large, in fact, that three men cannot encompass them. These large Syrian trees are probably the Cedars of Lebanon, which Martyr believes Theophrastus had only heard of, and which he took to be the same with the Syrian cedar, only larger; for in the twelfth chapter of the third book, where he de-

The body-guar of Juniperus, is, for Pine, and the hence.

A female occupied one to herself, over which her name was inscribed; hence cella inscripta means a brothel.

The interior of a temple, that is, the part included within the outside shell, σενώς (see the lower wooden in Ante), was also called cella. There was sometimes more than one cella within the same peristyle or under the same roof; in which case they were either turned back to back, as in the Temple of Venus and Vespasian, built by Hadrian on the Via Sacra, the remains of which are still visible, or parallel to each other, as in the Temple of Jupiter Optimus Maximus in the Campus. In such instances, each cell took the name of the deity whose statute it contained, as Cella Jovis, Cella Junonis, Cella Minerva. (Vid. CAPITOLIUM.)

CELLARIUS. (Vid. CELL.)

CÉNCHROS (κένχρος), a species of Hawk, answering to the modern Kestrel, or Falco tinnunculus. (Vid. HIRAX.)

CÉNCHROS (κένχρος). I. A species of Graín, the same, according to the best authorities, with Panicum miticantum, or Millet. II. Called also CÉNCHROS (κένχρος), a species of Serpent, which some confound with the ἀκροίμα, but which Gesner regards as a different kind. "It is more probable, however," says Adams, "that both were merely varieties of the Coluber burus, or Viper. I make no objection here, moreover, that the C. burus and the C. prester are the only venomous serpents which we have in Great Britain, and that many naturalists hold them to be varieties of the same species." (EN.)

CENSORS

Cenctaphia were considered as religious, and therefore divi juris, till a rescript of the emperors Antoninus and Verus, the divi frates, pronounced them no such. But Censores, two magistrates of high rank in the Roman Republic. They were first created B.C. 445, and were a remarkable feature in the constitution then established. They were elected by the curie and confirmed by the centuries; and thus were not merely elected from, but also by the patricians. At first they held their office for five years, but in Marmecius Rutilus, the dictator, passed in B.C. 433, by which the duration of the office was limited to 18 months, the election still taking place, as before, at intervals of five years, so that the office was vacant for three years and a half at a time. The censors were always patricians of consular rank till B.C. 350, when a plebeian, C. Marcus Rutilius, who had also been the first plebeian dictator, was elected censor. Subsequently, the censors might be, both of them, plebeians, and even persons who had not filled the consulship or pretorship might be elected to this magistracy; but this was very uncommon, and was put a stop to after the second Punic war. The censorship was merged in the imperial rank. The duties of the censors were to hold a register of the patrician senators, equites, members of tribes, and equestrians, and as their lists were the sole evidence of a man's position in the state, it of course rested with them to decide all questions relative to a man's political rank. And thus we find that, in effect, they could, if they saw just cause, strike a senator off the list, deprive an eques of his horse, or debar a citizen to the rank of the equites. The offences which rendered a man liable to these degradations were, ill treatment of his family, extravagance, following a degrading profession, or not properly attending to his own, or having incurred a judicium turpe. The power of the censors even extended to a man's property, which was the basis of the Roman aristocracy. The censors a minute and detailed account of his property, which was taken down in writing by the notaries, so that, as Niebuhr says, there must have been an enormous quantity of such documents and reports in the register-office. But the censors had unlimited power in estimating the value or fixing the taxable capital: thus cases are known in which they rated the taxable value of some articles of property, as high-priced slaves, at ten times the purchase-money. And they not only did that, but even fixed the rate to be levied upon it. The censors also managed the farming of the vectigalia or standing revenues, including the state monopoly on salt, the price of which was fixed by them. They were therefore the resource of the state in the case of deficits in the state revenue, and were therefore in frequent employment in cases of public exigencies. The care of the temples, &c., devolved on the praetor urbana when there was no censor; but there does not appear to be any reason for concluding, with Niebuhr, that the offices of praetor and censor were ever combined. The censor had all the insignia of consular dignity except the fibulae, and wore the entire costume of a consular deputy, as we learn from the Roman coins, but upon which Niebuhr, Ant. Rom., ii., 1.—2. (Niebuhr, Hist. Rom., iii., p. 345.)—3. (Niebuhr, Hist. Rom., ii., p. 350.)—4. (Cic. Pro Cluent., 42.—Damas., iv., § 182.)—5. (Hist. Rom., iii., p. 390.)—6. (Liv. xxxv. 44. 4.—Liv. xxix. 27, 8.)—8. (Hist. Rom., iii., p. 350.)—9. (Polyb. iv., 53.)

not replaced, and his colleague resigned. 4. A censor's funeral was always very magnificent. 5. Further details with regard to the censors, see Niebuhr, Hist. Rom., ii., p. 354, &c., and Arnold, Hist. Rom., i., p. 346, &c.

CENSUS, or register of persons and property, constituted a man's actual claim to the rights of citizenship both in Greece and at Rome.

1. The Census at Athens seems to date from the constitution of Solon. This legislator made four classes (συγκρατη, &c.), and divided each into ten groups, or centuries, consisting of 500 males, dry or liquid, from their lands. 2. Knights, who had an income of 300 measures. 3. Zeugites, whose income was 150 measures. 4. Thetes, or capite censi. The word τετράκειμα, as used in the orators, means the valuation of the property; i.e., not the capital itself, but the taxable capital. Now if the valuation of the income was that given in the distribution of the classes just mentioned, it is not difficult to get at the valuation of the capital implied. Solon reckon-

dried dry measure, or medimnus, at a drachma. 5. Now it is probable that the income was reckoned at a twelfth part of the value of the land, on the same principle which originated the uncetariam farm, or 81 per cent. at Rome; if so, the land property of a knight was reckoned at 12, or 15×500=6000 drachmas; of a knight's: at 12×300=3600 dr.; and that of a zeugites at 12×1800=1800 drachmas. In the first class the whole estate was considered as taxable capital; but in the second only 5ths, or 3000 drachmas; and in the third, 7ths, or 1000 drachmas; to which Pulilux alludes when he says, in his blundering way, that the first class of citizens, or one-twelfth part of the whole, had an estate, the second, 30 minas; the third, 10 minas; and the thetes, nothing. In order to settle in what class a man should be entered on the register (πίσταγαθίον), he returned a valuation of his property, subject, perhaps, to the check of a counter-valuation (πλουσιαγαθίον). The valuation was made very frequently; in some states, every year; in others, every two or four years. The censors, who kept the register at Athens, were probably at first the naucrari, but afterward the demarchs performed the office of censor. Although this institution of Solon's seems particularly calculated for the imposition of the property-tax (συγκρατη), Thucydides, speaking of the time of the Peloponnesian war, says that the Athenians first raised a property-tax of 200 talents. It seems, however, that the amount of the tax constituted its singularity; for certainly property-taxes were common not only in Athens, but in the rest of Greece, before the Peloponnesian war, and Anti-

pho expressly says that he contributed to many of them. In the archonship of Nausinicus (Olym. 100, 3; 13 O. 379) a new valuation of property took place, and classes (συγκρατη) were introduced expressly for the property-taxes. The nature of these classes, our knowledge of which principally depends on a note of Ulpian, is involved in considerable obscurity. Thus much, however, may be stated, that they consisted of 1200 individuals, 120 from each of the ten tribes, who, on account of their property, advanced the money for others liable to the tax, and got it to them by the ordinary legal processes. In a similar manner classes were subsequently formed for the discharge of another and more serious liturgy, the trierarchi; and the stratēgai, who nominated the trierarchi, had also to form
of the property taxes. 1 What we have here said of the census at Athens renders it unnecessary to speak of the similar registrations in other parts of Greece. When the constitution essentially depended on this distribution according to property, it was called a timocracy, or aristocracy of property (τιμοκρατία, ἀπὸ τιμωμένων πολιτών).

II. The Census at Rome took place every five years, and was attended by a general purification, whence this period of time got the name of a lustrum. The census was performed in the Campus, where the censors sat in their curule chairs, and where the people of the city came to be registered by them, and give an account of their property. When the census was finished, one of the censors offered an expiatory sacrifice (lustrum conditum) of swine, sheep, and bullocks (hence called suovetaurilia), by which the city was supposed to be purified. The census originated, like that of Athens, in a distribution of the citizens into classes at the comitia centuriata, which distribution is attributed to Servius Tullius. (Vid. Comitia.) But this old constitution was never completely established, was very soon overthrown, and only gradually and partially restored. There was a considerable difference between the modes of valuation at Rome and Athens. In the latter city, as we have seen, the whole property was valued; but the taxable capital selfdom amounted to more than a third of what it was much smaller in the case of the poorer classes. Whereas at Rome only res mancipi were taken into the account, estates in the public domain not being returned to the censors, and some sorts of property were rated at many times their value; nor was any favour shown to the poorer classes when their property, however small, came within the limits of taxation. The names of persons included in the censuses which have come down to us were not the names of the Roman citizens, but also all the persons connected with Rome in the relation of isopoli; they refer, however, only to those of man's estate, or able to bear arms. 3

*Centaurea or -EUM (κενταύριον and -εύμ), the herb Centauria, so called from the Centaur Chiron who was said to have been thereby cured of a wound accidentally received from Hercules. 4 It was also, from this circumstance, styled Chironia and Χελεπος ριζας. 5 There are two kinds of Centauria, the greater and the less, which have no other similitude than in the bitterness of their taste. The less is also called *εσπερα, 6 from its loving moist grounds. "It grows wild in England," says Martyn, "in many places, and is the best kind."

The κενταύριον μυσσα is referred by Sprengel and Matthioli to the Centaurea Centaurium, L., and κ. amropov to the Erythraea Centaurium, Pers. Stackhouse makes the κ. of Theophrastus to be the Centaurea Centauria. 7 The less is called in Greece, θεομηχανός. Sibthorpe found it everywhere in Greece in the level country. 8

*CENTRIFO (κεντηρία), a species of fish mentioned by Theophrastus. According to Willughby, it was a species of Casterosterus, called in English Stickleback or Barnacle-stickle. 9

CENTRITE (κεντηρίτης), a species of fish mentioned by Athenaeus and Oppian. It is the *Squalus Centria, in Italian *Pesce porco. Rondelet says it has some resemblance to a sow, and delights in filth. 10

CENTRUARI VIRI. 1

The foregoing notice is founded on Hollweg in his essay; his opinions on some points, however, are hardly established by authorities. Those who desire to investigate this exceedingly obscure matter may compare the two essays cited at the head of this article.

CENTURIA. (Vid. CENTURIO, C O M I T U M.)

CENTURIO, the commander of a company of infantry, varying in number with the legion. 

Festus may be trusted, the earlier form was centurio, like decurio, decuriorum. Quintilian tells us that the form centurio was found on ancient inscriptions, even in his own times.

The century was a military division, corresponding to the civil centuria; the centurio of the one answered to the curio of the other. From analogy, we are led to conclude that the century originally consisted of thirty men, and Niebuhr thinks that the influence of this favoured number may be traced in the ancient array of the Roman army. In later times the legion (not including the velites) was composed of thirty maniples or sixty centuries. The exactions on this plea were one cause of the sedition in the army of Blesus, mentioned by Tacitus. The vittis was the badge of office with which the century punished his men. The short tunic, as Quintilian seems to imply, was another mark of distinction. He was also known by letters on the crest of the helmet. The following woodcut, taken from a bas-relief at Rome, represents a centurio with the vittis in one of his hands.

The centurions were usually elected by the military tribes, subject, probably, to the confirmation of the consul. There was a time, according to Polybius, when desert was the only path to military rank; but, under the emperors, centurionships were given away almost entirely by interest or personal friendship. The father in Juvenal wakes his son with Vitem posse libello, "petition for the rank of centurion;" and Pliny tells us that he had made a similar request for a friend of his own, "Huic ego ordinis imperaveram." Dio Cassius, when he makes Maceinas advise Augustus to fill up the senate, in tivo isti urbi, seems to imply that some were appointed to this

CERASUS

According to this view of the subject, the χέλλον, φωτείς, μόδινος, and φάκονιος of Athenaeus must have been merely varieties of it.

CUvier, however, admits several species, placing the M. Cephalus, or common Mullet, at the head.

"The genus Mugil," observes Griffith, "is supposed to derive its name from the contraction of the Latin words significating "very small sailor" (colaegulus)."

The species of this common Mullet is very well known, as has been noticed by Aristotle. It appears to be a stupid character, a fact which was known in the time of Pliny, since that author tells us that there is something ludicrous in the disposition of the mullets, for if they are afraid they conceal their heads, and thus imagine that they are entirely withdrawn from the observation of their enemies.

The ancients had the flesh of the Mullet in great request, and the practice of it is still very constant in all the countries of Europe. According to Athenaeus, these mullets were formerly in very high esteem which were taken in the neighbourhood of Sinope and Abdera; while, as Paulus Jovius informs us, those were very little prized which had lived in the salt marsh of Orbitello, in Tuscany, in the lagoon of Ferrara and Venice, in those of Pselion and Redalia, or Lezzi, and others such as came from the neighbourhood of Comacchio and Ravenna.

All these places, in fact, are marshy, and the streams by which they are watered are brackish, and communicative to the fish which they support the odour and the fluid of the mud."

The ancients believed the Mullet to be a very salacious kind of fish, which circumstance may, perhaps, have given rise to the custom alluded to by Juvenal.

CEPHALUS (képálos), the Mullet. Linnaeus and several of his successors have condemned all the European mullets under a single specific, namely, MUGIL Cephalus. According to this view of the subject, the χέλλον, φωτείς, μόδινος, and φάκονιος of Athenaeus must have been merely varieties of it.

CUvier, however, admits several species, placing the M. Cephalus, or common Mullet, at the head.

"The genus Mugil," observes Griffith, "is supposed to derive its name from the contraction of the Latin words significating "very small sailor" (colaegulus)."

The species of this common Mullet is very well known, as has been noticed by Aristotle. It appears to be a stupid character, a fact which was known in the time of Pliny, since that author tells us that there is something ludicrous in the disposition of the mullets, for if they are afraid they conceal their heads, and thus imagine that they are entirely withdrawn from the observation of their enemies.

All these places, in fact, are marshy, and the streams by which they are watered are brackish, and communicative to the fish which they support the odour and the fluid of the mud."

The ancients believed the Mullet to be a very salacious kind of fish, which circumstance may, perhaps, have given rise to the custom alluded to by Juvenal.

CEPHERUS (képóros), a species of Bird. Erasmus and others take it for the Gull or Sea-mew; but, as Adams remarks, Aristotle distinguishes between it and the lapis. It may, however, as the latter thinks, have been the species of Gull called Dung-hunter, or Larus pariasicus, etc. It makes the Cataracte cephalus."

CERACHANTHES (kérapántés), an agate of the colour of wax (kérnos), mentioned by Pliny. (Vid. ACHANTHES.)

CERASTES (kérrastés), the Horned Serpent, so-called, according to Isidore, because it has horns on its head like those of a ram. Dr. Harris thinks that it was a serpent of the viper kind. It is the Shephephon of the Hebrews. "Sprengel," remarks Adams, "holds it to be the same as the Hemorrhao, referring both to the Coluber Cerasotes, L.; and, from the resemblance of the effects produced by the sting of the Hemorrhao, and of the Cerasotes, as described by Aristotle, Aetius, and Paulus Aegineta, I am disposed to adopt this opinion, although unsupported by the other authorities." (Vid. A. MORRUSB.)

CERASUS (kérasos), the Cherry-tree, or Prunus Cerasus, L. According to some authorities, it derived its name from the city of Cerasus in Pontus, where it grew very abundantly; while others make the city to have been called after the tree. Lucullus, the Roman commander, is said to have planted an orchard of these trees in his garden at Rome, near the Esquiline hill.
CEREPITHCUS.

CEREVISIA.

To have first brought the Cherry-tree into Italy, and hence the terms cerasus and cerasum (the latter signifying the fruit) were introduced into the Roman tongue. Servius, indeed, says that cherries were known before this in Italy that they were of an inferior quality, and were called corna; and that, subsequently, this name was changed into cera-cerasus. Pliny, on the other hand, expressly denies that cherries were known in Italy before the time of Ceres. According to Gesner, however, they were known at a much earlier period, having been described by Theophrastus and the Sibylline Diaphylus. This latter writer, who is quoted by Athenaeus, speaks of cherries as being stomachic, though not very nutritive. He makes the very red kind, and another called the Milesean, to have been the better, and to thrive better in the Argolic country than in the Peloponnesus. The best kind of all, however, was the cherry-tree of the Phrygians as esteemed by the Phrygians. This cherry-tree could never have acclimated in Egypt. According to modern travellers, the hills near the site of ancient Cerasus are still covered with cherry-trees, growing wild.

* CERATIA (κεράτια), the Carob-tree, or Cerato-nia siligia. Horace,1 observes Adams, speaks of the Carobs as being an inferior kind of food, and so also Juvenal and Persius. It has been conjectured that it was upon Carobs, and not upon Locusts, that John the Baptist fed in the wilderness. This point is discussed with great learning by Olaus Celsius, in his Historiobotanica. To me it appears that the generally received opinion is the more probable.

* CEREAUIII (κεραυνών), a variety of the Treluld, or Tubor Cibarium.

* CERCIS (κερκός), according to Stackhouse, the Judas-tree, or Cercis silicicursum. Schneider, however, rather inclines to the Aspen-tree, or Populus tremula.

CERCOPITHECUS (κέρκοπιθήκος), a species of Monkey, with a long tail, from which circumstance the Greek name has originated (κέρκος, "a tail," and πίθηκος, "a monkey"). Pliny describes the animal as having a black head, a hairy covering resembling that of an ass, and a cry different from that of other apes. Harcbin refers it to the Mar- moth, but this is very improbable. Counts, indeed, that among the monkeys in India there are some with long tails, grayish hair, and the face black; as, for example, the Simia entellus and the Simia fau- nus. None, however, are found, according to him, in this same country with grayish hair, and the whole head black.1 On the other hand, Wilkin- son2 states that Pliny's description of the Cercopitéhus, with a tail, is not to be found in any other species of monkeys still found in Ethiopia. The Cercopitéhus was worshipped, according to Juvenal, in Thebes, the old Egyptian capital, and, as Wilkinson states, would seem to have been embalmed, not only in that city, but also in other places in Egypt. It was frequently represented as an ornament in necklaces, in common with other animal figures, and fanciful devices; and the neck of a bot-}

---

CERUSI.

Smyrna in Cestus plant, species v., {Vid. (Ano. (De Adams, J. Dr. Adairi, Gesner, K7ipwOoc, White Lead, or Plumbi sub-carbonas. The ancient Cerase, like the modern, was prepared by exposingLead to a flame. The term vepz is minutely described by Theophrastus: "Lead is placed in earthen vessels over sharp vinegar, and after it has acquired a sort of rust of some thickness, which it commonly does in ten days, they open the vessels, and scrape from it a kind of mould. They then place the lead over the vinegar again, repeating again and again the same method of scraping it till it is wholly gone at the bottom. What has been scraped off they then heat to powder and boil for a long time; and what at last subsides to the bottom of the vessel is the ceruse." Similar processes are described by Dioscorides and Vitruvius. "The substance spoken of by Pliny," remarks Dr. Moore, "as a native cerese, found at Smyrna on the farm of Theodotus, appears to have been that greenish earth mentioned by Vitruvius as occurring in many places, but the best was flown at Smyrna and called by the Greeks Theodotov, from the name of the person, Theodotus, upon whose farm it was first discovered. From the fact that this green earth was regarded as a sort of ceruse, we might infer that the cerese of the ancients was not always of a very pure white."  

*CERYLUS (cereuloc), a species of Bird; the same, according to Suidas and Tzetzes 1 with the male kind, and by Sanian and Moschus, however, as Adam's remarks, appear to consider it a different bird. Gesner and Schneider are undecided.  

CERYX (cereus). (Vid. Caduceus, Petialis.)  

*CERYX (cereus), "A genus of Trestase, now placed," remarks Adams, "in the Molsusca by naturalists. It is the Murex of the older authorities. The two principal species are the Bouceminum and Purpura, which Sprengel refers to the Buccasnum harp., L., and B. lapicida, Dr. Coray remarks, that the Greek writers often make no distinction between the kóros and the ηορφια, but modern naturalists distinguish between the Murex and the Purpura." (Vid. Merue.)  

CER'SIO BONO'RUM. (Vid. Bonorum CER'SIO IN JUKE. (Vid. In Jure CERSSIO.)  

CER'SIO (cereus). (Vid. Bireclus,) p. 17.)  

*CESTRUM (késterop), I. a species of Betony. Sprengel, in his R. H., was inclined to make it the Betonica officinalis; but in his edition of Dioscorides he adopts the opinion of Dalechamp, who proposed the Betonica alopecurus. Dioscorides describes it as growing in very cold places, and Stiborth accordingly found the B. alopecurus growing plentifully on Parnassus, one of the coldest regions of Lydia. (Vid. Pictura.)  

CESTUS was used in two significations:  

I. Cestus signified the thongs or bands of leather which were tied round the hands of boxers in order to render their blows more powerful. These bands of leather, which were called ηηυξις, or ηυξις γυνακιον, in Greek, were also frequently tied round the arm as high as the elbow, as is shown in the following statue of a boxer, the original of which is in the Louvre at Paris.  

prepare themselves for boxing, they put on their bands thongs made of ox-hide (μαυτος ευπροσ Δδης ργαθυμων); but it should be recollected that the cestus, in heroic times, appears to have consisted merely of thongs of leather, and differed materially from the frightful weapons, loaded with lead and iron, which were used in later times. The different kinds of cestus were called by the Greeks in later times μελιάζες, πτέραι βωσίς, σφαιρίς, and μύρμηκας: of which the μελιάζες gave the softest blows, and the μύρμηκας the most severe. The μελιάζες, which were the most ancient, are described by Pausanias\(^1\) as made of raw ox-hide cut into thin pieces, and joined in an ancient manner: they were tied under the hollow or palm of the hand, leaving the fingers uncovered. The athlete in the palaestra at Olympia used the μελιάζες in practising for the public games (πληθυς των μαλακέτων); but in the games themselves they used those which gave the severest blows.

The cestus used in later times in the public games was, as has been already remarked, a most formidable weapon. It was frequently covered with knots and nails, and loaded with lead and iron; whence Virgil,\(^2\) in speaking of it, says,

\[\text{Ingenia sepient.}\]

\[\text{Terga bouno plumbmo insuto ferroque vigileant.}\]

Statius\(^3\) also speaks of \textit{nigrantias plumbm tegmna}. Such weapons, in the hands of a trained boxer, must have frequently occasioned death. The μύρμηκας were, in fact, sometimes called γνωστός, or "limb-breakers." Lucilius\(^4\) speaks of a boxer whose head had been so battered by the μύρμηκας as to resemble a sieve.

Figures with the cestus frequently occur in ancient monuments. They appear to have been of various forms, as appears by the following specimens, taken from ancient monuments, of which drawings are given by Fabretti.\(^5\)

---

---

II. Cestus also signified a band or tie of any kind;\(^6\) but the term was more particularly applied to the zone or girdle of Venus, on which was represented everything that could awaken love.\(^7\) When Juno wished to win the affections of Jupiter, she borrowed this cestus from Venus;\(^8\) and Venus herself employed it to captivate Mars.\(^9\)

The scholiast on Statius\(^4\) says that the cestus was also the name of the marriage-girdle, which was given by the newly-married wife to her husband; whence unlawful marriages were called \textit{incesta}. This statement is confirmed by an inscription quoted by Plutarch,\(^10\) in which a \textit{matrona} dedicates her cestus to Venus.

\[\text{CETRA} \] or \[\text{E.CETRA} \] (σατρής), a target, i.e., a small round shield, made of the hide of a quadruped.\(^11\) It formed part of the defensive armour of the Oscii.\(^12\) (Vid. \textit{Actis}). It was also worn by the people of Spain and Mauritania.\(^13\) By the latter people it was sometimes made from the skin of the elephant.\(^14\) From these accounts, and from the distinct assertion of Tacitus\(^15\) that it was used by the Britons, we may with confidence identify the cestra with the target of the Scottish Highlanders, of which many specimens of considerable antiquity are still in existence. It is seen covering the left arms\(^16\) of the two accompanying figures, which are copied from a MS. of Prudentius, probably written in this country, and as early as the ninth century.\(^17\)

---

It does not appear that the Romans ever wore the cestra. But Livy compares it to the \textit{pelts} of the Greeks and Macedonians, which was also a small light shield (cestratos, quos pellastos vocavat).\(^18\)

CHALCIDICUM. CHALCI- 

"CHALK'ANE (χαλκαίνη) appears to have been the well-known Greek resin, which exudes from the Chel ten Galbanum. Pliny, in describing it, says, "Quod maxime laudant, cartilaginum, parum, ad similitudinem Hymeniaci." In the Edinburgh Dispensary it is said that "Galbanum agrees in virtue with gum Ammoniacum." Hence Adams concludes that the Galbanum was identical with the modern. 

CHALCHANTHUS (χαλκάνθος), according to Pliny, the same with the "Atramentum sutoriorum" of the Romans, so called because used to blacken leather. The account of the Roman writer is as follows: "Graci cognitionem aris nomine fecerunt et a tramento sutorio, appellant enim Chalchanthum. Color est caruleus perquam spectabilis nitore, vitruminque esse creditur." From this language of Pliny there can be no doubt that Hardouin was correct in making it to be Copperas, or Blue Vitriol (chalcanthus, i. e. flos aris). "Yet," continues Adams, "both Sprengel, in his edition of Dioscordes, and Dr. Milligan, in his Annotations on Celsus, call it a natural solution of sulphate of copper in water. The quotation from Pliny proves that it was a vitriol, the word vitriol being, in fact, formed from vitrum. And, farther, Dioscordes' description of its formation agrees very well with Jameson's account of the origin of copperas. The ancients, however, as Dr. Hill states, were acquainted with a fictitious vitriol, which they called Pseudum and Epithymum, obtained by boiling some of the vitriolic ores in water."

CHALKEIA (χαλκεία), a very ancient festival celebrated at Athens, which at different times seems to have had a different character, for at first it was solemnised in honour of Athene, or been a festival of the people of Athens, whence it was called "Αριστή or Πανόθος. At a later period, however, it was celebrated only by artisans, especially smiths, and in honour of Hephaestus, whence its name was changed into Xalkeia. It was held on the 30th day of the month of Pyaneposion. Meander had written a comedy called Xalkeia, a fragment of which is preserved in Athenaeus. 

CHALCIDICA (χαλκιδίκα). A variety of meaning seems to have been attached to this word, which is not of unfrequent occurrence in inscriptions, and in the Greek and Latin writers. 

The meager epitome of Festus informs us merely that it was a sort of edifice (genius edificii), so called from the city of Chalce, but what sort is not explained; neither do the inscriptions or passages cited below give any description from which a conclusion respecting the form, use, and locality of such buildings can be positively affirmed. 

"CHALCIDEIA were certainly appurtenances to some basilica, in reference to which the following attempts at identification have been suggested: 1. A mint attached to the basilica, from χαλκίς and δέκα, which, though an ingenious conjecture, is not supported by sufficient classical authority. 2. That part of the Basilica which was annexed to the front of the tribune, corresponding to a nave in the modern church, of which it was the original, where the lawyers stood, and thence termed τάξις κατακοιλίας. 

In the upper gallery, in the form of a balcony. Internal chambers on each side of the tribune for the convenience of the judges, as in the basilica of Pompeii. (Vid. Basilica, p. 141) 5. The vestibule of a basilica, either in front or rear; which interpretation is founded upon an inscription discovered at Pompeii, in the building appropriated to the fillers of cloth (fullonicae): 

Eumachia. L. F. Sacerd. Pub. * * * 

CHALCIDIUM, CRYSTAL PORTION 

* * * SEA. PERN. PRIT. RAMESQUE. DE DIBIT. 

By comparing the plan of the building with this inscription, it is clear that the chalcidicum mentioned can only refer to the vestibule. Its decorations likewise corresponded in richness and character with the vestibule of a basilica described by Procopius, which is twice designated by the term χαλκίς. The vestibule of the basilica at Pon. pei is shown upon the plan on page 141. 

In another sense the word is used as a synonyme with cavaeula. "Scibitur Di vestit in triclinio calestibus atque in chalcidicis urcis caretare." These words, compared with Homer, 

Τρήηθε δε εὶς ἑνδέκατο καρκαλίσσω, and the translation of οὔπωρον by Auseonius, 

"Chalcidicum grexus maxis superabant ani", 

together with the known locality of the ancient cavaeula, seem fully to authorize the interpretation given. 

Finally, the word seems also to have been in the same sense as manionum, a balcony. 

CHALCIOCIA (χαλκιοκλία), an annual festival, with sacrifices, held at Sparta in honour of Athene, surnamed Xalkeiokeia, i. e., the goddess of the linen-house. Young men marched on the occasion in full armour to the temple of the goddess, and the ephors, although not entering the temple, but remaining within its sacred precincts, were obliged to take part in the sacrifice. 

"CHALCIS (χαλκίς), I. A species of Bird, described as inhabiting mountains, rarely seen, and of a copper colour (from which the name, or else from its shrill cry). It was probably one of the Falcon tribe, and is considered by some authors to be the same bird, but it must be carefully determined what kind of bird it really was. An other name for this bird is κυμοφόρος, in Homer and Ionic authors. Both names occur in the 14th book of the Iliad, where it is noted that χαλκίς is the older name. The cry of the bird is represented by κικαιβάδ. 

II. A species of Lizard, so called from having copper-coloured streaks on the back. It is termed in Greek, not only χαλκίς, but also καρποχρόνιον. Some of the ancient authorities call it εἰφό, and the French naturalists describe it under the name of Le Seph, but, according to Buffon, improperly. It is the Chalces Vittatus, L. Cuvier thinks it very probable that the ancients designated by this name the Seph with three toes of Italy and Greece. The name Chalces has the same signification as the Greek χαλκίς. It is probable that the word "Chalce" called Chalcedon by Lamartine was but a variety of the Seph." Buffon remarks, "It appears to bestow a strong affinity to the viper, and, like that animal its bite may be dangerous." Dr. Brookes, 139. 

CHALCOS.

"The Seps, or the Chalcidian Lily of Aldrovandus, is rather a serpent than a lizard, though it has four small legs, and paws divided into 4. Dr. Hill, in the 1st account of the Flos aris, given by Kidd, is inaccurate, and we give it merely to caution the reader not to be misled even by such a high authority: "In the spontaneous formation of sulphate of copper, the pyrites first loses its splendour, then swells and separates into numerous tassels. After this, its surface is partially coated with a white efflorescing powder, which is the Flos aris of Pliny.

"CHALCOPHONOS (χαλκόφωνος), a dark kind of stone, sounding, when struck, like brass. Traugelians were recommended to carry one. It was probably a species of cink-stone."

"CHALCOSMARAGDUS (χαλκόσμαραγδός), according to Pliny, a species of Emerald, with veins of a coppery hue. It is supposed to have been Diplotace (Archirute) in its gang of copper pyrites."

CHALYBS (χαλύβος), Steel, so called, because obtained of an excellent quality from the country of the Chalybes. "The Indian Steel, mentioned by the author of the Peruus, was probably," observes Dr. Moore, "of the kind still brought from India under the name of wootz; and the ferrum candidum, putrified with the same, is described as resembling the Chalybidic, indispensable to the steel-smiths of this country, as the Iceland spar to the astronomer."

These kinds were the Chalybidic, the Sicopic, the Lydian, and the Lacedemonian. The Chalybidic was best for carpenters' tools; the Lacedemonian for files, and drills, and gravers, and stone-chisels; the Lydian, also, was suited for files, and for knives, and razors, and rasps." According to Tychsen, nothing occurs in the Hebrew text of the Scriptures relative to the hardening of iron, and the quenching of it in water. Iron (barzeh) often occurs, and in some passages, indeed, Steel may, he thinks, be understood under this name. For example, in Ezekiel, ferrum fabrefactum, or, according to Michaelis and others, subale blades from Usal (Sanaa in Yemen). A pretty clear indication of steal is given in Job xxviii. 10, 11, where the Hebrew word is described as the hardest. It appears that the Hebrews had no particular name for Steel, which they perhaps comprehended, as the same writer conjectures, under the term barzeh, or distinguished it only by the epithet "Northern." Among the Greeks, Steel was used as early as the time of Homer, and, besides Chalybes, it is only commonly called asirrma (στελμα), which, however, did not so much denote Steel itself as the steeled part of the instrument. Adams, also, was frequently used to indicate Steel. (Vid. Adamas.) "The Romans," observes Beckmann, "borrowed from the Greeks the word chalybs; and, in consequence of a passage in Pliny, many believe that they gave also to Steel the name of acies, from which the Italians took their acciaio, and the French their acier. The word acier, however, denoted properly the steeled or cutting part only of an instrument. From this, in later times, was formed aciaria, for the Steel which gave the instrument its sharpness, and also actarre, to steel." The preparation by fusion, as practised by the Chalybes, has been twice described
CHARISIA.

The Steel of the ancients, however, in consequence of not being cemented, suffered itself to be hammered, and was not nearly so brittle as the hardest steel with which we are acquainted at present. On the other hand, the singular method of hardening steel by immersing it suddenly into red-hot water, is very old; Homer says, that when Ulysses bored out the eye of Polyphemus with a burning stake, it hissed in the same manner as water, when the smith immerses in it a piece of red-hot iron in order to harden it. Sophocles uses the comparison of being hardened like immersed iron; and Salmacius quotes a work of the Greek chemist, who treats of the method of hardening iron in India. It is also a very ancient opinion, that the hardening depends chiefly on the nature of the water. Many rivers and wells were therefore in great repute, so that steel-works were often erected near them, though at a considerable distance from the mines. The more delicate articles of iron were not quenched in water, but in oil.

CHALKOUS. (Vid. Aes.)

CHARLES CT (χαρακτήρ), the Dwarf-welder. (Vid. Acte.)

CHARLES DRYX (χαράδρυς), the Wall German, or Terecinium Chamaedrys. Apuleius makes the Chamaedrys a synonome of the Terecinium.

CHARLES ERSUS (χαρακτέρας), supposed by Sprengel to be the Lily of the Valley, or Convallaria majalis.

CHARLES LEON (χαρακτέλων), I. a species of plant, so called from the changeable colour of its leaves. Gesner and Humbertius, according to Adams, can only refer it in general terms to the Thistle tribe. Stephens, Schoultz, and Stackhouse hold that the χαρακτέλων λεον is the Carthia occa-

II. The Chameleons, or Chameleo Egyptiani. The ancient naturalists describe this species of lizard accurately, and mention, in particular, its remarkable property of changing colour. These colours, in fact, change with equal frequency and rapidity; but it is by no means true, as stated by Suidas and Philo, that the animal can assimilate its hue to that of any object it approaches. Neither is it true, as asserted by Ovid* and Theophrastus, that it lives upon air and dew, for it eats flies. In the Latin translation of Avicenna it is called Alchabe.

"It was believed, in the time of Pliny, that no animal was so timid as the Chameleon; and, in fact, not having any means of defence supplied by nature, and being unable to secure its safety by flight, it must frequently experience internal tears and agitations more or less considerable. Its epidermis is transparent; its skin is yellow, and its blood of a lively violet blue. From this it results, that when any passion or impression causes a greater quantity of blood to flow into the heart to the surface of the skin, and to the extremities, the mixture of blue, violet, and yellow produces, more or less, a number of different shades. Accordingly, in its natural state, when it is free and experiences no disquietude, its colour is a fine green, with the exception of some parts, which present a shade of reddish brown or grayish white. When in anger its colour passes to a deep blue green, to a yellow green, and to a gray or less blackish; and if maggot, its colour becomes yellowish gray, or that sort of yellow which we see in dead leaves. Such is the colour of almost all the Chameleons which are brought into cold countries, and all of which speedily die. In general, the colours of the Chameleons are much the more lively and variable as the weather is warmer, and as the sun shines with greater brilliancy. All these colours grow weaker during the night.*

CHARLES LEONON (χαρακτέλων), the herb Chamelemon. The Greek name means "ground apple," from the peculiar apple-like perfume of the flowers. The term comprehends the Anthemis nobilis, and probably some other species of ChamaemUlum. In modern Cyprus this plant is called πατομίτος. It is frequently met with in the islands, and flowers early in the spring, according to Sibthorp.†

CHARIS'TIA. (χαρίστια), the herb Ground pine. (Vid. Aegita.)

* CHARLES LEON (χαρακτέλον). "Doussieux states correctly," observes Adams, * that Scrapiio and Avicenna confounded both the Chamelea and Chameleon together, under the name of Maizerion; and it must be admitted, that the learned commentators on the Arabian medical authors have not been able to clear this difficulty. According to Sibthorp, the Daphne odorata is the species which has the best claim to be identified with the ancient Chamelea. Mattheiwiis, and the writer of the article on Botany in the Encyclopedic Methodique, refer it to the Cneorum tricoccon. 11.

* CHARADRIUS (χαράδρος), the name of a sea bird described by Aristotele and Eilian. It is supposed to have been the Dalvyle, or Ring Plover. The full name of this bird was made by Plato, Aristophanes, and Plutarch. The scholiast on Plato says that the sight of it was believed to cure the jaundice. 7

* CHELIDONIUM (χελίδωνιον), a plant of which two kinds are mentioned, the Chelidonium majus, or Greater Celandine, and the C. minor, or Romanu- lus flavia, the Figwort, popularly called the Lesser Celandine, under whose name, says Adams, it has been celebrated by the muse of Wordsworth.†

* CHELI'SON (χελίδων), I. the Swallow. (Vid. Hirundo.) II. The Flying-fish, or Trigla volitans. L.*

* CHELONE (χελόνη), the Tortoise. (Vid. Testudo.)

CHARISTIA. The charista from χαρίστια, to grant a favour or present, to be solicitous; to which none but relatives and members of the family were invited, in order that any quarrel or disagreement which had arisen among them might be made up, and a reconciliation effected. The day of celebration was the viii. Cal. Mart., or the 19th of February, and is thus spoken of by Ovid:

CHEIMEL.  

CHEIRONOMIA (χείρονομια), a mimetic movement of the hands, which formed a part of the art of dancing among the Greeks and Romans. The word is also used in a wider sense, both for the art of dancing in general, and for any signs made with the hands in order to convey any desire. In gymnastics it was applied to a certain kind of pugilistic combat.

CHEIROROTINEIN CHEIROROTONIA (χειροροτινειν, χειροροτινα). In the Athenian assemblies two modes of voting were practised, the one by pebbles (τυχ. Παραπτυχια), the other by a show of hands (χειρονομεν). The latter was employed in the election of those magistrates who were chosen in the public lot (τυχεστοις), for these were the names which were hence called χειρονομενοι, in voting upon laws, and in some kinds of trials on matters which concerned the people, as upon προσβολαι and διασωλεια. We frequently find, however, the word ψηφισειθα used where the votes were really given by show of hands.

The manner of voting by a show of hands is said by Strabo to have been as follows: "The herald said, "Whoever thinks that Midias is guilty, let him lift up his hand." Then those who thought so stretched forth their hands. Then the herald said again, "Whoever thinks that Midias is not guilty, let him lift up his hand;" and those who were of this opinion stretched forth their hands. The number of hands was counted each time by the herald; and the president, upon the herald's report, declared on which side the majority voted (διανογενος τας χειρονομες).

It is important to understand clearly the compounds of this word. A vote condemning an accused person is καταχειρονομια; one acquitting him, υποχειρονομια; επιχειρονομεν is to confirm by a majority of votes; επιχειρονομια τω νομιο was a revision of the laws, which took place at the beginning of every year; επιχειρονομια τω λαοι was a vote taken in the first assembly of each Prytanion on the conduct of the magistrates; in these cases, those who voted for the confirmation of the law, or for the continuance in office of the magistrate, were said επιχειρονομεν, those on the other side, υποχειρονομεν. Διαχειρονομια is a vote for one of two alternatives, and was made in opposition to a proposition. The compounds of ψηφισειθηναι have similar meanings.

CHEIROROTONETOI. (Vid. Arcahseial.)

CHELIDONIA (χελίδονια), a custom observed in the island of Rhodos in the month of Boëdromion, the time when the swallows returned. During that season, boys, called χελιδωνιστα, went from house to house collecting little gifts, ostensibly for the returning swallows (χελιδωνιστα), and singing a song which is still extant. It is said to have been introduced by Cleobulus of Lindus at some period when the town was in great distress. The chelidonia, which have sometimes been called a festival, seem to have been nothing but a peculiar mode of begging, which, on the occasion of the return of the swallow, was carried on by boys in the manner stated above. Many analogies may still be observed in various countries at the various seasons of the year.

CHEME (χημη), a Greek liquid measure, the capa-

city of which (as is the case with most of the smaller measures) is differently stated by different authorities. There was a small cheme, which contained two eicchelaria or two drachmes, and was the seventy-second part of the cotele, =0068 of a pint English. The large cheme was to the small in the proportion of 3 to 2. Other sizes of the cheme are mentioned, but they differ so much that we cannot tell with certainty what they really were.

*CHENALÒPEX (χενάλοπεξ), a species of aquatic fowl. (Vid. Anas.)

CHENISCUS (χενισκος) was a name sometimes given to the οηκροτολον of a ship, because it was made in the form of the head and neck of a goose (κητειος) or other aquatic bird. This ornament was probably adopted as suitable to a vessel which was intended to pursue its course, like such an animal, over the surface of the water. We are informed that a ship was sometimes named "The Swan" (κητειος), having a swan carved upon the prow.

Though commonly fixed to the prow, the cheniscus sometimes adorned the stern of a ship. It was often gilt. A cheniscus of bronze is preserved in the Royal Library at Paris. Not unfrequently we find the cheniscus represented in the paintings found at Herculanum, and on antique gems. Examples are seen in the annexed woodcut, and in that at p. 62.

*CHENOPODIUM (χενοποδος) and CHENO PUS (χενοπος), a species of plant, commonly called the Goosefoot. Dioscorides and Pliny mention two kinds, the wild goosefoot (αιδετεατε and Καλλονεια), the former of which is the same with the ατριπλας or ατριπλας, the latter the Atriplice kertensis, or Orach (the χρυσαλοχανον of Theophrastus). The modern Greeks use the Chenopodium as a good remedy for wounds, and call it πανακα. The Chenopodium botryis has a balmy perfume, and yields an essential oil, which renders it tonic and antiseptic. Shibarop found it between Smyrna and Bousra, on the banks of the streams. The seed resembles a cluster of grapes, and has a vinous smell, whence the name botryis (βοτρυς, a "cluster"). The most important property possessed by the Goosefoot tribe is the production of soda, which some of them yield in immense quantities.

CHERNICHERNIBON CHERNIBON (χερνιβον, χερνιβον), from χερνιβον and νιτα, signifies the water used for ablution and purification, or the vessel which was contained in it. A marble vase containing lustral water was placed at the door of both Greek and Roman temples, which was applied to several purposes. The priest stood at the door with a branch of laurel or olive

CHIROGRAPHUM.

The form of which is frequently met with upon medals and bas-reliefs.

Another Greek rite was performed by the priest taking a burning torch from the altar, which he dipped into the lustral water (χειροποσφίαν) and then sprinkled it over the by-standers. Water was also sprinkled over the head of the victim as an initiation to the sacrifice; hence the expression χειρωποσφίαν, "to perform a sacrifice," and χειροποσφία, the lustral rite.

The vessel which the Romans used was of the kind called labrum, resembling those still employed for a somewhat similar purpose in the Roman churches, one of which is shown in the Lacoicum at Pompeii. (Vir. Cat., i., p. 156.)

But the word, as its etymology indicates, is of a more domestic origin: and, in reference to the custom, common to both nations, of washing their hands before meals, is used with the same double meaning above mentioned. In the first passage cited from Homer, χειροσφία is put for the water itself; in the second, χειροποσφία is used for the vessel which receives it. In both instances the water is poured out of a jug (πόσσον), and the two together correspond with our terms basin and ewer.

*CHERNITES (χερνίτις), a species of Stone, which Pliny, after Theophrastus, says was very like ivory, and in a coffin of which the body of Darius lay. The French commentators on Pliny make it and the porus, mentioned by the same writers as resembling in colour and hardness Parian marble, to have been varieties of calcareous tufa (carbonate de chaux sedimentaire, on crista grossiers et compacte, chloriteuse, renfermant des silex blonds et des glyptistes).

CHEROSTAII. (Vid. Herbs.)

*CHERSYDRUS (χερσυδρός), a species of Snake, lying, as the name imports, both on land and in the water (χερσυδρός, "land, ὕδωρ, "water"). A good description of its form and nature is given by Virgil.

According to the poet, it was marked with large spots on the belly. Under the head of Chersydrus, at the present day, Cuvier ranks the Oulardimpfe (Acrochordus Fasciatus, Sh.), a very venomous serpent which inhabits the bottoms of the rivers of Java.

*CHIE TERRA (Xia yi), a species of Earth obtained from the island of Chios. The ancients used it internally as an astringent; but its chief use was as a cosmetic, it being highly valued for cleansing the skin and removing wrinkles. Galen says it was an earth of a white colour, but not a bright, clear white, and that it was brought in flat pieces; and Dioscorides says it was whitish, but tending to ash colour. "Like the Selinasian and Phigidic earths," observes Almus, "it is an argil more or less pressed down, and considered as the earth of the small animal (χειραμαξιον, from χείρ and ἄλοξ, a sort of easy-chair or "go-cart," used for invalids and children. It differed from the sella graetatoria, which answers to our sedan-chair, in which the person was carried by his slaves or servants, since it went upon wheels, though moved by men instead of animals. Doubts are entertained whether this small vessel was drawn or propelled, as it is observed that men draw from the neck and shoulders, and push with their hands, which latter method is clearly the one intended by Aurelian, "vehiculum manibus actum."

CHIRIDOTIA (χειρίδοτια, from χείρ, manus, manica), a tunic with sleeves. The tunic of the Egyptians, Greeks, and Romans was originally without sleeves (vid. Exomis), or they only came a little way down the arm. On the other hand, the Asiatic and Celtic nations wore long sleeves sewed to their tunics, together with transversals as the clothing of their lower extremities, so that these parts of attire are often mentioned together. (Woodcuts, pages 15, 171.) The Greeks also allowed tunics with sleeves to females (woodcut, p. 188), although it was considered by the Latins indecorous when they were worn by men. Cicero mentions it as a great reproach to Catiline and his associates that they wore long shirts with sleeves (manicatis et talarius tunice). Catigula, nevertheless, wore sleeves, together with other feminine ornaments (manicae).

Sleeves were worn on the stage by tragic actors (χειρίδοτια?); and they were used by shepherds and labourers, who had no upper garment, as a protection against the severities of the weather (pellibus manicatis). (Vid. Woodcuts, p. 112, 132.)

All the woodcuts already referred to show the sleeves of the tunic coming down to the wrist. We now insert from an Etruscan vase the figure of a woman, whose sleeves reach only to the elbow, and who wears the copisium to assist her in blowing the tibias pater.* (Vid. Manica, Tunica.)

CHIROGRAPHUM (χειρογραφον) meant first, as its derivation implies, a handwriting or autograph. In this its simple sense, χείρ in Greek and manus in Latin are often substituted for it.

Like similar words in all languages, it acquired several technical senses. From its first meaning it was easily derived that of a signature to a will or other instrument, especially a note of hand given by a debtor to his creditor. In this latter case it did not constitute the legal obligation (for the debt might be proved in some other way); it was only a proof of the obligation.

According to Asconius,10 chirographum, in the sense of a note of hand, was distinguished from syngrapha; the former was always given for money actually lent, the latter might be a mere sham agreement (something like a bill of accommodation,

---

though with a different object) to pay a debt which had never been actually incurred. The *chirurgium* was kept by the creditor, and had only the debtor's signature; the *syngrapha*, on the contrary, was signed and kept by both parties.

In the Latin of the middle ages, *chirurgium* was used to signify tribute collected under the signature of a person in authority, similar to the briefs and benedictions of former times in our own country. It was also used, till very lately, in the English law for an indenture. Duplicates of deeds were written on one piece of parchment, with the word *chirurgium* between them, which was cut in two in a straight or wavy line, and the parts given to the care of the persons concerned. By the Canonists, and the Romans, *chirurgia* was employed in the same way, and hence gave its name to these kinds of writing.

**CHIRURGIA.** The practice of surgery was for a long time conserved by the ancients to be merely a part of a physician's duty; but, as it is now almost universally allowed to be a separate branch of the profession, it will perhaps be more convenient, till we come to speak of the subdivision of it in modern times, not to allow it to be necessary to touch upon the disputed questions, which is the more ancient, or which is the more honourable branch of the profession; nor even to try to give such a definition of the word *chirurgia* as would be likely to satisfy both the physicians and surgeons of the present day; it will be sufficient in this place to call the art of healing by the instruments representing upon the body, as was used by the ancients; and then, adhering closely to that meaning, to give an account of this division of the science and art of medicine, as practised among the Greeks and Romans. Referring to the article *Medicina* for farther particulars.

The word *chirurgia* is derived from χείρα, the hand, ἐπίγονος, the son, and ὄγος, mouth, thus *chirurgus* means to make that part of medicine which man was curat, "which cures diseases by means of the hand;" in *Diogenes Laertius* it is said to cures διὸ τῶν ρέουσαν καὶ καλεῖν, "of cutting and burning;" nor (as far as the writer is aware) is it ever used by ancient authors in any other sense. Omitting the fabulous and mythological personages, Apollo, Ἀσκληπιός, Chiron, and others, who are mentioned by medical writers as having invented the art of surgery before the establishment of the republics of Greece, and even until the time of the Peloponnesian war, are to be found in the Iliad and Odyssey. There it appears that surgery was almost entirely confined to the treatment of wounds; and the imaginary power of enchantment was joined with the art in healing the sick. The Greeks received surgery, together with the other branches of medicine, from the Egyptians; and, from some observations made by the men of science who accompanied the French expedition to Egypt in 1798, it appears that there are documents fully proving that in very remote times this extraordinary people had made a degree of progress of which the present medicine has not the smallest notion upon the ceilings and walls of the temples at Ten-tyra, Karnak, Luxur, &c., basso-relieves are seen, representing limbs that have been cut off with instruments very analogous to those which are employed at the present day for amputations: The same instruments are again observed in the mummy of the pharaohs, and vestiges of other surgical operations may be traced, which afford convincing proofs of the skill of the ancient Egyptians in this branch of medical science.

The earliest remaining surgical writings are those of Hippocrates, who was born, according to Clinton, *De Hoc leans Medicus*; 2. *Petri Aemiliii, De Fracturis*; 3. *Petri et Aemiliii, De Articulis*; 4. *M. Vogli, De Visceris;* 5. *Petri Aemiliii, De Vesiculis*; 6. *Petri Aemiliii, De Fracturis*; 7. *Petri Alaminii, De Hemorrhoidibus*; 8. *Petri et al., in De Therap. De arteriis*; and, 10. *Petri Aemiliii, De Corporum Reseccione.* Of these it should be remarked, that only the eighth is considered undoubtedly genuine; though the first, second, third, and fourth, if not written by Hippocrates himself, appear to belong to very early age. 2 Hippocrates far surpassed all his predecessors (and, indeed, most of his successors) in the boldness and success of his operations; and, though the scanty knowledge of anatomy possessed in those times prevented his attaining any very great perfection, still we should rather admire his genius, which enabled him to do so much, than blame him because, with his deficient information, he attempted more than his skill permitted. He is said to have reduced fractures and luxations displayed in his works, *De Fracturis, De Articulis,* excites the admiration of Haller, and he was probably the inventor of the amputation, an old surgical machine for dislocations of the shoulder, which, though now fallen into disuse, for a long time enjoyed a great reputation. He is also said to have reduced fractures and luxations displayed in his works, *De Fracturis, De Articulis,* excites the admiration of Haller, and he was probably the inventor of the amputation, an old surgical machine for dislocations of the shoulder, which, though now fallen into disuse, for a long time enjoyed a great reputation. He is also said to have reduced fractures and luxations displayed in his works, *De Fracturis, De Articulis,* excites the admiration of Haller, and he was probably the inventor of the amputation, an old surgical machine for dislocations of the shoulder, which, though now fallen into disuse, for a long time enjoyed a great reputation. He is also said to have reduced fractures and luxations displayed in his works, *De Fracturis, De Articulis,* excites the admiration of Haller, and he was probably the inventor of the amputation, an old surgical machine for dislocations of the shoulder, which, though now fallen into disuse, for a long time enjoyed a great reputation.
operation of bronchotomy, though he himself never performed it; and Ammonius of Alexandria, sur-
named Αμώνιος, who is supposed to have lived rather later, is celebrated in the annals of surgery
for having been the first to propose and to perform
the operation of Lithotritia, or breaking a calculus in
the stone by means of a heavy instrument, for its
extraction. Celsus has minutely described his
mode of operating, which very much resembles
that lately introduced by Civiale and Heurteloup,
and which proves that, however much credit they
may deserve for bringing it again out of oblivion
into public notice, the praise of having originally
thought of it belongs to the ancients. A book,
such as this, is to be read with care, so as to judge
how the stone as to resist and prevent its recoiling into
the bladder, even when struck; then an iron instru-
ment is used, of moderate thickness, flattened to-
towards the end, thin, but blunt; which, being placed
against the stone, and struck on the farther end,
cleaves it; great care being taken, at the same
time, that neither the bladder itself be injured by the
instruments, nor the fragments of the stone fall back
into it.
Celsus describes this mode of getting rid of a calculus, though he does not
describe the operation so minutely as Celsus. The
next surgical writer after Hippocrates, whose works
are still extant, is Celsus, who lived at the begin-
ing of the first century A.D., and who has given
up the last four books of his work, De Medicina,
as well as the seventh and eighth, entirely to sur-
gey. He says, "Medicine is a secondary treatise
of the art of healing." Celsus, that, since the time of Hippocrates, surgery
had made very great progress, and had, indeed,
reached a high degree of perfection. He is the first
author who gives directions for the operation of
lithotomy, and the method described by him (called the apparatus minor, or Celsus's method) continued to
be practised till the commencement of the sixteenth
century. It was performed at Paris, Bordeaux, and
other places in France, upon patients of all ages,
even as late as a hundred and fifty years ago; and
a modern author recommends it always to be pre-
ferred on boys under fourteen. He describes the
operation of Invidiaulato, which was so commonly
performed by the ancients upon singers, &c., and is
often alluded to in classical authors. He also de-
scribes the operation alluded to by St. Paul* as
"tēτματος της ἐκκλήσις: μὴ ἔνσωποιτά." Compare
Paulus Ἱησινή, who transcribes from Antyllus a
second method of performing the operation. See
also Parkhurst's Lexicon, and the references there
given.

The following description, given by Celsus, of the
necessary qualifications of a surgeon, deserves to be quoted: "A surgeon," says he, "ought to
be young, or, at any rate, not very old; his hand
should be firm and steady, and never shake; he
should be able to use his left hand with as much
dexterity as his right; his eyesight should be acute
and clear; his mind intrepid, and so far subject to
pity as to make him desirous of the recovery of his
patient, but not so far as to suffer himself to be
moved by his cries; he should neither hurry the
operation more than the case requires, nor cut less
than is necessary, but do everything just as if the
other's screams made no impression upon him."*

The reading of Targa's edition, miniscors, has been
followed in this passage of Celsus, though minisc
cribros will also admit of a very good sense; for
as Richerand has observed, Celsus did not mean
by it that a surgeon ought to be quite insensible to
pity; but that, during the performance of an opera-
tion, this emotion ought not so to overcome him, as all
emotion would then be weakness.

Perhaps the only surgical remark worth quoting
from Aretaeus, who lived in the first century A.D.
is, that he condemns the operation of bronchotomy,
and thinks "that the wound would endanger an in-
flammation, cough, and strangling; and that, if the
danger of being choked could be avoided by this
method, yet the parts would not heal, as being car-
tilized;"—two points he is not very right in.

Omitting Scribonius Largus, Moschion, and Er-
ratus, the next author of importance is Celsus Au-
rolanus, who is supposed to have lived about the
beginning of the second century A.D., and in whose
works there is a good deal relating to surgery,
though nothing that can be called original. He
re-
jected as absurd the operation of bronchotomy. He
mentions a case of that operation performed by
paracentesis, and also a person who recovered af-
ter being shut through the lungs by an arrow.

Galen, the most voluminous, and, at the same
time, the most valuable medical writer of antiquity,
is less celebrated as a surgeon than as an anato-
mist and physician. He appears to have practised
surgery at Pergamus; but, upon his removal to
Rome (A.D. 165), he refuted himself entirely to
medicine, and wrote in the following, as he says himself, the treatise on
the bones of the place. This would seem also to have
been the custom among the Arabsians, as Avenza-
s says that a physician ought to be able to perform
operations, but should not do so except in cases of
necessity. Galen's writings prove, however, that
he did not entirely abandon surgery. His Commen-
taries on the Treatise of Hippocrates, De Officis
Medici, and his treatise De Socia patefens, De
Pascics, show that he was well versed even in the
minor details of the art. He appears also to have
been a skilful operator, though no great surgical
inventions are attributed to him. His other surgical
writings consist of Commentaries on Hippocrates.

De Practicis and De Articulis; besides a good
deal of the matter of his larger works, De Methodis
medicinae, De Socia patefens, De Socia patefens,

Antyllus, who lived some time between Galen and
Oribasius, is the earliest writer whose directions for
performing bronchotomy are still extant, though
the operation (as was stated above) was proposed
by Asclepiades about three hundred years before

Only a few fragments of the writings of Antyllus
remain, and among them the following passage
is preserved by Paulus Zyginita. Our best sur-
geons have described this operation, Antyllus par-
	
	— We think this practice useless,
	and not to be attempted where all the arteries
	and the lungs are affected (by the word ὀργωνία here,

t means the bronchia, or ramifications of the trachea.

Vid. Arteria); but when the inflammation
lies chiefly about the throat, the chin, and the
tissues which cover the top of the windpipe, the cal
very, when the artery is unaffected, this opera-
tion is impracticable, to prevent the danger of suffocation.

When we proceed to perform it, we must cut through
some part of the windpipe, below the larynx, about
the third or fourth ring; for to cut quite through would
be dangerous. This place is the most commo-
dious, because it is not covered with any flesh, and
because it has no vessels near it. T.13refere, bendi
CHIRURGIA.

The natural text is a page from a book discussing surgical instruments and their usage. It mentions the work of various medieval and Renaissance physicians and surgeons, including Oribasius, Paulus Aegineta, and Savenko, and describes the types of instruments used in surgery, such as scalpels, curettes, and forceps. The text also refers to the publication of surgical instruments in engravings and their role in the medical field.

1. [Abu'l-Hasan, Hist. Dynast., p. 181, ed. Podesta.] 2. De chirurg., Boccaccio, Abhuii. 3. De bes jongs, dell. 4. Chirurg., Vol. 1, nos. 26, 57. 5. The plate containing these instruments is wanting in the copy of the Reuss Medicale in the library of the College of Surgeons, so that the accompanying figures are copied from the German work, in which some of them appear to be drawn very badly. Their authenticity was at first doubted by Kühn, who thought they were the same that had been described by Bayard in his Catal. Antich. Monument. Herculan. ed. Nap., 1754, fol., n. 256-294; when, however, his dissertation was afterward republished, he acknowledged himself to be completely satisfied on this point, and has, given in the tract referred to, a learned and in genrous description of the instruments and their supposed uses, from which the following account is chiefly abridged. It will, however, be seen at once that the form of most of them is so simple, and their uses so obvious, that very little explanation is necessary.
CHIAMYS.

of which it is susceptible rendered it peculiarly proper. The Chian marble would appear to have been of the Obsidian kind, and it is, in fact, sometimes called "Lapis Obsidianus Antonorum." The name Obsidianus would seem to have been a corruption from Opisthion (ὁπίσθιον, ἀπὸ τῆς ὀπισθᾶς).†

†CHIUM VINUM (Xioς οἶνος), Chian Wine, a Greek wine made in the island of Chios (the modern Scio). It is described by some writers as a thick, luscious wine; and that which grew on the craggily heights of Arianthus, extending three hundred statute miles along the coast, is extolled by Strabo as the best of all Greek wines. From Athenaeus we learn that the produce of the Arianthus vineyards was usually divided into three distinct species: a dry wine, a sweetish wine, and a third sort of a peculiar quality, thence termed 

CHALAINA (χαλάινα). (Vid. LANA.)

CHALMYS (χάλμυς, dim. χαλμύδιον), a saw. This term, being Greek, denoted an article of the amictus, or outer raiment, which was, in general characteristic of the Greeks, and of the Orient's races, with which they were connected. The name, both in its form and in its application it approached very much to the lacerna and paludemum of the Romans, and was itself, to some extent, adopted by the Romans under the emperors. It was the most part woolen; and it differed from the blanket (θάλαντος), the usual amictus of the male sex, in these respects, that it was much smaller; also face, thin, more variegated in colour, and more susceptible of ornament. It moreover differed in being oblong instead of square, its length being generally about twice its breadth. To the regular oblong, a, b, c, d (see woodcut), gores were added, either in the form of a right-angled triangle, $\tau$, $\rho$, producing the modification $a$, $g$, $d$, which is exemplified in the annexed figure of Mercury, or of an obtuse-angled triangle, $a$, $e$, $b$, producing the modification $a$, $b$, $h$, $g$, $d$, which is exemplified in the figure of a youth from the Panathenaic frieze in the British Museum. These gores were called στερέγες, wings, and the scarf with these additions was distinguished by the epithet of Thessalian or Macedonian. Hence the ancient geographers compared the form of the inhabited earth (τῆς οἰκουμένης) to that of a chlamys.

The scarf does not appear to have been much worn by children, although one was given, with its brooch, to Tiberius Cesar in his infancy. It was generally assumed on reaching adolescence, and was worn by the ephelai from about seventeen to twenty.
CHLAMYDS.

Clamydes, a kilt or short skirt, is the usual name given by antiquaries to a garment which was worn in ancient times as a riding or traveling dress, or as a part of the armor of soldiers. It was usually made of a strong material, such as linen or wool, and was fastened at the waist with a belt or girdle. The height of the wearer was determined by the length of the clamydes, which was usually about two or three yards long. The clamydes was worn over a tunic or other undergarment, and was often ornamented with belts, embroidery, or other decorative elements.

CHLOREUS.

Chlamydemus, u. p. sed. apee, Coloc. ut librus, totumque apparat aum.

The Chloreus was a type of garment worn by soldiers and was usually made of a heavy material, such as leather or chain mail. It was fastened at the shoulders and was often ornamented with metallic studs or other decorative elements. The Chloreus was worn over a tunic or other undergarment and was often used as a form of armor. It was particularly associated with the Roman military, and was used by soldiers during the time of the Republic and the Empire.

The Chloreus was considered to be a symbol of military strength and courage, and was often worn as a badge of honor by soldiers who had distinguished themselves in battle. It was also considered to be a symbol of the Roman Empire, and was often depicted on coins and other forms of Roman art. The Chloreus was eventually replaced by other types of armor, such as the Scale Mail and the Breastplate, but it remained an important symbol of Roman military tradition and identity. The Chloreus is still worn today as a symbol of the Roman Empire and of the ancient Roman military.
CHORAGUS.

CHORUS.

CII JOKIS (χορικός) the name of a Bird described by Aristotle. Gesner, upon the authority of Turner, holds it to be the Greenfinch, or Fringilla chloris, Temminck. 1

CHOES (Χόης). (Vid. Dionysia.)

CHENIX (χοινός), a Greek measure of capacity, the size of which is differently given; it was probably the measure of several states. Pollux, 2 Suidas, Cleopatra, and the fragments of Galen, make it equal to three coticyle (=1-48966 pints English); another fragment of Galen 4 and other authorities 5 make it equal to four coticyle (=1-9821 pints English); Rhemnus Fannius 8 and another fragment of Galen 7 make it eight coticyle (=8-9641 pints English).

CHIRONIX (χιρωνίκαι), a species of Fish, probably the Rattle, or Perna cornua, L. It is a small fish, of good flavour; rather olive, and spotted with brown. 9

CHORAGUS, a person who had to bear the expenses of the chorus, one of the regularly-recurring state burdons (ήγκυκλία λειτουργία) at Athens. Originally (as is shown in the article CHORUS) the chorus consisted of all the inhabitants in the state. With the decline of the arts of music and dancing, the distinction of spectators and performers arose; it became more a matter of art to sing and dance in the chorus; paid performers were employed; and at last the duties of this branch of worship devolved upon one person, selected by the state to be their representative, who defrayed all the expenses which were incurred on the different occasions. This person was the chorus (χοραγός) or chorus-leader (χοραγός). This was the duty of the managers of a tribe (τεμπελαία φύλος) to which a chorus had come round, to provide a person to perform the duties of it; and the person appointed by them to meet the expenses of the chorus in all plays, tragic or comic (τραγῳδίαις, κωμῳδίαις), and satirical; and of the lyric choruses of men and boys, the pyrrhichias, clycian dancers, and flute-players (μεγάλαι ἄρτας, οὔκερδα χοροί, πατιδελφοὶ χοροί, πιθήκης χορός, αὐληται ἄρτας), &c. He had first to collect his chorus, and then to procure a teacher (χοροδιδακτός), whom he paid for instructing the choir. The choragi drew lots for the first choice of teachers; for as their credit depended upon the success of their choruses in the dramatic or lyric contests, it was essential to provide such assistance as they secured. 10 When the chorus was composed of boys, the chorus was occasionally allowed to press children for it, in case their parents were refractory. 11 The chorus generally maintained, during the period of their instruction, at the expense of the chorus, and he had also to provide such meat and drink as would contribute to strengthen the voice of the singers (Οἱ ἐκ τῆς χορωτικής ἱερευναῖς ἱγκελαὶ καὶ θριάκια καὶ σκελλίδας καὶ μελημένωσι παραστάσεις, εὐάχρων ἐπὶ πολυν χρόον, φωνακωρισμάνους καὶ τορναίοις). 12 The expenses of the different choruses are given by Lysias 13 as follows: Choruses of men, 20 minae; with the triphd, 50 mina; pyrrhich choruses, 8 mina; pyrrhich choruses of boys, 7 mina; tragic chorus, 30 mina; comic, 16 mina; clycian chorus, 300 mina. According to Demosthenes, the chorus was given to the person placing the greatest price more than the prize a chorus would have received, as a prize a trio, which he had the expense of consecrating, and sometimes he had also to build the monument on which it was placed. There was a whole street at Athens formed by the line of these tripod-temples, and called "The Street of the Tripods. The laws of Solon prescribed at as the proper age for the chorus, but this law was not in force. 14

On the subject of the chorus, see Böckh's "Isth. Econ. of Athens," i, p. 207, &c.

CHOREGIA (χορεγία). (Vid. CHORAGUS.)

ΧΥΡΙΟΤΙΟΙ ΑΙΚΗ (χωρίων δήμων), a suit to recover land, was a diadecasia within the jurisdiction of the thesmothetae. The parties to a suit of this kind were necessarily either Athenian citizens, or such favoured aliens as had had some interest in their regulation (καὶ ἵκαις ἑγγευτεῖς) bestowed upon them by special grant of the people. Of the speeches of Isaeus and Lysias in causes of this kind, the names are all that survive.

CHORUS (χορός), a band of singers and dancers, engaged in the public worship of some divinity. This is, however, only the secondary meaning of the Greek word. The word χορός, which is connected with the verb χόροω, χορεύω, "to dance," is generally used in a market-place, where the chorus met. Thus Homer calls the dancing-place the χοροί; λένεναι δὲ χορῷ πέταλον χοροῦ θεόν ποίαν; 15 οὐθεὶς 'της Ποιημένης οἰκίας καὶ χοροῖς εἰσένθη. 16 Εὐνοία δὲ ἔστω Νυμφών καὶ χορὸς ἅγιον θυσίαν; 17 Now the dancing-place for the public chorus in a Greek town would naturally be the largest space which they had, it.e., the marketplace, which was called by the more general name of τὸ μέσον τῆς πόλεως or "the space" (χώρα). Thus the χοροί at Sparta was called the χοροί, 18 and εὐνοία is a common epithet of a large city; thus Sparta and Athens are both called εὐνοίας which either meant "having a wide chorus or market," or, generally, "extensive" (εὐνοίας), as when it is applied as an epithet to Αἰείδει in Findik. 19 Thus also, the king says to the chorus, in the Iliad 10, 463-476, Εὔνοιαν ποιῆσαι εὐνοίαν. 20 This explanation of the word χορός is important, from its connexion with the idea of a primitive chorus. In the oldest times the chorus consisted of the whole population of the city, who met in the public place to offer up thanksgivings to their country's god, by singing hymns and performing corresponding dances. The hymn, however, was not sung by the chorus, but some poet or musician sang or played the hymn, and the men or women who formed the chorus, only allowed their movements to be guided by the poem or the tune. The poet, therefore, was said to "lead off the dance" (ἐξάρχων μολιστης), and this was said not merely of the poet: 21 but also of the principal dancers; 22 and even the leader of a game at ball is said ἔρχεσθαι μολίσθης. From this it will be seen that the words μελόρχησαν and μελότρικα were used in writing in the old chorus, to imply the regular, graceful movements of the dancers; 23 and the εὐνοίαποιηθείης were not singers of hymns, but dancers in the chorus of Demeter and Dionysia. This old chorus, or the chorus proper, was always accompanied by the ἐσθαρα, the lyre, or the phorminx; and these were different kinds of stringed instruments; when the accomplishment was the flute, it was not the chorus, but an ἔλευθρον or a κύκλος, a much more riotous chorus, which was used, not more by the nature of a procession than of a dance, and in which there was often no σχαράξα, but one joined into the song or cry of joy at his pleasure. 24

246
CHORUS

chorus was the hymnean or bridal procession, though this seems to have been a mixture of the chorus and the *comus*, for the harp and a chorus of damseis are mentioned in the descriptions of it by Homer and Hesiod. The former merely says, 1 "A loud *kumene* arose; young men skinned in the dance *moun* [or *moin*]; and among them flutes and harps resounded" (κυμένη, φΰρριγες τε). Hesiod’s description is much more elaborate. 2 The inhabitants of the fortified city which he describes were enjoying themselves with festivities and dances (αὐγάλω τε χοροφι τε): the men, (i.e., the *kumones*) were conducting the bride to her husband on the well-wheel’d mule-car; and a loud *kumene* arose; from afar was seen the gleam of burning torches carried in the band of slaves; the damseis (i.e., the *choroi*) were moving forward in all joy and festivity (ψυλας χειλαλας); and they were both attended by sporting choruses. The one chorus, consisting of men (the *kumones*), were singing with youthful voices to the shrill sound of the pipe (ι. e., ζύριγες); the other, consisting of the damseis (the *choroi*), were leading up the cheerful choruses (i.e., were dancing) to the notes of the harp (φυρρια). This account of the immediate preparation for the exaction of the comus proper, i.e., a riotous procession after a banquet. 4 On another side, some young men were moving on in the *comus* (κυκλωματος) to the sound of the flute; some were amusing themselves with singing and dancing; others moved on in groups, and sung the chief songs, and festivity (θαλια τε χορον τε ψυλασσε). The chorus received its first full development in the Doric states, and in them it was particularly connected with their military organization. The Doric chorus was composed of the same persons who formed their battle-array: the best dancers and the principal *chori* were of same name, called (μουλλες); the back rows in each were called "un-equipped" (ψυλετς); and the figures of the dance were called by the same name as the evolutions of the army. 5 The Doric deity was Apollo; consequently, we find the Doric chorus, which was properly accompanied by the lyre, and of which the lyric poet was himself a part, was immediately connected with the worship of Apollo, the inventor of the lyre. The three principal Doric choruses were the *pyrrhos*, the *gymnopedie*, and the *hysperchymaic*. These were afterward transferred to the worship of Bacchus, and appear as the three varieties of the dramatic chorus, which celebrated the worship of that divinity: the *emmelita* or tragic dance, the *gymnopedie*, the comic dance to the *hysperchymaic*, and the *satyric* to the *pyrrhos*. All these dances were much cultivated and improved by Thaletas, who introduced a combination of the song and dance for the whole chorus, of which Lucian speaks when he says, by way of contrast to the pantomimic dancers of more modern times, that "the chorus was of circular form, and that, older times the same performers both sang and danced." This extension of the song of the *exarchos* to the whole chorus seems to have given rise almost naturally to the division of the chorus into strophes and antistrophes, which Steichorus farther improved by the addition of an epode, thus breaking through the monopoly of composition of strophe and antistrophe by the insertion of a stanza of a different measure. This improvement is referred to in the proverbi, Οδος ε τρα τη Στραφων χικλωσας. The choruses of Steichorus consisted of combinations of rows of eight daedalean, and, from his partiality to the number 8, we have another proverb, the *πατρα βοτα* of the grammarians.

The most important event in the history of Greek choral poetry was the adaptation of the dithyramb, or old Bacchic song, to the system of Doric chorus; for it was to this that we owe the Attic drama. The dithyramb was originally of the nature of a *kumene*; it was sung by a band of revellers to the accompaniment; and in the time of Archilochus had its leader, for that poet says that "he knows how to lead off the dithyramb, the beautiful song of Dionysus, when his mind is inflamed with wine." 6

Ος Διονυσος κατακόττα πατρα του θεος, ουδεν διδαξαμεν ουν της συγγραμμενης φρονος.

Arius, the celebrated player on the cithara, was the first to practise a regular chorus in the dithyramb, and to adapt it to the cithara. This he did at Chius, in a Doric city; and therefore we may suppose some alteration of the chorus, which agrees with the system of Doric choral poetry. The dithyramb was danc’d round a blazing altar by a chorus of 50 men or boys; hence it was called a circular *chorus* (κυκλωμα χοροδ). The dithyramb poet was called κυκλωμαθεις, and Arius is said to have been the son of *Cyclops*. 7

Aristotle tells us that tragedy arose from the recitations of the leaders of the dithyramb (πατρα του ταραχηματον των διδακτων); and from what Suidas has said that Arion was the inventor of the tragic style (τραγοκο τροπος ευρηστιν). This latter statement seems to refer to the fact that Arion introduced satyrs into the dithyramb: for the satyrs were also called *trages*, so that *tragesia* is the song of the satyrs. And hence the satyr chorus in the *tragedia*; the tragic or satyric drama arose from the leaders of the dithyrambic choruses, as arranged by Arion. If we examine the use made of this dithyrambic chorus by *Aeschylus*, we shall easily see what is the meaning of Aristotle’s statement. In the tragic trilogies of *Aeschylus* we find a chorus and two actors. As tragedy arose from the leaders of the dithyramb, the first beginning would be when the poet Thespis, as leader of his dithyrambic chorus, either made long Epic or narrative speeches, or conversed with his chorus. The improvement of *Aeschylus*, then, was to introduce a dialogue between two of the *exarchoi*, who would thus become actors. It should be observed that at the time of *Aeschylus* the dithyrambic chorus of 50 would be succeeded by a tragic chorus of 48, and two actors. And this we find to be the case. If we examine the extant trilogy—the *Orestes*—we find that the *Agamemnon* has a chorus of 12 old men; the *Choephorae*, a chorus of either 12 or 15 women; and the *Eumenides*, a chorus of 15 furies; if this would leave 9 or 6 for the chorus of tragedy, that the drama appended to the tragedy, according to what we take the smaller or greater number for the chorus in the *Choephorae*. It seems more probable that we should take the larger number; for it is probable that, in most cases, *Aeschylus* would divide the main chorus of 48 into four subchoruses of 12, to which the the dramatic alternations, and comedies were acted in single plays, it is not unlikely that they would assign to a comic poet double the chorus used by the tragedian in his single plays, or half his whole chorus. If so, the satyric drama might, as less important, be contented with half the ordinary tragic chorus, when the exigencies of the piece rendered it desirable to increase the chorus from 12 to 15 in one or more of the individual plays.

Besides, if the chorus of Stesichorus, which was antistrophic, and therefore quadrangular, consisted of 48, as it is improbable, and this chorus of 48 was divided into rows of eight (as in πίνακα δεσταων), six would be an element of the regular chorus, and, therefore, a diphthong to represent the six least important parts.

See on this subject Müller,1 from whose view the account here given differs in some particulars.

The tragic chorus, though quadrangular, still mustered around the thymele, or altar of Bacchus in the theatre, thereby showing some last traces of its dihyrrhabic origin; and though the lyric was its general accompaniment, it did not by any means replace the chorus as the highest accord of the dihyrrhab. When the chorus consisted of 15, it entered the orchestra either in ranks three abreast, or in files five abreast; in the former case it was said to be divided κατά γωνία, in the latter κατά στοιχεία. No doubt a similar distinction was made in the case of the chorus of 12.

The expense of the chorus, as it is stated in the article Chorous, was defrayed by the choragos, who was assigned to the poet by the archon. In the case of a dramatic chorus, the poet, if he intended to represent at the Lenaia, applied to the king archon; if at the great Dionysia, to the chief archon, who "gave him a chorus" if his play was thought to deserve it; hence χορον δοομαι signifies "to praise or approve a poet."19 The successful poet was said to "receive the chorus." The commendation was not at first thought worthy of a public chorus, but the chorus in that species of drama was at first performed by amateurs (θηλωνωτα), as was also the case with the dihyrrhab in later times.

CHOUS or CHOEUS (χοις, or χοιες), a Greek measure of liquids, which is stated by all the authorities to be equal to the Roman congus, and to contain about 0.833 gallon, or 1.235 liters.20 Suidas alone makes a distinction between the χοις and the χοιες, making the former equal to two sextarii, and the latter equal to six. Now when we remember that the χοις was commonly used as a drinking vessel at Athenian entertainments—that, on the day of the χοις (συν διονυσία), a prize was given to the person who first drank off his χοις; and that the χοιες was said to represent its least import—viz. χοις of wine at a draught,21 it is incredible that, in these cases, the large χοις mentioned above could be meant. It seems, therefore, probable that there was also a smaller measure of the same name, containing, as Suidas states, two sextarii,—=9823 pints English. At first it was most likely the common name for a drinking vessel. According to Crates,22 the χοις had originally a similar form to the Panathenian amphora, and was also called πέλεκας.

ΧΡΥΣΩΤΙΣ ΔΙΚΗ (χρυσάοτις δίκαιος), a simple action for debt, was, like most of the other cases arising upon an alleged breach of contract, referred to the jurisdiction of the thesmotheta as the sum in question amounted to more than ten drachmas. If otherwise, it fell under the cognizance of those in querent, where the sum originally thirty in number, and styled, accordingly, οἱ τριάκοντα; but afterward, in consequence of the odium attached to this name, which had also served to designate the oligarchic tyrants, received an accession of ten colleagues and a corresponding change of title.14 If the cause could be classed among the ἑμμονία δίκαια, as, for instance, when the debt arose upon a mere cattle transaction, the thesmothetē would still have jurisdiction in it, though one of the parties to the suit were an alien; otherwise it seems that when such a person was the defendant, it was brought into the court of the polemarch.15 If the cause were treated as a δίκη ἕμμονια, as above mentioned, the plaintiff would forfeit a sixth part of the sum contested upon failing to obtain one fifth of the votes of the decaites;26 but we are not informed whether this regulation was applicable, under similar circumstances, in all cases for prosecutions for debt. The speech of Demosthenes against Timotheus was made in a cause of this kind.

*CHRYSIS or CHREMPS (χρυσissent, χρυσίης, οι χρυμένων), a species of Fish, the same with the Sparus Chronis, L., and called in French Moron. Random says it is a small fish, and little esteemed. According to Cuvier, it is a chestnut-brown fish, taken by thousands in the Mediterranean. The fishermen on the coast of Genoa call it Cassidrago, on account of its chestnut colour. The Chrysias Nitica, on the other hand, is of an agreeable flavour, and is considered the best fish in the Nile.27

*CHRYSALIS or CHRYSSLALLIS, a name applied to the first apparent change of the coccus, or maggot, of any species of insect. In a special sense, it denotes the "tomb of the caterpillar and the cradle of the butterfly." The name has reference to the golden colour (χρυσής, "gold") which the coccus assumes as an essential attribute.

*CHRYSANTHEMUM (χρυσάνθεμον), the Corn Marygold, or Chrysanthemum coronarium. The Greek name has reference to its golden-hued flowers. Another appellation is θεοβιθολόγων, though this in strictness belongs to the Ox-eyed Daisy, or Chrysanthemum leucanthemum. Fee thinks that Virgil means the C. coronarium by the Chrysanthes of the Aen. vi. 259, which was called a "chrysargyrous," and that he calls this plant Τυργυρίδον, and in the Archipelago, * Μαρτενία. Sibthorp found it among the villages, and by the margins of roads.

*CHRYSERECTRUM (χρυσοέλεκτρον), a variety of Amber. Fourcroy calls it "transparent amber of a golden yellow colour."

*CHRYSERECTUS (χρυσόελεκτρος), a name applied to the Indian Ceylon Electrum (Yellow Sapphire, or Oriental Topaz), having a foil of brass laid under them, and hence approaching in their colour to amber, or electrum.

CHRYSENDETA, costly dishes used by the Romans at their entertainments. They are mentioned several times by Martial,28 and, from the epithet flavus which he applies to them, as well as from the analogy of the same name, they appear to have been of silver, with golden ornaments. Cicero29 mentions vessels of this kind. He calls their golden ornaments in general sigilla, but again distinguishes them as crusta and emblema;30 the former were probably embossed figures or chasings fixed on to the silver, and the latter inlaid or wrought into it.31 The embossed works appear to be referred to by Paulinus (sympha argentea crusitis iligatura),32 and the inlaid ornaments by Seneca (argyrum, in quod solidi auric calatoria descenderit).33

CHRYSTITES (χρυσίτης), another name for the Basanite lapis, or Touchstone, from its use in testing gold.34
CHRYSOPHYS

*CHRYSTIIS (χρυσοιτις), supposed to have been the yellow oxide of lead, used as a pigment by the ancients, and forming one of the three varieties of litharge (λιθάργυρος) described by Dioscorides\(^2\) and Pliny.\(^3\) Its name, was, in all likelihood, derived from its yellow and shining colour, resembling that of gold.\(^4\)

*CHRYSSOCOLLA (χρυσοκόλλα). — "The ancients," remarks Adams, "applied this term to two distinct substances: First, to a mineral called Chryssocola by Aiken, Malachite by Kidd, and Copper Green by Jameson and Cleaveland. It consists almost entirely of oxide of copper and silica — Second, to a fictitious substance prepared from copper oxide and copper silicate, now prepared and not to be Pliny.\(^5\) It is often confounded with the Borax, or Soda Boras of the moderns, from its being used like Boras in soldering gold. There is much misapprehension in the descriptions of the ancient Chryssocolla given by Matthiolus, Agricola, Milligan, and most of the modern commentators, which it is proper to caution the student to some extent, and to state that the Ancients, as he thinks, were preferred the Indian, which may have been the yellow sulphar, or Oriental topaz. The best were set open. Underneath others a foil of brass was laid. These were called chryseleuthri, whose colour approached to that of amber (electrum). Those of Pontus might be distinguished by their lights of ancient coins, and besides, the Bohemian topaz; or yellow fluor spar, the false topaz, whose specific gravities are to that of the Oriental topaz as three and four respectively to five. The Chrysolite obtained in Spain, from the same locality with rock-cystal, we may suppose was yellow quartz. Such as had a white vein running through them, were stiled Chrysolite; because the protection of agate; yellow quartz with a vein of chalcedony; and the capsia we may translate smoke-topaz. Some resembled a glass of yellow saffron colour; and those made of glass could not be distinguished by the sight, but might be detected by the touch (of the tongue, no doubt), as being warmer.\(^6\)

*CHRYSSOPRASTUS (χρυσοπραστός), according to Billerbeck, the sweet Orange, and not a species of Quince, as it is sometimes styled. It is a variety of the Citrus Aurantium.\(^7\)

*CHRYSPIS (χρυσός), a species of Precious Stone, having, according to Pliny, the appearance of gold. Dalecampa takes it for Hyacinth.\(^8\)

*CHRYSPHYRIS (χρυσόφυρης), a large species of Flowers, called Gift Hortus or Gift Poll, the Sparsus auratus.\(^9\) The Greek name, which means "golden eyebrow," was given to it on account of its crescent-shaped band of a golden hue extending from one eye to the other. Du Hamel says its flesh is delicate, but rather dry; according to Xenocrates, it is firm and nutritious. With the exception of the bright band between the eyes, we can find nothing in the Chrysophyris of the ancients," observes Griffith, "that is absolutely characteristic of the modern fish of the same name; though, at the same time, we find nothing which can give rise to exclusion. According to Aristotle, the chrysophryi have two pairs of fins; its pyloric appendages are few in number; it remains close to the coast, and in salt marshes or pools; it spawns in summer; and deposits its eggs at the mouths of rivers; the great heats oblige it to conceal itself; the cold also causes it to suffer; it is carnivorous, and the fishermen take it by striking it with a trident while asleep. Zelian tells us that it is the most timid of fishes, and that a stick will stop it, and that the Ancients say, it is crossed by a reef during a reflex, so terrified the chrysophyris which were brought back by the flood, that on the succeeding reflex they did not dare to move, and suffered themselves to be taken by the hand. That the Aurata of the Latins was the same fish as the Chrysophyris of the Greeks, is evident from a passage in Pliny, which was first taken from Aristotle, and where the first word is put as a transposition of the second. Colomella tells us that the Aurata was of the number of those fishes which the Romans brought up in their vinaria; and even the inventor of vinaria, Sergius Orata, appears to have derived from this fish the surname which he bore, and which he left to his branch of the family. It was, above all, the Aurata of the Lucerne lake that the Romans esteemed; and Sergius, who obtained nearly entire possession of that lake, in all probability introduced the species there."\(^10\)

*CHYSPRAS'US LAPIIS (χρυσοπράσων), the Chrysoprase, a precious stone, resembling in colour the juice of the leaf (τριαντα), but with somewhat earthy turbulence of a character which we can describe by the name given it. The name is now called Chrysopraso, however, by Jameson and Aiken, could hardly, as Adams thinks, have been known to the ancients, since it is found only in Lower Silicea. It is composed almost entirely of silica, with a small admixture of nickel, to which it owes its colour. The Chrysoprase has a smooth, always polished, yellowish-brown, was most probably a variety of the Prasus.\(^11\)

CHTHONIA (Χθόνια), a festival celebrated at Hermione in honour of Demeter, surnamed Chthonia: The following is the description of it given by Pausanias: \(^12\) "The inhabitants of Hermione celebrate the Chthonia every year, in summer, in this manner: Four oxen with a large yoke, and guarded by priests and magistrates of the year, are followed by men and women. Even for children it is customary to pay homage to the goddess by joining the procession. They wear white garments, and on their heads they have chaplets of flowers, which they call κοσμοστάδια, which, however, from their size and colour, as such as from the letters inscribed on them, are not properly chaplets, but to me seem to be lycanthia. Behind the procession there follow persons leading by strings an untamed heifer, just taken from the herd, and drag it into the temple, where four old women perform the sacrifice, one of them cutting the animal’s throat with a scythe. The doors of the temple, which during this ceremony has been opened, are closed, and persons especially appointed for the purpose lead in a second heifer, then a third and a fourth, all of which are sacrificed by the matrons in the manner described. A curious circumstance in this solemnity is, that all the heifers must fall on the side on which the first fell." The splendid and rich offerings of this festival are also mentioned.
CICADA

by Aelian, who, however, makes no mention of the matrons of whom Pausanias speaks, but says that the sacrifice of the heifers was performed by the priestess of Demeter.

The Laecanemonians adopted the worship of Demeter Chthonia from the Hermioneans, some of whose kinsmen had settled in Messene; 2 hence we may infer that they celebrated either the same festival as that of the Hermioneans, or one similar to it.

CHYTRA (χθυρά), an earthen vessel for common use, especially for cooking. It was commonly left unpainted, and hence all unprofitable labour was described by the proverb χθύραν ποικίλλειν. 3

*CICADA (τήττετ), a species of Insect, frequently mentioned by the classical writers. According to Dodwell, 4 it formed like a large fly, with long transparent wings, a dark brown back, and a yellow belly. It is originally a caterpillar, then a chrysalis, and is converted into a fly late in the spring. Its song is much louder and shriller than that of the grasshopper, as Dodwell terms the latter. This writer says that nothing is so piercing as their note; nothing, at the same time, so tiresome and inharmonious; and yet the ancient writers, and especially Plutarch, 5 says the sweetness of their song, and Plutarch 6 says they were sacred to the Muses. According to Aelian, 7 only the male Cicada sings, and that in the hottest weather. This is confirmed by the discoveries of modern naturalists. The Cicada is extremely common in the south of Italy. It is found also in the United States, being called in some parts the Harvest-fly, and in others, very curiously, the Locust. 8 The Cicada has a suckler instead of a mouth, by which it lives entirely on liquids, such as dew and the juices of plants. The song of the Cicada, as it has been called, is made by the males for the purpose of calling to their females in the season of reproduction, and it is made by the action of certain muscles upon two membranes, turned in the form of a kettle-drum, lodged in the cavity of the belly. Several species of Cicada are described by Aristotle, 9 Suidas, and Aelian, 10 but more especially two, namely, οἱ μεγάλοι τῆτινες, οἱ φάντατες, called also ἄγαντα, 11 and οἱ μικροί, called also τεττυγία. The former would appear to be the Cicada plebeia, the latter the Cicada ornata. This insect is called Cicale in Italian, and Cigale in French. "The Tettix," observes Kirby, "seems to have been the favourite of ancient poets, and Cicero, Pliny, and Theophrastus. Supposed to be perfectly harmless, and to live only on the dew, they were addressed by the most esteeming epithets, and were regarded as all but divine. So attached, indeed, were the Athenians to these insects, that they were accustomed to fasten golden images of them in their hair, implying, at the same time, a boast, that they therefore possessed the Cicada plebeia, and that "εἰς τὸν ζῆσιν, or children of the earth." 12 Anderson, in one of his ode's, 13 says of the Tettix, that old age wastes it not away. In this he has reference to the fable of Thitonus, the favourite of Aura, who, having wished for immortality, without having asked, at the same time, for perpetual youth, became so decrepit, that Aura, out of compassion, could not bear to see the attraction of the ancient beauty, hid aside its skin every summer, and thus renewed its youth. The truth is, the Tettix or Cicada, like all the other species of the Gryllus, though existing but for a single season since it dies at the close of the summer, casts its skin in the same manner as the caterpillar, and deposits in the fields a membrane so accurately true to its entire shape, that it is often mistaken, at first sight, for the Tettix itself. The belief that this insect was indigenous, or, in other words, sprung from the very earth, appears to have arisen from the circumstance of large numbers being seen immediately after showers, though not visible previously.

*CICEK. (Vid. Erebinthus.)

*CICHORIUM. (Vid. Intybus.)

*CICI (κίκι), a plant, the same as the Pisonia Christi or Ricinus communis. "This plant," observes Woodville, speaking of the Pains Christi, "appears to be the κίκι, or κάκιον of De'corridore, and I may add that the seeds are powerfully potheratic: it is also mentioned by Aelian, Paulus Aegineta, and Pliny." 14

*CICONIA, the Stork. (Vid. Pelargus.)

*CICUTA, Hamlock. (Vid. Conium.)

*CITARIS. (Vid. Tiera.)

*CILI CIUM (χίλιοιος), a Haircloth. The material of which the Greeks and Romans almost universally made this kind of cloth, was the hair of goats. The Asiatics made it of camel's-hair. Goats were bred for this purpose in the greatest abundance, and with the longest hair, in Cilicia; and from this country the Latin name of such cloth was derived. Lycia, Phrygia, Spain, and Libya also produced the same article. The cloth obtained by spining and weaving goat's-hair was nearly black, and was used for the coarse habits which sailors and fishermens wore, as it was the least subject to be destroyed by being wet; also for horse-cloths, tents, sacs, and bags to hold workmen's tools (fabrilia nasus), and for the purpose of covering military engines, and the walls and towers of besieged cities, so as to render the force of the ram (vid. Aries), and to preserve the woodwork from being set on fire. 15

Among the Orientals, sackcloth, which was with them always haircloth, was worn to express mortification and grief. After the decline of the Roman power, it passed from its other uses to be so employed in Europe also. Monks and anchorites almost universally adopted the ciliation as fit to be worn for the sake of humiliation, and they supposed their end to be more completely attained if this part of their raiment was never washed. Hence Jerome 16 describes the life of the monk Hadrian, says of his hair shirt, "Sacrum, quod semper fuerat indutus, manumquam lavatum, et superfusionem sedicis, munditiae in cilio quarto." 17

*CIXEMEX (κικώρη), the Bug, under which many names are included by the ancients, which modern naturalists have distinguished from one another. Aristotle makes the κικώρη to be engendered from the wings of the female of the insect mentioned as a remedy against the bite of serpents and especially of asps: "fugitivis cum antihygrostatis inascessus causas leeches to loose their hold; and if any of them afterwards go astray, I have heard that the cicomexes, taken internally, served as a cure. They were good for weak eyes when mixed with salt and the milk of a female, and for complaints of the ear.

230
CINCI LEX

when mingled with honey and oil of roses. Numerous other medical virtues were ascribed to them, which, like the preceding, were purely fabulous, although Guettard, in modern times, recommends them in hysterical cases.

*CIMOLIA TERRA (Κιμολία τῆς), Cimolian Earth, so called from the island Cimulus, one of the Cyclades, whence it was principally obtained, although found also in other of the adjacent islands, particularly Siphnos. It was used by the ancients in cleaning their clothes, pretty much in the same way as fuller's earth is now employed. The ancients named it a good substitute for fuller's earth; it got its specific name, Cinara, from the god in St. Anthony's fire; and Dioscorides highly commends it, mixed with vinegar, in swellings, inflammations, and many other external affections.

The ancient writers mention two kinds of Cimolian Earth, a white and a purplish. Galen says that the white kind was dry, and the purple fattish, and that the purple was preferred to the better of the two. Dioscorides says that the purple kind was cold to the touch, a particular very observable in staphytae.

"Many authors," remarks Sir John Hill, "have ranked Cinolian Earth among the clays, and Tournefort makes it a chalk; but it appears to me to have been neither of these, but properly and distinctly a marl. Many have imagined our fuller's earth to have been derived from it; it is certainly a marl, but erroneously; the substance which comes nearest it of all the now known fossils, is the staphyte of the soap rock of Cornwall." 1

*CINARA (κινάρα), the Ash-Tree. The Cinara scolyceum, our common ash-artochrome, is described in distinct terms in Columella, and he is the only ancient and modern author who makes this plant a subject of any particular regard.

CINCI LEX, or MUNERAI'LIS. This lex was a plebiscitum passed in the time of the tribune M. Cincius Alimentus (B.C. 204), and entitled De Donis et Munribus. 2 One provision of this law, which forbade a person to take anything for his pains in pleading a cause, is recorded by Tacitus. 3 "Ne gratia ob causam orandum pecuniam donumse accipiat." In the time of Augustus, the lex Cinca was confirmed by a senatus consultum, and a penalty of four times the sum received was imposed on the advocate. This fact of confirmation will explain a passage in Lucan. 4 The law was so far modified in the time of Claudius, that an advocate was allowed to receive his fees in scriba; if he took any sum beyond that, he was liable to be prosecuted. 5 "Repetundarum tenebatur." (Vid. Repetund. o.m.) It appears that this permission was so far restricted in Trajan's time, that the fee could not be paid till the work was done. 6

So far the Cinca law presents no difficulty; but it appears that the provisions of the law were not limited to the case already stated. They applied, also, to gifts in general; or, at least, there were enactments which did limit the amount of what a person could give, and also required gifts to be accompanied with certain formalities; and it does not seem possible to refer these enactments to any other than the Cinca law. The numerous complications and difficulties which perplex this subject are perhaps not so great, as is generally supposed, and are removed by the following conjecture of Savigny: 7 "Gifts which exceeded a certain amount were only valid when made by mancipatio, in jure cesso, or by tradition: small gifts, consequently, were left to the person's free choice, as before; but large gifts (except in the case of near relatives) were to be accompanied with certain formalities." The object of the law, according to Savigny, was to prevent foolish and hasty gifts to a large amount, and, consequently, was intended, among other things, to prevent fraud. This was effected by declaring that certain forms were necessary to make the gift valid, such as mancipatio and in jure cesso, both of which required some time and ceremony, and so allowed the giver opportunity to reflect on what he was doing. These forms, also, could not be observed, except in the presence of other persons, which was an essential requirement in a case of this kind. The advantage of this law was not secured by the law in the case of the most valuable of things, nec mancipi, namely, money, for the transferring of which bare tradition was sufficient; but, on the other hand, a gift of a large sum of ready money is one that people of all gifts are least likely to make. The lex, however, was a complete protection against simple fraud, was to be of place where, with or without an actual completion of the promise at the time.

Savigny concludes, and principally from a passage in Pliny's letters, 8 that the Cinca law originally contained no exception in favour of relatives, but that all gifts above a certain amount required the formalities already mentioned. The Emperor Augustus, however, removed the prohibition of gifts to children, and also of collateral kinsmen. It appears that this exception was subsequently abolished, 9 but was restored by Constantine (A.D. 319) so far as it was in favour of parents and children; and so it continued as long as the provisions of the Cinca law were in force.

And we find, in which law this forbade a gift to be made, except in conformity to its provisions, see Savigny, Zeitschrift, &c., iv., p. 36.

The matter of the lex Cinca is also discussed in an elaborate essay by Hesse, 10 which, together with the essay of Savigny, will furnish the reader with all the necessary references and materials for investigating this obscure subject. Anything farther on the matter would be out of place here.

In every system of jurisprudence, some provisions seem necessary on the subject of gifts. In our own system gifts are valid as against the giver; and though the general rule be that an agreement to give cannot be enforced, this rule is subject to exceptions in the case of persons standing in a certain relation to the giver, such as parents, and others designated by the law.

It might be conjectured that one object of the Cinca law was to prevent debtors from cheating their creditors by gifts of their property, or by pretended gifts; but perhaps it would be difficult to establish this point satisfactorily in the present state of our knowledge on this subject.

*CINNABARIS. (κιναρίας, or -ιας), Cinnabar.

Martyn writes thus concerning it: "Minium is the native Cinnabar, or ore out of which the quicksilver is derived to the value of which is called superfine, and is designated red lead; but we learn from Pliny that the Minium of the Romans was the Millos or Cinnabari of the Greeks." Woodville says of it, "the Cinnabaris and Sanguis Draconis seem to have signified the same thing with the Greeks." Adams thinks that the ancients had three kinds of Cinnabar: 1st, the red, or sanguis draconis being the resin of the tree called Dracaena Draco; 2d, the Nat-

cive Cinnabar, or Sulphur of Quicksilver; and 3d,

CIRCUS

who died at the age of eighteen years, one month, and twenty-four days. Below the tablet, a festoon of fruits and flowers is suspended from two rams' heads at the corners; and at the lower corners are two sphinxes, with a head of Pan in the area between them.

On several cippi we find the letters S. T. L., that is, Sit tibi terra levis, whence Persius, in the passage already referred to, says, "Non leior cippos numer imperit ossa."

It was also usual to place at one corner of the burying-ground a cippus, on which the extent of the burying-ground was marked, towards the road (in front), and backward to the fields (in agrum).

CIRCUS (dabus), a Compass. The compass used by staturists, architects, masters, and carpenters, is often represented on the tombs of such artists, together with the other instruments of their profession or trade. The annexed woodcut is copied from a tomb found at Rome. It exhibits two kinds of compasses, viz., the common kind used for drawing circles and measuring distances, and one with curved legs, probably intended to measure the thickness of columns, cylindrical pieces of wood, or similar objects. The common kind is described by the author in the epigrams of Ovid, who compares its form to that of the letter A. The mythologists supposed this instrument to have been invented by Perdix, who was the nephew of Deadasus, and, through envy, thrown by him over the precipice of the Athenian acropolis.

Compasses of various forms were discovered in a statuary house at Pompeii.

CIRCULITIO. (Vid. Castra, p. 222.)

CIRCULITIO-VIO. (Vid. Alludv.)

CIRCUITORES. (Vid. Castra, p. 222.)

CIRCUS. When Tarquinius Priscus had taken the town of Apolis from the Latins, as related in the early Roman legends, he commemorated his success by an exhibition of races and pugilistic contests in the Murcian valley, between the Palatine and Aventine Hills; around which a number of temporary platforms were erected by the patricians and equites, called spectacula, fori, or forulii, from their resemblance to the deck of a ship; each one raising a stage for himself, upon which he stood to view the games. This course, with its surrounding scaffolding, was termed circus; either because the spectators stood round to see the shows, or because the procession and races went round in a circus. Previously, however, to the death of Tarquin, a permanent building was constructed for the purpose, with regular tiers of seats, in the form of a theatre. To this the name of Circus Maximus was subsequently given, as a distinction from the Flaminian and other similar buildings, which it surpassed in extent and splendour; and hence, 'the Campus Martius, it is often spoken of as the Circus, without any distinguishing epithet.

Of the Circus Maximus scarcely vestige now

CIPPUS.

the Sil Atticum, or Factitius Cinnabar, which was very different from ours, being a preparation of a shining arenaceous substance.

CINNAMOMUM (κινηματομ), the Cinnamon-tree, and also Cinnamon itself. It is supposed by many that the κινηματομ of the ancients was the Laurus Cinnamomum. The only objector to this opinion, as Adams remarks, is, that the latter is a native of Ceylon (the ancient Taprobane), and that it is scarcely to be believed that they could have been so familiar with a production of that island, as it appears they were with their own Cinnamon. Yet, notwithstanding this, many of the authorities, as, for example, Sprengel and Dierbach, hold it to be the Laurus Cinnamomum. It is probable, however, that the Laurus Cassa was often confounded with it. Various kinds of cinnamon were described by ancient writers, such as the μελανος, which was the best, of a dark wine colour, sometimes of a dark gray, the dark smooth, the branches small and slender, and having many knots; pungent in taste, and, when warmed, somewhat saltish: the δρέσης, or mountain Cinnamon; the μέλανος, or "black:" the λευκός, or "white:" the υδαθής, or "yellowish," to which some add the xyro-cinnamomum and the pseudo-cinnamomum. The main difference between the κινηματομ and κασσα appears to have been, that the former far surpassed the latter in odor and taste; and, in fact, Galen remarks that the highest kind of cassia did not differ much from the lowest kind of cinnamon. The best cinnamon was obtained from the nest of a species of thrush (Turdus Zelomitus), which always built with it, and hence was called κινηματομος, or "cinnamon-collector" (Vid. Cassia.)

CIPPUS was a low column, sometimes round, but more frequently rectangular. Cippi were used for various purposes; the decrees of the senate were sometimes inscribed upon them; and, with distances engraved upon them, they also served as milestones. They were, however, more frequently employed as sepulchral monuments. Several of such cippi are in the Townley collection in the British Museum, one of which is given in the woodcut annexed. The inscription is to the memory of

remains beyond the palpable evidence of the site it occupied, and a few masses of rubble-work in a circular form, which may be seen under the walls of some houses in the Via de' Cerchi, and which retain traces of having supported the stone seats\(^1\) for the spectators. This loss is, fortunately, supplied by the remains of a small circus on the Via Appia, commonly called the Circus of Caracalla, the

---

\(2\). The most remarkable object upon the spina were two columns (F) supporting seven conical halls, which, from their resemblance to eggs, were called *ova.* These are seen in the woodcut representing the spina. Their use was to enable the spectators to count the number of rounds which had been run; for which purpose they are said to have been first introduced by Agrrippa, though Livy speaks of them long before. They are, therefore, seven in number, such being the number of the circuits made in each race; and, as each round was run, one of the *ova* was put up or taken down, according to Varro.* An egg was adopted for this purpose in honour of Castor and Pollux.\(^4\) At the other extremity of the spina were two similar columns (G), represented also in the woodcut over the second chariot, sustaining seven dolphins, termed *delphine,* or *delphinarum columnae,* which do not appear to have been intended to be removed, but only placed there as corresponding ornaments to the *ova*; and the figure of the dolphin was selected in honour of Neptune.\(^5\) In the Lyons mosaic, subsequently to be noticed, the *delphines* are represented as fountains spouting

---

\(3\). The ground-plan of which, together with most of the superstructure, remains in a state of considerable preservation. The ground-plan of the circus in question is represented in the annexed woodcut; and may be safely taken as a model of all others, since it agrees in every main feature, both of general outline and individual parts, with the description of the Circus Maximus given by Dinnysius.\(^6\)
CIRCUS.

In the mosaic of Lyons the man is represented apparently in the act of letting go the rope (οππόδωρον), in the manner described by Dionysius. The vii below in the 'Circus Maximus,' represents a set of four carceres, with their Hermae and cancelli open, as left after the chariots had started, in which the gates are made to open inward.

The preceding account and woodcuts will be sufficient to explain the meaning of the various words by which the carceres were designated in poetical language, namely, clustra, crypta, fences, ostia, fores carceris, repagula, limina equorum.

It will not fail to be observed that the line of the carceres is not at a right angle with the spina, but forms the segment of a circle, the centre of which is a point on the right hand of the arena; the reason for which is obviously that all the chariots might have, as nearly as possible, an equal distance to pass over between the carceres and mouth of the course. Moreover, the two sides of the circuses are not parallel to each other, nor the spina to either of them; but they are so planned that the course diminishes gradually from the mouth at J, until it reaches the corresponding line at the opposite side of the spina (K), where it is narrower by thirty-two feet. This might have proceeded from economy, or to be in a marble instance of accuracy, of the limited extent of the circus; for as all the four or six chariots would enter the mouth of the course nearly abreast, the greatest width would be required at that spot; but as they got down the course, and one or more took the lead, the same width would be no longer necessary.

The carceres were divided into two sets of six each, accurately described by Cassiodorus as hisue ostia, by an entrance in the centre (L), called Porta Pompa; because it was the one through which the Circensian procession entered, and which, it is inferred from a passage in Ausonius, was always open, forming a thoroughfare through the circus. Besides this entrance, there were four others, two at the termination of the seats between the caesa and the oppidum (M), another at (N), and the fourth at (O), under the vault of the frons decorations are still visible. This is supposed to be the Porta Triumviris, to which its situation seems adapted. One of the others was the Porta Libitinensis, so called because it was the one through which the dead bodies of those killed in the games were carried out.

Such were the general features of a circus, as regards the interior of the fabric. The area had also its divisions appropriated to particular purposes, with a nomenclature of its own attached to each. The space immediately before theoppidum was termed circus primus; that near the meta prima, circus interior or intimus; which latter spot, in the Circus Maximus, was also termed ad Marecum or ad

7. (Suet., Galba, 10.)

8. (Cic., De Am., 27. — Seneca, Epist., 108.)

The statues of the gods formed the most conspicuous feature in the show, and were paraded upon wooden platforms, called *formula* and *thenea.* The former were borne upon the shoulders, as the statues of saints are carried in modern processions; the latter drawn along upon wheels, and hence the *thenea* bore the statue of Jupiter is termed *Jovis plautrum* by Tertullian, and Δήβ σέβεσ by Dion Cassius. The former were for painted images, or those of light material, the latter for heavy statues. The whole procession is minutely described by Dionysius.

I. CIRCUS, the races. The carriage usually employed in the circus was drawn by two or four horses (*biga, quadriga*). (Vid. *Biga, Bigatus.*

The usual number of chariots which started for each race was four. The drivers (*aurige, agitatores*) were also divided into four companies, each distinguished by a different colour, to represent the four seasons of the year, and called a *factio:* thus *factio prasina,* the green, represented the spring, whence *Eventus viridis quo colligo panni:* *factio rusa,* red, the summer; *factio veneta,* azure, the autumn; and *factio alba* or *albata,* white, the winter. Originally there were but two factions, *albata* and *russata,* and, consequently, only two chariots started at each race. Domitian subsequently increased the whole number to six, by the addition of two new factions, *aurata* and *purpurea;* but this appears to have been an exception to the usual practice, and not in general use. The driver stood in his car within the reins, which went round his back. This enabled him to throw all his weight against the horses, by leaning backward; but it greatly enhanced his danger in case of an upset, and caused the death of Hippolytus. To avoid this peril, a sort of knife or bill-hook was carried at the waist for the purpose of cutting the reins in a case of emergency, as is seen in some of the ancient reliefs, and is more clearly illustrated in the annexed woodcut.

When all was ready, the doors of the carrius were flung open, and the chariots were formed abreast of the *alba linea* by men called *mo atores,* from their duty; the signal for the start was then given by the person who presided at the games sometimes by sound of trumpet, or more usually by letting fall a napkin, whence the Circusian games are called *spectacula napric.* The origin of this custom is founded on a story that Nero, while at dinner, hearing the shouts of the people, which began at the time when his napkin was the signal, the *alba linea* was then cast off, and the race commenced, the extent of which was seven times round the *spina,* keeping it always on the left. A course of seven circuits was termed *unus missus,* and twenty-five was the number of races run in each day, the last of which was called *missus ararius,* because in early times the expense of it was defrayed *by a collection of money* (*se*) made among the people. Upon one occasion Domitian reduced the number of circuits from seven to five, in order to exhibit 100 *missus* in one day. The victor descended from his car at the conclusion of the race, and ascended the *spina,* where he received his reward (*bravium,* from the Greek βραβευμον): this consisted of a considerable sum of money, and accounts for the great wealth of the *curule aediles,* to which Juvenal alludes, and the truth of which is testified by many sepulchral inscriptions.

A single horseman, answering to the *klysos* of the Greeks, attended each chariot, the object of which seems to have been twofold; to assist his companion by urging on the horses, when his hands were occupied in managing the reins, and, if necessary, to ride forward and clear the course, as seen in the cut from the British Museum representing the race, which duty Cassiodorus assigns to him, with the title of *opus desulatorum.* Other writers apply that term to those who practised feats of horsemanship in the circus, leaping from one to another when at their speed. In other respects, the horse-racing followed the same rules as the chariots.

The enthusiasm of the Romans for these races exceeded all bounds. Lists of the horses (*libella*), with their names and colours, and those of the drivers, were handed about, and heavy bets made upon each faction; and sometimes the contests between two parties broke out into open violence and bloody quarrels, until at last the disputes which originated in the circus had nearly lost the Emperor Justinian his crown.

II. LUDUS TROJANUS, a sort of sham-fight, said to have been invented by Xenas, performed by young men of rank on horseback, often exhibited by Augustus and succeeding emperors, which is described by Virgil.

III. PUGNA EQUESTRIS ET PEDESTRIS, a representation of a battle, upon which occasions a camp was formed in the circus.

IV. CERTAEMEN GYMNICUM. *Vid. Athletae,* and the references to the articles there given.

nothing games of the circus by the Goths (A.D. 410); but the chariot races continued at Constantinople until that city was besieged by the Venetians (A.D. 1204).

CIRCUMVALLATIO. (Vid. VALLUM.)—

CIRIS, a species of Lark, according to some, while others think it is a solitary bird with a purple crest, which continually haunts the rocks and shores of the sea. The poets fabled that Scylla, daughter of Nisus, was changed into this bird.4

CISUM (σισους). Sprengel, upon the whole, inclines to the opinion that this is the Slender Thistle, or Carduus tenuiflorus.3 (Vid. however, CARVUS.)

CIS (κις), an insect mentioned by Theophrastus3 as injurious to grain. Aldrovandus decides that it is the same with the Cursula, which infects wheat and barley, meaning, no doubt, the Cursula graminis L., or Weevil. The Termens was a species of Curtula which infects pulse: Scaliger remarks that it is also called μελας by Theophrastus.5

C'ISIUM, a gig, i.e., a light open carriage with two wheels, adapted to carry two persons rapidly from place to place. Its form is sculptured on the monumental column at Igel, near Trewes (see woodcut). It had a bed called sedia under the seat.6 The eisai were quickly drawn by mules (eisi volantiae). Cicero mentions the case of a messenger who travelled 56 miles in 10 hours in such vehicles, which were kept for hire at the stations along the great roads; a proof that the ancients considered six Roman miles per hour as an extraordinary speed.7 The conductors of these hired gigs were called eisiarit, and were subject to penalties for careless or dangerous driving.8

CISSA or CITTA (σισσα, κιτα), a species of Bird, which Hardouin and most of the earlier commentators considered the same as Corvus Pica L. Schneider, however, thinks the Jay, or Corvus glandarius, more applicable to the κιτα of Aristotle. The latter is certainly the bird described by Pliny under this name.10

CISSERIS (σισσορς), Pumice. Theophrastus11 was well aware that Pumice is formed by the action of fire. He speaks of various kinds, specifying particularly the pumices of Nysius and Melos, the former of which, however, are not genuine pumices, according to Hill, but Tophi. The island of Melos has always been kept abound with pumices, and those of the very finest kind. This appears to have been the case even in the time of Theophrastus, as appears by his description of their being light and sandy, or easily reduced into powder.12

CYSSOS or CITTOP (σισσος, κιττος), the common Ivy, or Hedera helix. The three species of it described by Dioscori12 and other ancient writers are now looked upon as mere varieties. Theophrastus,13 for example, says that the three principal sorts are the white, the black, and that which is called helix (κιττος). The blue, or helix, and the helix seems to be only the same plant before it has become capable of bearing fruit. "That the helix is the ivy in its barren state," observes Martyn, "is plain from the account which Theophrastus gives of it: he says the leaves are angular, and more neat than those of ivy, which has

them round and more simple. He adds, moreover, that it is barren. As for the white ivy, it seems to be unknown to us. Some, indeed, imagine it to be that variety of the leaves are variegated with white. But Theophrastus expressly mentions the whiteness of the fruit. Pliny2 has confounded the ivy with the cistas, being deceived by the similarity of the two names, that of ivy being κισσος or κιττος, and that of the cistas, κισσος." Fee3 thinks that the white ivy is the Azarina of the Middle Ages; in other words, the Antirrhinum aristatum. L. Sprengel, on the other hand, makes it the same with the helix; "saeot enim," he observes, "quamdro folia habeat nervos alios pallentia."—The botanists of the Middle Ages established as a species of Ivy, under the name of arbores, a variety which the moderns merely distinguish by the epithet "corymbosa." It is the same with that of which Virgil speaks in the third Eclogue, and in the second book of the Georgics,2 and which is also described with as much elegance as precision in a passage of the Cycles. The Hedera nigra of the seventh and eighth Eclogues is the same which the ancients termed "Dionysia," from its being sacred to Bacchus. It is the Hedera poetica of Banbius. The epithet nigra has reference to the dark hue of its varieties, and the deep green colour of the leaves.4 Sibthorpe, speaking of the Hedera helix, as found at the present day in Greece, remarks, "This tree hangs as a curtain in the picturesque scenery of the marble caves of Pendeli. The leaves are used for issues."7

CISTA (κιστα) was a small box or chest, in which anything might be placed; but the term was more particularly applied, especially among the Greeks, to the small boxes which were carried in procession in the festivals of Demeter and Dionysus. These boxes, which were always kept closed in the public processions, contained sacred things connected with the worship of these deities.6

In the representations of the Dionysian processions, which frequently formed the subjects of paintings on ancient vases, women carrying cistae are constantly introduced. From one of these paintings, given by Millin in his Pictures of Vases Antiques, the preceding woodcut is taken; and a similar figure from the same work is given on page 188.
CITRUS.

*CISTUS* or *CISTUS* (κιστός, κυττός). The common κυττός of the Greeks was either the *Cistus Orictus* or *C. laurifolius*. This is the *C. Linn. ssp. lanatus* (Gins., Vid. Ladin. %.). Sibthorp makes the κυττός ἡδέος of Dioscorides to be the *Cistus salebrosus*.

CISTOPHORUS (κιστοφόρος), a silver coin, which is supposed to belong to Rhodes, and which was in general circulation in Asia Minor at the time of the conquest of that country by the Romans. It took its name from the device upon it, which was either the sacred chalice, or which Bacchus, or, more probably, a flower called κυττός. Its value is extremely uncertain, as the only information we possess on the subject is in two passages of Festus, which are at variance with each other, and of which certainly one, and probably the other, is corrupt.

Mr. Hussey (p. 74, 75), from existing coins which he takes for cistophors, determines it to be about 3/4 of the later Attic drachma, or Roman denarius of the Republic, and worth in our money about 7½d.

CITHARA (Vid. Lyra.)

*CITRUS* (κιτρώς or κυτρία), the Citron-tree. For a long period, as Féé remarks, the Citron was without any special name among both the Greeks and Romans. Theophrastus merely calls it μῆλον Μηδών ή Περσικόν. Pliny* styles it the Median or Assyrian Apple-tree, *Malus Mediae sive Assyriaca.* At a later period, μῆλον Περσικά became a name appropriate to the Citron; and *citrus* and *citron-treæ* ceased to be used at all: the designation of the Citron-tree then became more precise, under the appellation of *Malus Medica* or *Citus* (μῆλον Μηδών ή κυτρία). Of all the species of "Citrus," which botanists term, per excellence, the Citron-tree of Media, was probably the first known in the West. Virgil* gives a beautiful description of it, saying: "felix est genus in fruitibus;" and Cicero* is meant to indicate the "happy" employment of the fruit as a means of cure in cases of poisoning, as well as on other occasions; while the *tristes succi* indicate, according to Féé, the bitter savour of the rind, for it is of the rind that the poet here points out, as he thinks, the medical use: he makes no allusion to the refreshing effects of the citron, but to the factitious ones, which he had from a friend of his who was governor of Egypt. This governor had condemned two malefactors to death by the bite of serpents. As they were being led to execution, a person, taking compassion on them, gave them a citron to eat. The consequence of this was, that though they were exposed to the bite of the most venomous serpents, they received no injury. The governor, being surprised at this extraordinary result, inquired of the soldier who guarded them what they had eaten or drunk that day, and being informed that they had only eaten a citron, he ordered that the next day one of them should eat citron and the other not. He who had not tasted the citron died presently after he was bitten; the other remained unhurt!—Palladius* seems to have been the first who cultivated the citron with any success in Italy. He has a whole chapter on the subject of this tree. It seems, by his account, that the scene was carefully arranged so that the fruit of Pliny and Palladius have said of it, that it was not esculent. It may have been melliorated by culture since his time.

CIVI'L' JUS. (Vid. Jus Civile.)

CIVILIS ACTIO. (Vid. Actio, p. 17.)

CIVIS. (Vid. Civitas.)

CIVITAS (GREEK) (Πολιτεία). In the third book of the Politics, Aristotle inquires into the nature of states with the question: "What constitutes a citizen?" (πολίτης). He defines a citizen to be one who is a partner in the legislative and judicial power (μέτοχος κράσων και ἀρχῶν). No definition will equally apply to all the different states of Greece, or to any single state at different times; the above seems to comprehend more or less properly all those whom the common use of expression has referred to the name of citizens.

A state in the heroic ages was the government of a prince; the citizens were his subjects, and derived all their privileges, civil as well as religious, from their nobles and princes. Nothing could have been farther from the notions of those times than the ideas respecting the natural equality of freemen which were considered self-evident axioms in the democracies of Athens and later republics. In the early governments there were no formal stipulations; the kings were amenable to the gods alone. The shadows of a council and assembly were already in existence, but their business was to obey. Community of language, of religion, and of legal rights, as far as they then existed, was the bond of union; and their privileges, such as they were, were really granted to naturalized strangers. Upon the whole, as Achamnidas has well observed, the notion of citizenship in the heroic age only existed so far as the condition of aliens or of domestic slaves was its negative.

The rise of a dominant class gradually overthrew the monarchies of ancient Greece. Of such a class, the chief characteristics were good birth and the hereditary transmission of privileges, the possession of land, and the performance of military service. To these characters the names γυναῖκα, ἀντίγωνα, ἐννοιά, ἀνταφορία, &c., severally correspond. Strictly speaking, these were the only citizens: yet the lower class were quite distinct from bondmen or slaves. It commonly happened that the nobility occupied the fortified towns, while the δῆμος lived in the country and followed agricultural pursuits: whenever the latter were gathered within the walls, and the property of one person became the property of many, the difference of ranks was soon lost, and wealth made the only standard. The quarrels of the nobility among themselves, and the admixture of population arising from immigrations, all tended to raise the lower orders from their political subjection. It must be remembered, too, that the possession of domestic slaves, if it placed them in no new relation to the government of things at any rate gave them leisure to attend to the higher duties of a citizen, and served to increase their political efficiency.

During the convulsions which followed the heroic ages, naturalization was readily granted to all who desired it; as the value of citizenship increased, it

1. (Theophrast., Vi., 2.—Diocres, i., 139.—Adams, Append., s. v., 2.—Liv., xxvii., 45, 46, 40 a.; xxviii., 1.—Cic. ad Att., ii., 6.—S., xi., 1.)—3. (Festas, s. v. Euclamum: Tac., and Tattuoromous, &c.—Bell. Jud., ii., 5.—Place de Virgile, p. civ.)

7. (P.ii. 1, c.)
8. (Civ., ii., 10.—Liv., iii., 39.)
It is evident, then, from the very object of the prariae, why the newly-admitted citizen was not enrolled in them. As the same reason did not apply to the children, these, if born of women who were citizens, were enrolled in the phratra of their maternal grandfather. 1 Still an additional safeguard was provided by the register of the deme. At the age of sixteen, the son of a citizen was required to devote two years to the exercises of the gymnasia, at the expiration of which term he was enrolled in his deme; and, after taking the oath of a citizen, was armed in the presence of the assembly. He was then of age, and might marry; but he was required to spend two more years as a *peteia* lec in frontier service before he was admitted to take part in the assembly of the people. The admission into the phratra and deme were alike attended with oaths and other solemn formalities: when a *doukasia* or general scrutiny of the claims of citizens took place, it was intrusted to both of them; indeed, the registry of the deme was the only chart of the citizen himself.

These privileges, however, were only enjoyed while the citizen was *πεπίτυμος*; in other words, did not incur any sort of *άτυμια*. *άτυμια* was of two sorts, either partial or total. In the former case, the rights of citizenship were forfeited for a time or in a particular case; as when public debtors, for instance, swore that as such they would not appear in courts until the debt was paid; 2 or when a plaintiff was subjected to *άτυμια*, and debarred from instituting certain public suits if he did not obtain a fifth part of the votes. 3 Total *άτυμια* was incurred for the worse sort of crimes, such as bribery, embezzlement, perjury, neglect of parents, &c. 4 It did not affect the property of such a citizen, but deprived him of his political rights: perhaps it did not contain any idea even of dishonour, except in so far as it was the punishment of an offence. The punishment did not necessarily extend to the family of the offender, although in particular cases it may have done so. 4

Recurring, then, to Aristotle's definition, we find the essential properties of Athenian citizenship to have consisted in the share possessed by every citizen in the legislature, in the election of magistrates, in the δοξολογία, and in the courts of justice.

The invest unity under which the citizen was contained was the *γένος* or *κλην*; its members were termed *γένους* or *φράτρα* or *δήμοι*. Thirty *γένη* formed a *δήμος*, which latter division, as was observed above, continued to subsist long after the four tribes, to which the twelve phratres anciently corresponded, had been done away by the constitution of Clisthenes. There is no reason to suppose that these divisions originated in the common descent of the persons who were included in them, as they certainly did not imply any such idea in later times. Rather they are to be considered as mere political unions, yet formed in imitation of the natural ties of the patriarchal system.

If we would picture to ourselves the true notion which the Greeks imbedded in the word *πλῆθος*, we must lay aside all modern ideas respecting the nature and object of a state. With us, practically, if not in theory, a state is considered as embracing more than the protection of life and property. The Greeks, on the other hand, had the most vivid conception of the state as a whole, every part of which was to co-operate to some great end, to which all other duties were considered as subordinate. Thus the aim of democracy was said to be liberty; wealth, of oligarchy; and education, of ar-

---

CIVITAS.

istoracy. In all governments the endeavour was to draw the social union as close as possible, and it seems to have been with this view that Aristotle laid down a principle which answered well enough to the accidental circumstances of the Grecian states, that a πόλις must be of a certain size (Υδ. VII. 10, 11). This unity of purpose was nowhere so fully carried out as in the government of Sparta; and, if Sparta is to be looked upon as the model of a Dorian state, we may add, in the other Dorian governments. Whether Spartan institutions in their essential parts were the creation of a single mastermind, or the result of circumstances modified only by Spartan genius, their design was evidently to unite the governing body among themselves against the superior numbers of the subject population. The division of lands, the syssitia, the education of their youth, all tended to this great object. The most important thing, next to union among themselves, was to divide the subject class, and, accordingly, we find the government conferring some of the rights of citizenship on the Helots. Properly regarded, the Helots cannot be said to have had any political rights; yet, being serfs of the soil, they were not absolutely under the control of their masters, and were never sold out of the country even by the state itself. Their condition was not one of hopeless servitude; a legal way was open to them, by which, through many intermediate stages, they might attain to liberty and citizenship. Thus they were the most nearly regarded as a deemed worthy of especial confidence; indeed, when they served among the heavy-armed, it seems to have been usual to give them their liberty. The δεσποινοναύται, by whom the Spartan fleet was almost entirely manned, were freedmen, who were allowed to dwell where they pleased, and probably had a portion of land allotted them by the state. After they had been in possession of their liberty for some time, they appear to have been called νεοδαιμονείς, the number of whom soon came near to that of the citizens. The μίθραοι or μίθρακες (as their name implies) were also emancipated Helots; their descendants, too, must have received the rights of citizenship, as Calliocrates, Lysander, and Glyippus were of Mothiac origin. We cannot suppose that the other cities, which were divided into several classes of citizens, were allowed into the full Spartan franchise; it is much more probable that at Sparta, as at Athens, intermarriage with citizens might at least entirely obliterate the badge of former servitude.

The perioeci are not to be considered as a subject class, but rather as a distinct people, separated from their customs as well as by their origin from the genuine Spartans. It seems unlikely that they were admitted to vote in the Spartan assembly; yet they undoubtedly possessed civil rights in the communities to which they belonged, and which they would hardly be called πόλεις unless they had been in some sense independent bodies. In the army they commonly served as hoplites, and we find the command at sea intrusted to one of this class. In respect of political rights, the perioeci were in the same condition with the physicians in the early history of Rome, although in every other respect far better off, as they participated in the division of lands, and enjoyed the exclusive privilege of engaging in trade and commerce.

What confirms the view here taken is the fact that, as far as we know, no individual of this class was ever raised to participate in Spartan privileges.

Nothing, however, could be more erroneous than to look upon them as an oppressed race. Ever since their leaving the assembly cannot be viewed in this light; for, had they possessed the privilege, their residence in the country would have been barred them from its exercise. It only remains to consider in what the superiority of the genuine Spartan may have consisted. In the first place, besides the right of voting in the assembly and becoming a candidate for the magistracies, he was possessed of lands and slaves, and was thus exempt from all care about the necessities of life. Secondly, on the field of battle he always served among the hoplites; thirdly, he participated in the Spartan education, and in all other Dorian institutions.

The way in which Sparta showed to admit foreigners was proportioned to the value of these privileges: indeed Herodotus says that Sparta had only conferred the full franchise in two instances. In legal rights at Spartans were equal; but there were yet several gradations, which, when once formed, retained their hold on the aristocratic feelings of the people. First, they had been at a more remote epoch of the Dorian immigration, and the very name of the Hellenes, secondly, they were of the dignity of the Heraclidae families, and, connected with this, a certain pre-eminence of the Hylean tribe. Another distinction was that between the ὡμοὺς and ἀνομοὺς, which in later times appears to have been considerable. The latter term probably comprehended those citizens who, from degeneracy of manners or other causes, had undergone some kind of civil degradation. To these the ὡμοὺς were superior, who were the most sincerely independent of the state, as being the only class of citizens which was assimilated to the Romans. The very name would imply a kind of superior civility (Civitas civitatem).

The perioeci were considered as a class of citizens possessing the same views as the Spartans, and as being obliged to hold the state in a similar respect. This is shown by the special laws which were made to protect them, and which are called ἰατρεία, ἱματα, ἐπαρτοεία.
CIVITAS.

Latinus, the (Geschichte a he) "De any the Savigny, was and and was the peregrinus, in the sense above stated, originated in the conquest of a state by the Romans, when the conquered state did not obtain the civitas; and he conjures to the notion of peregrinatus was applied originally to all citizens of foreign states who had a feudus with Rome.

The rights of a Roman citizen were acquired in several ways, but most commonly by a person being born of parents who were Roman citizens. A patrician, a filius familaris, a mater familias, and filia families, were all Roman citizens, though the first only was sui juris, and the rest were not. If a Roman citizen married a Latina or a peregrina, believing her to be a Roman citizen, and begot a child, the child was not in the power of his father, because it was not a Roman citizen; but the child was either a Latinus or a peregrinus, according to the condition of his mother; and no child followed the condition of his father unless there was connubium between his father and mother. By a senatus consultum, the parents were allowed to prove their child's natal status, and, on this being done, both the mother and the child were Roman citizens, and, as a consequence, the son was in the power of the father. Other cases relating to the matter, called causa probatio, are stated by Gaius, from which it appears that the facilities for obtaining the Roman civitas were gradually extended.

A slave might obtain the civitas by munus præs. sion (vindicia), by the census, and by testamentum, if there was no legal impediment; but it depended on circumstances, as already stated, whether he became a civis Romanus, a Latinius, or in the number of the peregrini dedicati. (Vid. Man. civ.)

The civitas could be conferred on a foreigner by a lex, as in the case of Archias, who was a civis of Herculean, a civitas which had a feudus with Rome, and who claimed the civitas Romanus under the provisions of a lex of Silvanus and Carbo, B.C. 89. By the provisions of this lex, the person who chose to take advantage of the privilege was required, within sixty days after the passing of the lex, to signify to the praetor his wish and consent to accept the civitas (proferit). Cicero speaks of the civitas being given to all the Neapolitani; and in the oration Pro Balbo he alludes to the Julian lex (B.C. 90), by which the civitas was given to the socii and Latini; and he remarks that a great number of the people of Herculea and Neapolis made opposition to this measure, because they did not desire to be considered as civitates federates (federati sui libertatem) to the Roman civitas. The lex of Silvanus and Carbo seems to have been intended to supply a defect in the Julia lex, and to give the civitas, under certain limitations, to foreigners who were citizens of federate states (federati civitates adscripti).

Thus the great mass of the Italicus obtained the Roman citizenship, which was known as civitates federates extended to the provinces, first to part of Gaul, and then to Sicily, under the name of Jus Latii or Latinitas. This Latinitas gave a man the right of acquiring the Roman citizenship by a privilege which belonged to the federate civitates of Italy before they obtained the Roman

1. (Gaius, i. 67.)—2. (i. 29, &c.; i. 66, &c.).—3. (See new Urban, Fragment. tit. 3. "De Latiniis."—4. (Cic., Pro Arch. 4.—5. (Ep. ad Fam., xii. 36.)—6. (C. 7.)
devise. It probably also included the Latinitas of Ulpius, that is, the commercial or individual privilege.

With the establishment of the imperial power, the political rights of Roman citizens became insignificant, and the commerce and the more easy acquisition of the rights of citizenship were the only parts of the civitas that were valuable. The constitution of Antoninus Caracalla, which gave the civitas to all the Roman world, applied only to communities, and not to individuals; its effect was to make all the cities in the empire municipia, and all Latin into civitates. The distinction of civitas and Latinus, from this time forward, were individuals, namely, to freedmen and their children. The peregrinitas, in like manner, ceased to be applicable to communities, and only existed in the dedi-
ticia as a class of individuals. The legislation of Justinian finally put an end to what remained of this ancient division into classes, and the only division of persons was into subjects of the Caesar and slaves.

The origin of the Latinitas of Ulpius is referred by S weigh, of an ingenious conjecture, to the year B.C. 209, when eighteen of the thirty Latin colonies remained true to Rome in their struggle against Hannibal, while twelve refused their aid. The disloyal colonies were punished; and it is a conjecture of S weigh, and, though only a conjecture, one supported by strong reasons, that the bribe which they received the commodity as the reward of their loyalty, and that they are the origin of the Latinitas of Ulpius. This conjecture renders intelligible the passage in Cicero's oration, in which he speaks of nuxem and hereditas as the rights of the twelve (eighteen?) colonies.

The word civitas is often used by the Roman writers to express any political community, as Civitas Antiochenae, &c. (S weigh, Zeitschrift, v., &c., Uber die Entstehung, &c., der Latinita; Heinece, Syntaxe, ed. Haubold, Epicrius; Rossdrith, Grundlinien des Röm. Rechts, Eidunkleitung; and vid. Banishment, and Capi-
ta.

CLAVIS. (Vid. FEVISL.)

CLASSEI. (Vid. CLAPIT, COMPTA.)

CLA'SCITUM.

CLAV'ARIIUM. (Vid. CLAVUM.)

CLAVIS (κλεις, dim. κλειδον), a Key. The key was used in very early times, and was probably introduced from Greece to Egypt; although Estchus states that in early times all fastenings were made by chains, and that keys were comparatively of a much later invention, which invention he attributes to the Lapobians. Pliny4 refers the name of Theodorus of Samos as the inventor, the person to whom the art of fusing bronze and iron is ascribed by Pausanias. (Vid. Bronzer, p. 178.)

We have no evidence regarding the materials of which the Greeks made their keys, but among the Romans the larger and coarser sort were made of iron. Those discovered at Pompeii and elsewhere are mostly of bronze, which we may assume to be of a better description, since we are only kept by the mistresses (matronae) of the household. In ages still later, gold and even wood are mentioned as materials from which keys were made.5

Among the Romans the key of the house was consigned to the porter (janitor), and the keys of the other departments in the household to the slave upon whom the care of each department devolved, upon a knowledge of which custom the point of the epi-
gram in Martial6 turns.

When a Roman woman first entered her husband's house after marriage, the keys of the stores were consigned to her. Hence, when a wife was divorced, the keys were taken from her; and when she separated from her husband, she sent him back the keys.7 The keys of the wine-cellar were, how-
ever, not given to the wife, according to Pline, who relates a story, upon the authority of Fabius Pictor, of a married woman being starved to death by her relatives for having picked the lock of the closet in which the keys of the cellar were kept.

The annexed woodcut represents a key found at Pompeii, and now preserved in the Museum at Naples, the size of which indicates that it was used as a door-key. The tongue, with an eye in it, which projects from the extremity of the handle, serves to suspend it from the porter's waist.

The expression sub clavis esse8 corresponds with the English one, "to be under lock and key," but clavis is sometimes used by the Latin authors to signify the bolt it should be. The keys are "locked by keys," like those of our own towns during the Middle Ages.

Another sort of key, or, rather, a key fitting another sort of lock, which Plautus calls clavis Laco-
nica,9 is supposed to have been used with locks which could only be opened from the inside, such as are stated to have been originally in use among the Egyptians and Laconians (ov γάρ, ὡς μόνον αὐτὸν ἐκλέξει, δὲ δ' ἐκείνου τοῦ πατέρων παρ᾽ Ἀργοστήλων, καὶ Δίαστος). These are termed κλειδαί καρταί by Aristophanes,10 because they were not visible on the outside, and in the singular, clavis clavis, by Virgi-
li;11 but the reading in this passage is very doubt-
ful.12 Other writers consider the κλειδα κρατια and claves Laconicae to be false keys, such as we now call "skeletons," and the Romans, in familiar language, adulterinae,13 wherein consists the wit of the allusion in Ovid, "Norum coniuncta, quid agamus, adulteria clavis."14

The next woodcut represents one of two similarly formed keys, which were discovered in Holland, and published by Lipsius.15 It has the handle tinted as a lever, and, therefore, could not have been made for a lock with wards, which cannot be turned without a certain application of force; but, by inserting the thumb or forefinger into the ring, it would be am-

enously sufficient to raise a latch or push back a bolt; and thus one sort, at least, of the keys termed spat-

raii seems to be identified with the "latch-keys" in use among us; for, when placed in the keyhole (clavis immittenda foramin8), it would be almost en-

CLAVUS, a Nail. In the subterranean chamber at Mycenae, supposed to be the treasury of Atreus & view of which is given in Sir W. Gell's Itinerary of Greece (plate vi.), the stones of which the cylindrical dome is constructed are perforated by regular series of bronze nails, running in perpendicular rows, and at equal distances, to the top from the bottom of the vault. It is supposed that they served to attach thin plates of the same metal to the masonry, as a coating for the interior of the chamber; and hence it is that these subterranean works, which served for prisons as well as treasuries, like the one in which Danaë is said to have been confined, were called by the poets brazen chambers. Two of these nails are represented in the annexed woodcut. of two thirds the real size; they consist of 88 parts of copper to 12 of tin.

The writer was present at the opening of an Etruscan tomb at Cære, in the year 1836, which had never been entered since the day it was closed up. The masonry of which it was constructed was studded with nails exactly similar in make and material to those given above, upon which were hung valuable ornaments in gold and silver, entombed, according to custom, with their deceased owner. Nails of this description were termed trabales and tabularius by the Romans, because they were used, in building, to join the larger beams (trabes) together. Hence the allusion of Cicero, "Ut hoc beneficium clavo trabali figure," and Horace arms Necesitas with a nail of the same kind, or of adamant, wherein to rivet, as it were, irrevocably the decrees of Fortune. Thus Atropos is represented in the subjoined woodcut, taken from a cup found at Perugia, upon which the story of Meleager and Atalanta is imbody'd, with a hammer in her right hand, driving a nail which she holds against the wall with her left.

The next cut represents a nail of Roman workmanship, which is highly ornamented and very curious. Two of its faces are given, but the pattern varies on each of the four.

It is difficult to say to what use this nail was applied. The ornamented head shows that it was never intended to be driven by the hammer; nor would any part but the mere point, which alone is plain and round, have been inserted into any extra-neous material. It might possibly have been used for the hair, in the manner represented in the woodcut on page 21.

Bronze nails were used in ship-building, and to ornament doors, as exhibited in those of the Pantheon at Rome; in which case the head of the nail was called bulba, and richly ornamented, of which specimens are given at page 181.

The soles of the shoes worn by the Roman soldier were also studded with nails, thence called "clavi caligarii." (Vid. Calig. & Tacit.) These do not appear to have been hob-nails, for the purpose of making the sole durable, but sharp-pointed ones, in order to give the wearer a firmer footing on the ground; for so they are described by Josephus, & Πηδοδομάτα πενταμένα πυυνοί καὶ δέκαν χοίρον. The men received a donation for the purpose of providing themselves with these necessary, which was thence called clavarium.  

CLAVUS ANNA-LIBRA. In the early ages of Rome when letters were yet scarcely in use, the Romans kept a reckoning of their years by driving a nail, on the idea of each September, into the side wall of the temple of Jupiter Optimus Maximus, which ceremony was performed by the pretor Maximus. In after ages this practice fell into disuse, though the ignorant peasantry seem to have retained the custom, as a method of matching dates, down to a very late period. Upon some occasions a dictator was created to drive the nail; but then it was not for the mere purpose of marking the year, but from a superstitious feeling that any great calamity, which happened at the time to afflict the city, would be stayed if the usual ceremony was performed by another Roman than the dictator.

CLAVUS GUBERNA-CULL, the handle or shaft of a rudder, which Vitruvius appropriately terms "ansa gubernaculi, quod ola gracies appellar;" and by Cicero. But it is sometimes used for the rudder itself, as, for instance, by Ennius:

"Ut clavum rectum teneam, navemque gubernem."  

Ola is also used in both senses, and in the same way. The true meaning of the word will be understood by referring to the woodcut at page 58 in which a ship with its rudder is represented: the

---

263
poled by which it is fastened to the ship’s side is the **clavus**. (Vid. *Gubernaculum*.)

**CLAVUS LATUS. CLAVUS ANGUSTRUS.**

The meaning of these words has given rise to much difference of opinion among modern writers. Scullenger considered the clavus to have been an ornament detached from the dress, and worn round the neck like a *balla*. (Vid. *Bulla*.) Ferrarius supposed it to be a scarf or band thrown over the shoulders, the ends of which hung down in front. Some writers consider it to have been a round boss or buckle, resembling the head of a nail, fastened to the front part of the tunic which covered the chest; others the head of an iron dart, either at the edges or at the bottom; and others, again, the dress itself checkered with stripes of purple, or with ornaments resembling nails, either sewn on to, or woven in, the fabric, such as in modern language would be termed figured.

It is a remarkable circumstance, that not one of the ancient statues, representing persons of senatorial, consular, or equestrian rank, contain the slightest trace in their draperies of anything resembling the accessories above enumerated; some indications of which would not have been constantly omitted, if the *clavus* had been a thing of substance either affixed to the dress or person. But, if it formed only a distinction of colour, without producing any alteration in the form or mass of the material worn, the garment was made, such as a mere streak of purple interwoven in the fabric, or embroidered or sewed on it, it will be evident to any person conversant with the principles of art, that the sculptor, who attends only to form and mass, would never attempt to express the mere accidents of colour; and, consequently, that such a clavus would not be represented in sculpture. But in painting, with which the master art, we do find examples in some works executed at a very late period, some of which are subsequently inserted, in which an ornament like the clavus, such as it is implied to be by the words of Horace, *latum demisit pectore clavum*, seems evidently to have been represented.

The most satisfactory conclusion, therefore, seems to be that the clavus was merely a band of purple colour,<sup>4</sup> hence called *lumen purpurum*, either sewed to the dress<sup>8</sup> or interwoven in the fabric.<sup>7</sup>

**CLAVUS LATUS.**

The clavus worn by the Romans was of two fashions, one broad and the other narrow, denominated respectively *clavus latus* and *clavus anguistrus*.<sup>2</sup> The vest which it distinguished properly and originally was the tunic (*vid. Tunica*), called *clavum* by Tacitus, *praetexta* in the Statius, i.e. a broad band, and hence the word *clavus* is sometimes intended to express the garment itself.<sup>10</sup> The former was a distinctive badge of the senatorial order,<sup>11</sup> and hence it is used to signify the senatorial dignity,<sup>12</sup> and *laticlavius* for the person who enjoys it.<sup>12</sup> It consisted in a single broad band of purple colour, extending perpendicularly from the neck down the chest of the tunic, in the manner represented in the annexed woodcut, which is copied from a painting of Rome persified, formerly belonging to the Barberini family, the execution of which is of a very late period.

The position of the band in the centre of the chest is identified with the tunic clavus, because *mecostipho 1.

---

---

*opus*<sup>1</sup>, in the Septuagint, is translated in the Vulgate *tunica clavata purpurea*; and the converse, *χείλεως* πορφυρον μεδιέλεκτον<sup>2</sup>, is thus interpreted by Quintus Curtius. *"Purpureae tunicae medium album integrum est."

In distinction to the anguistrus clavus, it is termed *purpurea major*, *purpura litoris*, and the garment it decorated, *tunica potens*, or *χείλεως ραξαφύνης*.<sup>3</sup>

The tunic laticlavia was not fastened round the waist like the common tunic which is worn by the centurion (p. 231), but left loose, in order that the clavus might lie flat and conspicuously over the chest, which accounts for the allusion of Sylia, when he termed Julius Caesar male precinctum purpurum; for we are informed by Suétionius that he was the centurion of a person ever known to wear a girdle to his laticlavete.

It seems to be generally admitted that the latus clavus was not worn in childhood, that is, with the toga praetexta; but it is not so clear whether, during the earlier ages of the Republic, it was assumed with the toga virilis, or only upon admission into the senate. Probably the practice was different at different periods.<sup>13</sup>

The right of wearing the latus clavus was also given to the children of equestrians,<sup>11</sup> at least in the time of Augustus, as a prelude to entering the senāte-house. This, however, was a matter of personal indulgence, and not of individual right; for it was granted only to persons of very ancient family and corresponding wealth,<sup>12</sup> and then by special favour of the emperor. In such cases, the latus clavus was assumed with the toga virilis, and worn until the age arrived at which the young equestrian was admissible into the senate, when it was relinquished and the anguistrus clavus resumed, if a disinclination on his part, or any other circumstances prevented him from entering the senate, as was the case with Ovid.<sup>14</sup>

*"Curia restabat; clavi mensura coacta est; Majus erat nostris viribus illud opus."*

But it seems that the latus clavus could be again resumed if the same individual subsequently wished to become a senator,<sup>12</sup> and hence a fickle character is designated as one who is always changing his clavus.<sup>14</sup>
CLERUSTRI.  

The latus clavus was also worn by the priests of Saturn at Carthage, and by the priests of Hercules at Cadiz, and napkins were sometimes so decorated, as well as table-cloths, and coverlets (loraria) for the couches upon which the ancients reclined at their meals.

The latus clavus is said to have been introduced at Rome by Tullus Hostilius, and to have been adopted by him after his conquest of the Etruscan; nor does it appear to have been confined to any particular class during the earlier periods, but to have been worn by all ranks promiscuously. It was laid aside in public mourning.

CLAVUS ANGSTUS. This ornament is not found, any more than the latus clavus, upon any of the works executed before the decline of the arts; and therefore the same difficulties occur in attempting to define its form and fashion. That it was narrower than the other is evident from the name alone, as well as from other epithets bestowed upon it—"peper clavus," "arctum purpures lumen," and that it was of a purple colour, attached to a tunic girt at the waist, is also evident from the passages of Statius and Quinctilius already cited.

There is, moreover, reason for supposing that the angustius clavus consisted in two narrow stripes instead of one broad one; for it is observed that the word clavus is always used in the singular number when the tunic laticlavia is referred to, whereas the plural number (clavi) is often met with in reference to the angusticlavia; as in the passage of Quinctilian just mentioned, purpura is applied to the former, and purpura to the latter of these garments. It seems, therefore, probable that the angustius clavus was distinguished by two narrow purple stripes, running parallel to each other from the top to the bottom of the tunic, one from each shoulder, in the manner represented by the three figures introduced below, all of which are taken from sepulchral paintings executed subsequently to the introduction of Christianity at Rome. The female figure on the left hand, which is copied from Buonarroti, represents the goddess Moneta, and she wears a regular tunic. The one on the right hand is from a cemetery on the Via Salara Nova, and represents Priscilla, an early martyr; it is introduced to show the whole extent of the clavi; but the lress she wears is not the common tunic, but of the kind called Dalmatica, the sleeves of which are also clavate.

The next figure is selected from three of a similar kind, representing Shadrach, Meshach, and Abednego, from the tomb of Pope Cunlallo on the Via Appia; all three wear the ordinary tunic girt at the waist, as indicated by Quinctilius, but with long sleeves, as was customary under the Empire, and the stripes are painted in purple; so that we may fairly consider it to afford a correct example of the tunica angusticla.

This decoration belonged properly to the equitrian order, for, though the children of equestrians, as has been stated, were sometimes honoured by permission to wear the latus clavus at an early age, they were obliged to lay it aside if they did not enter the senate when the appointed time arrived, which obligation appears to have been lost sight of for some time after the Augustan period; for it is stated by Lampadius, that Alexander Severus distinguished the equites from the senators by the character of their clavus, which must be taken as a recurrence to the ancient practice, and not an innovation then first adopted.

*CLEMATIS or CLEMATTTIS (klymatis, klymatites), a species of plant, commonly identified with the Winter-green or Periwinkle. Dioscorides mentions two kinds: the first of these Sprengel refers to the Periwinkle, namely, Vinca major or minor; the other, which is properly called klymatitcς, he is disposed to follow Sibthorp in referring to the Clematis cirrhosa. The term klymatis is derived from klyma, "a tendril" or "a clasper," and has reference to the climbing habit of the plant. The epithets δανθοντες ("laurel-like") and αρμοιονες ("myrrh-like") are sometimes given to the klymatiς, as well as that of πολυγονος, or Knot-grass." Pliny derives the Latin name vinca from vincere, "to bind" or "encircle," in allusion to the Winter-green's encircling or twining around trees. The same writer alludes to various medical uses of this plant, in cases of dysentery, fluxions of the eyes, hemorrhoids, the bite of serpents, &c. It is found sometimes with white flowers, less frequently with red or purple ones. The name of this plant in modern Greek is γροφολία. Sibthorp found it in Ellis and Argolis.

CLEPSY-DRA. (Phil. Horaioas). CLERUSTRI (klymates). Athenian citizens who occupied conquered lands were termed klymaτος, and their possession klymatia. The earliest example to which the term, in its strict sense, is applicable, is the occupation of the domains of the Thracian knights (imποδωρα) by four thousand Athenian citizens, B.C. 506.

In assigning a date to the commencement of this system of colonization, we must remember that the principle of a division of conquered land had existed from time immemorial in the Grecian states. Nature herself seemed to intend that the Greek should rule and the barbarian obey; and hence, in the case of the barbarian, it wore no appearance of
narness. Such a system, however, was more rare between Greek and Greek. Yet the Drrians, in their conquest of the Peloponnesse, and still more remarkably in the subjugation of Messenia, had set an example. In what, then, did the Athenian κληρονομία differ from this division of territory, or from the ancient colonies? In the first place, its name, in its technical sense, was of later date, and the Greek would not have spoken of the κληρονομία of Lycurgus, any more than the Roman of the "Agricola" of Metal. After Athens, however, we should remember that the term was always used with a reference to the original allotment: as the lands were devised or transferred, and the idea of the first division lost sight of, it would gradually cease to be applied. The distinction, however, between κληρονομία and ἀποτοκία was not merely one of words, but of things. The only object of the earlier colonies was to relieve surplus population, or to provide a home for those whom internal quarrels had exiled from their country. Most usually they originated in private enterprise, and became independent of, and lost their interest in, the parent state. On the other hand, it was essential to the very notion of a κληρονομία that it should be a public enterprise, and should always retain a connexion more or less intimate with Athens herself. The word κληρονομία, as Wachsmuth has well observed, conveys the notion of property to be expected and formally appropriated; whereas the ἀποτοκία of ancient times went out to conquer lands for themselves, not to divide those which were already conquered.

The connexion with the parent state subsisted, as has just been hinted, in all degrees. Sometimes, 1 as in the case of Lesbos, 2 the holders of land did not reside upon their estates, but let them to the original inhabitants, while themselves remained at Athens. The condition of these κληρονομία did not differ from that of Athenian citizens who had estates in Attica. All their political rights they only retained, but exercised as Athenians; in the capacity of landholders of Lesbos they could scarcely have been recognised by the state, or have borne any corporate relation to it. Another case was where the κληρονομία resided on their estates, and either with or without the old inhabitants, formed a new community. These still retained the rights of Athenian citizens, which distance only precluded them from exercising: they used the Athenian currency, and, in the event of an emergency to return to Athens, naturally and of course they regained the exercise of their former privileges. Of this we have the most positive proof: 3 as the sole object of these κληρονομία was to form outposts for the defence of Athenian commerce, it was the interest of the parent state to unite them by a tie as kindly as possible; and it cannot be supposed that individuals would have been found to risk, in a flourishing enterprise, the rights of Athenian citizens.

Sometimes, however, the connexion might gradually dissolve, and the κληρονομία sink into the condition of mere allies, or separate wholly from the mother-country. In Ἐγίνα, Scione, Potidaea, and other places, where the original community was done away, the colonists were most completely unconnected with Athens. 4 The names of the inhabitants were left unmasked, we may conceive their admixture to have had a twofold effect: either the new-comers would make common cause with them, and thus would arise the alienation alluded to above, or jealousy and dread of the ancient inhabitants might make the colonists more entirely dependent on the mother state. It seems improbable to define accurately when the isopollite relation with Athens may have ceased, although such cases undoubtedly occurred.

A question has been raised as to whether the κληρονομία were among the Athenian tributaries. Probably this depended a good deal upon the prosperity of the colony. We cannot conceive that colonies which were established as military outposts, in otherwise unconquered situations, would begin such a burden: at the same time, it seems improbable that the state would unnecessarily forego the tribute which it had previously received, where the lands had formerly belonged to tributary allies.

It was to Pericles Athens was chiefly indebted for the extension and permanence of her colonial settlements. His principal object was to provide for the redundancies of population, and raise the poorer citizens to a fortune becoming the dignity of Athenian citizens. It was of this class of persons the settlers were chiefly composed; the state provided them with arms, and defrayed the expenses of their journey. The principle of division doubtless was, that all who wished to partake in the adventure applied voluntarily; it was then determined by lot who should or should not receive a share. Sometimes a leader appointed, who, after death, received all the honours of the founder of a colony (ολιστης).

The Cleutchiæ were lost by the battle of Εγγαποπατί, but partially restored on the revival of Athenian power. For a full account of them, see Wachsmuth, Historical Antiquities, § 56, 6: Böckh, Public Econ. of Athens, iii., 18; and the references in Herman's Manual, vi., 117.

CLETERIÆ or CLETORÆ (κλητήρες or κληρονομίαι). The Athenian summoners were not official persons, but merely witnesses to the prosecutor that he had served the defendant with a notice of the action brought against him, and the day upon which it would be requisite for him to appear before the proper magistrate, in order that the first examination of the case might commence. 5 In Aristophanes 6 we read of a summoner only being employed, but two are generally mentioned by the orators as the usual number. 7 The names of the summoners were subscribed to the declaration or bill of the prosecutor, and were, of course, essential to the validity of all proceedings founded upon it. What has been hitherto stated applies in general to all causes, whether δικαίωμα or γραμμα: in some the former was always used, in others the latter. The summoners were, before magistrates, and an arrest of the accused in consequence (as in the case of ἐνδείξεις or ἐνοικιασθείαι), there would be no occasion for a summonus, nor, of course, witnesses to its service. In the ἐκθέσεως and δοκύασθαι also, when held at the regular times, no summons was issued, as the persons whose character might be affected by an accusation or defence were usually present, or presumed to be so; but if the prosecutor had let the proper day pass, had proposed to hold a special ἐκθέσει at any other time during the year in which the defendant was liable to be called to account for his conduct in office (ὑπ’ ἐκθέσιν), the agency of summoners was as requisite as in any other case. Of the δοκύασθαι, that of the orators alone had no fixed time; but the first step in the cause was not the usual legal summons (δικαίωμα), but an announcement from the prosecutor to the accused in the assembly of the people. 8

In the event of persons subscribing themselves falsely as summoners, they exposed themselves to
an action (ϕευνοληγείας) at the suit of the party aggrieved.

Cleithra (κλίθρα), the Alder. (Vid. Alnur.)

CLIBANARII. (Vid. Cataphracti.)

CLIENTS is said to contain the same element as the verb clere, to "hear" or "obey," and is accordingly compared by Niebuhr with the German word höriger, "a dependant."

In the time of Cicero, we find patrons in the sense of protectors or defenders, answering to clizens in the sense of the person defended, or the consulutor; and this use of the word must be referred, as we shall see, to the original character of the patrons. The relation of a master to his liberated slave (libertas) was expressed by the word patron, and the libertus was the cliens of his patron. Any Roman citizen who wanted a protector might attach himself to a patron, and would thenceforward be a cliens. Distinguished Romans were also sometimes the patrons of states and cities, which were in a certain relation of subjection or friendship to Rome; and in this respect they may be compared to colonial agents, or persons among who are employed to look after the interests of the mother-country, except that among the Romans the patron did not necessarily maintain the connection, though there might be an indirect remuneration. This relation between patron and cliens was indicated by the word clientela, which also expressed the whole body of a man's clients. In the Greek writers on Roman history, patron is represented by προσωτής, and cliens by προλάγος.

The cliens, clientela, and patron, are different from the potestas, which are much farther back as the records or traditions of Roman history extend; and the following is a brief notice of its origin and character, as stated by Dionysius, in which the writer's terms are kept:

Romulus gave to the eθναρχαί the care of religion, the honors (άρετα), the administration of justice, and the care of the patrocinia of all the munioi (whom, in the preceding chapter, he has explained to be the πάρτικες) had none of these privileges, and they were also poor; husbandry and the necessary arts of life were their occupation. Romulus thus intrusted the διονύσιοι to the safe keeping of the πάρτικες, who are the eθναρχαί, and permitted each of them to choose his patron. This relation of patron and client was thus called, says Dionysius, patrona.

The relative rights and duties of patrons and clients were, according to Dionysius, the following:

The patron was the legal adviser of the cliens; he was the client's guardian and protector, as he was the guardian and protector of his own children; he maintained the client's suit when he was wronged, and defended him when another complained of being wronged by him: in a word, the patron was the guardian of the client's interests, both private and public. The client contributed to the marriage portion of the patron's daughter, if the patron was poor, and to his ransom, or that of his children, if they were taken prisoners; he paid the costs and damages of the client, and suffered with him the penalty in which he was condemned; he bore a part of the patron's expenses incurred by his discharging public duties, or filling the honourable places in the state. Neither party could accuse the other, or hear testimony against the other, or give his vote against the other. This relationship between patron and client subsisted for many generations, and resembled in all respects the relationship by blood. It was the glory of illustrious families to have many clients, and to add to the number transmitted to them by their ancestors. But the clients were not limited to the διονύσιοι: the coloni, and the states connected with Rome by alliance and friendship, and the conquered states, had their patrons at Rome; and the senate frequently referred the disputes between such states to their patrons, and abided by their decision.

The value of this passage consists in its containing a tolerably intelligible state, if it were true or false, of the relation of a patron and client. What persons actually composed the body of cliens, or what was the real historical origin of the clientela, is immaterial for the purpose of understanding what it was. It is clear that Dionysius understood the Roman state as originally consisting of patrici and plebes, and he has said that the clients were the plebs. Now it appears, from his writings and from Livy, that there were clients who were not the plebs, or, in other words, clients and plebs were not convertible terms. This passage, then, may have little historical value as explaining the origin of the clients; and the statement of the clientela being voluntary is improbable. Still something may be derived from it. It appears as if he was able to reconcile it altogether with all other evidence. The clients were not servi: they had property of their own, and freedom (libertas). Consistently with this passage, they might be Roman citizens, enjoying only the commercium and cunnibulum, but not the suffragium and honores, which belonged to their patron. (Vid. Ann. 26.)

It would be hasty to be content with the statement of Dionysius, that there were free men in the state who were not patrici, and did not choose to be clients; but if such persons existed in the earliest period of the Roman state, they must have suffered under great civil disabilities, and this, also, is inconsistent with the testimony of history, nor can it be supposed that it would be possible for a free person to be called a cliens; for this involved a tacit assumption that the clients were originally slaves; and this may be true, but it is not known. Besides, it cannot be true that a patron had the power of life and death over his freedman, who had obtained the civitas, any more than he had over an emancipated son. The body of clients might, consistently with all that we know, contain perigrini, who had no privileges at all; and it might contain that class of persons who had the commercium, if the commercium existed in the early ages of the state. (Vid. Civitas.) The latter class of persons would require a patronum, to whom they might attach themselves for the protection of their property, and who would defend them in all suits, on account of the (here assumed) inability of such persons to sue in their own name in the early ages of Rome. (Vid. Banishment.)

The relation of the patronus to the cliens, as represented by Dionysius, has an analogy to the patria potestas; and the form of the word patronus is consistent with this.

It is stated by Niebuhr, that "if a client died without heirs, his patron inherited; and this law extended to the case of freedmen; the power of the patron over whom must certainly have been found originally on the general paternal right." This statement, if it be correct, would be consistent with the quasi patria potestas...
**CLIPUS.**

But if a client died with heirs, could he make a will? and if he died without heirs, could he not dispose of his property by will? if he could not make, or did not make a will, and had heirs, who must they be? must they be sui heredes? had he a familia, and, consequently, agnati? (vid. Connoi) had he, in fact, that connubium, by virtue of which he could acquire the patria potestas? He might have all this consistently with the statement of Dionysius, and yet be a citizen non optimo jurie; for he had not the homines of the other distinguishing privileges of the patriici, and, consistently with the statement of Dionysius, lie could not vote in the comitia curiata. It is not possible to prove that a client had all this, and it seems equally impossible, from existing evidence, to show what his rights really were. So far as our extant ancient authorities show, the origin of the clientela, and its true character, were unknown to them. This seems certain; there was a body in the Roman state, at an early period of its existence, which was neither a patrician nor client, and a body which once did, but ultimately did, participate in the sovereign power; but our knowledge of the true status of the ancient clients must remain inexact, for the want of sufficient evidence in amount, and sufficiently trustworthy.

It is stated by Livy that the clients had votes in the comitia of the centuries: they were therefore registered in the censorship's books, and could have quiritarian ownership. (Vid. Centumviri.) They had, therefore, the commercium, possibly the connubium, and certainly the suffragium. It may be doubted whether Dionysius understood them to have the suffragium at the comitia curiata; but, if such was the legal status of a client, it is impossible that the exposition of their relation to the patricians, as given by some modern writers, can be altogether correct.

It would appear, from what has been stated, that patrician and patrician were originally convertible terms at least until the plebs obtained the honors. From that time, many of the reasons for a person being a client of a patrician would cease; for the plebeians had acquired political importance, had become acquainted with the laws and the legal forms, and were fully competent to advise their clients. This change must have contributed to the destruction of the strict old clientela, and was the transition to the clientela of the later ages of the Republic.

Admitting a distinction between the plebs and the old clients to be fully established, there is still room for careful investigation as to the real status of the clients, and of the composition of the Roman state before the estate of the plebs was made equal to that of the patricians.

This question is involved in almost inextricable perplexity, and elements must enter into the investigation which have hardly been noticed. Any attempt to discuss this question must be prefaced or followed by an apology.

**CLIENTELA. (Vid. Clienes.)**

**CLIMAX. (Vid. Tormentum.)**

**CLITON (κλίτων), a plant deriving its name from the resemblance which its round flower bears to the foot of a couch (κλίτων, "a couch," and κλύτων, "a foot"). It is most probably Clitomenes vulgare, or Field Basil, as Bawin and others think. According to Prosper Alpinus, however, it is the same as the Satureja Gratia. Shibetop found it on the mountains of Greece and in the island of Crete.**

**CLIPUS (κλίπις), the large shield worn by the Greeks.** Romans, which was originally of a circular form and is said to have been first used by Preutus and Acrisius of Argos, and therefore is called clipes Argoleticus, and likened to the sun (Compare, cfr., απονθανος ηπανος, αυθονος κτινος.) But the clipes is often represented in Roman sculpture of an oblong oval, which makes the distinction between the common buckler and that of Argos.

It was sometimes made of osiers twisted together, and therefore is called iria, or of wood. The wood or wicker was then covered over with ox hides of several folds deep, and finally bound round the edge with metal.

The outer rim is termed νυσς, νις, πεφερεια, or κελος (vid. Antvys). In the centre was a projection called ὄμοδος or μυσιφαλος, which served as a sort of weapon by itself (κελος υμοτονις repellit) or adsorbed the enemy to glance off from the shield. It is seen in the next woodcut, from the column of Trajan. A spike, or some other prominent ex necessitude, was sometimes placed upon the ὄμοδος, which was called the κτειφαλον.

In the Homeric times the Greeks used a belt to support the shield; but this custom was subsequently discontinued in consequence of its great inconvenience (vid. Bultrus, p. 139), and the following method was adopted in its stead: A band of metal, wood, or leather, termed καρων, was placed across the inside from rim to rim, like the diameter of a circle, to which were affixed a number of small iron bars, crossing each other somewhat in the form of the letter X, which met the arm below the inner bend of the elbow joint, and served to steady the orb. This apparatus, which is said to have been invented by the Carian, was termed καρων or δεκαν. Around the inner edge ran a leather thong (παρνας), fixed by nails at certain distances, so that it formed a succession of loops all round, which the soldier grasped with his hand (ὑμαλς παρνας γενενας χρης) The annexed woodcut, which shows the whole apparatus, will render this account intelligible. It is taken from one of the terra cotta vases published by Tischbein.

---

At the close of a war it was customary for the Greeks to suspend their shields in the temples, when the παράστες were, taken off, in order to render them unserviceable in case of any sudden or popular outbreak; which custom accounts for the alarm of Demostratus, in the Knights of Ariosto, when he saw them hanging up with their handles on.

According to Livy, when the census was instituted by Servius Tullius, the first class only used the clipeus, and the second were armed with the scutum (vid. Scutum); but after the Roman soldier received pay, the clipeus was discontinued altogether for the Sabine scutum. Diodorus Siculus asserts that the original form of the Roman shield was square, and that it was subsequently changed for that of the Tyrrhenians, which was round.

The Roman shields were emblazoned with various devices, the origin of armorial bearings, such as the heroic feats of their ancestors, or with their portraits, which custom is illustrated by the preceding beautiful gem from the antique, in which the figure of Victory is represented inscribing upon a clipeus the name or merits of some deceased hero. Each soldier had also his own name inscribed upon his shield, in order that he might readily find his own, when the order was given to unclench arms; and sometimes the name of the commander under whom he fought.

The clipeus was also used to regulate the temperature of the vapour bath. (Vid. Bains, p 150.)

CLITELLUS, a pair of panniers, and therefore only used in the plural number; in Italy they were commonly used with mules or asses, but in other countries they were also applied to horses, of which an instance is given in the annexed woodcut from the column of Trajan; and Plautus figuratively describes a man upon whose shoulders a kind of any kind, either moral or physical, is charged, as homo citellarius.

A particular spot in the city of Rome, and certain parts of the Via Flaminia, which from their undulations in hill and valley, were thought to resemble the flowing line of a pair of panniers, were also termed clitellus.

CLOACA. The term cloaca is generally used by the historians in reference only to those spacious subterraneous vaults, either of stone or brick, through which the foul waters of the city, as well as all the streams brought to Rome by the aqueducts, finally discharged themselves into the Tiber; but it also includes within its meaning any smaller drain, either wooden pipes or clay tubes, with which every almost house in the city was furnished, to carry off its impurities into the main conduit. The whole city was thus intersected by subterranean passages, and is therefore designated by Pliny as urbs pensilis.

The most celebrated of these drains was the Cloaca Maxima, the construction of which is ascribed to Tarquinius Priscus, and which was formed to carry off the waters brought down from the adjacent hills into the Velabrum and valley of the Forum. The stone of which it is built is a mark of the great antiquity of the work; it is not the peperino of Gabii and the Alban Hills, which was the common building-stone in the time of the Commonwealth; but it is the "tufa litoide" of Brocchi, one of the volcanic formations which is found in many places in Rome, and which was afterward supplant- ed in public buildings by the finer quality of the peperino. This cloaca was formed by three tiers of arches, one within the other, the innermost of which is a semicircular vault of 18 Roman palms, about 14 feet in diameter, each of the hewn blocks being 75 palms long and 4½ high, and joined together without cement. The manner of construction is shown in the annexed woodcut, taken on the spot, where a part of it is uncovered near the arch of Janus Quadrifrons.

The mouth where it reaches the Tiber, nearly opposite to one extremity of the insula Tiberina, 1.

1. (Veget., ii. 17.)(Hirt., Bell. Alex., 35.)—2. (Hist. Sat., l. 47. Plaut., Most., i. 91.)(Hor., i. c. 30.)—3. (Eclog., xxi., 8.)(Virg., viii., i. 2. 685.—5. (Bell., viii., 395.)(Id., xvii., 398.)
still remains in the state referred to by Pliny. It is represented in the annexed woodcut, with the adjacent buildings as they still exist, the modern fabrics only which encumber the site being left out.

The passages in Strabo and Pliny which state that a cist (ομπαξ, σελης) looked by day could pass down the Clauza Maximia, will no longer appear incredible from the dimensions given of this stupendous work; but it must still be borne in mind that the vehicles of the Romans were much smaller than our own. Dion Cassius also states that Agrippa, when he cleansed the sewers, passed through a drain in a boat, to which Pliny probably alludes in the expression with subito navigato; and their extraordinary dimensions, as well as those of the embouchures through which the waters poured into them (vid. CANALIS), are still further testified by the exploits of Nero, who threw down the sewers the unfortunate victims of his nightly riots.

The Clauza Maximia formed part of the Forum from the river, but was subsequently continued as far up as the Subura, of which branch some vestiges were discovered in the year 1742. This was the crypta Subura to which Juvenal refers.

The expense of cleansing and repairing these Clauza was, of course, very great, and was defrayed partly by the treasury, and partly by an assessment called clauarium. Under the Republic, the administration of the sewers was intrusted to the censors; but under the Empire, particular officers were appointed for that purpose, clauarum curatora, mention of whom is found in inscriptions, who employed condemned criminals in the task.

ΚΑΩΠΗ ΑΙΚΗ (κλαυρίς δίκη), the civil action for theft, was brought in the usual manner before a trialetes or a court, the latter of which Meier in 1.

1. ἐπί τοῦ ναοῦ τοῦ Χριστοῦ. A.D. 820. —②. (λεπιδίνους, σελης) looked by day could pass down the Clauza Maximia, will no longer appear incredible from the dimensions given of this stupendous work; but it must still be borne in mind that the vehicles of the Romans were much smaller than our own. Dion Cassius also states that Agrippa, when he cleansed the sewers, passed through a drain in a boat, to which Pliny probably alludes in the expression with subito navigato; and their extraordinary dimensions, as well as those of the embouchures through which the waters poured into them (vid. CANALIS), are still further testified by the exploits of Nero, who threw down the sewers the unfortunate victims of his nightly riots.

The Clauza Maximia formed part of the Forum from the river, but was subsequently continued as far up as the Subura, of which branch some vestiges were discovered in the year 1742. This was the crypta Subura to which Juvenal refers.

The expense of cleansing and repairing these Clauza was, of course, very great, and was defrayed partly by the treasury, and partly by an assessment called clauarium. Under the Republic, the administration of the sewers was intrusted to the censors; but under the Empire, particular officers were appointed for that purpose, clauarum curatora, mention of whom is found in inscriptions, who employed condemned criminals in the task.

ΚΑΩΠΗ ΑΙΚΗ (κλαυρίς δίκη), the civil action for theft, was brought in the usual manner before a trialetes or a court, the latter of which Meier in 1.

1. (Att. Process, 67.) 279

letters to have been under the presidency of the thes
meisthe, whether the prosecutor preferred the ac-

s. We learn from the law quoted by Demosthenes, 2

that, failing of this, he was bound to reimburse

him tenfold, that the court might inflict an addi-

tional penalty, and that the criminal might be

confined in the stocks (κρανία) five days and as

many nights. In some cases, we person that had

been robed was permitted by the Atic law to enter

the house in which he suspected his property

was concealed, and institute a search for it (φο-

ρέων); 3 but we are not informed what

powers he was supplied with to enforce this right.

Besides the above-mentioned action, a prosecutor

might proceed by way of γραφή and, when the de-

nunciation was detected in the act, by ἀκολούθα

or ἐφηγος. To these, however, a penalty of 1000

drachmas was attached in case the prosecutor failed

in establishing his case; so that a diffident plainti

would often consider them as less eligible means of

obtaining redress. 3 In the aggravated cases of steal-

ing in the daytime property of greater amount than

50 drachmas, or by night anything whatsoever (and

under no consideration of the owner being permitted

to wound, and even kill the depredator in his flight),

the most trifling article from a gymnasium, or any-

thing worth 10 drachmas from the ports or public

baths, the law expressly directed an ἀκραγή to the

Eleven, and, upon conviction, the death of the

offender. 4 If the γραφή were adopted, it is pro-

bable that the punishment was fixed by the court;

but both in this case, and in that of conviction in a

diax, besides restitution of the stolen property, the

disfranchisement (ἀκραγία) of the criminal would be

a necessary incident of conviction. 4

*CLYMENON (κλήμονον), a plant, about what the

authorities are much at variance. Sprengel,

in his edition of Dioscorides, adheres to the op-

inion of Fabius Columba, who held it to be the

Scorpius vermiculatus. Sibthorp, however,

contains for the Convolvulus sepium, or Great Bind-

weed. 5

*CLupea, a very small species of Fish, found, ac-

cording to Pliny, in the Po, and which, as he in-

forms us, destroys a large kind of fish named At-

tilus (a species of sturgeon), by attaching itself to

a vein in the throat of the latter. Pliny very proba-

bly refers to one of those numerous parasitical animals

which, by piercing the hinder parts of the branchial

fishes, and suck their blood; perhaps to a species of

small lamprey. In modern ichthyology, the name

Clupea has been assigned by Linnaeus to the whole

herring family.

*CNAPHOS (κναφός). (Vid. TORMENTUM.)

*CNEO' RUM (κνεώρον), according to Stackhouse

and Sprengel, the Daphne Cneorum. Galeus makes

it the same with the Tormentum of Hippocrates.

Two kinds are mentioned by the ancient writers,

the white and black, of which the former was the more

remarkable for its perfume. The Cneorum is the

Casia spoken of in the Georgics of Virgil among

the food for bees. The whole question is fully dis-

cussed by Martyn.

*CNICUS or CNECUS (κνίκος, κνίκη, a species of

plant, which some have taken for the Carduus

Benedictus but which the commentators on Mesue

and the translator of Avicenna, Dodonaes, Alston, and

Sprengel, concurring in setting down for the *Ceratium miniatum*, or bastard Saffron.

*CNIPE (oxides). (Fed. Acaleph.)

*CNIPE or SCNIPS (oxides, saphe), a numerous genus of insects, which prey upon the leaves of trees. They form the *Aphis*, L. The *Cnips* is often confused with the *B. penaei*.

*CNIPOLORUS (kunipoloro), the name of a bird briefly noticed by Aristotle. According to Geerter, it is the white Wagtail, or Motacilla alba. Aristotle describes it as of an ashy colour (sepiaurum), and marked with spots (kastikotetos), and having a little cry (phoei de mirop). This account suits very well the *Motacilla A.*, and its cry of *gust*, *gust*. It is ranked by the Greek naturalists among the *epeionea*, and the Motacilla, it is well known, makes as much havoc among flies, gnats, and smaller insects as either the fly-catchers or swallows.

COA VESTIS, the Coan robe, is mentioned by various Latin authors, but most frequently and distinctly by the poets of the Augustan age. From their expressions we learn that it had a great degree of transparency, that it was remarkably fine, that it was chiefly worn by women of loose reputation, and that it was sometimes dyed purple and enriched with stripes of gold. It has been supposed to have been made of silk, because in Cos silk was spun and woven at a very early period, so as to obtain a high celebrity for the manufacturers of that island. The annexed woodcut is from a painting discovered at Pompeii. It represents a lady wearing a tunic of almost perfect transparency, so as to correspond to the description of the Coa vestis. Her headress is of the kind called *kerafuroz* in Greek, and *reticulum* in Latin, which also occurs in a figure on page 187.

*COACTOR*. This name was applied to collectors of various sorts, e.g., to the servants of the publican, or farmers of the public taxes, who collected the revenues for them; also to those who collected the money from the purchasers of things sold at a public auction. Horace informs us that his father was a coactor of this kind. Moreover, the servants of the money-changers were so called, from collecting their debts for them. The "coactores agminis" were the soldiers who brought up the rear of a line of march.

*COCALIS* (kócalis tov sitou), the *Agrostemma*

*COCHLEA*. Its English name, Corn-Cockle, is evidently derived from the ancient appellation as Admon, or red snail.

*COCUM, or COCCI GRANUM, a name given by the ancients to what they conceived to be a species of grain, producing a bright scarlet or crimson colour, but which modern naturalists have discovered to be a kind of insect (kerme). The *Quercus coccifera* is the tree that principally engenders them, and the name *coccum, coccus* that the term *cochlea* has been derived. The coxens of the ancients came from Portugal, Sardinia, Asia Minor, and Africa.

*COCYCTEAN* (kokythereos), a species of plant mentioned by Theophrastus, and which, according to Schneider, has been generally taken for the *Rhur cotinus*, L. It appears from Sibthorp that the modern name makes a flame-red colour.*

*COCYCELEA* (kokythereos), a kind of Plum. Isidorus says, "Coccymela, quam Latinob colorem prunum notant, cujus generis Damascena nactus."

Sprengel refers that of Dioscorides to the *Prunus insititia*, or Bullace-tree, a well-known species of plum. Sibthorp’s authority is in favour of the *Prunus domestica*. The Damask plums, or ῥα καρα το υδατικον, or Galen, are much commended by ancient authors.

*COCYX* (kokyce). I. The Cuckoo, or *Cuculus canorus*. Its history is correctly given by Aristotle. "If we consult the ancients, and even some modern naturalists," observes Griffith, "we shall find stories of the greatest absurdity connected with the name of the cuckoo. It would seem that everything the most monstrous in fable, or the most odious and criminal in the history of mankind, had been carefully sought out, and attributed to these inoffensive birds: this, because men could not discover the secret springs which Nature has employed to give to this species manners, habits, and a mould of life, which oppose the character of others, and the union of which fixes on the cuckoo a distinguishing character from all other known animals." The ancients held the flesh of the cuckoo in high estimation, as do also the modern Italians.

II. A species of Fish, the same with the *Trigla Cuculus*, L. It is the Red Gurned, or Rotchett; in French, *Gurnet*. *COCCOGENES* (coleucus), the seed of the *Punica granata*, or Pomegranate.

*COCHLEA* (soylia), the Snail, a genus of Mollusca. Of snails there are three sorts, the Sea, the River, and the Land. The last are the *Helices*, one of which, the *Helix pomatia*, or edible snail, was much used by the Greeks and Romans as an article of food. The ancients, as Adams remarks, must have been also well acquainted with the *Helix fruticum* and the *Helix arbutus*. "The uses of the *Helix*, or Snails," observes Griffith, "are not very numerous. It appears, however, that the larger species, and especially the garden-snails (*Pomata, L.*), serve for the aliment of men in many countries, and according to Pliny it consumed great quantities of them; and they must have been in great estimation for the table, since that author has thought fit to give, in his Natural History, the name of him who first turned his attention to the rearing of these animals in sorts of perches or dofts, and of fattening them with particular substances. The best came from the island of Astypalia,

COCHLEA.

one of the Cyclopes; the smallest from Reate, in the Sabine territory, and the largest from Illyria. The Romans also greatly esteemed the snails of Sicily, of the Balearic Isles, and of the island of Capea. They shut them up in sorts of warrens, and fattened them there with cooked meat, flour, &c. It was Fulvius Hiprinos who first conceived the idea of this, a short time previous to the civil war between Pompey and Cesar. He carefully separated each species, and succeeded in obtaining individuals whose shells contained exogonia quadrantes, about ten quarts. All this history is taken from Pliny; but there would appear to be some confusion in it, especially with regard to the size produced by education; for Varro, after whom he writes, says the same only concerning the African species, which naturally attained to these dimensions. It does not appear that this mode of educating snails was practised for any great length of time, for Mærobius says nothing about it. 5

COCHLEA (κοχλεα), which properly means a snail, was also used in several other significations.

I. It signified a screw, one of the mechanical powers, so named from its spiral form, which resembles the worming of a shell. The woodcut annexed represents a clothes-press, from a painting on the wall of the Chalcidicum of Eumachia, at Pompeii, which is worked by two upright screws (cochleæ) precisely in the same manner as our own linen presses.

A screw of the same description was also used in oil and wine presses. 3 The thread of the screw, for which the Latin language has no appropriate term, is called περικοχλον in Greek.

II. COCHLEA was also the name of a spiral pump for raising water, invented by Archimedes, 4 from whom it has ever since been called the Archimedian screw. It is described at length by Vitruvius.

A pump of this kind was used for discharging the bilge-water in the ship of Hiero, which was built under the directions of Archimedes. 5

III. COCHLEA was also the name of a peculiar kind of door, through which the wild beasts passed from their dens into the arena of the amphitheatre. 7 It consisted of a circular cage, open on one side like a lantern, which worked upon a pivot and within a shell, like the machines used in the convents and foundling hospitals of Italy, termed rote, so that any particular beast could be removed from its den into the arena merely by turning it round, and without the possibility of more than one escaping at the same time; and therefore it is recommended by Varro 6 as peculiarly adapted for an avairy, so that the person could go in and out without affording the birds any opportunity of escape.

COCHLEA, therefore, maintains that the cochlea in question was nothing more than a portculis (catapulta) raised by a screw, which interpretation does not appear as probable as the one given above.

COCHLEA (κοχλιάριον) was a kind of spoon which appears to have terminated with a point at one end, and at the other was broad and low like our own spoon. The polos of polos (cochlea) out of those shells, and calying them, whence it derived its name; and the broad part for eating eggs, &c. Martial 8 mentions both these uses of the cochlea:

"Suum cochleae habitis nec sum minus utilis ovæ." 9

Cochlea was also the name given to a small measure like our spoonful. According to Rhenmanni Fannius, it was a part of the cyathus.

CODEX is identical with caudex, as Claudius and Clodius, clastrum and clostrum, cauda and cauda. Catô 5 still used the form caudex in the same sense in which afterward codex was used exclusively. 10 The word originally signified the trunk or stem of a tree, 11 and was also applied to designate anything composed of large pieces of wood, whence the small fishing or ferry boats on the Tiber, which may originally have been like the Indian canoes, or were manufactured of several roughly-hewn planks nailed together in a rude and simple manner, were called nāses cādicaria, or codicariae, or caudiceae. 8 The surname of Caudex given to Appius Claudius must be traced to this signification. But the name codex was especially applied to wooden tablets bound together and lined with a coat of wax, for the purpose of writing upon them; and when, at a later age, parchment, or paper, or other materials were substituted for wood, and put together in the shape of a book, the name of codex was still applied to them. 9 In the time of Cicero we find it also applied to the tablet upon which a bill was written; and the tribune Cornelius, when one of his colleagues forbade his bill to be read by the herald or scribe, read it himself (legit codicem suam 10). At a still later period, during the time of the civil wars, the word codex is applied to express any collection of laws or constitutions of the emperors, whether made by private individuals or by public authority. See the following articles.

CODEX GREGORIANUS and HERMOSI-

A-RUS. It does not appear quite certain if this title denotes one collection or two collections. The general opinion, however, is, that there were two codices, compiled respectively by Gregorians and Hermogenes, who are sometimes, though, as it seems, incorrectly, called Gregorius and Hermogens. The codex of Gregorians consisted of thirteen books at least, which were divided into titles. The fragments of this codex begin with constitutions of Septimius Severus, and end with Diocletian and Maximian. The codex of Hermogenes, so far as we know it, is only quoted by titles, and it also contains constitutions of Diocletian and Maximian; it may, perhaps, have consisted of one book only, and it may have been a kind of supplement or continuation to, or an abridgment of, the other. The name Hermogenes is always placed after that of Gregorians when this code is quoted. According

The Consultationes, the Codex of Hermogenianus also contained constitutions of Valens and Valentinian II, which, if true, would bring down the compiler to a time some years later than the reign of Constantine the Great, under whom it is generally assumed that he wrote. These codices were not made by imperial authority, so far as we know: they were the work of private individuals, but apparently soon came to be considered as authority in courts of justice, as is shown indirectly by the fact of the Theodosian and Justianine Codex being formed on the model of the Codex Gregorius and Codex Justinianus.

The Digest is the last of the four great collections of Justinian. In February of the year A.D. 628, Justinian appointed a commission, consisting of ten persons, to make a new collection of imperial constitutions. Among these ten were Tribonianus, who was afterward employed on the Digesta and the Institutiones, and Theophilius, a teacher of law, Constantine, which the code was directed to compile one code from those of Gregorius, Hermogenianus, and Theodosius, and also from the constitutions of Theodosius made subsequently to his code, from those of his successors, and from the constitutions of Justinian himself. The instructions given to the commissioners empowered them to omit unnecessary preambles, repetition, and all other matter which, according to them, did not press the laws to be derived from the sources above mentioned in brief language, and to place them under appropriate titles; to add to, take from, or vary the words of the old constitutions, when it might be necessary, but to retain the order of time in the several constitutions, by preserving the dates and arranging them in order. They were also directed to arrange them under their several titles in the order of time. The collection was to include rescripts and edicts, as well as constitutions properly so called. Fourteen months after the date of the commission, the code was completed and declared to be law, under the title of the Justinianus Codex; and it was declared that the constitutions, from which the code was derived, were no longer to have any binding force, and that the new code alone should be referred to as of legal authority.

The Digest or Pandect, and the Institutiones, were compiled after the publication of this code, subsequently to which, fifty decisions and some new constitutions also were promulgated by the emperor himself. These constitutions were also arranged under their several titles in the order of time; and, accordingly, a commission for that purpose was given to Tribonianus Dorotheus, a distinguished teacher of law at Berytus in Phoenicia, and three others. The new code was promulgated at Constantinople on the 16th of November, 654, and the use of the decisions, the new constitutions, and of the first edition of the Justinianus Codex, was forbidden. The second edition (secunda editio, repetitio praetexta, Codex repetitus praetextus) is the code that we now possess, in twelve books, each of which is divided into titles. It is not known how many books the first edition contained. The constitutions are arranged under their several titles, in the order of time and with the proper authority by whom they were respectively made, and their dates.

The constitutions in this code do not go farther back than those of Hadrian, and those of the immediate successors of Hadrian are few in number; a circumstance owing, in part, to the use made of the earlier codes in the compilation of the Justianine Code, and also to the fact of many of their earlier constitutions being incorporated in the writings of the jurists, from which alone any knowledge of many of them could be derived.

The constitutions as they appear in this code, have been in many cases altered by the compilers, and, consequently, in an historical point of view, the Code is not always trustworthy. This fact appears from a comparison of this code with the Theodosian code and the Novellae. The order of the subject matter in this Code corresponds, in a certain way, with that in the Digest. Thus the seven volumes to which the fifty books of the Digest are distributed, correspond to the first nine books of the Code. The matter of the last three books of the Code is hardly treated of in the Digest. The matter of the first book of the Digest is placed in the first book of the Code, after the law relating to ecclesiastical matters, which, of course, is not contained in any Digest; and the Anastasis, books of the first part of the Digest correspond to the second book of the Code. The following books of the Code, the ninth included, correspond respectively, in a general way, to the following parts of the Digest. Some of the constitutions which were in the first edition of the Code, and are referred to in the Institutions, have been omitted in the second edition. In addition, a number of books, which have been lost in the course of time, have been restored by Charondas, Cujacius, and Codax, from the Greek version of them. For the editions of the Code, see Corpus Juris.

The Theodosianus, in the year 429, Theodosius II., commonly called Theodosius the Younger, made a new code, called Codex Theodosianus or Codex Theodosianus Testamenti Principis, which, if it is to be credited, had as its aim to reform the Code of Theodosius. But the work was never completed, and as it was never published, it never came into use. The code was in two parts: the first part consisted of the constitutions promulgated to the year 429, the second part consisted of those promulgated till the year 449. The constitutiones of the first part of this code are in seven books, those of the second part in four books. The first book contains constitutions of the year 429, the second book those of the year 429 to 434, the third book those of the year 434 to 440, and the fourth book those of the year 440 to 449. The second edition of the Code of Theodosius was made about the year 447, and was completed in 450. The Code of Theodosius was the last of the four great collections of Justinian. The Code of Theodosius consists of sixteen books, the greater part of which, as well as his No.
The prandium, called by Suetonius13 citius meridians, was usually taken about twelve or one o'clock.14 For the luxurious palate, as we gather incidentally from Horace's Satires, very different provisions were made from what was described above as his own simple repast. Fish was a requisite of the table:15

"Foris est provens, et atrum
Defendens pices hyemet mare;"

to which the choicest wines, sweetened with the finest honey, were to be added:

"Nisi Hymettia mella Falerno
Nobilis dilata;"

which latter practice is condemned by the learned gastronomer16 who recommends a weaker mixture.

"Lent praecordia mulsus
Proculus melius;"

and gravely advises to finish with mulberries fresh gathered in the morning.17

The words of Pestum, "casa apud antiquos dicitur quad mundum prandium," have given much trouble to have been usual, except in the case of children or sick persons, or the luxurious, or, as Nunius adds, of labouring men. An irregular meal (if we may so express it) was not likely to have any very regular time: two epigrams of Martial, however, seem to fix the hour at about three or four o'clock in the morning.1 Bread, as we learn from the epigram just quoted, formed the substantial part of the early breakfast, to which cheese,19 or dried fruit, as dates and raisins,4 was sometimes added. The jentaculum of Vitellius6 was doubtless of a more solid character; but this was a case of monstrous luxury.

Next followed the prandium or luncheon, with persons of simple habits a frugal meal:

"Quantum interpellet mani
Venire diem durare.":

agreeably with Seneca's account,8 "Panis deinde steus et sine mensa prandium, post quod non sunt laetana mensae." From the latter passage we learn incidentally that it was a hasty meal, such as sailors3 and soldiers9's wont of when on duty, without sitting down. The prandium seems to have originated in these military meals, and a doubt has been entertained whether in their ordinary life the Romans took food more than once in the day. Pliny11 speaks of Aulus Bassus as following the ancient custom in taking luncheon; but again,12 in describing the manners of an oldfashioned person, he mentions no other meal but the cena. The following references13 seem to prove that luncheon was a usual meal, although it cannot be supposed that there were many who, like Vitellius, could avail themselves of all the various times which the different fashions of the day allowed ("cupsas trifurium semper, interdum quadrifariam disperditionis, in jentaculum et prandium, et connas, consamatesque; facile omnium sufficiens, somnii comitans consecutus")24. It would evidently be absurd, however, to lay down uniform rules for matters of individual caprice, or of fashion at best.

The prandium, ante the time of Justinian, was doubled, and the twelfth hour of the day was considered as the proper time to take it. The meal, which with the Romans was not always clearly distinguished, it will be convenient to treat of all under the most important one. The following article is designed to give a short account of the familiar day of the Romans. No one who remembers the changes which custom has brought about in our own country during the last century, will expect the same description of domestic manners to apply. The reader will, however, in some measure, be enabled to take in the ordinary life of the middle rank of society in the Augustan age, noticing incidentally the most remarkable deviations, either on the side of primitive simplicity or of late refinement.

The meal with which the Roman sometimes began the day was the jentaculum, a word derived, as Isidore would have us believe, a jejunio sabbendi, and answering to the Greek ἁκιστός. Pestus tells us that it was also called prandicum or siothum. Thus by no means uncommon, it does not appear

1. (De Re Cib., i., 4.)—2. (Mart., Epigr., xiv., 283; vii., 67.
9.—3. (April, Met., i., p. 110, ed. Francon, 1891.) — 4. (Suet.
to the critics, perhaps needlessly, when we remember the change of hours in our own country. If we translate *ccena*, as, according to our notions, we ought to do, by "dinner," they describe exactly the alteration of our own manners during the last century. The analogy of the Greek word *eiskena*, which, according to Athenaeus, was used in a similar way for *upavos*, also affords assistance. Another meal, termed *merenda*, is mentioned by Isidore and Festus, for which several refined distinctions are proposed; but it is not certain that it really differed from the *premonium*.

The sauce was made of citron, maple-wood, or even of ivory, 9 was covered with a *menula*, and each of the different courses, sometimes amounting to seven, 9 served upon a *ferculum* or waiter. In the "munda supellex" of Horace, great care was taken.

"Ne tarpe toral, ne sordida mappa
Corruget nares; ne non et cantharus et lana
Ostendat tibi.* 10

And on the same occasion, the whole dinner, which consisted of vegetables, was served up on a single plate.

To return to our description, the dinner usually consisted of three courses: first, the *promulus* or *antecena*, called also *gestatio*, made up of all sorts of stimulants to the appetite, such as those described by Horace, "Rapula, lactuca, radices, qualia lassum
Pervellunt stomachum, sicer, alec, facula Coo.* 11

Eggs also were so indispensable to the first course that they almost gave a name to it (ab ovo *Usque ad male*). In the *promulus* of Trimalchio's supper—probably designed for the Emperor—*a sas* of Corinthian brass is introduced, bearing two panners, one of white, the other of black olives, covered with two large dishes inscribed with Trimalchio's name. Next come dormice (*galeres*) on small bridges sprinkled with poppy-seed and honey, and hot sausages (*tomacula*) on a silver gridiron (*crascula*), with Syrian prunes and pomegranate berries and pomegranate juice. These however, were imperial luxuries; the frugality of Martial only allowed of lettuce and Sicenian olives; indeed, he himself tells us that the *promulus* was a refinement of modern luxury. 18 Macrobius 11 has left an authentic record of a *ccena pontificum*, given by Lentinus on his election to the office of flamen, in which the first course was made up of the following dishes: Several kinds of shell-fish (*chichini, ostra crusde, petrodisca, spondylis, glycocyamides, maccias pura, balani albi et nigri*), thrushes, asparagus, a fattened hen (*gallina altissima*), beccaficoes (*facculde*), nettles (*urtica*), the haunches of a goat and wild boar (*lumbi capregnatis, eprynti*), rich meats made into pasties (*alitiae ex formis melonicae*), many of which are twice mentiond in the inventory.

It would far exceed the limits of this work even to mention all the dishes which formed the second course of a Roman dinner, which, whoever likes, may find minutely described in Bulengerus. 19 Of birds, the Guinean-hen (*afra alve*), the pheasant (*phaisin*), so called from Phainos, a river of the Emporium, and the *petraea* mentioned in the *IXI. C.*; the liver of a cappus steeped in milk (*Pliny*), and beccaficoes (*facculde*) dressed with pepper, were held a delicacy. 14 The peacock, according to Macrobius, was first introduced by Hortenius the orator, at an inaugural dinner, and acquired such a name among the Romans gourmends as to be commonly sold for fifty denaries. Other birds are mentioned, as the duck (*anaud*), especially its head and breast; the woodcock (*aita gen*), living in the breeding flamingo (*phoenicopterus*), the tongue of which, Martial tells us, especially commended itself to the delicate palate of fish. Of the variety, was perhaps still greater: the chart (*scaurus*), the turbot (*thormbus*), the sturgeon (*cippenisser*), the mullet (*muileus*), were highly prized, and dressed in the most various fashions. In the banquet of Nastidenius, an eel is brought, garnished with prawn swimming in its own blood. 13 O. Cassius, says Martial, seems to have been the favourite dish, especially sucking-pig; the paps of a sow served up in milk (*suum*), the flitch of bacon (*petasao*), the womb of a sow (*vulva*), are all mentioned by Martial. Boar's flesh and venison were also in high repute, especially the former, described by Juvenal 13 as animal proprius convivium natum. "Condiments were added to most of these dishes: such were the murria, a kind of pickled made from the tunny-fish; the *garum socium*, made from the intestines of the mackerel (*scomboer*), so called because brought from abroad; alec, a sort of brine; *fæx*, the sediment of wine. 13 &c., for the receipts of which we must again refer the reader to Cato's learned instructor. 17 Several of these dishes are mentioned by Martial, such as mushrooms (*tuberece*) which either made dishes by themselves, or formed the garniture for larger dishes.

It must not be supposed that the *artesiae* of imperial Rome were at all behind ourselves in the preparation and arrangements of the table. In a large household, the functionaries to whom this important part of domestic economy was confided was the *caret* or *cook*, the *butler* (*promulus*), the *cook* (*archimagnirus*), the arranger of the dishes (*structor*), and the carver (*carpior or scissor*). Carving was taught as an art, and, according to Petronius, 15 performed to the sound of music, with appropriate gesticulations, "Negque enim minimo discrimine retract
Quo culti lepores et quo gallina sociatur." 16

In the supper of Petronius, a large round tray (*ferculum, repertorium*) is brought in, with the signa of the *botrarius*, a slave who introduced it. The *artesiae* (*structor*) had placed some appropriate viand: a goose on Aquarius; a pair of scales, with tarts (*sorbile*), and cheese-scakes (*plaecetas*) in each scale, on Libra. &c. In the middle was placed a hive supported by delicate herbage. Presently four slaves come forward, dancing to the sound of music, and take away the upper part of the dish; beneath appear all kinds of dressed meats: a bare with wings, to imitate Pegasus, in the middle; and four figures of Marayas at the corners, pouring hot sauce (*garum pipipate*), over the fish that were swimming in the Eurus below. So entirely had the Romans lost all shame of luxury, since the days when Cincinnus, in supporting the Fannian law, charged his own age with the enormity of introducing the barbarous *Trojanus* (a sort of pudding stuffed with the flesh of other animals) 14.

The bellaria or dessert, to which Horace alludes when he says of Tigellinus ab ovo *Usque ad mala citrat*, consisted of fruits (which the Romans usually ate uncooked), such as almonds (*amygdala*), dried grapes (*voce passus*), dates (*palmae, laetae, discreti*); of savoury fruit preserves, called *essece, dulciaria*, such as cheesecakes (*cupodia, crustula, liba, plactena, aritogalam*), almond-cakes (*copitos*), tarts
CENA.

(puritide), whence the maker of them was called pistor dulcarinus, placentarius, librarius, &c.

We will now suppose the table spread and the guests assembled, each with his (digitus crepidus), and in his dinner-dress, called canatoria or cubatoria, usually of a bright colour, and variegated with flowers. First they took off their shoes for fear of soiling the couch, which was often inlaid with ivory or tortoise-shell, and covered with cloth of gold. Next they lay down to eat, the head resting on the left elbow, and supported by cushions. There were usually, but not always, three on the same couch, the middle place being esteemed the most honourable. Around the tables stood the servants (ministri), clothed in a tunic, and girt with napkins; some removed the dishes and wiped the tables with a rough cloth (groupe); others gave the guests water for their hands, or cooled the room with fans. Here stood an Eastern youth behind his master's couch, ready to answer the noise of the fingers (digitus crepidus), while others bore a large platter (mazonum) of different kinds of meat to the guests.

Whatever changes of fashion had taken place since primitive times, the cena in Cicero's day was at all events an evening meal. It was usual to bathe about two o'clock and dine at three, hours which seem to have been observed, at least by the higher classes, long after the Augustan age. When Juvenal mentions two o'clock as a dinner hour, he evidently means a censure on the luxury of the person named.

"Exul ab octavo Marius bibit."

In the banquet of Nasidienus, about the same hour is intended when Horace says to Fundanius,

"Nam mibi quaranti convivum dixit here ille."

De medio potare die."  

Horace and Maccenas used to dine at a late hour, about sunset. Perhaps the various statements of classical authors upon this subject can only be reconciled by supposing that with the Romans, as with ourselves, there was a great variety of hours in the different ranks of society.

Dinner was set out in a room called canatio or dieta (which two words perhaps conveyed to a Roman ear the same meaning as our dining-room and parlour). The canatio, in rich men's houses, was fitted up with great magnificence. Suetonius mentions a supper-room in the Golden Palace of Nero, constructed like a theatre, with shifting scenes to change with every course. The garret of the poor man was termed canaculum. In the midst of the canatio were set three couches (triclinia), answering in shape to the square, as the long semicircular couches (sigmata) did to the oval tables. An account of the disposition of the couches, and of the place where each guest occupied, is given in the article Triclinium.

The Greeks and Romans were accustomed, in later times, to recline at their meals; though this practice could not have been of great antiquity in Greece, since Homer never describes persons as reclining, but always as sitting at their meals. In the midst of the canatio there was a popular custom at Rome. The earliest writers of the Roman empire instance this custom; but it seems to be, has the shade of the subject, both shows the naked feet of Icarus, who has partly raised himself from his couch to welcome li-

cotta in the British Museum, representing this subject. While the naked feet of Icarus, who has partly raised himself from his couch to welcome his
cota in the British Museum, representing this subject, both shows the naked feet of Icarus, who has partly raised himself from his couch to welcome his
**COGNATI.**

**COGNA'CULUM. (Vid. Cogn.)**

**COGNA'TO. (Vid. Cogn.)**

**COGNATI.** The following passage of Ulpian will serve as the best introduction to the meaning of the term, and to some of the points that are involved in the question of cognatio and agnatio:

"The heir bdRev in intestate ingenui belong in the first place to their sui heredes, that is, children who are in the power of the parent, and those who are in the place of children as grandchildren, for instance; if there are no sui heredes, it belongs to the consanguinei, that is, brothers and sisters by the same father (or, with respect to one another, that they should be by the same mother); if there are no consanguinei, it belongs to the remaining and nearest agnati, that is, to the cognati of the male sex, who trace their descent through males, and are of the same family. And this is provided by the following law of the Twelve Tables: "_Sic intestato motur eiu sueae herae nee exsct, agnatus promus familia habeatur._"

The foundation of cognatio is a legal marriage. The term cognatus (with some exceptions) comprehends agnatus: an agnatus may be a cognatus, but a cognatus is only an agnatus when his relationship by blood is traced through males.

The following will give a correct notion of agnatus and cognatus. Familia means all those free persons who are in the power of the same paterfamilias, or head of a familia; and in this sense familia signifies all the agnati, or all those who are united in one body by the common bond of the patri potestas.

The cognatio, as already said, was the relationship of blood which existed between those who were sprung from a common pair, and it therefore (with some exceptions) contained the agnatio. But legitimate grandchildren of sons who were not emancipated were also in the patri potestas, consequently formed part of the familia, and were agnati. Adopted children were also in the father's power, and, consequently, were agnati, though they were not cognati. Some of the potestas maintained his power over his familia so long as he lived, except over those who were emancipated, or passed into another familia, or in any way sustained a deminutio capitis. On his death, the common bond of the patri potestas was dissolved, and his sons became respectively heads of families; that is, of persons who were in the power of their parents, with respect to one another, were agnati. But all these persons continued to be members of the same familia; that is, they were still agnati, and, consequently, the agnatio subsisted among persons so long as they could trace back their descent through males to one common paterfamilias.

Agnati, then, are those who would be in the paternal line, as a wife in her man's, or in the manus of a son who is in the father's power, if the paterfamilias were alive: and this is true whether such persons ever were actually so or not." We must suppose, then, in order to obtain a clear notion of agnatio, that if the person from whom the agnati claim a common descent were alive, and they were all in his power, all the manus of those who are in his power, they would all be agnati. In order, then, that agnatio may subsist between persons, the person from whom the descent is claimed must have lost his patri potestas by death only, and not by any capita deminutio, and, consequently, not by any of his children passing into any other patri potestas, or into the

---

1. (Hugo, Lehrbuch, &c.)
This table shows all the degrees of cognatio in the Roman law, and, of course, also the degrees of agnatio. The degree of relationship of any person to a person who is not a collateral by consanguinity to the person with respect to whom the relationship is inquired after (is sene, &c.), is indicated by the figures attached to the several words. The Roman numerals denote the degree of cognatio in the canon law, and the Arabic numerals the degrees in the Roman or civil law. The latter are reckoned in Rome. It will be observed, that in the canon law, the number which expresses the collateral degree is always the greater of the two numbers (when they are different) which express the distance of the two parties from the common ancestor; but in the civil law, the degree of relationship is ascertained by counting from either of the two persons to the other through the common ancestor. All those words on which the same Roman or the same Arabic numerals occur, represent persons who are in the same degree of cognatio, according to these respective laws, to the person is sene, &c.,

Cognitor. (Vid. Actio.)

Cognomen. (Vid. Nomen.)

Cohors. (Vid. Army, Roman, p. 104.)

*COIX (εκίδη), a species of Egyptian Palm-tree, of the genus of which and its various relations several species are known. See following, the Coix laet-ryma Joly. Baumh. mentions that some had taken it for a species of Lithospernum. The term κόιδη in Theophrastus, out of which some would make the Cynca revoluta, or Japanese Sago-palm, is merely the accusative plural for κόιδη, from κόιδη, just as some read coca for κόιδη in Pliny.

*COLOCICUM (κολοκισι), the Meadow Saffron, or Colchicum Autumnale. This herb commonly mentions it as a poisonous plant, but Alexander of Tralles, a physician of the sixth century, prescribes it in cases of gout, in which, as also in the rheumatism and neuralgic affections, it is still found a valuable medicine at the present day. The celebrated specific for gout, known by the name of Eau Medicinale d'Hyssop, is said to be the venomous infusion of Colchicum. The poisonous infusion of this plant has been recommended in cases of gout by Sir Everard Home. It very rarely fails in such complaints to break up the paroxysm, sometimes acting on the bowels, at other times on the kidneys and skin, and often without any apparent accompanying effect. It is but right to state, however, that the most judicious writers on gout consider it a dangerous medicine ultimately.4 (Vid. Ephemerides and Hermodactyles.)

Collatio bonorum. (Vid. Bonorum colla-
tio.)

Collegium. The persons who formed a collegium were called colleges or sodales. The word collegium properly expresses the notion of several persons being united in one office or for any common purpose. The etymology of the word is of doubtful origin; it is the substantive of the personal suffix collegii, and the union which bound them together. The collegium was the etuosia of the Greeks.

The legal notion of a collegium was as follows:

A collegium or corpus, as it was also called, must consist of three persons at least.4 Persons who legally formed such an association were called corpus haberes, which is equivalent to our phrase of being incorporated; and in later times they were said to be corporat, and the body was called a corporato.

Those who formed the public revenues mines, or salt-works (salinae) might have a corpus. The power of forming such a collegium or societas (for this term also was used) was invested in colleges, senatus consulta, and imperial constitutions. Associations of individuals, who were entitled to have a corpus, could hold property in common; they could hold it, as the Roman jurists remark, just as the state held property (res communes). These collegia had a common chest, and could sue and be sued by their syndicus or actio. Such a body, which was sometimes called a universitas, was a legal unity. That which was due to the body was not due to the individuals of it, and that which the body owed was not the debt of the individuals. The common property of the body was liable to be seized and sold for the debts of the body. The collegium or universitas was governed by its own regulations, which might be any regulations that the body agreed upon, provided they were not contrary to law: this provision, as Gaits cu. journals,4 was derived from a law of Solon, which he quotes. The collegium still subsisted, though all the original members were changed: it had, as our law expresses it, perpetual succession. Thus it appears that the notion of a collegium is precisely that of our modern corporations, the origin of which is clearly traceable to these Roman institutions.

A lawfully constituted collegium was legitimate. Associations of individuals, which affected to act as collegia, but were forbidden by law, were called illicita.

It does not appear how collegia were formed, except as some were specially established by legal authority. Other collegia were probably formed by voluntary associations of individuals, under the provisions of some general legal authority, such as that of the publicani. This supposition would account for the fact of a great number of collegia being formed in the course of time, and of many of them being occasionally suppressed as not legitimate.

Some of these corporate bodies resembled our companies or guilds; such were the faborum, pictorum, &c., collegia. Others were of a religious character; such as the pontificum, augurum, &c., collegia. But the collegia were both concerned about government and administration; as tribunorum plebis, questorum, decurionum collegia. The titles of numerous other collegia may be collected from the Roman writers and inscriptions.

According to the definition of a collegium, the consule, being only two in number, were not a collegium, though each was called collega with respect to the other, and their union in office was called collegium. It does not appear that the Romans ever called the individual who, for the time, filled an office of perpetual continuance, a universitas or collegium: a kind of contradiction in terms, which it has been reserved for modern times to introduce, under the name of a corporation sole. But the notion of collegia belonging to all the property and legal rights of a predecessor was familiar to the Romans in the case of a heres, who was said to take per universitatem, and the same notion, no doubt, always existed with respect to individuals who held any office in perpetual succession.

According to Upian, a universitas, though reduced to a single member, was still considered a universitas; for the individual possessed all the rights and properties belonging to the body, and the name by which it was distinguished.

When a new member was taken into a collegium,

COLOCASIA. COLONIA.

From the document, it appears that the text is discussing the geographical and cultural aspects of different places, possibly focusing on colonies and cities. The text mentions places like Colocasia, Colonia, and other locations, and discusses their historical or geographical significance. The text also references works by authors like Virgil and Polybius, indicating a scholarly or educational context.

The text seems to be a mix of historical and geographical references, possibly from a scholarly work or a historical text. It touches on various topics, including the cultural and political aspects of the places mentioned, and may include discussions on earlier works by other authors.

Overall, the document appears to be a detailed exploration of various cities and colonies, emphasizing their historical contexts and their roles in the region. The use of Latin names and terms suggests that the text is aimed at a scholarly audience familiar with these references.
and the practice was continued, without interruption, during the Republican and under the Empire. Signor Cicero enumerates six main causes or reasons which, from time to time, induced the Romans to send out colonies; and these causes are connected with many memorable events in Roman history. Colonies were intended to keep in check a conquered people, and also to repress hostile incursions, as in the case of the colony of Narnia, which was founded to check the Umbri; and Minturnae and Sinuessa were similarly founded for similar purposes. Cicero calls the old Italian colonies the “propaganda imperii;” and in another passage he calls Nabro Martius (Narbonne), which was in the province Gallia, “Colonia nostrorum civium, speculatio populi Romani et propagandae.” Another object was to increase the power of Rome by increasing the population. Sometimes the immediate object of a colony was to carry off a number of turbulent and discontented persons. Colonies were also established for the purpose of providing for veteran soldiers, a practice which was begun by Sulla, and continued under the emperors: these colonies were called militares.

It is remarked by Strabo, when speaking of the Roman colonies in the north of Italy, that the ancient inhabitants of the places were retained, and that, though the people in his time were all Roman, they were called by the names of the previous occupiers of the soil. This fact is in accordance with the character of the old Roman colonies, which were in the nature of garrisons planted in conquered towns, and the colonists had a portion of the conquered territory (usually a third part) assigned to them. The inhabitants retained the rest of their lands, and lived together with the new settlers, who alone composed the proper colony. The conquer ed people must at first have been quite a distinct class from, and inferior to, the colonists. The definition of a colony by Gellius will appear, from what has been said, to be sufficiently exact: “Ex civitate quasi propagata — populi Romani quasi effigies pars urbis simulacrum.”

No colony was established without a lex, plebisitum, or senatus consultum; a fact which shows that a Roman colony was never a mere body of adventurers, but had a regular organization by the parent state. As to the nature of an ancient definition quoted by Niebuhr, a colony is a body of citizens, or states, made up to possess a commonwealth, with the approbation of their ruler, by the arrangement and devised by the state to which they belong; and it is added, those are colonies which are founded by public act, not by any secession. Many of the laws which relate to the establishment of colonies were leges agrariae, or laws for the division and assignment of public lands, of which Siginius has given a list in his work referred to.

When a law was passed for founding a colony, persons were appointed to superintend its formation (coimium dedicare). These persons varied in number, but three was a common number (triurum viri ad colonos deductores). We also read of duumviri, quinqueviri, vigintiviri for the same purpose. The law fixed the quantity of land that was to be distributed, and how much was to be assigned to the colony. If some colonists could not secure a colony without his free consent, and when the colony was not an inviting one, it was difficult to fill up the number of volunteers.

Roman citizens who were willing to go out as members of a colony gave in their names at Rome. Cicero says that Roman citizens who elapsed to become members of a Latin colony must go voluntarily (vacuerent factis), for this was a capitis deminutio; and in another passage he adds the fact of Roman citizens going out in Latin colonies as a proof that loss of civitas must be a voluntary act. It is true that a member of a Roman colony would sustain no capitis diminutio, but in this case, also, there was a plagues for any who, in the time he ever joined such a colony without his consent.

The colony proceeded to its place of destination in the form of an army (sub vestito), which is indicated on the coins of some colonies. If one did not already exist, it was a necessary part of a new colony, and its limits were marked out by a plough, which is also indicated on ancient coins. The colony had also a territory, which, whether marked out by the plough or not, was at least marked out by metes and bounds. Thus the urbs and territory of the colony respectively corresponded to the urbs Roma and its territory. Religious ceremonies always accompanied the foundation of the colony, and the anniversary was afterward observed. It is stated that a colony could not be sent out to the same place to which a colony had been sent in due form (auspicio dedicato). This merely means that, once the colony had maintained its existence, there could be no new colony in the same place; a doctrine that would hardly need proof, for a new colony implied a new assignment of lands; but new settlers (novi subscripti) might be sent to occupy colonial lands not already assigned. Indeed, it was not unusual for a colony to receive conditions; and a colony might be re-established, if it seemed necessary from any cause; and under the emperors such re-establishment might be entirely arbitrary, and done to gratify personal vanity, or from any other motive.

The commissioners appointed to conduct the colony had apparently a profitable office, and the establishment of a new settlement gave employment to numerous functionaries, among whom Cicero enumerates procuratores, scriba, librarii, procuratorial architects. The foundation of a colony might, then, in many cases, not only be a mere party measure, carried for the purpose of gaining popularity, but it would give those in power an opportunity of providing places for many of their friends.

A colony was a part of the Roman state, and it had a people; but its relation to the parent state might vary. In Livy’s the question was, whether Aquileia should be a colony cives Romanorum or a Latina colony; a question that had no reference to the persons who should form the colony, but to their political rights with respect to Rome as members of the colony. The members of a Roman colony (colonia civium Romanorum) must, as the term itself implies, have always had the same rights, which, if they would have had at Rome. They were, as Niebuhr remarks, a sort of old Roman colonies, “the populus; the old inhabitants, the commonalty.” These two bodies may, in course of time, have frequently formed one; but there could be no political union between them till the old inhabitants obtained the commerce and connubium, in other words, the civitas; and it is probable that, among the various causes which weakened the old colonists, the recurring wars impeded a union of the colonists necessary, we should enumerate the want of Roman women; for the children of a Roman were

not Roman citizens unless his wife was a Roman, or unless she belonged to a people with which there was connubium. It is important to form a precise notion of the relation of an ancient Roman colony to Rome. That the colonists, as already observed, had all the rights of Roman citizens, is a fact capable of perfect demonstration; though most writers, following Siginonius, have supposed that Roman citizens, by becoming members of a Roman colony, lost the suffragium and honores, and did not obtain them till after the passing of the Julian law. Such an opinion is inconsistent with the notion of Roman citizenship, which was a personal, not a local right; and it is also inconsistent with the very principle of Roman policy apparent in the establishment of Roman colonies. Further, the loss of the suffragium and honores would have been a species of capitum deminutio; and it is clear, from what Cicero says of the consequences of a Roman voluntarily joining a Latin colony, that no such consequences resulted from becoming a member of a Roman colony: If a Roman ever became a member of a Roman colony without his consent, it must have been in the early ages of the state; when the colonies still retained their garriam character, and to join a colony was a kind of military service; but such a duty to protect the state, instead of implying any loss of privilege, justifies quite a different conclusion.

It is somewhat more difficult to state what was the condition of those conquered people among whom the Romans did not allow them to become Roman citizens. They were not Roman citizens, nor yet were they socii; still they were, in a sense, a part of the Roman state, and in a sense they were cives, though certainly they had not the suffragium, and, perhaps, originally not the connubium. It is probable that they had the commercium, but even this is not certain, because it might be a privilege of the conquerors without being cives, and the difficulty of ascertaining their precise condition is increased by the circumstance of the word cives being used loosely by the Roman writers. If they were cives in a sense, this word imported no privilege; for it is certain that, by being incorporated in the Roman state, they became at least Roman subjects, or at any rate, administering their own affairs, and obtained no share in the administration of the Roman state; they had not the honourable rank of socii, and they were subject to military service and taxation. They lost all jurisdiction, and it is probable that they were brought entirely within the rules and procedure of the Roman law, so far as that was practicable. Even the commercium and connubium with the people of their own stock were sometimes taken from them, and thus they were disinherited from their own nation, and made a part of the Roman state. So far, then, was the civitas (without the suffragium) from being always a desirable condition, as some writers have supposed, that it was, in fact, the privilege of the conquerors. If the conquerors preferred their former relation to Rome to being incorporated with it as complete citizens. It appears that, in some cases at least, a prefectus juri dicundo was sent from Rome to administer justice among the conquered people, and between them and the coloni. It appears, also, to be clearly proved, by numerous instances, that the condition of the conquered people among whom a colony was sent was not originally always the same; something depended on the resistance of the people, and the temper of the Romans at the time of the conquest or surrender. Thus the conquered Italian towns might originally have the civitas in different degrees, until they finally obtained the complete civitas by receiving the suffragium; some of them obtained it before the social war, and others by the Julian law.

The nature of a Latin colony will appear sufficiently from what is said here, and in the article Civitas. Besides these colonies there were colonia Italii juris, as some writers term them; but which, in fact, were not colonies. Suginoni, and most subsequent writers, have considered the jus Italium as a personal right, like the civitas and Latinitas; but Savigny has shown it to be quite a different thing. The jus Italium was granted to favoured provincial cities; it was a grant to the community, not to the individuals composing it. This right consisted in quiritarian ownership of the soil (commercium), and its appurtenant capacity of municipio, usucaption, and vindicatio, together with freedom from taxes; and also in a municipal constitution, after the fashion of the Italian towns, with duurni, quinquennales, ediles, and a juridictio. Many provincial towns, which possessed the jus Italicum, have on their coins the figure of a standing Silenus, with the hand raised, which was the peculiar symbol of municipal liberty. Pliny has mentioned several towns that had the jus Italium; and Lugdunum, Vienna (in Dauphiné), and colonia Agrrippensis had this privilege. It follows, from the nature of this privilege, that towns which had the Latinitas or the civitas, which was a personal privilege, might not have the jus Italium; but the towns which had the jus Italicum could hardly be any other than those which had the civitas or Latinitas, and we cannot conceive that it was ever given to a town of Pergami

The colonial system, which originated in the earliest ages, was peculiarly well adapted to strengthen and extend her power: "By the coinage the empire was consolidated, the decay of population checked, the unity of the nation and of the language diffused." The countries which the Romans conquered within the limits of Italy were inhabited by nations that cultivated the soil and built cities. To destroy such a population was not possible nor politic; but it was a wise policy to take part of their lands, and to plant bodies of Roman citizens, and also Latinae coloniae, among the conquered people. The power of Rome over her colonies was derived, as Niebuhr has well remarked, "from the supremacy of the parent state, to which the colonies of Rome, like sons in a Roman family, even after they had grown to maturity, continued unalterably subject." In fact, the notion of the patria potestas will be found to lie at the foundation of the institutions of Rome.

The difficulty with which the Republic had in maintaining her colonies, especially in the north of Italy, appears from numerous passages; and the difficulty was not always to protect them against hostile aggression, but to preserve their allegiance to the Roman state. The reasons of this difficulty will sufficiently appear from what has been said.

1. (Liv. ix. 43; viii. 14.)
N N

I. (iii. 3 and 21.)—2. (Machavelli, qu. * by Niebuhr.)
The principles of the system of colonization were fully established in the early ages of Rome; but the colonies had a more purely military character, that is, were composed of soldiers, in the latter part of the Republic and under the earlier emperors, at which time, also, colonies began to be established beyond the limits of Italy, as in the case of Narbonne, already mentioned, and in the case of Neanassa (Nîmes), which was made a colony by Augustus, an event which is commemorated by medals, and an extant inscription at Nîmes. In addition to the evidence from written books of the numerous colonies established by the Romans in Italy, and subsequently in all parts of the Empire, we have the testimony of medals and inscriptions, in which COI., the abbreviation of colonia, indicates this fact. The prodigious activity of Rome in settling colonies in Italy is apparent from the list given by Frontinus, most of which appear to have been old towns, which were either walled when the colony was founded, or strengthened by new defences.

Colonies were sometimes established under the Empire with circumstances of great oppression, and the lands were assigned to the veterans without strict regard to existing rights. Under the emperors, all legislative authority being then virtually in them, the foundation of a colony was an act of imperial grace, and often merely a title of honour conferred on some favoured spot. Thus M. Aurelius raised the rank of colonia the small town (vicus) of Halae, at the foot of Taurus, where his wife Faustina died. The old military colonies were composed of whole legions, with their tribunes and centurions, who, being united by mutual affection, composed a political body (res publica); and it was a complaint in the time of Nero, that soldiers, who were strangers to one another, without any head, without any bond of union, were suddenly brought together on one spot, numerus magnum genusque.” And on the occasion of the mutiny of the legions in Pannonia, upon the accession of Tiberius, it was one ground of complaint, that the soldiers, after serving thirty or forty years, were separated, and dispersed in remote parts; where they received, under the name of a grant of lands (per nomen agrorum), swampy tracts and barren mountains. Their name seems to have been most common. Their principal duties were the administration of justice, and, accordingly, we find on inscriptions “Duumvir J.D.” (jure dicendo), “Quattuorviri J.D.” They were styled magistrates pre-eminently, though the name “duumvir” was more common, and was the most general name for all persons who filled similar situations. The name consul also occurs in inscriptions to denote this chief magistracy; and even dictator and praetor occur under the Empire and under the Republic. The office of the duumvir lasted a year. Sallust shows that under the Republic the jurisdiction of the duumvir in civil matters was unlimited, as it was only under the Empire that it was restricted in the manner which appears from the extant Roman law.

In some Italian towns there was a prefectus juri dicundo; he was in the place of, and not coexistent with, duumvir. The duumviri were, as we have seen, originally chosen by the people; but the prefect was appointed annually in Rome, and sent to the town called a prefectura, which might be either free town or part of a municipium, or municipium, for it was only the matter of the prefectura that a town called a prefectura differed from other Italian towns. At pinum is called both a municipium and a prefectura; and Cicero, from this place, obtained the highest honours that Rome could confer.

The censor, curator, or quinquennalis, all which names denote the same functionary, was also a municipal magistrate, and corresponded to the censor at Rome, and in some cases, perhaps, to the questor also. Censors are mentioned in Livy¹ as magistrates of the twelve Latin colonies. The quinquennales were sometimes duumviri, sometimes quattuorviri; but they are always carefully distinguished from the duumviri and quattuorviri J. D.; and their functions are clearly shown by Sallusty to have been those of censors. They held their office for one year, and during the four intermediate years the functions were not exercised. The office of censor or quinquennalis was higher in rank than that of praefectus, and could only be filled by those who had discharged the other offices of the municipality.

For a more complete account of the organization of these municipalities, and of their fate under the Empire, the reader is referred to an admirable chapter in Sallusty, from which the above brief notice is taken.

The terms municipium and municipices require explanation in connexion with the present subject, and the explanation of them will render the nature of a prefecture still clearer. One kind of municipium was a body of persons who were not Roman citizens, but possessed all the rights of Roman citizens except the suffragium and the honores. But the confusion of these and other examples of this kind of municipium are the Fundani, Firmiani, Campani, Acerrani, Lanuvini, and Tusculani, which were conquered states, and received the civitas without the suffragium; and all these places received the complete civitates before the social war, or, as Festus expresses it, "Post aliqut annos cives Romani effectis est, ut videtur, quod alia est another ancient definition of this class of municipia. Persons who had the rights of Roman citizens, except the honores, were cives; and among such communities are enumerated the Cumani, Acerrani, and Atellani. This discrepancy merely shows that the later Roman writers used the word civis in a very loose sense, which we cannot be surprised at, as they wrote at a time when these distinctions had ceased. Another kind of municipium was, when a civitas was completely incorporated with the Roman state; as in the case of the Anagnini, Cariei, and Ariciini, who completely lost all internal administration of their cities; while the Tusculani and Lanuvini retained their internal constitution, and their magistrature called a dictatores. A third class of municipium was that whose inhabitants possessed the full privileges of Roman citizens, and also the internal administration of their own cities, as the Tiburtines, Praenestini, Pisani, Urbanites, Nolani, Bononicenses, Placentini, Nepcami, Sutrini, and Lucrenses (Lucenses)¹. The first five of these were given the civitates at earum republicae, the second five coloniae Latine; they all became municipia, but only by the effect of the Julia Lex, B. C. 90.

It has also been said that a prefectura was so called from the circumstance of a prefectus J. D. being sent from Rome. Those towns in Italy were called prefecture, says Festus, "In quibus et jus diebatar et mandane agebatur; et ex parte a municipio prefectus suus habebatur; in quas legibus prefecti mittebatur quotidiam, quis judieerent." Thus a prefectura had a respublica, but no magistratus. He then makes two divisions of prefectures. To the first division were sent four prefects chosen at Rome (popule sufragio); and he enumerates ten places in Campania to which these quattuorviri were sent, and among them Cumae and Accra, which were municipia; and Volturnum, Liternum, and Putetoli, which were Roman colonies established after the second Punic war. The second division of prefecture comprised those places to which the praefectus urbani sent a prefectus every year; namely, Fundi, Formiae, Vesta, Varvurum, Alba, Privernum, Anagana, Frusina, Reate, Saturnia, Nursia, Arpinum, alliaque ceterae. Only one of them, Saturnia, was a colony of Roman citizens; the rest are municipia. It is the conclusion of Zumpt, that all the municipia of the older period, that is, up to the time when the complete civitas was given to the Latin and the socti, were prefecturae, which had only the power to pass the laws of colonies and were also prefecturae. Now as the prefectura was appointed for the purpose of administering justice (iuri dicendo), and was annually sent from Rome, it appears that this was one among the many admirable parts of the Roman polity for maintaining harmony in the whole political system by a uniting certain municipalities into one municipal body. The same prefectura continued after the year B. C. 90; but Zumpt seems that, in some places at least, this functionary ceased to be sent from Rome, and various prefecturae acquired the privilege of having magistrates of their own choosing, as in the case of Putetoli, B. C. 63.³ The first class or kind of prefect, the quattuorviri, who were sent into Campania, was abolished by Augustus, who, in conformity with the general tenor of his policy, B. C. 13. After the passing of the Julia Lex de Civitate, the cities of the socii which received the Roman civitas still retained their internal constitution; but, with respect to Rome, were all included under the name of municipia: thus Tibur and Praeneste, which were Latin civitates, then municipia. Zumpt enumerates the municipalities: Colonia and Loca, which were originally Latin colonies, also became Roman municipia in consequence of receiving the Roman civitas, though they retained their old colonial constitution and the name of municipium. Thus Cicero⁴ could with propriety call Placentia a municipium, though in its origin it was a Latin civitas. In Latin colonies the Prefectura spermata enumerates municipia, coloniae, and prefecturae as the three kinds of towns or communities under which were comprehended all the towns of Italy. The testimony of the Heraclevita tablet is to the like effect; for it speaks of municipia, coloniae, and prefecturae as the three kinds of places which had the rights of Roman citizens, and that enumeration it adds fora and conciliabula, as comprehending all the kinds of places in which bodies of Roman citizens dwell.

It thus appears that the name municipium, which, originally had the meanings already given, acquired a narrower import after B. C. 90, and in this narrower import signified the civitates socioruni and coloniae, which thenceforward became the members of the Roman state. Thus there was then really no difference between these municipia and the coloniae, except in their historical origin, and in their original internal constitution. The Roman law prevailed in both.

The following recapitulation may be useful. The old Roman colonies (ciusim Romanorums) were placed in conquered towns, and the colonists continued to be Roman citizens. These colonies were near Rome, and few in number. Probably some of the old Latin colonies were established by the Romans in conjunction with other Latin states (Antium). After the conquest of Latinum, Latin colonies were established by the Romans in various parts of Italy, ¹ [xxv., 15.—2. (Geschichte des Röm. Rechts, 2e. ed., 16, etc.)—3 (Festus, s. v. Municipium.)—4 (Livy, viii., 14, 5 (LProv., 14, 22.)]

1. ¹(Liv., xxxvi., 55.)—2. (Cic., De Leg. Agr., ii., 51.)—3. (in Pla., 23.)—4. (c. 14.)
These colonies should be distinguished from the colonies cívium Romanorum, inasmuch as they are sometimes called colonies populi Romani, though they were not coloniae cívium Romanorum. Roman citizens who chose to join such colonies, gave up their civic rights for the more solid advantage of a grant of land.

When Latin colonies began to be established, few Roman colonies were founded until after the close of the second Punic War (B.C. 201), and these few were chiefly maritime colonies (Amnis, &c.). These Latin colonies were subject to and part of the Roman state; but they had not the civitas: they had no political bond among themselves; but they had the administration of their internal affairs. As to the origin of the commercium, Savigny's conjecture has been already stated. (Vid. CIVITAS.) The colonies of the Gracchi were Roman colonies; but their object, like that of subsequent Agrarian laws, was merely to provide for the poorer citizens: the old Roman and the Latin colonies had for their object the extension and conservation of the Roman Empire in Italy. After the passing of the Lex Julia, which gave the civitas to the socii and the Latin colonies, the object of establishing Roman and Latin colonies ceased; and military colonies were thence-forward generally established, under the emperors, in the provinces. These military colonies had the civitas, such as it then was; but their internal organization might be various.

It would require more space than is consistent with the limits of this work to attempt to present anything like a complete view of this interesting subject. The following references, in addition to those already given, will be useful to the reader to abundant sources of information: Signionus, De Jure Antiquo, &c.; Niebuhr, Roman History; Savigny, Uber das Jus Iaticum, Zeitschr., vol. v.; Tabula Heracleensis Mazochi, Neap., 1754; Savigny, Der Königliche Volkschluss der Tafel von Heraclea; and Rudorff, Uber die Lex Mamulia de Colonia, Zeitschr., vol. ix.; Rudorff: Das Ackergezet von Sp. Thrissus, and Puchta, Uber den Inhalt der Lex Rubria de Galia Cualipina, Zeitschr., vol. x.

Since this article was written, and after part of it was printed, the author has had the opportunity of reading two excellent essays: De Jure et Condicione Coloniorum Populi Romani Quaestio historica, Maddvig Oppuscl., Haunio, 1834; and Uber den Unterschied der Benennungen Municipium, Colonia, collegia, &c., von Kantz, Berl., 1840. With the help of these essays, he has been enabled to insert some important additions. But the subject is incapable of a full exposition within narrow limits, as the historical order is to a certain extent necessary, in order to present a connected view of the Roman colonial system. The essay of Maddvig has established beyond all dispute several most important elements in this inquiry; and, by correcting the errors of several distinguished writers, he has laid the foundation of a much more exact knowledge of this part of the Roman polity.

GREEK COLONIES. The usual Greek words for a colony are ἀρχαιωστίκης and καλλονοὶ. The latter word, which signified a division of conquered lands among Athenian citizens, and which corresponds in some respects to the Roman colonies and our notions of a modern colony, is explained in the article Athen.

The earlier Greek colonies, called ἀρχαιωστίκης, were usually composed of mere bands of adventurers, who left their native country, with their families and property, to seek a new home for themselves. Some of the colonies, which arose in consequence of foreign invasion or civil wars, were undertaken without any formal consent from the rest of the community; but usually a colony was sent out with the approbation of the mother-country, and under the management of a leader (οἰκείστης) appointed by it. But whatever may have been the origin of the colony, it was always considered, in a political point of view, independent of the mother-country (called by the Greeks μητρόπολις), and entirely emancipated from its control. At the same time, if its colony origin is evident, it was always connected with the mother-country, and the colony was regarded as a part of the empire of that state. If, however, it was admitted as a separate and independent state, it was united to it by the ties of filial affection; and, according to the generally received opinions of the Greeks, its duties to the parent state corresponded to those of a daughter to her mother.

Hence, in all matters of common interest, the colony gave precedence to the mother state; and the founder of the colony (οἰκείστης), who might be considered as the representative of the parent state, was usually worshipped, after his death, as a hero. Also, when the colony became in its turn a parent, it usually sought a leader for the colony which it intended to found from the original mother-country; and the same feeling of respect was manifested by embassies which were sent to honour the principal festivals of the parent state, and also by bestowing places of honour and other marks of respect upon the ambassadors and other members of the colony, when they visited the throne on festivals and similar occasions.

The colonists also worshipped in their new settlement the same deities as they had been accustomed to honour in their native country; the sacred fire, which was constantly kept burning on their public hearth, was taken from the Prytaneum of the parent city; and, according to one account, the priests who ministered to the gods in the colony were brought from the parent state. In the same spirit, it was consiidered a violation of sacred ties for a mother-country and a colony to make war upon one another.

The preceding account of the relations between the Greek colonies and the mother-country is supported by the history which Thucydidies gives us of the quarrel between Corcyra and Corinth. Corcyra was a colony of Corinth, and Epidamnus a colony of Corcyra; but the leader (οἰκείστης) of Epidamnus was a Corinthian, who was invited from the metropolis Corinth. In course of time, in consequence of civil dissensions and attacks from the neighbouring barbarians, the Epidamnians apply for aid to Corcyra, but their request is rejected. They next apply to the Corinthians, who took Epidamnus under their protection, thinking, says Thucydidies, that the colony was no less theirs than the Corcyreans; and also induced to do so through hatred of the Corcyreans, because they neglected them though they were colonists; for they did not give to the Corinthians the customary honours and deference in the public solemnities and sacrifices that the other colonies were wont to pay to the mother-country. The Corcyreans, who had become very powerful by reason of the commerce at the Corinthian harbour, receiving Epidamnus under their protection, and the result was a war between Corcyra and Corinth. The Corcyreans sent ambassadors to Athens to ask assistance; and in reply to the objection that they were a colony of Corinth, they said "that every colony, as long as it is treated kindly, respects the mother-country; but when it is injured, it is alienated from it, for its friends are not sent out as subjects, but that they may have equal rights with those that remain at home."
COLORES.

it is true that ambitious states, such as Athens, sometimes claimed dominion over other states on the ground of relationship; but, as a general rule, colonies may be regarded as independent states, attached to their metropolis by ties of sympathy and common descent, but no farther. The case of Pole
tide, to which the Corinthians sent annually the chief magistrates (θυσιαρχοι), appears to have been an exception to the general rule.1

COLORES. The Greeks and Romans had a very extensive acquaintance with colours as pig
mens. This knowledge is derived, in the first place, from chapters of books xxxiii., xxxiv., and xxxv. of Pliny's Natural History, contain much interesting matter upon their nature and composition; and these works, together with what is contained in book v. of Dioscorides, and some remarks in Theophrastus,2 constitute the whole of our information of any importance upon the subject of ancient pigments. From these sources, through experiments and observa
tions of Sir Humphrey Davy3 on some remains of ancient colours and paintings in the baths of Titus and of Livia, and in other ruins of antiquity, we are enabled to collect a tolerably satisfactory account of the colouring materials employed by the Greek and Roman painters.

The painting of the Greeks is very generally considered to have been inferior to their sculpture; this partially arises from very imperfect information, and a very erroneous notion respecting the resources of the Greek painters in colouring. The error originated apparently with Pliny himself, who says,4 "Quatuor coloribus solis immortalis tilla opera fecerunt, ex abis Melion, ex silaceis Attico, ex rubris Sinopt, et ex rubrico officinali Apelle."5 Mela
thianus, Nicomachus, clariassimi pictores;" and6 "Legentes meminicit omnia ex quatuor coloribus facta." This mistake, as Sir H. Davy has suppos
ed, may have arisen from an imperfect recollec
tion of a passage in Cicero,7 which, however, di
cely contradicts the statement of Pliny: 8 "In pic
turis divinis et Polygnotan, ex Timanthen, et orvam, quas non sunt nisi planquam quatuor coloribus, for
tas ut lineamenta laudamus : at in Echione, Nicoma
cho, Protegene, Apelle jam perfecta sunt omnia." Here Cicero extols the design and drawing of Poly
gnotan, Zeusix, and Timanthes, and those who used but four colours; and observes in contradiction to Pliny, that Echione, Apelles, and Nicon
camus used all the colours, and that all things were perfect. But the remark of Pliny, that Apelles, Echion, Melanthianus, and Nicomachus used but four colours, including both black and white to the exclusion of all blue (unless we understand by "ex nigris atrimenta" black and indigo, is evidently an error, independently of its con
traction to Cicero; and the conclusion drawn by some from it the remark of Cicero, that the early Greek painters were acquainted with but four pigments, is equally without foundation. Pliny himself speaks of two other colours, besides the four in question, which were used by the earliest painters; the testa-tritic8 and cinnabaris or vermil
ion, which he calls medium.9 He mentions also the Etrurian earth used by Nicomachus, and the elephan
tianum, or orpiment, used by Apelles,10 thus contradicting himself when he asserted that Apelles and Nicomachus used but four colours. The above tradition, and the simplex color of Quintilian,11 are our only authorities for defining any limits to the use of colours by the early Greeks as applied to painting, but we have no authority whatever for supposing that they were limited in

any remarkable way in their acquaintance with them. That the painters of the earliest period had not such abundant resources in this department of art as those of the later, is quite consistent with experience, and does not require demonstration, but to suppose that they were confined to four pig
mants, is quite a gratuitous supposition, and is op
tosed to both reason and evidence. (Vid. PICTURA.)

Sir H. Davy also analyzed the colours of the so
called "Aldobrandini marriage," all the reds and yellows of which he discovered to be oxides; the blues and greens, as not requiring of copper, are various blacks, all carboneous; the browns, mixtures of oxides and black, and some containing oxide of manganese; the whites were all carbonates of lime.

The reds discovered in an earthen vessel containing a variety of colours were, red oxide of lead (minium), and two iron oxides of different tints, a dull red, and a purplish red nearly of the same tint as prussic acid, of which they were all mixed with chalk or carbonate of lime. The yellows were pure oxides of copper with carbonate of lime, and ochre mixed with minium and carbonate of lime. The blues were oxides of copper with carbonate of lime. Sir H. Davy discovered a frit, made by means of soda, and coloured with oxide of copper, approaching al
most in tint to the supposed leaden frit of Alexandria; its composition, he says, was per
fec" that of imbodying the colour in a composition resembling stone, so as to prevent the escape of elastic matter from it, or the decomposing action of the elements; this is a species of artificial lapis-lazuli, the colouring matter of which is naturally in
erent in a hard siliceous mass.

Of the yellows he mentions many shades, all, however, either carbonate or oxide of copper, mixed with carbonate of lime. The browns consisted of oxides calcined, and oxides of iron and of manganese, and compounds of ochres and blacks. Sir H. Davy could not ascertain whether the lake which he discovered was of animal or of vegetable origin; if of animal, he supposed that it was very probably the Tyrian or marine purple. He discovered also a colour which he supposed to be black wad, or hy
drated binoxide of manganese; also, a black colour composed of chalk, mixed with the ink of the sepia officinalis, or cuttle-fish. The transparent blue glass of the ancients he found to be stained with oxide of copper, which was called the Tyrian by the ancients.

The following list, compiled from the different sources of our information concerning the pigments known to the ancients, will serve to convey an idea of the great resources of the Greek and Roman painters in this department of their art; and which, in the opinion of Sir H. Davy, were fully equal to the resources of the great Italian painters in the sixteenth century.

Red. The ancient reds were very numerous. Κόσμιαρος, μελός, cinnabaris, cinnabar, vermil
ion, bisulphuret of mercury, called also by Pliny and Vitruvius minium.

The κόσμιαρος ιοτιῶν, cinnabaris Indica, mentioned by Pliny and Dioscorides, was what is vul
garly called cinnabar, which was not produced from various species of the calamine palm. Μελός seems to have had various significations; it was used for cinnabaris, minium, red lead, and rubrica, red ochre. There were various kinds of rubric, the Cappadocian, the Egyptian, the Spanish, and the Lennian; all were, however, red iron oxides, of which the best were the Lennian, called from the town of Lennion, by the Kouns rubrica Sinopica, by the Greeks Συμ
πιτια, from Sinope in Paphlagonia, whence it was first brought. There was also an African rubrica called escuria.
COLORES.

Minium, red oxide of lead, red lead, was called by the Romans cerusa uesta, and, according to Vitruvius, sandaracha; by the Greeks, μηλινόν, and, according to Dioscorides,  ἵππος νυμος. Pliny tells us that it was discovered through the accidental calcination of some cerussa pigments by a fire in the Piraeus, and was first used as a pigment by Nicias of Athens, about 330 B.C.

The Roman sandaracha seems to have had various significations, and it is evidently used differently by the Greek and Roman writers. Pliny speaks of different shades of sandaracha, the pale or massicot (yellow oxide of lead), and a mixture of the yellow with minium; it appears that he regarded realgar or the red sulphuret of arsenic; there was also a compound colour of equal parts of sandaracha and rubrica calcined, called sandyx, σάνδυς. Sir H. Davy supposed this colour to approach our crimson in tint; in painting it was frequently glazed with purple, to give it additional lustre.

Pliny speaks of a dark ochre from the isle of Syros, which he calls Syricum; but he says also that it was made by mixing sandyx with rubrica Sinopica.

Yellow. Yellow ochre, hydrated peroxide of iron, the sil of the Romans, the ἢρχα of the Greeks, formed the base of many other yellows, mixed with various colours and carbonate of lime. Ochre was procured from different parts; but the Attic was considered the best; it was first used in painting, according to Polygnotus and Micon, at Athens, about 460 B.C.

Aροετακοῦν, auripigmentum, orpiment (yellow sulphuret of arsenic), was also an important yellow; but it has not been discovered in any of the ancient paintings. (Vid. Assercon.) The sandaracha has been already mentioned.

Green. Chrysocolla, χρυσόκολλα, which appears to have been mean carbonate of copper or malachite (green verditer), was the green most approved of by the ancients; its tint depended upon the quantity of carbonate of lime mixed with it.

Pliny mentions various kinds of verdigris (dioscatate of copper), αργυρό, λόγ, λό γαλκον, σπυρια αργυρο, and σιρκω, and a particular preparation of verdigris called ρυπρινα. Sir H. Davy supposes the ancients to have used, also, at least five sorts of copper (dioscatate of copper); besides these, there were several green earths, all cuprous oxides: Thedoloton (Θεόδοτον), so called from being found upon the estate of Thedolotus, near Smyrna; Aprimum; and the creta viridis, common green earth of Verona.

Blue. The ancient blues were also very numerous; the principal of these was carulium, καυλος, azure, a species of verditer or blue carbonate of copper, of which there were many varieties. It was generally mixed with carbonate of lime. Vitruvius and Pliny speak of the Alexandrian, the Cyprian, and the Sicanian; the Alexandrian was the most valued, as approaching nearest to ultramarine. It was made also at Pozzuoli by a certain Vestorius, who had learned the method of its preparation in Egypt; this was distinguished by the name of colo.

There was also a washed crystall called not known, but it has been supposed to be the χαλκος of Theophrastos, which he mentions was used for staining glass. No ochre, however, has been discovered in any of the remains of ancient painting.

Purple. The ancients had also several kinds of purple, purpurissum, ostrum, hyuginum, and various compound colours. The most valuable of these was the purpurissum, prepared by mixing the creta argentaria with the purple secretion of the morix (μορις).

Hyuginum, δισυνο (δοτις, woad!), according to Vitruvius, is a colour between scæzile and purplia.

The ancient compound of red ochre and blue oxide of copper.

Vitruvius mentions a purple which was obtained by cooling the ochra uesta with wine vinegar.

Rubia radix, madder-root.

Brown. Ochra uesta, burned ochre. The brownes were ochres calcined, oxides of iron and of manganese, and compounds of ochres and blacks.

Black, atramentum, μελαιον. The ancient blacks were mostly carbonaceous. The best for the purposes of painting were elephantium, ἔλεφαντον, ivory-black; and trygynum, τρύγυνον, vine-black, made of burned vine twigs. The former was used by Apelles, the latter by Polygnotus and Micon.

The atramentum Indicum, mentioned by Pliny and Vitruvius, was probably the Chinese Indian ink. The blacks from spesia, and the black woad, have been already mentioned.

White. The ordinary Greek white was melium, μηλιον, an earth from the Isle of Melos; for fresco painting, the best was the African paraotinum, παραοτίνον, so called from the place of its origin on the coast of Africa, not far from Egypt. There was also a white earth of Eretria, and the annularian white, creta annularia or annular, made from the glass composition worn in the rings of the poor.

Carbonate of lead or white lead, cerussa, ψυκθον, was apparently not much used by the ancient painters; it was nowhere found among the Roman ruins.

Sir H. Davy is of opinion that the azure, the red and yellow ochres, and the blacks, have not undergone any change of colour whatever in the ancient frescos. It was also found that many of the greens, which are now carbonate of copper, were originally laid on in a state of acetate.

Pliny divides the colours into colores floridi and colores austeri; the colores floridi were those which, in his time, were supplied by the employer to the painter, on account of their expense, and to secure their being genuine; they were minium, Armenium, cinnabar, chrysocolla, Indicum, and purpurissum; the rest were the austeri.

Both Pliny and Vitruvius class the colours into natural and artificial; the natural are those obtained immediately from the earth, which, according to Pliny, are Sinopis, rubrica, parotonum, melium, Eretria, and auripigmentum; to these Vitruvius adds ochra, sandaracha, minium (carmine), and chrysocolla, being of metallic origin. The there are called artificial, on account of requiring some particular preparation to render them fit for use.

To the above list of colours more names might still be added; but, being for the most part merely compounds or modifications of those already mentioned, they would only take up space, without giving us any additional insight into the resources of the ancient painters; those which we have already enumerated are sufficient to form an infinite variety of colour, and conclusively prove that the ancient painters, if they had not more, had at least equal

COLOSSUS.

COLOMBARIUM.

In this most essential branch of painting with the artists of our own times.

COLOMBARIUM (kolumbarioi). The origin of this word is not known, the suggestions of the grammarians being either ridiculous, or imperfect in point of etymology. It is, however, very ancient, probably of Ionic extraction, and rarely occurs in the Attic writers. It is used both by the Greeks and Romans to signify a statue larger than life, and thence a person of extraordinary stature is termed colossoros; and the architectural ornaments in the upper members of lofty buildings, which require to be of large dimensions, are called colossicopeis, being known to be of collosinikoptes. Statues of this kind, simply colossal, but not posterostrously large, were too common among the Greeks to excite observation merely from their size, and are, therefore, rarely referred to as such, the word being more frequently applied to designate those figures of gigantic dimensions (mode statuum, turrios, turriose passare) which were first executed in Egypt, and of which some specimens may be seen in the British Museum.

Among the colossal statues of Greece, the most celebrated was the bronze colossus at Rhodes, dedicated to the sun, which was commenced by Chares of Lindus, a pupil of Lysippus, and terminated, at the expiration of twelve years, by Laches, of the same place, at a cost of 300 talents. Its height was 90 feet according to Hyginus, 70 cubits according to Pliny, or 105 according to Festus. It was thrown down by an earthquake fifty-six years after its erection. It is to this statue that Statius refers.

Another Greek colossal, the work of Calamis, which cost 500 talents, and was twenty cubits high, was dedicated to Apollo, in the city of Apollonia, was transferred from thence to the Capitol by M. Lucullus. Some fragments in marble, supposed to have belonged to this statue, are still preserved in the courtyard of the Museo Capitolino.

There were two colossal statues in bronze, of Greek kingsmanship, at Thurii, one of Jupitor; the other and lesser one of Heracles, by Lysippus, which was transplanted to the Capitol by Fabius Maximus.

In the works of this description made express by or for the Romans, those most frequently alluded to are the following: 1. A statue of Jupiter upon the Capitol, made by order of Sp. Carvilius, from Sicily, 100 feet, and was twenty cubits high, dedicated to Apollo, in the city of Apollonia, was transferred from thence to the Capitol by M. Lucullus. Some fragments in marble, supposed to have belonged to this statue, are still preserved in the courtyard of the Museo Capitolino.

The word occurs more frequently in the plural number, in which it is used to express a variety of objects, all of which, however, derive their name from their resemblance to a dovecote.

In the singular, COLUMBARIUM means one of those sepulchral chambers formed to receive the ashes of the lower orders, or dependants of great families; and in the plural, the niches in which the cinerary urns (olche) were deposited. Several of these chamber urns are still to be seen at Rome. One of the most perfect of them, which was discovered in the year 1822, at the villa Rufini, about two miles beyond the Porta Pia, is represented in the annexed woodcut.

Each of the niches contained a pair of urns, with the names of the persons whose ashes they contained inscribed over them. The use of the word, and

1. (Hyginus, in Fab. 107.)—Columb., a plant, which has been reduced to the genus Colby, L., or Bladder-Senna. Three species are described by Theophrastus, namely, 'L. alata, L. alata, and L. argyrantha'.

*COLOMBO, the Pigeon. (Vid. Perniera.)

COLUMBUS (fidaio), a strainer or colonizer. Various specimens of this utensil have been found at Pompeii. The annexed woodcut shows the plan and profile of one which is of silver.

Wine-strainers (fidaio) were also made of bronze, and their perforations sometimes formed an elegant pattern. The poor used linen strainers; and, where nicety was not required, they were made of broom or of rushes. The Romans filled the strainer with ice or snow (cota nitaria) in order to cool and dilute the wine at the same time that it was cleared. The bone of the nose, which is minutely perforated for the passage of the olfactory nerves, was called fedia, the ethmoid bone, from its exact resemblance to a strainer.
in a machine used to raise water for the purpose of irrigation, as described by Vitruvius, the vents through which the water was conveyed into the receiving trough were termed *columbaria*. This will be understood by referring to the woodcut at p. 65. *Vid. Antiqu.* The difference between that representation and the machine now under consideration consisted in the following points: The wheel of the latter is a solid one (*tympanum*) instead of radiated (rota), and was worked as a treadmill, by men who stood upon platforms projecting from the flat sides instead of being turned by a stream. Between the intervals of each platform a series of grooves or channels (*columbaria*) were formed in the sides of the tympanum, through which the water taken up by a number of scoops placed on the outer margin of the wheel, like the jaws in the cut referred to, was conducted into a wooden trough below (*labrum lignenum suppositum*).

III. The cavities into which the extreme ends of the beams upon which a roof is supported (*tignorum cubita*), and which are represented by triglyphs in the Doric order, were termed *columbaria* by the Roman architects; that is, while they remained empty, and until filled up by the head of the beam. *Columnar* (κουλναριν, κουλναρις, κουνιαρις, κουνιαρισ, κουνιαρα, κουνιαρος), a Pillar or Column.

The use of the trunks of trees placed upright for supporting buildings, unquestionably led to the adoption of similar supports wrought in stone. Among the agricultural Greeks of Asia Minor, whose modes of life appear to have suffered little change for more than two thousand years, Mr. Fellows observed an exact conformity of style and arrangement between the wooden huts now occupied by the peasants, of one of which he has given a sketch (see woodcut),

and the splendid tombs and temples, which were built on the rock, and constructed at the expense of the most wealthy of the ancient inhabitants. We have also direct testimonies to prove that the ancients made use of wooden columns in their edifices. Pausanias describes a very ancient monument in the market-place at Elis, consisting of a roof supported by pillars of oak. A temple of June at Metapontum was supported by pillars made from the trunks of vines. In the Egyptian architecture, many of the greatest stone columns are manifest imitations of the trunk of the palm.

As the tree required to be based upon a flat square stone, and to have a stone or tile of similar form fixed on its summit to preserve it from decay, so the column was made with a square base, and was covered with an *abacus*. (Vid. Abacus.) Hence the principal parts of which every column consists are three, the base, the shaft, and the capital.

In the Doric, which is the oldest style of Greek architecture, we must consider all the columns in the same row as having one common base (*pistyle*), whereas in the Ionic and Corinthian each column has a separate base, called *stipe*. (Vid. Spira.) The capitals of these two latter orders show, on comparison with the Doric, a yet greater degree of complexity and a much richer style of ornament; and the character of lightness and elegance is farther obtained in them by their more slender shaft, its height being much greater in proportion to its thickness. Of all these circumstances, some idea may be formed by the inspection of the three accompanying specimens of pillars, selected from each of the principal orders of ancient architecture. The first is from a column of the Parthenon at Athens, the capital of which is shown on a larger scale at p. 9. The second is from the temple of Bacchus at Teos, the capital of which is introduced at p. 116. The third is from the remains of the temple of Jupiter at Labrada.

In all the orders, the shaft (*ecamus*) tapers from the bottom towards the top, thus imitating the natural form of the trunk of a tree, and at the same time conforming to a general law in regard to the attainment of strength and solidity in all upright bodies. The shaft was, however, made with a slight swelling in the middle, which was called the *fistula*. It was, moreover, almost universally, and from the earliest times, channelled or fluted; i.e., the outside was striped with incisions parallel to the axis. These incisions, called *striae*, were always worked with extreme regularity. The section of them by a plane parallel to the base was, in the Ionic and Corinthian orders, a semicircle; in

COLUMNA.

COLUMNA.

...and Doric, it was an arc much less than a semicircle.

The capital was considerably more than the base of stone, the shaft consisting of several cylindrical pieces fitted together. When the column was erected, its component parts were firmly joined together, not by mortar or cement, but by iron cramps fixed in the direction of the axis. The anned woodecut is copied from an engraving in Swinburne's Tour in the Two Sicilies, and represents a Doric column, which has been thrown prostrate in such a manner as to show the capital lying separate, and the five drums of the shaft, each four feet long, with the holes for the iron cramps by which they were united together.

Columns of an astonishing size were nevertheless erected, in which the shaft was one piece of stone. For this purpose it was hewn in the quarry into the requisite form and shape, and then rolled over the ground, or moved by the aid of various mechanical contrivances, and by immense labour, to the spot where it was to be set up. The traveller now sometimes views with wonder the unfinished pillars, either occupying their original site in the quarry, or left after having performed one half their journey, while he finds other shafts arranged in their intended position, and consisting each of a single piece of marble, alabaster, porphyry, jasper, or granite, which is either corroded by time, or retains its polish and its varied and beautiful colours, according to the situation in which it has been placed, or the durability of its substance. The mausoleum of the Emperor Adrian, a circular building of such dimensions that it serves as the fortress of modern Rome, was surrounded by forty-eight lofty and most beautiful Corinthian pillars, the shaft of each pillar being a single piece of marble. About the time of Constantine, some of these were taken to support the interior of a church dedicated to St. Paul, which a few years ago was destroyed by fire. The interest attached to the working and erection of these noble columns, the undivided shafts of which consisted of the most valuable and splendid materials, led numerous individuals to employ their wealth in presenting them to public structures. Thus Creesus contributed the greater part of the pillars to the temple at Ephesus. In the ruins at Labranda, now called in Caria, tablets in front of the columns record the names of the doners, as is shown in the specimen of them above exhibited.

""The columns used in the architecture of the Greeks," observes Stuart, "though with numberless minute variations of ornaments and proportions, arrange themselves into three general classes, and offer the most obvious and polished manner of distinguishing them in the orders. The Doric capital, which preserves more of the primitive type than any other, is extremely plain, but its simplicity is not without beauty. It consists of a broad and massive abacus, an ovolo under the abacus, from three to five fillets under the ovolo, and under these a neck called the frieze of the capital. In the Ionic capital there is great invention, and a particular character is displayed; indeed, so much so, that it never fails to distinguish itself, even on the most slight and careless observation. It consists of a small and moulded abacus, below which depend to the right and left two spiral volutes; it has also an echinus, which is not unfrequently enriched, and a bead. The Corinthian capital is most richly ornamented, and differs extremely from the others. In this the abacus is hollowed, forming a quadrilateral figure with concave sides, the angles of which are generally truncated. Sometimes the abacus is enriched, but more frequently it is adorned with volutes, but the abacus the capital has the form of a vase or bell, surrounded with two tiers of the leaves of the acanthus, or, rather, of leaves resembling those of a species of the acanthus plant. Under each angle of the abacus springs a volute, and under the flower in the centre of the abacus there are cauliual. With so great a length as this, there are no authenticated remains of the order; and the precepts of Vitruvius on this head are so very obscure that the modern compilers of systems of architecture have, of course, varied exceedingly in their designs; the order, therefore, that passes under this name must be regarded rather as a mod. than an ancient invention. It has been made to differ from the Ionic and Doric by a number of peculiarities, by the suppression of parts and mouldings. But, though the Tuscan capital is plain and simple in the highest degree, it well becomes that column whose character is strength. The Composite capital is formed by a union of the Ionic and Corinthian. It consists of a vase or bell, and a first and second row of palmettes, and some small shoots, a fillet, astragal, ovolo, four volutes, and a hollowed, abacus with a flower in its centre."

Columns were used in the interior of buildings to sustain the beams which supported the ceiling. As both the beams and the entire ceiling were often of stone or marble, which could not be obtained in blocks large enough as to be accommodated by the columns, there were in such circumstances frequent in proportion not being more than about ten or twelve feet apart. The opisthodomus of the Parthenon of Athens, as appears from traces in the remaining ruins, had four columns to support the ceiling. A common arrangement, especially in buildings of an oblong form, was to have two rows of columns parallel to the two sides, the distance from each side to the ground line of columns being less than the distance between the rows themselves. This construction was adopted not only in temples, but in palaces (abacoi), i. e., in houses of the greatest size and splendour. The great hall of the palace of Ulysses in Ithaca, that of the King of the Phaeacians, and that of the palace of Tereus at Phcenicia, can be supposed to have been thus constructed, the seats of honour both for the master and mistress, and for the more distinguished of their guests, being at the foot of certain pillars. In these regal halls of the Homeric era, we are also led to imagine the pillars decorated with arms. When Telemaechus enters his father's hall, he places his arms against a column, and, "within the polished circular order," by which we mean one of the rings or channels of the shaft. Above the base of the columns, near the entrance, all the warriors of the family were accustomed to incline their spears; and from the upper part of the same they suspended their bows and quivers on nails or hooks. The minstrel's lyre hung upon its peg from the..."
another column nearer the top of the room. The columns of the hall were also made subservient to less agreeable uses. Criminai work was tied to them in order to be secured or otherwise tormented. According to the description in the Odyssey, the oecoms of the hall of Ulysses were of silver; in such a case, the apartment was to be very spacious without being overcrowded with columns. Such, likewise, was the hall of the palace of Atreus at Mycenae: *Palgi turba capax Immame Lectum, cul-

pus orvias trabea Vayis columnas nobiles maculis fec-

tur.*

Rows of columns were often employed within a building to enclose a space open to the sky. Beams supported ceilings passed from above the columns to the adjoining walls, so as to form covered passages or ambulatory (entoir). Such a circuit of columns was called a peristyle (περίστυλον), and the Roman atrium was built upon this plan. The largest and most splendid temples enclosed an open space like an atrium, which was accomplished by placing one peristyle upon another. In such cases, the lower rows of columns being Doric, the upper were sometimes Ionic or Corinthian, the lighter being properly based upon the heavier. A temple so constructed was called hypathral (ὑπαθρακός).

On the outside of buildings columns were by no means destitute of utility. But the chief design in erecting them was the attainment of grandeur and beauty; and, to secure this object, every circumstance relating to their form, proportions, and arrangement was studied with the utmost nicety and exactness. Of this the truth of observation, some idea may be formed from the following list of terms, which were employed to distinguish the different kinds of temples:

1. Terms describing the number and arrangement of the columns.
   * Δυάστυλος, δυάστυλος, without any columns. 3
   * Εν παραστάσις, in antis, with two columns in front between the aantes. (Woodcut, p. 61.)
   * Πρόστυλος, prostyle, with four columns in front.
   * Διπλόπροστυλος, amphiprostyle, with four columns at each end.
   * Περίστυλος οί Αμφιπερίστυλος, peripteral, with columns at each end and along each side, the angle being about twice as many as the end columns, including two divisions, viz.:
     * Εξαστύλος, hexastyle, with six columns at each end, and either nine or eleven at each side, besides those at the angles. Example, the Temple of Apollo at Athens.
     * Οκτάστυλος, octastyle, with eight columns at each end, and fifteen at each side, besides those at the angles. Example, the Parthenon at Athens.
   * Διπτέρος, dipteral, with two ranges of columns (πτέρος) all round; the one within the other.
   * Πενταδιπτέρος, pseudodipteral, with one range only, but the front columns outside of the walls of the cells as the outer range of a diptere.
   * Λεκάστυλος, decastyle, with ten columns at each end, which was the case only in hypathral temples.

II. Terms describing the distance of the columns from one another, and from the walls of the cells.
1. Πολυάστυλος, polymostyle, the distance between the columns a diameter of a column and half a diameter.
2. Εύαστυλος, systyle, the distance between the columns two diameters of a column.

3. Εύαστυλος, eustyle, the distance between the columns two diameters and a quarter, except in the centre of the front and back of the building, where each intercolumniation (intercolumnium) was three diameters, called eustyle, because it was best adapted both for beauty and convenience.
4. Διάστυλος, diastyle, the intercolumniation, one distance between the columns, three diameters.
5. Αραπόστυλος, arapostyle, the distances excessive, so that it was necessary to make the epistyly (ἐπιστύλον), or architrave, not of stone, but of timber.

Columns in long rows were used to convey water in aqueducts, and single pillars were fixed in harbours for mooring ships. Some of these are found yet standing.

Single columns were also erected to commemorate persons or events. Among these, some of the most remarkable were the columns rostrata, called by that name because three ship-beaks proceeded from each side of them, and designed to record successful engagements at sea (navalis surgetors ar. columnas). The most important and celebrated of those which yet remain is one erected in honour of the consul C. Duillius, on occasion of his victory over the Carthaginian fleet, B.C. 261 (see the annexed woodcut). It was originally placed in the

Forum, and is now preserved in the museum of the Capitol. The inscription upon it, in great part effaced, is written in obsolete Latin, similar to that of the Twelve Tables. When statues were raised to eminently celebrated persons at the Olympic and other games, or to commemorate persons who had obtained any high distinction, the tribute of public homage was rendered still more notorious and decisive by fixing their statues upon pillars. They thus appeared, as Pliny observes, to be raised above other mortals.

But columns were much more commonly used to commemorate the dead. For this purpose they varied in size, from the plain marble pillar bearing a simple Greek inscription, to those lofty and elaborate columns which are now among the most wonderful and instructive monuments of ancient Rome. The column on the right hand, in the last woodcut, exhibits that which the senate erected to the honour of the Emperor Trajan, and crowned with his colossal statue in bronze. In the pedestal of a door, which leads to a spiral staircase for ascending to

COMA. 

8. Қέρως (қёра қўллос), a term used when the hair was combed up from the temples on each side, so as to give it the appearance of two horns, as is seen in the heads of fawns and satyrs, and in the bust of Jupiter introduced below. 9. Қийнўс, пўлўмос, қўлдўл, a hair which falls in ringlets, either natural or artificial, which was sometimes called бўстўрғос и плоскиарос. All these terms, when strictly appropriated, seem to designate that singular style of coiffure which is observable in Etruscan and early Greek works, and common to both sexes, as is seen in the casts from the temple of Jupiter Panhellenius in the British Museum.

Besides the generic coma, the Romans made use of the following terms, expressive of some peculiar qualities in the hair, or particular mode of arrangement: 1. Capillus, according to the old etymologie, quasi capitis pilus. 2. Crista, the hair when carefully dressed. 3. Cassaries, which is said, though without much probability, to be connected with cadu, the hair of the male sex, because they wore it short, whereas the women did not. 4. Cinvitus, κινωνος, the hair when platted and dressed in circles, like the head on page 21 (vid. Aevus), as it is still done by the women of Mola di Gaieta (Formico). Martial11 terms these circles annulus, and Claudian10 orbes. 5. Cirrus, a lock of curly hair. The locks which fell over the forehead were termed caprona, quasi a capitis prona, and prosome,12 those which fell from the temples over the ears, antics.14 Both the antis and caprona are accurately traced in the figure of Cupid bending his bow, in the British Museum, from following woodcut is taken.

All the Greek divinities are distinguished by a characteristic coiffure, modified in some respects as the arts progressed, but never altered in character from the original model; so that any person tolerably conversant with the works of Greek art may almost invariably recognise the deity represented from the disposition of the hair. We proceed to specify some of the principal ones.

The head of the lion is the type upon which that

Instead of a hand, the people of Athens fastened the bow with an ornamental clasp, fashioned like a grasshopper, to show that they were aborigines.14 Крўбдос is also used for a cap of network, like that represented at p. 137. 1271. (Vid. Calpurns.) 7. Маллдос, which properly means wool, was also used for the short, round, curly hair, which resembles the fleece of a lamb, such as is seen in some of the early Greek sculptures, particularly in the heads of

the summit. Light is admitted to the staircase through numerous apertures. A spiral bas-relief is folded round the pillar, which represents the emperor's victories over the Daianians, and is one of the most valuable authorities for archæological inquiries. Including the statue, the height of this monument, in which the ashes of the emperor were deposited, was not less than 130 feet. A similar column, erected to the memory of the Emperor Marcus Aurelius, remains at Rome, and is commonly known by the appellation of the Antonine column. After the death of Julius Caesar, the people erected to his memory a column of solid marble, 20 feet high, in the Forum, with the inscription PARENT PATER.

Columns still exist at Rome, at Constantinople, and in Egypt, which were erected to other emperors.

COMA (кома), the hair of the head. Besides this general term, there are various other words, both in Greek and Latin, signifying the hair, each of which acquires its distinctive meaning from some peculiarity of the hair itself, or from some peculiarity in the mode of arranging it, the principal of which are as follow: 1. 'Еєθεро, a head of hair. When carefully dressed. 2. Xατη, properly the mane of a horse or lion, is used to signify long flowing hair. 4. Φωθα, when accurately used, implies the hair of the head in a state of disorder incident to a person under a sense of fear. 4. Ποκας, from πικαο or πικαγ, the hair when combed and dressed. 5. Ορις, a general term for hair, from the plural of which the Romans borrowed their word trica, τριγωας and τριγωμα are used in the same sense. 3. Κοπας, from κωρ, the head, signifies properly the hair on the top of the head; and hence a particular fashion of arranging the hair among the Greek women was termed κωρμος.11 or, when worn in the same style by the men, it was designated by another derivative from the same word, κρўбдос.12 To produce this effect, the hair was drawn up all round the head from the front and back, and fastened in a bow on the top, as exemplified in the two foregoing busts, one of the Apollo Belvidere, the other of Diana, from the British Museum.

1. (Gaez, Jbl., viii. 85.—2. (Hom., ii. xvi. 795.)—3. (Schoel. ad Thucydi. i. 14.)—4. (Hom., ii. xvi. 141.)—5. (Soppl., Ed. Col., 1405.—Antig.', 416.)—6. (Homer.)—7. (Aristop.), Thesm., 547.—8. (Neriisus, s. v.)—9. (Esch., Sept. o Thuc., 665.—Eur., Iph. Tudr., 73.—10. (Jamot, Glos. ad Socr., 664.)—11. (Thucydi., i. 6.—15. (Schoel. ad Thucydi, i. 6. 16.)—12. (Thucydi., i. 6.—Virg., Circe, 129.)

Hercules, one of which is subjoined from a spect men in the British Museum.
COMA.

of Jupiter is formed, particularly in the disposition of the hair, which rises from the forehead, and falls back in loose curls down the sides of the face, until it forms a junction with the beard. This is illustrated by the next two woodcuts, one of which is from a statue of Jupiter in the Vatican, supposed to be a copy of the Phidian Jove; and the other is a lion’s head, from the British Museum. The same disposition of the hair is likewise preserved in all the real or pretended descendants from Jupiter, such as Ἑσκελάπιος, Alexander, &c.

Pluto or Serapis has the hair longer, straighter, and lower over the forehead, in order to give severity to the aspect, and with the modius on his head, as represented in the next drawing, from the British Museum. The modius is decorated with an olive branch, for oil was used instead of wine in sacrifices to Pluto.

The hair of Neptune is cut finer and sharper than that of Jupiter. It rises from the forehead, and then falls down in flakes, as if wet, in the manner represented in the following head, from the British Museum.

Apollo is usually represented with the κράταρος; but when the hair is not tied up on the top of the head, it is always long and flowing over the neck and shoulders, as represented in the next woodcut,

1 (Chamber vii., No. 13.)—2. (Chamber vii., No. 88.)—3. (Wing., Ξn., vi., 254.)—4. (Chamber ii., No. 27.)

from a very beautiful and early Greek sculpture is represented with braided hair, in the Etruscan κηρίσ, and a sharp-pointed beard (see the right hand woodcut, from an altar in the museum of the Capitol at Rome), whence he is termed σφυροκορυφής.

Hercules has short, crisp hair, like the curls between the horns of a bull, the head of which animal formed the model for his, as is exemplified in the subjoined drawings, one being the head of the Farnese Hercules, the other that of a bull, from a bas-relief at Rome, in which all the characteristics of Hercules, the small head, thick neck, and particular form of the hair, are strongly preserved.

The hair of Juno is parted in the front, and at the top of the head is a kind of diadem, called in Latin corona, and in Greek ορφησίσ, from its resemblance to a sling, the broad part of which is placed above the forehead, while the two lashes act as bands to confine the hair on the sides of the head, and fasten it behind, in the manner represented in the next woodcut, from the British Museum.

Paras is rarely seen without her helmet; but when portrayed with her head uncovered, the hair is tied up in a knot at some distance from the head, and then falls from the band in long parallel curls.

Venus and Diana are sometimes adorned with the κόρυφοςς (woodcut, p. 291); but both these divisions are more frequently represented with their hair dressed in the simple style of the young Greek girls, whose hair is parted in front, and conducted round to the back, so as to conceal the upper part of the ears. It is then tied in a plain knot at the nape of the neck, or, at a lower part of the head, less frequently, at the top of the head; both of which fashions are represented in the two woodcuts subjoined; one, that on the left, a daughter of Niobe, and the other from a bas-relief at Rome.

For the other styles of Venus and Diana, see the Venus di Medici, and British Museum. Chamber ii., No. 8; iii., 13; iv., 11; xii., 19; and Venus of the central saloon: the other ornaments sometimes seen in statues of Diana are works of a later age.

Fair hair was much esteemed both by the Greeks and Romans; hence, in some of the statues, the hair was gilt, remains of which are discernible in the Venus di Medici, and in the Apollo of the Capitol; and both sexes dyed their hair when it grew gray.

False hair, or wigs, φευκτώς, πυρετής, κόρυφοςς προσεχές, τρύγος προσεχές, galerus, were also worn by the people of both countries.

In very early times the Romans wore their hair long, as was represented in the oldest statues during the age of Varro, and hence the Romans of the Augustan age designated their ancestors intomai and capitilli. But this fashion did not last after the year B.C. 300, as appears by the remaining works of art. The women, too, dressed their hair with simplicity, at least until the time of the emperors, and probably much in the same style as those of Greece; but at the Augustan period a variety of different head-dresses came into fashion, many of which are described by Ovid. Four specimens of different periods are given below. The

COMMISSATIO.

*COMAROS (κομαρος), the wild Strawberry-tree, or Arbutus Uncedo. (Vid. Arbutus.)

*COMBRETUM, a plant mentioned by Pliny, who makes it closely resemble the Bucchar.

Modern botanists, however, taking Pliny's word for the leaves, have not agreed with him in opinion on this head. Celsalpinus makes the Combretum (written sometimessombetum) to be the same with a species of rush, called in Tuscanza Herba lusio, and which has been referred to the Luscaza maxima, L.

*COME (κομα), a plant, the same with the ἄγρανυς, or Crociufolium Trogopogon, so called from its leaves resembling those of the Coccus. Sibberop. found it growing in Cyprus.

COMES. The word comes had several meanings in the Latin of the Middle Ages, for which the reader is referred to Du Frenan's Glossary and Supplement, s. v. In classical writers, and even to the end of the fourth century, its senses are comparatively few.

First it signified a mere attendant or companion, distinguished from suetes, which always implied some bond of union between the persons mentioned. Hence arose several technical senses of the word, the connexion of which may be easily traced. It was applied to the attendants on magistrates, in which sense it is used by Stetnonius. In Horace's time it was customary for young men of family to go out as consiulatoriae to governors of provinces, and in the eye of the writer the art of war and peace. This seems to have led the way for the introduction of the comites at home, the maintenance of whom was, in Horace's opinion, one of the miseries of wealth. Hence a person in the suite of the emperor was termed comes. As all power was supposed to flow from the imperial will, the term was easily transferred to the various offices in the palace and in the provinces (comites palatini, provinciales). About the time of Constantine it became a regular honorary title, including various grades, answering to the comes ordinis primi, secondi, tertii. The power of these officers, especially the provincial, varied with time and place; some presided over a particular department with a limited authority, as we should term them, commissioners; others were invested with all the powers of the ancient proconsuls and praetors.

The names of the following officers explain themselves: Comes Orientis (of whom there seem to have been two, one the superior of the other), comes Egypti, comes Britanniae, comes Africae, comes rei militaris, comes portuum, comes stabulorum, comes domesticorum, Comes curiae, Comes linteae vestis or vestiaris (master of the robes). In fact, the emperor had as many comites as he had duties: thus, comes consistorii, the emperor's privy-council; comes largitionum privatuarum, an officer who managed the emperor's private revenue, as the comes largitionum sacrarum did the public exchequer. The latter office united, in a great measure, the functions of the magister and quinqueret. The four comes commerciorum, to whom the government granted the exclusive privilege of trading in silk with barbarians, were under his control.

COMISSA'TIO (derived from κομισα), the name of a drinking entertainment, which took place after the cena, from which, however, it must be distinguished. Thus Deimetros says to his guests, after they had taken their cena in his own house, "Quin comissatim ad fratrem ismus!" and when Balin

nas comes to Trimalchio's house after taking his cena elsewhere, it is said that "Comissatim intravit." It appears to have been the custom to partake of some food at the comissatio, but usually only as a kind of relish to the wine.

The comissatio was frequtly prolonged to a late hour at night; and the substantive comissator means "to revel," or the substantive comissator a "reveller" or "debauchee." Hence Cicero calls the supporters of Catiline's conspiracy comissatorum conjurationes.

COMITIA, or public assemblies of the Roman people (from com-ιο(seco for coeno), at which all the most important business of the state was transacted, such as the election of magistrates, the passing of laws, the declaration of war, the making of peace, and, in some cases, the trial of persons charged with public crimes. There were three kinds of comitia, according to the three different divisions of the Roman people.

I. THE COMITIA CUERITATA, OR ASSEMBLY OF THE CURIAS, the institution of which is assigned toRomulus.

II. THE COMITIA CENTURIALA, OR ASSEMBLY OF THE CENTURIES, in which the people gave their votes according to the classification instituted by Servius Tullius.

III. THE COMITIA TRIBUTA, OR ASSEMBLY of the people according to their division into the local tribes. The first two required the authority of the senate, and could not be held without taking the auspices; the comitia tributa did not require these sanctions. We shall consider the three assemblies separately.

I. COMITIA CURIATIA, this primitive assembly of the Romans originated at a time when there was no second order of the state. It was a meeting of the populares, or original Burgesses, assembled in their tribes of houses, and no member of the plebs could vote at such a meeting. The ancient populace of Rome consisted of two tribes: the Rammis or Romenses, and the Titiones or Tittes, called after the two patronymic heroes of the state, Romus, Romus, or Romulus, and Titus Tatius; to which was subsequently added the third tribe, the Luceres or Lucerenses. Of these last Festus says, in a passage of some interest and importance, "Lucusraces et Luce- rentes, etiam populi Romani est distributo a Tatio et Romulo, appellati sunt a Lucero, Ardea regis, qui auxilio sui Romulo adversus Titum bellam," From which it may be inferred, that as the Titones were Sabines, and the Romans the Romans proper, so the Luceres were Latins or of Tyrrhenian stock. It will be observed, also, that in this passage of Festus the name of Tatius is placed first; so, also, in the same author we have, "Quia civitates Romanae in sex est distributa parte, in primos secundosque Titones, Rammes, Luceres." This seems to point to a tradition rather inconsistent with the supposed precedence of "the haughty Ramnes" (celsius Ramnes).

The different nations of antiquity had each of them their own regulative political number, or numerical basis; and as 3 x 4 was this basis with the Ionian tribes, so 3 x 10 seems to have been the basis of the Roman state-system. The Athenian solar year consisted of 365 days; the Roman cyclic year of 304; and 360, the number of the houses of clans at Athens, bears the same relation to the former year that 300, the number of Roman houses, does to the latter. The three original tribes of the populares or patres were divided into 30 curiae, and

COMITIA.

each of these into ten houses; and this number of the houses also corresponded to the number of coun-
cillors who represented them in the senate. The division into houses was so essential to the patrician order, that the appurtenant ancient term to des-
ign that order was circmunlocution, the patrician gen-
tes (gentes patriciae). " Plebes disciut," according to Capito, "in qua gentes civium patriciae non in-
sunt." The derivation of curia from cura, which is given by Festus and Varro, is altogether inadmis-
sible. It is obvious that curia means " the as-
sembly of the master-burgesses," " the free household-
ers," or, more accurately, the general element as the Greek κώρος, κόσμος, κοινότης, κόσμος, κόρυφος, κώρας, &c., which element also appears in the Latin quirites, curiates, curiati, &c. The word quirites appears to be nearly identical with κώρας, which signifies "noble warriors," as in Homer, κράνιους κώρας ἁρπαγάς Παναχώγων. The same root is also contained in the Sanscrit χύ-
ρας, " a hero." In the same way as the Greeks used κώρος of the head of a family, the Romans spoke of the free burgess and his wife as patronus and matrona in reference to their children, servants, and clients. These last, so called from clure -the tientes, the hörigen, the "hearers" or dependants—were probably, in the first instance, aliens, natives of the city, who had taken up their residence there by virtue of the jus essulandae and the jus applicationis; and most likely their relation to the patronus, or man of the curia, was analogous to that subsisting between the resident alien and his protector in a Greek state. These clients belonged to the gentes of their patron and matronum, and were considered as freemen of freedmen were classed among the servants in reference to the franchise at the comitia majora, it is exceedingly improbable that they would vote with their patron at the comitia curiata. From the num-
ber of houses which they contained, the patrician tribes were called centuries; and the three cen-
turies formed by Tarquinius were tribes of houses who voted in the comitia curiata like the original patricians. They were united with the old tribes under the title of the sex suffragia, or "the six votes"—Sex suffragia appellantur in equitum centuriarum, qui sunt aedifici et numero centuriarum, quis Priscus Tarquinius rex constituuit. But the number of houses, and the number of centuries according to one or other of the following solutions which Nie-
buhr has suggested: 1. The 300 houses may have been complete, and 300 new houses were ad-
mitted into the tribes, so as to assign 20 houses to each curia; the number of the curiae continuing un-
altered, but 5 curiae instead of 10 being reckoned to the century. 2. That more probably the houses had fallen short. Suppose there were now only 5 to the curia. Then, if the 150 houses were collected into half the number of curiae, the remaining 15 cu-
rie might be filled up with newly-adopted houses, the ancient proportion of 10 houses to a curia re-
mainin unaltered. "This latter hypothesis," says Niebuhr, "is confirmed, and almost establish-
ed; and, lastly, no less than 5 centuries at the end of the "senate, raising the number from 150 to 300; only here two changes are confounded, between which a considerable interval would probably elapse " Although the number of patrician curiae remained un-
changed by this measure of Tarquinius, it seems in-
dubitable that it was considered as an increase in the number of them that the curia antica, or the curiae, as it is usu-
deal, the name implies, and as Festus, quoted

above, most expressly states; the new and old tribes being distinguished as first and second Titiae, Ramnes, and Lacaces.

The comitia curiata, which were thus open to the original burgesses alone, were regarded as a meet-
ing principally for the sake of a certain ordi-
nance of the senate: a senatus consultum was an

indispensable preliminary; and with regard to eli-
tions and laws, they had merely the power of con-
firming or rejecting what the senate had already decreed. The two principal reasons for summon-
ing the comitia curiata were, either the passing of a

law, or, for the sake of certain judicial occur-
ences. The lex curiata imperio, which was the same as the actauctoriatum patrum, was necessary in order to confer upon the dictator, consuls, and other magis-
trates the imperium, or military command; without this they had only a potestas, or civil authority, and were not allowed to meddle with military affairs.

And thus Livy makes Camillus speak of the comitia curiata, quae rem militemque continent, as distinguished

from the "comitia centuriaria, quisque consulibus tribunusque militares creati." The comitia curiata were also held for the purpose of carrying into effect the form of adoption called adrogatio, for the confir-
mination of wills, and for the ceremony called the detes-
fatio sacrorum. They were held in that part of the forum which was called the tribunal (suggestum) stood. The patrician magis-
trates properly held the comitia curiata; or, if the question to be proposed had relation to sacred rights, the pontifices presided. They voted, not by houses, but by curia; this was probably the reason why Tarquinius was careful not to alter the number of them. Instead of 150, a new number of 295 was prescribed. The lex curiata imperio, which was called the comitia curiata curiata, was formed by the comitia curiata, and the comitia curiata centuriaria. This was the sixth of Rome, and Chief of the Senate. The object of this legislator seems to have been to unite in one body the populus or patricians—the old burgesses of the three tribes, and the plebs or pale-burgesses—the commonalty who had grown up by their side, and to give the chief weight in the state to wealth and numbers rather than to birth and family preten-
sions. With a view to this, he formed a plan, by virtue of which the people would vote on all impor-
tant occasions according to their equipments when on military service, and according to the position which they occupied in the great phalanx or army of the city: in other words, according to their prop-
erty; for it was this which enabled them to equip themselves as members of the army. The arrangement of the army of the state, was peculiar to the constitution of Servius. This arrange-
ment considered the whole state as forming a reg

buhr, i., p. 381.)—3. (Liv., v., 52.)
COMITIA.

The army, with its cavalry, heavy-armed infantry, reserve, carpenters, musicians, and baggage-train.

The cavalry included, first, the six equestrian centuries, or the sex suppeditum, which made up the body of the populus, and voted by themselves in the comitia curiata; to which were added twelve centuries of plebeian knights, selected from the centuriates of the provo and centuriata. The foot-soldiers were organized in the following five classes: 1. Those whose property was at least 100,000 asses, or pounds' weight of copper. They were equipped in a complete suit of bronze armour. In order to give their wealth and importance its proper political influence, they were reckoned as forming 80 centuries, namely, 40 of young men (juniores) from 17 to 45, and 40 of older men (seniores) of 45 years and upward. 2. Those whose property was above 75,000 and under 100,000 asses, and who were equipped with the wooden scutum instead of the bronze clibanum, but had no coat of mail. They made up 20 centuries, 10 of juniores and 10 of seniores. 3. Those whose property was above 50,000 and below 75,000, and who had neither coat of mail nor greaves. They formed 20 centuries, the second class, similarly divided into juniores and seniores. 4. Those whose property was above 25,000 and below 50,000, and who were armed with the pike and javelin only. This class also contained 20 centuries. 5. Those whose property was between 15,500 and 25,000 asses, and who were armed with slings and darts. They formed 30 centuries of the classe-minime, whose property fell short of 375 asses. All these centuries were classed according to their property: but, besides these, there were three centuries which were classed according to their occupation: the fabri, or carpenters, attached to the centuries of the first class; the cornicines, or horn-blowers, and the tubicines or lictores, the trumpeters, who were reckoned with the fourth class. Thus there would be in all 195 centuries, 18 of which would form the first class, or those of the Plebeians; the second, the third, and the fourth; of these five, the last three would consist of the reserve and camp-followers, and three of the smiths and musicians. In voting, it was intended to give the first class and the knights a preponderance over the rest of the centuries, and this was effected as we have just mentioned; for the first class, with the knights and the fabri, amounted to 99 centuries, and the last four classes, with the supernumeraries and the municiplum, to 96 centuries, who were thus outvoted by the others, even though they themselves were unanimous. See the remarkable passage from Cicero,1 most ingeniously restored by Niebuhr.2 Even if we suppose that the fabri were expected to vote rather with the lower classes than with the first class to which they were assigned, the first class, with the knights, would still have a majority any way.2

The same principle was observed when the army was serving in the field. As the centuries of seniores consisted of persons beyond the military age, the juniores alone are to be taken into the account here. The first class sent its 40 centuries of juniores, of which 30 formed the principes, and 10 were posted among the triarii, who, as Niebuhr suggests, probably owed their name to the fact that they were made up out of all the three heavy-armed classes; the second

---

1. (De Republica.)—2. (i., p. 444.)

COMITIA.

and third centuries furnished 20 centuries apiece, i.e., twice the number of their junior classes, and 10 from each class stood among the triarii, the rest being hastati with shields; the fourth class supplied 10 centuries, the number of its junior votes, who formed the hastati without shields. The fifth class furnished 30 centuries, twice the number of its junior votes, who formed the 30 centuries of velites. To these were added 10 turmae of cavalry, or 300 men. This was the division and arrangement of the army as a legion. But when it was necessary to vote in the camp, they would, of course, revert to the principles which regulated the division of the classes for the purpose of voting at home, and would reunite the centuries of the two classes that supplied 105 centuries of junior votes, or 90 with the fire unclassified centuries; that is to say, we have again 3×30, the prevailing number in Roman institutions. Of these, the first class with the fabri formed 41 centuries, leaving 49 for the other centuries; but with the first class the 10 turmae of the cavalry would also be reckoned as ten centuries, and the first class would have 51, thus exceeding the other main classes.

Such were the principles of the classification at the centuries, as it has been developed by Niebuhr. Their comitia were held in the Campus Martius without the city, where they met as the exercitus urbanus, or army of the city; and, in reference to their military organization, they were summoned by the sound of the horn, and not by the voice of the magistrates, as was the case with the comitia curiata.

On the connexion of this division into centuries with the registration of persons and property, see Censors and Census. The general causes of assembling the comitia centuriata were, to create magistrates, to pass laws, and to decide capital causes when the offence had reference to the whole nation, and not merely to the rights of a particular order. They were summoned by the king, or by the magistrates in the Republic who represented some of his functions, that is, by the dictator, consuls, pretors, and, in the case of creating magistrates, by the interrex also. The pretors could only hold the comitia in the absence of the consuls, or, if these were present, only with their permission. The consuls held the comitia for the appointment of the praetors and the "comevilla" (the priests, and the censors. It was necessary that seventeen days' notice should be given before the comitia were held. This interval was called a trimenidium, or "the space of three market-days" (trex nudanda, "three nine-days"), because the country people came to Rome to buy and sell every eighth day, according to our mode of reckoning, and spent the interval of seven days in the country ("reliquas septem rura coh- bant"). The first step in holding the comitia was to take the auspices. The presiding officer, accompanied by one of the augurs (austri adiutus), pitched a tent (tabernaculum cepit) without the city, for the purpose of observing the auspices. If the tent was not pitched in due form, all the proceedings of the comitia were utterly vitiated, and a magistrate elected at the election would declare the comitia null and void, unless they would be held in his office, as in the case mentioned by Livy.3 "Non tamen pro formato statut magistratus ejus ius: quia tertia mense, quam inierunt, augurum decreto, perito c- e-rati, honoré abire: quia C. Curtius, qui comitia corum praefurat, perum recte tabernaculum co- pisset." The comitia might also be broken off by a tempest; by the intercession of a tribune; if the standard, which was set up in the Janiculum, was taken down; or if any one was seized with the epig.
COMITIA.

The first step taken at the comitia centuriata was for the capite, who held them to repeat the words of a form of prayer after the augur. Then, in the case of an election, the candidates' names were read, and, in the case of a law or a trial, the proceedings or bills were read by a herald, and different speakers were heard on the subject. The question was put to them with the interrogation, *Felix, jubeatis, Quiritis*.” Hence the bill was cast to the vote of the people, and the question put was that of a plebiscita.* Hence the form of commencing the bill was: “Si voce videtur, disceare, Quiritis,” or “In sufragium, bene jurantis dixit, et quae patres consuerunt, vocabant.” The order in which the centuries voted was decided by lot; and that which gave its vote first was called the centuria praegrapho. The rest were called *partes vocato.* In ancient times the people were polled, as at our enclosure of the 26th of October. But at a later period the ballot was introduced by a set of special enactments (the leges tabulariae), having reference to the different objects in voting. These laws are enumerated by Cicero. 3.

1. *Sunt enim quattuor leges tabellariae: quarum prima de magistratibus mandantis; ea est Gabinius, latum valorem. Quae sunt? 2. Sed de secunda, quae post Cassia est, de populi judicio, a nobili homine fata L. Cassio, sed (pace familias dixerim) dissidente a bonis atque omnes rumutulos popularis ratione acuepante. Carbomius est tertia, de juvendia legibus et vetandis, sededitis atque impribo civis, cui ne deditis quidem ad bonos salutem a bonis potius affere. 3. Ubique leges huius modi voce publicarum voce suffragium, quod ipsa Cassius excepserat, perpetuam. Dedit hic quoque judicio C. Calvis tabellam, doluitque vadum xixi, se ut opprimeret C. Popillium, nocitasse reipublicae.” The dates of these four bills for the introduction of ballot at the comitia centuriata are as follows: 1. The Gabinian law, introduced by Gabinius, the pontifex maximus, in B.C. 140. 2. The Cassian law, B.C. 138. 3. The Papirian law, introduced in B.C. 132. 4. The Calian law, B.C. 108. In voting, the centuries were summoned in order into a boarded enclosure (septum or ovale), into which they entered by a narrow passage (pons) slightly raised from the ground. There was probably a different enclosure for each century or group of centuries, and the offices of the presiding magistrates were admitted into them in the plural. The tabellae with which they had to ballot were given to the citizens at the entrance of the pons by certain persons called *diribitori,* and here intimidation was often practised. If the business of the day were an election, the tabella had the initials of the candidates. If it were the passing or rejection of a law or a trial, they received two tabellae: one inscribed U.R., i.e., ut rogauj, “I vote for the law;” the other inscribed A., i.e., antiquo, “I am for the old law.”

Most of the terms are given in the following passage of Cicero: 4. *Quun die venisset rogatrum ex S. C. ferenda, concursabant barbatuli juvenes, et populum, ut antiquaret, rogabant. Pino autem consul, later rogatrum, idem erat disserans. Quae etiam statio elektor. tabellae: tabellae in centuriam, ita ut nulla daretur ut rogass.” In the old system of polling, each citizen was asked for his vote by an officer called *rogator,* or “the polling-clerk.” Under the ballot system they threw whichever tabella they pleased into a box at the entrance of the booths, and certain officers, called custodiae, were standing at the entrance to check the tabella (puncta) marked on a tablet. Hence punctum is used metaphorically to signify “a vote,” as in Horace: “Discedo Alcmea puncto illius;” and we have the metaphor at greater length,

“Centuriae xerorum agitans experta frugis, Celsi pretoreturn austera poenata Ramnas; Omne tuli punctum qui miscit utile dulci.”

The diribitori, rogatores, and custodiae were generally friends of the candidates, who voluntarily undertook these duties. But Augustus selected 900 of the equestrian order to perform the latter offices.

The acceptance of a law by the comitia centuriata did not mean its immediate adoption, as it had been sanctioned by the comitia curiata, except in those cases of a capital offence against the whole nation, when they decided alone. The plebeians originally made their testaments at the comitia centuriata, as the patricians did theirs at the comitia curiata; and as the *advocati* required a decree of the curiis, so the adoption of plebeians must have required a decree from the centuriat. Hence *plebiscita* was divided into those of the plebs or commonalty which took its rise from the formation of a domain or territory, and the tribes of the community or pale-burgers were necessarily local, that is, they had regions corresponding to each of them; therefore, when the territory diminished, the number of these tribes diminished also. Now, according to Fabian, there were originally 30 tribes of plebeians, that is, as many plebeian tribes as there were patrician curiae. These 30 tribes consisted of four urban and 26 rustic tribes. But at the admission of the Crustumine tribe there were only 20 of these tribes. So that probably the cession of a third of the territory to the Plebeians diminished the number of tribes by one third. 5.

It is an ingenious conjecture of Niebuhr's, that the name of the 30 local tribes was perhaps originally different, and that only 10 of them were called by the name *tribus;* hence, after the diminution of their territory, there would be only two tribes, and the two *tribuni plebis* were in fact two cousins or prætors who presided at the comitia tributa. Such being the nature of the plebeian tribes, no qualification of birth or property was requisite to enable a citizen to vote at the comitia tributa; whoever belonged to a given region, and was, in consequence, registered in the corresponding tribe, had a vote at these comitia. They were summoned by the *tribuni plebs,* who were also the presiding magistrates, if the purpose for which they were called, was the election of tribunes or ediles; but consuls or praetors might preside at the comitia tributa, if they were called for the election of other inferior magistrates, such as the questor, proconsul, or procurator, who were also elected at these comitia. The place of meeting was not fixed. It might be in the Curiae Hostilia and the Forum, in the Comitia Centuriata, in the Comitia Tributa, or in the Comitia Tributa majecta, or the Forum, or the Circus Flaminius. Their judicial functions were confined to cases of lesser importance. They could not decide in those referring to capital offences. In their legislative capa Against the city they passed *plebiscita,* or decrees of the plebs, which were originally binding only on themselves.

297
whatever legislative enactments they pleased, without or against the authority of the senate. 2

COMMAC'TUS, a surlough, or leave of absence from the army for a certain time. 2 If a soldier exceeded the time allowed him, he was punished as a deserter, unless he could show that he had been detained by illness, or some other cause, which absolutely prevented his return. 2

COMMENTARIUS or COMMENTARIUM meant a book of memoris or memorandum-book, which the expression Comes Commiliarum Acts. Caesar libroes de bellis a se gestis commentarios incurripit, quod nudi essent omnes ornato virtutis, tangquam veste detracto. Hence it is used for a lawyer's brief, the notes of a speech, &c. 6

In the Digest the word commentarii is frequently used in the sense of a recorder or registrar; sometimes, as Valerius Maximus 6 uses it, for a registrar of prisoners; in other words, an jailer. 7 A military officer so called is mentioned by Asconius, 8 who probably had similar duties. The word is also employed in the sense of a notary or secretary of any sort.

Most of the religious colleges had books called Commentarii, as Commentarii Augurium, Pontifexium. (Vid. Fast.)

COMMISSARIO LEX. (Vid. CIVITAS, ROMAN.)

COMMISSARIUM. One sense of this word is that of "forfeited," which apparently is derived from that sense of the verb committere, which is "to commit a crime," or "to do something wrong." Asconius says that those things are commissaria which are either done or omitted to be done by a heres against the will of a testator, and make him subject to a penalty or forfeiture; thus, commissaria hereditata would be the inheritance forfeited for some act of commission or omission. Cicero speaks of an hypothecated thing becoming commissaria; that is, becoming the absolute property of the creditor for default of payment. A thing so forfeited was said in commissarium invicere or cadere. Commissarium was also applied to a thing in respect of which the vestigial was not paid, or a proper return made to the publilcian. A thing thus forfeited (vestigialum nomin) ceased to be the property of the owner, and was forfeited, under the Empire, to the fiscus. 10

COMMISSORIA LEX is the term applied to a clause often inserted in conditions of sale, by which a vendor reserved to himself the privilege of rescinding the sale if the purchaser did not pay his purchase-money at the time agreed on. The lex commissoria of Roman law was the equivalent of the modern conditional purchase; for in that case, if the property were placed in the hands of the purchaser, and damaged or destroyed, the loss would be the loss of the vendor, inasmuch as the purchaser, by non-payment of the money at the time agreed on, would fail to perform the condition; but it was an absolute sale, subject to be rescinded at the pleasure of the vendor, who, if not satisfied with the performance of the time agreed on, and, consequently, if after this agreement the property was in the possession of the vendor, and was lost or destroyed before the day agreed on for payment, the loss fell on the purchaser. If the purchaser intended to take advantage of the lex commissoria, it was necessary that he should declare his intention as soon as the condition was agreed on. In the case of the purchase-money after the day agreed upon, it was held that he thereby waived the advantage of the lex commissoria. (Vid. PONENS.) 11

COMMUNI DIVIDU'NDO A'CTIO is one of those actions which are called mixtæ, from the circumstance of their being partly in rem and partly in personam; and duplicia judicia, from the circumstance of both plaintiff and defendant being equally interested in the matter of the suit, though the person who instituted the legal proceedings was proper the actor. This action was maintainable between those who were joint owners of a corporeal thing which accordingly was called res communs; and it was maintainable whether they were owners (domini), or had merely a right to the publica actio in rem; and whether they were socii, as in the case of a joint purchase; or not socii, as in the case of a thing bequeathed to them (legata) by a testament; but the action could not be maintained in the matter of an hereditas. In this action an account might be taken of any injury done to the common property, or anything expended on it, or any profit received from it, by any of the joint owners.

Any corporeal thing, as a piece of land or a slave, might be the subject of this action.

It seems that division was not generally effected by a sale; but if there were several things, the judge would adjudicate (adjudicare) them severally 3 to the several persons, and order (condemnare) the party who had the more valuable thing or things to give (damnum) of the other thing or things to the other. It follows from this that the things must have been valued; and it appears that a sale might be made, for the judex was bound to make partition in the way that was most to the advantage of the joint owners, and in the way in which they agreed that partition should be made; and it appears that the joint owners might bid for the thing, which was common property, before the ; and if the thing was one and indivisible, it was adjudica- ted to one of the parties, and he was ordered to pay a fixed sum of money to the other or others of the parties. This action, and that of family erisunane, bear some resemblance to the now abolished English writ of partition, and to the bill in equity for partition. 9

COMMODA'TUM is one of those obligations which are contracted re. He who lends to another a thing for a definite time, to be enjoyed and used under certain conditions, without any pay or reward, is called commodans; the person who receives the thing is called commodatarius; and the contract is called commodatum. It is distinguished from mutuum in this, that the thing lent is not one of those things which are in cadere, numero, mensurase constant, as wine, corn, &c.; and the thing commodatum does not become the property of the receiver, who is therefore bound to restore the same thing. It differs from locatio et conductio in this, that the use of the thing is gratuitous. The commodatarius is liable to the actio commodati if he does not restore the thing; and he is bound to make good all injury which is done to the thing while it is in his possession, provided it be done by a careful person could have prevented, or provided it be done in such a manner that the thing has sustained in being used contrary to the conditions or purpose of the lending. In some cases the commodatarius had an actio contratua against the commodans, who was liable for any injury sustained by the commodatarius through his dolus or culpa; as, for instance, if he knowingly put the thing in other hands, and the wine or oil of the commodatarius was thereby lost.

COMMODIA (κομμωδία), a branch of dramatic poetry, which originated in Greece, and passed from thence into Italy.

COMÉDIA.

1. Greek Comedy, like Greek tragedy, arose from the worship of Bacchus; but comedy sprang from a more ancient part of Bacchic worship than tragedy. A band of Bacchic revelers naturally formed a comus (κομός); their song or hymn was properly a κομῳδία, or "comus-song," and it was not till a comparatively late period that the Bacchic ode or dithyramb was performed by a regular chorus. From this regular chorus the Tragedy of Greece was derived and so to the evolution of the Bacchic or phallic revelers we may assign the origin of comedy. It is true that Aristotle derives comedy from κωμή, "a village," so that κομῳδία is "the village song," but this etymology, like so many others proposed by Greek authors, is altogether inadmissible, however much it may be in accordance with the fact that the Bacchic comus did in time to village—it was a village or country amusement; but it is clear, from the manner in which Athenian writers speak of this Bacchic procession, that it was a comus; thus, in an old law, quoted by Demosthenes, 1 "Ο κόμος καὶ οἱ κωμῳδίαι, and Aristophanes, 2 Παῖξ, ἑταῖρε Βακ- 
χίων, ἤγγισε: and as the tragedy sprang from the regular chorus of Bacchic revelers, we have seen that the dithyramb, so this comus-song, as a branch of dramatic poetry, seems to be due to analogous effusions of the leaders in the phallic comus; and thus Anthes of the Lindian, according to Athenaeus, 3 Καὶ κομῳδίας ἐποίη καὶ ἄλλα τολὴ ἐν τούτῳ τῷ τραγῳ τοῦ ποιη- 
ματος, ἀ θέρηται τα μετ’ αὐτῶν φαλλοφοράς. This branch of Greek drama was very much enjoyed by the inhabitants of a little village in Attica, which claimed to have been the first to receive the worship of Bacchus in that part of Greece; and Susarion, a native of Tripodiscus, in Megara, was the first to win the prize—a basket of figs and a jar of wine—which was given to him as the successful leader of a comus of Icarian glue-rangers (ρυπαντίδων). For it can be shown that they adorned their faces with the lees of wine; a rude disguise, which was sometimes substituted for the mask worn by the κομῳδός, when they afterward assumed the form of a regular chorus. The Dorian of Megara seemed to have been from the first distinguished for a vein of coarse jocularity, which naturally gave a peculiar turn to the comus songs sung among them; and thus we find that comedy, in the old sense of the word, first came into being among the Megarians and their Sicilian colonists. 4 Susarion flourished in the time of Solon, a little before Thes- 
pis, but he seems to have stood quite alone; and, indeed, it is not likely that comedy, with its bold spirit of caricature, could have thriven much during the despoticism of the Pisistratids, which followed so close upon the time of Susarion. The very same 
causes which might have induced Pisistratus to encourage tragedy, would operate to the prevention of comedy; and, in fact, we find that comedy did not thoroughly establish itself at Athens till after the democratical element in the government had con- 
quered the aristocratic influence over the old ar- 
istocratical principles, namely, in the time of Pericles. The first of the Attic comedians, Chionides, Eclip- 
tides, and Magnes, flourished about the time of the Persian war; and were followed, after an interval of thirty years, by Cratinus, Eupolis, and Aristophanes, whom Horace justly mentions as the greatest authoress of the comedy of caricature. 5 This branch of comedy seems to have been the natural descendant of the satirical libation of Archilochus and others: it was a combination of the imaginary lampoon with the comus, in the same way as 
tragedy was a union of the epic rhapsody with the dithyrambic chorus. This old comedy ended with Aristophanes, whose last productions are very different from his early ones, and approximate rather to the middle Attic comedy, which seems to have sprung naturally from the old, when the free democratic spirit which had fostered its predecessor was broken and quenched by the events which followed the Peloponnesian war, and when the people of Athens were no longer capable of enjoying the wild license of political and personal caricature. The middle Attic comedy was employed rather about criticisms of philosophical and literary pretenders, and censures of the fobules and folies of the whole classes and orders of men, than about the personal caricature which formed the staple of the old com-
edy. The writers of the middle comedy flourished between B.C. 380 and the time of Alexander the Great, when a third branch of comedy arose, and was carried to the greatest perfection by Menander and Philemon. The comedy of these writers, or the new comedy, as it is called, went a step farther than its immediate forerunner: instead of criticizing some class and order of men, it took for its object the whole body of mankind, and treated it as a whole with a sort of general censure, or a comedy of character, like that of Far- 
quhar and Congreve; the object of the poet was, by some ingeniously-contrived plot and well-imagi-
inated situations, to represent, as nearly as possible, the life of Athens as it went on around him in its every-day routine; hence the well-known hyperbole addressed to the greatest of the new comedians: 

Δ Μέναντερ καὶ Μίλη, 
πάτερον ἵτ’ ὅσιον κτησίματο.

The middle and new comedy, though approaching much more nearly to what we understand by the name comedy, could scarcely be called by the name κομῳδία with any strict regard to the original meaning of the word; they had nothing in them akin to the old revelry of the κόμος: in fact, they had not even the comic chorus, which had succeeded and superseded the κόμος, but only marked the inter-
vals between the acts by some musical voluntary or interlude. It belongs to a history of Greek liter-
ature, and not to a work of this nature, to point out the various steps by which Attic comedy passed from its original boisterous and almost drunken merriment, with its personal invective and extravag-
rant indecency, to the calm and refined rhetoric of Menander and the progressive Epicureanism of Menander; still less can we enter here upon the literary characteristics of the differ-
ent writers whose peculiar tendencies had so much influence on the progressive development of this branch of the drama. It is sufficient for our pur-
purpose to point out generally the nature of Greek comedy, as we have done above, and to enable the student to understand and to appreciate the outward features of Greek comedy and tragedy.

The dance of the comic chorus was called the κόρδας, and was of the most indescribable description: the gestures, and, indeed, the costumes of the chor-
use, were such that even the Athenians consid-
ered it justifiable only at the festival of Bacchus, when every one was allowed to be drunk in hon-
our of the god; for, if an Athenian citizen danced the κόρδας sober and unmasked, he was looked upon as the most shameless of men, and forfeited alto-
gether his character for respectability. 1 Aristoph-

COMÉDIA.

chene, or imitative dance, in which the choreuta expressed the words of the song by merry gestures. Such a dance was the hyperchome of the Spartan δεικτής; a sort of merry-andrews, whose peculiar mimic gestures seem to have formed the basis of the Dorian comedy, which prevailed, as we have seen, in Megaris, and which probably was the parent stock, not only of the Attic, but also of the Sicilian and Italian comedy.

The comic chorus consisted of twenty-four persons, of half the number of the full tragic chorus; and as the comedians did not exhibit with tetralogies as the tragedians did, this mocide appeared on the stage undivided, so that a comedy had, in this respect, a considerable advantage over a tragedy. The chorus entered the stage in rows of six, and singing the parados as in tragedy; but the parados was generally short, and the stasimata still less important and considerable. The most important business of the chorus in the old comedy was to deliver the parabasis, or address to the audience. In this the chorus turned round from its usual position between the thymele and the stage, where the choreuta stood with their faces turned towards the actors, and made an evolution so as to pass to the other side of the thymele. Here they stood with their faces turned towards the spectators, and added to the apparatus of anapestic tetrameters, generally speaking in the name of the comic poet himself. When the parabasis was complete, it consisted of: 1. The κοιμάτων, a short introduction in trochaic or anapestic verse. 2. A long system of anapestic tetrameters, called the πιγος or the μαξοδ. 3. A lyrical strophe, generally in praise of some divinity. 4. The ἐπιθ., consisting of six verses, according to the number of six trochaic verses, in which the chorus indulged in witticisms directed against some individual, or even against the public in general. The parabasis, though a good deal refined by the better taste of Aristophanes, retained much of the abusive scripulity of the c1st race; so that we may regard it as the only living representative of the old wagon-joets of the phallic procession in which comedy originated, and as the type of that predominant element in the old comedy which the Roman satirist Lucilius made the object of his imitations.

II. ILLIAN COMEDY may be traced, in the first instance, to the rude efforts of the Dorian comus in Sicily. It has been shown by Müller that even the Oean fastas, called the fabula Attelana, which passed from Campania to Rome, may be traced to a Dorian origin, as the names of some of the standing masks in these fastas, such as Pappus, Maceus, and Simus, are clearly Greek names. The more complete development of the Sicilian comedy by Epicharmus appears to have paved the way for the establishment of a more regular comic drama in Italy. Imitations of Epicharmus seem to have been common from Campania to Rome, and may be traced so early as B.C. 240. Livius Andronicus exhibited at Rome translations or adaptations of Greek comedies, in which he did not attempt to obliterate the traces of their Greek origin: on the contrary, from first to last, most of the Latin comedies were pro-"fessedly Greek in all their circumstances; and the translators or imitators, though many of them were men of great verum, did not hesitate to speak of themselves as barbari in comparison with their Greek masters, and called Italy barbara in comparison with Athens. The Latin comedians, of whom we can judge for ourselves, namely, Plautus and Terence, took their models chiefly from the new comedy of Greece. The latter, as far as we know,

never imitated any other branch of Greek comedy. But Plautus, though he chiefly follows the poets of the middle or new comedy, sometimes approximates more nearly to the Sicilian comedy of Epicharmus, or to the σατυρική of Rhinthon and others. It is doubtful whether the Amphitryon, which Plautus himself terms a tragicco-comedia, is an imitation of Rhinthon or of Epicharmus. That Plautus did imitate Epicharmus is clear from the words of Horace:Dicitur ... Plautus ad exemplar Siciliani Epicharmi;" and A. W. Schlegel would infer from this passage alone that the Amphitryon was borrowed from some play by Epicharmus, whom, as is well known, composed comedies on mythical subjects like that of the Amphitryon of Plautus.

Although Roman comedy, as far as it has come down to us, is cast entirely in a Greek mould, the Romans had authors who endeavored to bring forward these foreign comedies in a dress more Roman than Grecian. Comedies thus constructed were called fabula togate (from the Roman garb, the toga, which was worn by the actors in it), as opposed to the fabula palliata, or comedies represent ed in the Greek costume. From the words of Horace in the passage referred to above, it is sufficiently obvious that the fabula togate was only an imitation of the Greek new comedy clothed in a Latin dress: "Dicitur Afranti toga conveniebat Menandro." Not that the writers of these comedies absolutely translated Menander or Pluteus, like Plautus and Terence; the argument or story seems to have been Roman, and it was in the method and plan that they made the Greek comedians their model. For this, also, we have Horace's testimony.

"Nol intematur nostrà lique pòetà: Nee minimum mearse decus, vestigia Graeci Assi deserre, et celebrare donnatiae finita, Vel qui prætextas, vel qui docueris togatam." The protatestate fabula alluded to here was a sort of history.

"The protateuta merely bore resemblance to a tragedy: it represented the deeds of Roman kings and generals; and hence it is evident that at least it wanted the unity of time of a Greek tragedy—that it was a history, like Shakespear's." The grammarians sometimes speak of the protateuta as a "kai touto komedia," which it certainly was not. The clearest statement is that of Euthyphion (de fabula): "Illo vero tenendum est, post video kymainh Lai- noe multa fabularum genera protrulisse: ut togatas, a scenisatis etiam argumentum Latinis; protateutis atque dignitatem personarum et Latina historia; Attelana, a civitate Campaniae, ubi actae sunt phrime; Rhinthonias, a auctoribus nomine; tabernarias, a humilate argumenti et styli; mimos, ad dictura imitatione rerum et levium personarum." But even here there is a want of discrimination; for the mi- mus was entirely Greek, as the name shows; the Latin style corresponding to it was the planipecs. Hermann has proposed the following classification of Roman plays, according as they strictly followed or deviated from their Greek models:

Argumentum.

1. (Epist. II. 1., 58.)—2. (Hor. Epist. II. 1., 57.)—3. (Epist. II. 1., 282, &c.)—4. (Nicolius, Hist. Rom., vol. i., liv. ii., 24.)—5. (Opuscula, v. 260.)—6. (De Fabula Romanum to gutta, p. 50.)
CONCUBINA.

that is, festivals which were celebrated on days ap
pointed annually by the magistrates or priests.
The exact day on which this festival was celebrated
appears to have varied, though it was always in
the winter. Dionysius¹ says that it was celebrated
a few days after the Saturnalia, and Cicero² that it
fell on the Kalends of January (the old editions
read lii. Kal. Jan.). But in one of his letters to At-
tilus³ he speaks of it as falling on the fourth before
the nones of January. The exact words in which
the announcement of the day on which the compi-
talía was to be kept, are preserved by Macrobius⁴
and Aulus Gellius⁵: "Die · Noni · (i. e., nono)
Popolo · Romano · Quiritibus · Comptalia ·
Exe · Quando · Concepta · Forevint · (or · fa-
te · Fourth · of · a · New · Year)," ⁶

COMPLUVIUM. (Vid. House.)

CONCHA (κόχυς), a Greek and Roman liquid
measure, of which there were two sizes. The
smaller was half the cyathus (≈ 0412 of a pint
English); the larger, which was the same as the
oxybaphum, was three times the former (≈ 1238
of a dry gill). ⁷

*CONCHA (κόχυς), a term frequently applied,
like conchylia, to shell-fish in general, but more
particularly to the Chame. Horace, it is probable,
means the Chame in the following line: "Mittulis
et vitres pellett oldastia concia." ⁸

*CONCHYLIIUM (κοχυλίαν). This term is
sometimes used in a lax sense, as applied to the
Tartessus in general, or to those in the apparatus
of their flesh. ⁹ Xencoruses uses κοχυλίαν in the
same sense. ¹⁰ It is also applied to the Purpura
in particular, and likewise to the purple coloured
from it. According to Aldrovandus, Horace applies
it to oysters in the following line: "Miscervis sīa
simil conversionis turdiz." ¹¹

CONCUBINA (GREEK). The παλλακάς or
παλλακις occupied at Athens a kind of middle rank
between the wife and the harlot (πραιση). The
distinction between the ἔταιρα, παλλακάς, and legal
wife is accurately described by Demosthenes. ¹² τῆς
μεν γὰρ ἕταιρα ήδης ἕνα ἔχον τὸ δὲ παλλακάς,
τῆς ἐπεξηγεῖτο ὅτι αὐτὰ ἔχειν τὸς γυναῖκας,
τόν δὲ παλλακήν γυναῖκας καὶ τὸν ἴκανον φίλον
τίν τινί ἔχειν. Thus Antiphon speaks of the παλλακάς
of Philoneus as following him to the sacrifice, ¹³ also
waiting upon him and his guest at table. ¹⁴ If
her person were violated by force, the same penalty
was exigible from the ravisher as if the offence
had been committed upon an Attic matron; and a man
conspiring together with a harlot in the sacrificial
intercourse with his παλλακή, might be slain by
him on the spot, as in the parallel case. ¹⁵ (Vid.
ADUERTEM.) It does not, however, appear very
clearly from what political classes concubinae were
chiefly selected, as cohabitation with a foreign (ξένη)
woman was strictly forbidden by law, ¹⁶ and the
provision of concubines for the army in time of war
must in most cases have prevented their sinking to
this condition. Sometimes, certainly, where there
were several destitute female orphans, this might
take place, as the next of kin was not obliged to
provide for more than one; and we may also
conceive the same to have taken place with respect
the daughters of families so poor as to be unable
to supply a dowry. ¹⁷ The dowry, in fact, seems to
have been a decisive criterion as to whether the

When the word came afterward to be applied more strictly as a repository for the dead.

In the earlier ages of Greek and Roman history, the body was consumed by fire after death (vid. Bystum), the ashes only receiving sepulture; and as there could be no danger of infection from these, the sepulchres which received them were all above ground. 1 But subsequently, when this practice fell into partial or entire disuse, it became necessary to provide sepulchres for the bodies of both males or females, or, in contrast to those which contained the bones and ashes only. It is so used by Petronius 2 for the tomb in which the husband of the Ephesian matron was laid; by Pliny, 3 for the vault where the body of a person of gigantic stature was preserved entire; and by Quintilian 4 for the chamber in which a dead body is laid out, "cubulum conditiorum mortis tua," in a single passage of Pliny 5 it is synonymous with monument, and in an inscription, 6 "ollas vi. minores in avito conditorio," the mention of the cinerary olla indicates, that the tomb alluded to was of the kind called columbarium. (Vid. Columbarium.) The corresponding word in Greek is οὐσίων οὐκ ἐνεπέτευξα, ἔππεγερε. 7

Conditorium is also used for the coffin in which a body was placed when consigned to the tomb and when used, the same distinction is implied. 8 CONEION (κεισεως), Hemlock, or Conium maculatum. It is called Cicutae by Celsus. This poisonous plant possesses highly narcotic and dangerous qualities, and an infusion of it was given at Athens to those who were condemned to capital punishment. By a decocation of this kind Socrates lost his life. The effects of the poison in his case are strikingly described in the Phaedon of Plato. Sithorp found the θειοςεως between Athens and Megara. It is not unfrequent throughout the Peloponnesus also. The modern Greeks call it Βροονικοτευ. 9

CONFERREA TIO. (Vid. Marriage.)

CONFESSORIA ACTIO is an actio in rem, 10 by which a person claims a jus in re, such as the use and enjoyment (usu fructus) of a thing, or claims a servitut (jus cundi, agenda, &c.). The actio negotaria or negotativa is that in which a person disputes a jus in re which another claims and attempts to exercise.

If a person has claimed a servitus, each may bring his action; if several claimed as fructuarius, they must join in the action. None but the owner of the property, to which the servitus was allotted to be due, could maintain a directa actio for it. The condemnation in the actio confessoria was adapted to secure to the fructuarius his enjoyment of the thing if he proved his right, and to secure the servitus of the plaintiff made out his claim to it.

The negotaria were those in which a person was to claim a servitus to a thing against a person who claimed a servitus in it, and at the same time endeavored to exercise it. The object of this action was to prevent the defendant from exercising his alleged right, and to obtain security (cautio) against future attempts, which security it was competent for the judex to require. But this action was extended to the getting up of a nuisance; as, if a man put a heap of dung against your wall so as to make it damp; or

Thus, in the case of a man building on another man's ground, the building belonged to the owner of the ground (superficies solo cedit); or in the case of a tree planted, or seed sown on another man's ground, the rule was the same. If a man wrote, even in letters of gold, on another man's parchment or paper, the whole belonged to the owner of the parchment or paper; in the case of a picture painted on another man's canvass, the canvass became the property of the owner of the picture. If a piece of land was torn away by a stream (avulso) from one man's land and attached to another's land, it became the property of the latter when it was firmly established by a stream. It was thus acquired from that of Alluvio. And in all these cases the bungling party was entitled to compensation, with some exceptions as to cases of mala fide.

Thus the commixtio, or mingling of things, is itself a null action; it cannot be this which we have been speaking of. Thus, in the case of a man building on another man's ground, the building belonged to the owner of the ground (superficies solo cedit); or in the case of a tree planted, or seed sown on another man's ground, the rule was the same. If a man wrote, even in letters of gold, on another man's parchment or paper, the whole belonged to the owner of the parchment or paper; in the case of a picture painted on another man's canvass, the canvass became the property of the owner of the picture. CONSTITUTIONES.

CONSIDER.

sometimes also termed congiiaria. Congiiaria was, moreover, occasionally used simply to designate a present or a pension given by a person of high rank, or a prince, to his friends; and Fabius Maximus called the presents which Augustus made to his friends, on account of their smallness, hennervatives, or head of congiiaria, because hennervative was only the twelfth part of a congius.

CONGIUS, a Roman liquid measure, which contained six sextars, or the eighth part of the amphora (=5.9471 pints Eng.). It was equal to the larger χοῖρος of the Greeks. (Vid. Chus.) Cato tells us that he was wont to give each of his slaves a congius of wine at the Saturnalia and Compitalia. 5 Pilate is said to have used it for hard drinking, 6 that Novellus Torquatus Mediolanensis obtained a cognomen (tricongius, a nine-bottle-man) by drinking three congii of wine at once.

There is a congius in existence, called the congius of Vespasian, or the Farme congius, bearing an inscription, which states that it was made in the year 75 A.D., according to the standard measure in T. Capit., and that it contained, by weight, ten pounds. (Imp. Caes. vi. T. Cap. Aug. P. III. Cap. Mensusurae exacte in Capitolio, P. x.) By means of this congius the weight of the Roman pound has been ascertained. (Vid. Libra.) This congius holds, according to an experiment made by Dr. Hase in 1824, 52037692 grams of distilled water. Now the imperial gallon of eight pints, as determined by act of Parliament in 1824, holds 10 lbs. avoirdupois, or 70,000 grams of distilled water. Hence 52037692 x 8 = 5-9471, as above. Its capacity in cubic inches is 200-1241.

A congius is represented in Fabretti. 7

*CONILE (κονιά), a plant, most probably, as Sprengel suggests, the Saturcia Greca, or Greek Savory.

CONNIUM. (Vid. Marriage.)

CONOPÆUM (κουπανοε), a gnat curtain, i.e., a covering made to be expanded over beds and couches to keep away gnats and other flying insects, so called from κουφα, a gnat.

The gnat-curtains mentioned by Horace 8 were probably of linen, but of the texture of gauze. The use of them is still common in Italy, Greece, and other countries surrounding the Mediterranean. Congiaria, or gnat curtains, were extremities of the Roman Senate.

According to Herodotus, 9 the Egyptian fishermen used to provide a substitute for gnat-curtains in the following manner: The fisherman, having gone through the day worked at his employment with his casting-net (αμφιθάλαντος), in the evening fixed the point of it on the top of an upright pole, so that it might be expanded round him in the form of a tent. Under this he reposed, secure from the attacks of the gnats, which, as has been lately proved, will not pass through the meshes of a net, though quite wide enough to admit them. 10

*CONOPS (κουφα), a name most properly applied to the Culex pipiens, or Gnat. Schneider, however, shows that it is sometimes indiscriminately applied also to the Ephesia (Mayfly), and the Phryganus. 11

CONQUISITORES. These persons were employed to go about the country and impress soldiers,

when there was a difficulty in completing a levy. Sometimes commissioners were appointed by a decree of the senate for the purpose of making a consequitio. 12

CONSAU/NEI. (Vid. CONGIAT.)

CONSECRA'TIO. (Vid. Apothegm.)

CONSILIA/R. (Vid. Conventus.)

CONSILIUM. (Vid. Conventus.)

CONSTITUTIO'NES. "Constitutio principia," says Gaits, 13 "is that which the imperator has constituted by decretum, edictum, or epistola; nor has it ever been doubted that such constitutio has the force of law, inasmuch as by law the imperator receives the imperium. Hence such laws were often called " Constitutio principia."

An imperial constitution, then, in its widest sense, might mean everything by which the head of the state declared his pleasure, either in a matter of legislation, administration, or jurisdiction. A decreum was a judgment in a matter in dispute between two parties which came before him, either in the way of appeal or in the first instance. Edicta, so called from their analogy to the old edict, edictes, rescripts, leges, leges perpetue, &c., were laws binding on all the emperor's subjects. Under the general head of rescripta 4 were contained epistolas and subscriptiones, 5 which were the answers of the emperor to those who consulted him either as public functionaries or individuals. 6 In the time of Tiberius, the word rescriptum had hardly obtained the legal signification of the time of Gaits. It is easy to see how in the later constitutions the emperors, from their nature, have the force of leges genera, but, inasmuch as these determinations in particular cases might be of obvious general application, they might gradually obtain the force of law.

Under the early emperors, at least in the time of Augustus, many leges were enacted, and in his time, and that of his successors to about the time of Hadrian, we find innumerable senatorial constitutio.

In fact, the emperor, in whom the supreme power was vested from the time of Augustus, exercised his power through the medium of a senatorial consultum, which he introduced by an oratio or libellus, and the senatorial consultum was said to be made " imperatore auctore." Probably, about the time of Hadrian, senatorial consultum became less common, and finally imperial constitutions became the common form in which a law was made.

At a later period, in the Institutes, it is declared, that whatever the imperator determined (constituit) by epistola, or decided judicially (cognoscens decrevit), or declared by edict, was law; with this limitation, that those constitutions were not laws which in their nature were limited to special cases.

Under the general head of constitutio we also read of mandates, or instructions by the Caesar to his officers.

Many of these constitutions are preserved in their original form in the extant codes. (Vid. Codex Theodosianus, &c.)

CONSU/A, a festival, with games, celebrated by the Romans, according to Festus, Ovid, 14 and others, in honour of Consus, the god of secret deliberation, or, according to Livy, 15 of Neptune Equestris. Plutarch, 16 Dionysius of Halicarnassus, 17 and the Pseudo Asconius, however, 18 say that Neptune Equestris and Consus were only different names for one and the same deity. It was solemnised every year in the circus by the symbolic ceremony of uncovering an altar dedicated to the

1. (Hirt, De Bell. Alex. i., 22.—Liv. xxi., 11.—2. (Liv. xxi., 5.)—3. (i. 5.—4. (Gaius, i., 93.—5. (Gaius, 75, 73.—6. (Cic., de Leg., xi., 12.—7. (Suet., Augustus, Appellation.)—8. (Epod. xiii., 9).—10. (See Judith, viii., 9; ii. 9; ix. 18.—11. (Gaius, vi. 90.—12. Spencon a Trans. of the Entomological Society for 1834.—13. Aristot., h. A., iv., 7.—Eliani, n. A., xiv., 22.)
gut, which was buried in the earth. For Romulus, who was considered as the founder of the festival, was supposed to have discovered an altar in the earth on that spot. The solemnity took place on the 23rd of August with horse and chariot races, and libations were poured into the flames which consumed the sacrifices. During these festive games, horses and males were not allowed to do any work, and were adorned with garlands of flowers. It was at their first games that they introduced the ancient custom on the Sabine maidens were carried off. Virgil, in speaking of the rape of the Sabines, describes it as having occurred during the celebration of the Circensian games, which can only be accounted for by supposing that the great Circean games, in subsequent times, superseded the ancient Consulalia, and that thus the poet substituted games of his own invention for the ancient一处, with the same name, to the ancient consul. Thus consules is tantamount to consentes, the name given to Jupiter's council of gods. This is not quite correct. The syllable sul contains the root of the verb salio, "to go" or "come;" and consul-sul-tum is merely "a coming together," like convensus, contio. So consules are "a coming together," praevid他 who goes before," except he who goes out.

The institution of consuls or joint presidents of the state seems to have been intimately connected with the first principles of the Roman political system. The old tradition with regard to the first two kings seems to point directly to something of the kind, and Servius, in his Commentaries, has made a perfect fit for a restoration of the old division of the sovereign power between two functionaries. They do not, however, appear to have existed under this name till after the expulsion of Tarquinius, when L. Junius Brutus and L. Tarquinius Collatius (or M. Horatius) were appointed chief magistrates at Rome with this title. At the first election, the two elected were to choose one of their number to be consul at Rome, and had all the power of the kings whom they succeeded. Cicero ascribes to them the regia potestas: "Idque in republica nostra maxima valuit, quod ei regalis potestas praeexit—quod et in his etiam qui nunc regnant manet." "Quibus autem regia potestas non placuit, non ni femin, sed non se cum ipse minor potestate numquam regal, with the exception of the golden crown, which they did not wear at all, and the trabea, which they only wore on the occasion of a triumph. They had ivory sceptres surmounted by eagles; in the public assemblies they sat upon a throne (sella curulis); they had an elevated seat in the senate, where they presided; they appointed the praetors; they contracted foreign alliances; they had the jurisdiction, i.e., they were the supreme judges in all suits, whence we also find them called pretatores; and they had the imperium, or supreme command of the armies of the state. The most prominent outward symbols of their authority were the fasces, or bundle of rods surrounding an ax, and borne before the consuls by twelve lictors or beards.

At first each of the consuls had his own twelve lictors; but P. Valerius, called Publius, from his attention to the wishes of the populus, or original burgesses, removed the axe from the fasces, and allowed only one of the consuls to be preceded by the lictors while they were in Rome. The other consul was attended only by a single accensus. This division of the honours was so arranged that the consuls enjoyed the outward distinctions alternately from month to month; the elder of the two consuls received the fasces for the first month, and so on, till the reign of Augustus, when it was decreed by the Lex Julia and Papia Poppaea, that the precedence should be given to him who had the greater number of children. To this alternation in the honours of the consulate Horace seems to refer indirectly, when he says,

"Virtus, repulse nescia soror,
Intaminitas fulget honoribus:
Nec summi aut posti secures
Arbitrio popularum aura." 1

While they were out of Rome, and at the head of the army, the consuls wore their insignias in the fasces, and each had his own lictors as before the time of Valerius.

The consuls were for some time chosen only from the populus or patricians, and, consequently, always sided with their own order in the long struggle which was carried on between the patricians and the plebeians. The first showing of their power was great enough, when the senate of the tribune plebis, who were a sort of plebeian consuls, and, like the others, were originally two in number. They presided at the comitia tributa, or assemblies of the plebs, as the consuls did at the other comitia, and had the right of interposing a veto, which put a stop to any consular or senatorial measure. The consular office was divided among the two, the consules, the term being of the same length as that of the tribuni plebis, and their functions performed by a board of ten high commissioners (decemviri), appointed to frame a code of laws, according to a motion of the tribune Terentius. On the re-establishment of the consulate in B.C. 444 the tribunes proposed that one of the consuls should be chosen from the plebeians, and this gave rise to a serious and prolonged struggle between the two orders, in the course of which the office of consul was again suspended, and its functions administered by a board of tribuni militares, corresponding to the στρατηγοι at Athens. At length, in B.C. 366, the plebeians succeeded in procuring one of the consuls to be elected from their own body, and after that time, so far as we have any record of them, the two consuls, in their own turn, were chosen from the plebeian order. The prerogatives and functions which were originally engrossed by the consuls, were afterward divided between them, and different magistrates appointed to relieve them under the great pressure of business introduced by the increase of the state. The consuls, appointed in B.C. 442, performed some of their duties, and the first elected in B.C. 365, undertook the chief part of the jurisdiction, or judicial functions of the consuls. When a consul was appointed to some command or office out of Rome, he was said provinciam accipere; and when the consul was appointed to a foreign command after the expiration of his year of office, he was called praetor domino. In the Greek writers on Roman history, the consulate is called the consules; the praetores were called praetores; and the consules were called consules. In the old period, the consul might also be succeed by the dictator, who was appointed with absolute power for certain emergencies. A similar authority, however, was occasionally vested in the consuls themselves by virtue of the senatus decreto, which was worded, "Videntes consules ne quid repudiae deserentem capitum, s. l. conj. consules look to it, that no harm befall the state." 2

The consuls were elected some time before they

1 (Carm., III, ii, 17)
entered upon their office, and till then were called *contubernalis*.
In later times they entered on their office on the 1st of January, and were obliged to take the oath of office within the five days following, the effect of which they had to repeat in an oath which they took on quitting their office at the end of the year. The commencement of the consulate was always celebrated by a solemn procession to the Capitol, and a sacrifice there to Jupiter Capitolinus, and after that there was a great meeting of the consuls, the "Convivium" (B.C. 181) it was decreed that the consul should be 43 years of age.
But many were elected consuls at an earlier age. It was also a law that an interval of ten years should elapse between two elections of the same person to the office of consul; but this law was not strictly observed, and instances occur of five or six re-elections to this office. C. Marius was seven times consul.
The office of consul continued after the downfall of the Republic. In the reign of Tiberius the consuls were no longer elected by the people, but were appointed by the senate; and subsequently the number was increased, and consuls were appointed for a part of the year only, till at last it became only an honorary or complimentary appointment. In these times the consuls were divided into several classes: the *consules ordinarii* (who were the nearest representatives of the older consuls; the *consules suffecti*, appointed by the emperors for the rest of the year; and the *consules honorarii*, who had only the name, without a shadow of authority.
The consuls, like the ἄρχων ἐπόνομος at Athens, gave their names to the year; calendars or annual registers were kept for this purpose, and called *Consularia*. The last consul serving a year, was called Basilius junior, in the reign of Justinian, A.D. 1294, A.D. 541.

**CONVIVIUM. (Vid. Obligations)**

*Contubernales (στενάκιον).* This word, in its original meaning, signified men who served in the same army and lived in the same tent. It is derived from taberna (afterward tabernaculum), which, according to Festus, was the original name for a military tent, as it was made of boards (tubae). Each tent was occupied by ten soldiers (*contubernales*), with a subordinate officer at their head, who was called *decanus*, and in later times *caput contubernii*.3

Young Romans of illustrious families used to accompany their father on a military general on his expeditions or to his provincial triumphs, under his superintendence a practical training in the art of war or in the administration of public affairs, and were, like soldiers living in the same tent, called *contubernales*.3

In a still wider sense, the name *contubernales* was applied to persons connected by ties of intimate friendship, and living under the same roof; and hence, the word is used to describe a band of training slaves, who were not allowed to contract a legal marriage, lived together as husband and wife, they were called *contubernales*; and their connexion, as well as their place of residence, *contubernium*. Cicero calls Caesar the *contubernales* of Quirinus, thereby alluding to the fact that Caesar had allowed his own statues to be erected in the temple of Quirinus.4

**CONVOLUMUS. (Vid. Contubernales, Concubina.**

[CONUTS (κούτιον, from κεῦτο, I prick or pierce.)]

[CONVOLVULUS. (κούτιον, from κεῦτο, I prick or pierce.)]

was, as Nonius 1 expresses it, a long and strong wooden pole or stake, with a pointed iron at the one end.2 It was used for various purposes, but chiefly as a punt-pole by sailors, who, in shallow water, thrust it into the ground, and thus pushed up the boat.2 It also served as a means to sound the depth of the water.5 At a later period, when the Romans became acquainted with the huge lance or pikes of some of the northern barbarians, the word *contus* was applied to any kind of weapon, especially spear or spear-like to the Sarmanians were always designated by this name.6

**CONVENTER IN MANUM. (Vid. Marriage.)**

*Conventer (στρογγυλός, στρογγυλός, or στρογγυλόν)* is properly a name which may be given to any assembly of men who meet for a certain purpose. But when the Romans had reduced foreign countries into the form of provinces, the word *contus* was used to designate the civil police, a term similar to the Sarmanians were always designated by this name.6

**CONVENTIVUM IN MANUM. (Vid. Manumission.)**

*Conventer (στρογγυλός, στρογγυλός, or στρογγυλόν)* is properly a name which may be given to any assembly of men who meet for a certain purpose. But when the Romans had reduced foreign countries into the form of provinces, the word *contus* was used to designate the civil police, a term similar to the Sarmanians were always designated by this name.6

[CONUTS (κούτιον, from κεῦτο, I prick or pierce.)]

epithet of 

C. 

to grow as a vegetable underneath the waves, and to harden into stone when removed from its native element.11

The corn was measured after threshing, *corvus palustris*, which held a certain measure of green food for cattle; *corvus constricte*, when put over the noses of cattle with sore mouths, like a muzzle, to prevent them from rubbing their lips. These were all of the larger sort, the same as that mentioned by Plautus, "Geriote amicus vestris aurum coribulis."

The smaller basket (*corbula*) was used for gathering fruit (*aliquot corbulas unaram*); as a breakfast dish, *corbulae unaram*; for carrying up vials from the kitchen to the *canaeum* and, when Nero attempted to cut through the Isthmus of Corinth, he put the earth into a *corbula*, which he took from a soldier, and carried it away on his shoulders (*limestone corbulae congetas*), which identifies the sort of basket termed *kophos* by Josephus, which constituted part of the marching accoutrements of every Roman soldier.

The *corbus* was also used in the Roman navy. Being filled with stones, it afforded a substitute for an anchor in places where the soil was impervious to, or not sufficiently tenacious for, the fluke of an anchor, which practice is not yet forsaken, for the writer has repeatedly seen the identical "*corbella*" delineated above so applied in the bay of Mola di Gaeta.

CORBITAE, merchants of the larger class, so called because they hung up a *corbus* at the masthead for a sign. They were also termed *omeraria*; and hence Plautus, in order to designate the voracious appetites of some women, says, "Corbitam cibi comesse possunt." They were noted for their heavy build and slaggish sailing, and carried passengers as well as merchandise, answering to the large "fetucca" of the present day. Cicero proposed to take a passage in one of these vessels from Rhagium to Puteoli, which he opposes to the smaller class of *jackets* (*actuatario*).

*CORCHUS* (*kophoros*), a plant, probably the same with the Jews' *malow*, or *Corchorus olitorius*. It is still used as a potherb by the Jews at Aleppo. A *Japanese* species of this shrub is well known in Great Britain, according to Adams; but the *Corchorus olitorius* is seldom cultivated.

*CORYLUS* (*kordoneor*), an amphibious animal described by Aristotile.

"From the discussions of Belon, Rondalet, Gesner, and Schneider, it would appear to be settled," remarks Adams, that it was a sort of Lizard, probably a variety of the *Siren Lacertata*.

II. The fry of the Tunny-fish, according to Pliny. Modern naturalists, however, think that it is probably a variety of the *Scomber-thynnus*, L.

*CORNIDIUM* (*kophiavon or kophos*), Coriander, or *Coriandrum sativum*. It grows wild in Italy. The name is derived from the strong smell of *bedungs* (*kophos*, "a bedbug") which the seed has when fresh. The synonyms say there were several kinds. According to Pliny, Coriander-seed, taken in moderate quantities, was good in aiding digestion; and the ancients, therefore, generally took it after eating. Sibthorp makes the modern Greek name to be *kophiavon or kowbaraz.* He found it a Peloponnese (the Morea) and the island of Cythera.

*CORIS* (kopher), I., a name applied to several species of the genus *Cimerius*, or bug. (*Vind. Corix*).

II. A plant, the same with the *Hypericum Coris*, L.

CORDAX. (Vid. Ceidia, p. 299.)

CORNELIA LEX. (Vid. Majestas, Repertum, &c.)

CORNELIA FULVIA LEX. (Vid. Ambratus.)

CORNELIA LEX DE FALSIS. (Vid. Falis.)

CORNELIA LEX DE INJURIS. (Vid. Injur.)

CORNELIA LEX DE SICARIIS ET VENERIS. (Vid. Silvis.)

A law of the Twelve Tables contained some provision as to homicide, but this is all that we know. It is generally assumed that the law of Numa Pompilius, quoted by Festus, "Si quis hominem liberum dolo scientis morti duxit partici est", was incorporated in the Twelve Tables, and is the law referred to which Pliny refers; but this cannot be proved. It is generally supposed that the laws of the Twelve Tables contained provisions against incantations (*natulum cartum*) and poisoning, both of which offences were also included under *parricidium*: the murderer of a parent was sewed up in a sack (*culesus or culceus*) and thrown into a river. It was under the provisions of some old law that *parricidium*, by a *canaeum* or ordered the *confio* P. Scipio and D. Brutus (B.C. 138) to inquire into the murder in the *Silva Scantia* (*Silvis*). The lex Cornelia of Sicaris and Veneficus was passed in the time of the dictator Sulla, B.C. 82. This lex contained provisions as to death or fire caused by dolus malus, and against persons going about armed with the intention of killing or slaying. The law not only provided for cases of poisoning, but contained provisions against those who made, sold, bought, possessed, or gave poison for the purpose of poisoning; also against a magistrate or senator who conspired in order that a person might be condemned in a judicium publicum, &c. To the provisions of this law was subsequently added a *lex consularis* against mas-sacrificia, otherwise called impia sacrificia, the agents in which were brought within the provisions of this lex. The punishment inflicted by this law was the interdictio aequ et ignis, according to some modern writers. Marcian says that the punishment was deportatio in insulam et honorum ademtio. These statements are reconcilable when we consider that the deportatio under the emperors took the place of the interdictio, and the expression in the Digest was suited to the period to which the laws or the compilers. Besides, it appears that the lex was modified by various senatus consulta and imperial rescripts.

The lex Pompeia of Parricidios, passed in the time of Cn. Pompeius, extended the crime of parricide to the killing (dolo male) of a brother, sister, uncle, aunt, and many other relations enumerated in the lex. This enumeration also comprised victrices, novercas, proxenae, prives, prives servandas, patrona, an avus who killed a nepos, and a mother who killed a filius or filia; but it did not extend to a father. All privy to the crime were also punished by the law, and attempts at the crime also came within its provisions. The punishment was the same as that affixed by the lex Cornelia of Sascria, by which means the same punishment is inflicted on the fixed crimes of the same kind. He who killed a father or mother, grand-father or grandmother, was punished (more majo-rum) by being whipped till he bled, sewn up in a
CORNU.

From which lines we learn the distinction between the cornu and lituus, as from Ovid we learn that between the tuba and cornu:

"Non tuba directi, non aris cornua flexi."

The preceding woodcut, taken from Bartholinus, illustrates the above account.

CORONA (στρέφανος), a Crown; that is, a circu-
lar ornament of metal, leaves, or flowers, worn by
the ancients round the head or neck, and used as a
festival as well as funereal decoration, and as a re-
ward of talent, military or naval prowess, and civil
worth. It includes the synonyms of the species,
for which it is often used absolutely, ασπίδα, αττί
στρέφανος, corolla, setum, a garland or wreath.

The first introduction of this ornament is attri-
buted to Janus Bifrons, the reputed inventor of ships
and coinage, whence many coins of Greece, Italy,
and Sicily bear the head of Janus on one side, and
a ship or a crown on the reverse.

Judging from Homer's silence, it does not appear
to have been a favourite of the Greeks in the be-
roic ages as a reward of merit or as a festive de-
coration, for it is not mentioned among the luxuries
of the delicate Phaeacians or of the suitors. But
a golden crown decorates the head of Venus in the
lyam to that goddess.

Its first introduction as an honorary reward is
attributable to the attached poets, in some of which
it was bestowed as a prize upon the victor, from
whence it was adopted in the Roman circus. It
was the only one contended for by the Spartans in
their gymnastic contests, and was worn by them when
going to battle.

The Romans refined upon the practice of the
Greeks, and invented a great variety of crowns,
formed of different materials, each with a separate
appellation, and appropriated to a particular purpose.

We proceed to enumerate these and their proper-
ties, including in the same detail an account of the
corresponding ones, where any, in Greece.

I. CORONA OBSIDIONALIS. Among the hono-
ratory crowns bestowed by the Romans for military
achievement, the most difficult of attainment, and
the one which conferred the highest honour, was the
-corona obsidionalis, presented by a beleaguered
army after its liberation to the general who broke
up the siege. It was made of grass, or weeds and
wild flowers, thence called corona graminae, and
graminae obsidionalis, gathered from the spot on
which the beleaguered army had been encircled, in
allusion to a custom of the early ages, in which the
vanquished party, in a contest of strength or agility,

placed a handful of grass from the meadow where

1. (Metam., i. 98.)—2. (De Thibis, p. 403.)—3. (Athen., xxv.
iv. 36.)—7. (Argol. in Pharn., De Litter. Circ., i. 10.)—8. (Hamilton's

909.
CORONA.

the struggle took place, and gave it to his opponent as a token of victory. A list of the few Romans who gained this honour is given by Pliny. A representation of the corona graminea is introduced in the preceding woodcut.

II. CORONA CIVICA, the second in honour and importance, was presented to the soldier who had preserved the life of a Roman citizen in battle, and therefore accompanied with the inscription "Ob crem servaturn," as seen on the medal of M. Lepidus, introduced in the next woodcut, in which the letters H. O. C. S. stand for hostem occidit, civem servavit. It was originally made of the ilex, afterward of the asculus, and finally of the quercus, three different sorts of oak, the reason for which choice is explained by Plutarch. It is represented in the next woodcut, above which the medal of Lepidus, just mentioned, is placed.

As the possession of this crown was so high an honour, its attainment was restricted by very severe regulations, so that the following combinations must have been satisfied before a claim was allowed: To have preserved the life of a Roman citizen in battle, slain his opponent, and maintained the ground on which the action took place. The testimony of a third party was not admissible; the person rescued must himself proclaim the fact, which increased the difficulty of attainment, as the Roman soldier was commonly unwilling to acknowledge his obligation to the prowess of a comrade, and to show him that deference which he would be compelled to pay to his preserver if the claim were established. Originally, therefore, the corona civica was presented by the rescued soldier; after the claim had been thoroughly investigated by the tribune, the reluctant hero must come forward and give his evidence; but under the Empire, when the prince was the fountain from which all honours emanated, the civic crown was no longer received from the hands of the person whose preservation it rewarded, but from the prince himself, or his delegate.

The preservation of the life of an ally, even though he were a king, would not confer a sufficient title for the civic crown. Once obtained, it might always be worn. The soldier who had acquired it had a place reserved next to the senate at all the public spectacles; and they, as well as the rest of the company, rose up upon his entrance.

He was freed from all public burdens, as were also his father, and his paternal grandfather; and the person who owed his life to him was bound, ever after, to cherish his preserver as a parent, and afford him all such offices as were due from a son to his father.

A few of the principal characters who gained this reward are enumerated in the following passages: Plin., H. N., vii., 29; xvi., 5.—Liv., vi., 20; x., 46. L. Gellius Publicola proposed to confer it upon Cicero for having detected and crushed the conspiracy of Catiline, and among the honours bestowed upon Augustus by the Senate, it was decreed that a civic crown should be suspended from the top of his house; hence a crown of oak leaves, with the inscription ob cives servatos, is frequently seen on the reverse of the Augustan medals, as also on those of Galba, Vitellius, Vespasian, Trajan, &c., showing that they likewise assumed to themselves a similar honour.

Other chariots of leaves of many kinds were used both at Rome and in Greece, but they are distinct in character and purpose from the corona civica. An oak wreath was given by the Greeks to Jupiter, but that has no acorns, which formed a prominent feature in the corona civica; and likewise to Hecate; of ivy to Bacchus, commonly seen in his statues, from which he is termed Kastorakipp. Those who assisted at a sacrifice wore a crown of bay, and the victim a wreath of cypress, pine, or flowers, and leaves of the tree sacred to the deity to whom the offering was made. Romulus bestowed a crown of leaves upon Hostus Hostilius, as the first man who stormed the city of Fidenae; and the army paid a similar compliment to P. Decius, by whom it was saved from destruction during the battle of Areus.

It will not fail to be remarked, as characteristic of Roman manners and early republican virtue, that the two crowns which were the most difficult to obtain, and held in the highest honour, possessed no intrinsic value.

III. CORONA NAVALIS or ROSTRA, called also CLASSICA. It is difficult to determine whether these were two distinct crowns, or only two designations for the same one. It is, therefore, useless to consider both terms in one sentence, "Tempora neque fulgent rostra corona." But it seems probable that the former, besides being a generic term, was inferior in dignity to the latter, and given to the sailor who

CORONA

was boarded an enemy's ship; whereas the latter was given to a commander who destroyed the whole fleet, or gained any very signal victory. At all events, they were both made of gold; and one, at least (rostrata), decorated with the beaks of ships, like the rostra in the Forum, as seen in a medal of Agrippa, the other (nassata), with a representation of the entire bow, as shown in the subjoined woodcut.

The Athenians likewise bestowed golden crowns for naval services, sometimes upon the person who got his trireme first equipped, and at others upon the captain who had his vessel in the best order.

IV. CORONA MURALIS. The first man who sealed the wall of a besieged city was presented by his commander with a mural crown. It was made of gold, and decorated with turrets (muri pinnatis), as represented in the next woodcut, and being one of the highest orders of military decorations, was not awarded to a claimant until after a strict investigation.

Cybele is always represented with this crown upon her head; but in the woodcut annexed the form of the crown is very remarkable, for it includes the whole tower as well as the turrets, thus affording a curious specimen of the ancient style of fortification.

V. CORONA CASTRENSIS OR VALLARIS. The first soldier who surmounted the salutum, and forced an entrance into the enemy's camp, was in like manner presented with a golden crown, called corona castrensis or vallaris, which was ornamented on the palisades (vallul) used in forming an intrenchment, as represented in the annexed woodcut.

VI. CORONA TRIUMPHALIS. There were three sorts of triumphal crowns, the first of which was worn round the head of the commander during his triumph. It was made with laurel or bay leaves, which plant is frequently met with on the ancient coins, both with the berries and without them. It was the latter kind, according to Pliny, which was used in the triumph, as is shown in the annexed woodcut, from a medal which commemorates the Parthian triumph of Vettidius, the lieutenant of Antony. Being the most honourable of the three it was termed laura insignis and insignis corona triumphalis.

The second one was of gold, often enriched with jewels, which, being too large and massive to be worn, was held over the head of the general during his triumph by a public officer (serus publicus). This crown, as well as the former one, was presented to the victorious general by his army.

The third kind, likewise of gold and great value, was sent as presents from the provinces to the commander as soon as a triumph had been decreed to him, and therefore they were also termed provinciales. In the early ages of republican virtue and valour these were gratuitous presents, but before the extinction of the Republic they were exacted as a tribute under the name of auro cornarium, to which none were entitled but those to whom a triumph had been decreed. (Vid. Aurum Cornarii.) The custom of presenting golden crowns from the provinces to victorious generals was likewise in use among the Greeks, for they were profusely bestowed upon Alexander after his conquest of Darius.

VII. CORONA OVALIS was another crown of less estimation, appropriated solely to commanders. It was given to those who merely deserved an ovation, which happened when the war was not duly declared, or was carried on against a very inferior force, or with persons not considered by the laws of nations as lawful enemies, such as slaves and pirates; or when the victory was obtained without danger, difficulty, or bloodshed; on which account

VIII. CORONA OLEAGINA. This was likewise an honorary wreath, made of the olive leaf, and conferred upon the soldiers well as their commanders. According to Gellius, it was given to any person or persons through whose instrumentality a triumph had been obtained, but when they were not personally present in the action. It is represented in the next woodcut, from a medal of Lepidus, and was conferred both by Augustus and the senate upon the soldiery on several occasions.

Golden crowns, without any particular designation, were frequently presented out of compliment by one individual to another, and by a general to a soldier who had in any way distinguished himself.

The Greeks, in general, made but little use of crowns as rewards of valor in the earlier and better periods of their history, except as prizes in the athletic contests; but, previous to the time of Alexander, crowns of gold were profusely distributed, among the Athenians at least, for every trilingue, whether civil, naval, or military, which, though lavished without much discrimination as far as regards the character of the receiving parties, were still subject to certain legal restrictions in respect of the time, place, and mode in which they were conferred. They could not be presented but in the public assemblies, and with the consent, that is, by suffrage, of the people, or by the senators in their council, or by the tribes to their own members, or by the demos of members of their own demos. According to the statement of Eschines, the people could not lavishly give crowns in any place except in their assembly, nor the senators except in the senate-house; nor, according to the same authority, in the theatre, which is, however, denied by Demostenes; nor at the public games; and if any citizen there proclaimed the crowns, he was sub-

II. CORONA PUNEBRIS ET SEPTEYHALLIS. The Greeks first set the example of crowning the dead with chaplets of leaves and flowers, which was imitated by the Romans. It was also provided by a law of the Twelve Tables, that any person who had acquired a crown might have it placed upon his body, and that it should be laid in the funereal procession. Garlands of flowers were also placed upon the bier, or scattered from the windows under which the procession passed, or entwined about the cinerary urn, or as a decoration to the tomb.

In Greece these crowns were commonly made of parsley (σεβεπρος).

III. CORONA CONVITIALIS. The use of chaplets at festive entertainments sprung likewise from Greece, and owe their origin to the practice of tying a woolen fillet tight round the head, for the purpose of mitigating the effects of intoxication.

Thus Mercury in the Amphitryon, when he is about
Corona.

Corpus Juris Civilis.

to snam drunk, says, "Caput coronam mihi in caput, assimilabo me esse ebrum." But, as luxury increased, they were made of various flowers or shrubs such as were supposed to prevent intoxication; of roses (which were the choicest), violets, myrtle, ivy, phillyra, and even parsley. The Romans were not allowed to wear these crowns in public, "in sae promission", which was contrary to the practice of the Greeks, and those who attempted to do so were punished with imprisonment.

IV. CORONA NATURALIS. The bridal crown was also of Greek origin, among whom it was made of flowers plucked by the bride herself, and not bought, which was of ill omen. Among the Romans it was made of verbeus, also gathered by the bride herself, and worn under the flavemum, with which the bride was always provided. The bridal gown also wore a chaplet.

The doors of their house were likewise decorated with garlands, and also the bridal couch.

V. CORONA NATALITIA. The chaplet suspended over the door of the vestibule, in the houses of both Athens and Rome, in which a child was born. At Athens, when the infant was male, the crown was made of olive; when female, of wool; at Rome it was of laurel, ivy, or passion. Besides the crowns enumerated, there were a few others of specific denominations, which received their names either from the materials of which, or the manner in which, they were composed. These were:

I. CORONA LONGA, which is commonly thought to resemble what we call a "fascia", and, as such seem to have been chiefly used to decorate tombs, curule chairs, triumphal cars, houses, &c. But the word must have had a more precise meaning, and was probably called longa from its greater size, and meant a circular string of anything, like the "rosary" used by the lower orders in Catholic countries to recount up their prayers, which in Italy is still called la corona, a hawker selling its origin to the corona longa of their heathen ancestors, to which description it answers exactly.

II. CORONA DROSICA was a golden crown, made to imitate the crown of oak leaves, studded with gems, and decorated with ribbons (lemnisci) or ties of gold. Any crown fastened with these ribbons, whether real or artificially represented, was also termed coronalemniscata, a specimen of which is given by Caylus.

III. CORONA PACTLIS, probably the same as the corona plectis of Plautus,* corona torta, plexia, strophium pleroi, and κυκλοσ τησ τησ. It was made of flowers, shrubs, grass, ivy, wool, or any flexible material twisted together. This crown was also of a kind used by the Sali in their festivities. It was made in the first instance of any kind of flowers sewed together, instead of being wreathed with their leaves and stalks; but subsequently it was confined to the rose only, the choicest leaves of which were selected from the whole flower, and sewed together by a skillful hand, so as to form an elegant chaplet.

VI. CORONA RADIATA was the one given to the gods and deified heroes, and assumed by some of the emperors as a token of their divinity. It may be seen on the coins of Trajan, Caligula, M. Aurelius, Valerius Probus, Theodosius, &c., and is given in the woodcut annexed, with a medal of Maro Antony.

VII. The crown of vine leaves (pampinea) was appropriated to Bacchus,* and considered a symbol of the arts. It is said to have been invented in Egypt, and was worn by the Roman knight, when he saw Claudius with such a crown upon his head, augured that he would not survive the autumn.

*CORONE (κορώνη), the Cultus Corone, or Carrion Crow. (Vid. Corax.) The specific name of an Ætolus κορώνη is applied by Aristotle* and by Elian* to a water-bird, which, was, or at least, some species either of the coromant or coot. It occurs also in the Odyssey of Homer* as a sea-bird.

*CORONOPUS (κορώνωπος), a plant, about which there has been some difference of opinion, but which, in all probability, is the same with the Buck's-horn Plantain, or Plantago Coronopus.

CORPUS JURIS CIVILIS. The three great compilations of Justinian, the Institutes, the Pandects, and the Code, together with the Novelle, form one body of law, and were considered as such by the glossators, who divided it into five volumina. The Pandects were distributed into three volumina, under the respective names of Digest, Novellae, and Codex; and Novella the name Corpus Juris Civilis was not given to this collection by Justinian, nor by any of the glossators. Savigny asserts that the name was used in the twelfth century: at any rate, it became common from the date of the edition of D. Gothofredus of 1604.

Most editions of the Corpus also contain the following matter: Thirteen edicts of Justinian, five constitutions of Justin the younger, several constitutions of Tiberius the younger, a series of constitu-

R R
CORTINA.

CORYBATES (Κορυβάτες). The history and explanation of the deities bearing this name, in the early mythology of Greece, cannot be given in this place, as it would lead us to enter into historical and mythological questions beyond the limits of this Dictionary. The Corybantes, of whom we have to speak here, were the ministers or priests of Rheia or Cybele, the great mother of the gods, who was worshipped in Phrygia. In their solemn festival they displayed the most extravagant fury in their dances in armour, as well as in the accompanying music of flutes, cymbals, and drums. Hence κορυβατεύεσθαι was the name given to an imaginary disease, in which persons felt as if some great noise were rattling in their ears.

CORYBANTICA (Κορυβαντικά), a festival and mysteries celebrated at Cnossus in Crete, in commemoration of one Corybas, who, in common with the Curetes, brought up Zeus, and concealed him from his father Cronos in that island. Other accounts say that the Corybantes, nine in number, independent of the Curetes, saved and educated Zeus; a third legend states that Corybas was the father of the Cretan Apollo who disputed the sovereignty of the island with Zeus. But to which of these three traditions the festival of the Corybantes owed its origin is uncertain, although the first, which was current in Cretae itself, seems to be best entitled to the honour. All we know of the Corybantes is, that the person to be initiated was seated on a throne, and that those who initiated him formed a circle and danced around him. This part of the solemnity was called ὑστομικὸς or ἄναρμος.

CORYMBUS (κορυμβός) was a particular mode of wearing the hair among the Greek women, which is explained in the article CORUM (p. 291). The following woodcut, taken from Millingen, represents a woman whose hair is dressed in this manner.

Corymbium is used in a similar sense by Pernius.

CORYS (κόρης). (Vid. GALEA.)

CORVUS, I. a sort of crane, used by C. Dulcius against the Carthaginian fleet in the battle fought off Mylae, in Sicily (B.C. 260). The Romans, we are told, being unused to the sea, saw that their
only chance of victory was by bringing a sea-fight to resemble one on land. For this purpose they invented a machine, of which Polybius has left a minute description, though not very perspicuous. In the fore part of the ship a round pole was fixed perpendicularly, twenty-four feet in height and about nine inches in diameter; at the top of this was a pivot, upon which a ladder was set, thirty-six feet in length and four in breadth. The ladder was guarded by crossbeams, fastened to the upright pole by a ring of wood, which turned with the pivot above. Along the ladder a rope was passed, one end of which took hold of the corvus by means of a ring. The corvus itself was a strong piece of iron, with a spike at the end, which was raised or lowered by drawing in or letting out the rope. When an enemy's ship drew near, the machine was turned outward, by means of the pivot, in the direction of the assailant. Another part of the machine, which Polybius has not clearly described, is a breastwork, let down (as it would seem) from the ladder, and serving as a bridge, on which to board the enemy's vessel. By means of these cranes, the Carthaginian ships were either broken or closely locked with the Roman, and Durrus gained a complete victory.

*CORVUS, the Crow. (Vid. Corone.)

*CORVUS (κορώνη), the Hazel-tree, or Corvus Anetiana. (Vid. Aretus.)

CORVOS or CORVUS (κορώνετα, κυαρώνετα), a Bow-case. This was worn suspended by a belt (vib. Balteus) over the right shoulder, and it frequently held the arrows as well as the bow (sagittifere corvit). On this account, it is often confounded with the Phakela or quiver.

It is generally carried by the armed Persians, who are represented on the Persepolitan bas-reliefs; and in this, as in many other respects, we observe the agreement between them and the European nations situated to the north of the Euxine Sea.

'The place vaulta turida felle gerat.'

Though its use was comparatively rare among the Greeks and Romans, we find it exhibited in a bas-relief of the Museum at Corinth,3 which adorning the front of a temple of Hercules near Tiberius. (Vid. Arcus.) This bow-case seems to be of leather. See the preceding woodcut.

COSME'TIΔ, a class of slaves among the Romans, whose duty it was to dress and adorn ladies. Some writers on antiquities, and among them Bötticher, have supposed these slaves were female slaves, but the passage of Juvenal is alone sufficient to refute this opinion; for it was not customary for female slaves to take off their tunics when a punishment was to be inflicted upon them. There was, indeed, a class of female slaves who were employed for the same purposes as the cosmati; but they were called cosmetria, a name which Niaveus chose as the title for one of his comedies.

COSMI (κοσμοί). The social and political institutions of Crete were so completely Dorian in character, and so similar to the Spartan, that it was a disputed point among the ancients whether the Spartan constitution had its origin there, or the Cretans adopted it from the Dorians. The historian Ephorus expressly states that the Spartan institutions had their origin in Crete, but were perfected and completed in Sparta; so that there is good reason for the assertion of Müller, that the constitution founded on the principles of the Doric race was there first moulded into a con- stitution and government of a more perfect and admir- ament form than in Sparta at a subsequent period. Thus much, at any rate, we know for certain, that there were various Dorian cities in the island, the political arrangements of which so closely resembled each other, that one form of government was ascribed to all. In the earliest ages of which we have historical information, this was an aristocracy consisting of three component bodies, the cosmi, the gerusia, and the ecclesia. The cosmi were ten in number, and are by Aristotle, Ephorus, and Ciceron compared to the ephors at Sparta. Müller, however, compares them with the Spartan kings, and supposes them to have succeeded to the functions of the kingly office; which Aristotle (probably alluding to the form of government then existing in the city of Megara) represents as theocratic. They were established in Crete. These cosmi were ten in number, and chosen, not from the body of the people, but from certain yepo or houses, which were probably of more pure Doric or Athenian descent than their neighbours. The first of them in rank was called procosmus, and gave his name to the year. They commanded in war, and also conducted the business of the state with the representatives and ambassadors of other cities. With respect to the domestic government of the state, they appear to have exercised a joint authority with the members of the yepevOai, as are said to have consulted with them on the most important matters. In the time subsequent to the age of Alexander, they also performed certain duties which bore a resemblance to the introduction of the lawsuits into court by the Athenian magistrates: Their period of office was a year; but any of them, during that time might resign, and was also liable to deposition by his colleagues. In some cases, too, they might be indicted for neglect of their duties.

356
On the whole, we may conclude that they formed the executive and chief power in most of the cities of Crete.

COTHURNUS

The *geryonia*, or council of elders, called by the Cretans *bouly* or *boulyê* consisted, according to Aristotle, of thirty members who had formerly been cosmi, and were in other respects approved of (το τα ἄλλα δέκα κρατίματα). They retained their office for life, and are said to have decided in all matters that came before them according to their own judgment, and not agreeably to any fixed codes of laws. They are also said to have been irresponsible, which, however, hardly implies that they were independent of the "unwritten law" of custom and usage, or uninfluenced by any fixed principles. On important occasions, as we have before remarked, they were *επιμελειοι, or councillors of the cosmi.

The democratic element of the ecclesia was almost powerless in the constitution; its privileges, too, seem to have been merely a matter of form; for, as Aristotle observes, it exercised no function of government except ratifying the decrees of the *γέροντες* and the *κοσμιοι*. It is, indeed, not improbable that it was only summoned to give its sanction to these decrees; and, though this may appear to imply the power of witholding assent, still the fact that it was consulted and custom would prevent such an alternative being attempted, or, perhaps, even thought of.

From these observations, it is clear that the Cretan constitution was formerly a Dorian aristocracy, which, in the age of Aristotle, had degenerated to what he calls a *δηνοστασία, i.e., a government vested in a few privileged families. These quarrelled one among the other, and raised factions or parties, in which the demos joined, so that the constitution was frequently broken up, and a temporary monarchy, or rather, anarchy, established on its ruins.

The cosmi were, in fact, often deposed by the most powerful citizens, when the latter wished to impede the course of justice against themselves (μυ δουνα δίκαιον), and an *ἀκοσμία* then ensued, without any legal magistrates at the head of the state.

In the time of Polybius, the power of the aristocracy had been completely overthrown; for he tells us that the election of the magistrates was annual, and determined by "democratical principles." In other respects, also, he points out a difference between the institutions of Crete and those of Lycurgus at Sparta, to which they had been compared by other authors.

Müller observes that the cosmi were, so far as we know, the chief magistrates in all the cities of Crete, and that the constitution of these cities was in all essential points the same; a proof that their political institutions were determined by the principles of the governing, i.e., the Doric, race.

We will now briefly explain some of the social relations of the Cretans, which were almost identical with those of the Spartans.

The inhabitants of the Dorian part of the island were divided into three classes, the freemen, the pericei or *περικότα*, and the slaves. The second class was as old as the time of Minos, and was undoubtedly composed of the descendants of the conquered population; they lived in the rural districts, round the *temple of the Great Goddess*, and, though they were free, they were not allowed to exercise none of the professions or influence of citizens, either in the administration and enactment of the laws, or the use of heavy arms. They occupied certain lands, for which they paid a yearly tribute or rent, supposed, from a statement in Athenaeus," to have been an ἐγερματικαί ἐπιφύτειαι, in the constitution of Crete, 1 and it was probably the term for the pericei, *δοῦλοι* being used as a generic term for those who were not full and free citizens.

They were divided into two classes; the public bondsmen (θέαντας *δοῦλας*), and the slaves of individuals. The former were called the *μένοι, μνοι, μνα, μίνους, the latter, *ὁμίλοι* or *κλάμασας*. The *μένοι* were named after the villages, or "metros" or villages, assigned to private citizens, and were therefore agricultural bondsmen (οί κατ᾽ *αγρούς*). The *μνοι* was distinguished, by more precise writers, both from the pericei and the apohamiote, so that it has been concluded that every state in Crete possessed a public domain, cultivated by the *μνοι*, just as the private allotments were by the bondsmen of the individual proprietors. We would here observe, with Mr. Thirlwall, that the word *μνοι* is more properly connected with *δουλος* than Minos.

The origin of the class called *μνοι, and the *κλάμασας*, was probably twofold; for the analogy of other cases would lead us to suppose that they consisted partly of the slaves of the conquered freemen of the country, and partly of such freemen as rose against the conquerors, and were by them reduced to serfdom. But in these states, there was also a class of household servants employed in menial labour, and called *χρυσόβους*: they were, as their name denotes, purchased, and imported from foreign countries.

*COSYPHUS* or *COSTICHUS* (κόστικος, κόστος), the Blackbird or Merle, the *Pardus Merula, L.* It is the same with the *Merula sylvina* of the later authorities on Natural History. Aristotle also makes mention of a white species found among the mountains of Arcadia.

*COSTUM* (κόστος), an aromatic shrub, which yielded a fragrant ointment, commonly supposed to be Spikenard. Woodville says of it: "Some have thought the Zedoeary to be the *κόστος* of Dioscorides, the *Guardar* of Avicenna, and the *Zerumel* of Serapion." After comparing the descriptions of Dioscorides and Serapion, Adams is satisfied that the *Zerumel* of Serapion is the Zedoeary, but that it is not the *κόστος* of the Greeks; for both Serapion and Rhases, according to him, treat separately of the *κόστος* by name in another place. "Geoffrey," remarks Adams, "confesses his ignorance of it. Sprengel and Stackhouse name it the Costus Arbaticus, a plant, by-the-way, so rare, that Linnaeus had never seen it." Dr. Hill, however, was of a different opinion regarding it; he says, "Our Costus Arbaticus does not seem to be the same with either of the kinds mentioned by the Greeks and Arabians. Upon the whole, there is not an article in the Materia Medica of the ancient authors about which there is greater uncertainty. We shall only add regarding it, that although, as we have already stated, Zedoeary or *Zerumel* of Serapion is the *κόστος* of the Greeks, it would appear that the one was sometimes used as a substitute for the other in the composition of the Mithradate."

COTHURNUS (κόθορνος), a Boot. This was a particular kind of covering for the foot, included under the general term *calceus*; whence Pliny says, *calceus cuthurnus, i.e., wearing boots. Its appearance was so little changed from that of a shoe, that it rose above the middle of the leg, so as to enclose the calf (*alte surae vincere calthurne*), and sometimes it reached as high as the knees. It was worn principally by horsemen, by hunters, and by men of rank and authority. The ancient marble, representing these
different characters, show that the cothurnus was often ornamented in a very tasteful and elaborate manner. The boots of the ancients were laced in front, and it was the object in so doing to make them fit the leg as closely as possible. The paws and head of the wild animal out of whose hide they were made, sometimes turned down like flaps on the side of the wearer's leg. The skin or leather was dyed purple (purpureo cothurno), or of other splendid colours. The patriarchs of Rome wore a small ivory crescent (vima) attached to their boots. It is evident, from the various representations of the cothurnus in ancient statues, that its sole was commonly of the ordinary thickness. But it was sometimes made much thicker than usual, probably by the insertion of slices of cork. The object was to make the appearance of the wearer thicker; and this was done either in the case of women who were not tall as they wished to appear, or of the actors in Athénian tragedy, who assumed the cothurnus as a grand and dignified species of calcemamentum, and had the soles made unusually thick, as one of the methods adopted in order to magnify their whole appearance. Hence tragedy in general was called cothurnus.

As the cothurnus was commonly worn in hunting, it is represented both by poets and statuary as a part of the costume of Diana. It was also attributed to Bacchus and to Mercury. The accompanying woodcut shows two cothurni from statues in the British Museum; P. Clemens, i.e., with the chlamys sitt mounted, and attired for the chase (vid. Chlamys), and that on the right is from a statue of the goddess Roma, agreeing with the description of her in Stesichorus Apollinaris.

COTINOS (κότινος), the wild Olive, or Olea sylvestris. L., called also Ελάια άφρια, οὐραλκάτα, οὐράλκαρα, and Oeleaster. The name given to this wild olive by the modern Greeks is ουράλκαρα, and by the Turks Κατας Ζατηα Άγινι. It is a wild sort of olive-tree, differing in some respects from the domesticated olive, as crabs do from apples. It is smaller besides, has prickly branches, a short, hard leaf, and small, bitter fruit. According to Theophrastus, it was but little improved by pruning and transplanting. The crown given at the Olympic Games was made of it, probably on account of its being more enduring than the domesticated kind. The legend, however, was, that Hereules brought this tree into Greece from the banks of the Ister. The φιλα of Homer is a vari-

Cybele, v. i., 103, "That plant," observes Martyn, "which is cultivated in our gardens, under the name of Oeleaster, is not an olive. Tournouf refers it to his genus of Elaeagnum. It grows in Syria, Ethiopia, and on Mount Lebanon. Crusius observed it in great plenty, also, near Guadix, a city in the kingdom of Granada, as also in the south of France and in Germany. It is thought to be the Cappadocian Albion, which are mentioned by Pliny among the kinds of trees, Συκονικα, Alpinum, V. 38, 39: - ουτοντας: his odorantes similis olearium floribum. The flowers of the Elaeagnum are much like those of the Olive, but the ovary of the Elaeagnum is placed below the petal, whereas that of the Olive is contained within the petal. They are very sweet, and may be smelt at a distance.

COTTONUM MALUM, another name for the Cydonium malum, or Quince. (Vid. Cydonium Malum.)

COTTAIUS (κότταη), Ionic κώνος or κότταη, a social game, which was introduced from Sicily into Greece, where it became one of the favourite amusements of young people after their repasts. The game was in a manner in which it originally was played was this: One of the company threw a certain quantity of pure wine, at a certain distance, into a metal basin, endeavouring to perform this exploit in such a manner as not to spill any of the wine. While he was doing this, he either thought of or pronounced the name of his mistress, and from the more or less full and pure sound with which the wine struck against the dishes, the lover drew his conclusions respecting the attachment of the object of his love. The sound, as well as the wine by which it was produced, were called λυταν or κότταη: the metal basin had various names, either κοττεθαι, ου κοτταθεται, ου λαμαθεται, ου χαλκαθεται, or κελαθεται, κοταθεται. The action of throwing the wine, and sometimes the goblet itself, was called άγκελο, because the persons engaged in the game turned round the right hand with great dexterity, on which they prided themselves. Hence Εκυχις − spoke of κότταη άγκελο, Thuc. 3. c. 10, 2: - ουτος κοταθεται. Thus the cotta-, in its simplest form, was nothing but one of the many methods by which lovers tried to discover whether their mistress had returned or not. But this simple amusement soon assumed a variety of different characters, and became, in some instances, a regular contest, with prizes for the victor. One of the most celebrated modes in which it was carried on is described by Athenaeus, and in the Etymologicon Magna, and was called δε δεδεδινως. A basin filled with water, with simple empty bowls swimming upon it. Into these the young men, after another, threw the remnant of the wine from their goblets, and he who had the good fortune to drown most of the bowls obtained the prize (κοτσταθεθαι), consisting either of simple cakes, sweetmeats, or sesame-cakes.

A more and more complicated form of the cotta- is thus described by Suidas: A long piece of wood being erected on the ground, and a dish was placed upon it in a horizontal direction, with two dishes hanging down from each end; underneath each dish a vessel full of water was placed, in each of which stood a gilt brazen statue, called μαγις. Every one who took part in the game stood at a certain distance from the game, filled a bowl of wine, which he endeavoured to throw into one of the dishes, in order that, struck down by the weight, it might knock against the head of the statue which was concealed under the water. He who spoiled least of the wine

112
of the licentious practices which disgraced those of Thrace and Greece, unless we refer the allusion made by Theocritus to the Cotytyia, to the Sicilian festival.

"COTYLA (κοτύλα) was a measure of capacity among the Romans and Greeks: by the former it was also called hemina; by the latter, ῥηβαίος and ἤμια or ἄμια. It was the half of the sextarius or șō̄rēa, and was used down into ancient times, with no diminution of weight. (Mr. Hussey’s comment) 4955 of a pint English.

This measure was used by physicians with a graduated scale marked on it, like our own chemical measures, for measuring out given weights of fluids, especially oil. A vessel of horn, of a cubic or cylindrical shape, of the capacity of a cotyla, was divided into twelve equal parts by lines cut on its side. The whole vessel was called thron, and the parts, spha. Each spha contained one ounce of weight (by a weight) so that the ratio of the weight of the oil to the number of ounces it occupied in the measure would be 9:13 or 3:4.

"COTYLEDON (κοτυλήδον), a plant, called in English Navelwort. The two species described by Dioscorides may be confidently referred, according to Adams, to the Cotyledon umbilicatus and C. serrata.

"KOTYKION (κοτύκιον) or EENAPoi (ἐνεαπόν) is a sort of Palm. Stockhouse suggests that it may have been the Palma Thébaica, called "Doom-tree" in Bruce’s Travels.

"COVIVUS (Celtic kowain), a kind of car, the spokes of which were armed with long sickles, and which was used as a scythe-chariot chiefly by the ancient Belgians and Britons. The Romans designated by the name of covinus a kind of travelling carriage, which seems to have been covered on all sides with the exception of the front. It had no seat for a driver, but was conducted by the traveller himself, who sat inside. There must have been a great similarity between the Belgian scythe-chariot and the Roman travelling carriage, as the name of the one was transferred to the other, and we may justly conclude that the Belgian car was likewise covered on all sides except the front, and that it was occupied by one man, the covinarius only, who, by the structure of his car, sufficiently protected. The covinarius (this word occurs only in Tacitus) seem to have constituted a regular and distinct part of a British army.

"COUREUS (κούρευς). (Vid. BARBA.)

"CRAABE. (Vid. BABA.)

"CRABEIS (κραβέις), formerly held to be a species of Squilla. "The term is now used in a generic sense by late naturalists," observes Adams: "thus the common shrimp is named the Crangon vulgaris. It is worthy of remark, however, that Cuvier and Schneider contend that the krágyon of the Greeks corresponds to the Cancer digitalis."

"CRANIA or CRANIAE (κρανία, κρανία). "All agree, remarks Adams, "that the krána of Homer is the Cornua mascula, L., called in English the Cornelian Cherry, or Male Cornel-tree. For the other, see THELCRANIA (θελκρανία)."

"CRANOS. (Vid. GALEA.)

"CRAZLEGUS (κραζλέγος). Sprengel refers the tree described by Theophrastus under this name to the Azorula, or Crategus Azorulis, but Stackhouse to the C. terminalis. The plant of this name

CRATER.

described by Theophrastus in another part of his work was most probably the same as the Cratagon (κρατάγονον). 1

1. (Phileophr., iii. 15, ix. 18; Adans., Append. e. v. 2. — Dioec.), ii. 193.— (Vit. iii. ii. 360; Od. iv. 168, v. 109, v. 271, v. 371; Com. 6, 251; Buttmann, Lect. i. 12 § 30; Hdt. vii. 356.) — (O. iv. 616.) — (II. xxvii. 216.) — (Od. xxx. 146, xxxi. 333, compared with 361.) — (I. ii. 302.) — (O. v. K. 11; Rousina, c. v. 'Aγαθαντίαν—Compare Athen. iv. xiv. 602. c. d.—Aristoph. Vesp. 507; Par. 300.) — (Ath. iv. xvi. 626. F. c. d.—II. xxiii. 741, d. c.) — (Hesiod. L. 76.) — (I. ii. 16; (iv. 152.)

CRATON. (Theophr., 11., the for Lipsius, 6, crater a, from κράτανω, I mix), a vessel in which the wise, according to the custom of the ancients, who very seldom drank it pure, was mixed with water, and from which the cups were filled. In the Homeric poems it is mentioned only in connection with the libation at religious shrines, and is never employed in such a manner as to be distinguished from a libation. In sacrifices the libation was always taken from a crater; 4 and sailors, before they set out on their journey, used to take the libation with cups from a crater, and pour it into the sea. 5 The name crater was also sometimes used as synonymous with στίλιον, seat, a pill in which water was foweled. 6

The Romans used their crater or craters for the same purpose, with which they were carried in Greece; but the most elegant specimens were, like so many other works of art, made by the Greeks. 7 CRATES (τάφος), a Hurdle, used by the ancients for several purposes. First, in war, especially in assaulting a city or camp, they were placed before or over the head of the soldier, to shield off the enemy’s arrows. For this purpose they were employed in the same way, they differed only in not being without the covering of raw hides. A lighter kind was thrown down to make a bridge over fosses, for examples of which see Caesar, De Bell. Gall., vi., 81, 86. By the besieged they were used joined together, so as to form what Vegetius calls a metella, and filled with stones: these were then poised between the two hurdles and were used as a weapon of war, and as the storming party approached upon the ladders, overturned on their heads. 10

A capital punishment was called by this name, whence the phrase sub crate necari. The criminal was thrown into a pit or well, and hurdles laid upon him, over which stones were afterwards heaped. 11 Craters, pots or vats, were made carried by people upon which to dry yrs, grapes, &c., in the rays of the sun. 12 These, as Columnella informs us, were made of sedge or straw, and also employed as a sort of matting to screen the fruit from the weather. Virgil 13 recommends the use of hurdles in agriculture to level the ground after it has been turned up with a plough (rastrum). Any texture of rods or twigs seems to have been called by the general name craters.

CREPIDA (ερπήτης), dim. CREPIDULA, a Slipper. Slippers were worn with the pallium, not with the toga, and were properly characteristic of the Greeks, though adopted from them by the Romans. Hence Suetonius says of the Emperor Tiberius, 14 "Deaposita palami in opus adornavit, pallium e crepidis." They were also worn by the Macedonians, 15 and with the chlamys. 16 As the chamaeon was assumed by tragedians, because it was adapted to be part of the grand and stately attire, the actors of comedy, on the other hand, wore crepidae and other cheap and common coverings for the feet. (Vid. Virgi., Eclog. iv. 13.)

310
Creta.

Also, whereas the ancients had thei three finished boots and shoes made right and left, their slippers, on the other hand, were made to fit both feet indifferently. 1

CRETA, in a general sense, means any whitish earth or clay, such as potter’s clay, pipe-clay, &c. 6 Cassius also explains this kind of earth, and says, for which wine-jars and dishes were made: Virgil 7 calls it “tough” (tenax); and the ancient writers on Agriculture give the same epithet to marl which was employed to manure land. 4 In a more special sense, several varieties of Creta occur in the ancient writers. Thus: I. Creta, properly so called (Terrae Creta, Krypton για), is our chalk, which obtained its name from the island of Creta, where it abounds. The earth called thea Creta is in some places lighter than the Terra Chia; and they were also accustomed to use it with a cleanser of silver vessels. 3—II. Creta annularia. The earth called annularia, spoken of by Pliny in connexion with Selenusian, and which was stained with wood to produce an imitation of Indicum, 4 is probably, 6 observes Dr. Moore, the same with the annularia (vidium) mentioned afterward by the same writer, and which was so called because made of clay coloured with common green ring-stones. This, at least, strange as it is, appears to be the only sense we can extract from Pliny’s words, the meaning of which Beckmann acknowledges he had not been able to discover. 8

The same author infers that the earth called annularia received its name from its use in sealing; a practice which is in use in the making of rings, or those earthy balsams and an acrimonious taste, and in a violent fire runs into a very pure pale blue glass. What distinguishes it, however, in a more marked manner from other earths is, that if a little be wetted and drawn over a plate of brass or copper, so as to mark a line, the mark will in a little time appear bluish. This is a character originally recorded of it by Diocles of Babylon, 6 and so Hill explains by assigning the earth in question alkaline property in common with the proper degree than other earths possess. In the Materia Medica of former days, it was used as an astringent and sudorific. The ancients mention another Eretrian earth of a pure white, but this appears to have been no other than the true white Bole of Armonia 26. V. Creta Sarda, a species of earth obtained from the island of Sardinia. Pliny calls it “vicea omnium cimicorum generum,” the worst kind of Cimolite. It was, however, used in the first place to cleanse garments that were not dyed, which were then fumigated with sulphur, and finally scoured with Cimolia Terra. 11—VI. Creta Selinusia, an earth obtained from the neighbourhood of Selinus in Sicily, whence its name. It is now found in Corbicola near the globe; the finest kind, however, is, however, is the Sicilian. Discollous describes it as of a very bright and shining white, friable, and very readily disuniting and diffusing itself in water. It was used by the ancient physicians as an astringent, and among females as a cosmetic. 12

CREX (sорт), a species of Bird with a creaking note, whence its name. Some commentators suppose it the same as the ἄρπνογνυα of Aristotle, who treats of them separately. “It is generally held,” says Adams, “to be the Land Rail or Corn Crake, namely, the Rallus Erex, L., or Ostrogynen- cras, Linn. The name Creta is applied to it, but if Tzetzes was correct in describing it as a sea-bird, resembling the Egyptian ibis, this opinion must be admitted to be untenable. Dr. Trail suggests that the one may have been the Land, and the other the Water Rail.” 6

CRETIO HEREDITATIS. (Vid. HEREDITATION.)

CRIME. Though this word occurs so frequently, it is not easy to fix its meaning. Crime is often equivalent to accusation (ἀποκαλομένου); but it frequently means an act which is legally punishable. In this latter sense there seems to be no except a recognition of it given by the Roman jurists. According to some modern writers, crimes are either public or private; but if this definition is admitted, we have still to determine the notions of public and private. The truth seems to be, that there was a want of precise terminology as to what, in common language, are called criminal offences among the ancients. Naturalists; but crimes and delicts are sometimes used as synonymous. 6 In one passage 7 we read of majora delicta (which, of course, imply minora), which expression is coupled with the expression omnia criminis in such a way that the inference of crimes containing delictum is, so far as concerns this passage, necessary; for the omnia criminis comprehend (in this passage) more than the delicta majora.

Some judicia publica were capitalia, and some were civilia. The former crimes were not, for that reason only, public. There were, therefore, crimes which were not tried in judicia publica. This is consistent with what is stated above as to those crimes (delicta) which were the subject of actions. Those crimes only were the subject of judicia publica which were made so by special laws: such as the Julia de adulteris, Cornelia de securis et vestitus, Pompeia de parabolis, Julia peculii, Cornelia de testamentis, Julia de vi privata, Julia de vi publica, Julia de ambitu, Julia repetundarum, Julia de annona. 8 So far as Cicero enumerates causa crimini, they were cause publici judicii; but he adds, 15 “crimina est multitudo infinita.” Again, infamia was not the consequence of every crime, but only of those crimes which were “publici judicii.” A condemnation, therefore, for a crime, not publici judicii, was not followed by infamia, because the crime laid the foundation of an actio, in which, even in the case of a privata judgment, the condemnation was followed by infamia; as furtum, rapina, injuriae. 11 Crime, then, must be an act which, if

1. (Aristot., H. A., ix., 2, 4.—Adams, Appended, s., v. 2.—De Oiff. 47, tit. 1, s. 3.—J. Y., 190.)—5. (Dig. 47, tit. 4, s. 5.)—6. (Dig. 47, tit. 1, s. 7.)—7. (Dig. 47, tit. 10, s. 5.)—8. (Dig. 47, tit. 1, s. 1.)—9. (De Oiff. ii., 25, 10—10. (i., 81.)—11. (Dig. 18, tit. 4, s. 7.)
proven against the offender, subjected him to some punishment, the consequence of which was infamia; but it would not therefore follow that infamia was only the consequence of a crime.

Most modern writers on Roman law have considered delicta as the general term, which they have subdivided into delicta publica and privata. The legal consequences of delicta in this sense were compensation of persons and infants as a consequence of the other two. The division of delicta into publica and privata had, doubtless, partly its origin in the opinion generally entertained of the nature of the delict; but the legal distinction must be derived from a consideration of the form of obtaining redress for, or punishing, the wrong. Those delicta which were punishable according to special leges, senatus consulta, and constitutions, and were prosecuted in judicata publica, were apparently more especially called criminia; and the penalties, in case of conviction, were loss of life, of freedom, of civitas, and the consequent infamia, and sometimes pecuniary penalties also. Those delicta not provided for as above mentioned, were punishable by action (actiones penales), and were the subjects of judicia privata, which were usually commenced at the instance of the wrong-doer, and were frequently carried to the level of delictum (delict), for pecuniary compensation, he followed the jus ordinaria; but if he wished to punish the offender otherwise (extraordinaria, the latter bore to this small creature, just as our Aligator is the Portuguese "al legato," the Lizard. Hence Aristotle calls the Crocodile κροκόδιλος ὁ ποτόμος, and the Lizard κροκόδιλος ὁ χρυσόπολος. The Egyptians, says Herodotus, called the Crocodile ψαργός: this, however, is a mere corruption in Greek of an Egyptian name, for έπαργος, which the Copts still retain in Amaad, from which the Arabs have derived their modern appellation Temesh. The ancient writers have left us accounts of this animal, but they are more or less imperfect. Thus Herodotus says it is blind in the water; an evident error, unless he mean by the Crocodile a different species, or merely "dim-sighted," or "comparing it to the blind" when compared with its keenness of vision on the land. So, again, Herodotus says it has no tongue. This, however, is a popular error: it has a tongue, like the rest of animals, but this is connected by a rough skin with the lower jaw; and, not being extensive, is easily seen at first view, since it completely fills the cavity of the jaw between the two rows of teeth, it has been supposed to have no actual existence. Again, the Crocodile, according to Herodotus, does not move its lower jaw, but brings the upper one down in contact with it. Now the truth is just the other way: the lower jaw alone is moved, and not the upper. The lower jaw extends the head, and so that the neck must be somewhat bent when it is opened. The appearance thus produced has led to the very common error of believing that the Crocodile moves its upper jaw, which is, in fact, incapable of motion, except with the rest of its body. "Naturalists de- scribe four species of the Crocodile, namely, Croco dus niloticus, C. caiman, C. gavial, and C. ran- vera. The three of these being found only in Italy, and the fourth being peculiar to America, it follows that the ancient writers could have had little acquaintance with any other species than the Alligator.

1. (Adams, Append., s. v. — (Theophrast., E., viii., 5.) [3. (Herod., i. 20., 1. 250.) — (Isocr., Tract. p. 352, C, with Cory's note, c.) (A. e 421.) — (Herod., ii., 60.) — (c. c.)

2. (Ctes. i. 1., 1. 5.) — (Herod., i. 20., 1. 250.) — (Isocr., Tract. p. 352, C, with Cory's note, c.) (A. e 421.) — (Herod., ii., 60.) — (c. c.)
and the Cyprian. Alien, however, must be supposed to allude to the Gavial when he mentions the Crocodile of the Ganges. Both Linnaeus and Buffon reckon the first two as mere varieties, but they are now generally held to be distinct species. Bochart, with great learning, has proved that the Leviathan of Job is the Crocodile. 1 Athenæus ranks the Crocodile and the Hippopotamus with the κριτην. 2 Among the Egyptians, the Crocodile was peculiarly sacred, and its Will o' the Wisps around its grave did not extend to every part of Egypt; some places considering it the representative of the Evil Being, and bearing the most deadly animosity to it, which led to serious feuds between neighbouring towns. Such was the cause of the quarrel between the Oinobles and the Tentries, as described by Juvénal; and the same animal which was worshipped at Ombos, was killed and eaten by the inhabitants of Apollinopolis. The Crocodile enjoyed great honours at Coptos, Ombos, and Crocodilopolis or Arbirhis, in the Thebaid. In Lower Egypt, it was particularly sacred at a place called the City of Crocodiles (Crocodilopolis), and afterward Arsinoë, the capital of a nome, now the province of Fyoom. The animals were there kept in the Lake Marris, and were buried in the under-ground chambers of the temple of the Crocodile. When the Crocodile was devoured, the flesh being bad. Indeed, in former times, it seems rather to have been eaten as a mark of hatred towards the Evil Being, of whom it was the emblem, than as an article of food. 3 The Crocodile at present is found in the Nile only towards the region of Upper Egypt, where it is extremely hot, and where this animal never falls into a lethargic state. Formerly, there was a need to descend the branches of the river which water the Delta, it used to pass the four winter months in caverns, and without food. Of this fact we are informed by Pliny and other ancient naturalists.—In the year 58 B.C., the edile Scaurus exhibited at Rome five crocodiles of the Nile; and subsequently, the Emperor Augustus had a circus filled with water, and exhibited there to the people thirty-six crocodiles, which were killed by an equal number of men who were habituated to fight with these animals. 4

* KROKODEILEGOS (χέρσος ος αικέγος), the Skink, or Land Crocodile. There are two species of the Skink with which the ancients may be supposed to have been well acquainted, namely, Scincus officinalis and S. Algirnata. Moses Charras says of the Skink, that it is a little animal like to lizards, or, rather, like to little crocodiles, by which name they are known. 5

*CROCODEILETUM (κροκοδιδέλιον), a species of plant. Matthioli informs us that it had been supposed to be the Eryngium marinum, or Sea Eryngium, and the Carina, or Carline Thistle; but he rejects both these suppositions, admitting, however, at the same time, his own want of acquaintance with it. Sprengel, on the other hand, inclines to think it the Eryngium. 6

*CROCUS (κρόκος), the Saffron Crocus, or Crocus sativus. The genuine Saffron grows wild in the Levant and in Southern Europe. Sthithorp found it in the fields of Greece and on the mountains around Athens. The flower of the C. sativus is of a violet colour, and appears in autumn; hence the epithet autumnalis. The Saffron Crocuses were introduced into this country by Sir James Stuart, from Cilicia and from Mount Tmolus in Lydia. The Lycian Olympus and the island of Sicily also produced a very good sort. Saffron was much used by the Romans as a condiment in various articles of food, as it still is by many Oriental nations. It was also put into wine. Saffron, diluted in water or wine, was sprinkled as a perfume in the theatres and other places, and also on the funeral pile. It was also made into an unguent (Crocinnum unguintun). Saffron-coloured garments were also much in vogue.

*CROCOTAS (κροκόττας), an animal mentioned by the ancient writers, and said to be produced from the wolf and dog, but to be much more ferocious than either of these animals. Such, at least, is the account of Artemidorus, 7 Diodorus Siculus, 8 and Agatharchides. 9 But the coupling of the wolf and dog, though easy, and often effected in menageries at this day, produces no durable species. It is more probable, therefore, that the Crocotas answers to the Hyena, since the latter has very strong teeth, and breaks bones with the greatest ease, as the Crocotas is said to have done. The earliest passage respecting the Crocotas is found in Ctesias, and the description there given is almost the same with that by which the Oriental writers describe the Hyena. 10

*CROMYON or CROMYTON (κρόμυον, κρόμυτον), the Allium cepa, or Garlic. (Vid. Allium.)

CROTNA (κρόνωνa), a festival celebrated at Athens in honour of Cronus, whose worship was said to have been introduced into Attica by Cecrops. He had a temple in common with Thea. 11 The festival was held on the twelfth of the month of Hecatombium, 12 while the moon was new, by the people of Attica, bore the name of υπό Κρόνων. 13

The Rhodians also celebrated a festival in honour of Cronus, perhaps the Phoenician Moloch, to whom human sacrifices, generally consisting of criminals, were offered. This festival was held on the sixteenth of Metagistion. 14

Greek writers, when speaking of the Roman Saturnalia, sometimes name the Crocota. 15

CROTALUM, a kind of Cymbal, erroneously supposed by Scaliger and Brodus to be the same with the sidarium. The mistakes of learned men on this

2. (Hieroc., 25, 4, 13.)—2. (Athen., ii., 90.—Adams, Append., s. v.)
point are refuted at length by Lampe. From Suidas and the scholiast on Aristophanes, it appears to have been a spit reed or cane, which clattered when shaken with the hand. According to Eustathius, it was made of shill and brass as well as of wood. Clemens Alexarchus further says that it was an invention of the Sicilians.

Women who played on the crotaulum were termed crotastria. Such was Virgil's Copa.

"Crispus sub crotaulo docto mutare latus."* The line alludes to the dance with crota (similar to castanets), for which we have the additional testimony of Macrobius. The annexed woodcut, taken from the drawing of an ancient marble in Spon's Myriophanes, represents one of these crotastria forming an introduction to CRYPETIA.

The words κροταλος and κροταταλος are often applied, by an easy metaphor, to a noisy, talkative person.*

*CROTON (κροτόν), I. an insect found on oxen and dogs, and sometimes on men, namely, the Ace tus redwius, L., or Tick. —II. According to Galen, the same with the κικη. (Vid. Cic.)

CRYPETIA (κρυπτεια, also called κρυτεια or κροτεια) was, according to Aristotle,* an institution introduced at Sparta by the legislation of Lycurgus. Its character was so cruel and atrocious, that Plutarch only with great reluctance submitted to the authority of Aristotle in ascribing its introduction to the Spartan lawgiver. The description which he gives of it is this: The ephors, at intervals, selected from among the young Spartans those who appeared to be best qualified for the task, and sent them in various directions all over the country, provided with daggers and their necessary food. During the daytime these young men concealed themselves; but at night they broke forth into the highways, and massacred those of the Helots whom they met, or whom they thought proper. Sometimes, also, they ranged over the fields (in the daytime), and despatched two, their number, the best and bravest of the Helots. This agreement agrees with that of Heracleides of Pontus,* who speaks of the practice as one that was still carried on in his own time, though he describes its introduction by Lycurgus only as a report.

The crypetia has generally been considered either as a kind of military training of the Spartan youths, in which, as in other cases, the lives of the Helots were unaccountably sacrificed, or as a means of lessening the numbers and weakening the power of the slaves. But Müller,* who is anxious to soften the notions generally current respecting the relations between the Helots and their masters, supposes that Plutarch and Heracleides represent the institution of the crypetia in a way which the ephors themselves, on entering upon their yearly office, proclaimed against the Helots. Hermelides, however, does not mention this proclamation at all, and Plutarch, who mentions it on the authority of Aristotle, does not represent it as identical with the crypetia. Müller also supposes that, according to the received opinion, this chase of the slaves took place regularly every year; and showing at once the absurdity of such an annual proclamation of war and massacre among the slaves, he rejects what he calls the common opinion altogether, as involved in inextricable difficulties, and has recourse to Plato to solve the problem. But Thirlwall much more judiciously considers that this proclamation of war is not altogether groundless, but only a misrepresentation of an existing case, and that its real character was more probably connected with the crypetia. Now if we suppose that the thing here misrepresented and exaggerated into a proclamation of war was some promise which the ephors, on entering upon their office, were obliged to make: for instance, to protect the state against any danger that might arise from too great an increase of the numbers and power of the Helots—a promise which might very easily be distorted into a proclamation of war—there is nothing contrary to the spirit of the legislation of Lycurgus; and such an institution, by no means surprising in a slave-holding state like Sparta, where the number of free citizens was comparatively very small, would have conferred upon the ephors the legal authority occasionally to send out a number of young Spartans on a chase of the Helots. Thirlwall has shown the barbarous and atrocious character which we have described above.* If the crypetia had taken place annually, and at a fixed time, we should indeed have reason, with Müller, to wonder why the ephors did not give the Helots a chance of escaping alone, and were united by despair for the sake of common protection, did not every year kindle a most bloody and determined war throughout the whole of Laconia; but Plutarch, the only author on which this supposition can rest, does not say that the crypetia took place every year, but ἀπ' ἀρχῆς, i. e., "at intervals," or occasionally. The crypetia which Müller finds in what he calls the common account of the crypetia, are thus, in our opinion, removed, and it is no longer necessary to seek their solution in the description given by Plato,* who proposed for his Cretan colony a similar institution, under the name of crypetia. From the known partiality of Plato for Spartan institutions, and his inclination to model what existed in a favorable light, it may be admitted that, on a subject like this, his evidence will be of little weight. And when he adopted the name crypetia for his institution, it by no means follows that he intended to make it in every respect similar to that of Sparta; a partial resemblance was sufficient to transfer the name of the Spartan institution to the colony which he projected, and to establish; and it is sufficiently clear, from his own words, that his attention was more particularly directed to the advantages which young soldiers might derive from such hardships as the κρυτεια had to undergo. But even Plato's colony would not have

239
been of a very humane character, as his κρυπτός 
were to go out in arms and make free use of the 
CRUX (κρυστάλλος, κρύσταλλος), an instrument of capital 
punishment used by several ancient nations, 
especially the Romans and Carthaginians. The words 
κρυστάλλος κρύσταλλος are also applied to Persians 
and Egyptian punishments, but Casaubon doubts 
whether they describe the Roman method of cruci-
fixion. From Seneca we learn the latter to have been of two kinds, the less usual sort being rather 
implausible than what we should describe by the 
word crucifixion, as the criminal was transfixed by 
a pole, which passed through the back and spine, 
and came out at the mouth.

The cross was of several kinds; one in the shape 
of an X, called cruz Andreae, because tradition 
reports St. Andrew to have suffered upon it; another 
was found like a T, as we learn from Lucian, who makes it the subject of a charge against the letter.

The third, and most common sort, was made of 
two pieces of wood crossed, as to make four right 
angles. It was on this, according to the unanimous 
testimony of the fathers, who sought to confirm it 
by Scripture itself, that our Saviour suffered. 
The punishment, as is well known, was chiefly inflicted on slaves and the worst kind of malefactors.

The manner of it was as follows: The criminal, after 
sentence pronounced, carried his cross to the place 
of execution; a custom mentioned by Plutarch and 
Artemidorus, as well as in the Gospels. From 
Livy and Valerius Maximus, scourging appears to 
have formed a part of this, as of other capital 
punishments among the Romans. The scourging 
of our Saviour, however, is not to be regarded in 
this light, as Grotius and Hammond have observed 
it was inflicted before sentence was pronounced. 
Furthermore, it is more probable that he 
nailed or bound to the cross. The latter was 
the more painful method, as the sufferer was left to die 
of hunger. Instances are recorded of persons who 
were sold into slavery and afterwards 
were sold again and put under the same master. 

CPRYTA (from κρυπτεῖν, to conceal), a Crypt. 
Among the Romans, any long narrow vault, 
whether wholly or partially below the level of the earth, 
is expressed by this term; such as a sewer (cyptra Suburana) (vid. Cloaca), the carceres of the 
circus (vid. Circus, p. 554), or a magazine for the 
reception of the wood.

The specific senses of the word are:

1. A covered portico or arcade, called more defi-
cently crypto-porticus, because it was not supported 
by open columns like the ordinary portico, but closed 
at the sides, with windows only for the admission of light and air. 

2. These were frequent during summer for their coolness. A portico of this kind, 
almost as rare, is still remaining in the suburban 

Villa of Arrius Dionnes at Pompeii.

Some theatres, if not all, had a similar portico 
atached to them for the convenience of the 
performers, who there rehearsed their parts or 
practised their exercises.

One of those is mentioned by P. Victor as the 
crypta Balbi, attached to the 
theatre built by Cornelius Balbus at the instigation 
of Augustus, which is supposed to be the ruin now 
known as the Vitt. Via di S. Maria di Piazza, between 
the church of that name and the S. Maria di Piazzolla.

II. A grotto, particularly one open at both 
extremities, forming what in modern language is de-
nominated a "tunnel," like the grotto of Pausilippo, 
well known to every visitant of Naples. This is 
a tunnel excavated in the tufo rock, about 20 feet high 
and 1800 long, forming the direct communication 
between Naples and Pozzuoli (Futalo), called by the Romans crypta Nepotiana, and described by 
Seneca and Strabo.

A subterranean vault used for any secret wor-
ship, but more particularly for the licentious rites 
consecrated to Priapus, was also called crypta.

III. When the practice of consuming the body 
by fire was relinquished (vid. Busto, Conditoni-
uas), and a number of bodies was consigned to one 
place of burial, as the catacombs, for instance, this 
common tomb was called crypta. One of these, 
the crypta Nepotiana, which was in the vicus Patri-

cus, under the Esquiline, was used by the early 
Christians, during the times of their persecution, as a 
place of secret worship.

CRYOPTORICUS. (Vid. CRYP TA.)

*CRYSTALLUS or -UM (κρύσταλλος), Crystal. 
The ancients were of opinion that crystal was only 
found in the Cretan islands, and that it was 
more durable than common; and Pliny thought it 
was nowhere to be found but in excessively cold 
regions. "That it is ice is certain," says this 
writer, "and hence the Greeks have given it its 
name." In accordance with the etymology here 
alluded to, κρύσταλλος is thought to come from 
κρύος, "ice, or, from κρύος (κρύατος), "to 
freeze, or, to chill." This latter thought, and the 
idea of crystal being formed by frost, has led 
Moore, "will appear less ridiculous if we consider 
that, although water really converted into a solid 
crystalline mass, by exposure to a very ordinary 
degree of cold, resumes its fluid state when the 
heat of which it was deprived is again restored; 

yet the results of chemical analysis teach us that 
water, in a permanently solid state, constitutes a 
concrete body, or a certain shape in many crystalline substances. 
Of the hydrate of magnesia, for example, it forms 
neatly a circle; and of the sulphate of soda, consider-
ably above one half. Rock-crystal is one among 
the very few minerals whose crystalline form Pliny 
has remarked. He mentions one remarkable use of 
crystal in applying actual cautery, the crystal 
being used as a lens. This, however, was 
only known before, mention of it having been made 
in the Clouds of Aristophanes and in the poem of 
the pseudo-Orpheus on the properties of Stones."

CUBETA. (Vid. Tessera.)

CUBICAL/RI were slaves who had the care of 
the sleeping and dwelling rooms. Faithful slaves 
were always selected for this office, as they had, to 
a certain extent, the care of their master's person. 
When Julius Caesar was taken by the pirates, he 
released some of his other slaves, only 
retaining with him a physician and two cubiculari. 
It was the duty of the cubicularii to introduce 
visitors to their master, for which purpose they 
appear to have usually remained in an ante-room.

Under the later emperors, the cubicularii belonging
CULIX

CULIX, the Gnat. (Vid. Canops.)

CULIX, in its most common acceptation, means a place for cooking victuals, whether the kitchen of a private habitation (vid. House), or the offices attached to a temple, in which the flesh of the victim was prepared for the sacred feasts or for the priesthood.

It signifies also a convenience, cabinet d'aisance, aestas, aedilis. A. Quedam quotidian, ut culina et capilla. De debeat exemplari, unless the con- jecture of Schneider is admitted, who proposed to read sueb et capile.

Lastly, it is used for a particular part of the funereal pyre, or of the basilum, on or in which the viands of the funeral feast were consumed. Com pare an anonymous poet in Catalet.

"Neque in culinam et secta comitatio
Daqueque daces sordidas;"

In which sense it corresponds with the Greek εκσάθα.

 Elsewhere, the words κναυλίας κοινλάθους ῥηματίζον.

CULIX (κόλας δίμ. κοιλίας, κολίδων), a common Greek drinking-cup called by the Romans calix. The name was sometimes applied to large

CULIX

CULEUS or CULLEUS, a Roman measure, which was used for estimating the produce of vineyards. It was the largest liquid measure used by the Romans, containing 20 amphores, or 118 gallons 7-546 pints.

"Est et, bis decies quem confectis amphora nostra,
Culisse: hac major nulla est mensura liquoris."9

CULEUS or CULLEUS. (Vid. Cornelia lex de Sacris.)

CULEUS, or CULLEUS, a Roman measure, which was used for estimating the produce of vineyards. It was the largest liquid measure used by the Romans, containing 20 amphores, or 118 gallons 7-546 pints.

"Est et, bis decies quem confectis amphora nostra,
Culisse: hac major nulla est mensura liquoris."9

CULEUS or CULLEUS. (Vid. Cornelia lex de Sacris.)

CULUS, or CULLEUS, a Roman measure, which was used for estimating the produce of vineyards. It was the largest liquid measure used by the Romans, containing 20 amphores, or 118 gallons 7-546 pints.
CULPA.

The general notion of damnum, and the nature of dolus malus, are most conveniently explained under this head.

Damnum is injury done by one man to the property of another, and done illegally (injuria, i. e., contra jus); for this is the meaning of injury in the actio damni injuriae given by the lex Aquilia; and injury, in this sense, must not be confounded with the actio injuriarum. This damnum, injuria of the lex Aquilia, is done by culpa or by dolus malus; for damnum done without culpa or dolus malus is casual (casus), and the door is not punishable. Damnum, in fact, implies injuria; and, generally, a man is not bound to make good the damage done by him to another man's property, except on the ground of contract, or on the ground of illegal act where there is no contract, that is culpa or dolus.

Neither culpa nor dolus can be taken as a genus which shall comprehend the species culpa and dolus, though some writers have so viewed these terms. Dolus malus is thus defined by Labeo: "Dolus malus est omnis calliditas, fallacia, machinatorio ad circumveniendum, fallendum, decipendum alterum adulata." Dolus malus, therefore, has reference to the evil design with which an act is omitted that ought to be done. The definition of Aquilii, a learned jurist, the friend of Cicero, and his colleague in the praetorship, labours under the defect of the definition of Servius, which is criticised by Labeo. This seems to be the Aquilii who, by the edict, gave the action of dolus malus in all cases of dolus malus where there was no legislative provision, and there was a just causa.

It is generally considered that culpa may be either an act of commission or omission; and that an act of commission may fall short of dolus, as not coming within the above definition, but it may approach very near to dolus, and so become culpa dolo proxima. But the characteristic of culpa is omission. It is true that the damnum, which is necessary to constitute the culpa, is the consequence of some act; but the act derives its culpous character from an act omitted; otherwise it might be casus, or casual damage.

Culpa, then, being characterized by an act of omission (negligentia), or omission diligentia, the question always is, how far is the person charged with culpa bound to look after the interest of another, or to use diligentia. There is no such general obligation, but there is such obligation in particular cases. Culpa is divided into lata, levius, and levisima. Luta culpa "eat nimia negligentia, id est, non intelligere quod omnes intelligere." If, then, one man injured the property of another by gross carelessness, he was always bound to make good the damage (damnum prestare). Such culpa was not dolus, because there was not intention or design, but it was as bad in its consequences to the person charged with it.

Levis culpa is negligence of a smaller degree, and the responsibility in such case arises from contract. He who is answerable for levius culpa, is answerable for injury caused to the property of another by some omission, which a careful person could or might have prevented. For instance, in the case of a thing lent (vid. COMMUNITAS), a man may take at least as much care of it as a careful man does of his own property. There is never any culpa if the person charged with it has done all that the most careful person could do to prevent loss or damage. Levissima culpa came within the meaning of the term culpa in the lex Aquilia; that is, any injury that happened to one man's property through the conduct of another, for want of such care as the most careful person would take, was culpa, and therefore punishable.

The word culpa occurs very frequently in the Latin writers in a great variety of meanings; but the characteristic of such meanings is "carelessness" or "neglect." Hence may be explained the passage of Horace:

1. (Herod, iv, 70,—2. (Xen., Sympo, ii, 26.)—2. (xii, p. 480.))—4. (Gaius, iii, 210.—Dig. 6, tit. 2, c. 5.—5. (Gaius, iii, 220.))—6. (Dig. 4, tit. 3, c. 1.)—7. (Off., iii, 16.—8. (Dig. 4, tit. 84.)

326

CULPA.

The following woodcut, which is referred to in several articles, is taken from Millin, and represents a symposium. Three young and two older men are reclining on a couch (civitas), with their left arms resting on striped pillows (προσεκάλασμα ὑπογυμνίων). Before the couch are two tables. Three of the men are holding the κήλαι suspended by one of the handles, as shown in the annexed woodcut.

Athenaeus informs us that these cups were usually made of earthenware, and that the best kind were manufactured in Attica and Argolis.

Post hoc ludus erat culpa potare magistri; which means to have no magistrate at all, or, as the

1. (Peintures de Vases Antiques, vol. ii, pl. 58.)—2. (Beckett Charicles, vol. i, p. 255; vol. ii, p. 499.)—3. (Dig. 66, tit. 11, c. 21.)—4. (Sat., 11, ii, 123.)

2. (Dig. 66, tit. 11, c. 21.)
The name culter was also applied to razors' and kitchen-knives. That in these cases the culter was different from those above represented, and most probably smaller, in certain; since, whenever it was used for shaving or domestic purposes, it was always distinguished from the common culter by some epiteth, as culter tonsorius, culter copinataris. Fruit-knives were also called cultri; but they were of a smaller kind (culleti), and made of bone or ivory. Columella, who gives a very minute description of a fals vinctoria, a knife for pruning vines, says that the part of the blade nearest to the handle was called culter on account of its similarity to an ordinary culter, the edge of that part forming a straight line. This culter, according to him, was to be used when a branch was to be cut off which required a hard pressure of the hand on the knife. The name culter, which was also applied to the sharp and pointed instrument of the plough, is still extant in English, in the form coultet, to designate the same thing. (Vid. ATRAM.)

The expression in cultrum or in culтро collocatis signifies placed in a perpendicular position.

CULTRARIUS.

CUPRESSUS.

"CUMINUM or CYMUM NUM (κεμίνον), 1 Cumin, an umbrelliferous plant, of annual duration, found wild in Egypt and Syria, and cultivated from time immemorial for the sake of its agreeable aromatic fruit, which, like that of caraway, dill, anise, &c., possesses well-marked stimulant and carminative properties." The seeds were used by the ancients as a condiment, and the mode of preparing what was termed the cuminatum is given by Apicius. Drinking a decoction of cumin produced paleness, and hence the allusion in Horace to the "exsanguem cuminum." Pliny says it was reported that the disciples of Porcius Latro, a famous master of the art of speaking, made an oath with his ground, so that the slightest touch of the least degree of moisture had contracted from his studies. The ancients used to place cumin on the table in a small vessel, like salt; the pereunous were sparing of its use in this way, whence arose the expressions κυμινοπρότητα, "a splitter of cumin-seed," analogous to καρδαμοζήλησ, "a cutter or scraper of cresses," and in Latin cuminum, which was used between the ears and misery person. It can admit of no doubt, according to Adams, that the κεμίνον κυρον of Dioscorides, which is the only species treated of by Hippocrates and Galen, was the Cuminum cumintum, L. Of the two varieties of the κεμίνον εγύρον described by Dioscorides, the first, according to Matthiolius and Sprengel, is the Lagarea cuminoides, L.; the other, most probably, the Myrtilla arvensis, or wild Penny flower.

CUNICIUS (κυνώνος). A mine or passage under ground was so called, from its resemblance to the burrowing of a rabbit. Thus Martial says,
CURATOR.

the funeral piles of the noble and wealthy. Its
dark foliage also gave it a funereal air.1

•CUPRUM, Copper. (Vid. As) and Chalcos.)

CURA. (Vid. Curator.)

CURATELA. (Vid. Curator.)

CURATOR. (Vid. Curator.)

The curator was, in the time of puberty, every
Roman citizen incapable of doing any legal
act, or entering into any contract which might be
injurious to him. The time when puberty was at-
tained was a matter of dispute; some fixed it at
the commencement of the age of procreation, and
some at the age of fourteen.2 In all transactions
by the impuses, it was necessary for the auctores of
the tutor to be interposed. (Vid. Auctores, Tu-
tor.)

With the age of puberty, the youth attained
the capacity of contracting marriage and becoming a
paterfamilias: he was liable to military service, and
entitled to vote in the comitia; and, consist-
ently with this, he was freed from the control of
a tutor. Females who had attained the age of
puberty became subject to another kind of tutelis, which
is explained in its proper place. (Vid. Tutela.)

V. CURATELA.

We have seen that the age of puberty by a
Roman youth, every legal capacity was acquired
which depended on age only, with the exception of
the capacity for public offices, and there was no
rule about age, even as to public offices, before
the passage of the lex Villia. (Vid. Edilis, p. 25.)
It was, however, a matter of necessity to give some
legal protection to young persons, who, owing to the
irresponsible capacity of being attainted with the
age of puberty. This was accomplished by the lex
Plutoria (the true name of the lex, as Saviagey has shown), the date of which is
not known, though it is certain that the law ex-
isted when Plautus wrote.4 This law established
a distinction of age, which was of great practical
importance, by forming the citizens into two clus-
tes, those above and those below twenty-five years
of age (minores viginti quinque annis), whence a
person under the last-mentioned age was sometimes
called minor. The object of the lex was to
protect persons under twenty-five years of age,
and curators were provided for them. The person
who was guilty of such a fraud was liable to a judicium
publicum,4 though the offence was such as in the case
of a person of full age would only have been matter
of action. The punishment fixed by the lex Plutor-
ria was probably a pecuniary penalty, and the con-
sequential punishment of infamy or loss of political
rights. The minor who had been fraudulently led
to make a disadvantageous contract might protect
himself against an action by a plea of the lex
Plutoria (exceptio legis Plutoria). The lex also
appears to have farther provided that any person who
dealt with a minor might avoid all risk of the consequen-
ces of the Plutoria lex, if the minor was aided and
assisted in such dealing by a curator named or
chosen for the occasion. But the curator did not
act like a tutor: it can hardly be supposed that his
consent was even necessary to the contract; for the
minor had full legal capacity to act, and the busi-
ness of the curator was merely to prevent his being
defrauded or surprised.

The pretorian edict carried still farther the prin-
ciple of the lex Plutoria, by protecting minors gen-
erally against positive acts of their own, in all cases
in which the consequences might be injurious to them.
This was done by the "in integrum resstitu-
1 (Flint, N. xvi, 33.—Virg. Æn, v, 64.—Horat, Carm.,
l, 14, 23, 3—2. (Caesar, i, 196.)—3. (Pseudoiulus, i, 3, 69.)
(Cic. De Nat. Deor., lib. 30.)

2 (Dig. 4, tit. 4.—De Minoribus et Curatione, 1, 10.1,—2. (Plaut., Plant., i, 3, 69.)
property of the pupillus. If it was intended that the curator should have the care of that which the minor acquired after the curator's appointment, by will or otherwise, a special application for this purpose was necessary in Rome, to the property which was placed under the care of the curator, both as regards alienation and the getting in of debts, the minor was on the same footing as the prodigies: his acts in relation to such matters, without the curator, were void. But the legal capacity of the minor to contract debts was not affected by the appointment of a curator, and he might be sued on them, if requested by the creditor. Nor was there any inconsistency in this: the minor could not spend his actual property by virtue of the power of the curator, and the preservation of his property during minority was the object of the curator's appointment. But the minor would have been deprived of all legal capacity for doing any act which was injurious to himself or to others; and if the contract was not in its nature immediately injurious, and when the time came for enforcing it against the minor, he had the general protection of the restitutio. If the minor wished to be adrogated (vid. Adrogio), it was necessary to have the consent of the curator. It is not stated in the extant authorities what was the form of proceeding wherein it was possible to have the minor declared a minor by the curatela or by the curatela munimentum. It was not necessary that any act should be done by the minor or by the curatela munimentum, but it may be safely assumed that the minor acted (for he alone could act on such an occasion) and the curator gave his consent, which, in the case supposed, would be analogous to the auctoritas of the tutor. But it would differ from the auctoritas in not being, like the auctoritas, necessary to the completion of the legal act, but merely necessary to remove all legal objections to it when completed.

The cura of spendthrifts and persons of unsound mind, as already observed, owed its origin to the laws of the Twelve Tables. The technical word for a person of unsound mind in the Twelve Tables is demens; hence is equivalent to decemns; and both words are distinguished from insanus. Though furor implies violence in conduct, and dementia only mental imbecility, there was no legal difference between the two terms, so far as concerned the cura. Insanus is merely weakness of understanding (stultitia constantia, id est, aequalis vacans), and it was not necessary to remove all legal objections to the property. In later times, the prætor appointed a curator for all persons whose infirmities required this law. This law of the Twelve Tables did not apply to a pupillus or pupilla. If, therefore, a pupillus was of unsound mind, the tutor was his curator. If an agnatus was the curator of a furiosus, he had the power of alienating the property of the minor if he failed to use the cura of a decemns. The prodigus only received a curator upon application being made to a magistratus, and a sentence of interdicting being pronounced against him (ei bonis interdictum est). The form of the interdictio was thus: "Quando tibi bona paterna avitae nequita tua disperderis, liberisque tuae ad egestionem perdideris, ob eam rem tibi cura pro commerce interdico." The cura of the prodigus was suspended till the interdictio was dissoluted. It might be inferred from the form of the interdictio, that it was limited to the case of persons who had children; but perhaps this was not so.

It will appear from what has been said, that, whatever similarity there may be between a tutelum and a curator, an essential distinction lies here. The tutelum is the representative of property, though in the case of a furiosus he must also have been the guardian of the person. A curator must, of course, be legally qualified for his functions, and he was bound, when appointed, to accept the duty, unless he had some legal exemption (excessuatio). The curator was also bound to account at the end of the curatela, and was liable to an action for mismanagement.

The word cura has also other legal applications:
1. Cura bonorum, in the case of the goods of a debtor, which are secured for the benefit of his creditors.
2. Cura bonorum et veniris, in the case of a woman being pregnant at the death of her husband.
3. Cura hereditatis, in case of a dispute as to who is the hereditary owner, when a supposed child is under age.
4. Cura hereditatis jam dux, in the case of a property, when the heres had not yet declared whether or not he would accept the inheritance.
5. Cura bonorum absentis, in the case of property of an absent person who had appointed no manager of it.

This view of the curatela of minors is from an essay by Savigny, who has handled the whole matter in a way equally admirable, both for the scientific precision of the method, and the force and perspicuity of the language.  

CURATORES were public officers of various kinds under the Roman Empire, several of whom were first established by Augustus. The most important were:
1. Curatores Alvei et Riparum, who had the charge of the navigation of the Tiber. The duties of their office may be gathered from Ulpian. It was reckoned very honourable, and the persons who filled it received afterward the title of comedes.
2. Curatores Annuae, who purchased corn and oil for the state, and sold it again at a small price among the poorer citizens. They were also called curatores emendis frumenti et olei, and sitellas and elaivas. Their office belonged to the persona- lia munera; that is, it did not require any expenditure of a person's private property; but the curatores received from the state a sufficient sum of money to purchase the required amount.
3. Curatores Aquarum. (Vid. Aquæ Iuctor.)
4. IV. Curatores Kalendar, who had the care in municipal towns of the kalendaries, that is, the books which contained the names of the persons to whom public money was paid, which was not wanted for the ordinary expenses of the town, was lent on interest. The curatores Kalendar were appointed to the persona- lia munera. These officers are mentioned in inscriptions found in municipal towns.
5. Curatores Ludorum, who had the care of the public games. Persons of rank appear to have been usually appointed to this office. In inscriptions, they are usually called curatores munera gladiatori, &c.
6. Curatores Operum Publicorum, who had the care of all public buildings, such as the theatres, baths, aqueducts, &c., and agreed with the contractors for all necessary repairs to them. Their duties, under the Republic, were discharged by the ediles and censors. (Vid. Censores, p. 229.) They are frequently mentioned in inscriptions.
7. Curatores Regiones, who had the care of the fourteen districts into which Rome was divided.
Curia

under the emperors, and whose duty it was to prevent all disorder and extortion in their respective districts. This office was first instituted by Augustus. There were usually two officers of this kind for each district; Alexander Severus, however, appointed only one for each; but these were persons of consular rank, who were to have jurisdiction in conjunction with the praefectus urbi. We are told that Marcus Antonius, among other regulations, gave special directions that the curatores regionum should either punish, or bring before the praefectus urbi for punishment, all persons who exacted from the inhabitants more than the legal rate. 3

VIII. CURATOES REIPUBLICAE, also called LOCISTE, who administered the landed property of the municipality. 4 Ulpian wrote a separate work, De Officio Curatoris Reipublicae.

IX. CURATOES VIABUM. (Vid. V. E.) KYREIS (κυρίος). (Vid. Alex. Sav.) CURIA. (Vid. Curiae.) CURIAE. The accounts which have come down to us of the early ages of Rome, represent the burgesses or proper citizens (the populus of the Annals) to have been originally divided into three tribes, the Rames, Titienes, and Luceres. 5 (Vid. Tribus.) Each of these tribes was composed of a union of ten curie (φαρμακία) or wards, so that the whole number of the latter was thirty. Again, each of these thirty curie was formed of gentes or bands of families, which were not absolutely necessary; but just as at Athens the genetites or members of a γένος, also called διαμαλάκτες, were no way akin, but bore this name solely in consequence of their union. 6 Dionysius 7 farther informs us that Romulus divided the curie into decades, i. e., decades of gentes or houses, at the head of which were officers called decurions: each of the three tribes was thus constituted of one hundred gentes (vid. Genes); and as in the old legion the three centuries of horse corresponded to the three tribes, so did the thirty centuries of foot represent the same number of curie. We need not, however, infer from this that the number of soldiers in each century was always a hundred. 8

The curie whose names have come down to us are: the Saucia, the Tatinia, Titania, Vetus, and Vetula. According to Livy, 9 these names were derived from the Sabine women carried off during the consulsia; according to Varro, 10 from their leaders (κυρίοις κυρίοις), by which he may mean Heroes Eponymi, 11 others, again, connect them with the neighbouring places. 12 The poetical story of the rape of the Sabines probably indicates, that at one time no comitia, or right of intermarriage, existed between the Romans and the Sabines till the former extorted it by force of arms. A more intimate union would, of course, be the consequence.

Each of these thirty curie had a president (curio), who performed the sacred rights, a participation in which served as a bond of union among the members. 13 The curiones themselves, forming a college of thirty priests, were presided over by the curator maximus. Moreover, each of these corporations had its common hall, also called curia, in which the citizens met for religious and other purposes. 14 But, besides the halls of the old corporations, there were also other curie at Rome used for a variety of purposes: thus we read of the Curia Salutorum, on the

Palatine; 1 of the Curia Calabra, on the Capitoline hill; and the Curia Hostilia, of which the best accounts are contained in the works of Tacitus, where the name is derived from the name of the praefectus curiatus of the same name, who was appointed in the time of Augustus, and whose office was exercised by the magistrates of the same name (vid. Hostilia). The title of the Curia Hostilia was also given to the person who was commissioned by the praefectus urbani to keep the peace in the city. The Curia Hostilia is also called the Curia Hostilia Palatina, because of its location on the Palatine Hill. The Curia Hostilia was an important institution, as it was the place where the magistrates of the city were convened to discuss important matters.

The Curia Hostilia was also used as a meeting place for important matters, as it was the place where the magistrates of the city were convened to discuss important matters. The Curia Hostilia was an important institution, as it was the place where the magistrates of the city were convened to discuss important matters. The Curia Hostilia was also used as a meeting place for important matters, as it was the place where the magistrates of the city were convened to discuss important matters.

In later ages, curia signified the senate of a colony in opposition to the senate of Rome. (Vid. Colonia, p. 282.) Respecting the etymology of the word, see Comitia, p. 285.

CURIATA COMITIA. (Vid. Comitia.) CURIOS. (Vid. Curius.)

KYRIOΣ (κύριος) signifies generally the person that has the authority of a head of a family, or has the care of some members of a family as the law presumes to be incapable of protecting themselves; as, for instance, minors and slaves, and women of all ages. Fathers, therefore, and guardsians, husbands, the nearest male relatives of women, and masters of families, would all bear this title in respect of the various functions exercised by them in behalf of the respective objects of their care. The qualifications of all these, in respect of which they can be commissioned in one class, designated by the term κύριος, were the male sex, years of discretion, freedom, and, when citizens, a sufficient share of the franchise (εκτίμησις) to enable them to appear in the law-courts as plaintiffs or defendants in behalf of their several charges; in the case of the κύριος being a resident alien, the deficiency of franchise would be supplied by his Athenian patron (σύνστατος). The duties to be performed, and, in default of their performance, the penalties inflicted by guardians, and the proceedings as to their appointment, are mentioned under their more usual title. (Vid. Entrōpov.)

The business of those who were more especially designated κύριοι in the Attic laws was, to protect the interests of women, whether spinster or widows, or persons separated from their husbands. If a citizen died intestate, leaving an orphan daughter,
the son, or the father, of the deceased was bound to supply her with a sufficient dowry, and go to marry; and take care, both for his own sake and that of his ward, that the husband made a proper settlement in regard to what his bride brought him in the way of dower (ἰστιοτυπία, Hargorc.). In the event of the death of the husband or of a divorce, it became the duty of the χώρος that had betrothed her to receive her back and recover the dowry, or, at all events, alimony from the husband or his representatives. If the father of the woman had died intestate, without leaving such relations as above defined, these duties devolved upon the next of kin, who had also the option of marrying her himself, and taking her fortune with her, whether it were great or small. If the fortune were small, and he were unwilling to marry her, he was obliged to make up its deficiencies according to a regulation of Solon; if it were large, he might, for this purpose appear, have shifted her from a husband to whom she had been married in the lifetime and with the consent of her father.

There were various laws for the protection of female orphans against the neglect or cruelty of their kinmen; as one of Solon's, whereby they could compel their kinmen to endow or marry them; and another, which, after their marriage, enabled any Atty. or other person to compel or smear the kinmen against the cruelty of their husbands; and the archon was specially intrusted with power to interfere in their behalf upon all occasions. (Vid. Cocrxes.)

"CURMA, CURMI, CORMA, and CURMON, a species of Ale mentioned by Sulpicius and Dionysodores. (Vid. Gvres.)

CURSO'RES were slaves, whose duty it was to run before the carriage of their masters, for the same purpose as our outriders. They were not used during the times of the Republic, but appear to have first come into fashion in the middle of the first century of the Christian era. The slaves employed for this purpose appear to have frequently been Numidians. The word cursores was also applied to all slaves whose masters employed in carrying letters, messages, &c.

CURUS. (Vid. Circus, p. 255.)

"CUR'CA or CUR'CA, a bird mentioned by Aristotle under the name of ἵππαλος. Guiz transl. "Hippalos," and gives the Latin Hippalos. G. G. gives the opinion that it is the Titlar, or Anthus praetensis, Bechsthein.

CURULIS SELLA. (Vid. Sella Curulis.)

CURUS, dim. CUR'CULUM (ἄγος), a Chariot, a Car. These terms appear to have denoted those two-wheeled vehicles for the carriage of persons, which were open, and had consequently the carpentum, and closed in front, in which they differed from the cistium. One of the most essential articles in the construction of the curus was the ὄντος, or rim, and it is accordingly seen in all the chariots which are represented either in this article, or at p. 66, 209, 253. (Vid. Antux.) Another indispensable part was the axle, made of ὕφος (ἡπος), and called also ὑφος ἄξως. All these parts are well seen in the pictures which Homer gives of Phaethon's chariot. The ears of Juno and Neptune have metallic axles ( resilures, κτάλησις εξ>{11}.

One method of making a chariot less liable to be overthrown was to lengthen its axle, and thus to widen the base on which it stood. The axle was firmly fixed under the body of the chariot, which, in reference to this circumstance, was called ἀποτροπία, and which was often made of wicker-work, enclosed by the ἄψις. Fat (μύταρι) and pressed olives (αμυρία) were used to grease the axle.

The wheels (κύλη, τροχοί, ῥότα) revolved upon the axle, as in modern carriages; and they were prevented from coming off by the insertion of pins (ῥυόμοναι) into the extremities of the axle (ἀμαρσφια). Pelops obtained his celebrated victory over Κόνομας through the artifice of Hippodamia, who, wishing to marry Pelops, persuaded Myrtillos, the husband of Κόνομας, to come to a contest in which he (Pelliops) was to ride with the chariot of the linealips in his axe of his car, or to insert one of wax. She thus caused the overthrow and death of father Κόνομας, and then married the conqueror in the race.

Sir W. Gell describes, in the following terms, the wheels of three cars which were found at Pompeii:

The three chariots are of very different light, and dressed much like the modern, 4 feet 3 inches diameter, 12 spokes, a little thicker at each end. These cars were probably intended for the purposes of common life. From Xenophon we learn that the wheels were made stronger when they were intended for the field of battle. After each excursion the wheels were taken off the chariot, which was laid on a shelf or receptacle, and was put together and thoroughly set to again whenever it was wanted for use. The parts of the wheels were as follows:

(a) The nave, called πάλατος, κοινοκίς, κοινόδος. The last two terms are founded on the resemblance of the nave to a modius or bushel. The nave was strengthened by being bound with an iron ring, called the στεφάνος.

(b) The spokes, νήματα (literally, the 'joints,' radii. We have seen that the spokes were sometimes ten in number. In other instances they were eight (σύκλα διστάκτυμα), six, or four. Instead of being of wood, the spokes of the chariot of the sun, constructed by Vulcan, were of silver (radiorum argentum)."

(c) The felly, ἵππαι. This was commonly made of some flexible and elastic wood, such as poplar or the wild fig, which was also used for the rim of the chariot; heat was applied to assist in producing the requisite curvature. The felly was, however, composed of separate pieces, called areas (ἐπίκτες) of a certain length and breadth, and these were put together, or sewed, with such skill that a "wheel revolves, first one area is at the highest point, and then another." Hesiod evidently intended to recommend that a wheel should consist of four pieces.

(d) The tire, ἐπιδάουρος, κανθάς. Homer describes the chariot of Juno as having a tire of bronze wheels light, thus placing the harder metal in a position to resist friction, and to protect the softer. On the contrary, Ovid's description is more ornamental than correct: "Aurea summus curvatura rota." The tire was commonly of iron.

All the parts now enumerated are seen in an ancient chariot preserved in the Vatican, a representation of which is given in the following woodcut.

The chariot also shows the pommel (πόμυς, temenos)." It was firmly fixed at its lower extremity to the axle, whence the destruction of Phaethon's chariot is represented.

CURRUS.

by the circumstance of the pole and axle being torn
under (tempe resulsus axis). At the other end
(ακροβουλος) the pole was attached to the yoke,
either by a pin (εμπολος), as shown in the charriot
above engraved, or by the use of ropes and bands.
(Vid. Iouum.)

Carriages with two, or even three poles were
used by the Lydians. The Greeks and Romans,
on the other hand, appear never to have used more
than one pole and one yoke, and the currus thus
constructed was commonly drawn by two horses,
which were attached in it by their necks, and there-
called διτεσες ἵππος, συναρά, "gemini jum-
gales," "equi biujuges." 

If a third horse was added, as was not un-
fortunately the case, it was fastened by traces. It may
have been intended to take the place of either of
the yoke horses (διτεσες ἵππος) which might happen
to be disabled. The horse so attached was called
παρόρος. When Patroclus returned to battle in
the charriot of Achilles, two immortal horses, Xan-
thus and Ballis, were placed under the yoke; a
third, called Podasus, and mortal, was added on the
right hand; and, having been slain, caused confu-
sion, until the driver cut the harnesses by which this
third horse was fastened to the charriot. Ginzro
has published two drawings of chariots with three
horses from Etruscan vases in the collection at Vi-
enna. The ἵππος παρόρος is placed on the right of
the two yoke horses. (See woodcut at top of
next column.) We also observe traces passing be-
tween the two ἰππος, and proceeding from the
front of the charriot on each side of the middle horse.
These probably assisted in attaching the third or ex-
tra horse.

The Latin name for a charriot and pair was bia-
(Vid. Boa.) When a third horse was added, it
was called triors; and, by the same analogy, a char-
riot and four was called quadrigia, in Greek, τετρα-
ὀρος or τετράμπορος.

The horses were commonly harnessed in a quad-
riga after the manner already represented, the two
strongest horses being placed under the yoke, and
the two others fastened on each side by means of
ropes. This is implied in the use of the epithets
σερίας or σεριφόρος, and funalis or funarius, for a
horse so attached. The two exterior horses were
further distinguished from one another as the right
and the left trace-horse. In a charriot-race descri-
based by Sophocles, the driver, aiming to pass the
goal, which is on his left hand, restrains the nearest
horse, and gives the reins to that which was far-
thest from it, viz., the horse in traces on the right
hand (δεξιὸν ὀ ανεικοτερον ἵππον). In the splen-
did triumph of Augustus after the battle of Actium,
the trace-horses of his car were ridden by two of
his young relations. Tiberius rode, as Suetonius
relates, "sinisteriore funali equo," and Marcellus
"dextero funali equo." As the works of ancient
art, especially fictile vases, abound in representa-
tions of quadriga, numerous instances may be ob-
served in which the two middle horses (δ μεσὸς
δεξιὸς και δ μεσὸς ἀντιστερός) are yoked together as
in a biga; and, as the two lateral ones have collars,
(λειβάδαις) equally with the yoke-horses, we may
presume that from the top of these proceeded the
ropes which were tied to the rim of the car, and by
which the trace-horses assisted to draw it. The
first figure in the annexed woodcut is the charriot
of Aurora, as painted on a vase found at Canosa. The
reins of the two middle horses pass through
rungs at the extremities of the yoke. All the par-
ticulars which have been mentioned are still more
distinctly seen in the second figure, taken from a
terra-cotta at Vienna. It represents a charriot

392.
works of art, the currus was sometimes drawn by four horses without either yoke or pole; for we see it represented thus in the Andromeda, a Persepolitan painting, now in the Victoria and Albert Museum, and also in the frescoes of the fourth Persepolitan stela, on which the royal charioteer, Persepolitan at any rate, has the wheel and yoke, which seems to have been always attached to the carriage, though not strictly necessary to its purpose. But the yoke and pole were often dispensed with, as in the famous Suida in the Vatican Museum. The driver, when Adventus, he held the reins, and his companion, the charioteer, from going by his side or near him. Though in all respects superior, the peraβιαστης was often obliged to place himself behind the νιόξης. He so represented in the biga at p. 66, and in the Iliad Achilles himself stands behind his charioteer Automedon. On the other hand, a personage of the highest rank may drive his own carriage, and then an inferior may be his παραβιαστης. In some cases we have a charioteer who is a demagogue, and the best example is the one who acted in the same Toga anhoud, and Juno, holding the reins and whip, conveys Minerva, who is in full armor. In such cases a kindness, or even a compliment, was conferred by the driver upon him whom he conveyed, as when Dionysus, tyrant of Sicily, "himself holding the reins, made Pluto his παραβιαστής. In the contest which ensued, an act and an attitude which is unique in Greek mythology, Δηνος invites the reins to the unfaithful Myrtillus, and assumes the place of his παραβιαστής, while Perseus himself drives with Hippodamia as his παραβιαστής, thus honouring her in return for the service she had bestowed.

The Persepolitan sculptures, and the innumerable paintings discovered in Egyptian tombs, concur with the historical writings of the Old Testament, and with the testimony of other ancient authors, in showing how commonly chariots were employed on the field of battle by the Egyptians, the Persians, and other Asiatic nations. The Greek poetry of the age, and the description of the heroic age given in the Iliad and the Odyssey, reflect this preva- lently prevalent of the same custom in Greece. The ἀρτομέδωs, i. e., the nobility, or men of rank, who were made up complete suits of armour, all took their chariots with them, and in an engagement placed themselves in front. Such were the ἱππομάχοι or cavalry of the Homeric period; the precursors of those who, after some centuries, adopted the less expensive method of riding on horseback, but who, nevertheless, in consideration of their wealth and station, still maintained their own horses, rather to aid and exhibit themselves individually on the field than to act as members of a compact body. In Homer's battles we find that the horseman, who, for the purpose of using his weap- ons, often stood without his horse under his arm, is under the necessity of taking the place of παραβιαστής (see the woodcut of the triga, p. 332), often asssists or challenges a distant foe from the chariot; but that, when he encounters his adversity in close combat, they both dismount, "springing from their chariots to the ground," and leaving them to the care of the νιόξης. The charioteer is described by Virgil, " Dixit Turnus binitia; pedes apparat ire Commius." As soon as the hero had finished the trial of his strength with his oppo-
CURRUS.

drives four white horses when he goes armed with his thunderbolt to resist the giants: Pluto is drawn by four black horses. The following line,

"Quadrir grasp et Phaxus equis, et Delta bigis,"1

is in accordance not only with numerous passages of the poets, but with many works of art. A bronze lamp2 shows the moon, or Diana, descending in a biga, and followed by Apollo, who is crowned with rays as he rises in a quadriga. The same contrast is exhibited in the annexed woodcut, showing the devices on two gems in the royal collection at Berlin. That on the left hand, representing Apollo encircled by the twelve signs, calls to mind the en-

gravings on the seal of Amphitryon. "Cum quadriga sol exorians."3 In the Aeneid,4 Latins drives a chariot and four to express his claim to be descended from Apollo. The chariots of Jupiter and of the Sun are, moreover, painted on ancient vases with wings proceeding from the extremities of the axle (πτυχῶν ἑρώων τοւμερ κατηκ).5

These supernatural chariots were drawn not only by horses, but by a great variety of brute or imaginary beings. Thus Medusa received from the Sun a car with winged dragons.6 June is drawn by peacocks,6 Diana by stags,6 Vennes by doves or swans, Minerva by owls, Mercury by rams, and Apollo by griffins. To the car of Bacchus, and, consequently, of Ariadne (vid. Capistrum, p. 209), are yoked cen- taurs, tigers and lynxes:

"Tu bijugum pictis insignia frenis
Cola premis lyncaum."16

Chariots executed in terra-cotta (quadriga fictiles17), in bronze, or in marble, an example of which last is shown in the annexed woodcut from an ancient chariot in the Vatican, were among the most beautiful ornaments of temples and other public ed- 

No pains were spared in their decoration; and Pliny informs us18 that some of the eminent artists were employed upon them. In numerous instances they were designed to perpetuate the fame of those who had conquered in the chariot- race.19 As the emblem of victory, the quadriga was sometimes adopted by the Romans to grace the triumphal arch by being placed on its summit; and even in the private houses of great families, or ar- ots were displayed as the indications of rank, or the materials of conquest and of triumph.

CUSTODES. (Vid. Cornius, p. 207.)

CYATHUS (καιχούς), a Greek and Roman liquid measure, containing one twelfth of the sextarius or 0.925 of a pint English. It was, in later times at least, the measure of the common drinking-glass among the Romans, who borrowed it from the Greeks.20 The form of the cyathus used at ban quets was that of a small ladle, by means of which the wine was conveyed into the drinking-cups from the large vessel (σερραφ) in which it was mixed.21 Two of these cyath are represented in the annexed woodcut from the Museo Borbonico, vol. iv., p. 12.

The cyathus was the unica, considered with re- reference to the sextarius as the unit: hence we have sextans used for a vessel containing the sixth of the sextarius, or two cyath, quadrans for one containing three cyath, triens for four cyath, quinuca for five cyath, &c.22

*CYCLAMINUS (κυκλάμινος), a plant, of which Dioscorides mentions two species. The first ap- parents to be the Cyclamen Europaeum, or common Sow-bread. About the second there has been much difference of opinion. Dodoan and Hardouin conclude that it was the Bitter-sweet (Salaman dulcamara); but Sprengel gives Gesner in referring it to the Lonicera periclymenum, or Woodbine.23

*CYCNUUS (κύκνος). This appellation, as Adam remarks, is generally applied to the Anes Cycnus, L., or Wild Swan; but sometimes also to the Anes Olor, or Tame Swan. It is to the wild swan that the Homeric epithet δαίλυτοβιος, "long-necked," is particularly applicable.24 "It is to this species (the Anes Cycnus)," observes Griffith, "that the ancients attributed so melodious a voice: but this opinion, however accredited, was not universal. It was contested by Lucian, Pliny, and Athen.; and even Virgil speaks only of the disagreeable cries of the swan. Some moderns have, notwithstanding, adopted the popular notions of the ancients on this subject, and, even in contradiction to the evidence of their senses, have endeavored to persuade themselves of its truth. It is sufficient to observe, from all credible evidence, that the opinion is ut- terly unfounded. The swan neither sings during its lifetime, nor, as some assert, just before its death. The comparatively modern discovery of the Black Swan seems to lead to the conclusion that the Cycnus Niger of antiquity was not altogether a fabulous creature."25

334
CYMBALUM

*CYDONIUM MALUM*, the Quince, the fruit of the *Pirus Cydonia*. The name arose from that of the city of Cydon, in Crete, whence they were first brought to Greece. Cato first gave it the appellation of *Cotoneum malum*, and Pliny followed him. The ancient writers mention several varieties of the Quince: thus the true ones (*kotonia*) were small and round; another kind, the *oropodes*, was of a large size, and sweeter than the former. Columella enumerates three kinds, namely, *Struthia*, *Mustea*, and *Chrysomela*. The last, however, belongs to the orange family. The Quince-tree is still called *kudavia* in northern Greece. According to Sibthorp, it is cultivated in gardens with the apple-tree.1

*CYMINDIS* (*κυμίνδης*). (Vid. *Hierax*.)

CYCLAS (*κύκλας*) was a circualar robe worn by women, to the bottom of which a border was affixed, inlaid with gold.

"*Hae nunc aurata cyclade signat humum.*" 7

Alexander Severus, in his other attempts to restrain the luxury of his age, ordained that women should only possess one cyclas each, and that it should not be adorned with more than six unie of gold.3 The cyclas appears to have been usually made of some thin material (*tenui in cyclade*). It is related, among other instances of Caligula's ef- ficiency, that he sometimes went into public in a garment of this description.8 For the literature of this subject, see Ruperti, ad *Juv.*, vi., 259.

CYMBALUM (*κύμπαλον*), a musical instrument, in the shape of two half globes, which were held, one in each hand, by the performer, and played by being struck against each other. The word is originally Greek, being derived from *kúpos*, a hollow, with which the Latin *cymba*, *cymbium*, &c., seem to be connected. In Greek it has several other signiﬁcations, as the cone of a helmet; 7 it is also used for *apodycia*, 8 the vessel of puriﬁcation placed at the door of a house where there had been death.8 Besides this, it is often employed metaphorically for an empty, noisy person, as in 1 Corinthians, xiii., i, or, as Tiberius Caesar called Apion the grammarian, *Cymbalum mundi*. 9 In the middle-age Latia it is used for a church or convent-bell, and sometimes for the dome of a church.11

Several kinds of cymbals are found in ancient monuments, and, on the other hand, a great many names have been preserved by the grammarians and lexicographers; but the descriptions of the latter are so vague, that it is impossible to identify one with the other. A large class of cymbals was termed *krophiare*; which, if they were really distinct from the *spólamia*, as Spohn and Lampe suppose, cannot now be exactly described. (Vid. *Cymbalum.* The preceding drawing of a *krophi* is taken from an ancient marble, and inserted on the authority of Spohn.1

The *krophi* mentioned in the Homeric hymn to Apollo5 were of this kind, played on by a chorus of Delians. The scabilla or *krophi* were also on the same principle, only played with the foot, and inserted in the shoe of the performer; they were used by flute-players, perhaps to beat time to their music.

Other kinds of cymbals were, the *πλατάγια*, an invention of Archytas, mentioned by Aristotl6, and its diminutive *πλαταγιόνω*, which, from the description of Julius Pollux and Hesychius,7 appears to have been a child's rattle; *kófíla*, the two parts of which Suidas tells us6 were made of different materials, for the sake of variety of sound; *kófílai*, mentioned in the fragments of *Eschylus*, with several others noted by Lampe in his work *De Cymbals*, but perhaps without sufficient authority.

The cymbal was usually made in the form of two half globes, either resting on the ground, as to be grasped by the whole hand, or with a handle. It was commonly of bronze, but sometimes of baser material, to which Aristophanes alludes.7 The subjoined woodcut of a cymbalisteria is taken from an ancient marble, and given on the authority of Lampe. See also the figure in page 189.

The cymbal was a very ancient instrument, oc- cuing in the worship of Cybele, Baechus, Juno, and all the earlier deities of the Grecian and Roman mythology. It probably came from the East, from whence the Phoenicians, it was conveyed to Spain.8 Among the Jews it appears (from 3 Chron., v., 12, 13. — *Neuem.*, xii., 27.) to have been an instrument in common use. At Rome we first hear of it in Livy's account of the Bacchic orgies, which were introduced from Etruria.9 For *sistrum*, which some have referred to the class of *cymbala*, see *Sistrum*.

*CYNOCEPHALI* (*κυνοκεφάλοι*), a fabulous race, with the heads of dogs, mentioned by Pliny and others as dwelling in the interior of Africa. The *Cynocephali* of the ancients, however, were in reality a species of large baboon, with elongated, dog-like head, flat and compressed cheeks, projecting and strong teeth, and a forehead depressed below

1. (Miscell., sec. v, art. vii., fig. 44.)—2. (161—164.)—3. (Poldiac, Onom., x, 33. — *Pold., viii., 6.)—4. (v. 8.—6.)—7. (Ranea, 1805).—8. (Camspre Martial's Batic Cuinimates.—9. (Xenek., 9.)
the level of the superior margins of the orbits. Notwithstanding this close approximation to the shape of the dog's head, the form and position of the eyes, combined with the similarity of the arms and hands, gave to these creatures a resemblance to humanity as striking as it is disgusting.

*CYNOGLOSSUM* (κυνογλώσσαι ou -γλώσσαι), the Hounds'-tongue, or *Cynoglossum officinale*. Cup- pepper, the English herbalist, says, with respect to the etymology of the word, "it is called Hounds'-tongue because it ties the tongues of dogs; whether or not I have never tried." 17

II. The name of a fish mentioned by Athenaeus. Rondellet supposes it a species of the Bonglossus or Sole.

*CYNOCRAMBE* (κυνοκράμβη), a plant, which Sprengel, in his history of Botany, sets down as the *Chenopodium album*, or white Goose-foot; but in his edition of Dioscorides he joins Bothein in holding it to be the *Thelygonum cynocephalum*.

*CYNOMYIA* (κυνομυία), the Dog-fly, or Meusa canina.

*CYNORAITES* (κυνοραίητης), the Dog-thick, or *Acarus Ricinus*, L. 6

*CYNORODON* (κυνορόδων). "None of the commentators," observes Adams, "offer any explanation of what it was; but, as the word signifies the Dog's head, it is probable that it was the same as the κυνώδων." 17

*CYNOBATUM* (κυνοβάτων). "The commentators are not quite agreed respecting this plant," observes Adams. "Dierbach makes it to be the *Rosa pomifera*; Sprengel follows Dodonaeus in referring it to the *Rosa canina*, or Hug; and Stackhouse at first inclines to this opinion, but afterward decides in favour of the Rubus Idaeus. I am of opinion that it was most probably the *Rosa canina*.

*CYNOPS* (κυνόπως). Both Sprengel and Stackhouse call this plant *Plantago cynops*, but the latter hesitates about making it the *P. Psyllium*, or Fleawort.

*CYPERUS* (κυπέρος or -σος), the *Cyperus rotundus*, a plant still very common on the Greek islands. It is mentioned by Theocritus as an agreeable plant, and is also noticed by Homer and Nicander. According to Dodwell, the roots are taken medicinally for the stomach. The leaves are used for stringing and cutting the roots of *Athen*, and for tying the wigs on the cultivated trees.

*CYPRUS* (κύπρος), a plant; according to Pliny, the same with the *Ligustrum*. Martyr, however, remarks, that Prosper Alpinus found plenty of plants in Egypt answering to Dioscorides' description of the *Cyprus*, but at the same time declared that the Italian *Ligustrum*, or Privet, did not grow in Egypt. It has since been settled, according to Adams, that it is a species of *Lasianthus*, either the *inermis* or the *album*.

*CYTISUS* (κύτισος). "There has been considerable diversity of opinion respecting this plant. The point, however, seems at last to have been settled by Martyr and Sprengel in favour of the *Medicago arborea*, or Tree Medick." Sibthorp found the *M. arborea* growing among the rocks around Athens.

D.

**DACTYLIOTHECE** (δακτυλιόθηκα), a case or box where rings were kept. 1

The name was also applied to a cabinet or collection of jewels. We learn from Pliny 2 that Scaurus, the stepson of Sula, was the first person at Rome who had a collection of this kind, and that he was the only one till Pompey brought to Rome the collection of Mithradates, which he described. Cleopatra joined Caesar and placed six dactylithoces in the Temple of Venus Genetrix.

**DACTYLUS** (δακτύλος). (Vid. PES).

**DADUCIUS** (δαδούχος). (Vid. ELEUSINIA).

**DEDAEA** (Δαιδάλεια), a festival celebrated in Boeotia in honour of Hera, surnamed Νυμφοκράτης or Τελεία. 3 Its origin and mode of celebration are thus described by Pausanias: 4 Hera was once angry with Zeus, and withdrew herself to Eubea. Zeus not being able to persuade her to return, went to Citheroon, who then governed Plataeae, and who was said to be unequalled in wisdom. He advised Zeus to get a wooden statue, to dress and place it upon a chariot, and to say that it was Plataea, the daughter of Asopus, whom he was going to marry. Zeus followed the advice of Citheron, and no sooner had he placed the statue on the chariot than it was heavier than she returned. But when, on approaching the chariot and dragging off the coverings, she saw the wooden statue, she was pleased with the device, and became reconciled to Zeus. In remembrance of this reconciliation, the Plataeans solemnized the festival of the dadaela, which owes its name to Δαι- δαλεια, the appellation by which, in ancient times, statues and other works of ingenious and curious workmanship were designated. 5 Pausanias was told that the festival was held every seventh year; but he believes that it took place at shorter intervals, though he was unable to discover the exact time.

We have to distinguish between two festivals of this name: one, which was celebrated by the Plataeans alone, was called the lesser Dadaela (Δαιδαλεια μικρά), and was held in the following manner: In the neighbourhood of Alacome was the greatest oak-forest of Boeotia, and in it a number of oak-trunks. Into this forest the Plataeans went, and exposed pieces of cooked meat to the ravens, attentively watching upon which tree any of the birds, after taking a piece of the meat, would settle; and the trees on which any of the ravens settled were cut down and worked into dadaela, i. e., roughly- hewn statues.

The great Dadaela (Δαιδαλεια μεγάλα), in the celebration of which the Plataeans were joined by the other Boeotians, took place every sixtieth year; because at one time, when the Plataeans were absent from their country, the festival had not been celebrated for a period of sixty years. At each of the lesser Dadaela fourteen statues were made in the manner, and the pieces of meat were given by lot among the towns of Plataeae, Coronea, Thebe, Tanagra, Chersona, Orchomenos, Lebadea, and Thebes; the smaller towns took one statue each. The Boeotians assembled on the banks of the Asopus; here a statue of Hera was adored and raised on a chariot, and a young bride led the procession. The Boeotians then decided by lot in what order they were to form the procession, and dadaelas were placed among their chariots away from the river, and on Mount Citheron, on the summit of which an altar was erected of square pieces of wood, fitted together like stones. This altar was covered with a quanti-
DAPHNE.

DAMNUS.

Dry of wood, and the towns, persons of rank, and other wealthy individuals, offered each a heifer to Hera and a bull to Zeus, with plenty of wine and incense, and the happy proprietors placed their flocks upon the altar. For those who did not possess sufficient means, it was customary to offer small sheep; but all their offerings were burned in the same manner as those of the wealthier persons. The fire consumed both offerings and altar, and the immense flame thus kindled was seen far and wide.

The account of the origin of the dædal given by Pausanias is derived from the story related by Plutarch, who wrote a work on the Platæan dædal; the only difference is, that Plutarch represents Zeus as receiving his advice to deceive Hera from Alabamenes, and that he calls the wooden statue by which the goddess was to be deceived Dædalus instead of Platæa. Plutarch also adds some remarks respecting the meaning of the festival, and thinks that the dispute between Zeus and Hera had reference to the physical revolutions to which Beoûs, at a very remote period, had been subject, and their reconciliation to the restoration of order in the elements.

1. DACRYDON (δακρυδόν), a name for Scammony, given to it by Alexander of Tralles. (Vid. Scammony.)

2. DACYLI (δακύλι), the fruit of the Palm-tree. The earlier Greek writers called this by the names of φοίνιξ, φοίνικος βλάστης, and φοινικοκολλόνιον. The appellation δακυλος occurs first in the works of the medical authors, but came afterward into general use; from it the name of the fruit in question was derived by the Romans. The word is now applied to the fruit of various species of trees in the British Museum. (Fid. Phœnix.)

3. DAMASO'NIUM (δαμασωιόν), a plant, the main, according to Galen, with the άλησια of Dioscorides. Stephens calls it Plantago aquatica. Corbus, Sprengel, and Stephan accordingly acknowledge it as the Water Plantain, or Alisma plantago, f. 6.

4. DAMNI INJURIA ACTIO. The Aquilias, in the first chapter, provided that, if a man unlawfully (injuria) killed a slave or quadrapled (quae pseudum numero sili) which belonged to another, he was bound to pay to the owner the highest value that the slave or animal had possessed in the unlawful act. By the third chapter he was bound to pay the highest value that the slave or animal had had within the thirty days preceding the unlawful act. A person whose slave was killed (injuria) might either prosecute the offender capitaUly (capitales crimines), or might bring his action for damage under this. The actions of the lex Aquilias (aetiones drectae) were limited to damage done by actual contact (corpore), and only the owner of the thing damaged could sue. Afterward, an actio utilis was given in the case where the injury was done corpore but not corpore; as if a man persuaded a neighbour's slave to get up a tree, and he fell down and died, or was injured: such actio was also given. Most of the Código is based on this law.

5. DAMNUM signifies generally any injury to a person's property, and it is either damnum factum, datum, damage done, or damnum infectum, metuendum, damage apprehended. (Vid. Damnum Infectum.) Damage done to our actual property is simply called damnum; that damage which is caused by our being prevented from acquiring a certain gain is called lucrum cessans: both are sometimes comprehended under the phrase "id quod interest," though this expression is more frequently used for the compensation which a man claims beyond the bare value of the thing damaged, and sometimes it signifies the bare loss only. To make good any damage done is called damnum præstare.

The causes of damnum are either chance (causa) or the acts of human beings, which, when characterized by dolus malus or culpa, become damnum, and when done under some special sentence, it is a damnum Dei. Delay (mora) is included by some writers under the causes of damnum, but it might be appropriately considered as a form of culpa.

DAMNUM INFECTUM is damage not done, but apprehended. For instance, if a man feared that mischief might happen to his property from the dilapidated state of his neighbour's buildings, he could bring an action for the damage that was apprehended, and the court could take possession of the ruinous edifice. If a man's house fell and injured the house of a neighbour before any cautio had been given, the sufferer had no right of action, if the person whose house had tumbled down was content to relinquish all right to what had fallen on his neighbour's premises.

DANAE (δαναί), the name of a foreign coin, according to Hesychius 4 worth a little more than an obolus. According to some writers it was a Persian coin. This name was also given to the obolus which was placed in the mouth of the dead to pay the ferryman in Hades. At the opening of a grave a coin was sometimes thrown into the mouth, and it was also common to find between the teeth of the corpse.

G. DANEFTON. (Vid. Interessest of Money.)

DAPHNE (δαφνη), the Laurus of the Romans, and our Bay-tree; not the Laurel, as it is frequently rendered. "Translators," observes Martyn, "frequently confound the Laurel and the Bay, as if they were the same tree, and what the Romans called Laurus. Our Laurel was hardly known in Europe till the latter end of the sixteenth century, about which time it appears have been brought from Trebizond to Constantinople, and thence into most parts of Europe. The Laurel has no fine smell, which is a property ascribed to the Laurus by Virgil. Nor is the Laurel remarkable for cracking the fire, of which there is an abundant mention with regard to the Laurus. These characters agree very well with the Bay-tree, which seems to be most certainly the Laurus of the ancients, and is at this time frequent in the woods and hedges of Italy." The first discoverers of the Laurus gave it the name of Laurocerus, because it has a leaf something like a bay and a fruit like a cherry.

U V
IL short, as Adams remarks, the δόρυν is the Laure
nus nobis, L. The δόρυν 'Alexandria of Dios
corides is unquestionably, according to the same
authority, the Butcher's Broom, or Alexandrian
Laurel, i. e., Ruscus Hypoglossum.1

DAPHNEPHORIA (Daphnephoria), a festival cele
brated every ninth year at Thebes in honour of
Apollo, surnamed Ismenius or Galaxius. Its name
was derived from the branches of bay (δαφνων) which
were carried by those who took part in its celebra
tion. A full account of the festival is given by
Proclus.2 At one time all the Άσολιαν of Arne
and the adjacent districts, at the command of an
oracle, laid siege to Thebes, which was at the same
time besieged by Polyes, king of the neighbouring
country. But when the day came on which both parties had to celebrate a festival of Apollo, a truce was concluded, and on the day of the festival they went with bay-boughs to the
place where a temple of Apollo, and bay-boughs in their hands, were to go to his temple.
When, on the third day after this truce, both
parties again were engaged in close combat, Polema
tas gained the victory. He now fulfilled his prom
ise, and walked himself to the temple of Apollo in
the manner ascribed to the king he had seen in
his vision. And ever since that time the custom was observed. At one time all the Άσολια
of Arne and the adjacent districts, at the command of an oracle, laid siege to Thebes, which was at the same
time besieged by Polyes, king of the neighbouring
country. But when the day came on which both parties had to celebrate a festival of Apollo, a truce was concluded, and on the day of the festival they went with bay-boughs to the
temple of Apollo, and bay-boughs in their hands, were to go to his temple.
When, on the third day after this truce, both
parties again were engaged in close combat, Polema
tas gained the victory. He now fulfilled his prom
ise, and walked himself to the temple of Apollo in
the manner ascribed to the king he had seen in
his vision. And ever since that time the custom was observed.
Respecting the mode of celebration, he adds: At
the daphnephoria they adorn a piece of olive-wood
with garlands of bay and various flowers; on the
op of it a brazen globe is placed, from which small
er ones are suspended; purple garlands, smaller
than those on the top, are attached to the middle
part of the wood, and the lowest part is covered
with a crocus-coloured envelope. By the globe on
the top they indicate the sun, which is identical
with Apollo; the globe immediately below the first
represents the moon; and the smaller suspending
globes are symbols of the stars. The number of
boughs being 366, indicates the course of the year.
A beautiful procession was drawn by a youth,
whose father and mother must be living. The
youth was, according to Pausanias,3 chosen priest
of Apollo every year, and called ἄγαράς: he was always of a handsome figure and strong,
and taken from the most distinguished families of
Thebes. Immediately before this youthful priest
walked his nearest kinsman, who wore the adorned
piece of olive-wood, which was called σώλην. The
priest followed, bearing in his hand a bay-bran
ch, with dishevelled and floating hair, wearing a golden
crown on his head, a magnificent robe which reached
down to his feet (παιδοβρέον), and a kind of shoes,
called ιέράρχαια, from the general, Iphicrates,
who had first introduced them. Behind the priest
there followed a choir of maidens, with bouquets in
their hands and singing hymns. In this manner the
procession went to the Temple of Apollo Isme
nius or Galaxius. It would seem from Pausanias
that all the boys of the town wore laurel garlands
on this occasion, and that it was customary for the
sons of wealthy parents to dedicate to the god bra
zen tripods, a considerable number of which were
seen in the temple by Pausanias himself. Among
them was one which was said to have been dedica
ted by Amphitryon, at the time when Heracles was
daphnephoria. This last circumstance shows that
the daphnephoria, whatever changes may have been
subsequently introduced, was a very ancient festival

There was a great similarity between this fest
ival and a solemn rite observed by the Delphians,
who sent every ninth year a representation of the
Temple. This boy went on the sacred road,1 and returned
home as bay-bearer (δαφνηφόρος) amid the joyful
songs of choruses of maidens. This solemnity was
observed in commemoration of the purification of
Apollo at the altar in Tempe, whether he had fled
after killing the Python, and was held in the monts
of Thargelion (probably on the seventh day). It is
a very probable conjecture of Müller,4 that the Beot
can daphnephoria took its origin from an old commen
tation of the daphnephoria of Tempe, which was
on the day on which the Delphian boy broke the
purifying bay-boughs in Tempe.

The Athenians seem likewise to have celebrated
a festival of the same nature, but the only mention
we have of it is in Proclus,5 who says that the
Athenians honoured the seventh day as sacred to
Apollo; that they carried bay-boughs, and adorned
the basket (κιάμυνα, see Καρπαγοε) with garlands,
and sang hymns to the god. Respecting the astro
nomical character of the daphnephoria, see Müller,
Orchom., p. 220; and Creuzer, Symbol. und Mythol.
ii., p. 160.

DAPNIOIDES (Daphnoidés) according to Spen
gel, the Daphne Alpina; and the χωρογιαν Daph
i- corders, the Ruscus Canescens.6

DARE ACTIO/ NEM. (Vid. Actio, p. 19.)

Daphnephoria. Among the signs of Pausanias,7 was
gold, stamped on one side with the figure of an arch
arched crown and kneeling upon one knee, and on the
other with a sort of quadrata incus or deep clasp.
The origin of this coin is doubtful. We know from
Herodotus8 that Darius reformed the Persian cur
rency, and stamped gold of the purest standard;
whence it was supposed that the darcus was so called from him. Harpocrateion, however, says9 that the name was older than this Darius, and taken from an earlier king. Gesenius10 supposes
the name to be derived from an ancient Persian
word signifying king, or royal palace, or the bow
of the king, in allusion to the figure stamped upon it.

This coin had a very extensive circulation, not
only in the Persian empire, but also in Greece. The
money given by Cyrus to the soldiers of Cambyses was
a darcus a month;8 and the same pay was of
fers to the same troops by Thimbrion, a Macedo
monian general.9 In the later books of the Old Test
ament, the darcus is supposed to have been men
tioned under the names of adarkon (1237) and dark
mon (1237).10

Harpocrateion says that, according to some per
sons, the darcus was worth twenty silver drachmas;
which agrees with the statement of Xenophon12 who
informs us that 3000 drachmas were equal to ten tal
ents, which would consequently make the darcus equal
to twenty drachmes. The value of the darcus in our
money, computed from the drachma, is 162 s.; but if reckoned by comparison with the gold,
coin, it is worth much more. The darcus in the
British Museum weigh 1234 grains and 1268 grains
respectively. Hussey13 calculates the darcus as
containing on an average about 1237 grains of
pure gold, and therefore equal in value to 1912
of a sovereign, or about 1s. 1d. 167 farthings.
Very few darcus have come down to us; their

DECEMVIRI

Two actions for bribery at Athens: one, called ἐκατον γραφή, lay against the person who gave the bribe; and the other, called δώρον οτρωδοκίας γραφή, against the person who received it. These actions applied to the bribery of citizens in the public assemblies of the people (ἐκατονταρχοι τῆς ἐκκλησίας), of the Heliaea or any of the courts of justice, of the boule, and of the public advocates (συνήγοροι).

Demosthenes, indeed, says that orators were forbidden by the law not merely to abstain from receiving gifts for the injury of the state, but even to receive any present at all.

According to Aristotle, Anaximenes was the first person at Athens who bribed the judges; and we learn from Plutarch that he did so, when he was charged with having been guilty of treachery at Pylus, at the end of the Peloponnesian war. Other writers say that Meles was the first person who bribed the judges.

Actions for bribery were under the jurisdiction of the thebarchia. The punishment on conviction of the defendant was death, or payment of ten times the value of the gift received, to which the court might add an additional punishment (προστίμονα).

Thus Demosthenes was sentenced to a fine of 50 talents by an action for bribery, and also thrown into prison.

DECATONAI (δεκατόναι). (Vid. DECEMVIR).

DECEMBER. (Vid. Calendar. Roman).

DECEMPEDA, a pole ten feet long, used by the orators in the assembly of the people in the Aeginetan land. Thus we find that the orators sometimes called decempeda (L. Antonius, quae fuerat aquaeulis agris privatix et publici deccempeda (14)).

DECEMVIRI, the name of various magistrates and functionaries at Rome.

1. DECEMVIRI: London Screenends were ten persons who were appointed to draw up a code of laws, and to whom the whole government of the state was intrusted. As early as B.C. 460, a law was proposed by Caius Terentulus Harsa, that commissioners should be appointed for drawing up a body of laws; but this was violently opposed by the patricians; and the project fell through for a number of years, till the patricians consented to send three persons to Greece, to collect such information respecting the laws and constitutions of the Greek states as might be useful to the Romans. They were absent a year; and on their return, after considerable dispute between the patricians and plebeians, ten commissioners of the patrician order were appointed with the title of "decmviri legibus scribendi," to whom the revision of the laws was committed. All the other magistracies were suspended, and they were intrusted with supreme power in the state. Niebuhr, however, supposes that the tribuneship was not given up till the second decemvirate; but Dionysius expressly says that it was superseded in the first.

The decemvirs entered upon their office at the beginning of the year 449 B.C. They consisted of Appius Claudius and Titus Genciius, the new con

DECEMVIRI.

sists, of the wards of the city, and of the two quas-
tors parriediti, as Niebuhr conjectures, and of five
others chosen by the centuries. They discharged
the duties of their office with diligence, and dispo-
sed justice with impartiality. Each administered
the government day by day in succession, as dur-
ing an interregnum; and the fasces were only carried
before the one who presided for the day.1 They drew
up a body of laws, distributed into ten sections, which,
after being approved by the senate and the comitia,
were engraved on tablets of metal, and set up in the comitia.

On the expiration of their year of office, all par-
ties were so well satisfied with the manner in which
they had discharged their duties, that it was resolv-
ed to continue the same form of government for an-
other year; more especially as some of the decem-
virsi said that their work was not finished. Ten
new decemvirs were accordingly elected, of whom
Appius Claudius alone had belonged to the former
body;2 and of his nine new colleagues Niebuhr
thinks that five were plebeians. These magistrates
framed several new laws, which were approved of
by the centuries, and engraved on two additional tab-
les. They acted, however, in a most tyrannical
manner. Each was attended by twelve lictors, who
Carried, not the rods only, but the axe, the
emblem of sovereignty. They made common cause
with the patrician party, and all kinds of outrages
upon the persons and property of the plebeians;
and when the year's term was over, they refused to
resign or to appoint successors. Niebuhr, however, considers it certain
that they were appointed for a longer period than a
year, since otherwise they would not have been
required to resign their office, but interregues
would at the expiration of the year have stepped into their
place. This, however, does not seem conclusive, though
the existence of the decemvirs is acknowledged in the
whole of the public and private punishments of
the period. After the year's term expired, they refused to
resign or to appoint successors. Niebuhr, however, considers it certain
that they were appointed for a longer period than a
year, since otherwise they would not have been
required to resign their office, but interregues
would at the expiration of the year have stepped into their
place. This, however, does not seem conclusive, though
the existence of the decemvirs is acknowledged in the
whole of the public and private punishments of
the period. After the year's term expired, they refused to
resign or to appoint successors.

The decemvirs, in consequence, were obliged to resign their office, B.C. 445, and the usual magistracies were re-established.3

The ten tables of the former, and the two tables of the latter decemvirs, together form the laws of the Twelve Tables, of which an account is given in a separate article. (Vid. Twelve Tables.)

11. DECEMVIRI LIVIUS JUDICANDIUS. (Vid. Præ-
ator.)

11. DECEMVIRI SACRIS FLACUNDIS, sometimes
called simply DECEMVIRI SACRORUM, were the
members of an ecclesiastical collegium, and were elected for
life. Their chief duty was to take care of the Sibylline books, and to inspect them on all important
occasions by command of the senate.4 Virgil5 alludes to them in his address to the Sibyl: "Lectos
sacrae virum." Under the kings the care of the Sibylline books was committed to two men (duumvirii) of high rank,6 one of whom, called Atius or Tullius, was punished
by Tarquinii for being unfaithful to his trust, by being sewed up in a sack and cast into the sea.7
On the expulsion of the kings, the care of these books was intrusted to the nobest of the patricians,
who were exempted from all military and civil duties.

Their number was increased about the year 395 B.C. to ten, of whom five were chosen from
the patricians and five from the plebeians.8 Subse-
quently their number was still further increased to
fifteen (quindecemviri), but at what time is uncertain.
As, however, we learn from Suet. Aug. 33, that Crassus, B.C. 82, when the Capitol was burned,9 and we read
of decemviri in the time of Cicero,10 it appears proba-
tile that their number was increased from ten to
fifteen by Sulla, especially as we know that he in-
creased the numbers of several of the other eccle-
siastical corporations. Julius Caesar added one more
to their number,1 but this precedent was not fol-
lowed, as the collegium always appears to have consti-
tuted a body of ten only devoted to religious
or to civil matters.

It was also the duty of the decemviri and quin-
queviri to celebrate the games of Apollo12 and the
secular games. They were, in fact, considered
priests of Apollo, whence each of them had in
his house a bronze tripod dedicated to that deity.

DECIMA-TIO was the selection, by lot, of every
tenth man for punishment, when any number of
soldiers in the Roman army had been guilty of any
crime. The remainder usually had barley allowed
to them instead of wheat.13 This punishment does not appear to have been often inflicted in the early
times of the Republic, but is frequently mentioned
in the civil wars and under the Empire. It is said
to have been revived by Crassus, after being dis-
continued for a long time (Πάραυο τοῦ τοῦτο δα αὐτών
χρόνων κλώσεως τοὺς στρατιωτάτοις επιμένων). For the manner of this punishment, see Liv., ii. 33;
Suet. Aug. 24; Catull. 12. — Tacit., Hist., i. 37.— Dio,
xii., 35; xlix., 27, 38.

Sometimes only the twentieth man was punished
(vicessimo), or the hundredth (centesimo)14

DECRETUM seems to mean that which is de-
termined in a particular case after examination or
consideration. It is sometimes applied to a deter-
mation of the consuls, and sometimes to a deter-
mation of the senate.15 A decreum of the senate
would seem to differ from a senator's consultation
in the way above indicated: it was limited to the
special occasion and circumstances, and this would be true whether the decreum was of a judicial or a
legislative character. But this distinction in the
use of the two words, as applied to an act of the
senate, was, perhaps, not always observed. Oebel
states that a decreum is used when there is in this
passage apparently the same analogy
as between a consultation and decreum of the
Senate. A decreum, as one of the parts or kinds
of constituent, was a judicial decision in a case be-
fore the sovereign. (Vid. Consultatio.) Gains,1 when he is speaking of interdicta, says that they
are properly called decreta, "eum prætor aut pro-
consuli fieri aliquot jubet," and interdicta when he
forbids. A index is said to be "condemnare," not "de-
cernere," a word which in judicial proceedings is
appropriate to a magistratus who has jurisdiction.

DEMUME (sc. partes) formed a portion of the
vestigia of the Romans, and were paid by subjects
whose territory, either by conquest or descent, had
become the property of the state (ager publicum).
They consisted, as the name denotes, of a tithe of
the produce of the soil, levied upon the cultivators (cultivatores) of the lands, which, from being subject to this pay-
ment, were called agri decuman. The tax of a
tenth was, however, generally paid by corn lands:
plantations and vineyards, as requiring no seed and less labor, paid a fifth of the produce.16

We also find the expression "decumates agri"

1. (Liv., vi. 33—25) — 2. (Liv., viii. 35.) — Dioni,
applied to districts in Germany which were occupied by Roman soldiers or auxiliaries, after the expiration of the old proprietors, subject to the payment of a tenth part of the produce. It is probable that there were many such; and if so, it is useless to inquire where the lands so called were situated. ¹

¹ Tacitus merely says that they lay beyond the Rhine and the Danube. The name of decuman-i was also applied to the farmers of these tribunes, who were also called decuriones, ² to whom the purchase-money was dedicated, and collected them on their own account. (Vid. Publ. I. 1.)

The system of exacting a tenth of the produce from the occupiers of land which had become the property of the state, seems to have been of great antiquity: thus a tradition is preserved of the Romans themselves having at one time paid a tenth to the Etruscans, a story which Niebuhr ³ refers to as being not improbable. It was the custom for the persons in the class of decuriones, or something similar, to raise the money, which was afterwards paid to the state. The practice is best illustrated by the case of Sicily.

It appears from Cicero ⁴ that the Romans, on reducing this island to a province, allowed to the old inhabitants the continuance of their ancient rights (ut codem juris esseconst, quo fauseant), and that, with some few exceptions, the territory of all the states (omnis terrae urbis) possessed the right of requisition or compulsory payment of a tithe on corn, wine, oil, and the "fruges minute," it was further determined that the place and time of paying these tithes to the decurioni should be "be and continue" as settled by the law of King Hero (ex heroico), which enacted severe penalties against any arator who did not pay the tithe for "his" land. But this was sometimes carried beyond the tenth to pay more than their tenth. It is interesting to remark, that the coloni, who afterward occupied the lands of the Romish Church in Sicily, and were farmed out along with the smaller plots of land to the "conducatores" or Jesuits of the Church, paid for a fixed portion of the produce, which was sometimes delivered in kind, sometimes bought off with money. A letter of Gregory VII. shows that these coloni suffered the same sort of grievances as the aratores under the prætor Verres. ⁶

7. The form of this kind was not, however, peculiar to the foreign provinces of Rome: they were also levied on public lands in Italy; as, for instance, on the ager Campanus, which we read of as being tithed. In this case the land was divided into a number of small parcels, called tomos, for each Roman citizen by a lex agraria of Julius Cæsar. (Vid. Agrariae Leges.)

8. A similar system existed in Greece also; the tenth being paid as a usufruct on property which was not freehold, though the right of occupation might be acquired by inheritance or purchase: thus in the case of spes (sometimes deditio) the right as proprietor of the lands they occupied: Peisistratus, for instance, imposed a tax of a tenth on the lands of the Athenians, which the Peisistratide lowered to a twentieth. ⁷ We use the word "usufruct," in the previous sentence, in its common acceptance; but the "usu fructus" of Roman law was sometimes applied to the usufruct of a property which the state derived from the land which was termed "fructus," and the occupation for which it was paid, "usu." ⁸ The same principle was also applied to religious purposes: thus Xenophanes subjected the occupiers (tois ἔχοντας καὶ καταχρησίμους) of the land he purchased near Scillus to a payment of tithes in support of a temple of Artemis, the goddess of agriculture, who (probably boys to whom the purchase-money was dedicated) the Delian Apollo also received tithes from the Cyclades. ⁹ That many such charges originated in

DEIPNOS.

DEIPNOS.

dull from the words of Sosibius, we must conclude that the action represented was only alternating with comic dances, or accompanied by them. Athenæus gives a list of names by which these mimic actors, who were extremely popular among the ancients generally, were designated in various parts of Greece. It is highly probable that the representations of the Ætilestai were peculiar to some religious festival, and it has been supposed that they were connected with the celebration of the Dionysia at Sparta.

DEIGMA (δείγμα), a particular place in the Peiriæus, as well as in the harbours of other states, where merchants exposed samples of their goods for sale. The samples themselves were called δειγματα.

DEJECTUM EFFUSUM. (Vid. DEJECTI EFFUSIVE ACTIO.)

DEJECTI EFFUSIVE ACTIO. This was an action given by the praetor's edict against a person who threw or poured out anything from a place or upper chamber (cænaculum) upon a road which is frequented by passengers, or on a place where people use to stand. The action was against the occupier, not the owner. If several persons inhabited a cænaculum, and any injury was done to another by a thing being thrown or poured out of it, he had a right of action against any of them, if the deed was uncertain. The damages recoverable were to double the amount of the damage, except in the case of a libation, when they were fifty aurei if he was killed; if he was only injured in his person, they were quantum ob eam rem acquam judici videbitur eum cum quo agatur condemnari, which included the expenses of a medical attendant, loss of time, &c., but no damage done to his apparel, &c. If injury was caused by a thing being thrown from a ship, there was an actio; for the words of the edict are, “unque in eum locum quo volgo iter flat vel in quo consistatur, dejectum,” &c.

As many of the houses in Rome were lofty, and inhabited to the top by the poor, and probably as there were very imperfect means for carrying off rubbish and other accumulations, it was necessary to provide against accidents which might happen by such things being thrown through the window. According to Labeo's opinion, the edict only applied to the daytime, and not to the night, which, however, was the more dangerous time for a passer-by.

DEILE (δείλη). (Vid. Dis.)

DEILIAS TARPHI (δείλια γραφή), the name of a son of Eumolpus instituted first soldiers who had been guilty of cowardice. The presidency of the court belonged to the strategi, and the court was composed of soldiers who had served in the campaign. The punishment, on conviction, appears to have been útima. Compare ΑΣΤΡΑΤΕΙΑΣ TARPHI.

DEIPNON (δείπνων). The present article is designed to give a sketch of Grecian meals, and customs connected with them. The materials for such an account, during the middle or classical period of Athens and Sparta, are almost confined to incidental allusions of Plato and the comic writers. Several ancient authors, termed δείπνοιοι, are mentioned by Athenæus; but, unfortunately, their writings only survive in the fragments quoted by him. His great work, the Deipnomachus, is an inestimable treasure of this kind of knowledge, but ill arranged, and with little attempt to distinguish the customs of different periods.

The poems of Homer contain a real picture of early manners, in every way worthy of the antiquarian's attention. As they stand apart from all other writings, it will be convenient to exhibit in one view the state of things which they describe. It is not to be expected that the Homeric meals at all agree with the customs of a later period; indeed, it would be a mere waste of time to attempt adapting the poet to the other. Athenæus, however, has entered fully into the subject, remarks on the singular simplicity of the Homeric banquets, in which kings and private men all partake of the same food. It was common even for royal personages to prepare their own meals; and Ulysses declares himself no mean proficient in the culinary art:

Πυρ τε εν νησα, δια δε ξύλα βανδ κεκλων
Διατρεφοσ τε και οντησα και οικοφυσα.

Three names of meals occur in the Iliad and Odyssey: Æstus, Æstus, Æstus. This division of the meals is ascribed, in a fragment of Æschylus quoted by Pollux, to an ancient Æstus. The Æstus was possessed by the host, and the Æstus and Æstus with a modern Æstus, Æstus, Æstus, and Æstus, &c., were given to the guests. The word Æstus uniformly means the early (μικρος), as Æstus does the late meal; but Æstus, on the other hand, is used for either, apparently without any reference to time. We should be careful, however, how we argue from the unsettled habits of the table to the regular customs of ordinary life.

For the duration of the passages in Homer, Ajax, and Odysseus, it appears to have been usual to sit during meal-times. In the palace of Telemachus, before eating, a servant brings Minerva, who is habited as a stranger, the κέρων, or lustral water, "in a golden pitcher, pouring it over a silver vessel." Beef, mutton, and goat's flesh were the ordinary meals, usually eaten roasted; yet from the lines:

'Ως δε λέχθη ἐξ ἐννοι, ἐπεγεγυμνος πυρ πολύ
Κυνος μελόδυνος ἀποκτητέος σίλων,

we learn that boiled meats were held to be far from unsavoury. Cheese, flour, and occasionally fruits, and also for the part of the Homeric meals, bread, brought on in baskets, &c, and salt (λίον, to which Æmon gives the epithet θείος, are mentioned: from Ὀδ., xxv., 455, the latter appears, even at this early period, to have been a sign of hospitality; in Ὀδ., xii., 123, it is the mark of a strange people not to know its use.

Each guest appears to have had his own table, and he who was first in rank presided over the rest. Menelaus, at the marriage feast of Hermione, begins the banquet by taking in his hands the side of a roasted ox, and placing it before his friends. At the same entertainment music and dancing are introduced: "The divine minstrel hymned to the sound of the lyre, and two tumblers (καλυψτριτε) began the festive strain, wheeling round in the midst, and was not beneath the notions of those early days to stimulate the heroes to battle.

Έσχορ τε, κρατείτο τε, ἐς πλείον δεμάκατον:

and Ajax, on his return from the contest with Hector, is presented by Agamemnon with the νόστο

The names of several articles of the festive board occur in the Iliad and Odyssey. Knives, spoons, cups of various shapes and sizes, bottles made of goat-skin, casks, &c, are all mentioned. Many sorts of wine were in use among the heroes; some of Nestor's is remarked on as being eleven years old. The
The principal meal, however, was the deipnon, which ought, therefore, according to our notions, to be translated, like the Latin cena, by our word "dinner." It was usually taken rather late in the day, frequently not before sunset. Aristotle 3 says, "Horti aliquot adolescentes coimes in Pirro, In honorem diem ut de symbolis essences. Charcan et tri Praefecessum: dati annulis: locus, tempus constitutum est." This kind of entertainment, in which each guest contributed to the expense, is mentioned in Homer 4 under the name of ἐραφος. An entertainment in which each person brought his own provisions with him, or, at least, contributed something to the general stock, was called a δείπνον ἀνὰ σπορώδος, because the provisions were brought in baskets. 5 This kind of entertainment is also spoken of by Xenophon. 6 The most usual kind of entertainments, however, were those in which a person invited his friends to his own house. It was expected that they should come dressed with more than ordinary care, and also have bathed shortly before; hence, when Socrates was going to an entertainment at Agathon's we are told that he both washed and put on his shoes—things which he seldom did. 7 As soon as the guests arrived at the house of their host, their shoes or sandals were taken off by the slaves, and their feet washed (ὑπολακήνος καὶ ἀπόκυτος). In an ancient works of art we frequently see a slave or other person represented in the act of taking off the shoes, which an example is given, from a terra-cotta in the British Museum, in p. 276. 8

2. Aristophanes says, "Εἰ τοι ἁβάσετε, ἐκ τῶν δεικτών λιπαρών ἄρα περιβολήν." The Greek text is followed in this translation.

3. The principal meal, however, was the deipnon, which ought, therefore, according to our notions, to be translated, like the Latin cena, by our word "dinner." It was usually taken rather late in the day, frequently not before sunset. Aristotle says, "Εἰ τοι ἁβάσετε, ἐκ τῶν δεικτών λιπαρών ἄρα περιβολήν." The Greek text is followed in this translation.

4. This kind of entertainment, in which each guest contributed to the expense, is mentioned in Homer under the name of ἐραφος. An entertainment in which each person brought his own provisions with him, or, at least, contributed something to the general stock, was called a δείπνον ἀνὰ σπορώδος, because the provisions were brought in baskets. This kind of entertainment is also spoken of by Xenophon. The most usual kind of entertainments, however, were those in which a person invited his friends to his own house. It was expected that they should come dressed with more than ordinary care, and also have bathed shortly before; hence, when Socrates was going to an entertainment at Agathon's we are told that he both washed and put on his shoes—things which he seldom did. As soon as the guests arrived at the house of their host, their shoes or sandals were taken off by the slaves, and their feet washed (ὑπολακήνος καὶ ἀπόκυτος). In an ancient works of art we frequently see a slave or other person represented in the act of taking off the shoes, which an example is given, from a terra-cotta in the British Museum, in p. 276.
After their feet had been washed, the guests reclined on the κλίνα or couches. But Homer does not discuss persons reclining, but always as sitting at their meals; but at what time the change was introduced is uncertain. Müller concludes from a fragment of Alcman, quoted by Athenaeus, that the Spartans were accustomed to recline at their meals as early as the time of Alcman. The Dories of Crete always eat; but the Athenians, like the Spartans, were accustomed to recline. The Greek women and children, however, like the Romans (vid. Cic., p. 276), continued to sit at their meals, as we find them represented in ancient works of art.

It was usual for only two persons to recline on each couch. Thus Agathon says to Aristodemus, Ἔκ δ᾽ Ἀριστοδέμου, παρ᾽ Ἐρυθώνιον κατακλίνον: and to Socrates, Δέσποινα, Σώφρατε, παρ᾽ ἐμὲ κατεύθυνε. Also, at a banquet given by Attaginus of Thbes to fifty Persians and fifty Greeks, we are told that one Persian and one Greek reclined on each couch. In ancient works of art we usually see the guests represented in this way; but sometimes there is a larger number on one long κλίνα, as in the woodcut in page 326. The manner in which they reclined, the σκήχα τῆς κατακλίσεως, as Pliolot calls it, will be understood by referring to the woodcut already mentioned, where the guests are represented reclining with their left arms on stripped pillows (φισάρια), and having their right free; whence Lucian speaks of ἐπ᾽ ἄγκονος δεσποτινου. After the guests had placed themselves on the κλίνα, the slaves brought in water to wash their hands (θηρο κατὰ χερών εἴδοθ). The subsequent proceedings of the dinner are briefly described in two lines of Aristophanes:

Τῇρο κατὰ χερῶν· τοῦς τραπέτας εἰσφέρειν·
Δειπνοῦντες ὀποινίωνες· ἡς σπέσινες.

The dinner was then served up; whence we read, in Aristophanes and elsewhere, of τοὺς τραπέτας εἰσφέρειν, by which expression we are to understand, not merely the dishes, but the tables themselves. It appears that a table, with provisions upon it, was placed before each κλίνα: and thus we find, in all ancient works of art which represent banquets or symposia, a small table or tripod placed before the κλίνα, and when there are more than two persons on the κλίνα, several of such tables. (See woodcut in p. 296, 326.) These tables are evidently small enough to be moved on a single wheel.

In eating, the Greeks had no knives or forks, but made use of their fingers only, except in eating soups or other liquids, which they partook of by means of a spoon, called μοστήλη, μόστρον, or μύστρον. Sometimes they used, instead of a spoon, a hollowed piece of bread, also called μοστήλη. After eating, they wiped their fingers on pieces of bread. Sometimes, also, they did not even put on any clothes or napkins; the χειριστήρια και ίικαγεία, which are sometimes mentioned, were towels, which were only used when they washed their hands.

It appears that the arrangement of the dinner was intrusted to certain slaves. The one who had the chief management of it was called τραπεζούκας or τραπεζούτης. It went beyond the limits of this work to give an account of the different dishes which were introduced at a Greek dinner, though their number is far below those which were usually partaken of at a Roman entertainment. The most common food among the Greeks was the μάζα (Dor. μάζον), a kind of frumenty or soft cake, which was prepared in different ways, as appears by the various names which were given to it. The μάζα is frequently mentioned by Aristophanes. It appears to have been a favorite dish among the Persians, as is said by the scholiast that he has been made of barley and wine. The μάζα continued to the latest times to be the common food of the lower classes. Wheaten or barley bread was the second most usual species of food; it was sometimes made at home, but more usually bought at the market of the ιργονουλαι or ιργονουλοπίνα. The vegetables ordinarily eaten were κρότωμα (μονήκτες), leeks (θηρίκες), cabbages (δάφης), beets (αβόκα), lentils (οικαλ), &c. Pork was the most favourite animal food, as was the case among the Romans (vid. Cic., p. 275); Plutarch calls it τὸ δικαίωτατον κρέας. Sausages, also, were very commonly eaten (vid. Horat. Odeans). It is a curious fact, which Plato has remarked, that we never read in Homer of the heroes partaking of fish. In later times, however, fish, which was much a favorite food among the Greeks, is so much, in some measure, as to that name of δήμος was applied to it κατ᾽ εξέσεις. A minute account of the dishes which the Greeks were accustomed to eat is given at the end of the seventh book of Athenaeus, arranged in alphabetical order.

The ordinary meal for the family was cooked by the mistress of the house, or by the female slaves under her direction; but for special occasions, professional cooks (μυστῆρες) were hired, of whom there appear to have been a great number. They are frequently mentioned in the fragments of the comic poets; and those who were acquainted with all the refinements of their art were in great demand in other parts of Greece besides their own country. The Sicilian cooks, however, had the greatest reputation, and a Sicilian book on cookery by one Menan was mentioned in the Gorgias of Plato; and the most celebrated work of the subject was the Ἁρπαολογία of Archestratus.

A dinner given by an opulent Athenian usually consisted of two courses, called respectively πρῶτα τραπέζαι καὶ δεύτερα τραπέζαι. Polioth, indeed, speaks of three courses, which was the number at a Roman dinner (vid. Cic., p. 275); and in the Greek houses, where the slaves were under the management of the Empire speaking of three courses at Greek dinners; but before the Roman conquest of Greece, and the introduction of Roman customs, we only read of two courses. The first course embraced the whole of what we consider the dinner, namely, fish, poultry, meat, &c.; the second, which corresponds to our dessert and the Roman belétia, consisted of different kinds of sweetmeats and confections.

When the first course was finished, the tables were taken away (αἰρεῖν, ἀπολαεῖν, ἐκφαίνει, ἐκφέρει, βοσταίνει, τραπέζας), and water was given to the guests for the purpose of washing their hands. Crowns made of garlands of flowers were also then given to them, as well as various kinds of perfumes. Wine was not drunk till the first course was finished; but, as soon as the guests had eaten one of the main courses introduced in a large goblet, called μεταντέρον or μεταντείρο, of which each drank a little, after pouring...
out a small quantity as a libation. This libation was said to be made to the "good spirit" (φαῦλος βασιλεύς), and was usually accompanied with the singing of the paeon and the playing of flutes. After this libation, mixed wine was brought in, and with their first cup the guests drank to Δίος Σωτήρος. With the σωκονία, the δείτων closed; and at the introduction of the dessert (δειττηρία τραπέζα) the πότος, συνώνοια, or κόμως commenced, of which an account is given in the Delian State.

DELA'TOR, an informer. The delatores, under the emperors, were a class of men who gained their livelihood by informing against their fellow-citizens. They constantly brought forward false charges to gratify the avance or jealousy of the different emperors, and were, consequently, paid according to the importance of the information which they gave. In some cases, however, the law specified the sum which were to be given to informers. Thus, when a murder had been committed in a family, and any of the slaves belonging to it had run away before the questio, whoever apprehended such slaves received, for each slave whom he apprehended, a reward of five aurei from the property of the deceased; and if the slaves were unmarked they might be raised from the property of the deceased. In the senate consultum quoted from Frontinus, the informer received half of the penalty in which the person was fined who transgressed the decree of the senate. There seems also to have been a fixed sum given to informers by the lex Papia, since we are told that in Egypt, in a four days, the slaves which were to be given to informers.

The number of informers, however, increased so rapidly under the early emperors, and occasioned so much mischief in society, that many of them were banished, and punished in other ways, by Titus, Domitian, and Trajan.

DELICTUM. (Vit. Crimen.)

DELPH'NIA (δέλφνια), a festival of the same expiatory character as the Apollonia, which was celebrated in various towns of Greece, in honour of Apollo, surnamed Delphinus, who was considered the son of Athena. It was held on the 24th of the month of Thargelion. The Delphinius, as appears from the Hymn on Apollo, had existed from very early times, and were celebrated every fifth year, and, as Böckh supposes, with great probability, on the sixth and seventh days of Thargelion, the birthdays of Apollo and Artemis. The members of the amphitycty assembled on these occasions (θεσπιστα) in Delos, in large garments, with their wives and children, to worship the god with the musical and dramatic contests, choruses, and dances. That the Athenians took part in these solemnities at a very early period, is evident from the Delastria (afterward called θεσπιστα) mentioned in the laws of Solon; 2 the sacred vessel (θυσία) of the same name, which they placed in the temple of Apollo, was, however, removed the year after its establishment. Thus the Delphinius was said to be the same which Theseus had sent after his return from Crete. The Delains, during the celebration of these solemnities, performed the office of cooks for those who visited their island, whence they were called Ελεσθρα. In the course of the year, the celebration of this an-

DEMARCHII.  

DEMOCRATIA.  

was made in the shape of a dolphin. Barbs of iron used for balloon are at the present day called "pigs," though they bear no resemblance to that animal. The dolphins were hoisted aloft only when going to sea. When the Greeks wished to denote that they were fitted, not so much to the swift (ταχεία) triremes, as to the military transports (ποταμιγδαλοί, ὀπλαίτυγγοι), for the sailing of the former would be much impeded by so large a weight of metal. At any rate, those that Thucydides spoke of were not on the triremes, but on the ὀλυκίας.

DEPHILIS, DELPHIN, or DELPHYNUS, the Dolphin, or Delphinus Delphis, L. 1 This animal, " says Cuvier, speaking of the D. Delphis, "found in numerous troops in every sea, and celebrated for the velocity of its movements, which sometimes cause it to precipitate itself on the helms of vessels, appears to have been really the Dolphin of the ancients. The entire organization of the brain indicates that degree of docility which they universally attributed to this animal. 2 The internal organisation of the ear also renders this animal susceptible of great attention; with which property and particular sound, and enables the Dolphin to distinguish, at a considerable distance, the cries of joy or alarm of its congeners. " Some authors," observes Grif- fith, "more especially the ancients, have not only celebrated the mutual friendship subsisting among the Dolphins themselves, but have also asserted that they have a lively and natural affection towards the human kind, that whenever they are easily led to familiarize; and they have recounted many marvellous stories on this subject. All that is known on this point with certainty is, that when these animals perceive a ship at sea, they rush in a crowd before it, surround it, and express their confidences by rapid, varied, and repeated evolutions; sometimes bounding, leaping, and manoeuvring in all manner of ways, sometimes performing complicated circumvolutions, and exhibiting a degree of grace, agility, dexterity, and strength which is perfectly astonishing. We must not, however, be deceived by such external show of affection. These animals, represented as susceptible of so much attachment to men, are thoroughly carnivorous, and if they follow the track of vessels, it is, perhaps, with no other view but that of getting some fish, or any thing that may fall from them." The Grampus (a fish in nature nearly allied to the Dolphin) would seem to be the ὄρχα of Phily. "It is not noticed," observes Adams, "by the Greek authors, unless, as some have supposed, it be the δρυς of Strabo." 3

DEPHILTUM (δελφίτωμ), a plant. Sprengel recognizes the two species described by Dioscorides as being the Delphinium, or common Larkspur, and the D. tenuissimum of Sibthorp. From the circumstance of the Delphinium not being noticed in the Materia Medica of Galen, Orib- sais, or Paul of Ἑγίναι, Mattheus is disposed to regard as spurious the two chapters of Dioscorides 4 in which mention is made of it. "Among the syn- onymes of the Delphinium in Dioscorides," we find, remarks Adams, in continuation, "διόκινος and βοτόκειον μύγος of the Romans. It has, therefore, been supposed that the 'vaccinio nigra' of Virgil were Larkspurs." 5

DELIBRUM. (Vid. Tempur.)

DEMARCHI. These officers were the head boroughs or chief magistrates of the demi in Attica, and are said to have been first appointed by Cleis- themes. Their duties were various and important. Thus, they convened meetings of the demes, and took the votes upon all questions under considera- tion; they had the custody of the λατρευτικών μνη- mατα, or book in which the members of the demes had to register, and they maintained a regist- ter of the landed estates (χαλκία) in their district, whether belonging to individuals or the body cor- porate; so that, whenever e. εἰσορμητή, or extraor- dinary property-tax was imposed, they must have been of great service in assessing and collecting the quota of each estate. 6 Money's due to the demos for rent, &c., were collected by them, 7 and it may safely be allowed that they were employed to en- force payment of various debts and dues claimed by the demos. 8 For this purpose they seem to have had the power of restraining, to which al- lusion is made by Aristophanes. 9 In the duties which, however, were not confined to duties of this class, for they also acted as police magistrates: thus, in conjunction with the decaists of the towns (δεκαητες καθαροί), they assisted in preserving peace and order, and were required to bury, or cause to be buried, any dead bodies found in their district: for neglect of this duty they were liable to a fine of 1000 drachmas. 10 Lastly, they seem to have furnished to the proper authorities a list of the members of the towns who were fit to serve in war (κατ' αὐτοὺς ἐνορματη). (Vid. Demus.)

DEMON. (Vid. Curator.)

DEMNEMUS was an allowance of corn, which was given to Roman slaves monthly or daily 9 Do- natus 10 says that every slave received four modii of corn a month; but Seneca 11 speaks of five modii as the allowance. 12

DEMENTIA. (Vid. Curator, p. 329.)

DEMETRIA (δημητρία), an annual festival which the Athenians, in 307 B.C., instituted in hon- our of Demetria Poliorcetes, who, together with her father Antigonus, were consecrated under the title of saviour gods. It was celebrated every year in the month of Munychion, the name of which, as well as that of the day on which the festival was held, was changed into Demetria and Demetria. A priest ministered at their altars, and conducted the solemn procession, and the sacrifices and games. This festival, however, as well as the rest of the Dionysia, was suspended in the time of Demetrius Poliorcetes, but, when, under the reign of Alexander the Great, 13 we find the new god still more, the Athenians at the same time changed the name of the festival of the Dionysia into that of Demetria, as the young prince was fond of hearing himself compared to Dionysus. The Demetria mentioned by Athenaeus 14 are probably the Dionysia. Respecting the other extravagant flatteries which the Athenians heaped upon Demetria and Antigonus, see Athen., vi., p. 252; Herrn., Pol., Ant. of Greece, § 175, b. 6, 7, and 8; and Thirwall, Hist. of Greece, vii., p. 331.

DEMINUTIO CAPITIS. (Vid. Capit.)

DEMOPRATA (δημοπράτα, sc. σφαγία, οι κτήματα) was property confiscated at Athens and sold by public auction. The confiscation of property was one of the most common sources of revenue in many of the Greek states; and Aristoph- anes mentions the δημοπρατα as a separate branch of the public revenue at Athens. An account of such property was presented to the people in the first assembly of every pyrtagia, 15 and lists of it were posted upon tablets of stone in different pla-

to connect it with the Dorian δᾶρε for Χᾶ. In this
meaning of a country district, inhabited and under
a city government, δῆμος is not restricted to
Dorian states; but, perhaps, on no authority except the
form δῆμουγοι. Müller observes, on the contrary, that "they
were not uncommon in the Peloponnesus, but they do not
occur often in the Dorian states." They existed
among the Eleians and Mantinians, with whom
they seem to have been the chief executive magis-
tracy. Their ruler was called δῆμος, or δῆμος
archon, and the term denoting the subject pen-
untry (δῆμος φιλοδήμος), the other, the nobles at
the chief towns.

We now proceed to treat of the demi or country
parishes of Attica. The word δῆμος, in the sense
which we have here expressed by "parish," is
by some rendered "borough," by others, "township.
Of these terms, the former is certainly not appro-
priate to our subject, since we did not denote the chief
parish (δῆμος φιλοδήμος); the latter, the nobles at
the towns.

independent corporations, and had each their several magistrates, landed and other property, with a common treasury. They had, likewise, their respective convocations or "parish meetings," convened by the demarchs, in which was transacted the public business of the demus, such as the leasing of its estates, the elections of officers, the revision of the registers or lists of δημάτα, and the admission of new members. Moreover, each demus kept its own list of δημάτων, or those who held property in the public temples and religious worship (δημοτικά κέρατα), the officiating priests in which were chosen by the δημάτα; 5 so that, both in a civil and religious point of view, the demus appear as minor communities, whose magistrates, moreover, were obliged to submit to a δονοματία, in the same way as the public officers of the whole state. But, besides the magistrates, there were also demarchs (demoiarchs) and treasurers (ρασίους), elected by each demus, we also find that these were called δίκαια κατὰ δήμους: the number of these officers, originally thirty, was afterward increased to forty, and it appears that they made circuits through the different districts, to administer justice in all cases where the matter in dispute was not more than ten drachmae in value, more important questions being reserved for the δικαστήριον. 

We will now treat of the δημάτων, or members of each demus, their privileges, and relations to the body corporate, of which they formed a constituent part. We are told by Aristotle that, on the first institution of the demus, Cleisthenes increased the strength of the δήμος or community by making many new citizens, among whom are said to have been included not only strangers and resident foreigners, but also slaves. His words are, Πολιτὰς ἐφελέσατο ἑνίων καὶ (δοῦλοις) μετωκίους. We strongly suspect, however, that this δοῦλοι is an interpolation. The admission of slaves would, we conceive, have been very unpopular. Now an admission into a demus was necessary, before any individual could enter upon his full rights and privileges as an Attic citizen; and this, in the first instance, every one was enrolled in the registers of the demus in which his property and residence lay; this relation did not continue to hold with all the δημάτα; for, since a son was registered in the demus of his real or adoptive father, and the former might change his residence, it would often happen that the members of a demus did not all reside in it. Still this would not cause any inconvenience, since the meetings of each parish were not held within its limits, but at Athens. 6 No one, however, could purchase property situated within a parish to which he did not himself belong, without paying to the demarchs a fee for the privilege of doing so (εγκατεστών), which would, of course, go to the treasury of the parish. 7

Two of the most important functions of the general assembly of the demai were the admission of new members and the revision of the registers. The register of enrolment was called λεγεισαρίων γραμματεία, because any person whose name was inscribed in it could enter upon an inheritance and enjoy a patrimony, the expression for which in Attic Greek was τῆς

DENARIUS.

DEPOSITUM.

of grains, and those under the Empire at 52 2/3 grains. It we deduct, as the average, 1/3 of the weight for alloy from the denarius of the Commonwealth, there will remain 58 grams of pure silver; and since the shining contains 80 7/10 grams of pure silver, the value of the best denarius will be 58 ± 8 0/7 of a shilling, or 8.6245 pence; which may be reckoned in round numbers 8½ d. If the same method of reckoning be applied to the later denarius, its value will be 8 2/3 d. (Meaning 8 2/3 d. of a shilling, or 8 60/7 d.)

The Roman coins of silver went at one time as low down as the fortieth part of the denarius, the teruncius. They were, the quinarius, or half denarius; the sestertius, or quarter denarius (vid. Sestertii); the libella, or tenth of the denarius (equal to the as); the semibolla, or half libella; and the teruncius, or quarter libella.

The quinarius was also called victoriatris, from the impression of a figure of Victory which it bore. Pliny says that victoriatris were first coined at Rome in pursuance of the lex Ciodia, and that previous to that time they were imported as an article of trade from Ilyria. The Ciodius who proposed this law is supposed to have been the person who obtained a part of the silver from the Romans in Roman times and brought home a large sum of money, which would fix the first coinage of the victoriatris at Rome B.C. 177, that is, 92 years after the first silver coinage.

If the denarius weighed 60 grams, the teruncius would only have weighed 1½ grs., which would have been so small a coin that some have doubted whether it was ever coined in silver, for we know that it was coined in copper. (Vid. As, p. 110.) But Varro names it among the silver coins with the libella and semibolla. It is, however, improbable that the teruncius continued to be coined in silver after the as had been reduced to 1/4 of the denarius; for then the teruncius would have been 1/6 of the denarius, whereas Varro only describes it as a subdivision of the libella, when the latter was 1/10 of the denarius. In the time of Cicero, the libella appears to have been the smallest silver coin in use; and it is frequently used, not merely to express a silver coin equal to the as, but any very small sum. Granovius, however, maintains that there was no such coin as the libella when Varro wrote, but that the word was used to signify the tenth part of a sestertius. No specimens of the libella are now found.

If the denarius be reckoned in value 8½ d., the other coins which have been mentioned will have the following value:

It has been frequently stated that the denarius is equal in value to the drachma; but this is not quite correct. The Attic drachma was about equal to 9½ d., whereas we have seen that the denarius was but little above 8½ d. The later drachmae, however, appear to have fallen off in weight; and there can be no doubt that they were at one time nearly enough equal to pass for equal. Granovius has given all the authorities upon the subject in his De Numis Sestertiorum (lib. 2.)—(9, 10.)

The earliest denarius have usually, on the obverse, the head of Jupiter Many have, on the reverse, chariots drawn by two horses (sigta, quadrigae), whence they are called respectis sigtas et quadrigatas, ac. numm. (Vid. Bigatus.) Some denarii were called sertati, because their edges were notched like a saw, which appears to have been done to prove that they were solid silver, and not plated. Many of the family denarii, as those of the Cushi, Calpurnius, Papinius, Tullian, and numerus others, was, at least, 120 grains. (Vid. Avus., p. 159.) In later times, a copper denarius was called denarius. *DENDRACHTES (depharyntes), a species of Agate, the veins of which resemble a small tree. It is our Dendritic agate. A description of it is given in the Orphic poem under the name of ἀξοντα, dephreyς.

*DENDROLIBANUS (dephoryllahaus), a term occurring only in the Pharmaceutical work of Myrenius, meaning, or something of that nature.

*DENDROPTERIGUS (dephoryllthes), apparently, says Adams, a kind of Coral. It is mentioned by Theophrastus. Stockhouse conjectures it to be the Gorgonim nobils, or Red Coral.

DENTIFRIFICUM (ενθεορημα), a dentrifice or tooth-powder, appears to have been skillfully prepared, and commonly used by the Romans. It contained a variety of substances, such as the bones, hoofs, and horns of certain animals, crabs, egg-shells, and the shells of the oyster and the murex, constituted the basis of the preparation. Having been previously burned, and sometimes mixed with honey, they were reduced to a fine powder. Though fancy and superstition have directed the choice of these ingredients, the addition of astragals, earth, pyrite, or of nitre and of harsbtorn ground in a raw state, indicates science which was the result of experience, the intention being not only to clean the teeth and to render them white, but also to fix them when loose, to strengthen the gums, and to assuage toothache.

Foufond punicum was a more debiuos article, though Pliny says, "Utilem sunt ex his den- trifricis."

DEPENS. ACTIO. (Vid. Sponsor.)

DEPORTAT. (Vid. Banishment, Roman.)

DEPOSITI. ACTIO. (Vid. Depositum.)

DEPOSITUM. A depositum is that which is given by one man to another to keep until it is demanded back, and without any reward for the trouble of keeping it. The party who makes the deposit is called deponens or deponent, and he who receives the thing is called depositarius. The act of deposite may be purely voluntary, or it may be from necessity, as in the case of fire, shipwreck, or other casualty. The depositarius is bound to take every care of which he has been commanded to receive. He cannot use the thing itself, but he has permission to use it, either by express words or by necessary implication. If the thing is one " que usu non consumit," and it is given to a person to be used, the transaction becomes a case of locatio and conductio (vid. Locatio), if money is to be paid for the use of it; or a case of commutation (vid. Commutation), if nothing is to be paid for the use of it.

If a bag of money not sealed up is the subject of

but depositum, and the depositarius at any time asks for permission to use it, the money becomes a loan (de Mutrius) from the time when the permission is granted; if the deponents offer the use of the money, it becomes a loan from the time when the depositarius begins to use it. If money is deposited with the condition that the same amount be returned, the use of it is tacitly given; but the depositum does not therefore become mutuum. If the depositum continues purely a depositum, the depositarius is bound to make good any damage to it which happens through dolus or culpa lata; and he is bound to restore the thing on demand to the deponents, or to the person to whom the deponents orders it to be restored. The remedy of the deponents against the depositarius is by an actio depositi directa. The depositarius is entitled to be secured against all damage which he may have sustained through any culpa on the part of the deponents, and to all costs and expenses incurred by his charge; and his remedy against the depositarius is by an actio depositi contraria. The actio was in duplum if the deposit was made from necessity; if the depositarius was guilty of dolus, infamia was a consequence.\(^1\)

**DESERTOR** is defined by Modestinus to be one "qui per proximum tempus vagatus, reductur,\(^2\) and differs from an *answer* "qui dix vagatus ad castra egressitur.\(^3\) Those who deserted in time of peace were punished by loss of rank, corporeal chastisement, fines, ignominious dismission from the service, &c. Those who left the standards in time of war were usually punished with death. The *transfuga*, or deserters to the enemy, when taken, were sometimes deprived of their hands or feet,\(^4\) but generally were put to death.\(^5\)

**DESIGNATOR.** (Vid. *Fons*.)

**DESMOTERION** (δεσμοτηρίον). (Vid. *Cassar*.)

**DEPOSIGNAULTA** (δεποσηγναυτά). (Vid. *Civitas. Graec.*).

**DESOLATOR** (ἀνισσεπτος, ἀνισβατης, μεταλητης), a robber. Although riding on horseback is never mentioned among the martial exercises of the early Greeks, it was often practised by them as a swift and easy method of conveyance from place to place; and that they had attained to great skill in horsemanship is manifest from a passage in the Iliad,\(^6\) describing a man who keeps four horses abreast at full gallop, and leaps from one to another, amid a crowd of admiring spectators. The Roman desolator generally rode only two horses at the same time, sitting on them without a saddle, and vaulting upon either of them at his pleasure.\(^7\) He wore a hat or cap made of felt. The taste for these exercises was carried to so great an extent, that young men of the highest rank not only drove bigae and quadrigae in the circus, but exhibited these feats of horsemanship.\(^8\) Besides performing publicly for the amusement of the spectators, the Roman riders were employed to convey messages with the greatest possible dispatch, relieving either horse, when fatigued, by vaulting upon the other.\(^9\) Among other nations, this species of equestrian dexterity was applied to the purposes of war. Livy mentions a troop of horse in the Numidian army, in which each soldier was supplied with a couple of horses, and in the heat of battle, and when clad in armour, would leap with the greatest ease and celerity from that which was worn or disabled upon the back of the horse, which was still sound and fresh.\(^10\) The Scythians, Armenians, and some of the Indians, were skilled in the same art.

The annexed woodcut shows three figures of desultores, one from a bronze lamp, published by Bartoli,\(^1\) the others from coins. In all these the rider wears a p ileus, or cap of felt, and his horse is without a saddle; but these examples prove that he had the use both of the whip and the rein. On the coins we also observe the wreath and palm-branch as ensigns of victory.

**DEVERSIO/RUM.** (Vid. *Cassar*.)

**DEUX.** (Vid. As. p. 110.)

**DEXTANS.** (Vid. As. p. 110.)

**DIADEMA** (διάδημα), a white fillet used to encircle the head (fascia alba).\(^11\)

The invention of this ornament is by Pliny\(^2\) attributed to "Liber Pater." Diodorus Siculus adds,\(^3\) that he wore it to assuage headache, the consequence of indulging in wine. Accordingly, in works of ancient art, Bacchus wears a pleated bagage on his head, as shown in the woodcut at p. 208. Whether we reject or admit the conjecture of Diodorus, we may safely consider the diadem, even in its simplest form, as a decoration which was properly Oriental. It is commonly represented on the heads of Eastern monarchs. Justin\(^4\) relates that Alexander the Great adopted the large diadem of the kings of Persia, the ends of which fell upon the shoulders, and that this mark of royalty was preserved by his successors.\(^5\) Antony assumed it in his luxurious intercourse with Cleopatra in Egypt.\(^6\) Elian says\(^7\) that the kings of that country had the figure of an asp upon their diadems.

In process of time, the sculptors placed the diadem on the head of Jupiter, and various other divinities besides Bacchus (see examples at p. 245, 292), and it was also gradually assumed by the sovereigns of the Western world. It was tied behind in a bow; whence Tacitus\(^8\) speaks of the Euphrates rising in waves "white with foam, so as to resemble a diadem." By the addition of gold and gems,\(^9\) and of pearls from the Erythrean Sea\(^10\) and by a continual increase in richness, size, and splendour, this badge was at length converted into the crown which has been for many centuries the badge

DIETETICA.

No attention seems to have been paid to the branch of medicine before the date of Hippocrates; or, at least, we should see that, although Homer meant to represent it as it was in his own time, or as he supposed it to have been during the Trojan war, it must have been (according to our modern notions) very defective and erroneous. For instance, he represents Machaeon, who had been wounded in the shoulder by an arrow, and forced to quit the field, as taking a draught composed of wine, goat's-milk cheese, and flour, which certainly no modern surgeon would prescribe in such a case. Hippocrates seems to claim for himself the credit of being the first person who had studied this subject, and says the ancients had written nothing on it worth mentioning.

1. Among the works commonly ascribed to Hippocrates, there are three books, and only three, of which the title, or at least an allusion to it, is preserved in the Greek classics. The first, though evidently not all composed by the same author, is supposed to be as old as Hippocrates; and the fourth, if not the work of Hippocrates himself, is nevertheless very ancient. There is also a good deal of matter on this subject in his other works, as regimen and diet was the first, the chief, and often the only remedy that he employed. In this respect his object is commonly supposed to be, to separate in his contemporaries, on the subject of Hippocrates, the works by later authors that are still extant. Galen, and another corruptly entitled Tacuinum Sanitatis, Elisschamum Elimilaril de Sex Rubis non Naturalibus; and another by the celebrated Maimonides (Moshkh Ben Maimon), De Regimen Sanitatis; besides several chapters in the works of His Pllus, ii., ii., p. 456, p. 466. 2. Max. Tert., Ser. 29., Athenaeum, ii., 1, p. 160., 4. De Rat. Vet. in Medic. Anim. Tomii, ii., p. 526, ed. Kuls. 3. (Vid. Fabric., Bibl. Gr., vol. ii., ed. Hucnis. 4. (Pseudo. Hippocr., De Vut. Rait., lib. ii. om. i., p. 674, 686.)
Aurelia was rhetoric, as something extraordinary that the famous Asclepiades, at Rome, in the seven-teenth century A.D., sometimes ordered his patients to double and treble the quantity of wine, till at last it appears that wine was commonly diluted with five or six times its quantity of water. Hippocrates recommends wine to be mixed with an equal quantity of water, and Galen approves of the proportion; but Le Clerc thinks that this was only in particular cases. In one place (47), where the patient liga, is reduced to such a degree, that, in which passage it has been much doubted whether actual intoxication is meant, or only the "drinking freely and to cheerfulness," in which sense the same word is used by St. John 4 and the LXX. 5 According to Hippocrates, the proportions in which wine and water should be mixed together vary according to the season of the year; for instance, in summer the wine should be most diluted, and in winter the least so. 6 Exercise of various sorts, and bathing, are also much insisted upon by the writers on diet and regimen; but for farther particulars on these subjects, the articles Bunas and Gymnasia must be consulted. It may, however, be added, that the bath could not have been very common, at least in private families, in the time of Hippocrates, as he says that "there are few houses in which the necessary water conveniences are to be found." 7 Another very favourite practice with the ancients, both as a preventive of sickness and as a remedy, was the taking of an emetic from time to time. The author of the treatise De Victus Ratione, falsely attributed to Hippocrates, recommends it two or three times a month. 8 Celsus considers it more beneficial in the winter than in the summer, 9 and says it was always prescribed to patients whose stomachs had better do so on two successive days than once a fortnight. 10 At the time in which Celsus wrote, this practice was so commonly abused, that Asclepiades, in his work De Sanitate Tuenda, rejected the use of emetics altogether: "Offenenss," says Celsus, 11 "corum conscientiae, qui quotidiem efficiendo nomando faciunt munerationem." It was the custom, among the Romans, to take an emetic immediately before their meals, in order to prepare themselves to eat more plentifully; and again soon after, so as to avoid any injury from repletion. Cicero, in his account of the day that Cesar spent with him at his house in the country, 12 says, "Acculatit, aeatiget agsal, stagi et cedit et bibi idoneis et jucundis," and this seems to have been considered a sort of compliment paid by Cesar to his host, as it intimated a resolution to pass the day cheerfully, and to eat and drink freely with him. He is represented as having done the same thing when he was entertained by King Deiotarus. 13 The glutton Vitellius is said to have preserved his own life by constant emetics, while he destroyed all his companions who did not use the same precaution, 14 so that one of them, who was prevented by illness from drinking wine, is said, "he certainly have been dead if I had not fallen sick." 15 Even women, after bathing before supper, used to drink wine and throw it up again, to sharpen their appetite. 16

so that it might truly be said, in the strong language of Seneca, 17 "Yammt, ut edant; edunt, ut mort--17." By some the practice was thought so offensive for strengthening the constitution, that it was the constant regimen of all the athletes, or professional wrestlers, trained for the public shows, in order to make them more robust. Celsus, however, warns his readers against the too frequent use of emetics without necessity, and merely for luxury and to please him. 18 Cicero says that no man who has any regard for his health, and wishes to live to old age, ought to make it a daily practice. 19

DIAGRAPHEIS (diagrapheis). (Vid. Eiperobra.)

DIATETEAI (diatetaei). The diatetai, or arbitrators mentioned by the Athenian orators, were of two kinds; the one public, and appointed by lot (kleroterai), the other private, and chosen (aepetra) by the parties who referred to them the decision of a dispute. The former sitting at a court of justice; the judgments of both, according to Aristotle, being founded on equity rather than law (δια την διαιτητικην τω επικεκληνα δρα, δια διαιτητας τω νομον). We shall, in the first place, treat of the diatetai kleroterai, following, as closely as possible, the order and statements of Huidewalker in his treatise "Über die öffentlichen und Privat-Schiedsrichter Diatesen in Athen, und den Prozess vor denselben." According to Susa, public diatetes were required to be not less than 50 years of age; according to Polux 20 and Hesychius, not less than 60. With respect to their number there is some difficulty, in consequence of a statement of Ulpius, 21 according to which it was 440, i.e., 44 for each tribe (διαιτητοι τω παρεκτικω των διατητων, καθ᾿ εκατον εὐφύς). This number, however, appears so unnecessarily large, more especially when it is considered that the number of the tribes has been after one arbitrator in each case, that some writers have, with good reason, supposed the reading should be, ἡδ’ διαιτητοι διαιτητας, τισαρες κ. φ. ἐφ. At any rate, litigious as the Athenians were, it seems that 40 must have been enough for all purposes.

The words καθ᾿ εκατον εὐφύς imply that each tribe had its own arbitrator; an inference which is supported by Demosthenes, 22 whereby speaks of the arbitrators of the Oeoneid and Erechtheid tribes; as also by ὦ Lysias, 23 who, in the words προσκλητορος αὐτῶν προς τόδε το πτωχωδίτι διαδίκησιν, is thought to allude to the diatetai of the Hippothoid tribe. With regard to the election of these officers, it is doubtful whether they were chosen by the members of the tribe for which they adjudicated, or in a general assembly of the people. Huidewalker in his treatise says, in a note, that it is probable; we do not think so; for it seems as likely, if not more so, that the four arbitrators of each tribe were chosen in an assembly of the tribe itself. Again, whether they were appointed for life, or only for a definite period, is not expressly mentioned by the orators; but as none of the Athenian magistrates, with the exception of the Areopagites, were re-elected for life, it is probable, and most likely, that the public diatetes were chosen for the public diatetia of the year as being the last day of the diatetai (διαιτηται ημέρα τῶν διατητων), it seems almost certain that they were elected for a year only. The only objection to this conclusion arises from a statement in a fragment of Isaeus, 24 where an arbitrator is spoken of as being engaged on a suit for two years (ὅτι ἐντζ διαιτευσεν τα διατητα) for, if, however, we admit the conjectural reading τῶν διαιτητῶν,

the meaning would be in accordance with what we infer from other authorities, and would only imply that the same cause came before the arbitrators of two different years, a case which might not unfrequently happen; if, on the contrary, the reading of the text is correct, we must suppose that it was sometimes necessary or convenient to re-elect an arbitrator for the decision of a particular case.

After discussing the case, Hudtwalcker raises the question whether or not the public διαίτητα look any general oath before entering upon their duties. The point is not one of great importance, and therefore we shall only observe that such a guarantee would seem to be unnecessary; for we read of their taking oaths previous to giving judgment in the particular cases which came before them. From this circumstance, however, we may infer that we were not exacted from them before they entered upon office: Hudtwalcker is of the contrary opinion, and suggests that the purport of their oath of office (Ἀμνίσις) was the same as that of the Heliastic oath given by Demosthenes.

The διαίτηται of the different tribes appear to have differed in different cases, as temples, laws, and courts of justice, if not wanted for other purposes. Those of the Κενεῖδ and the Ερέθεσι tribes met in the heilæ; we read of others holding a court in the delphinium, and also in the στοί πωλί. Again we are told of slaves being examined by the διαίτηται, sitting for that purpose, under the appellation of Ἱπποκράτιοι (vid. Βασιλεία), in the hephalæum, or Temple of Hephaestus. Moreover, we are told of private arbitrators meeting in the Temple of Athena on the Acropolis; and, if the amended reading of Pollux is correct, we are informed by him, in general terms, that the arbitrators formerly held their courts in the temples (Διηθέντες ἐν ἔρημο πάξει). Harpocrates also contrasts the dictata with the arbitrators, observing that the former had regularly appointed courts of justice (Ἀμνίσις ἐποδέσυμα). Another point of difference was the mode of payment, inasmuch as the dictata received an allowance from the state, whereas the only remuneration of the διαίτηται was a drachma deposited as a paradox from the parties themselves, as is mentioned in the case of the suit, the same sum being also paid for the ἀνωμοιοσ, and every ἀνωμοιοσ sworn down in the proceedings.

The παράτασις of which we have been speaking is the same as the δραχμα τῆς λειτουργίας mentioned by Demosthenes. The defendant in this case had failed to give evidence of his case. So Hudtwalcker lave one, and therefore the plaintiff commenced proceedings against him for this arbitrary neglect before the arbitrators in the principal suit, the first step of which was the payment of the παράτασις.

The public arbitrators were ὑπερθύροι, i.e., every one who had, or fancied he had, a cause of complaint against them for their decisions, might proceed against them on the above-mentioned appeal, and even if the same cause were laid before the senate. For this purpose, says Ulpius, whose statement is confirmed by Demosthenes, the case of Straton, the public dictata were, towards the close of their year of office, and during the latter days of the month Thargelion, required to present themselves in some fixed place, probably near the senate-house, that they might be ready to answer any charge brought against them, of which they received a previous notice. The punishment, in case of condemnation, was ἀρίδας, or the loss of civic rights. Harpocrates, however, informs us that the ἀρίδας against the arbitrators was brought before the dictata or judges of the regular courts; but this probably happened only on appeal, or in cases of great importance, inasmuch as the ἀρίδας could not inflict a greater penalty than a fine of fifteen minae.

We may now discuss the competency of the dictata, i.e., the extent of their jurisdiction, with respect to which Pollux states, that in former times no suit was brought into a court before it had been investigated by the dictata (ὑπακοή δικαίων δικήν ἐπὶ διαίτητας ῥήτου εἴδοντο). There can be but little doubt that the dictata were engaged in cases of a similar nature before the arbitrators, as a means of saving the state the payment which would otherwise have been due to the dictata. Hudtwalcker is accordingly of opinion that the dictata were competent to act in all cases of civil action for restitution or compensation, but not of penal or criminal indictments (πρὸς Ἰουλίαν ἑαυτήν, ὡς ἡ ἄρματα). It is true that the arbitrator could not decide whether his cause was brought before them in the first instance, or sent at once to a higher court of judicature.

But, besides hearing cases of this sort, the διαίτητα sat as commissioners of inquiry on matters, whether not which could not be conveniently examined in a court of law. They also investigated the public affairs of the Athenian oracles. This was sometimes directed by our own Court of Chancery to an inferior court, for the purpose of trying a question of fact, to be determined by a jury. Either party in a suit could demand or challenge (πρόκαλεσθαι) an inquiry of this sort before an arbitrator, the challenge being called πρόκλεσθαι: a term which was also applied to the articles of agreement by which the extent and analysis of a contract were defined. Many instances of these πρόκλεσθαι are found in the orators; one of the most frequent is the demand or offer to examine by torture a slave supposed to be cognizant of a matter in dispute, the damage which might result to the owner of the slave being guaranteed by the party who demanded or offered to examine him. These cases were determined by the evidence of a third party. Sometimes, also, an appeal of a πρόκλοπος, by which a party was challenged to allow the examination of documents, as willis, deeds, bankers' books, &c.

It is manifest that the forms and objects of a πρόκλοπος would vary according to the matter in dispute, and the evidence which was producible; we shall therefore content ourselves with adding that the term was also used when a party challenged his adversary to make his allegation under

---

the sanction of an oath, or offered to take his own statements under the same obligation. 1

The presumption or prophecies which might arise from a voluntary oath in the last case, might be met by a similar procedure, tendered by the adverse party, to which the original challenger appears to have had the option of consenting or not, as he might think proper. 2 In all cases where any of these investigations or depositions were made before the dietetae, we may conclude with Haldwanker, 3 that they might be called as witnesses in subsequent stages of the action, either to state the evidence they had taken, or to produce the documents they had examined, and which were depo-

sited by them in an echinos (vid. appellatio, Greek).

We will now speak of the proceedings in the trials before the public arbitrators; these were of two sorts: 1st. When two parties agreed by a regular contract to refer a matter in dispute to a judge or judges selected from them. 2ndly. When a cause was brought before a public arbitrator, without any such previous arrangement, and in the regular course of law. The chief difference seems to have been that, in case of a reference by contract between two parties, the award was final, and no appeal could be brought before another court, though the unsuccessful party might, in some instances, move for a new trial (τά μεν οὖσαν υπολειπῆναι 4). Except in this point, the arbitrators appointed under the public διειται by litigant parties, seems to have been subject to the same liabilities, and to have stood in the same relation to those parties as an arbitrator appointed by lot: the course of proceeding also appears to have been the same before both, 5 an account of which is given below. It must, however, be first stated, that there are strong reasons for supposing that where a defendant was pronounced, and whenever a suitor wished to bring an action before one or more of the public dietetae, he applied to one of the many officers called εἰσαγωγικοί, whose duty it was to bring the cause (εἰσαγωγή) into a proper court. By some such officer, at any rate, a requisite number of arbitrators was allotted to the complainant, care being taken that they were of the same or opposite party. The arbitrators, thus selected, whenever a suitor wished to bring an action before one or more of the public dietetae, he applied to one of the many officers called εἰσαγωγικοί, whose duty it was to bring the cause (εἰσαγωγή) into a proper court. By some such officer, at any rate, a requisite number of arbitrators was allotted to the complainant, care being taken that they were of the same or opposite party. The arbitrators, thus selected, whether or not that a διειται refused to hear a cause, he might be punished with ἁτίμα: but it appears that under extraordinary circumstances, and after hearing the case, a dietetae sometimes refused to decide himself, and referred the parties to a court of justice ἴδιον ἄστέρα τῆς δικῆς. ἄλλη ἐφίλει ἡμᾶς εἰς τὸ δικαστήριον 6.

We may now state the process before the public dietetae. After complaint made, and payment of the περίστορας, the plaintiff supported his averment by an oath, to the effect that his accusation was true, which the defendant met by a like oath as to the matter of his defence. When the oath (ὑπομονὴ) had been thus taken by the parties, the arbitrators entered upon the inquiry, heard witnesses, examined the documents which had been held at public conferences (συνόδοι) with the parties as might be necessary for the settlement of the question. 7 The day of pronouncing judgment (ὁ ἁρματος τῆς δικῆς) was probably fixed by law, if we may judge from the name (ὁ κυριά συν. ἡμέρα) by which it is called in the orators; it might, however, with consent of both parties, be postponed. The verdict given was countersigned by the proper authorities, perhaps in the εἰσαγωγικοί, and thereby acquired its validity. The archons, mentioned by Demosthenes 8 as having signed the judgment, (ἐπιγράφοντες τὸν κρίνον τοῦ δικασταρίου), therefore we may suppose that the action was a δικαστήριον, which, is more, called an ἄτιμος ἔκπληκτος μὲν δίκη, τ. ε. an action where the plaintiff was not required to assess the damages (εἰσαμίτερι λίτην), the penalty, in case of a verdict for him, being determined by law: this alone is sufficient to prove that the dietetae sometimes decided in cases where the plaintiff sued for damages, as distinguished from those in which he sought restoration of rights or properties; nor, indeed, does there seem any reason for supposing that their jurisdiction was not extended to the ἵπτεμε τιμήριον, or actions where the plaintiff was required to assess or lay his damages, provided the assessment did not exceed some fixed amount. In support of this opinion we may adduce the authority of Pollux, 9 who expressly states that the plaintiff might assess his damages before the arbitrators, when the law did not so for him (ἐνεγραφαν τῷ γραμματεῖ καὶ τῷ τίμημα). If the defendant were not present on the proper day to make his last defence, judgment went against him by default (ἐπιγραφὴ δικά), the arbitrator being obliged to wait till the evening (επὶ ἑδρας). Sometimes, however, the time of pronouncing sentence was deferred in consequence of a defendant's sickness, or other temporary cause for postponement, such as sickness, absence from town, military service, or other reasons. To substantiate these, the applicant, when possible, appeared personally; but if a party was prevented from appearing on the day of trial by any unexpected event, the ὑπομονὴ might be made on oath by authorized friends. 10 The ὑπομονὴ might be met by a counter complaint called ἀνακεφαλαίωσις, which, after due hearing, affirming his belief that the reasons alleged were fictitious or colourable. In connexion with this point, we may observe that, according to Pollux, 11 the motion for a new trial could only be sustained in cases where the applicant had made a ὑπομονὴ, and demurred either personally or by proxy against the passing of judgment on the regular day. Moreover, when a new trial was given, or was refused for a new trial to move for it within ten days after judgment had been pronounced, and even then he was obliged to take a kind of ὑπομονὴ, to the effect that his absence on the proper day was involuntary (ὑπόσχοι μὴ εἴκοι ἐκπέπτων τὸν δικαιασμὸν). In default of compliance with these conditions, the previous sentence was confirmed. 12 We are told also by Philostratus, 13 that when a complaint for plaintiff as well as defendant to make for a new trial on the grounds we have mentioned. When it was granted, the former verdict was set aside (ἡ κρίσις ἐκλείπῃ), and the parties went again before an arbitrator, probably through the instrumentality of the εἰσαγωγικοί, to whom application had been made in the first instance. The process itself is called ὑποταξια in Greek, and does not seem to have been continued in trials before the διειται: the corresponding term in Roman law is restauratio eremodicia. 14 This, however, was not the only means of setting aside a judgment, inasmuch as it might also be effected by an ἄκεμοι, or appeal to the higher courts (vid. appellatio, Greek), and if false evidence had been tendered, by a δικαστήριον. 15 For an account of the proceedings consequent upon non-com |

DIAPSEPHISIS.

bela, or sixth part of the damages estimated in the original cause, was forfeited in some diamastigism, when the protester failed in obtaining a fifth of the voices of the dicasts; and in others, a deposit (παρακαθαρισμός) was forfeited by the unsuccessful party to his opponent.²

DIAMASTIGOSIS (διαμαστίγωσις) was a solemnity performed at Sparta at the festival of Artemis Orthia, whose temple was called Limneae, from its situation in a marshy part of the town. The solemnity was this: Spartan youths (θήρες) were scourged on the occasion at the altar of Artemis, by persons appointed for the purpose, until their blood flowed. The punishment of the youths was preceded by a preparation, by which those who intended to undergo the diastigmatis was tried to harden themselves against its pains. Paussannius describes the origin of the worship of Artemis Orthia, and of the diastigmatis, in the following manner: A wooden statue of Artemis, which Orestes had brought from Tauris, was found in a bush by Astрабanes and Alopenus, the sons of this. The two men were immediately struck mad at the sight of it. The Limneaeans and the inhabitants of other neighbouring places then offered sacrifices to the goddess; but a quarrel ensued among them, in which several individuals were killed at the altar of Artemis, who now demanded atonement for the blood shed. To procure a submission of the human victims were selected by lot and offered to Artemis, until Lycurgus introduced the scourging of young men at her altar as a substitute for human sacrifices.

The diastigmatis, according to this account, was a substitute for human sacrifice, and Lycurgus introduced this purification of blood, so far as he made it a part of the system of hardening the Spartan youths against bodily sufferings. According to another far less probable account, the diastigmatis originated in a circumstance, recorded by Plutarch, which happened before the battle of Platea.

The worship of Artemis Orthia was unquestionably very ancient, and the diastigmatis only a step from barbarism towards civilization. Many anecdotes are related of the courage and intrepidity with which young Spartans bore the lashes of the scourge; some even died without uttering a murmur at their sufferings, for to die under the strokes was considered as honourable a death as that on the field of battle.

DIANOMAL or DIADOSEIS (διανομή or διάδοσις) were public donations to the Athenian people, which corresponded to the Roman congiaria. (Vid. CONGNIARIUM) To these belong the free distributions of corn, the cleruchia (vid. CLERUCHIA), the revenues from the mines, and the money of the Persian exactions.

DIAPHANE EIMATA (διαφάνη εἴματα) were garments similar to the celebrated Coe veste of the Romans; but as they are mentioned in Aristophanes and the earlier Greek writers (διαφανῆ χιτώνια, ἡ διαφάνεια χιτώνια) they were probably made of muslin and not of silk, which is supposed to be the material of which the Coe veste were made. (Vid. CoE VESTA)

DIAPSEPHISIS, a political institution at Athens, the object of which was to prevent aliens, or such as were the offspring of an unlawful union,
marrige, from assuming the rights of citizens. As usurpations of this kind were not uncommon in Athens, 3 various means had been adopted against them (prodromias and dorokismis); but as none of them had the desired effect, a new method, the diasphrasis, was devised, according to which the trial on spurious citizens was to be held by the deme, within whose deme intruders were suspected to exist; for if each deme separately was kept clear of intruders, the whole body of citizens would naturally feel the benefit. Every deme, therefore, obtained the permission of the others to revise its lexigraphic registers, and to ascertain whether any had entered the names of those who had no claims to the rights of citizens. The assembly of the deme, in which these investigations took place, was held under the presidency of the dromarch, or some senator belonging to the deme; 7 for, in the case brought forward in the oration of Demosthenes against Eubulides, we do not find that he was dromarch, but it is merely stated that he was a member of the boulâ. When the demotai were assembled, an oath was administered to them, in which they promised to judge impartially, without favour towards, or enmity against those persons on whom they might have to pass sentence. The president then read the names of the demote from the register, asking the opinion of the assembly (diafophora), whether they thought him a true and legitimate citizen or not. Any one, then, had the right to say what he thought or knew of the person in question; and when any one was impeached, a regular trial took place. 8 Pollux 8 says that the demote on this occasion gave their votes with leaves, and not with pebbles, as was usual; but Demosthenes simply calls them ψῦκα. If it be true that having usurped the rights of a citizen (diasphrasis), his name was struck from the lexigraphic register, and he himself was degraded to the rank of an alien. But if he did not acquiesce in the verdict, but appealed to the great courts of justice at Athens, a heavier punishment awaited him, if he was found guilty there also; for he was then sold as a slave, and his property was confiscated by the state. 9
If by any accident the lexigraphic registers had been lost or destroyed, a careful scrutiny of the same nature as that described above, and likewise called diafophora, took place, in order to prevent any spurious citizen from having his name entered in the new registers. 10
It is commonly believed that the diafophora was introduced at Athens in B.C. 419, by one Demophileus. 11 But it has justly been remarked by Siebelis on Phileorus, 12 that Harpocrates, 13 the apparent authority for this supposition, cannot be interpreted in this sense. One diafophora is mentioned by Pto- tarch, 14 as early as B.C. 445. Clinton 15 has, moreover, shown that the diafophoria mentioned by Harpocrates, in the archonship of Archias, does not belong to the period of Eusebius; 16 to Demosthenes, 17 and to Hermann, 18 and Schibbm, 19 whose lengthened account, however, should be read with great care, as he makes some statements which seem to be irreconcilable with each other, and not founded on good authority.

The source from which we derive most information on this subject is the oration of Demosthenes against Eubulides.

Diasia (diasia), a great festival celebrated at Athens, without the walls of the city (Eso της Ήλ., 1. ep., in honour of Zeus, surnamed Meligus. 1 The whole people took part in it, and the wealthy citizens offered victims (leperita, while the poorer classes burned such incense as their country furnished (ψυκτικές ετερίκες), which the scholast on Thucydidis erroneously explains as cakes in the shape of animals. 2 The diasia took place in the latter half of the month of Anthesterion, 3 with feast and games. 4 In the former, like most other festi- vals, accompanied by a fair. 5 It was this festival at which Cylon was enjoined by an oracle to take possession of the acropolis of Athens; but he mis- took the oracle, and made the attempt during the celebration of the Olympic games. 6 The etymology of δίασία, given by most of the ancient gram- marians (from διός and σία), is false; the name is a more derivative from διός, as Ἀρσενίων, from Ἀρσενικός.

Diaulos. (Vid. Stadhum.)

Diazoma. (Vid. Subieaculum.)

Dicasterion (δικαστερίων) indicates both the aggregate judges that sat in court, and the place it self in which they held their sittings. For an ac- count of the former, the reader is referred to the article DICASTERIUS; with respect to the latter, our information is still imperfect. In the earlier ages there were five celebrated places at Athens set apart for the sittings of the judges, who had cognizance of the graver causes in which the loss of hu- man life was avenged or expiated, viz. the areopagitics and the ephebes. These places were the Arei- opagus (vid. Areiopedus), and the ἐπὶ Παλάθιον, ἐπὶ Δελτφιον, ἐπὶ Περιπάτειον, and ἐπὶ Φεροντι. The anti- quity of these last four is sufficiently attested for the present by the continual appropriation of such places to appropriate each: in the first we are told that accidental deaths were discussed; in the second, homicides confessed, but justifed; in the third there were quasi trials of inanimate things, which, by falling and the like, had occasioned a loss of human life; in the fourth, homicides who had returned from exile, and committed a fresh mas- slaughter, were appointed to be tried first by the judges in respect to these ancient institutions, of which little more than the name remained when the historical age commenced, it will be sufficient to observe that, in accordance with the ancient Greek feeling respecting murder, viz., that it partook more of the nature of a ceremonial pollution than a political offence, the presiding judge was invariably the king archon, the Athenian rex sacrorum; and that the place in which the trials were held open to the sky, to avoid the contamination which the judges might incur by being under the same roof with a murder- er. 8 The places, however, remained after the office of the judges who originally sat there was abolished, and they appear from Demosthenes to have been occasionally used by the more Helenic and Polyesist judges when trying a cause, the business of which had always taken them to the appropriate. The most im- portant court in later ages was the Heliaia, in which, we are told by the grammarians, the weighty causes were decided; and if so, we may conclude the thesmothetis were the presiding magistrates. Besides this, ordinary Helenic courts sat in the Odeum, in the courts Trigonon, the Greater (Mec- cov), the Middle (Mea), the Green, the Rod, that of Melidorus and the Parabryton, but of these we are unable to fix the localities, or to what magis- trates it usual to apporion them. They were

DICE

DIKE (δική) signifies generally any proceedings at law by one party directly or mediately against others.\(^1\) The object of all such actions is to protect the body politic, or one or more of its individual members, from injury and aggression; a distinction which has in most countries suggested the division of all causes into two great classes, the public and the private, and assigned to each its peculiar character and extent.\(^2\) In Athens these were implied by the terms public δίκαια or άγωνες or still more peculiarly by γραφαί: causes of the other class were termed private δίκαια or άγωνες or simply δίκαια in its limited sense. There is a still further subdivision of γραφαί into δημοτικα and δίκαια, of which the former is somewhat analogous to impeachments for offences directly against the state; the latter to criminal prosecutions, in which the object appears to be a party mediately injured in the violation or other wrong done to individual citizens. It will be observed that cases frequently arise, which, with reference to the wrong complained of, may with equal propriety be brought before a court in the form of the γραφα of last mentioned, or in that of an ordinary δίκη, and under these circumstances the laws of Athens gave the prosecutor an ample means to secure the rights of private or public proceedings,\(^3\) much in the same way as a plaintiff in modern times may, for the same offence, prefer an indictment for assault, or bring his civil action for trespass on the person. It will be necessary to mention some of the principal distinctions in the treatment of causes of the two great classes above mentioned, before proceeding to discuss the basis and treatment of the private lawsuit.

In a δίκη, only the person whose rights were alleged to be affected, or the legal protector (κτερος) of such person, if a minor, or otherwise incapable of appearing suo jure, was permitted to institute an action as plaintiff; in public causes, with the exception of some few in which the person injured or his family were peculiarly bound and interested to act, any free citizen, and sometimes of the state was directly attacked, almost any alien, was empowered to do so. In all private causes, except those of ξινόλης, ιβαμον, and ιαπαζεσέως, the penalty or other subject of contention was exclusively recovered by the plaintiff, while in most others the state alone, or jointly with the prosecutor, profited by the pecuniary punishment of the offender. The cause of damages to the property, was paid in private, but not in public causes, and a visible pecuniary penalty that compromised the action with the defendant was in most cases punished by a fine of a thousand drachmae and a modified disfranchisement; while there was no legal impediment at any period of a private lawsuit to the reconciliation of the litigant parties.

The proceedings in the δίκη were commenced by a summons to the defendant (πρόσκλησις) to appear on a certain day before the proper magistrate (ευκράντης), and there answer the charges preferred against him.\(^4\) This summons was often served by the plaintiff in person, accompanied by one or two witnesses (ευκερες), whose names were enjoined upon the declaration (δεξιος or έγγελμα). If there were an insufficient service in the summans, the lawsuit was styled ἄπροσκλησις, and dismissed by the magistrate. From the circumstance of the same officer that conducted the anacrisis being also necessarily present at the trial, and as there being, besides, die nefasti (ἄνεφολές) and festivals, during which none, or only some special causes could be commenced, the power of the plaintiff in selecting his time was, of course, in some degree limited; and of several causes, we know that the time for their institution was particularly limited.\(^5\) There were also occasions upon which a personal arrest of the party proceeded against took the place of, or, at all events, was simultaneous with, the service of the summons; as, for instance, when the plaintiff doubted whether such party would appear at the proper time to answer the motion; and, accordingly, we find that, in the cases of an Athenian plaintiff might compel a foreigner to accompany him to the polemarch's office, and there produce bail for his appearance, or, failing to do so, submit to remain in custody till the trial. The word κατεγέρσις is peculiarly used of this proceeding. Between the service of the summons and appearance of the parties before the magistrate, it is very seldom that any motion is made of which the prescribation of the period of intervention of a period of five days.\(^6\) If both parties appeared, the proceedings commenced by the plaintiff putting in his declaration, and at the same time depositing his share of the court fees (προνοεντ), the non-payment of which was a fatal objection to the further progress of a cause.\(^7\) These were very trifling in amount. If the subject of litigation was larger than this, the defendant was ordered to pay it if at more than 100 drachmae and less than 1000 drachmae, 3 drachmae was a sufficient deposit, and so in proportion. If the defendant neglected or refused to make his payment, it is natural to conclude that he underwent the penalties consequent upon non-appearance; in all cases, the successful party was reimbursed his ptystana by the other.\(^8\) The περαιστολή was another deposit in some cases, but paid by the plaintiff only. This was not in the nature nor of the usual amount of the court fees, but a kind of penalty, as it was forfeited by the suitor in case he failed in establishing his cause. In a suit against the treasury, it was fixed at a fifth; in that of a claim to the property of a deceased person by an alleged heir or devisee, at a tenth of the value sought to be recovered.\(^9\) If the action was not intended to be brought before an heliastic court, but merely submitted to the arbitration of a diestes (ευκερες), a course which was competent to the plaintiff to adopt in all private actions, the drachma paid in the place of the deposit above mentioned bore the name of παραστώς. The deposits being made, it became the duty of the magistrate, if no manifest objection appeared on the face of the declaration, to cause it to be written out upon a tablet, and exposed for the inspection of the public on the wall or other place that served as the cause-list of his court.\(^10\)

The magistrate then appointed a day for the further proceedings of the anacrisis (ευκρανία), which was done by drawing lots for the priority, in which there was a plurality of causes instituted at the same time in this proceeding the phrase λαγχανών δικαια, which generally derives to bring an action, is to be primarily attributed. If the plaintiff failed to appear at the anacrisis, the suit, of course, fell to the ground; if the defendant made default, judgment passed against him.\(^11\) Both parties, however, received an official summons before their non-appearance was made the ground of either. But leave the court might at this, as well as at other periods of the action, be attended by a person unable to attend upon the given day, and this would, if allowed, have the effect of postponing further proceedings (επιμονας); it might, however, be

unnecessary. The anacrisis began with the affidavit of the plaintiff {-apoujioaia), then followed the
answer of the defendant (ianoifiocia or avTiypa(p^)
{vid. Antigeaphe;, then the parties produced their
respective witnesses, and reduced their evidence to
writing, and put in originals, or authenticated copies
of all the records, deeds, and contracts that might
be useful in establishing their case, as well as memoranda of offers and requisitions then made by either side (irpoit'Kfiaeit). The whole of the documents
were then, if the cause took a straightforward
course {Eidv6i.Kia), enclosed on the last day of the
anacrisis in a casket (e;;fivof), which was sealed and
intrusted to the custody of the presiding magistrate
till it was produced and opened at the trial.
During the interval no alteration in its contents was
permitted, and, accordingly, evidence that had been
discovered after the anacrisis was not producible at
the trial.'' In some causes, the trial before the dioasts was by law appointed to come on within a
given time in such as were not provided for by
tiuoh regulations, we may suppose that it would
principally depend upon the leisure of the magistrate.
The parties, however, might defer the day
(Kvpiii} by mutual consent.'
Upon the court being
assembled, the magistrate called on the cause,* and
the plaintiff opened his case. At the commencement of the speech, the proper officer (o e(j>' Map)
filled the clepsydra with water.
As long as the
water flowed from this vessel, the orator was permitted to speak if, however, evidence was to be
read by the officer of the court, or a law recited, the
water was stopped till the speaker recommenced.
The quantity of water, or, in other words, the length
of the speeches, was not by any means the same in

sometimes interrui)led by the cry KUTuia " go
down," in effect, "cease speaking" ^from the dicasts, which placed the advocate in a serious dilemma ; for if, after this, he still persisted in his address,
he could hardly fail to offend those who bid him
stop if he obeyed the order, it might be found,
after the votes had been taken, that it had emanated from a minority of the dieasts.' After the
speeches of the advocates, which were, in general,
two on each side, and the incidental reading of the
documentary and other evidence, the dicasts proceeded to give their judgment by ballot. ( Vid.
Cadiskoi.)
When the principal point at issue was decided in
favour of the plaintiff, there followed, in many cases,
a farther discussion as to the amount of damages
or penalty which the defendant should pay. (Vid.

heavier penalty drew a long line, tlie otheia a iJiofl
Upon judgment being given in a private suit,

In addition to
which, the party against whom judgment had passed by default had the power to revive the cause,
ujjon proving that his non-appearance in court was
ijievitable (rriv sp^/iriv uvTiXaxstv')
this, however,
was to be exercised within two months after the
original judgment.
If the parties were willing to
refer the matter to an umpire (.diaiTT/r^;), it was in
the power of the magistrate to transfer the proceedings as they stood to that officer and in the same
way, if the diaetetes considered the matter in hand
too high for him, he might refer it to the Etaayuyeig,
to be brought by him before an heliastic court.
The whole of the proceedings before the diajtetes
were analogous to those before the dicasts, and
bore equally the name of SIkt/ but it seems thai
the phrase u.vTi,Xa;(elv rijv fo) ovcav is peculiarly applied to the revival of a cause before the umpire in
which judgment had passed by default. (Vid. Dinovo.

DICTATOR

The name and office of dictator are confessedly of Latin origin: thus we read of a dictator at Tusculum in early, at Lanuvium in very late times. Divi, also, a dictator was sometimes elected, as Mettus Fulcius on the death of his king Clauius. Nor was this magistracy confined to single cities; for we learn from a fragment of Cato, that the Tusulan Egerius was dictator over the whole nation of the Latin.

Among the Romans, a dictator was generally appointed in circumstances of extraordinary danger, whether from foreign enemies or domestic sedition. Instances occur very frequently in the early books of Livy, from whom we also learn that a dictator was sometimes created for the following purposes: 1. For fixing the "claus annalis" on the temple of Jupiter, in times of pestilence or civil discord. (Vit. Cl. Annalis.) 2. For holding the comitia, or elections, in the absence of the consuls. 3. For appointing holidays (feriae dictatorales), to procure public peace and safety. 4. Sometimes to order the drawing of lots; 5. For filling vacancies in the senates; 6. For filling vacancies in the senate.

In this last case there were two dictators, one abroad and another at home; the latter, however, without a magisterium.

According to the oldest authorities, the dictatorship was instituted at Rome ten years after the expulsion of the Tarquinii, and the first dictator was said to have been Tit. Lartius, one of the consuls of the year.

Another account states that the consuls of the year in which the first dictator was appointed were of the Tarquinian party, and therefore distrusted.

This tradition naturally suggests the inference that the dictator was on this first occasion appointed to direct and supersede the consuls (moderator et magister consualium appositus), not only with a view to foreign wars, but also for the purpose of summarily punishing any member of the state, whether belonging to the commonalty or the governingburghers, who should be detected in plotting for the restoration of the Tarquinii, or their representatives, with whose dictatorship the Romans would be unfamiliar.

The peculiarity of the Office was the power of life and death. The dictator was not only the executive, but the legislative and judicial monarch of the Roman state.

The power of life and death was the source of all his authority: he did not need to consult the Senate to execute his capital sentences, or to arrange for the execution of his military operations. He was thus a despot, but a despotic power was a necessary element of war.

The dictator was entitled to the fasces, the rods of government, and the fasces were symbols of despotic power. The fasces were symbols of despotic power. The fasces were symbols of despotic power. The fasces were symbols of despotic power.

**DICTATOR.**

On one occasion the people made a master of the horse, M. Minucius, equal in command with the dictator Fabius Maximus.1

**DIES.**

A festival with sacrifices, celebrated at Cydonia in Crete, in honour of Artemis, surnamed Δίκτυνα or Δίκτυνα, from δίκτυον, a hunter's net.2 Particulars respecting its celebration are not known. Artemis Δίκτυνα was also worshipped at Sparta,3 and at Ambyrus in Phocis.4

DIES (of the same root as δόξη and δεύς).5 The name dies was applied, like our word day, to the time during which, according to the notions of the ancients, the sun performed his course around the earth; and this time they called the civil day (dies civilis, in Greek νυκτιβίμερος, because it included both night and day).6 The natural day (dies naturalis), or the time from the rising to the setting of the sun, was the second part which was called μέτων ἡμέρα, or midday, during which the sun was thought to stand still.11 The third part bore the name of δεπηλή or δεπηλον ἡμέρα,12 which derived its name from the increased warmth of the atmosphere. The last part of the δεπηλή was sometimes designated by the words ποτε ἐπέσευξο or ποτε ἐπεσεύξον, to denote three great parts of the day; but others seem to have been known at the time when the Homeric poems were composed. The chief information respecting the divisions of the day in the period after Homer, and more especially the divisions made by the Athenians, is to be derived from Pausanias.13 The first and last of the divisions made at the time of Homer were afterward subdivided into two parts. The earlier part of the morning was termed πρώτη or πρῶτη τῆς ἡμέρας; the latter πλησίον τῆς ἁγίας, or περὶ πλησίου τῆς ἁγίας.15 The μέτων ἡμέρα of Homer was afterward expressed by μεσημβρία, μέσος ἡμέρας, or μέση ἡμέρα, and comprehended, as before, the middle of the day, when the sun seemed neither to rise nor to set. The two parts were called διπλά πρωτά or πρωτα, and διπλά νυκτά or νυκτά.16 This division continued to be observed down to

to the latest period of Grecian history, though an
other more accurate division, and more adapted to
the purposes of common life, was introduced at an
early period. But, as Pliny, or, according to others
his disciple Anaximenes, is said to have
made the Greeks acquainted with the use of the
Babylonian chronometer or sundial (called ἀκροβολ
or ἐφορίσιον, sometimes with the epithet σκηνοθρόνος
or σήκουσιον), by means of which the natural day was
divided into twelve equal spaces of time.1 These
spaces were, of course, longer or shorter, according
to the various seasons of the year. The name
hours (ὥραι), however, did not come into general
use till a very late period, and the difference be-
 tween natural and equinoctial hours was first ob-
served by the Alexandrine astronomers.
During the early ages of the history of Rome,
when artificial means of dividing time were yet un-
known, the natural phenomena of increasing light
and darkness formed with the Romans, as with the
Greeks, the standard of division, as we see from
the vague expressions in Consorinii.2 Pliny states3
that in the Twelve Tables only the rising and
the setting of the sun were mentioned as the two parts
into which the day was then divided; but from
Consorinii4 and Gallius5 we learn that midday (meri-
dies) was also mentioned. Varro6 likewise distin-
guished three parts of the day, viz.: manae, meridies,
and suprema solis tempestas, after which no assem-
blies were convened. The interval that was expressly
prescribed that a herald should proclaim the supre-
ma in the comitium, that the people might know
that their meeting was to be adjourned. But the di-
vision of the day most generally observed by the
Romans was that into tempus antemeridianum and
pomerdianum; the meridies itself being only consid-
ered as a point at which the one ended and the other
commenced. The importance of this moment was so
great that, when in the future of the sun had risen
over the horizon, the people, whatever their busi-
ness, ceased to be occupied; and the effect on the
mind of the Romans from this was considerable.
This was about the year B.C. 291, when L. Papirius
Cursor, after the war with Pyrrhus in southern Italy,
brought to Rome an instrument called solarium horologium,
or simply solarium.7 But as the solarium had been
made for a different meridian, it showed the time at
Rome very incorrectly. Seipio Nasica, therefore,
erected in B.C. 159 a public clepsydra, which indicated
the hours of the night as well as of the day.
Even after the erection of this clepsydra, it was cus-
tomary for one of the subordinate officers of the
prætor to proclaim the third, sixth, and ninth hours;
which shows that the day was, like the night, divi-
sed into four parts, each consisting of three hours.
See Dissen's treatise, De Partibus Notici et Diei ex
Divinationem Veterum, in his Kleine Lateinische und
Deutsche Schriften, p. 130, 150. (Compare the arti-
cles Horologium.)
All the days of the year were, according to dif-
ferent points of view, divided by the Romans into
different classes. For the purpose of the adminis-
tration of justice, all days were divided into dies fas-
ti and dies nefasti.
Dies fasti were the days on which the prætor
was allowed to administer justice in the public
courts: they derived their name from fars (far, um
erba; do, dies, adier). On some of the dies fasti
(19th of February) wars were proclaimed. Dies fas-
ti might be fasti in three different ways: 1. Dies fas-
ti prope et toli, or simply dies fasti, were days on
which the praetor used to hold his courts, and could do
justice at all hours. They were marked in the Roman
calendar by the letter F, and their number in the
course of the year was 38; 2. Dies proprius sed non
toti fasti, or dies interius, days on which the pra-
et used to hold his courts, but not at all hours, so
that sometimes one half of such a day was fastus, while
the other half was nefastus. Their number was 55 in
the year, and they were marked in the calendar
by the signs Fe. = fastus primo, Np = nefastus
primo, Em. = endotercius = interius. Q. Rex C. F. =
quando Rex comito fugit, or quando Rex comissi
fugis, Q. St. Df. = quando stercus defecerit; 3. Dies
proprius sed caei fasti, or days which were not fastus
properly speaking, but became fasti accidentally.
A dies comitalis, for instance, might become fastus,
either if during its whole course, or during a part
of it, no comitia were held, so that it accordingly
became either a dies fastus totus, or fastus ex parte.
Dies nefasti were days on which neither courts
of justice nor comitia were allowed to be held, and
which were dedicated to other purposes.8 Accord-
ing to the ancient legends, they were said to have
been fixed by Numitor. Numerous famous days and
cycles were marked besides; and accordingly it
might be understood that no part of a day might be
fastus, while another was nefastus. The nondina,
which had originally been dies fasti, had been made
nefasti at the time when the twelve-months year was
introduced; but in B.C. 268 they were again made fasti
by a law of Q. Hortensius. The term dies nefasti, which
originally had nothing to do with religion, but simply indicated
days on which no public courts were held, came to be
understood in the subsequent times applied to religious days in gen-
eral, as dies nefasti were mostly dedicated to the wor-
sip of the gods.9
In a religious point of view all days of the year
were either dies fasti, or dies profesti, or dies interius.
According to the definition given by Macrobius, dies
fasti were dedicated to the gods, and spent with holy
purposes. Dies profesti belonged to the gods, and
dies interius belonged to the state. Dies profesti
were days on which such a point of view was held
(guibus vademcum licet discreare)10 Dies staui were
days set apart for causes between Roman citizens
and foreigners (qui judicati causa eum perpetrauisse
imitatur). Dies profesti were days on which religion
did not hold, and days were spent with holy
purposes; a list of days and festivals on which it was
certainly the case. Dies comitalis or dies comiti
was a day on which no comitia were held, and
when a religious ceremony was to be performed.

DIGESTA. (Vid. Pandectes.)

DIGITUS. (Vid. Fex.)

DIPOLEIA (Διπόλεια), also called Διπόλεια ο. Διπόλεια, a very ancient festival, celebrated every year on the acropolis of Athens in honour of Zeus, surnamed Πολείτες. 1 Suidas and the scholiast on Aristophanes 2 are mistaken in believing that the Dipolia were the same festival as the Diasia. It was held on the 14th of Scirophorion. The manner in which his shield, he was slain. The offerings on this occasion, and the origin of the rite, are described by Porphyrius, 3 with whose account may be compared the fragmentary descriptions of Pausanias 4 and Elian. 5 The Athenians placed barley mixed with wheat upon the altar of Zeus, and left it unguarded; the ox destined to be sacrificed was then allowed to go and take of the seeds. One of the shepherds accompanied the κυνοφόροι (whose the festival was sometimes called κυνοφορία), at seeing the ox eating, snatched the axe, killed the ox, and ran away. The others, as if not knowing who had killed the animal, made inquiries, and at last also summoned the axe, which was in the end declared guilty of having committed the murder. Thus arose the curious custom, and is one following circumstance:—In the reign of Erechtheus, at the celebration of the Dionysia, or, according to the scholiast on Aristophanes, 6 at the Dipolia, an ox ate the cakes offered to the god, and one Baulen or Thaulon, or, according to others, the βουφόφορος, killed the ox with an axe and fled from his country. This was the origin of the festival, for the axe was declared guilty, and the rite observed at the Dipolia was performed in commemoration of that event. 7 This legend of the origin of the Dipolia manifestly leads us back to a time when it had not yet become customary to offer animal sacrifices to the gods, but merely the fruits of the earth. Porphyrius also informs us that three escaped, the axe was declared guilty, and the rite observed at the Dipolia was performed in commemoration of that event. 7 This legend of the origin of the Dipolia manifestly leads us back to a time when it had not yet become customary to offer animal sacrifices to the gods, but merely the fruits of the earth. Porphyrius also informs us that three escaped, the axe was declared guilty, and the rite observed at the Dipolia was performed in commemoration of that event. 7

2. (Vid. Fex.)

DIMACHAE (Διμαχάε) were Macedonian horse-soldiers who, also fought on foot when occasion required. Their armour was heavier than that of the ordinary horse-soldiers, and lighter than that of the regular heavy-armed foot. A servant accompanied each soldier in order to take care of his horse when he alighted to fight on foot. This species of troops is said to have been first introduced by Alexander the Great. 8

DIMINUTIO CAP'PTITUS. (Vid. Caput.)

DIOBOLOS. (Vid. Osolos.)

DIOCLEIA (Διοκλεία), a festival celebrated by the Megarians in honour of an ancient Athenian hero, Diocles, around whose grave young men assembled on the occasion, and made a pretence of weeping. We read that he who gave the sweetest kiss obtained the prize, consisting of a garland of flowers. 10 The scholiast on Theocritus 11 relates the origin of this festival as follows:—Diocles, an Athenian exile, fled to Megara, where he found a youth with whom he fell in love. In some battle, while protecting the object of his love with his shield, he was slain. The Megarians honoured the gallant lover with a tomb, raised him to the rank of a hero, and, in commemoration of his

faithful attachment, instituted the festival of the Diocese. See Böckh ad Pind. Olymp. vii. 157, p. 176, and the scholiast ad Aristoph., Acharn., 730, where a Megarian swears by Diocles, from which we may infer that he was held in great honour by the Megarians. 1

DIOMYSIA (Διόμυσια). (Vid. Antonios.)

DIONYSESIA (Διονύσεια), festivals celebrated in various parts of Greece in honour of Dionysus. We have to consider the great festivals of the same deity, although some of them bore different names; for here, as in other cases, the name of the festival was sometimes derived from that of the god, sometimes from the place where it was celebrated, and sometimes from some particular circumstance connected with its celebration. We shall, however, direct our attention chiefly to the Dianysia of Dionysus, as, on account of their intimate connexion with the origin and the development of dramatic literature, they are of greater importance to us than any other ancient festival.

The general character of the festivals of Dionysus was extravagant merriment and enthusiastic joy, which manifested themselves in various ways. The importunities of the spectators and their absurd practices in which the Greeks indulged during the celebration of the Dionysia, has been well explained by Müller: 2 "The intense desire felt by every worshipper of Dionysus to fight, to conquer, to suffer in common with him, made them regard the subordinate beigas (Satur, Pans, and Nymphs, to whom names were extended: was the object of the Dianysia, as, through whom life seemed to pass from him into vegetation, and branch off into a variety of beautiful or grotesque forms), who were ever present to the fancy of the Greeks, as a convenient step by which they could approach more nearly to the presence of their divinity. The customs so prevalent at the festivals of Dionysus, of driving out Baccha, of Dionysus, disturbed the original in this feeling, and not in the mere desire of concealing excesses under the disguise of a mask, otherwise so serious and pathetic a spectacle as tragedy could never have originated in the choruses of these satyrs. The desire of escaping from self into something new and strange, of living in an imagined and visionary world, is the true object of these festivals of Dionysus. It is seen in the colouring the body with plaster, soot, vermilion, and different sorts of green and red juices of plants, wearing goat and deer skins round the loins, covering the face with large leaves of different plants, and, lastly, in the wearing masks of wood, bark, and other materials, and of the complete costume belonging to the character. Drunkenness, and the boisterous music of flutes, cymbals, and drums, were likewise common to all Dionysiac festivals. In the processions called θυσια, from which they were celebrated, women also took part, in the disguise of Bacche, Lene, Thyaides, Naiades, Nymphs, &c., adorned with garlands of ivy, and bearing in their bands (where the god was sometimes called ΘΥΣΙΟΦΟΡΟΣ), so that the whole train represented a population inspired, and actuated by the powerful presence of the god. The choruses sung on the occasion were called dithyrambs, and were hymns addressed to the god in the freest metres and with the boldest imagery, in which he praised his power and achievements, were extolled. The phallus, the symbol of the fertility of nature, was also carried in these processions, 3 and men disguised as women, called θυσιαλια, 4 followed the

The indulgence in drinking was considered by the Greeks as a duty of gratitude which they owed to the giver of the vine; hence in some places it was thought a crime to remain sober at the Dioneia. 1

The Attic festivals of Dionysus were four in number: the Διονύσια κατά άρχοντας, or the rural Dionysia, the Λύκαια, the Ποιήματα, and the Ανθέωνες ιερέας. After Rathkemp 2 and Spalding 3 had declared the Anthesteria and the Lenaean to be only two names for one and the same festival, it was generally taken for granted that there could be no doubt as to the real identity of the two, until in 1817, A. Böckh read a paper to the Berlin Academy, 4 in which he established by incontrovertible arguments the difference between the Lenaean and Anthesteria. An abridgment of Böckh's essay, containing all that is necessary to form a clear idea of the whole question, is given in the Philologische Museum. 5

The season of the year sacred to Dionysus was during the months nearest to the shortest day; 6 and the Attic festivals were accordingly celebrated in the Poseideon, Gamelion (the Lenaean of the Ionian), Anthesteria, and Elaphebolion.

The Ποιήματα κατά άρχοντας or μαραθοί, the rural or lesser Dionysia, were celebrated in the various demes of Attica in the month of Poseideon, and were under the superintendence of the several local magistrates, the demarchs. This was doubtless the most ancient of all, and was held with the highest degree of merriment and freedom; even slaves enjoyed full freedom during its celebration; and their boisterous shouts on the occasion were always listened to with joy by the rustics. The origin of comedy, in the jests and the scurrilous abuse which the peasants vented upon the by-standers from a wagon in which they rode about (κόμιον τον άμφοτερο). Aristophanes 7 calls the comic poets τραγικοί, lee-singers, and comedy, τραγικόλα, lee-song; 8 from the custom of smearing the face with lees of wine, in which the merry country people dined. The most sumptuous Dionysia, those of Athens, which were afterward introduced into the city, seem also originally to have been peculiar to the rural Dionysia. The Dionysia in the Piræus, as well as those of the other demes of Attica, belonged to the lesser Dionysia, as is acknowledged both by Spalding and Böckh. Those in the Piræus were celebrated with as much splendour as those in the city; for we read of a procession, of the performance of comedies and tragedies, which at first may have been new as well as old pieces; but when the drama had attained a regular form, only old pieces were represented at the rural Dionysia. Their liberal and democratic character seems to have been the cause of the opposition which these festivals met with, when, in the time of Pisistratus, Thespis was permitted to introduce the rural amusements of the Dionysia into the city of Athens. 9 That in other places, also, the introduction of the worship of Dionysus met with great opposition, must be inferred from the legends of Orchomenos, Thebes, Argos, Ephesus, and other places. Something similar seems to be implied in the account of the restoration of tragic choruses to Dionysus at Sicyon.

The second festival, the Lenaean (from λύκας, the wine-press, from which, also, the month of Gamelion was called by the Ionians Lenaian), was celebrated in the month of Gamelion; the place of its celebration was the ancient temple of Dionysus Limneus (from λίμνη, as the district was originally a swamp, whence the god was also called Λιμναύς). This temple, the Lenaean, was situated south of the theatre of Dionysus, and close by it. 10 The Lenaes were celebrated during the possession and scenic contests in tragedy and comedy. 11 The procession probably went to the Lenaean, where a goat (τριγονός, hence the chorus and tragedy which arose out of it were called τριγονικόν χρόνος and τριγονίδια) was sacrificed, and a chorus standing around the altar sang the dithyrambic ode to the god. As the dithyramb was the element out of which, by the introduction of an actor, tragedy arose (vid. Χορος), it is natural that, in the scenic contests of this festival, tragedy should have preceded comedy, as we see from the important documents in Demosthenes. 12

The poet who wished his play to be brought out at the Lenaean applied to the second archon, who had the superintendence of this festival as well as the Anthesteria, and who gave him the chorus if the piece was thought to deserve it. Thucydides states that the Anthesteria was celebrated on the 12th of the month of Anthesterion, 13 that is to say, the second day fell on the 12th, for it lasted three days, and the first fell on the 11th 14 and the third on the 13th. 15 The second archon superintended the celebration of the Anthesteria, and distributed the prizes among the victors in the various games which were carried on during the season. The first day was called παιδούρια, the second Χοροί, the third Ιερά. In the second day Aristophanes 16 derived its name from the opening of the casks to taste the wine of the preceding year; the second from χοῦς, the cup, and seems to have been the day devoted to drinking. The ascolia seem to have been played on this day. (Vid. Ascall.) We read in Suidas 17 of another similar amusement peculiar to this day. The drinker placed himself upon a bag filled with air, trumpets were sounded, and he who emptied his cup quickest, or drank most, received as his prize a leather bag filled with wine and a garland, or, according to Είδιος, 18 a golden crown. The κόμιος τον ύμησο also took place on this day, and the jests and abuse which persons poured forth on this occasion were doubtless an imitation of the amusements customary at the rural Dionysia. Aristophanes 19 says that it was customary on the day of the Choes to send on to soothsay their salaries and presents, that they too might enjoy themselves with their friends. The third day had its name from χύτρος, a pot, as on this day persons offered pots with flowers, seeds, or cooked vegetables, as a sacrifice to Dionysus and Hermes Chthonious. 20 With this sacrifice were connected the δύνεις χύτρων remembered by the scholiast on Aristophanes, 21 which the second archon distributed the prizes. Slaves were permitted to take part in the general rejoicing of the Anthesteria; but at the close of the day they were sent home with the words δέρας, Κάρπε, οίνος ἔτοι Ανθέωνες. 22

It is uncertain whether dramas were performed at the Anthestheria; but Бёчк supposes that comedies were represented, and that tragedies only, which were to be brought out at the great Dionysia were perhaps rehearsed at the Anthestheria. The mysteries connected with the celebration of the Anthestheria were held at night, in the ancient temple Элай в муня, which was opened only once a year, on the 12th of Anthestheria. They were likewise under the superintendence of the second archon and a certain number of priests, who, with the purification ceremonies, called γερμαρι or γερμανοί, the venerable, who conducted the ceremonies with the assistance of one other priest. The wife of the second archon (βασιλισσα) offered a mysterious sacrifice for the welfare of the city; she was betrothed to the god in a secret solemnity, and also tendered the oath to the goddess, which, according to Demosthenes, ran thus: "I solemnly promise, and swear with my husband, Titus, my only child, and my possessions, and everything that is mine, to fulfill the commandments of my country and of the gods, and to do nothing which may bring disgrace on my country, nor anything which will bring shame to my name." The sacrifice offered to the god in these mysteries consisted of a sow, the usual sacrifice of Demeter, and in some places of a cow with calf. It is more probable than that the history of Dionysus was symbolically represented in these mysteries, as the history of Demeter was acted in those of Eleusis, which were in some respects connected with the former.

The fourth Attic festival of Dionysus, Διόνυσις τώ άστι, στίκτικον ο μεγάλα, was celebrated about the 12th of the month of Ελαφειαλούλ, but we do not know whether they lasted more than one day or not. The only place in which the Dionysia are mentioned as having been held, was, according to the document in Demosthenes, as follows: The great public processions, the chorus of boys, the κόινος (vid. Κοινός), comedy, and, lastly, tragedy. We possess in Athens the description of a great Bacchic procession, held at Alexandria in the reign of Ptolemaus Philopappus, from which we infer that Dionysiac processions were held in Athens. It seems to have been customary to represent the god by a man in this procession. Plutarch, at least, relates, that on one occasion, a beautiful slave of Nicias represented Dionysus. A ridiculous imitation of a Bacchic procession is described in Aristophanes. Of the dramatists which were performed at the great Dionysia, the tragedies, at least, were generally new pieces; repetitions do not, however, seem to have been excluded from any Dionysiac festival. The first archon had the superintendence, and gave the chorus to the dramatic poet who wished to bring out his piece at this festival. The prize awarded to the dramatist for the best play consisted of a crown and his piece was probably performed at Dionysia.

Strangers were prohibited from taking part in the choruses of boys. During this and some other of the great Attic festivals, prisoners were set free, and nobody was allowed to seize the goods of a debtor; but a war was not interrupted by its celebration. As the great Dionysia were celebrated at the beginning of spring, when the navigation was resumed, Athens was not only visited by numbers of country people but also by strangers from other parts of Greece; and the various and various parts of the occasion were not unlike those of a modern fair. Respecting the scrupulous regularity, and the enormous sums spent by the Athenians on the celebration of these and other festivals, see Demosthener. As many circumstances connected with the celebration of the Dionysia cannot be made clear without entering into minute details, we must refer the reader to the authors referred to in the notes.

The worship of Dionysus was almost universal among the Greeks in Asia as well as in Europe, and the character of his festivals was the same everywhere, only modified by the national differences of the various tribes of the Greeks. It is expressly stated that the Spartans did not indulge so much in drinking during the celebration of the Dionysia as the other Greeks. The worship of Dionysus was in general, with the exception of Corinth, Sicyon, and the Doric colonies in southern Italy, less popular among the Doric states than in other parts of Greece. It was most enthusiastic in Boeotia, in the orgies on Mount Cithaeron, as is well known from allusions and descriptions in several Roman poets. That the Bacchanalia were an extraneous form of Bacchic worship, conducted with which all festivals of this class were celebrated, did, in the course of time, lead to the greatest excesses, cannot be denied; but we must, at the same time, acknowledge that such excesses did not occur until a comparatively late period. At a very early period of Greek history, Bacchic festivals were connected with the temple and sacred mysteries, and traces of this custom are discernible even until very late. In Chios this custom was superseded by another, according to which the Bacchae were obliged to eat the raw pieces of flesh of the victim which were distributed among them. This act was called ψωμαγια, and Dionysus derived from it the name of Ψωμαδος and Ψωματας.

The theory that tragic poetry originated from the contest at Samos, at which three noble Persians were sacrificed to the divinity, is not much supported by another, according to which the Bacchae were obliged to eat the raw pieces of flesh of the victim which were distributed among them. This act was called ψωμαγια, and Dionysus derived from it the name of Ψωμαδος and Ψωματας.

But Plutarch's account of this very instance, if true, shows that at this time such savage rites were looked upon with horror.

The worship of Dionysus, whom the Romans called Bacchus, or, rather, the Bacchic mysteries and orgies of Bacchus; are said to have been introduced from southern Italy into Etruria, and from thence to Rome, where for a time they were carried on in secret, and, during the latter part of their existence, at night. The initiated, according to Livy, did not only indulge in feasting and drinking at their meetings, but, when their minds were heated with wine, they indulged in the coarsest excesses and the most unnatural vices. Young girls and youths were seduced, and all modesty was set aside; every kind of vice found here its full satisfaction. But the crimes did not remain confined to these meetings; their consequences were manifest in all directions; for false witnesses, forgeries, false wills, and all communications proceeded from these orgies. Persons accused of crime, when not exonerated, were carried on under the cover of this society; and the voices of those who had been fraudulently drawn into these orgies, and would cry out against the shameless practices, were drowned by the shouts of the Bacchantes, and the deafening sounds of drums and cymbals. The time of initiation lasted ten days, during the
which a person was obliged to abstain from all sexual intercourse; on the tenth he took a solemn meal, underwent a purification by water, and was led into the sanctuary (Bacchanal). At first only women were initiated, and the orgies were celebrated to the memory of a priestess named Semila, who died in 297. Mater Matronorum, the great priestess of Bacchus, changed the whole method of celebration: she admitted men to the initiation, and transferred the solemnization, which had hitherto taken place during the daytime, to the night. Instead of three days in the year, she ordered that the Bacchanalia should be held during five days. It was not until this time that these orgies were carried on after this new plan that, according to the statement of an eyewitness, licentiousness and crimes of every description were committed. Men as well as women indulged in the most unnatural appetites, and those who attempted to stop or to oppose such odious proceedings fell as victims. It was, as Livy says, a principle of the society to hold every ordinance of God and nature in contempt. Men, as if seized by fits of madness, and under great convulsions, gave oracles: and the matrons, dressed as Bacchoae, with dishevelled hair and burning torches in their hands, ran down to the Tiber and plunged their torches into the water; the torches, however, containing sulphur and chalk, were not extinguished. Men were seen flying about, or lying on the ground, with dishevelled hair and burning torches in their hands. These orgies were frequently thrown into dark caverns and despatched, while the perpetrators declared that they had been carried off by the gods. Among the number of the members of these mysteries were, at the time when they were suppressed, persons of all classes; and during the last two years, nobody had been initiated who was above the age of twenty years. As this age was thought most fit for seduction and sensual pleasure.

In the year B.C. 186, the consuls Spurius Postumius Albinus and Q. Marcus Philippus were informed of the existence of these meetings, and, after having ascertained the facts mentioned above, they made a report to the senate. The senate, alarmed by this singular discovery, and although they liked not the moral nature of these meetings, which should be involved, invested the consuls with extraordinary power, to inquire into the nature of these nocturnal meetings, to exert all their energy to secure the priests and priestesses, to issue a proclamation throughout Rome and Italy, forbidding any one to be initiated in the Bacchic mysteries, or to meet for the purpose of celebrating them; but, above all things, to submit those individuals who had already been secured to a rigid trial. The consuls, after having given to the subordinate magistrates all the necessary instructions, held an assembly of the people, in which the facts just discovered were explained to the public, in order that the objects of the proceedings which were to take place might be known to every citizen. A reward was at the same time offered to any one who might be able to give further information, or to name any one that belonged to the conspiracy, as it was called. Measures were also taken to prevent any one from leaving Italy. During the night following, a number of persons were apprehended; many of them put an end to their own lives. The whole number of the initiated was said to be 7000. The trial of all those who were apprehended lasted thirty days. It was attended with all the solemnity prescribed. The guilt of the more culpable was obvious; as well as the guilty had reason to fear. The punishment inflicted on those who were convicted varied according to the degree of their guilt; some were thrown into prison, others were put to death. The women were surrendered to their parents or husbands, that they might receive their punishment in private. The consuls then ordered the senate to destroy all Bacchanalia throughout Rome and Italy, with the exception of such altars as had been erected to the worshippers of Bacchus before the sun of the gods had existed there from ancient times. In order to prevent a restoration of the Bacchic orgies, the celebrated decree of the senate (Sénatus consulta of Bacchanalam) was issued, commanding that no Bacchanalia should be held either in Rome or Italy; that if any one should think such ceremonies necessary, or if he could not neglect them, they should be performed in a desolate and deserted place, and that he should apply to the praetor urbans, who might then consult the senate. If the permission should be granted to him in an assembly of the senate, consisting of not less than one hundred members, he might solemnize the Bacchic sacra; but no more than five persons were to be present at the celebration; there should be no common fund, and no master of the sacra or priest. This decree is also mentioned by Cicero (Pro Cluentio, i. 4.), and Galen (De loc. n. ii. 120), in his time. An important fragment of this important document was discovered near Baris, in southern Italy, in the year 1640, and is at present in the imperial Museum of Vienna. A copy of it is given in Drakenburch's edition of Livy.

We have, in our account of the Roman Bacchanalia, closely followed the description given by Livy, which may, indeed, be somewhat exaggerated; but, as, however, the difference in character between the Greeks and Romans, it cannot be surprising that a festival like the Dionysia, when once introduced among the Romans, should have immediately degenerated into the grossest and coarsest excesses. Similar consequences were seen immediately after the time when the Romans were made acquainted with the elegance and the luxuries of Greek life; for, like barbarians, they knew not where to stop, and became brutal in their enjoyments. But whether the account of Livy be exaggerated or not, thus much is certain, that the Romans, ever since the time of the suppression of the Bacchanalia, considered these orgies as in the highest degree immoral and licentious, as we see from the manner in which they applied the words derived from Bacchus, e. g., bacchus, bocab, bacchante, bacchus, and others. But the most important and the most surprising of all the statements of Livy is, that the Bacchanalia should have been celebrated for several years in the boisterous manner described above, and by thousands of persons, without any of the magistrates appearing to have been aware of it.

While the Bacchanalia were thus suppressed, another more simple and innocent festival of Bacchus, the Liberato (from Liber or Liber Pater, a name of Bacchus), continued to be celebrated at Rome every year on the 16th of March. A description of the ceremonies customary at this festival is given by Ovid, which may be compared Varro. Priests and aged priestesses, adorned with garlands of ivy, carried through the city wine, honey, cakes, and sweetmeats, together with an altar with a handle (anastas ather), in the middle of which there was a small firepan (opus ignis), in which time to time, sacrifices were burned. On this day Roman youths who had attained their sixteenth year received the toga virill. That the Liberalia were celebrated with various amusements and great merriment, might be inferred from the general character of Dionysiac festivals; but we may also see it from the name Ludi Liberala, which is sometimes used instead of Liberalia: and Navius expressly says, 1. (Livy, xxxix. 18.),—2. (De Leg. ii. 13.),—3. (Tom. ii), 109, seqq.—4. (Ovid., Fast. iii., 713.),—5. (L. c.—6. (De Leg. Legat. v. 56, ed. Bipont.).—7. (Cic. ad Att., i., 1. 8, (ap. Por.)

1. (Livy, xxviii. 13.),—2. (Livy, xxviii. 14.)
DISCUS.

1. (Compare vii., Ilor., Vid. Cic., "division,"
(27.)—} but is is do the (p. 11x52 ii., consisted conferred thatli that country adopted conjectures Theophrastus." festivals The Argostemma Flos Jevii; and Stackhouse hesitates between the Argostemma and the Dianthus Caryophyllus, or Carnation. 8

DISCOCURIA (Δισκούρια), festivals celebrated in various parts of Greece in honour of the Dioscuri. The Spartan Dioscuria mentioned by Pausanias8 and Stephan. and the Roman festival of a different character are both sacri
genowo and drinking. At Cyrene the Dioscuri were likewise honoured with a great festival. 8 The Athenian festival of the Dioscuri has been described under ΑΝΑΚΕΙΑ. Their worship was very generally adopted in Greece, especially in the Doric and Achaean states, as we conclude from the great number of temples dedicated to them; but scarcely anything is known respecting the manner in which their festivals were celebrated.

*DISCO ΠYRUS (Δίσκοπυρος), according to Stackhouse, the Diospyrus Lotus; but Schneider doubts whether the fruit of the latter agrees in character with the description of the Δίσκοπυρος as given by Theophrastus. 8 This was a vessel containing two ears (γράτας) or handles, used for holding wine. It appears to have been much the same as the amphora. (Vid. ΑΜΦΟΡΑ.)

*DIPHIYGES (διπηγες), "evidently," according to Adams, a metallic compound of copper. Sprengel says it consisted principally of burned copper, with a certain admixture of iron. Dr. Milligan calls it an oxide of copper. Matthiolus gives it the name of Μάρκος δραχμή, i. e., Husk of bronze. 8

*DIPSACUS (dipsaceus), the Dipsacus Fullenum, Fuller's Thistle, or manured steams. Stephens calls it Χάρδων Μενέτεϊα. The leaves are concave, and so placed as to contain water. 8

*DIPSAS (dipsas), the name of a venomous serpent, whose bite causes insatiable thirst, whence the name, from δίψαος, "to thirst." Sprengel marks it as the Caluber presster, or black viper. According to Adams, it is sometimes found in England. A splendid description of the effects of its sting is given by Lucan. For further information, the student is referred by Adams to Nicander, Dioscorides, Aetius, and Paulus Aegineta, and to Harriet, as also to Lucan in the treatise on the Dioscuras. 8

DIPHTHIERA (διβηχας) was a kind of cloak made of the skins of animals, and worn by herdsmen and country people in general. It is frequently mentioned by Greek writers. 11 Pollux 12 says that it had a covering for the head (ἐπιπαρακορ), in which respect it would correspond to the Roman cucullus. (Vid. CUCULLUS.)

DIPHIROS (διφηρος). (Vid. CURRUS, p. 333.)

DIPLOIS (διπλος). (Vid. PALLIUM.)

DIPLOMA was a writ or public document, which conferred upon a person any right or privilege. During the Republic it was granted by the consuls and senate; and under the Empire, by the emperor and the prefects. The diploma was at first intended to do so. 8 The diploma was sealed by the emperor. 14 It consisted of two leaves, whence it derived its name.

These writings were especially given to public writers, or to those who wished to procure the use of the public horses or carriages. 4 The tabellarii of the emperor would naturally always have a diploma, to the emperor, when we read in an inscription of a diploma

DIΠΡΡΟΩΗ ΝΗΕΣ (διπρωρος νηες). (Vid. ΑΔΙΠΡΡΟΩΗ ΝΗΕΣ.)

DIPUTCHA (διπυτχα) were two writing tablets which could be folded together. Herodotus 8 speaks of a tabella mystica, a kind of diploma written on different materials, commonly of wood, but sometimes of ivory.

Under the Empire, it was the custom of the consul and other magistrates to distribute among their friends and the people, on the day on which they entered on their office, tablets, called respectively dipytcha, consularia, praeinatoria, diplyctes, &c., which were inscribed with their names, and contained their portraits. Several of these dipytches are given by Montfaucon. 6

DIRECTA ACTIO. (Vid. Actio, p. 17.)

DIRECTIUS are said by most modern writers to have been the persons who gave to the citizens the tabella with which they voted in the comitia (vid. Comitia). We are so often proved, in the preface to his Codex Eufutensius, 8 that it was the office of the diribitors to divide the votes when taken out of the cista, so as to determine which had the majority. He remarks that the etymology of diribere would lead us to assign to it the meaning of separation or "division," as it is composed of dis and habere, in the same manner as dirimere is of dis and ere; and that appears to be the case, since in præcere and dehure, which come respectively from pra and habere, and de and habere. In several passages the word cannot have any other signification than that given by Wunder. 8

When Cicero says, "vos rogatores, vos diritori, in consularia tabellarum," we may presume that he mentions these officers in the order in which they discharged their duties in the comitia. It was the office of the rogatores to collect the tabella which each century gave, as they used, before the ballot was introduced, to ask (rogare) each century for its votes, and report them to the magistrate who presided over the comitia. The rogatores, as has been already remarked, divided the votes taken out of the cista, and handed them over to the custodes, who checked them off by points marked on a tablet.

Many writers have confounded the cista with the sitella or urna, into which the sorts or mere lots were east, the true difference between these words is explained under SITELLUS.

DISCUS (δικος), a circular plate of stone (ὑπ. νοικον) or metal (σπλενίδα πονδέρα δίσκη), made, for throwing to a distance as an exercise of strength and dexterity. This was, indeed, one of the principal gymnastic exercises of the ancients, being included in the Περισθήραν. It was practised in the horsemen and soldiers, and was totally forbidden by Apollo as they were playing together at this game, 13 also proves its very high antiquity.

The discus was ten or twelve inches in diameter, so as to reach above the middle of the forearm when held in the right hand. The object was to throw it...
DISCUS.

from a fixed spot to the greatest distance; and in doing this, each player had a friend to mark the point at which the discus, when thrown by him, struck the ground, as is done by Minerva on behalf of Ulysses when he contends with the Phaeacians; 

The distance to which it was commonly thrown became a measure of strength, called ἀπολογος. The space on which the discobolus, or thrower of the discus, stood, was called βάλλει, and was indicated by being a little higher than the ground surrounding it. As each man took his station, with his body entirely naked, on the βάλλει, he placed his right foot forward, bending his knee, and resting principally on this foot. The discus being held, ready to be thrown, in his right hand, he stooped, turning his body towards it, and his left hand was naturally turned in the same direction. This attitude was represented by the sculptor Myron in one of his works, and is adopted by Quintilian\(^2\) to show how much greater skill is displayed by the artist, and how much more powerful an effect is produced on the spectator, when a person is represented in action, than when he is at rest or standing erect.

We fortunately possess several copies, more or less entire, of this celebrated statue; and one of the best of them is in the British Museum (see the annexed woodcut). It represents the player just ready to swing round his outstretched arm, so as to describe with it a semicircle in the air, and thus, with his collected force, to project the discus at an angle of forty-five degrees, at the same time springing forward so as to give it the impetus of his whole body. *Hieron* "saepe contemptur turbae, et spes prosperi-

By metaphor, the term discus was applied to a mirror (vid. Spectrum); to the orb of the sun as seen by us; and to a flat round plate used to hold meat, whence the English dish.

Sometimes a heavy mass of a spherical form (σφραῖς) was used instead of a discus, as when the Greeks at the funeral games contended for a lump of iron, which was to be given to him who could throw it farthest. *The σφραῖς was perforated in the centre*, so that a rope or thong might be passed through, and used in throwing it. In this form the discobolus is still practised by the mountaineers of the canton of Appenzell, in Switzerland. They meet twice a year to throw round stones of great weight and size. This they do by a sudden leap and forcible swinging of the whole body. The same stone is taken by all, as in the case of the ancient discus and σφραῖς: he who sends it to the greatest distance receives a public prize. The stone is lifted as high as the right shoulder (see woodcut; κατα νικόν) before being projected.\(^8\)

DISPENSATOR. (Vid. Calculatores.)

DITHYRAMBUS. (Vid. Chorus, p. 247.)

DIVERSITAS. (Vid. Caprona.)

Divine, according to Cicero,\(^1\) a presentiment and a knowledge of future things; or, according to Chrysippus,\(^2\) a power in man which foresees and explains those signs which the gods throw in his way, and the diviner must therefore know the disposition of the gods towards men, the import of their signs, and by what means these signs are to be obtained. According to this latter definition, the meaning of the Latin word divinatio is narrower than that of the Greek μαντεία, i.e., a presage or knowledge, in which the latter signifies any means by which the decrees of the gods can be discovered, the natural as well as the artificial; that is to say, the seers and the oracles, where the will of the gods is revealed by inspiration, as well as the divinatio in the sense of Chrysippus. In the one, man is the passive agent through which the deity reveals the future; while in the other, man discovers it by his own skill or experience, without any pretension to inspiration.

As, however, the seer or vates was also frequently called divinus, we shall treat, under this head, of seers as well as of other kinds of divination. The subject of oracles is discussed in a separate article. (Vid. Oraculum.)

The belief that the decrees of the divine will were occasionally revealed by the deity himself, or could be discovered by certain individuals, is one which the classical nations of antiquity had, in common with many other nations, before the attainment of a certain degree of intellectual cultivation. In early ages such a belief was natural, and perhaps founded on the feeling of a very close connexion between man, God, and nature. But in the course of time, when men became more acquainted with the laws of nature, this belief was abandoned, at least by the more enlightened minds, while the multitudes still continued to adhere to it; and the governments, seeing the advantages to be derived from it, not only countenanced, but encouraged and supported it.

The seers or μαντης, who, under the direct influence of the gods, chiefly that of Apollo, announced the future events to have been connected with certain places where oracles were given; but in subsequent times they formed a distinct class of persons, independent of any locality; one of them is Calchas in the Homeric poems. Apollo, the god of prophecy, was generally the source from which the seers, as well as other diviners, derived their knowledge. In many families of seers the inspired vates was, however, of the family, and was hereditary, and to be transmitted from father to son. To these families belonged the Iamids,\(^3\) who from Olympia spread over a considerable part of Greece; the Branchidæ, near Miletus;\(^4\) the Eumolpiæ, at Athens and Eleusis; the Cylitidæ,\(^5\) the Tellidæ,\(^6\) the Acarnanian seers, and others. Some of these families retained their celebrity till a very late period of Grecian history. The manteis made their prophecies when either requested to do so on important emergencies, or they made them spontaneously whenever they thought it necessary, either

DIVINATIO.

o prevent some calamity or to stimulate their coun-
rymen to something beneficial. The civil govern-
ment of Athens not only tolerated, but protected
and honoured them; and Cicero 1 says, that the man-
archs were present in all the public assemblies of the
Athenians. 2 Along with the seers we may also
mention the Bacides and the Sibylla. Both existed
from a very remote time, and were distinct from
the manteis so far as they pretended to derive their
knowledge of the future from sacred books (γνωστά)
which they consulted, and which were in some places,
as at Athens and Rome, kept by the govern-
ment or some especial officers, in the acropolis and
in the most revered sanctuary. Baccus was, accord-
ing to ancient times, one of the Bacides, and Homer, who
was once inspired by nymphs, the scholar of Aris-
tophanes 3 and Είλια 4 mention three original Bac-
des, one of Eleon in Boeotia, a second of Athens,
and a third of Caphys in Arcadia. 5 From these three
Bacides all others were said to be descended, and
to have derived their name. Antichares, 6 Mu-
saeus 7 listless of the Sibylla is not at present known.
Bacides, 8 probably belonged to the Bacides. The Sib-
ylla were prophetic women, probably of Asiatic
origin, whose peculiar custom seems to have been to
wander with their sacred books from place to place. 9·
Είλια 10 states that, according to some authors,
there were four Sibylla, the Erythrean, the Sa-
man, the Egyptian, and the Sardisian; but that
other authors, as is high (Olim, there were only
three, namely, the Cumes, and another called the
Jewish Sibylla. Compare Suidas, 11 and Pausanias, 12
who has devoted a whole chapter to the Sibylla, in
which, however, he does not clearly distinguish be-
tween the Sibylly properly so called, and other wom-
* men who travelled about and made the prophetic art
their business, and who thus left behind them numer-
ous in all the parts of the ancient world. 13 The
Sibylla whose books gained so great an importance
at Rome, according to Varro, 14 the Erythrean:
The Locals which she said was said to have sold to one of
the Tarquins were carefully concealed from the
public, and only accessible to the duumvirs. The
ease with which the books were obtained, and the
assistance that of the Bacides; but in some legends of a late
date they occur even in the period previous to the
Trojan war, and it is not improbable that at an
early period every town in Greece had its prophe-
cies by some Bacis or Sibylla. 17 They seem to
have retained their celebrity down to the time of
Antipater of Tarentum. 18

Besides these more respectable prophets and
prophetesses, there were numbers of diviners of an
inferior order (χρηστολόγα), who made it their
business to explain all sorts of signs, and to tell
fortunes. They were, however, more particularly
popular with the lower orders, who are everywhere
most ready to believe what is most marvellous and
least probable. Sometimes, however, does not seem to have existed until a
comparatively late period, 19 and to have been looked
upon, even by the Greeks themselves, as nuisances to the
public. These soothsayers lead us naturally to the mode of
divination, of which such frequent use was made
by the ancients in all the affairs of public and pri-
vate life, and which chiefly consisted in the inter-
pretation of numberless signs and phenomena. No
public undertaking of any consequence was ever
entered upon by the Greeks and Romans without
consulting the will of the gods, by observing the
signs which they sent, especially those in the sac-
rifices offered for the purpose, and by which they
were thought to indicate the success or the failure
of the undertaking. For this kind of divination no
divine inspiration was thought necessary, but mere-
ly experience and a certain knowledge acquired by
routine; and although, in some cases, priests were
appointed for the purpose of observing and explain-
ning signs (αἴονα, ἑκάστορνα), yet on any sud-
den emergency, especially in private affairs, any
one who had the chance was allowed to act as his own interpreter. The principal signs by
which the gods were thought to declare their will,
were things connected with the offering of sacrifi-
ces, the flight and voice of birds, all kinds of nat-
ural phenomena, asliny as well as extraordinary
and dreams.

The interpretation of signs of the first class (ΤΕΩ-
νατσια or θεονατσια, κοινωπικαί or αρχαναπικαί)
was, according to Ασσέρνιος, the invention of Pro-
metheus. It seems to have been most cultivated by
the Etruscans, among whom it was raised into a
complete science, and from whom it passed to the
Romans. Sacrifices were either offered for the
special purpose of consulting the gods, or in the or-
dinary business of public assembly, and they were
observed, and when they were propitious, the sacri-
fice was said καλλεργες. The principal points that
which were generally observed were, 1. The manner in
which the victim approached to the altar, whether
uttering a sound or not; the former was consider-
ed a favorable omen in the sacrifice at the Pan-
cro. 2. The smoke that rose from the altar, the libation,
and various other things (σώματα) which were offered to
the gods, and served, according to the kind and
manner of their appearance, as a means through which the will of the gods
might be learned, is clear from the names κατημνικαί,
λαγανοεια, κρατομανια, and others. Special
care was also taken, during a sacrifice, that no inap-
propriate or frivolous words were uttered by any of the
by-standers; hence the admonitions of the priests,
μηδεσφοινικαί αγείονα, μηδεσφοινικαί γεια,
γεια, and others; for improper expressions were
not only thought to pollute and profane the sacred
altar, but to be unlucky omens (διοφομα, κληδονα,
μπα, φωσα, ορι μπα). 3. The art of interpreting signs of the second class
was called ουαντονεια, συμποτον or αρχιπειη. It
was, like the former, common to Greeks and Ro-
mans, and was held in very high estimation by the
system by the former as by the latter; nor did it
ever attain the same degree of importance in Greece
as it did at Rome. (Ειν. Αυρεομον.) The Greeks,
when observing the flight of birds, turned their face
towards the north, and then a bird appearing to the
right (east), especially an eagle, a heron, or a fal-
con, was thought to indicate the success or the failure
to the left (west) were considered as unlucky signs. 3
Sometimes the mere appearance of a bird was
thought sufficient: thus the Athenians always con-
sidered the appearance of an owl as a lucky sign, hence the proverb, γάλαξ ιπτας, "the owl is out,"
DIVINATIO.

1. e., we have good luck. Other animals appearing unexpectedly, especially to travellers on their road (iopea σύμωλον), were also thought ominous; and at Athens it was considered a very unlucky omen when a weasel appeared during the assembly of the people. Superstitions of this kind are still met with in several European countries. Various other medicines were used to ascertain the will of the gods, such as the ἀνουρωτρία, or divination by placing straws on red-hot iron; the μύλονερα, by observing the figures which melted lead formed; the βοτανωτρία, or divination by writing one's own name on herbs and leaves, which were then exposed to the wind, &c.

Of greater importance than the appearance of animals, at least to the Greeks, were the phenomena in the heavens, particularly by any public transaction. They were not only observed and interpreted by private individuals in their own affairs, but by the public magistrates. The Spartan ephors, as we learn from Plistarch, made regular observations in the heavens every ninth year during the night; and the family of the Pythaiaste, of Athens, made similar observations every year before the thessalorhodium. Among the curious phenomena in the heavens (τυφωτεία, σιγά or πορίενα) were thunder and lightning, an eclipse of the sun or moon, earthquakes, rain of blood, stones, milk, &c. Any one of these signs was sufficient at Athens to break up the assembly of the people. In common life, things apparently of no importance, when occurring at a critical moment, were thought by the divines to be signs sent by the gods, from which conclusions might be drawn respecting the future. Among these common occurrences we may mention sneezing, twinking of the eyes, tinkling of the ears, and numberless other things which we cannot here enumerate. Some of them have retained their significance with the superstitious multitude down to the present day.

The interpretation of dreams (ἐννοιωτα, which had probably been introduced into Europe from Asia, where it is still a universal practice, seems in the Homeric age to have been held in high esteem; for dreams were said to be sent by Zeus. In subsequent times, that class of diviners who occupied themselves with the interpretation of dreams seems to have been very numerous and popular; but they never attained to any position in the state, and were chiefly resorted to by private individuals. Some persons are said to have gained their livelihood by this profession. Respecting the oracles which were obtained by passing a night and dreaming in a temple, see ORACULUM.

For further information concerning the art of divination in general, see Cicero's work De Divinatione. The practice of the Greeks is treated of at some length by Wachsmuth.

The word divinatio was used in a particular manner by the Romans as a law-term, which requires some explanation. In any case two or more accusers came forward against one and the same individual, it was, as the phrase ran, decidi per divinatio who should be the chief or real accuser, whom the others then joined as subscribers, i.e., by putting their names to the charge brought against the offender. This transaction, by which one of several accusers was selected to conduct the accusation, was called divinatio, as the question here was not about facts, but about something which was to be done, and which could not be found out but by witnesses or written documents; so that the judges, had it as was to divine the course which they had to take. Hence the etymology of Cicero, in which he tries to show that he, and not Q. Cæcilius Niger, ought to conduct the accusation against Verres, is called Divinatio in Casuillum.

DIVISOR. (Vid. Ambitus.)

DIVORCIUM. generally a separation, and, in a special sense, a dissolution of marriage. A Roman marriage was dissolved by the death of the wife or husband, and by divorce or separation in the lifetime of the husband and wife.

Divorce, or the absolute determination of the marriage relation, always existed in the Roman policy so far back as we know anything of it; and there might be divorce both in the case of a marriage with conventio in manum, and in the case of a marriage when there was no conventio, and, consequently, the relation of the wife to her own familia was that of the wife to the husband, as it is said that the husband alone had originally the power of effecting a divorce, may be true; but we cannot rely altogether on such an authority. As one essential part of a marriage was the consent and conjugal affection of the parties, it was considered that the affection was necessary to its continuance, and, accordingly, either party might declare his or her intention to dissolve the connexion. No judicial decree, and no interference of any public authority was requisite to dissolve a marriage. Fili families, of course, required the consent of those in whose power they were. The first instance of divorce at Rome is said to have occurred about B.C. 334, when Sp. Carvilius Raga put away his wife on the ground of barrenness: it is added that his conduct was generally condemned. The real meaning of the story is explained by Sallust with his usual acuteness.

Towards the latter part of the Republic, and under the Empire, divorces became very common. Pompey divorced his wife Mucia for alleged adultery, and his conduct was approved, and Cicero speaks of Paula Valeria as being ready to serve her husband, on his return from his province, with ready and willing divorce. Cicero himself divorced his wife Terentia, after her living with him for fifty years, and married a young woman. If a husband divorced his wife, the wife's dose, as a general rule, was restored (vid. Dos); and the same was the case when the divorce took place by mutual consent. As divorce became more common, attempts were made to check it indirectly, by affixing pecuniary penalties or pecuniary loss to the party who wished to divorce. This was part of the object of the lex Papia Poppaea, and of the rules as to the retention dotis and judicium morum. There was the retentio dotis proper liberum, when the divorce was caused by the fault of the wife, or of her father, in whose power she was: three sixths of the dose was the limit of what could be so retained. On account of matters morum graviorum, such as adultery, a sixth part might be valued. In the case of matters morum leviorum, one eighth. The husband, when in fault, was punished by being required to return the dose earlier.

than it was otherwise returnable. After the divorce, either party might marry again.

By the lex Papia Poppea, a freedwoman who had married her patronus could not divorce herself; there appears to have been a: other class of persons subject to this incapacity.

Corresponding to the forms of marriage by confarretatio and coemator, there were the forms of divorce by diffarretatio and remanicatio. According to Festus, 1 diffarretatio was a kind of religious ceremony, so called, "quia fiebat farreo lito adhibito," by which a marriage was dissolved; and Plutarch 2 has been supposed to allude to this ceremony in the case of Sertorius, where it is said to have been announced that he was to marry another woman. It is said that originally marriages contracted by confarretatio were indissoluble, and in a later age, this was the case with the marriage of the flamen dialis, 3 who was married by confarretatio. In the case referred to by Plutarch, the emperor authorized the divorce. A marriage by confarretatio was revocable, divorcium facere; and the form of words of the ceremony was used, but still some distinct notice or declaration of intention was necessary to constitute a divorce: the simple fact of either party contracting another marriage was not a legal divorce. 4 The ceremony of breaking the nuptiales tiles, 5 or of taking the keys of the house from the woman and turning her out of doors, were proper consequences of the dissolution of the tie, but not sufficient, though it may be presumed that they were generally accompanied with declarations that could not be misunderstood. The general practice was apparently to deliver a written notice, and perhaps to assign a reason. In the case of Paula Valeria, mentioned by Cicero, no reason was assigned. By the 6th century, however, we read of marriage by declaration of the parties; there should be seven witnesses to a divorce, Roman citizens of full age (p uberes), and a freedman of the party who made the divorce.

Under the Christian emperors divorce was punished in various ways, but still the power of divorce remained, as before, subject to the observance of certain forms. The one of the bishops and Valentian III, and subsequently Justinian, made various laws, by which punishment was imposed, not only on the party who gave good cause for the divorce, or who without any good cause made a divorce, but also on both parties when they dissolved the marriage by agreement without legal good cause. The parties to a divorce were under certain solemnities; they were both pecuniary and personal.

The term repudium, it is said, properly applies to a marriage only contracted (vid. sponsali), and divorcium to an actual marriage; 7 but sometimes divorcium and repudium appear to be used indifferently. The phrases to express a divorce are munificentia repudii, divorcium facere; and the form of words in the case of the two was "Tuas res tibi habeo, tuas res tibi agito." 8 The phrase used to express the renunciation of a marriage contract were renitam repudium, repudium remittere, dicere, and repudiare; and the form of words might be: "Conditio tua non uto." For the subject of Greek divorce, see AIONAEI in Marriage.

DOMICAN.

Dicionaria. When any citizen of Athens was either appointed by lot or chosen by suffrage (κληρονομι και αιρεσι), to hold a public office, he was obliged, before entering on its duties, to submit to a δοκιμασία, or scrutiny into his previous moral life and character. The one who failed to pass this scrutiny was excluded from office. 

The δοκιμασία, however, was not confined to persons appointed to public offices; it was required of every Athenian man over the age of 30, prior to his election to any public position in the city. Therefore it was called "αντίδοκιμα δοκιμασίαν" against orators who spoke in the assembly while leading profligate lives, or after having committed flagitious crimes. This denounced might be made in public by any one πρὸς δοκιμασίαν τοῦ βίου, i.e., to compel the party complained of to appear before a court of justice, and give an account of his life and conduct. If found guilty, he was punished with ἀτύπα, and prohibited from the assemblies.

We will now explain the phrase ἀνδρὸν ἔτη δοκιμασθήναι. At the age of eighteen every Athenian became an ephebus, and after two years was enrolled among the men, so that he could be present and vote at public assemblies. If any one were heirs to property, this enrolment might take place before the expiration of the two years, on it's being established by a δοκιμασία that the youth was physically qualified to discharge any duties the state might impose upon him. If so, he was released from guardianship, and became a man ( ἄνδρος ἀριστος or δοκιμαστής), being thereby empowered to enter upon his inheritance, and enjoy other privileges, just as if he were of the full age of twenty. 9 We may add that the statements of the grammarians and orators are at variance on this point; but the explanation we have given seems the best way of reconciling them, and it agrees in substance with the supposition of Schollm, "that among the Athenians the enrolment, provided that it was not done before the attainment of the 18th, nor after the completion of the 20th year."

DODRANS. (Vid. As, p. 110.)

DOMO GATICA (δομογατικα), the oldest of the medical sects of antiquity, must not be confounded with

he philosophers mentioned by Diogenes Laërtius.¹ They derived their name from ὄγιαν, a philosophical tenet or opinion, because they professed to follow the opinions of Hippocrates, whereas they were sometimes called Hippocratici. Thesealles, the son, and Polybius, the second of the Hippocratic, were the last of this sect, about B.C. 400, which enjoyed a great reputation, and held undisputed sway over the whole medical profession, till the establishment of the Alexandrian school of philosophy called Empirici. (Vid. Empirici.) After the rise of this sect, for some centuries every physician ranged himself under one or other of the two parties. The different arguments brought forward on each side are stated in such clearness and elegance by Debrè,¹ that it is possible to the Dogmatici is here given at full length, and the objections of the other party in the article Empirici.

The Dogmatici held that it was necessary to be acquainted with the hidden causes of diseases, as well as the more evident ones; and to know how the natural actions and different functions of the human body take place, which necessarily suppose the existence of the elements. They gave the name of hidden causes to those which concern the elements or principles of which our bodies are composed, and the occasion of good or ill health. It is impossible, said they, for a person to know how to set about curing an illness unless he knows what it comes from; since there is no doubt that he must treat it in one way, if diseases in general proceed from the same cause, or in another, if they are made up of the four elements, as some philosophers have supposed; in another way, if all the malady lies in the humours of the body, as Herophilus thought; in another, if it is to be attributed to the respiration, according to the idea of Hippocrates (alluding, probably, to the work Πρὸς δρωγόν, De Flatibus, which is generally considered to be spurious); in another, if the blood excites inflammation by passing from the veins which are meant to contain it into the vessels that ought only to contain air, and if this inflammation produces the extraordinary movement of the blood that is remarked in fever, according to the opinion of Erasistratus; and in another, if it is by means of concupiscies which stop in the invisible passages and block up the way, as Aesclepiades affirmed. If this be granted, it may be necessary to appear that, of all physicians, the Gnostics will succeed the best in the cure of diseases who understands best their first origin and cause. The Dogmatici did not deny the necessity of experiments also; but they said that these experiments could not be made, and never had been made, but by reasoning. They added, that it is probable that the first men, or those first applied themselves to medicine, did not recourne to their patients, that the first thing that came into their thoughts, but that they deliberated about it, and that experiment and use then let them know if they had reasoned justly or conjectured happily. It mattered little, said they, that people declared that the greater number of remedies had been the subject of experiment from the first; provided they confessed that these experiments were the results of the frequenting of those who tried the remedies. They went on to say, that we often see new sorts of diseases break out, for which neither experiment nor custom has yet found out any cure; and that, therefore, it is necessary to observe whence they came and how they first commenced, for otherwise no one can tell why, in such an emergency, he makes use of one remedy rather than another. Such according to the Dogmatici, are the reasons why a physician ought to try and discover the hidden causes of diseases. As for the evident causes, which are such as can easily be discovered by anybody, and where one has only to know if the illness proceeds from heat or from cold, from having eaten too little or too much, and the like: it was necessary to inform one's self of all that, and make it on suitable reflections; but they did not think that one ought to stop there without going any farther. They said again, with regard to the natural actions, that it was necessary to know wherefore and in what manner we receive the air into our lungs, and why we afterward expire it; why food is taken into the body, how it is there prepared, and then distributed through the blood; if the different parts are subject to pulsation; what is the cause of sleep, wakefulness, &c.: and they maintained that a man could not cure the diseases relating to these several functions unless he were able to explain all these phenomena. To give an example taken from the process of digestion: The food, said these physicians, is either ground in the stomach, as Erasistratus and his disciples, or it is not thus ground; and this is the notion of Plistonicus, a disciple of Praxagoras, which is concocted by a peculiar heat, as was the opinion of Hippocrates; or else, if we are to believe Aesclepiades, all these opinions are equally erroneous, and nothing is concocted, but the alimentary matter is distributed throughout the body in the same crustate state in which it was taken into the mouth. However much they differ on this point, they all agree that the kind of food, or the real nature of the illness, which a person will vary according as one or other of these opinions be supposed to be the true one. For if the food is ground to pieces, we must choose that kind which is most easily ground; if it purifies, we must give what purifies most quickly; if it is concocted by heat, we must prefer such as is most apt to excite heat; but if it is not concocted, we need not search for an agent for a kind of food, but rather such as will remain as it is eaten, and change the least. And in the same way they argued that, when the breathing is affected, or there is too great sleepiness or wakefulness, if a physician understands thoroughly the nature of these phenomena, he will be able to cure the diseases connected with them. Lastly, they maintained that, as the principal pains and diseases proceed from the state of the body, so in like manner the physician ought to minister any remedy unless he is acquainted with these parts. They therefore contended that it was necessary to open dead bodies and examine the different viscera; but that it was much the best way to do as Herophilus and Erasistratus, who used to dissect alive the criminals condemned to death that were put into their hands, and who were thus enabled to behold during life those parts which nature had concealed, and to contemplate their situation, colour, figure, size, order, hardness or softness, roughness or smoothness, &c. They added, that it is not possible, when a person has any internal illness, to know what is the cause of it, unless one is exactly acquainted with the situation of all the viscera, nor can one heal any part without understanding its nature; that, when the intestines are open, we cannot distinguish what they are, unless we know what is their colour when in a healthy state cannot distinguish the sound from the disease parts, nor therefore apply proper remedies, while on the contrary, he who is acquainted with the natural state of the diseased parts will undertake the cure with confidence and certainty; and that, in short, it is not to be called an act of cruelty, as some persons suppose it, to seek for the remedies of a numerous number of innocent persons in the sufferings of a few criminals.

1. (De Vit. Philos., proem., 11.)—2. (De Med. pref. in lib. 1.)
DOLABRA.

Such were their opinions, and the arguments by which they supported them. Additional information on the subject may be found in various parts of Galen's works.

DOLABRA, dim. DOLABELLA (örkha, dim. orkhoi), a chisel, a celt.

For the purpose of planing and polishing wood, the ancients used the adze, which was impelled in the direction exhibited in the woodcut at page 12 (vid. Asinia), or the chisel, which was forced in the opposite direction, i.e., from the body of the orkman, as shown in the woodcut at page 62, in account of the use of these tools in ship-building. Juvenal describes the merchant as trusting his signi dolata. Statues also were made by the aid of these tools, of the other more | robore dolata, 14 trunca dolamine effigie. 15

The chisel used by stone-masons is represented at the bottom of the monument, which is the subject of the woodcut to the article Cursus (p. 252). Salar, i.e., stone adapted to be cut and smoothed by the chisel, was called lapis dolabili. A Greek inscription on marble is represented, having the name engraved by the strokes of the chisel (prroCp6n laiic kratoymenon 8), and such letters are called xcrp67b grimmata. 6

Dolabras were also much employed in the operations of horticulture and agriculture. A small sharp implement was used to cut out the dead wood from the trunk of the vine; an instrument of the same form, but of course, much more blunt and rough, and at called by the same name (dolabra), was employed to stir up the ground about its roots. 7 This tool was likewise used to refresh the soil in rose-cuts; 8 and the same term "dolabra" is applied to small spade, or small spade, which the ploughman carried with him to destroy weeds. Hence the ancient glossaries translate dolabra a tool for digging (purē); and Columella says, with a view to this object, "Nec minus dolabra, quam vornere, hulabas utatur." 9

It must have been in a form very similar that the dolabra was used by the Greek and Roman armies as a making intrenchments and in destroying fortifications. While they made a breach in the wall of a city, the expression is Dolabris perferre mun. 10 In what manner the instrument was applied we may infer from the statement of Livy, 11 that on a certain occasion soldiers were sent with dolabra to destroy the work of its foundation, 12 and that the execution of this task was easy, because the stones of the wall were built in clay or mud, and not in mortar. It is clear that the use of the chisels in this instance was to insert them between the stones, so as to remove the clay, and in doing this, to loosen and destroy the wall. 13

Dolabra abound in our public museums and in the cabinets of the curious, being known under the "celts" to antiquaries, who, however, generally use the word without understanding its true sense. 12 "Celts" is an old Latin word for a chisel, probably derived from calo, to engrave. Thus the phrase "celte sculptur in hixce" occurs in the Vulgate version of Job, 14 and "matleio et celte literatur stites" in an inscription at Pula. 15 These articles of bronze, more rarely of hard stone, are chiefly found, as we might expect from the ac-

On the other hand, figs. 5, 6, 7 exactly resemble the knife now used by leather-cutters, and therefore illustrate the account given by Julius Pollux, who reckons this same tool, the Olmu, among the ἑρέλεα τῶν εκπαίδευσαν. This instrument was also used for cutting paper, and probably in the same manner (μαλαχτόμας, sicilia). The following woodcut shows a small bronze cell fixed into a handle of stag's horn, and there

DOMINUM.

DOMI'NIUM. (Vid. STADIUM.)

DOMI'LIUM, a cylindrical vessel, somewhat resembling our tubs or easks, into which new wine was put to let it ferment. It was at first made of earth. To the time of Pliny, wood does not appear to have been used for this purpose either in Greece or Rome. At a later period dolia were made of wood, and together with hoops. Palladion speaks of dolia containing two hundred congii; it is incredible that such large vessels were made of earth. The shape preferred for dolia was long, and of a small diameter. Immediately after they were made they were covered with pitch, and subjected to a farther preparation, after which they were filled with wine, but not quite to the brim, and placed in a chamber (cella minaria), which was at least high enough above the ground for the wires to fit in easily. Here the dolia either stood on the ground or were let into it (dumera, depressa, or defossa). Wine which would not keep long was drunk from the dolia; that which improved by keeping was transferred from them to amphora. The expa and seria were vessels like the dolia, and used for the same purpose.

DE DOMINO MALO ACTIO. (Vid. CULPA.)

DOLUS MALUS. (Vid. CULPA.)

DOMINUM. Dominium signifies quiritarian ownership, or property in a thing; and dominus, or dominus legitimus, is the owner. Possessor is often used by Roman writers as equivalent to owner; but this is not a correct use of the word. In like manner, "to have ownership" is sometimes expressed by "possidere," and the thing in which there is property is sometimes called "possessio." The complete notion of property or ownership comprehends the determination of the things which may be the objects of ownership; the power which a man may have over such subjects, both as to duration of time and extent of enjoyment; the modes in which ownership may be acquired and lost; the personal or corporeal nature of the objects of acquiring, transferring, or losing ownership.

Res is the general name for anything. The chief division of res is into res divini juris and res humani juris. Res divini juris are those which are appropriated to religious purposes, namely, res sacra, saecula, religiosa; and, so long as they have this character, they cannot be objects of property. Res humani juris are all other things that can be the objects of property, and they are either res publicae or res privatae. Res publicae belong to the corporation of the state, and can only become private property by being deprived of this public character. (Vid. AGRARILAE LEGES.) Res universitatis are the property of a corporate body, which are not the property of any individual of the corporation. The phrase "humani juris" is sometimes used to mean that the thing cannot be the property of an individual, which is affirmed of things divini juris; when applied to things humani juris, it sometimes means that they are not the property of an individual, but of a body; yet such things may become the property of an individual; res hereditaria are res nullius until there is a heres. Res communia are those which cannot be the objects of property, and therefore are res nullius, as the sea.

Res corporales are defined to be those "quae tangi possunt." Incorporales are those "quae tangi non possunt, sed in jurae consistunt," as HEREDITAS, USUFRUCTUS, OBLIGATIONES; and they consequently include the possession of things corporeal. Of these things are divided into immobiles, or solum et res solit, and mobiles. The class of things quae pondere, mensura constant, are such things as wine, oil, corn, silver, gold, which are of such a nature that any the same number, weight, or measure may be considered the same thing. (Vid. MEASA.) There is another class of res, consisting of those "quae usus consummatur," and those "quae non," which may or may not be the same as things "quae numeros," &c.

A thing may either be a unity, singula res, or it may be several things of the same kind, singula res, or it may be a thing compounded of many various things, universitas, by which is understood a whole property, all that a person has, without respect to its component parts, and with all the rights and obligations attaching to it. The possession of things into res mancipi and res nec mancipi was one of ancient origin; and it continued to a late period in the Empire to be an important distinction. Res mancipi are not far from known by an enumeration of them, which is perhaps imperfect: they are praedia in Italico colo, both rustic and urban; also jura rusticiorum pretiorum, and others of like nature, to which may be added the possession of animals, as oxen, horses, &c., quod collo doro sovle donatur. Other things were nec mancipi.

All the things have been enumerated which are the subject of dominium, and some which are not. Every dominus has a right to the possession of the thing of which he is dominus; but possession alone, which is a bare fact without any legal character, neither makes a man dominus, nor does the want of possession deprive him of dominium. Possession has the same relation to a legal right to a thing, as the physical power to operate upon it has to the legal power; and, accordingly, the doctrine of possession precedes that of ownership. Things cannot be the objects of possessio civilis, which cannot be the objects of dominium.

The things called jura in re are not proper subjects of ownership (dominium), though a claim to them is prosecuted by an actio in rem: they are servitutes, emphyteusis, superficies, et pignus and hypotheca.

Dominium properly signifies the right of dealing with a corporeal thing as a person (dominus) pleat: this, of course, implies the right to exclude all others from meddling with it. The dominus is the right to possess, and is distinguished in that respect from the bare possessor, who has only the right of possession. The term dominion is sometimes (improperly) extended to jura in re; and sometimes he who takes as heres is called dominus hereditatis. Jura, or jura in re, are, however, detached parts of property, which are opposed to others from meddling with it. The dominus is the right to possess, and is distinguished in that respect from the bare possessor, who has only the right of possession. The term dominion is sometimes, as is, complete as the law allows any ownership to be, or it may be limited. The distinction between bare ownership and ownership united with the special interest is explained in another place. (Vid. IULIUS, PRAG, XIX.)
Bon. A person who has no ownership of a thing may have rights in or to it (jura in re), which, as far as they extend, limit the owner's power over his property. Ownership, being in its nature single and indivisible, may not be divided among two or more persons; consequently, there cannot be several owners of one thing, but several persons may own undivided shares or parts of a thing.

In order to acquire ownership, a person must have a legal capacity to acquire; and ownership may be acquired by such a person, or by another for him. There must also be a thing which can be the object of such ownership, and there must be a legal mode of acquisition (acquisitio civilis). Ownership may be acquired in single things (acquisitio rerum singularum), or it may be acquired in a number of things of different kinds at once (acquisitio per universitatem), in which case a person acquires them not as individual things, but as parts of a whole.

The latter kind of acquisition is either by use or by delivery, as in the case where a man advocates another, and so becomes the owner of all the advertised person's property, or it is successio mortis causa, as in the case of a testamentary heirs, or a heirs ab intestato.

Acquisiones per universitatem are properly discussed in the heads (vid. Annona, Haus, Universitas). The following remarks apply to acquisitiones rerum singularum. Acquisitions were either civiles (ex jure civili), or naturales (ex jure gentium), that is, there was no formality prescribed for the mode of acquisition; in both cases dominium could be acquired. The civil acquisitions of the single things varies much in every case in jure civilis and usucapio; those natural jure were either by traditio or delivery. In the case of res mancipii, the only modes of acquiring dominium were mancipatio, in jure cesso, and usucapio; but usucapio applied also to things nec mancipii. The alienation of things nec mancipii was the peculiar effect of tradition, or bare delivery, and if there was a just causa, dominium was thus acquired; for tradition, in the case of a thing mancipii, merely made it in bonis, and the ownership continued unchanged. The notion that, in the case of res nec mancipii, bare tradition did not confer quiritarian ownership or dominium, is erroneous; for when the Roman law did not require any formalities, the acquisition of property was effected in what may be called the natural way, that is, the simplest and most easy way in which the parties to the act could show their meaning and carry it into effect.

A man who was dominus of a thing, whether acquired jure civilis or naturali, prosecuted his right to it in the same way, by the rei vindication. He could not, of course, prosecute such a right unless he was out of possession, and, in order to succeed, he must prove his ownership. If he had a thing in bonis, and was in possession, he acquired the ownership by usucapio; if he was out of possession, it seems not an improbable conjecture of Unterholzer, that he was aided in his action, after the formula was introduced (for as to a previous time it is difficult to form any conjecture), by the fiction of his having received the property mancipiatio. There are examples of a similar fiction in the case of the bonorum possessor and the bonorum owner.1 A man could only dispose of a legacy by his will or by testament, and if the latter, otherwise he could only give it per damnationem or sinendii modum. A slave who was the property of his master (dominus) might attain the Roman citizenship by the act of manumission: if he was only in bonis of the person who manumitted him, he became only a Latinus by the act of manumission. The difference between quiritarian ownership and in bonis was destroyed by the legislation of Justinian, who declared in bonis to be complete ownership.

Some modern writers enumerate, in addition to the civil acquisitions here enumerated, addicio emtio sub corona, sectio bonorum, adjudicatio, and lex, by which last they understand those circumstances under which some special enactment gives possessory interest to a person, and caducum (vid. Caezarem) is mentioned as an instance.

A bona fidei possessor was not ownership (dominium), nor was it the same as in bonis. The two things are distinguished by Ulpian.2 A bona fidei possessor had a capacity for acquiring by usucapio the ownership of the thing possessed. He had a right of action as a public person, and could, by his act, which, if he lost the possession before he had acquired the ownership by usucapio, he could recover it against all the owner, in which latter respect he differed from him who had a thing in bonis, for his claim was good against the person who had the bare ownership.

As to the fundamental principles, it was an old principle of Roman law that there could be no dominium in them, that is, no quiritarian ownership (vid. Aemarles Leges); nor were they said to be in bonis; but the occupier had possessui and usufructus. In fact, the terms dominium and in bonis were not applicable to provincial lands, nor were the ficiones of their being applicable to the bonis applicable to provincial lands; but it is an ingenious conjecture of Uterholzer, that the formula actionis was adapted to the case of provincial lands by a fiction of their being Italics lands, combined with a fiction of their being acquired by usucapio. In the case of the ager publicus in Italy, the dominium was in the Roman people, and the terms possessui and possessor were applicable to this enjoyment and the person by whom the land was enjoyed. Still the property in provincial land was like the property in bonis in Rome and Italy, and it consequently became dominium after the distinction between quiritarian and bonitariam ownership was destroyed.

Ownership was also acquired in the case of occupatio, accessio, &c. (vid. Accessio, Alluvio, Confinio.)

A man who had a legal capacity could acquire property either himself or by those who were "in potestate, manc, mancipio." He could even acquire thus per universitatem, as in the case of an hereditas; and also he could thus acquire a legacy. If a slave was a man's in bonis, everything that the slave acquired belonged to the owner in bonis, and not to him who had the bare quiritarian ownership. If a man was the "bona fide possessor" of another person, whether that person happened to be a freeman supposed to be in possession, or possessed as a slave, or to be an owner of another, if the possessor only acquired the ownership of that which the person so possessed acquired "ex possessantibus" and ex "opcris suis." The same rule applied to a slave in which a man had only the usufructus; and the rule was consistent with the rule just laid down, for usufructus was not property. Sons who were in the potestate of a father, and slaves, of course, could not acquire property for themselves. (vid. Pretium.)

Ownership was lost either with the consent of the owner or against it. With the consent when he transferred it to another, which was the general

2 [Frag. xix., 20, 21.]
mode of acquiring and losing property; without the consent when the thing perished, when it became the property of another by accession or usucaption, when it was judicially declared to be the property of another, or forfeited by being pledged. Owners-hip was not lost by death, for the heirs was considered to be the same person as the defunct.

As certain persons had not a capacity to acquire, no personal property could not become the property of another by usucaption; a fundamental principle of law, which Cicero, with good reason, was surprised that his friend Atticus did not know.1

Ownership might be lost by the maxiins capitis dimittion ; when it was the consequence of a conviction for a crime, and the property was forfeited to the state. (Vid. Sectio Bonorum.) The mediae capitis dimittion only affected an incapacity for quititarion ownership: the person could still retain or acquire property by the jus gentium; still, if the mediae capitis dimittion was the consequence of conviction for a capital crime, it had the same consequences as the maxima.2

DOMITIA LEX. (Vid. Pontifex.)

DOMUS. (Vid. Hous.)

DONARIA (αναστήματα or αναστείμενα) are names by which the ancients designated presents made to the gods, either by individuals or communities. Sometimes they are also called dona or ὀδόμα. The belief that the gods were pleased with costly presents as natural to the ancients as the belief that they could be influenced in their conduct towards men by the offering of sacrifices; and, indeed, both sprang from the same feeling. Presents were mostly given as tokens of gratitude for some favour which a god had bestowed on man; but some are also mentioned which were intended to induce the deity to grant some especial favour. At Athens, every one of the six thousand, or, according to Plato,3 all the nine archons, on entering upon their office, had to take an oath, that if they violated any of the laws, they would dedicate in the temple of Delphi a gift statue of the size of the man who dedicated it (ἀρθράττο κρατούν ιματετρήτων). In this last case the anathema was a kind of punish-ment, in which the statue was regarded as a substitut-e for the person forfeited to the gods. Almost all presents of this kind were dedicated in temples, to which, in some places, an especial building was added, in which these treasures were preserved. Such buildings were called θυσιαρχοι (treasuries); and in the most frequented temples of Greece, many states had their separate treasures.4 The act of dedication was called θυσιαρξεῖα, donare, dáedere, or sacrær.

The custom of making donations to the gods is found among the ancients from the earliest times of which we have any record, down to the introduction of Christianity; and even after that period, it was, with some modifications, observed by the Christians during the Middle Ages. In the heroic ages of Greek history the anathemata were of a simple description, and consisted of chaplets and garlands of flowers. A very common donation to the gods seems to have been that of locks of hair (κεφαλής ἀρραγος), which youths and maidsens, especially young brides, cut off from their heads and

176

176

176

DONATIO MORTIS CAUSA.

were also effectuated in the Grotto of Pluto and Proserpina, in the neighbourhood of Nysa. In all cases in which a cure was effectuated, presents were made to the temple, and little tablets (tabula votiva) were suspended on its walls, containing an account of the danger from which the patients had escaped, and of the manner in which they had been preserved from it. In this kind, with their inscriptions, are still extant. From some relics of ancient art, we must infer, that in some cases, when a particular part of the body was attacked by disease, the person, after his recovery, dedicated an imitation of that part in gold or silver to the god to whom he owed his recovery. Persons who had received a wound from a harp (lyre) or flute (tuba) dress, which they wore at the time of their danger; but if they had escaped naked, they dedicated some locks of their hair. Shipwrecked persons also suspended votive tablets in the Temple of Neptune, on which their accident was described or painted. Individuals who gave up the profession or occupation by which they had gained their livelihood, dedicated in the temple the instruments which they had used, as a grateful acknowledgment of the favour of the gods. The soldier thus dedicated his arms, the fisherman his net, the shepherd his flute, the poet his lyre, cithara, or harp, &c.

It would be impossible to attempt to enumerate all the occasions on which individuals, as well as communities, showed their gratefulness towards the gods by anathematize. Descriptions of the most remarkable presents in the various temples of Greece may be read in the works of Herodotus, Strabo, Pausanias, Athenaeus, and others.

The custom of making presents to the gods was considered by the Romans as a most important duty. As the latter the donaria were neither as numerous nor as magnificent as in Greece; and it was more frequent among the Romans to show their gratitude towards a god by building him a temple, by public prayers and thanksgivings (supplicatio), or by celebrating festive games in honour of him, than to adorn his sanctuary with beautiful and costly works of art. Hence the word donaria was used by the Romans to designate a temple or an altar, as well as statues and other dedications dedicated in a temple. The occasions on which the Romans made donaria to their gods are, on the whole, the same as those we have described among the Greeks, as will be seen from the following:

DONATIO MORTIS CAUSA. There were three kinds of donatio mortis causa: 1. When a man, under no present apprehension of danger, but moved solely by a consideration of human mortality, makes a gift to another. 2. When a man, being in immediate danger, makes a gift to another in such a manner that the thing immediately becomes the property of the donee, when it had been restored to the like circumstances, gives a thing in such a manner that it shall become the property of the donee in case the giver dies. Every person could receive such a gift who was capable of receiving a legacy.

It appears, then, that there were several forms of gift called donatio mortis causa; but the third seems the only proper one, and that of which mention is chiefly made, for it was a rule of law that a donatio of this kind was not perfected unless death followed, and it was revocable by the donor.

A thing given absolutely could hardly be a donatio mortis causa; for this donatio, by its condition attached to it, namely, the death of the donor, and the surviviosity of the donee. The thing might be a thing capable of tradition or delivery, or it might be a promise of a sum of money to be paid after the death of the testator. It would appear as if the law about such donations was not free from difficulty. They were finally assimilated to legacies in all respects, and were dealt with in a similar manner; this in some particulars before his time. Still they differed in some respects from legacies, for such a donation could take effect though there was no alienation; and a filius, families, who could not make a will, might, with his father's consent, make a donatio mortis causa.

The English law of donaciones mortis causa is first stated by Bracton in the very words of the Digest; and the present law is expounded by Lord Hardwicke; but what he there states to be the English law is not exactly the law as stated in Bracton. The rules of donations mortis causa in English law are now pretty well fixed. Tradition or delivery is considered one essential of such a gift, and, as Bracton says, the donor is another essential.

The gift must not be an absolute gift, but a gift made in contemplation of, and to be perfected by the death of the donor.

DONATIO PROPERP NTUPTIAS signifies that which is given by a husband or by any other person to a woman on the occasion of her marriage, or marriage-like ceremony, whether at the time of securing her consent, or in payment of her support during the marriage or widowhood. Justinian required this donatio whatever the wife brought a dose; and it was enacted that it should be equal in amount to the dose, and should be increased when the dose was increased. Such a gift was the property of the wife, but it was managed by the husband; and he was bound to apply it to its proper purposes; but he could not alienate it, even with the consent of the wife.

DONATIONES INTER VIRUM ET UXOREM. During marriage, neither husband nor wife could, as a general rule, make a gift of anything to one another. This rule would, however, only apply where there was no provision in the marriage contract, and in case the rule of law would be unnecessary, because a gift between husband and wife would be legally impossible. The reason for this rule was said to be the preservation of the marriage relation in its purity, as a contract subsisting by affection, and not maintained by purchase or by gift from one party to the other; but it is difficult to see why it should be limited to the husband and wife, unless it is that which is given by the Roman writers. It has apparently a tacit reference to the power of divorce, and appears like an implied recommendation of it when the conjugal affection ceases. Donations of this kind were, however, valid when there were certain considerations, as mortis causa, divorci causa, servii manumittendii gratia. By certain administrations, this donatio was a singular gift to her husband in order to qualify him for certain honours. It must be remembered, that when there was no conventio in manum, a wife retained all her rights of property which she did not surrender on her marriage (vid. Dos), and she might, during the marriage, hold property quite distinct from her husband's.
husband. It was a consequence of this rule as to
gifts between husband and wife, that every legal
form by which the gift was affected to be transferred,
as marriage, inheritance, etc., did not confer
ownership; stipulations were not binding, and ac-
cceptions were no release. A difficulty might
remain as to usucapion, but the law provided for
this also. If a woman received from a third person
the property of her husband, and neither the third
person, nor she, nor her husband knew that it was
the husband's property, she might acquire the own-
ership by usucapion. If both the giver and the
husband knew at the time of the gift that it was
the husband's property, and the wife did not know, it
might also become her property by usucapion; but
not if she knew, for in that case the bona fides
which was essential to the commencement of pos-
session was wanting. If, before the ownership was
acquired by usucapion, the husband and wife
discovered that it was the husband's, though the
husband did not choose to claim it, there was no
usucapion; for this would have been a mere eva-
sion of the law. If, before the ownership was
acquired by usucapion, the wife alone discovered
that it was the husband's property, this would not
destroy her right to acquire the property by usucapion.
This, at least, is Savigny's ingenious explanation
of the passage in Digest 24, tit. 1, s. 44. The strik-
ing fact of it was this, that the gift was not regis-
taxed in the time of S. Severus, and they were
made valid if the donor died first, and did not revoke
his gift before death. There were also some ex-
ceptions as to the general rule, which it is not
necessary to particularize here.¹

DONATI VUM. (Vid. Conglurium.)

DONAS. (Donas), the species of myrrh called Arun-
dox Das. It derives its name from Donyus, "to agi-
tate" or "disturb," from its being easily agitated by
the wind. Pliny, in speaking of it, says, "callamus
fruticosissimus, qui vocatur Donas." Virgin styles
it "fauviali."² It was used for shepherds' pipes,
writing-pens, angling-rods, &c. The modern Greeks
call it Καθαρός. Sinthorp found it everywhere in
the marshy grounds.³

DOSCAS (doscar). By the earlier commenta-
tors on the classics, it was taken for a species of
wild goat, but it is now generally acknowledged to
be the Gazelle, or Antelopes Dorsas. "In fact," ob-
nerves Adams, "the Arabian medical authors, Avi-
cenna and Holy Abbas, were aware that it meant
the Gazelle; hence the term Dorskalid of Galen is
rendered gazelami by their translators. The Δόρας
is the title of the Hebrew Scriptures. It is also
called ζηφος and παρα.⁴

DORSAURUS or DOSCAURUS (υροφόρος),
a beast of burden.

In the mountainous parts of Italy, where it was
impossible to use wheeled carriages, the produce of
the country was borne on the backs of quadrupeds.
In this manner the corn, wine, and oil of Apulia and
Calabria were conveyed to the seacoast by asses,
which are described by Varro⁵ as "assei dosauri."³

In these elevated regions, as we learn from the
same authority, the necessaries of life were brought
to the pastoral inhabitants either by mares or by
any other animal, "quod usuos dorso ferre possit."³

an expression designed to explain the etymologic of the epithet "dosauri."³

Beasts of burden also accompanied the army,¹
and were used to carry a part of the baggage.
In Eastern countries the camel has always been
employed as a beast of burden.³

The "jumenta dosauria" carried their load ei-
ther by means of panniers (καμήλης) (vid. Ollier,
iii.) or of the pack-saddle (σύρη). From using
the latter, they were called "equi sagmarii," "muli
sagmarii," &c., with the German "sam-
thier," "saum-rum," &c., and the English "sum-
ter-mule" and "sumpter-horse."³

The following woodcut, representing a mule and
a camel accompanied by two Sythian or Scythic
conductors, is taken from the column which was
erected at Constantinople to commemorate the vic-
tories of Theodosius I., and of which this view
were made by command of Mohammed II.

*DORYC'NIUM (dorxnyum), a plant, in deter-
mining which, botanical writers find some diffi-
culty. The evidence preponderates in favour of the Cor-
nera and the sagmarus, or the Lensby of Lindwood.⁴

DORY (dory). (Vid. Hasta.)

DOS (GREEK). Euipides⁵ makes Medea com-
plain that, independent of other misfortunes to which
women were subject, they were obliged to buy their
husbands by great sums of money (κυρώνων ιπτ-
boly). On this the scholiast remarks, that the poet
wrote as if Medea had been his contemporary, and
not a character of the heroic ages, in which it was
customary for the husband to purchase his wife from
her relations by gifts called ἐφα or ἑκβ. The same
practice prevailed in the East during the patriarchal
ages,¹ and Tacitus⁶ says of the ancient German,
"Dotem non uxor marito, sed uxor marius offerit."

The custom of the heroic times is illustrated by
many passages in Homer. Thus we read of the
συγμελανα and ποιεις δομα, or many gifts, by
which wives were purchased.⁷ In another place⁸ we
are told of a hundred oxen and a thousand sheep
and goats having been given by a Thracian hero to his
maternal grandfather, whose daughter he was about
to marry. Moreover, the poetic epithet, ἀλεπο-
βοης,¹¹ applied to a female, is supposed to have led its
origin in the presents of this sort which were made
to a woman's relatives on her marriage. These
nuptial gifts, which were given with their daughters
(ἀδελφων), and which were called, were returned
to the husband in the event of the com-
mission of adultery by his wife, and perhaps in
other cases.¹²

We must not infer from the above facts that it
was not usual in those times for relations to give a
portion with a woman when she married. On the
contrary, mention is made¹³ of the μείγα, or mar-
rriage gifts which were given with the daughters
(δίπλωμα), and we are told by Xanthine¹⁴ of one of
the sons of Theseus having received a portion near
Ampelis as a φιλίος, or donor with his wife.
Moreover, both Anactorchae and Penelope are spoken of as άλογα πόλεμοι, or wives who brought to their husbands many gifts, which probably would have been returned to their relations in case of a capricious dismissal. The word for portion for a woman was διοίγον, and Müller observes that we know for certain that daughters in Sparta had originally no dower, but were married with a gift of clothes only; afterward they were at least provided with money and other personal property, but in the time of Aristotle, so great were the dowers given (διὰ τοῦ πρόσ

of the dos depended on the will of the giver; but certain persons, such as a father and father's father, were bound to give a dos with a woman when she married, and in proportion to their means. The dos might be either given at the time of the marriage, or there might be an agreement to give. The technical words applicable to the dos were dare, dīcer, promittere. Anyone person was competent dare, promittere. The word dare was applied to the woman, promittere to the man. It was implied that the man promised all property as dos, but the promise was not binding unless certain legal forms were observed (non debēri vīro doatem, quam nullum autore dixisset). An example of a promissio dotis occurs in Plautus. As the dos became the husband's property, he had a right to the sole management, and to the fruits of it; in fact, he exercised over it all the rights of ownership, with the exception hereafter mentioned. He could dispose of such parts of the dos as consisted of things movable: but the Julia lex (de adulteria) prevented him from alienating such part of the dos as was land (fundus dotalis, dotalia pradia; dotales uxor) without his wife's consent, or pledging it with her consent. The legislation of Justinian prevented him from selling it also, even with the wife's consent, and it extended the law to personal effects.

The husband's right to the dos ceased with the marriage. If the marriage was dissolved by the death of the wife, her father or father's father (as the case might be) was entitled to recover the dos profecticia, unless it had been agreed that in such case the dos should belong to the husband. The dos adventicia became the property of the wife's heirs, unless the person who gave it had stipulated that it should be returned to him (dos recepticia). The dos could be claimed immediately upon the dissolution of the marriage, except it consisted of things quod numerro, &c., for which time was allowed.

In the case of divorce, the woman, if she was sui juris, could bring an action for the restitution of the dos; if she was in the power of her father, he brought the action jointly with his daughter. (Vid. Divortium)

The dos could not be restored during the marriage, for this was contrary to a positive rule of law. (Vid. Donatio inter vīrum et uxorēm.) Yet, in the case of the husband's insolvency, the wife could demand the dos adventicia at various times during the marriage. In certain cases, also, the husband could restore the dos during the marriage, and such restoration was a good legal accession to him: these excepted cases were either cases of necessity, as the payment of the wife's debts, or the sustentation of near kinsfolk.

What should be returned as dos depended on the fact of what was given as dos. If the things given were ready money, or things estimated by quantity, &c., the husband must return the like sum or the like quantity. If the things, whether movable or immovable, were valued when they were given to the husband (dos assimata), this was a species of sale, and at the end of the marriage the husband must restore the things or their value. If the thing of what was valued, he must restore the specific things, and he must make good all losses or deterioration which had happened to them except by accident. But the husband was entitled to be reimbursed for all necessary expenses (impensa necessaria); as, for instance, necessary repairs of houses incurred by him in respect of his wife's property, and also for all outlays by which he had improved the property (impense utiles).

The husband's heirs, if he were dead, were bound to restore the dos. The wife's father, or the surviving wife, might demand it by an actio ex stipulatu de dote redditus, which was an actio stricta juris, if there was any agreement on the subject; and by an actio rei uxoriae or dosis, which was an actio Praebenda. A third person who had given the dos must always demand it ex stipulatu, when he had bargained for its restoration. Justinian enacted that the action should always be ex stipulatu, even when there was no contract, and should be an actio bona fide.

The wife had no security for her dos, except in the case of the fundus dotalis, unless she had by contract a special security; but she had no privileges as compared with the husband's creditors. Justinian enacted that on the dissolution of the marriage the wife's ownership should revive, with all the legal remedies for recovering such parts of the dos as still existed; that all the husband's property should be considered legally pledged (acta hypothecae) as a security for the dos; and that the wife, but she alone, should have a priority of claim on such portion of the personal and other creditors to whom the sum might be pledged.

The dos was a matter of great importance in Roman law, both because it was an ingredient in almost every marriage, and was sometimes of a large amount. The frequency of divorces also gave rise to many legal questions as to dos. A woman whose dos was large (dota uxor) had some influence over her husband, insasmuch as she had the power of divorcing herself, and thus of depriving him of the enjoyment of her property. The allusions to the dos are numerous in the Roman writers.

It is a disputed point whether there could be dos, properly so called, in the case of a marriage with conventio in manum. (Vid. Marriage)

1. DOULOS (δοῦλος). (Vid. Servus.)
2. DRABE (δράμβη), Pepperwort, or Lepidium draba.
3. DRACHMA (δραχμή), the principal silver coin among the Greeks. The two chief standards in the currencies of the Greek states were the Attic and Αειγεινίατι. We shall, therefore, first speak of the Attic drachma, and afterward of the Αειγεινίατι.

The average weight of the Attic drachm from the time of Solon to that of Alexander was 66.5 grains. It contained about 96th of the weight alto, and hence it were regarded 48 grains to be valued. Each of our shillings contains 80 grains of pure silver. The drachma is, therefore, worth 65-4 of a shilling, or 9 72 pence, which may be called 96. After Alexander's time, there was a slight decrease in the weight of the drachma, till, in course of time, it only weighed 63 grains. The drachma contained six obols (δοδολίς): and the Athenians had separate silver coins, from four drachmās to a quarter drachma. Among those now preserved, the tetradrachm is commonly found; but we possess no specimens of the tridrachm, and only a few of the didrachm. Specimens of the tetrobolus, triebolus, diobolus, three quarter obol, half obol, and quarter obol, are still found. The following table, taken from Hussey, gives the value in English money of the Athenian coins, from a quarter obol to a tetradrachm:

1. (Hussey, Rhein. Mus., ii. 75.—Compare Ulp., Dig., vi. Dig. 23, tit. 3.—Cod. v., tit. 12.)—3. (Dioscor., ii., 186.)—J. (Hussey, Ancient Weights and Money, p. 47, 48.)
DRACO.

The Attic obols, and that the Agineitan talent contained 10,000 Attic drachmas. His authority, however, cannot be of any weight against the evidence of existing coins; for the comparative value of Agineitan and Attic money is a plain fact, which can be proved by experiments. But, as Mr. Hussey remarks, "when he speaks of the Attic drachmas, does not mean the money of the full weight, which was coined in the time of Pericles or Xenophon, but such as passed for Attic in the Augustan and following ages, namely, the Roman denarius; and this, too, not of the earliest standard, at the rate of 60 or 61 grains, but as it was coined when the weight had been reduced to 4th of the Roman ounce, or about 53 grains." (Vid. Denarius.)

AKINEITAN DRACHMA. BRITISH MUSEUM.

Actual size.

The Attic and Agineitan were, as already remarked, the ancient standards of money in Greece; but there was a third standard, and by some extent, namely, that of the early coinage of Macedon, which was also adopted by the Greek kings of Egypt. The average weight of the Macedonian drachma was 109.4 grains; and, assuming the same quantity of alloy as in the Agineitan drachma, one drachm should contain about 418 grains, or in other money 1s. 5d. 2½ farthings, or very nearly 1s. 3½d. It has been supposed, however, by some writers, that this drachma was in reality a drachma; but the existence of large silver coins of four times this weight is an argument for believing it to be the drachma, as we do not find any notice of eight-drachma pieces.

As the Romans reckoned in sexters, so the Greeks generally reckoned by drachmas; and when a sum is mentioned in the Attic writers without any specification of the unit, drachmas are usually meant.

DRACO. I. (Vid. Signa Militaria.)

Il, or drakos χειροσ, the Land Dragon. "All the classical authors," observes Adams, "speak of the Land Dragon as a most formidable animal, and of immense bulk, some say 60, some 60, and some 80 cubits in length. St. Augustine calls him the largest animal upon the face of the earth. Two species are described; one with wings, and the other without wings." These accounts but ill agree with the following description of the Draco solans, L., by M. l'Abbe Bonnafore: "Le plus grand des individus qu'on conserve au Cabinet du Roi a huit ponceaux deux lignes de longueur totale. Il est doux, farouche, et est le moins à craindre de tous les reptiles. Pourra-t-on se persuader que c'est Dragon à plusieurs têtes, qui réunissait l'agilité de l'aigle, la force de lion, qui vomissait des flammes, et dont les anciens nous ont fait un peintre?"... He also calls it the flying beard, a little harmless animal that only preys on insects. I cannot help thinking, however, that the extraordinary stories of antiquity regarding the Dragon must have had their origin in the exaggerated reports of travellers about the Bea Constrictor. I shall point out one circumstance which leads forcibly to this conclusion. Before it can give an account of extraordinary size, namely, 70 cubits long, which Alexander the Great saw in India, and which was kept as an object of worship. The poet Nonnus, 1. (p. 32.)—2. (Böckh, Pub. Econ. of Athens, i, p. 25.)—3 (Encyc. Meth., lib. xxxii., 61.)

The proportion of the Agineitan drachma to the Attic, according to the value given above, is as 93 to 65-4, or as 4-18 to 3 nearly. According to Pollux, however, the proportion was 5 to 3; for he states that the Agineitan drachma was equal to 10...
DROMEDARIUS.

DUPLICARI

also repeatedly connects the Dragon with the Indian wrestler of Bacchus.1 Now it is known that the Boa is worshipped even to this day in some parts of Hindustan.2 Still further, if the reader will compare the descriptions of the Ethiopian dragons given by Ælian3 and Philo4 with the stories which Pliny5 and Diodorus Siculus6 tell of serpents, he will readily perceive that they are all referable to the great Boa. Another argument in favour of this opinion may be drawn from the famous group of "Laocoon" in the Vatican. It must strike every person who has seen a model of it, that the immense serpents which are composed, on the human figure resemble Beasts. New these serpents are called "dragones" by Pliny5 in describing the group, and by Virgil6 in his relation of the event which forms the subject of it. Lord Byron,8 by-the-way, is singularly unfortunate in calling the serpent of the Laocoon an "asp," since the asp was a comparatively small reptile, and is said by Nicander and other toxicologists to despatch its victim without pain. But the following passage in Jerome's life of Hilarius puts the identity of the Dragon and the Boa beyond dispute: "Siquidem Draco, mare magnitudinis, quos genti nomine Boas vocant, ab eo quod tam grandes sint ut boves glutire solemnt, omnem autem vastat provinciam,"9 &c. In confirmation of this theory which is here sought to be established, he reads: "referred to the remarks of Grubenius in an edition of Cuvier. It may be stated with regard to the etymology of the term Boa, that, according to some of the ancient writers, this serpent was so called from its habit of following the hinds, in order to fasten itself to the teats of cows and suck their milk ("bovin lacte delictantur"). The so-called boas of the Eastern continent belong properly to "De Dracontium (draconum), a plant answer- ing, according to Fuchsius, Dodonaeus, Sprengel, and other botanical authorities, to the Arum Dracontium, or Dragon herb. It is the τραχύς of Simon Seth. The ὁσώντων ἄρρηπον is the Arum Ilicatum, Lam., according to Sprengel. Stackhouse makes the ὁσώντων of Theophrastus to be the Arum Ilicatum, which is called Waking-bobbin.10 "DREPANIS (drepavic), the name of a bird incidentally mentioned by Aristote and Pliny. According to Gaea and Scaliger, it is the same with the Reed-sparrow; but this opinion is rejected by Hardouin. Schneider is inclined to rank it under the genus Procellaria of Linneus, called in English the Petrel, or Snowy Petrel.11

DROMEDARIUS, the Dromedary, or Camelus Dromedarius.1 This is the Arabian Camel (Καμηλος d'Arabos, Aristot.; Camelus Arabius, Plin.), having only one hump, the Bactrian having two. Strictly speaking, however, the Dromedary is only a breed of the one-hump kind. The name is of Greek origin, and refers to the fleetness of the animal (δρόμος; "a race"). The one-hump species exists in the northern provinces of Persia and Arabia, in northern Persia, the Bactrian, Turkey, Arabia, northern Africa, and India. (Vid. Camelus.) Those of Turkey are the strongest, and best suited for burden; those of Arabia and Bambay the lightest; and those of India, where there are breeds for both purposes constantly supplied by fresh importations from the northwest, are yet probably inferior in the northwestern to those more in the vicinity of their original climate.12

DRYNUS (Dryvov), a species of serpens, so called from its lodging in the hollows of oaks (ὄξις, an oak). According to Nicaener,2 it was also called "serpents" because given it. Because in its scales are rough like those of a tortoise (accur, "a tortoise"). Sprengel supposes it to be the Colub- ber libertinus. Gesner says it is called in English the Sea-snail.3

DROCOLAPTES (drokolapty), the Picus, or Woodpecker. "About the three species described by Aristotle,4 there is considerable doubt. The first would be the Picus Marius, L., or the black Woodpecker; and the Picus viridis, the green Woodpecker, or Popenjay. That the largest species is the Picus major, or Whitwall, has been conjectured, but cannot be affirmed with certainty. The δρυνον of Aristophanes was most probably the Picus viridis.5

DROPTERIS (drupteris), according to Sprengel, the Polyodium dryopteris, or Oak-fern. Dierbach, however, holds that the Asplenium adian- tum nigrum is also comprehended under it.6

DROPSIS (dropsis), according to Sprengel and Stockhouse, the Drypsis spinosa. Schneider, how- ever, has doubts.7

DROPS (drops), the Oak. (Vid. Quercus.)

DUCENA (ducenaril, the name of various officers and magistrates, of whom the principal were as fol- 

I. DUCENARI was the name given to the Roman procurators, who received a salary of 200 sestertia. Dion Cassius7 says that the procurators first received a salary in the time of Augustus, and that they derived their title from the amount of their salary. We thus read of centenarii, trecenarii, &c., as well as of ducenarii.8 Claudius granted to the procurators of the collegia centuriae and ducenarum.9

II. DUCENARI formed a class or decuria of judi- cies, and were first established by Augustus.10 They were so called because their property, as valued in the census, only amounted to 200 sestertia. They appear to have tried causes of small importance.11

III. DUCENARI were in later times officers who commanded two centuries, and who held the same rank as the praetor hasting in the adjacent legion.

DUCENTE-SIMA was a tax of half per cent. upon all things sold at public auctions. The cente- sima, or tax of one per cent., was first established by Augustus,12 and was reduced to half per cent. by Tibersius.13 The tax was abolished altogether by Caligula as far as Italy was concerned,14 whence we find on some of the coins of this emperor the letter C, and the words Reim Cesare Consular.15 We can be no doubt that the interpretation given above is correct.

DUPLICARI were soldiers who received double pay or double allowances for their services.16 They are frequently mentioned in inscriptions,17 but more commonly under the name of dupliarii.18 In one in-

Echeneis

Acquiry the form duplicarius occurs. 1 Vegetus 2 calls them duplares milites.

DUPLICATIO. (Vid. Acroto, p. 19.)

DURODNIUS. (Vid. As, p. 111.)

DUVMURI, or the two men, the name of various magistrates and functionaries at Rome, and in the colonies and municipia. In inscriptions we also meet with the form duurmes 3 and duuri 4.

I. Duvmuri Jurci Deuowo were the highest magistrates in the municipal towns. (Vid. Colonia, p. 282.)

II. Duvmuri Nauales were extraordinary magistrates, who were created, whenever occasion required, for the purpose of equipping and repairing the fleet.

These appear to have been originally appointed by the consuls and dictators, and first created for the people. (Ad. 3.11.)

III. Duvmuri Perpetuillions. (Vid. Perpelidio.)

IV. Duvmuri Quinquenales were the consors in the municipal towns, and must not be confounded with the duvmuri jurc diucdo. (Vid. Colonia, p. 283.)

The duvmuri sacrorum originally had the charge of the Sibylline books. Their duties were afterward discharged by the decemviri sacris faciundis. (Vid. Decemviri, p. 340.)

Duvmuri were also appointed for the purpose of building or dedicating a temple. 6

E.

*EBTENUS (Ithov), Ebony. According to Virgil, 7 India was the only country that produced it. Dioscorides, 8 however, remarks, that it grows also in Ethiopia; and there is a passage in Herodotus 9 in which Ebony is spoken of among the articles of tribute paid by the Ethiopians to the king of Persia.

Either, therefore, the name of Ethiopia is to be taken for that country, in which the Ebony trees are found, either on sun-burned races, and may consequently include India, or else Virgil is in error.

Notwithstanding the numerous botanists who have travelled into India, we have not been able, until recently, to determine what tree the Ebony was to be assigned.

It is now certain that it is one of the genus Diospyrus, 10 and seems to be a common tree. It was mentioned by Dioscorides, 11 and is therefore recorded by the celebrated Dioscorides, 12 13 14

Diospyrus, 15 is the wood of a tree called in the Tamil language Atcha marum, which grows abundantly in the Gaugam-Oiers, in Berrn, and even in the island of Ceylon, where the natives term it Navegada. According to the author of the work just mentioned, it is the Diospyrus Ebenaster of Keorgen. As regards the name under which the Greeks and Romans have given this tree, and which still bears in all the languages of Europe, it may be remarked, that it comes from the Hebrew homonym haban. Its Arabic name, Abnous, is nothing more than a corruption from Ithov. 16

Modern botanists, 17 says Adams, 18 have applied various names to the Ebony-tree, namely, Ebenus Cretica, L.; Diospyrus Ebenaster, Diospyrus Ebenaster, Dio-

Ebenaster is the species of this genus, described by Dioscorides. 19

It is the very same as the Liberaria of Tourne-

fort (namely, Woundwort), and hence it is now called Antihius vulgaris. 20 21

*ECHENEIS (Iyoxe), a species of Fish. It would appear that the ezque of Aristotle and Pliny was different from that of Oppian and Alian, and that the former corresponded to the Echeneis: Thares, 22 or, sucking-fish, and the latter to the Petras-

myon Lampetra, 23, or Lamprey-eel. Artedi states that the Galarias (galaxias) of Galen corresponds to the Lamprey, and Rondelet and Nomius refer the bokkula of Strabo to the same.

The ancient stories about its stopping vessels in their course would appear to be fabulous, and yet it is worthy of notice, that although still credited by the inhabitants of Dalmatia and the neighboring countries, 24 *ECHIVM (Iyox), a plant, supposed to be a remedy against the bite of a viper (Eych). 25

"The Echium vulgare, or common Viper's Bugloss, has been generally acknowledged to be the Iyox of Nic-

ander and Dioscorides; but, according to Sprengel, this is a mistake, since the flowers of the Echium Dumburi were supposed to resemble the subject of the purple colours of the ancient, Sprengel remarks, "Carneous color, quum Graeci eanovin vaceat, nihil aliud est quam pura delutor et palliador." 26

*ECHINUS (Iyox), I., the Iyox chrysos of the Hedgehog, or Erinaceus Europaeus. The modern Greek name is esaxoxomuros. The first part of this word is a corruption of sanac (Atanthis vulgaris), and the second of Echinus. The Hedgehog is prescribed in Syria medicinally in some dis-

orders. Russell says he saw the animal carrying grapes as well as mulberries on its prickles, a story which certainly needs confirmation. 27

II. A testaceous genus containing many species:

in English, the Sea-urchin. Aristotle gives a very accurate description of the species. Sprengel says, that the species called paetaog and bioneo cannot be satisfactorily determined. The difference of habitats in the Land and Sea urchin gave rise to the Greek proverb expressive of irreconcilable habits, which they ascribe to the *Iyox ax Lyloxos. 28

VI. (Vid. Dike.)

ECHIS and ECHIDNA (Iyox, Iyox). Most of the ancient authors who treat of reptiles represent these as the Male and Female Viper; but, from the descriptions of them given by Nicander, it would appear that they were distinct species. Sprengel accordingly refers the Asiatic Iyoxa to the Coluber Erigentes, the European Iyoxa to the Coluber Berus, and the Iyox to the Coluber Amphidactylus. The word Ilyox is often applied as Ix Iyox to the Viper (Coluber Berus), and hence Ixoxi is used to signify the Eletctuary of Vipers. The Viper is the Ephe of Scripture. 29

ECLOGIA/SIA (iKxaiayia). The iKxaiayia of the Athenians were the representatives of the citizens in which they met to discuss and determine upon matters of public interest. These assemblies were either ordinary, and held four times in each prytany, or extraordinary, that is, specially convened upon any sudden emergency, and therefore called syv-

alj. 1

383
the city, and then the assembly was called a κατωκλον, the proper meaning of κατωκλον being to call from the council chamber to the city. For part of the council buildings were called κοιων and κορία, according to the scholiast on Aristophanes, who moreover informs us that there were three such in every month. But, according to the best-informed grammarians, who followed Aristotle, the name κοιων was appropriated to the first only of the regular assemblies of each prytany. Such, at least, is the account given by Pollux and Harpocrates, the former of whom asserts that the third of the regular assemblies in each prytany was partly devoted to the reception of ambassadors from foreign states.

Aristophanes, however, in the Acharnians, represents ambassadors who had just returned from Persia and Thrace as giving an account of their embassy in a κοιων ἐκκλησία, which, according to Pollux, would be not the third, but the first of the regular assemblies. With a view of reconciling these discrepancies, Schömann supposes that Sophocles originally appointed one βίβλιον, called κοιων, to be held on a certain day of every prytany, and that afterward additional assemblies were instituted, appropriated respectively to particular purposes, though the term κοιων was still reserved for the assembly formerly so called. If, however, the representation of Aristophanes is in agreement with the account of the scholiast, it is certain, what is very probable, that the arrangements for business, as described by Pollux, were not always observed even in the time of the poet; and since, a few years after Aristotle’s time, many changes took place in the constitution of Athens, it may have happened that the name κοιων was then given to all the regular assemblies, in which case the scholiast probably identified the customs and terms of a language with those of an earlier period. Moreover, the number of prytanies in each year, originally ten, one for each tribe, was, on the increase in the number of the tribes at Athens, raised to twelve, so that two prytanies would then coincide with the months of the year: a fact which, taken in conjunction with other circumstances, seems to show, that the authorities who speak of three regular assemblies in each month had in view the times when a prytany and a month were the same thing. Some authors have endeavoured to determine the particular days on which the four regular assemblies of each prytany were held; but Schömann has proved almost to demonstration, that there were no invariably fixed days for expressing a certain prytany and rate, even if there were, we have not sufficient data to determine them. Ulpius says, in allusion to the times when there were three assemblies in each month, that one was held on the eleventh, another about the twentieth, a third about the thirtieth, of each month; and it is, of course, not improbable that they were always held at nearly equal intervals.
